1. *Veronica americana* (Raf.) Schwein. AMERICAN BROOKLIME. Fleshy and more or less succulent glabrous perennial with creeping to decumbent bases; stems to about 1 dm. long; principal leaves of middle and upper part of flowering stems distinctly petioled, narrowly ovate to lanceolate, somewhat acute, to about 9 cm. long, the margins serrate to dentate; racemes lax, with arching rachises, axillary below the prolonged tip, 6- to 30-flowered; pedicels to about 11 mm. long, the lower mature ones filiform and divergent; corolla light bluish-violet; capsule turgid, suborbicular. In shallow water or wet sandy soil of gravelly streams in Edwards Plateau (Kendall Co.), June-Aug.; from Nfld. w. to Alas., s. to N.C., Tex., Mex. and Calif.; also n.e. Asia.

2. *Veronica Anagallis-aquatica* L. WATER SPEEDWELL, BROOK-PIMPERNEL. Usually perennial, glabrous throughout or obscurely glandular-puberulent in the inflorescence; stems shortly creeping and rooting at base, then ascending to erect, to 1 m. high; leaves sessile, rounded to clasping bases, oblong-lanceolate, acute, serrate to merely denticulate, those of autumnal shoots smaller and rounded; flowers many in small-bracted axillary racemes; pedicels 6-8 mm. long; sepals 4, lanceolate, acute, 4-4.5 mm. long; corolla 5-6 mm. wide, pale-lavender, the lobes with violet lines; style 1.8-2.5 mm. long; capsule 4 mm. long, more or less orbicular, obtuse at the narrowed obscurely notched apex; seeds about 0.5 mm. long. Usually in water of streams and in gravelly-sandy soils in cen. and n.-cen. (Fannin Co.) Tex., Mar.-June; throughout N.A., naturalized from Euras.

3. *Veronica peregrina* L. PURSLANE SPEEDWELL, NECKLACE WEED. Annual, erect, simple or with spreading branches, to 3 dm. high, glabrous throughout or pubescent with gland-tipped hairs; leaves sessile or with the lower somewhat petioled, usually linear-oblong, obtuse, dentate to entire; flowers in spiciform leafy-bracted terminal racemes; pedicels 1-2 mm. long; sepals 4, linear-oblong to oblanceolate, obtuse, about 3 mm. long; corolla

white, 2-2.5 mm. wide; filaments very short; style about 0.3 mm. long; capsule 3-3.5 mm. long. In water of tanks and streams, open flatwoods, swamps, prairies and dune areas throughout most of Tex., Feb.-June; throughout most of N.A., introd. in many parts of the world.

Represented in Texas by two variants.

- 1. Plant glabrous var. *peregrina*.
- 1. Plant pubescent with short gland-tipped hairs that are usually present even on the capsules var. *xalapensis* (H.B.K.) Penn.

4. *Veronica arvensis* L. COMMON SPEEDWELL, CORN SPERRY. Annual, erect or ascending, the stems simple or branched at base, to 3 dm. long, pubescent and sometimes glandular; leaves sessile or the lower rounded at base to short petioles, ovate, rounded-obtuse, crenate-dentate, to 15 mm. long; flowers in spiciform leafy-bracted terminal racemes; pedicels abbreviated; sepals 4, linear-lanceolate, acutish, 3.5-4 mm. long, the lower pair slightly the longest; corolla bright-violet-blue, 2-2.5 mm. long; filaments short; style about 0.7 mm. long; capsule 2-2.5 mm. long, rounded, deeply obcordate, its lobes flaring, ciliate-pubescent; seeds 1 mm. long. On moist open-wooded slopes, in fields and sandy flatwoods in e. Tex., Mar.-June; throughout most of U.S. and s. Can., naturalized from Euras.

5. *Veronica persica* Poir. PERSIAN SPEEDWELL. Annual, branched at base, the stems ascending, to 4 dm. high, pilose with glandless hairs; leaves scattered or alternate, truncate to petioles shorter than the blades, ovate, obtuse, to 3 cm. long, dentate with rounded lobes; flowers in axils of foliaceous bracts; pedicels 2-3.5 cm. long, much-exceeding leaves; sepals 4, ovate-elliptic, obtuse, short-ciliate, 5-6 mm. long; corolla 7-11 mm. wide, violet-blue, pale ventrally, all lobes darker veined; filaments 2 mm. long; style 2 mm. long; capsule 2.5-3 mm. long, widely notched, the rectangular lobes widely flaring; seeds 1.5 mm. long. Waste ground and lawns in w. and cen. Tex., Feb.-May; in much of N.A., naturalized from Euras.

6. *Veronica polita* Fries. WAYSIDE SPEEDWELL. Annual with prostrate or reclining pilose stems that are usually branched at base, to about 2 dm. high; leaves short-petioled, ovate to oval, to about 15 mm. long, rounded to subcordate at base, coarsely and irregularly crenate-serrate; flowers in axils of foliaceous bracts; pedicels equal to or shorter than leaves; sepals ovate to elliptic, obtuse, little if at all longer than the capsule; corolla 4-8 mm. wide, usually uniformly bright-blue; style 1 mm. long; capsule broader than long, the lobes erect, with both short glandless and longer glandular hairs; seeds 9 to 12 in each cell. In waste places, lawns and along roadsides in e. and n.-cen. Tex., in e. U.S. and Mex., naturalized from Euras.

21. AUREOLARIA RAF. FALSE FOXGLOVE

Large annual or perennial herbs with branched or rarely simple stems; lower leaves opposite, entire to deeply lobed, progressively smaller upward to become irregularly alternate, the uppermost subtending the large solitary pedicellate flowers; calyx tube campanulate to cup-shaped, the often unequal lobes triangular to linear; corolla yellow, zygomorphic, campanulate, the tube somewhat oblique; corolla lobes 5, shorter than the tube, all equally distinct and broadly rounded; stamens 4, didynamous, the lower pair the longest; filaments slender, villous; anthers pubescent with each anther sac awned at base; style slender, with 1 stigma; capsule ovoid to ellipsoid, loculicidal, the few to several seeds winged or wingless.

About 10 species from southern Canada to Mexico.

- 1. Annual, glandular-hirsute throughout; leaves bipinnatifid, pectinately toothed; calyx lobes pectinately toothed; capsule glandular pubescent 1. *A. pectinata*.
- 1. Perennial, glabrous to densely cinereous-puberulent but not glandular; leaves entire to pinnatifid, not pectinately toothed; calyx lobes entire to dentate; capsule glabrous (2)

- 2(1). Plant more or less densely cinereous-puberulent; floral bracts usually dentate; calyx lobes evidently dentate to entire2. *A. grandiflora*.
- 2. Plant glabrous to minutely and sparsely puberulent; floral bracts mostly entire; calyx lobes entire (3)
- 3(2). Stem finely puberulent, not glaucous; pedicels and calyx externally sparsely puberulent3. *A. dispersa*.
- 3. Stem glabrous, often glaucous; pedicels and calyx externally glabrous 4. *A. flava*.

1. *Aureolaria pectinata* (Nutt.) Penn. Annual to about 75 cm. high, diffusely much-branched, the glandular-pubescence of the herbage densely villous; leaves thin, spreading, lanceolate to ovate-lanceolate in outline, deeply bipinnatifid, the larger 2-4 cm. long; pedicels 3-10 mm. long; calyx tube nearly hemispherical, hirsute to lanate, the pinnately cut lobes 8-15 mm. long; corolla 3-4 cm. long, yellow, often tinged with reddish-purple, glandular-pubescent outside, the lobes orbicular; capsule ovoid, glandular, about 12 mm. long, with only its base embraced by the calyx tube; seeds wingless, about 1 mm. long. *A. Pedicularia* (L.) Raf. var. *pectinata* (Nutt.) Gl., *Dasistoma pectinata* (Nutt.) Benth. In sandy soil of grasslands and open woodlands in s.e. Tex., Sept.-Nov.; from Fla. to Tex., n. to N.C., Ky. and Mo.

2. *Aureolaria grandiflora* (Benth.) Penn. Perennial to 15 dm. high, widely branched, pubescent; lower leaves ovate in outline, more or less pinnatifid, the upper progressively reduced; bracteal leaves laciniate to entire, finely pubescent; pedicels stout, 5-14 mm. long at anthesis, abruptly upcurved, densely but minutely pubescent; calyx pubescent similarly to the pedicels, the tube hemispheric, almost invariably longer than the lanceolate or triangular lobes; corolla yellow, about 4 cm. long; capsule glabrous, ovoid, 1.5-2 cm. long. *Gerardia grandiflora* Benth. In dry open woods and along streams in woods mostly in forest belt of e. Tex., June-Oct.; from the Lake States, s. to Tex.

Represented in Texas by the following variants.

- 1. Calyx lobes broadly lanceolate, evidently dentate; petioles mostly 5-6 mm. long; bracts coarsely toothedvar. *grandiflora*.
- 1. Calyx lobes linear to lanceolate, entire or only slightly dentate; petioles mostly 10-15 mm. long (2)
- 2(1). Bracts serrate to entire, oblong, acute; upper leaf blades (similar to the bracts) abruptly smaller than the lower, relatively small; pedicels rather slender, in fruit 7-13 mm. longvar. *serrata* (Torr.) Robins.
- 2. Bracts entire to shallowly serrate, lanceolate, acuminate-attenuate; upper leaf blades gradually smaller than the lower, relatively large; pedicels stouter, in fruit 5-9 mm. longvar. *cinerea* Penn.

3. *Aureolaria dispersa* (Small) Penn. Stem to about 12 dm. high, sparsely puberulent; leaves ovate-lanceolate to ovate, nearly entire to deeply and coarsely lobed, finely puberulent, the larger to about 12 cm. long and with as many as 4 pairs of lateral lobes; pedicels 4-10 mm. long; calyx lobes 5-7 mm. long, triangular-lanceolate to lanceolate; corolla 3.5-5 cm. long, the depressed orbicular lobes 1-1.3 cm. long; capsule 14-18 mm. long, ovoid. *Gerardia dispersa* (Small) K. Schum. In sandy soil of open woodlands and thickets in s.e. Tex., Aug.-Oct.; also e. to Ala.

4. *Aureolaria flava* (L.) Farw. Perennial, to about 22 dm. high, branched above, the stems glabrous and glaucous; lower leaves deeply pinnatifid to half or more of their width (often nearly to the midrib), the lobes oblong to lanceolate, entire or dentate, widely divergent, separated by broad sinuses, the upper leaves less deeply lobed; bracteal leaves narrowly lanceolate to linear-lanceolate, entire or merely serrate; pedicels stout, abruptly upcurved, 4-10 mm. long at anthesis; calyx glabrous, its lobes 2-14 mm. long; corolla yellow, 3.5-6 cm. long; capsule ovoid, 12-27 mm. long. On open-wooded slopes, edge of woods and along streams in s.e. Tex., May-Sept.; from Me. to Ont., Mich. and Wisc., s. to Fla. and Tex.

Our plants are usually referred to var. *macrantha* (Penn.) Fern., characterized by having more permanently puberulent leaves and calyx lobes 5-14 mm. long in contrast to var. *flava* with calyx lobes 2-5 mm. long.

22. DASISTOMA RAF.

MULLEIN FOXGLOVE

A monotypic genus. Sometimes misspelled *Dasystoma* in some works.

1. *Dasistoma macrophylla* (Nutt.) Raf. Annual, rather pubescent, to about 2 m. high, branched, said to be parasitic on *Aesculus*; leaves opposite, ovate to lanceolate in outline, the margins subentire to crenate-serrate, to about 3 dm. long and 1 dm. wide, the lower ones pinnately divided and with the broad lanceolate divisions pinnatifid and incised, progressively smaller up the stem with the uppermost ones narrowly lanceolate; flowers in an elongate leafy spike; calyx slightly zygomorphic, about 1 cm. long, the tube cup-shaped, the 4 lower oblong lobes obtuse and about equaling the tube, the upper median lobe shorter and narrower; corolla tube narrowly campanulate, incurved, about 1 cm. long, woolly within, the spreading limb about 15 mm. wide; stamens 4, strongly didynamous; filaments villous, inserted near middle of corolla tube and barely exerted; anthers oblong, completely dehiscent; style somewhat dilated and notched at apex; capsule globose-ovoid, about 1 cm. long, loculicidal, each valve terminated by a short flat triangular beak; seeds angular, 2-3 mm. long, the papery coat reticulate. *Seymeria macrophylla* Nutt. In rich woods and on banks of streams in n.-cen. Tex., June-Sept.; from W.Va. to Wisc., Ia. and Neb., s. to Ga., Ala., Miss., La. and Tex.

23. SEYMERIA PURSH

Erect branching annual or perennial herbs; leaves pinnatifid to bipinnatifid or variously dissected, opposite or the uppermost alternate and bractlike; flowers in interrupted racemes or spikes; calyx regular, campanulate, deeply 5-cleft; corolla zygomorphic, yellow, with a short and thick tube not longer than the 5 ovate to oblong or lanceolate nearly equal and spreading lobes; stamens 4, equal; filaments short, inserted in the corolla tube, pubescent at base; anthers approximate by pairs, oblong, 2-celled, the cells equal and acute or pointless; style filiform, elongate; capsule loculicidal, many-seeded.

About 20 species, primarily in the United States and Mexico.

1. Leaf segments and calyx lobes filiform-linear; corolla lobes lanceolate; capsule about 5 mm. long, urceolate, acuminate, glabrous; distribution in east Texas 1. *S. cassioides*.
1. Leaf segments and calyx lobes lanceolate to linear-oblong, not filiform; corolla lobes suborbicular to ovate; capsule more than 5 mm. long, ovoid, acuminate, with short glandular hairs or glandular-tomentose (2)
- 2(1). Leaf blades strongly bipinnatifid, the primary ones mostly 2-4 cm. long; pubescence long, soft, cottony; distribution on Edwards Plateau 2. *S. texana*.
2. Leaf blades pinnatifid or rarely with some slightly bipinnatifid, less than 2 cm. long; pubescence short and often scabrous (3)
- 3(2). Herbage manifestly hispidulous-scabrous; all primary leaf blades pinnatifid; corolla glabrous on outer surface; capsule sparsely short-glandular; distribution in mountains of Trans-Pecos Texas 3. *S. scabra*.
3. Herbage not noticeably scabrous; some leaf blades slightly bipinnatifid; corolla glandular-tomentose on outer surface; capsule glandular-tomentose; distribution in Rio Grande Plains of south Texas 4. *S. Havardii*.

1. *Seymeria cassioides* (Walt.) Blake. Annual to about 1 m. high, much-branched, the stems slender, finely pubescent; leaves ovate in outline, 1-2 cm. long, deeply pinnatifid or bipinnatifid with the segments filiform-linear; flowers solitary in the upper leaf axils, with filiform pedicels to 8 mm. long; calyx lobes setaceous, 2-3 mm. long; corolla lemon-yellow, sometimes marked with purple within, 6-10 mm. long; filaments woolly at base; anthers about 3 mm. long, dehiscent from apex; capsule urceolate, acuminate, about 5 mm. long. *S. tenuifolia* Pursh, *Afzelia cassioides* (Walt.) J. F. Gmel. In sandy pinelands, e. Tex., Sept.-Oct.; Bah. I., Fla. and La. n. to Va., Tenn. and Ala.

2. *Seymeria texana* (Gray) Penn. Plant to 1 m. high and wide, the stems widely branched, densely pubescent throughout with viscid-glandular cottony hairs; leaves rela-

tively few, to about 4 cm. long, narrowly triangular-lanceolate in outline, mostly bipinnatifid, the lower leaves sometimes tripinnatifid and the upper ones often merely pinnatifid, the segments linear to oblong; pedicels weak and slender, to about 1 cm. long; calyx lobes pubescent, oblong to oblong-lanceolate, 3-4 mm. long, obtuse; corolla about 1 cm. long, broadly campanulate, softly glandular-pubescent on outer surface, the stout limb less than 1 cm. wide and lobes oval to oval-orbicular; filaments pubescent; capsule ovoid, 6-8 mm. long, glandular. *Afzelia texana* (Gray) Small. On limestone cliffs and slopes of calcareous hills on Edwards Plateau, Sept.-Oct.; endemic.

3. *Seymeria scabra* Gray. Plant hispidulous-scabrous throughout, not conspicuously glandular, with slender erect or wide-spreading branches, to about 6 dm. high and wide; leaves 1-1.5 cm. long, sparingly pinnatifid into few narrow linear divisions or the upper leaves essentially entire; pedicels short and stout, mostly less than 6 mm. long; calyx lobes linear-subulate, to about 5 mm. long; corolla about 7 mm. long, glabrous on outer surface but the obovate to oval lobes marginally ciliate; filaments broad, pubescent below the middle; capsule ovoid, gradually acuminate, 8-12 mm. long, more or less glandular. On dry rocky mt. slopes in the Trans-Pecos, July-Sept.; also adj. Mex.

4. *Seymeria Havardii* (Penn.) Penn. Stem about 4 dm. high, much-branched, pubescent with retrorse-spreading to -incurved hairs, with longer similar gland-tipped hairs; leaves lanceolate to ovate-lanceolate, slightly bipinnatifid, with the lanceolate segments falcately spreading, glandular-hirsute; stem leaves 15-17 mm. long, 6-8 mm. wide, with 5 or 7 pairs of lateral lobes; pedicels slender, in flower 6-10 mm. long, in fruit 7-12 mm. long; calyx glandular-hirsute; calyx lobes 3-4 mm. long, lanceolate, acute, dentate; corolla 7.5-8 mm. long; corolla lobes 5 mm. long, ovate, rounded, spreading, the 2 posterior lobes united one-half to three-fifths of their length, externally glandular-tomentose, within pubescent in a ring about the bases of the filaments but glabrous below the posterior sinus, the lobes irregularly ciliate; filaments 2.5 mm. long, stout, posterior ones incurved, dilated and pubescent for two-thirds their length, anterior ones straight, less dilated, pubescent only one-half their length; connective glabrous; anthers 3 mm. long, linear-oblong, opening one-half their length; capsule 9-12 mm. long, narrowly ovoid, acuminate, glandular-tomentose; seeds 1-1.2 mm. long, pale-brown, the raised reticulations thin and somewhat winglike. *Afzelia Havardii* Penn. Limestone hills near Eagle Pass, Maverick Co. Only locality known.

24. TOMANTHERA RAF.

Annual herbs with the stems retrorsely pubescent; leaves opposite, numerous and crowded; flowers sessile in the upper axils to form a leafy spike; calyx regular or nearly so, the lobes longer than the tube; corolla zygomorphic, purplish, often variously marked, the tube campanulate and somewhat distended on lower side, the limb about equally 5-lobed with the lower lip spreading and the upper lip arched; stamens 4, didynamous, the lower pair longer; filament and anthers villous; style elongate, the stigma linear; capsule loculicidal.

Two species in temperate North America.

1. Leaves lanceolate to broadly lanceolate, the upper ones auricled at base, all scabrous on the upper surface; stem with numerous long hairs; spike rather lax; capsule broadly ovoid, 10-13 mm. long 1. *T. auriculata*.
1. Leaves pinnatifid, the segments linear or nearly so, nearly glabrous on the upper surface; stem with few or no long hairs; spike densely crowded; capsule obovoid, 8-10 mm. long 2. *T. densiflora*.

1. *Tomanthera auriculata* (Michx.) Raf. Scabrous annual with retrorse-hirsute 4-angled simple or sparingly branched rigid stems to about 8 dm. high; leaves subsessile, lanceolate to ovate-lanceolate, to 55 mm. long and 2 cm. wide, the uppermost with divergent basal auricles; flowers sessile in leafy-bracted spikes; calyx campanulate, with unequal ovate-lanceolate lobes 9-12 mm. long; corolla 2-2.5 cm. long, purple, the upper lobes longer than the lower ones, the throat dark-spotted; upper filaments 5-6 (lower about 10) mm. long; upper anthers about 2 mm. long, the lower 2.2-5 mm. long and

blunt-based; capsule thick-ovoid; seeds ellipsoid-ovoid, 1.3-1.6 mm. long. *Gerardia auriculata* Michx., *Otophylla auriculata* (Michx.) Small. Prairies, open woods and fields in n.-cen. Tex., Aug.-Sept.; from N.J. to Minn., s. to Va., Ala., Tenn., Ark. and Tex.

2. *Tomanthera densiflora* (Benth.) Penn. Plant hispid and rough, very leafy, much-branched, to about 8 dm. high; leaves rigid, nearly glabrous on upper surface, pinnately parted into 3 to 7 narrowly acute divisions, those subtending the densely spicate flowers similar and much-crowded; calyx tube one third to one half the length of the capsule, minutely scabrous-puberulent to glabrate, the lobes ascending-scabrous-puberulent and the margins ciliate; corolla pale-mallow-purple, anteriorly with dark-purple spots, 23-32 mm. long; style glabrous; capsule 8-10 mm. long; seeds 1.5-1.8 mm. long, ovoid-triangular, sharply angled. *Gerardia densiflora* Benth., *Otophylla densiflora* (Benth.) Small. In dry limestone soils on prairies in cen. Tex., Aug.-Oct.; from Kan. to Tex.

25. AGALINIS RAF.

Annual (in ours) or perennial herbs with usually thin stems and branches; leaves linear, mostly entire, opposite, tending to become alternate on the branches; flowers often large for the plant, arising from the axils of the somewhat reduced upper leaves to form a raceme or (by reduction) appearing to be terminal, frequently only one flower of pair developed; calyx regular, gamosepalous, the tube campanulate to hemispheric, usually much longer than the lobes; corolla zygomorphic, membranous, pink to purple, sometimes white, commonly with yellow lines and reddish-purple spots in throat; corolla tube campanulate, often somewhat distended on the lower side; corolla lobes all equally distinct, commonly marginally ciliate, the lower 3 spreading, the upper 2 arched and spreading or somewhat recurved; stamens 4, didynamous, the lower pair the longer; filaments pubescent (at least toward base); anther sacs obtuse to cuspidate at base; capsule typically globose or sub-globose, loculicidal.

About 60 species in temperate America.

- 1. Pedicels mostly 1 cm. long or more, typically filiform and always much longer than the calyx at anthesis (2)
- 1. Pedicels mostly less than 1 cm. long, stoutish or slender and about as long as or shorter than the calyx at anthesis, rarely with some slightly longer than calyx (10)
- 2(1). Plants yellowish-green, not tending to blacken in drying; calyx tube evidently reticulate-venose; corolla pinkish; seeds yellow or yellowish-brown (3)
- 2. Plants relatively dark-green, tending to blacken in drying; calyx tube slightly or not reticulate-venose; corolla purplish-pink or deep-pink; seeds dark-brown or blackish (4)
- 3(2). Capsule globose to globose-ovoid, 4-5 mm. long; corolla 12-20 mm. long; seeds more or less rounded and turgid; calyx tube 2.5-3.5 mm. long, its lobes mostly less than 1.5 mm. long; stem slender, rather evenly branched; leaves wide-spreading 1. *A. Gattereri*.
- 3. Capsule globose-obovoid, 5-7 mm. long; corolla 8-13 mm. long; seeds angled, not turgid; calyx tube 3.5-4 mm. long, its lobes 1.5-2 mm. long; stem much-branched, the primary branches long and widely ascending, the secondary branches shorter; leaves erect-ascending, often paralleling the stems .. 2. *A. viridis*.
- 4(2). Plant fleshy and succulent, bushy-branched below and with elongated racemes above; leaves and calyx lobes obtuse or essentially so; in saline habitats 3. *A. maritima*.
- 4. Plant not fleshy, more uniformly branched; leaves and calyx lobes acute to acuminate; in nonsaline soils (5)
- 5(4). Upper lobes of corolla reflexed-spreading, subequal to lower lobes; corolla often pubescent within, its outer surface somewhat pubescent to glabrate (6)
- 5. Upper lobes of corolla arching or projecting forward over stamens and style, shorter than the lower lobes; corolla essentially glabrous within (8)

- 6(5). Stem scabrous; leaves linear-setaceous, 1 mm. wide or less, axillary fascicles usually conspicuously developed; corolla 2.5-3 cm. long; intrareticular areas of seeds hexagonal; distribution in southeast Texas 4. *A. pulchella*.
6. Stem glabrous or nearly so; leaves linear, mostly with some more than 1 mm. wide; corolla mostly smaller than above (7)
- 7(6). Calyx lobes 1-2 mm. long; corolla strongly upcurved, with a narrow line of hairs below the posterior sinus; intrareticular areas of seeds hexagonal; leaves typically strict to often parallel the branches; distribution mainly in Rio Grande Valley and adjacent coastal region 5. *A. strictifolia*.
7. Calyx lobes shorter than above; corolla slightly upcurved, with hairs commonly diffused over bases of upper lobes; intrareticular areas of seeds narrowly elongated; leaves spreading; distribution in northeast Texas . . . 6. *A. caddoensis*.
- 8(5). Upper lobes of corolla much-abbreviated, less than half the length of the lower lobes, flattened-projected 7. *A. homalantha*.
8. Upper lobes of corolla more than half the length of the lower lobes, concave-arched (9)
- 9(8). Corolla pubescent within in a narrow line below posterior sinus; racemes relatively short, of 3 or 4 pairs of pedicels; distribution on Edwards Plateau in central Texas 8. *A. edwardsiana*.
9. Corolla glabrous within below the posterior sinus; racemes elongated, of more than 4 pairs of pedicels; distribution mostly in northeast Texas 9. *A. tenuifolia*.
- 10(1). Plant fleshy and succulent, bushy-branched below and with elongated racemes above; leaves and calyx lobes obtuse; in saline habitats 3. *A. maritima*.
10. Plant not fleshy, more uniformly branched; leaves and calyx lobes acute to acuminate; in nonsaline soils (11)
- 11(10). Calyx lobes nearly as long as to longer than the tube, the sinuses narrow; leaf blades linear-lanceolate to lanceolate or sometimes linear, to 6 mm. wide, the lower occasionally 3-cleft at base (12)
11. Calyx lobes typically much-abbreviated, much shorter than the tube, the sinuses broad and open; leaf blades linear to filiform or subulate, always entire (13)
- 12(11). Distribution in mountains of Trans-Pecos Texas; pedicels more than 5 mm. long 10. *A. calycina*.
12. Distribution in east and south Texas; pedicels 3 mm. long or less 11. *A. heterophylla*.
- 13(11). Capsule ovoid-ellipsoid, subcylindric, distinctly longer than wide; the fastigately branched stem, subrigid leaves and erect pedicels harshly scabrous; distribution along the Red River in north-central Texas . . 12. *A. aspera*.
13. Capsule globose to globose-ovoid, shorter than to slightly longer than wide; the variously spreading branches, usually more flexible leaves and spreading to ascending pedicels smooth to scabrous; distribution in east and central Texas (14)
- 14(13). Main leaf blades greatly reduced, less than 1 cm. long, scalelike 13. *A. oligophylla*.
14. Main leaf blades not reduced, typically more than 2 cm. long (15)
- 15(14). Primary leaves to 4 cm. long, spreading or widely arcuate-ascending; stem smooth to more or less scabridulous, commonly angled; stigma 2-3 mm. long 14. *A. purpurea*.
15. Primary leaves mostly less than 2.5 cm. long, erect-ascending or closely arcuate-ascending, often somewhat appressed to stem, typically with well-developed axillary fascicles; stem scabrous-puberulent, subterete; stigma 3-4 mm. long 15. *A. fasciculata*.

1. *Agalinis Gattingeri* (Small) Small. Plant to about 7 dm. high, the smoothish stem nearly terete and with many spreading-ascending branches, the slender lateral branches

bearing a few small leaves and several or rarely more than a single apparently terminal flower; leaves linear, acuminate, the primary ones 2-3 cm. long and to 1.2 mm. wide; upper bracteal leaves one half to nearly as long as the pedicels; a terminal raceme scarcely developed; pedicels to 25 mm. long; calyx tube campanulate, 2.5-3.5 mm. long, its triangular-lanceolate teeth to 1.8 mm. long and scarcely callous-thickened; corolla rose-pink, 1.2-2 cm. long, its lobes 4-6 mm. long; capsule globose to globose-ovoid, 4-5 mm. long. *Gerardia Gattingeri* Small. In moist or dry soils on slopes and in open woodlands and barrens in e. Tex., Sept.-Oct.; from Ont. to Minn. and Neb., s. to Ala., La. and Tex.

2. *Agalinis viridis* (Small) Penn. GREEN GERARDIA. Stem to about 6 dm. high, with long slender widely divergent branches and many shorter secondary branchlets, essentially glabrous; leaves strictly erect-ascending, linear, acuminate, finely scabrous on upper surface, those of the stem 15-22 mm. long and to 1.3 mm. wide, gradually reduced above; racemes somewhat elongate, up to 9-flowered, often only one flower of pair developed; pedicels spreading, slender, clavate, in flower to 15 mm. long (often with many less than 1 cm. long), in fruit to 22 mm. long; calyx tube obovoid-campanulate, often stramineous, evidently reticulate-veiny, 3.5-4 mm. long, somewhat truncate, the triangular-lanceolate to lanceolate lobes 1.5-2 mm. long and not or scarcely callose; corolla pale-pink, 8-13 mm. long, its tube 6-9 mm. long and slightly upcurved, its truncate to erose lobes 2-4 mm. long and spreading; capsule globose-obovoid, light-brown, 5-7 mm. long. *Gerardia viridis* Small. In sandy soils in pinelands and prairies in e. Tex., Sept.-Oct., rarely in spring; from Mo. to La., Tex. and Okla.

3. *Agalinis maritima* (Raf.) Raf. SEASIDE GERARDIA, SALT MARSH GERARDIA. Plant to about 6 dm. high, usually much smaller, with short leafy branches below, smooth; leaves fleshy, broadly linear, obtuse, to about 3 cm. long and 3 mm. wide; flowers few, in a more or less naked simple raceme; pedicels 2-10 mm. long, shorter to longer than the floral bracts; calyx tube broadly campanulate, 2-3 mm. long in anthesis, slightly longer in fruit; calyx lobes broad, short and thick, 0.5-1 mm. long, very obtuse to acutish; corolla rose-pink, glabrous, 1.2-2 cm. long; anther cells mucronulate at base, 1.3-2.3 mm. long, villous to glabrous; capsule globular to ovoid, 4-6 mm. long. *A. spiciflora* (Engelm.) Penn., *Gerardia maritima* Raf. In salt marshes and beach dunes along the coast, May-July; from N.S. to Fla. and Tex.; also Mex. and W.I.

Our material is usually referred to var. *grandiflora* (Benth.) Shinners, characterized by having anther cells 1.8-2.3 mm. long and usually villous with long white hairs; pedicels mostly equaling or longer than the bracts; calyx lobes typically obtuse; corolla 1.5-2 cm. long.

4. *Agalinis pulchella* Penn. Stem 6-10 dm. high, slender, with numerous ascending-spreading branches, striate-quadrangular, scabrous; leaves spreading, narrowly linear to subfiliform, acute, very scabrous on upper surface, those of the stem 2-3 cm. long and 0.4-0.9 mm. wide, reduced above; axillary fascicles often well-developed, rarely equaling the subtending leaves; racemes slightly elongated, often but one flower of pair developed, 4- to 6-flowered; pedicels ascending-spreading, very slender, minutely scabrous, in flower 1.5-3 cm. long, in fruit 2.5-4 cm. long; calyx tube 3-4 mm. long, hemispheric, truncate, apex of tube within sparingly puberulent; calyx lobes to 0.5 mm. long, subulate, callose and usually recurved; corolla rose-purple to deep-lavender, 2.5-3 cm. long, its tube 16-23 mm. long and moderately upcurved, its spreading lobes 9-12 mm. long and emarginate; capsule 5-6 mm. long, globose, brown. *Gerardia pulcherrima* (Penn.) Penn. In sandy or clayey soils in longleaf pinelands and grasslands on slopes in s.e. Tex., Sept.-Oct.; from n. Fla. and Ga. to Tex.

5. *Agalinis strictifolia* (Benth.) Penn. Stem 5-8 dm. high, slender, with numerous rigidly ascending or ascending-spreading branches, more or less strongly quadrangular-striate, glabrous; leaves on stem and primary branches spreading or often reflexed, linear, acuminate, 2-3.5 cm. long, 1-3 mm. wide; leaves of flowering branchlets linear-subulate, erect and somewhat appressed to stem, to about 13 mm. long, all the leaves finely scabrous to scabro-roughened or nearly glabrous on upper surface; racemes slightly elongated, often but one flower of pair developed, 4- to 10-flowered; pedicels ascending-spreading, slender, glabrous, in flower usually 1-2.5 cm. long, in fruit 1.5-3 cm. long; calyx tube 3-4 mm. long, campanulate-hemispheric, obscurely to evidently rib-veined, scarcely truncate, apex of tube and lobes within minutely pubescent; calyx lobes 1-2 mm.

long, triangular-lanceolate to subulate, acuminate; corolla rose-pink to lavender, 2-2.5 cm. long, its tube 12-15 mm. long and strongly upcurved, its spreading lobes 8-10 mm. long and truncate-erose; capsule broadly quadrangular, nearly as broad as long, irregular, to about 6 mm. long, the testa dark and with firm reticulations. *Gerardia strictifolia* Benth. In old fields, open sandy mesquite plains, open areas and on ridges in scrub, from Austin and Travis cos., s. and w. to the Rio Grande, Sept.-Nov. and May; also adj. Mex.

6. *Agalinis caddoensis* Penn. Stem 4-6 dm. high, slender, with numerous loosely ascending branches, finely striate, 4-angled above, very sparingly scabrellous; leaves spreading, filiform, acuminate, scabrous above, strongly involute, those of the stem 2.5-3 cm. long and about 0.8 mm. wide, reduced above; racemes scarcely elongated, interrupted, 1- to 5-flowered; pedicels ascending-spreading, slender, sparingly scabrellous to glabrous, in flower 13-22 mm. long, equaling to slightly longer than the bracts, many on the branches appearing as terminal; calyx tube 4-5 mm. long, hemispheric-campanulate, obscurely 5-ribbed, truncate, apex of tube and lobes within evidently puberulent; calyx lobes 0.7-1 mm. long, triangular-subulate, not callose; corolla rose-pink, 2-3 cm. long, spreading 23-28 mm. wide, its tube 19-23 mm. long and slightly upcurved, its spreading lobes 6-7 mm. long and rounded to retuse. *Gerardia caddoensis* (Penn.) Penn. In dry loam in oak woods, undoubtedly in n.e. Tex. (no material seen), Sept.-Oct.; in extreme n.w. La.

7. *Agalinis homalanthia* Penn. Stem 4-7 dm. high, slender, with numerous ascending-spreading branches, slightly scabrellous; leaves spreading, linear, acuminate, those of the stem 2.5-3 cm. long and 1-1.5 mm. wide, reduced above, somewhat scabrous on upper surface; axillary fascicles strongly developed, shorter than the subtending leaves; racemes elongated, 4- to 10-flowered; pedicels ascending-spreading, slender, slightly clavate, somewhat scabrellous, in flower 1-2 cm. long, in fruit to 3 cm. long, 1.5 to 2.5 times the length of the bracts; calyx tube 3-3.5 mm. long, truncate, apex of tube and lobes within densely puberulent; calyx lobes 1-1.2 mm. long, rarely much longer, lanceolate, acuminate; corolla lavender to pinkish, 23-27 mm. long, its straight tube 15-18 mm. long, the lower lobes spreading and 8-9 mm. long, the upper lobes 3-4 mm. long and flat-extended over stamens and style; capsule subglobose, about 6 mm. long. *Gerardia homalanthia* (Penn.) Penn. In sandy soil of post-oak woods, cut-over fields and plains in e. and n.-cen. Tex., Aug.-Oct.; also s. Okla.

8. *Agalinis edwardsiana* Penn. Stem 4-8 dm. high, slender, with many laxly ascending-spreading branches, essentially glabrous; leaves spreading or the lower frequently somewhat reflexed, linear, acuminate, scabro-roughened to nearly glabrous on upper surface, those of the stem 2-3.5 cm. long and 0.5-0.9 mm. wide, reduced above; racemes slightly elongated, 2- to 9-flowered; pedicels ascending-spreading, slender, glabrous, to 3 cm. long at anthesis; calyx tube 3.5-4.5 mm. long, hemispheric, truncate, the triangular-subulate to subulate acuminate lobes to 0.5 mm. long; corolla 2-2.3 cm. long, its tube 12-14 mm. long, its lobes erose to emarginate, the spreading lower lobes 8-9 mm. long, the upper lobes 5-6 mm. long and broadly arched over stamens and style; capsule 6-7 mm. long, globose to obovoid-globose, dark-brown. Incl. var. *glabra* Penn., *Gerardia edwardsiana* (Penn.) Penn. In thin soil and adobe on limestone hills of the Edwards Plateau, Aug.-Oct.; endemic.

9. *Agalinis tenuifolia* (Vahl) Raf. Plant usually smooth, to about 5 dm. high, usually much smaller, paniculately much-branched; leaves mostly narrowly linear and plane, spreading, to 6 mm. wide, about equaling the lower but mostly shorter than the uppermost pedicels; inflorescence racemose; pedicels filiform, widely divergent, commonly 1-2 cm. long at anthesis; calyx tube 2-4 mm. long; calyx lobes broadly triangular to subulate, usually less than 1 mm. long, rarely to 2 mm.; corolla pink to mallow-purple or paler, 1-2.3 cm. long, glabrous except for the ciliate margins of the nearly equal lobes, its upper lip arching over the stamens; anther cells cuspidate-mucronate at base, densely to sparingly villous; capsules 3-7 mm. long. *Gerardia tenuifolia* Vahl. and var. *leucanthera* (Raf.) Shinn. In moist areas along streams, about ponds, in meadows, fields and low flatwoods, mostly in n.e. Tex., Sept.-Nov.; from Me. to Man. and N.D., s. to Fla. and Tex.

Our material is usually referred to subsp. *leucanthera* (Raf.) Penn. characterized by having a corolla 15-23 mm. long and calyx lobes less than 1 mm. long.

10. *Agalinis calycina* Penn. Stem at least 4 dm. high, with numerous divergent-ascending branches, relatively slender, glabrous; leaves spreading, linear, acuminate,

entire, more or less scabro-roughened on the upper surface, those of the stem 2-4 cm. long and to 1.5 mm. wide; bracts scarcely reduced; racemes somewhat irregular, 4- to 12-flowered; pedicels ascending, slender, glabrous, usually 5-7 mm. long at anthesis, at least 8 mm. long in fruit; calyx tube 5-6 mm. long, campanulate, obscurely veined, not truncate, its nearly linear lobes 5-7 (-15) mm. long, the apex of tube and lobes within finely granular-puberulent; corolla deep pink, 2-2.5 cm. long, its tube 17-21 mm. long, its spreading ciliate lobes 3-5 mm. long and rounded-truncate, externally pubescent with ascending hairs, within nearly glabrous to slightly pubescent in a ring about the bases of the filaments, pubescent in a narrow line below posterior sinus; anther cells 2.5-3 mm. long, acuminate-tipped at base. *Gerardia calycina* (Penn.) Penn. Moist places in the Trans-Pecos; also Coah.

11. *Agalinis heterophylla* (Nutt.) Small. PRAIRIE AGALINIS. Plant to about 6 dm. high, the stem smoothish, paniculately branched or the branches virgate; leaves rather erect, thickish or rigid, the lowest or primary ones broadly linear (to 45 mm. long and 8 mm. wide) and 3-cleft or lacinate, the others narrowly linear and mucronate-acute, those of the branchlets short and somewhat subulate, scabrous above and on the margins; pedicels to 2 mm. long; calyx tube 3.5-5 mm. long, the midvein keeled into the lobes; calyx lobes triangular-lanceolate or subulately attenuate from a broad base, very acute, in age spreading, 3.5-6.5 mm. long, almost always as long as or longer than the tube; corolla deep-pink to white and lavender-tinged, 2.5-3 cm. long; capsule subglobose, about 8 mm. long. *Gerardia heterophylla* Nutt. In prairies and plains, grasslands and fallow fields, sometimes on rocky soils or in open woodlands, usually somewhat moist, in Tex. in a line from Grayson Co. to Cameron Co. and eastw., June-Oct.; from Mo. and Okla. to La. and Tex.

12. *Agalinis aspera* (Benth.) Britt. Stem 2-8 dm. high, simple or with many ascending branches, relatively stout, somewhat quadrangular, sparingly scabrelous; leaves ascending, narrowly linear, acicular-acuminate, densely ascending-scabrous on upper surface, those of the stem 2.5-4 cm. long and 0.8-1.5 mm. wide, reduced above; axillary fascicles abundantly developed; racemes elongated, 4- to 18-flowered; pedicels nearly erect, slender, glabrous or nearly so, mostly less than 1 cm. long, in flower to 13 mm. long, in fruit to 18 mm. long, shorter than the bracts; calyx tube 4-6 mm. long, campanulate, obscurely veined, not truncate, apex of tube and lobes within densely puberulent; calyx lobes 1.5-3 mm. long, triangular-lanceolate to lanceolate; corolla pale-pink to lavender-pink, 18-25 mm. long, its straight tube 15-17 mm. long, its lobes 5-6 mm. long and rounded to emarginate, the upper lobes ascending or somewhat spreading; capsule 7-11 mm. long, oblong to ovoid-oblong, dark-brown. Prairies and dry sandy soil or rocky hills in n.-cen. Tex., Aug.-Oct.; from Man., s. to Okla. and (?) Tex.

No material of this species has been seen from Texas but it should be found in the area of Wilbarger and Hardeman counties, only 30 miles south of its nearest known locality in Oklahoma.

13. *Agalinis oligophylla* Penn. Stem 3-8 dm. high, slender, with few to many ascending branches, striate-ridged, minutely hispidulo-roughened on the ridges, terete below, obscurely quadrangular above; leaves spreading to ascending, linear-setaceous to subulate, acuminate, somewhat involute, scabrous on upper surface, those of the stem 5-10 mm. long and 0.2-1 mm. wide, those on the flowering branchlets reduced to minute subulate bracts; racemes scarcely elongated, 1- to 8-flowered; pedicels stoutish, clavate, minutely hispidulo-roughened to glabrous, rarely to 1 cm. long; calyx tube 2-3 mm. long, hemispheric, obscurely veined, truncate, apex of tube and lobes within puberulent; calyx lobes 0.4-0.6 mm. long, triangular-subulate, becoming somewhat callose; corolla pink, 15-22 mm. long, its tube 11-15 mm. long and somewhat upcurved, its spreading lobes 4-7 mm. long and truncate to emarginate; capsule globose to globose-ovoid, about 5 mm. long. *Gerardia microphylla* (Gray) Small, *G. aphylla* of auth. In sandy or clayey soils in prairies, savannahs and longleaf pine regions in s.e. Tex., Sept.-Nov.; also La.

14. *Agalinis purpurea* (L.) Penn. Plant to 12 dm. high, usually much smaller, smooth to scabridulous, commonly angled, with virgate rather wide-spreading branches; leaves usually spreading or widely arcuate-ascending, narrowly linear, to about 4 cm. long and 4 mm. wide, either somewhat scabrous or smooth with merely scabrous margins; axillary fascicles sometimes slightly developed; flowers few to many; pedicels 1-4 mm. long, shorter than the calyx; calyx tube 2-4 mm. long; calyx lobes triangular, acute to acuminate,

1 mm. long or more; corolla rose-pink to pink, 2.5-3 cm. long; capsule globular, 4-6 mm. long. *Gerardia purpurea* L. Moist sandy soil in bogs, seepage areas, moist prairies, open pinelands, barrens and along shores in e. Tex., Aug.-Nov.; from N.S. to Minn., s. to Fla. and Tex.; also Mex. and the W.I.

15. *Agalinis fasciculata* (Ell.) Raf. Plant to about 7 dm. high, the stem scabrous-puberulent, nearly terete at base, the branches angled; leaves erect-ascending to closely arcuate-ascending, scabrous, commonly 1-2 mm. wide, the axillary fascicles usually well-developed; bracteal leaves reduced, much shorter than the flowers; racemes elongate, 12- to 30-flowered; pedicels 2-4 mm. long at anthesis; calyx tube 3-4 mm. long, with subquadrate sinuses, the acuminate lobes to 2 mm. long; corolla 2-3.5 cm. long, rose-pink, with rounded to truncate spreading lobes 7-10 mm. long; anther cells 2.5-3.5 mm. long, with acute to cuspidate bases; capsule globose-ovoid, 5-6 mm. long; seeds to 0.8 mm. long. *Gerardia fasciculata* Ell. In dry or moist soils in savannahs, open weedy areas, open flatwoods and in dune hollows and tidal marshes in e. and n.-cen. Tex., Sept.-Oct.; from Fla. to Tex., n. to Md., Mo. and Ark.

26. BUCHNERA L. BLUEHEARTS

Perennial rough-hairy herbs that turn black in drying, apparently root-parasitic; leaves sessile, opposite or the uppermost alternate; flowers opposite in a terminal spike, bracted and with 2 bractlets; calyx tubular, obscurely nerved; corolla with a straight or curved tube and an almost equally 5-cleft limb, the lobes oblong to cuneate-obovate, flat; stamens included, the anthers 1-celled; style clavate and entire; capsule bivalved and many-seeded.

About 100 species, mostly in the Old World tropics and subtropics.

1. Leaf blades clearly 3-veined, ovate-lanceolate, sinuate-dentate to somewhat lacerate; corolla lobes 5-8 mm. long; capsule usually 6-7 mm. long; stem usually hirsute-pubescent 1. *B. americana*.

1. Leaf blades obscurely or not 3-veined, elliptic-lanceolate, repand-dentate to entire; corolla lobes 2-5 mm. long; capsule about 5 mm. long; stem pilose to glabrate ..
..... 2. *B. floridana*.

1. *Buchnera americana* L. Plant rough-hairy, the virgate stem to about 8 dm. high; lower leaves lanceolate to obovate-oblong, to 1 dm. long, the others ovate-oblong to linear-lanceolate, sparingly and coarsely toothed, scabrous, veiny; spike interrupted; calyx pubescent, 6-7 mm. long, exceeding the bracts; corolla deep-purple, the tube about 1 cm. long, the lobes 5-8 mm. long; capsule ovoid-oblong, about 7 mm. long. In moist sandy soil of open woods, prairies, meadows and marshy areas in e. Tex., June-Dec.; from Fla. to Tex., n. to N.J., N.Y., Ont., Mich., Ill., Mo. and Kan.

2. *Buchnera floridana* Gand. Stem to about 6 dm. high, slightly pilose to glabrate above, commonly from thickened root; leaves rough-pubescent, the larger ones elliptic-oblong and to 1 dm. long and 18 mm. wide; bracts 2-3 mm. long, spreading; calyx lobes triangular, acute, to 1 mm. long, the anterior sinus the deeper; corolla violet to purplish or rarely white, the tube 7-8 mm. long, the triangular-obovate lobes 3-5 mm. long; capsule about 5 mm. long. *B. breviflora* Penn. In sandy or gravelly soils throughout most of the s. half of Tex., Apr.-Nov.; from Fla. to Tex., n. to N.C.

27. SCHWALBEA L. CHAFF-SEED

A monotypic genus.

1. *Schwalbea americana* L. Minutely pubescent upright perennial herb; stems simple, to 8 dm. high; leaves alternate, sessile, 3-nerved, entire, ovate to oblong or lanceolate, the upper gradually reduced to narrow bracts, to about 5 cm. long and 15 mm. wide; flowers solitary in axils of uppermost leaves; bractlets about 1 cm. long; calyx tubular, 10- to 12-ribbed, 5-toothed, the posterior tooth much the smallest, the 2 anterior lobes united higher than the others, about 2 cm. long; corolla 3-3.5 cm. long, bilabiate, yellowish on tube, suffused above with purple, the upper lip oblong and entire, the erect shorter lower lip 2-plaited and with 3 very short and broadly obtuse lobes; capsule ovoid,

1-1.2 cm. long; seeds linear, with a loose chafflike coat. *S. australis* Penn. Moist to dry pinelands, oak woods and clearings, local from Fla. to e. Tex., n. to Mass., Conn., N.Y., Ky. and Tenn., summer.

28. PARENTUCELLIA Viv.

Four species native to Eurasia.

1. *Parentucellia viscosa* (L.) Caruel. Erect glandular-pubescent annual, to about 5 dm. tall; stem simple or branched above the middle; leaves opposite to subopposite or spirally arranged, 3-5 cm. long, ovate-lanceolate to triangular-lanceolate, acute, sessile and clasping at the rounded base, saliently toothed, pubescent except between ribs on lower leaf surface; flowers essentially sessile in spicate racemes terminating the main stem and branches; bracteoles none; calyx with 4 lanceolate lobes; corolla golden-yellow, 15-17 mm. long, 2-lipped with the upper lip galeate; capsule about 8 mm. long, distally brown-hirsute; seeds 0.3 mm. long. In moist to wet sandy soil in s.e. Tex. (Jasper Co.), Apr.-June; an Old World species introd. in n. Calif., Ore. and Tex.

29. PEDICULARIS L.

LOUSEWORT. WOOD-BETONY

About 500 species in the Northern Hemisphere.

1. *Pedicularis canadensis* L. COMMON LOUSEWORT. Perennial, hairy; stems simple, closely clustered, to about 4 dm. high; leaves scattered, the lowest pinnately parted, the others partly pinnatifid, all or nearly all petioled, the blade to about 15 cm. long and 5 cm. wide; large-bracted raceme dense and short (3-5 cm.) in flower, elongated to 2 dm. in fruit; calyx 7-9 mm. long, split in front, otherwise almost entire, oblique; corolla yellow or yellowish, to 23 mm. long, strongly bilabiate, the incurved upper lip hooded and 2-toothed under the apex; lower corolla lip erect at base, 2-crested above, 3-lobed; lobes commonly spreading, the lateral ones rounded and larger; anthers transverse, the cells pointless; capsule lance-oblong-flattened, several-seeded, twice as long as calyx. In open forests, on the edge of forests, on open seepage slopes, also in clearings and prairies, in e. Tex., Mar.-May; from Me. and Que. to Man., s. to Fla., Miss., La., Tex. and n. Mex.

30. CASTILLEJA L.f.¹⁷⁹

INDIAN PAINTBRUSH. PAINTEDCUP

Perennial or annual herbs, sometimes woody at the base; leaves alternate, entire or pinnately lobed; flowers in bracteate spikes; bracts prominent, usually more conspicuously colored than the flowers; calyx tubular, terminating in 4 or (if wholly united laterally) 2 lobes; corolla extremely zygomorphic, with a long narrow galeate (hooded) upper lip and a shorter often vestigial lower lip, the tube long and narrow; stamens 4, didynamous, each pair of anther sacs unequally placed; capsule ovoid, bilocular, loculicidal; seeds numerous, the testa loose and alveolately reticulate.

More than 150 species, concentrated in western North America, Mexico and Central America; 1 species in the West Indies, about 5 species in South America and about 10 species in Eurasia. The common name "Indian blanket" is sometimes loosely applied to this genus but that name should be reserved for *Gaillardia* of the Compositae.

1. Corolla tube long, falcate, exerted from the calyx, 25-45 mm. long, the corolla purplish to yellow, sometimes cream-white; calyx and bracts inconspicuous, wholly green or sometimes pink-tipped (2)
1. Corolla tube shorter, usually enclosed by the calyx, 16-25 mm. long (to 33 mm. long in *C. integra*), the corolla usually greenish except for the colored ventral margins of the galea and often the teeth of the lower lip; calyx and bracts bearing most of the attractive coloration on distal parts (3)

¹⁷⁹ Contributed by Noel H. Holmgren.

- 2(1). Calyx segments long and narrow, 8-14 mm. long; lower lip of the corolla 5-6 mm. long, not glandular-pubescent; stems short-villose to somewhat lanate 1. *C. sessiliflora*.
2. Calyx segments shorter, 2-6 mm. long; lower lip of the corolla 6-8.5 mm. long, glandular-puberulent; stems hispid-hirsute 2. *C. tortifolia*.
- 3(1). Calyx segments distinct for at least one third the length of the primary lobes, the lateral clefts 3-16 mm. deep (4)
3. Calyx segments wholly united laterally forming entire or (at most) emarginate primary lobes, never cleft for more than 1 mm. deep (7)
- 4(3). Leaves pinnately divided, at least the upper ones; calyx segments 7-16 mm. long, linear to subulate; lower lip of the corolla prominent, 1.5-7 mm. long, the lobes somewhat flaring to widely flaring; throughout central Texas 3. *C. purpurea*.
4. Leaves entire; calyx segments shorter, 3-11 mm. long, broadly linear to lanceolate; lower lip of the corolla very reduced, 1-2 mm. long, the teeth short and incurved; western Texas (5)
- 5(4). Stems whitish-tomentose or lanate; bracts glandular-puberulent on the colored portions; widespread in western Texas 6. *C. integra*.
5. Stems glabrous, hispidulose or (at most) finely villose; bracts not glandular-pubescent; local endemics (6)
- 6(5). Stems and leaves finely villose; dorsal surface of the galea minutely puberulent; known only from the Chisos Mountains, Brewster Co. 4. *C. elongata*.
6. Stems and leaves glabrous or hispidulose; leaves sometimes ciliate; dorsal surface of the galea tomentulose; known only from Mount Livermore in the Davis Mountains, Jeff Davis Co. 5. *C. ciliata*.
- 7(3). Annual; galea 6-9 mm. long; upper leaves usually pinnately lobed; eastern Texas 9. *C. indivisa*.
7. Perennial; galea 11-16 mm. long; leaves all entire; Trans-Pecos Texas (8)
- 8(7). Stems, leaves, bracts and calyces densely white-lanate, no gland-tipped hairs; bracts narrow-elliptic, usually with a pair of narrow lateral lobes 7. *C. lanata*.
8. Stems, leaves, bracts and calyces finely pubescent with spreading hairs, some hairs gland-tipped; bracts obovate to elliptic, entire 8. *C. latebracteata*.

1. *Castilleja sessiliflora* Pursh. Perennial; stems villose to somewhat lanate, clustered, 1-3 dm. tall, usually simple; leaves all entire or the upper with a pair of divergent narrow lateral lobes, linear, finely villose; bracts broader and shorter than the leaves and with a pair of lateral lobes, green, sometimes pink-tipped, finely villose; flowers yellow, sometimes pinkish to purplish; calyx 25-40 mm. long, the primary lobes 12-20 mm. long, the segment long and linear, 8-14 mm. long; corolla 35-55 mm. long, conspicuously exerted beyond the bracts, the galea 9-13 mm. long, the prominent lower lip 5-6 mm. long, with flaring lobes, the long falcate tube 25-45 mm. long. Incl. f. *purpurina* Penn. Dry rocky or sandy hills of the Panhandle and w. Tex., Mar.-May (Sept.); throughout the Great Plains, from s. Sask., s. Man. and Ill., s. to s.e. Ariz., n. Mex. and w. Tex.

2. *Castilleja tortifolia* Penn. Annual or at most a short-lived perennial; stems hispid-hirsute, strict or few-branched from the base, 8-25 (-30) cm. tall; leaves entire below, 3-parted above, margins of the midblade becoming crisped distally, linear, hispid; bracts 3- to 5-parted; flowers lemon-yellow; calyx 18-28 mm. long, the primary lobes 6-14 mm. long, the lanceolate segments 2-6 mm. long; corolla 35-55 mm. long, conspicuously exerted beyond the calyx and the bracts, glandular-puberulent, the galea 9-14 mm. long, the prominent lower lip with conspicuously flaring lobes, 6-8.5 mm. long, the long falcate tube 25-45 mm. long. *C. tortifolia* may belong to *C. mexicana* (Hemsl.) Gray. Open grassy hillsides in the cen. Trans-Pecos, Apr.-May (July); also s. to cen. Chih.

3. *Castilleja purpurea* (Nutt.) G. Don. Perennial; stems villose-lanate, several, clustered, 2-3 (-4) dm. tall; leaves 1 or 2 (rarely 3) pairs of divergent narrow lateral

lobes, linear to lanceolate, finely villose-cinereous; bracts with 1 or 2 pairs of lateral lobes, lanceolate to broad-lanceolate; bracts and calyces distally colored, the corolla bearing little of the coloration; calyx (20-) 25-34 mm. long, the primary lobes (10-) 13-22 mm. long, the segments linear to lanceolate and 7-16 mm. long; corolla 25-40 mm. long, the galea 9-13 mm. long, the lower somewhat protruding lip 2-7 mm. long, the tube 16-28 mm. long. Usually on calcareous gravelly or sandy soils in the humid region from s. Kan. and s. Mo., s. through Okla. and cen. Tex. to the Edwards Plateau and n. Rio Grande Plains.

Represented in Texas by the following variants.

1. Lower lip of the corolla long and widely flaring, 3-7 mm. long; bracts and calyces distally greenish-yellow to bright-yellow var. *citrina*.
1. Lower lip of the corolla shorter, 1.5-3 (-4) mm. long; bracts and calyces distally purple through red to orange and yellow-orange (2)
- 2(1). Bracts and calyces distally purple to purplish-red .. var. *purpurea*.
2. Bracts and calyces distally yellow-orange to red, sometimes brownish-orange
..... var. *Lindheimeri*.

Var. *citrina* (Penn.) Shinnars. *C. citrina* Penn., *C. labiata* Penn. Gravelly and sandy calcareous hills and prairies in cen. Tex. from the Red River in the Western Cross Timbers, s. to the s. edge of the Edwards Plateau and w. to Ector Co., Apr.-May; from s.-ccn. Kan., s. through w. Okla. and across Tex.

Var. *purpurea*. *Euchroma purpurea* Nutt. Local on limestone outcrops in the n. Blackland Prairies and Eastern Cross Timbers, common in the Grand Prairie, extending w. into the Western Cross Timbers and s. into the Central Mineral Region, Apr.-May; from s.w. Mo., across e. Okla. and s.w. through cen. Tex.

Var. *Lindheimeri* (Gray) Shinnars. *C. Lindheimeri* Gray, *C. Mearnsii* Penn., *C. Williamsii* Penn. Calcareous gravelly, sandy or clay soils on hills and prairies in the s. Blackland Prairies and the Grand Prairie to the s.e. part of the Edwards Plateau and the n. Rio Grande Plains, Mar.-May; endemic.

4. *Castilleja elongata* Penn. Perennial; stems 2-4 dm. tall, branched; stems, leaves and bracts finely villulose; leaves entire, linear; bracts entire or 3-parted, lanceolate, obtuse or rounded; bracts and calyces reported to be red-colored distally; calyx 17-23 mm. long, the primary lobes about 7 mm. long, the lanceolate segments 3.5-5 mm. long; corolla 25-28 mm. long, the galea about 12 mm. long, the lower lip reduced with incurved vestigial teeth. Habitat of the type, wooded slopes in the Chisos Mts., June-Aug.; a rarely collected endemic.

5. *Castilleja ciliata* Penn. Perennial; stems 2-6 dm. tall, usually strict; stems, leaves and bracts glabrous or scarcely hispid, the leaves and bracts sometimes ciliate; leaves entire, rarely 3-parted, linear, attenuate; bracts entire at first, becoming 3-parted, lanceolate to broadly lanceolate; bracts and calyces distally red; calyx 20-25 mm. long, the primary lobes 12-14 mm. long, the lanceolate acute segments 4-6 mm. long; corolla 25-37 mm. long, the galea 11-13 mm. long, with a tomentulose dorsal surface, the lower lip reduced. High elev. on rocky slopes of Mt. Livermore, Davis Mts., June-Oct.; a rarely collected endemic.

6. *Castilleja integra* Gray. Perennial; stems whitish-tomentose or lanate, clustered, 1-4 dm. tall; leaves entire, linear to narrow-lanceolate, often involute, short-villose on the lower surface, glabrous above, green on both sides; bracts lanceolate to ovate, sometimes oblanceolate or obovate, entire or usually 3-lobed; bracts and calyces distally scarlet to cerise, sometimes yellowish, also finely glandular-pubescent distally and villose proximally; calyx 21-37 mm. long, the primary lobes 10-18 mm. long, the lanceolate segments 4-11 mm. long; corolla 26-45 mm. long, the galea 8-15 mm. long, the lower lip reduced and short-toothed, the tube 17-33 mm. long. Dry gravelly soil on hills and plains in the Trans-Pecos and an outlying segment in Crockett Co., on the Edwards Plateau, Apr.-Oct.; Colo., s. to Ariz., N.M., w. Tex. and n. Mex.

A careful study of the Crockett County population may show it to be distinct from *C. integra*. It appears to differ from the species in having yellowish inflorescences and shorter floral measurements.

7. *Castilleja lanata* Gray. Perennial; stem to 9 dm. tall, often with woody bases, clustered and frequently branched; stems, leaves and proximal parts of the bracts and calyces densely white-lanate; leaves entire, linear, pubescence somewhat less dense than on the stem; bracts entire to 3-parted, oblanceolate; bracts and calyces red, sometimes pinkish or orange distally, colored portions less pubescent than the lanate bases; calyx 20-27 mm. long, the entire primary lobes 10-14 mm. long, rounded or retuse; corolla 23-33 mm. long, the galea 11-15 mm. long, the lower lip reduced, the tube 12-17 mm. long. Dry rocky slopes of the Trans-Pecos, Mar.-Aug. (continues to flower over a long period of time); s. Ariz., s. N.M., n. Mex. and w. Tex.

8. *Castilleja latebracteata* Penn. Perennial; stems several, clustered, 2-4 dm. tall; stems, leaves and proximal parts of the bracts and calyces finely viscid-glandular pilose; leaves entire, oblanceolate to linear, prominently 3-nerved; bracts obovate to elliptic, broadly rounded, prominently 3-nerved; bracts and calyces distally red to violet-red; calyx 22-35 mm. long, the entire primary lobes 8-11 mm. long, distally expanded, truncate-rounded to emarginate; corolla 25-40 mm. long, the galea 11-14 mm. long, the lower lip reduced, its teeth short and incurved, the tube 19-27 mm. long. Dry rocky slopes of mts. and canyons in the Trans-Pecos, Mar.-Dec. (continues to flower over a long period of time); w. Tex. and n. Mex.

Castilleja sp. described in Pennell, Proc. Acad. Nat. Sci. Phila. 92:307. 1940, from Ft. Davis, is similar to *C. latebracteata* except for the lobing of the bracts and calyx, and the wider leaves.

9. *Castilleja indivisa* Engelm. TEXAS PAINTBRUSH. Annual with a slender taproot; stems pilose below and villose in the inflorescence, usually strict, 2-4 dm. tall; leaves entire or often with 1 or 2 pairs of short divergent lobes, linear to lanceolate, nerves and margins pilose-ciliate, the lamina puberulent; bracts rhombic to broadly oblanceolate, frequently with very short lateral lobes near the apex 7-13 (-18) mm. broad, the broad midlobe mucronate-tipped; bracts and calyces distally various shades of red; calyx 18-25 (-28) mm. long, the entire primary lobes 6-9 mm. long, truncate-rounded to emarginate; corolla 20-28 mm. long, the galea 6-9 mm. long, the lower lip reduced but projecting forward, the tube 15-20 mm. long. *C. indivisa* f. *vivida* Cory. Wet sandy loam soils throughout the Coastal Plain and e. half of Tex., a few collections from low elev. in the Grand Prairie, Mar.-June; s.e. Okla., Tex.

31. CORDYLANTHUS NUTT.

CLUB-FLOWER. BIRD-BEAK

About 40 species centered in western North America.

1. *Cordylanthus Wrightii* Gray. Annual to about 6 dm. high, loosely and freely branched, almost glabrous to somewhat puberulent-scabrous, apparently somewhat root-parasitic; stems leafy, mostly erect and much-branched; leaves alternate, 3- or 5-parted, with setaceous-filiform segments; outer bracts 3- to 7-lobed, with the lobes very narrow; flowers several in dense terminal heads; calyx with a tubular base and a spathe-like lobe that is often opposed by a more or less similar bract to give the appearance of a bilobed calyx; corolla narrow, bilabiate, 2-3 cm. long, tubular, purplish, with rather long nearly equal lips; stamens 4, the anther cells dissimilar and villous; style hooked at apex; capsule compressed; seeds coarsely favose. On dry hills and plains in the Trans-Pecos; from Tex. to Ariz.

FAM. 161. BIGNONIACEAE JUSS.

CATALPA FAMILY

Shrubs, trees or woody vines; leaves opposite or the uppermost alternate, simple to pinnately compound, without stipules, entire to toothed or lobed; flowers rather large and showy, perfect, irregular, in terminal panicles or spikelike racemes, or axillary and paired or whorled; calyx short, bilabiate or unequally 4- or 5-toothed; corolla bilabiate or nearly regular, 5-lobed; stamens 2 or 4; pistil 1, the style and stigma 1; fruit a capsule; placentae parietal; seeds numerous, compressed, winged, sometimes comose.

About 650 species in more than 120 genera, mostly tropical, in both hemispheres.

1. Corolla bright-yellow or greenish-yellow to red-orange; leaves more or less compound, all opposite; trailing to high-climbing vines, viny shrubs or shrubs (2)
1. Corolla white to rosy-lavender or violet-color, often with orange-color or purple markings within; leaves simple, the uppermost usually alternate; trees or large shrubs (4)
- 2(1). Tendrils present; leaflets 2 or sometimes 1, entire, evergreen; flowers axillary; corolla curved-funnelform, the outer surface dull-red 1. *Bignonia*, p. 1443.
2. Tendrils absent; leaflets 5 to 13, sharply toothed, not evergreen; flowers terminal; corolla subcylindrical or funnelform, the outer surface bright-yellow or orange-color (3)
- 3(2). Viny shrub with aerial rootlets; leaflets petiolulate, mostly ovate; corolla thick-tissued, red-orange within; capsule stipitate ... 2. *Campsis*, p. 1443.
3. Shrub without aerial rootlets; leaflets sessile, mostly linear-lanceolate; corolla thin-tissued, yellow within; capsule not stipitate 3. *Tecoma*, p. 1444.
- 4(1). Leaves subsessile, linear-lanceolate, entire, glabrous 4. *Chilopsis*, p. 1444.
4. Leaves petioled, broadly ovate, often pubescent beneath, the larger ones sometimes lobed (5)
- 5(4). Calyx thin, distinctly bilobed; capsule cylindrical, long and narrow; seeds with tuft of hairs at each end 5. *Catalpa*, p. 1444.
5. Calyx thick, with 5 subequal lobes; capsule ovoid, beaked, woody; seeds winged ... 6. *Paulownia*, p. 1445.

1. BIGNONIA L.

A monotypic genus.

1. *Bignonia capreolata* L. CROSS-VINE, QUARTER-VINE. Evergreen high-climbing woody glabrous vine to 20 m. long; leaves opposite, with a petiole 1-2 cm. long, bifoliolate, the rachis ending in a tendril whose several branches are terminated by small disks; leaflets short-stalked, ovate-oblong to broadly elliptic or elliptic-lanceolate, to 15 cm. long and 5 cm. wide, obtuse to acuminate at apex, cordate at base; cymes axillary, short-stalked, 2- to 5-flowered; pedicels 2-4 cm. long; calyx campanulate, 6-8 mm. long, shallowly 5-lobed or truncate; corolla funnelform-campanulate, red-orange, lighter within, thickish, 4-5 cm. long, the rounded recurved lobes about one fourth as long as the tube, with a spreading slightly bilabiate limb; stamens 4, included, inserted near base of corolla; disk annular; ovary linear, many-ovuled; capsules linear, flattened parallel to the partition, 10-17 cm. long, septifragally dehiscent, with leathery valves; seeds elliptic, winged. *B. crucigera* L., *Anisostichus capreolata* (L.) Bur. Climbing in trees in moist woods in the e. Tex. pinelands, Mar.-May; from Md. and Va., w. to s. Ill., s. to Fla. and e. Tex.

2. CAMPSIS LOUR. TRUMPET-CREEPER

Two species, one in North America, one in eastern Asia.

1. *Campsis radicans* (L.) Seem. TRUMPET-HONEYSUCKLE, COW-ITCH VINE. Deciduous viny shrub climbing to 10 m. or more, with aerial rootlets; leaves opposite, odd-pinnate; leaflets 9 to 11, with a tuft of hairs on the leaf rachis between the short petiolules, broadly ovate to ovate-oblong or elliptic-lanceolate, acuminate at apex, broadly rounded to cuneate at base, to 9 cm. long and 4 cm. wide, serrate, usually somewhat pubescent beneath; pedicels stout, about 1 cm. long; flowers in terminal panicles; calyx tubular-campanulate, 2-2.5 cm. long, reddish-brown, leathery, the 5 triangular lobes much shorter than the tube; corolla thick-tissued, tubular-funnelform, orange to orange-red outside, with a scarlet limb, 6-9 cm. long, the tube about 3 times as long as the calyx, the limb 4-5 cm. broad; anthers 4 mm. long, glabrous; capsules stipitate, cylindrical-oblong, 8-12 cm. long, beaked, keeled along the sutures, loculicidally dehiscent, with leathery valves

that separate from the septum; seeds numerous, compressed, with 2 large wings. *Tecoma radicans* L. Climbing over shrubs and trees, and along fences in the e. half of Tex., May-Oct.; from N.J. to O. and Ia., s. to Fla. and Tex.

3. TECOMA JUSS. TRUMPET-FLOWER

About 16 species in the Western Hemisphere.

1. *Tecoma stans* (L.) JUSS. ESPERANZA, TRONADORA, MIÑONA. Erect deciduous shrub to 8 dm. high, usually much smaller; leaves opposite, with a petiole to 4 cm. long, odd-pinnate; leaflets 5 to 13, membranous, cuneate at the sessile base, ovate-lanceolate to elliptic or linear-lanceolate, acute to acuminate at apex, mostly glabrous but occasionally pubescent beneath, somewhat serrate or incised, to 1 dm. long and 2 cm. wide; pedicels to 1 cm. long, with 1 or 2 bracteoles near base; flowers in terminal racemes or panicles; calyx tubular-campanulate, 3-6 mm. long, 5-dentate at apex; corolla bright-yellow, funnel-form-campanulate, 35-65 mm. long, 5-lobate, the limb somewhat bilabiate and 3-5 cm. broad; stamens 4, included; anthers about 4 mm. long, pubescent; pistil filiform, about 25 mm. long; capsule compressed, linear, subterete, loculicidally dehiscent, with leathery valves, to 2 dm. long, about 6 mm. thick; seeds about 6 mm. long, oval to narrowly elliptic, flat, with 2 large thin scarious entire wings. Rocky areas in mts. of the Trans-Pecos, Apr.-Nov.; from Fla., Tex., N.M. and Ariz., s. through Mex. and the W.I. to S.A.

A specimen of var. *stans* has been collected "in alluvium" near San Antonio. All other material of this species is found only in Trans-Pecos Texas where it occurs on ledges and cliffs and at the base of bluffs in mountain canyons. This western plant, which seldom exceeds 3 m. in height and which has very narrow, more deeply incised, and often more numerous leaflets than in var. *stans*, is referred to var. *angustata* Rehd. [*Stenolobium incisum* Rose & Standl., *Tecoma Tronodora* (Loes.) I. M. Johnst., *T. incisa* (Rose & Standl.) I. M. Johnst.].

4. CHILOPSIS D. DON DESERT WILLOW. MIMBRE

One species native in North America.

1. *Chilopsis linearis* (Cav.) Sweet. Laxly ascending or spreading deciduous shrub or small tree to 10 m. high; sterile branchlets glabrous to somewhat woolly, without terminal buds; leaves opposite or alternate, short-petioled to sessile, entire, linear to linear-lanceolate, to 3 dm. long, rarely to 1 cm. wide, gradually narrowed at both ends, glabrous, often viscid; flowers fragrant, in terminal racemes or panicles to 3 dm. long; pedicels stout, pubescent, about 5 mm. long; calyx pubescent, bilabiate, 1-1.5 cm. long; corolla funnel-form-campanulate, slightly bilabiate, variously colored, usually whitish tinged with pale-purple, also purplish-red or pinkish with purple stripes, 2-3.5 cm. long and nearly as wide; stamens 4, included; staminodia 1; capsule slender, 2-valved, to 3 dm. long, about 6 mm. thick; seeds numerous, oval, flat, winged, with a fringe of hair at each end, 6 mm. long. *C. saligna* D. Don. Commonly along water courses and in dry stream beds of w.-cen. and far w. Tex., Apr.-Sept.; from Tex. to Calif., southw.

The plant with glutinous sterile branchlets and young leaves, segregated as var. *glutinosa* (Engelm.) Fosb., occurs in the Trans-Pecos, especially along the Rio Grande.

Frequently planted as an ornamental in central and southern Texas.

5. CATALPA v. WOLF. CIGAR-TREE

Deciduous trees; winter-buds with several outer scales; terminal bud wanting; leaves opposite, sometimes whorled, long-petioled, entire or very coarsely lobed, 3- to 5-veined from base, usually with a purple glandular spot in the axils of the primary veins beneath; flowers in terminal panicles or racemes; calyx irregularly splitting or bilabiate; corolla campanulate, bilabiate, with 2 small upper and 3 larger lower lobes; fertile stamens 2, included; style slightly longer than the stamens; capsules cylindric, very long and narrow, separating into 2 valves; seeds numerous, oblong, winged on each side with the wings cut into a fringe.

About a dozen species in North America and eastern Asia.

1. Leaves long-tapering at apex; panicle several-flowered; corolla sparsely spotted with purple-brown, about 4 cm. wide, its lower lobe notched; valves of capsules remaining semiterete after dehiscence 1. *C. speciosa*.
1. Leaves abruptly short-acuminate at apex; panicle many-flowered; corolla densely spotted with purple-brown, 2-3 cm. wide, its lower lobe entire; valves of capsules flattening after dehiscence 2. *C. bignonioides*.

1. *Catalpa speciosa* Warder. CATAWBA-TREE, CIGAR-TREE. Tree to 30 m. high, the crown pyramidal; bark red-brown, broken into thick scales; leaves with a petiole to 15 cm. long, ovate to ovate-oblong, 15-30 cm. long, long-acuminate at apex, truncate to cordate at base, bright-green and glabrous above, densely pubescent beneath, odorless; panicle relatively few-flowered, about 15 cm. high; corolla to 5 cm. long and 4 cm. wide, with slightly oblique limb, the lower lobe emarginate, whitish, with 2 yellow stripes within and inconspicuously spotted purple-brown; capsule 2-4.5 dm. long, about 1.5 cm. thick, with a thick wall; seeds 4-5 mm. wide. In damp woods and on the edge of swamps and along streams in e. Tex., Mar.-June; from s. Ill. and Ind., s. to e. Tex., occasionally escaped from cult.

2. *Catalpa bignonioides* Walt. COMMON CATALPA. Tree to 15 or rarely 20 m. high, with wide-spreading branches to form a broad roundish crown; bark light-brown, separating into thin scales; leaves often whorled, with a petiole up to 16 cm. long, ovate, 1-2 dm. long, abruptly short-acuminate at apex, truncate to subcordate at base, sometimes with a pair of small lobes, light-green and nearly glabrous above, pubescent beneath (especially on the veins), with an unpleasant odor when crushed; panicle broad-pyramidal, 15-20 cm. high; corolla 2.5-4 cm. long, 2-3 cm. wide, white, with 2 yellow stripes within and thickly spotted purple-brown, with oblique limb and entire lower lobe; capsule to 4 dm. long and 1 cm. thick, with thin walls, its valves flattening after dehiscence; seeds 2.5-4.5 mm. wide, the hairs of the terminal tufts connivent into a point. Uncommon in e. Tex., Mar.-June; a s. U.S. species that occasionally escapes cult. farther n.

6. PAULOWNIA SIEB. & ZUCC. PRINCESS-TREE

About 17 species that are native to eastern Asia. Placed by some authors in the family Scrophulariaceae.

1. *Paulownia tomentosa* (Thunb.) Steud. Deciduous tree to 15 m. high, with stout spreading branches to form a round crown; bark grayish; branchlets densely soft-pubescent when young, becoming glabrous; leaves opposite, with a petiole 8-20 cm. long, broadly ovate to ovate, to 3 dm. long or (on vigorous shoots) much longer, acuminate at apex, cordate at base, entire or sometimes shallowly 3-lobed, pubescent above, densely pubescent or tomentose beneath; panicle pyramidal, terminal, 2-3 dm. long; calyx 1-1.5 cm. long, broad-campanulate, with 5 ovate obtuse lobes, rusty-tomentose like the pedicels; corolla funnelform-campanulate, 5-6 cm. long, pale violet, with darker spots and yellow stripes within, glandular-pubescent outside, with a spreading oblique 5-lobed limb; stamens 4, with distinct spreading anther cells, sterile stamen wanting; capsules ovoid, beaked, 3-4 cm. long, woody, loculicidally dehiscent by 2 valves; seeds small, numerous, winged. An e. Asia ornamental species that escapes cult. and occurs along roadsides, in clearings and on the edge of woods in e. Tex., Apr.-May; from Fla. to Tex., n. to W.Va. and N.Y.

FAM. 162. MARTYNIACEAE STAFF¹⁸⁰

UNICORN-PLANT FAMILY

Coarse stout annual or perennial herbs with branching stems, viscid to glandular-pubescent and usually strongly scented; leaves exstipulate, simple, long-petioled, opposite to alternate; flowers usually large and showy in loose terminal racemes; calyx bi-

¹⁸⁰ Contributed by Richard H. Hevly.

bracteate, composed of 5 irregular sepals or spathaceous and 5-lobed; corolla sympetalous, 5-lobed and somewhat bilabiate; fertile stamens 4, didynamous (the rudiment of the 5th usually obvious), or 2, the second pair forming staminodes; filaments attached to the corolla; anthers gland-tipped and with 2 divergent cells; carpels 2, united to form a 1-celled ovary with 2 parietal intruded placentae expanded into 2 broad lamellae, the ovary apparently inserted on an annular glandular disk; ovules anatropous; style 1, slender; stigma with 2 flat sensitive lobes; fruit a drupaceous capsule, bivalved and loculicidally dehiscent or indehiscent, imperfectly 5-celled, frequently crested and always terminated by a prominent incurved 2-horned beak; exocarp fleshy, separating in age from the woody reticulate-sculptured or spinose endocarp; seeds 4 or many, the testa corky-tuberculate or membranous-reticulate; endosperm none; embryo straight; cotyledons large and fleshy.

About 20 species in 5 genera, native to the Western Hemisphere.

1. PROBOSCIDEA SCHMID.

UNICORN-PLANT. DEVIL'S CLAW.

CINCO LLAGAS

Erect to decumbent herbs arising from well-developed annual taproots or perennial tuberous roots; leaves opposite to alternate, orbicular-reniform to ovate-lanceolate and entire to palmately or pinnately lobed; flowers 2-7 cm. in length, few to many in terminal racemes which usually exceed the foliage, axis of inflorescence lengthening in fruit; pedicels erect to spreading but lengthening, thickening and becoming deflexed in fruit; pedicel bracts linear to oblanceolate, deciduous or absent; calyx spathaceous, membranous, more or less unequally 5-lobed, split ventrally to the base, deciduous, with 2 frequently fleshy-thickened linear to orbicular bracts; corolla reddish-purple, pinkish-lavender, creamy-white or orange-yellow, tubular-cylindric to campanulate or infundibular, more or less gibbous and ventricose, 5-lobed; fertile stamens 4, didynamous, adhering by their edges; filaments arcuate and glabrous or pubescent in part; pistil about as long as to longer than stamens; ovary ovate to lanceolate and usually glabrous; style slender, stigma lobes obovate-oblanceolate; fruit dehiscent, crested ventrally and also sometimes dorsally, beak exceeding the fruit body in length one and one fourth to three and one half times; endocarp reticulate-sculptured; seeds 6-8 mm. long, angled, numerous, with a thick corky tuberculate black or rarely white testa.

About 12 species, most of which are confined to North America.

1. Plant perennial, arising from a tuberous root; corolla light-yellow to bronze; fruit crested on two sides 1. *P. altheaefolia*.
1. Plants annual, arising from a taproot; corolla purplish, reddish, pinkish, creamy-yellow or white; fruit crested on only one side (2)
- 2(1). Corolla tube usually lacking spots or blotches internally but (if these are present) they are few, scattered and restricted to the lower half of the tube; filaments glandular at and below their point of attachment but glabrous above; flowers 2-4 cm. long, reddish-purple, pink or white, 10 or fewer in lax racemes surpassed by the foliage 2. *P. parviflora*.
2. Corolla tube with conspicuous reddish-purple spots and smaller more pale-lavender blotches extending internally the entire tube-length; filaments glabrous or sparsely villous or tomentose below their point of attachment, glandular on the arcuately curved portion; racemes 10- or more-flowered and exceeding the foliage except in *P. sabulosa* (3)
- 3(2). Corolla purplish-violet to reddish-purple or rarely white, 35-65 mm. long; leaves broadly ovate to deltoid in outline, 5- or 7-lobed, dentate 3. *P. fragrans*.
3. Corolla pinkish-lavender, creamy-yellow or dull-white (lobes purple or purplish-red in *P. spicata* and *P. sabulosa*); leaves broadly ovate to suborbicular or subreniform, entire to undulate-repand or sinuate (4)

- 4(3). Corolla tubular-cylindric, about 2 cm. long, the lobes 4-5 mm. in diameter; inflorescences with fewer than 6 flowers and surpassed by the foliage 4. *P. sabulosa*.
4. Corolla funnelform to campanulate, 2-5.5 cm. long, the lobes 5 mm. or more in diameter; inflorescences 8- or more-flowered and exceeding the foliage (5)
- 5(4). Flowers 20 or more in a spicate raceme; pedicels mostly about 15 mm. long; corolla about 20 mm. long, funnelform-campanulate, scarcely ventricose, the lobes 5-10 mm. long; leaves to 1 dm. long and wide 5. *P. spicata*.
5. Flowers 8 to 20 in a loose raceme; pedicels 20-30 mm. long; corolla 35-55 mm. long, campanulate, ventricose, the lobes 15-30 mm. long; leaves to 3 dm. long and wide 6. *P. louisianica*.

1. *Proboscidea altheaefolia* Dcne. DESERT UNICORN-PLANT. Coarse spreading viscid-pubescent perennial with a large fusiform root; branches decumbent, spreading to 6 dm. and ascending to 3 dm.; petioles 3-18 cm. long; blades nearly reniform or suborbicular to broadly ovate, 2-7 cm. long and 2-8 cm. wide, the margins nearly entire to crenate or undulate-sinuate and unlobed to deeply 5- to 7- (9)-lobed, 3- to 7-nerved; flowers fragrant, 3 to 16 in short racemes having an initial axis length of 5-12 cm. but lengthening in fruit to 1-2 dm.; pedicels 2-8 cm. long, slender, ascending in anthesis and with a linear basal bract; calyx bracts orbicular or broadly ovate to oblong-falcate, 5-10 mm. long, 2-5 mm. wide; calyx 1-1.5 cm. long, the lobes cut one third to one half its length, viscid-pubescent without, glabrous within, the margins glandular-ciliate; corolla yellowish-brown externally, yellow to bronze-orange internally, the tube with pale blotches and frequently with maroon, reddish-brown or rust-colored spots forming 2 rows internally, 2-3 cm. long, slightly to strongly ventricose, infundibular to campanulate, the lobes spreading, 1-1.5 cm. long, 1.5-3 cm. wide, occasionally with maroon or brownish reticulations or flecks in the throat and on the lobes; filaments viscid-pubescent at their base; pistil about as long as or longer than the stamens; fruit body very slender, 5-6 cm. long, about 12 mm. thick, the horns about twice as long as the body, crested on two sides, the distal tooth on the dorsal suture often forming a slender horn. In sandy soil and on dunes and gravelly hills in the s. Plains Country and Trans-Pecos, June-Sept.; from w. Tex. and e. N.M. to s. Calif. and n. Mex.

The yellow-flowered species of *Proboscidea* from Texas has previously been referred to *P. arenaria* (Engelm.) Dcne. for the most part, but that species, contrary to various reports, is perennial and conspecific with *P. altheaefolia*.

2. *Proboscidea parviflora* (Woot.) Woot. & Standl. Plant large, annual, sprawling, as much as 1.5 m. across and to 5 dm. high, the herbage glandular-pubescent throughout; stem thick and heavy; petioles to 25 cm. long or more; blades broadly triangular-ovate to suborbicular-ovate, cordate or inequilateral, rounded to obtuse at apex, to 25 cm. long and nearly as broad, the margins nearly entire to shallowly 3- to 7-lobed, the sinuses obtuse, denticulate; flowers 10 or fewer, borne in a short slender raceme to 1 dm. long that is overtopped by the leaves; pedicels rather stout, 1.5-3 cm. long in anthesis, lengthening in fruit to about 45 mm.; pedicel bract obovate to oblanceolate, 3-5 mm. long; calyx bracts ovate to elliptic or oblong in outline, obtuse, 5-8 mm. long, 3.5 mm. wide, 2 mm. thick; calyx thin-herbaceous, 1-1.5 cm. long, the lobes unequally cut one fourth to one half the length of the calyx; corolla tubular-campanulate, only slightly ventricose, 2.5-4 cm. long, viscid-glandular without and only slightly so within but with short articulate hairs at throat; corolla tube reddish-purple, pink or white, 1.75-3 cm. long, 7.5-15 mm. wide across orifice, with cylindrical base 4-8 mm. long, usually lacking spots or blotches externally but (if these are present) they are few, small, scattered and restricted to the lower half of the tube, a bright-yellow band extending along the lower portion of the tube and out into the lower lobe; corolla lobes the same color as tube but the upper lobes frequently with a single large purple or reddish-purple blotch each, subequal, broadly rounded, 5-10 mm. long and 10-15 mm. wide, upper and lateral lobes wide-flaring or reflexed, 1.75-2.25 cm. across the lobes when spread out; filaments glandular at and below their point of attachment, glabrous above; fruit body ellipsoid,

strongly keeled on the ventral side, 5.5-10 cm. long, 1.5-3 cm. thick, tapered above into a stout curved horn that is 1.25 to 3.5 times as long as the body; seeds rarely white in semicultivated strains utilized by certain southwestern aboriginal groups for the fiber obtained from the horns. *Proboscidea crassibracteata* Correll. In sandy, gravelly or clay soils in the Trans-Pecos, June-Sept.; from w. Tex. and N.M. to s. Calif. and n. Mex.

3. *Proboscidea fragrans* (Lindl.) Dcne. Viscid-pubescent annual, spreading to 2 m. in diameter and to 6 dm. in height, dichotomously branched, the stems thick and heavy; petioles to 2 dm. long; blades broadly triangular to broadly ovate, nearly entire to 5- or 7-lobed, the sinuses acutish, cordate or inequilateral at base, obtuse at apex, to 25 cm. long and nearly as broad; flowers fragrant, 8 to 20 in a loose raceme surpassing the foliage; pedicels 1-2.5 cm. long in anthesis, lengthening in fruit to about 45 mm.; pedicel bracts elliptic-ob lanceolate, 5-10 mm. long or apparently absent; calyx bracts oblong to ovate or linear-elliptic, becoming plano-convex and spongy with age, to 12 mm. long; calyx papery, to 25 mm. long, the unequal lobes cut one third to one half the length of the calyx, the lateral lobes 1 cm. or more broad, glandular-pubescent without and glabrous within; corolla strongly ventricose, 3.5-6 cm. long, cylindrical portion of the tube to 5 mm. long, flaring portion of the tube 2.5-4 cm. long, purplish-violet to reddish-purple or rarely white, orifice 1.75-3 cm. wide, the limb often with deeper colored blotches on the upper lobes but flaring, lobes 1-2 cm. long and 2-3 cm. wide, viscid-glandular without and slightly so within, the tube interior with violet blotches and darkish reddish-purple spots, a bright-yellow band extending along the lower portion of the tube and out onto the lower lobe; filaments glabrous or sparsely villous or tomentose below their point of attachment, glandular on the arcuately curved portion; fruit slender, the body about 1 dm. long and the horns up to 2 times as long. In sandy, gravelly or clay soils in the Trans-Pecos, June-Sept.; from Tex. to n. Mex.

4. *Proboscidea sabulosa* Correll. DUNE UNICORN-PLANT. Plant annual, sprawling and much-branched, to about 12 dm. across and 4 dm. high, the herbage viscid-pubescent throughout; leaves with thickened petioles to 1 dm. long or more, triangular-ovate to broadly subreniform, broadly cordate at base, rounded to obtuse at apex, the margins undulate-repand, to about 12 cm. long and broad; flowers several, borne in a congested raceme on an abbreviated peduncle, greatly exceeded by the foliage; pedicels slender and about 1 cm. long in flower, becoming stout and about 2 cm. long in fruit; pedicel bracts linear, about 5 mm. long; calyx bracts oblong-elliptic, 7-8 mm. long; calyx 1-1.3 cm. long, irregularly 5-lobed above the middle; corolla tubular-cylindric, only slightly ventricose; corolla tube cream-color and sparsely glandular without, about 2 cm. long and 1 cm. across the orifice, the glabrous throat cream-color with small reddish spots and a deep yellow line running the length of the tube on the lower side, paler blotches also present throughout the tube interior; corolla lobes ovate to somewhat quadrate, purplish-red, 4-5 mm. long, recurved, the lower lobe pleated; filaments glabrous or sparsely villous or tomentose below their point of attachment, glandular above; fruit body oblong-ellipsoid, somewhat laterally compressed, the endocarp coarsely sculptured, keeled on the dorsal surface, about 7 cm. long and 1.5-2 cm. thick, tapered into a slender recurved horn that is about twice as long as the body. Endemic in deep sand in the s.w. corner of the South Plains in w. Tex., July-Aug.

This is the smallest flowered species in this genus. The abbreviated inflorescences are concealed by the foliage, and it is necessary to search the plant in order to locate flowers.

5. *Proboscidea spicata* Correll. Annual, spreading, branched from base, to about 3 dm. high, the herbage viscid-pubescent throughout; leaves with slender petioles to about 1 dm. long, suborbicular-ovate to subreniform, to about 1 dm. long and wide, cordate at base, rounded at apex, entire to shallowly 3-lobed; flowers small, as many as 25 or more crowded in a spicate inflorescence to 17 cm. long; peduncle and rachis stout, rigid; pedicels weak, slender, mostly about 15 mm. long in flower; pedicel bracts oblanceolate, about 7 mm. long; calyx bracts oblanceolate-spatulate, obtuse, 5-8 mm. long; calyx campanulate, about 15 mm. long, very shallowly and irregularly 5-lobed; corolla funnelliform-campanulate; corolla tube pinkish, scarcely ventricose, strongly constricted near base, cylindrical portion about 7 mm. long, very sparsely glandular without, about 2 cm. long and 15 mm. wide across the orifice, the glandular throat provided with reddish spots and less conspicuous blotches; corolla lobes suborbicular, spreading, purple, about 1 cm. in diameter; filaments glabrous or sparsely villous or tomentose below their point of attachment, glandular on the arcuately curved portion; pistil 25 mm. long; fruits unknown. In

dry sandy soil along the Rio Grande in Presidio Co., May-June; undoubtedly also in adj. Mex.

6. *Proboscidea louisianica* (Mill.) Thell. UNICORN-PLANT, COMMON DEVIL'S CLAW, RAM'S HORN. Coarse viscid-pubescent annual with prostrate or ascending opposite branches to 1 m. long; leaves opposite or the upper ones subalternate, with densely short-pubescent petioles to 2 dm. long and 5 mm. thick, orbicular-reniform to broadly ovate, cordate at base, with entire or sinuate margins, to 3 dm. wide and slightly shorter; flowers 8 to 20 in an open raceme; pedicels 20-30 mm. long in anthesis, 45 mm. in fruit; pedicel bracts linear, 5-10 mm. long; calyx bracts oblong-falcate to ovate, 1 cm. long or less; calyx to 2 cm. long, the 5 lobes acutish to obtuse, one half the length of the calyx, thick and green or somewhat membranous and yellowish; corolla to 55 mm. long and nearly as wide, dull white or somewhat purplish or pinkish throughout, mottled or blotched with reddish-purple and yellow or occasionally nearly clear reddish-violet, conspicuous reddish-purple spots extending internally the entire tube length, the cylindrical portion of the tube short (5 mm. or less), the remainder broadly campanulate, 15-25 mm. long, 15-17.5 mm. wide at orifice, ventricose, the lobes 1.5-2 cm. long and 1.5-3 cm. wide; filaments glabrous or sparsely villous or tomentose below their point of attachment, glandular on the arcuately curved portion; fruit body stout, to 1 dm. long, 3 cm. thick, the horns one and one half to three times longer than the body. *P. Jussieui* Schmid., *Martynia louisianica* Mill. In meadows, playas, waste places and on stream banks, mostly in cen. and n.e. Tex., June-Sept.; nat. to s. U.S. but spontaneous northw.; sometimes cult. for its young pods which are made into pickles.

FAM. 163. OROBANCHACEAE VENT.*

BROOMRAPE FAMILY

Herbaceous fleshy plants parasitic on roots of various plants, appearing to be devoid of chlorophyll, provided mostly with alternate scales instead of green foliage and solitary or spicate usually luridly colored gamopetalous bisexual flowers; calyx persistent, 2- to 5-parted or spathe-like; corolla tubular, more or less bilabiate, ringent, persistent and withering, the upper lip entire or 2-lobed, the lower lip 3-lobed; stamens 4, didynamous, inserted on the tube of the corolla; anthers 2-celled, caudate, white, persistent; ovary free, ovoid, superior, with 2 carpels and 1-loculed, the placentation parietal, pointed with a long style; stigma discoid, peltate or 2-lobed; capsule 1-celled, 2-valved with each valve bearing on its face 1 or 2 placentae; seeds minute, numerous.

About 180 species in 14 genera mostly in the Northern Hemisphere of the Old World.

1. Plants confined to east Texas, parasitic on the roots of beech trees (*Fagus grandifolia*); stems slender, brittle and commonly branching; flowers scattered along the branches; corolla 4-toothed, the upper lip undivided; fruit laterally flattened (asymmetrical) 1. *Epifagus*, p. 1449.
1. Plants occurring west of the east Texas Timber Belt or (if in east Texas) with flowers on elongated pedicels or in a dense spike; stems stout, usually simple; corolla 5-toothed, the upper lip divided; fruit not asymmetrical (2)
- 2(1). Flowers in a thick scaly spike; calyx spathe-like, cleft abaxially, the upper lip large and 4-toothed; stamens exserted; style (and stigma) commonly persistent, arcuate; seeds smoothish, tan-color, vernicose; entire plant yellow, glabrous 2. *Conopholis*, p. 1450.
2. Flowers solitary and long-stalked or spicate; calyx regular or equally 2-lipped; stamens mostly included; seeds deeply pitted, brownish, dull; plants with some purplish color, viscid-pubescent (at least in part) . . 3. *Orobanche*, p. 1450.

1. EPIFAGUS NUTT.

BEECH-DROPS. CANCER-ROOT

A monotypic genus.

1. *Epifagus virginiana* (L.) Bart. Plants often forming large clumps; stems slender, to 45 cm. tall, pale-brown striped or suffused with purple or yellowish-brown, simple or

* Cf. another treatment by John W. Thieret in C. L. Lundell, *Flora of Texas* II: 331-337. 1969.

much-branched, with small scattered alternate triangular-ovate scales about 3 mm. long; flowers laterally white, with a broad dorsal band and a narrower lower band of brown-madder, about 1 cm. long, curved, 4-toothed, scattered along the stems; calyx 5-toothed; stigma capitate, somewhat bilobed; capsule 2-valved, with 2 approximate placentae on each valve, oblique, about 5 mm. wide; seeds minute, elliptic-fusiform, yellowish-white. Parasitic on the roots of beech trees in e. Tex., Feb.-June; from e. Can., s. to Fla. and along the Gulf Coast to e. Tex., inland to Wisc., Ill., Mo. and Ark.; also Tam. and Hgo.

All of the Texas plants examined have only cleistogamous, fertile flowers.

2. CONOPHOLIS WALLR. SQUAWROOT. CANCER-ROOT

A small American genus of several species.

1. *Conopholis mexicana* Gray. Low herb to about 25 cm. high, with thick short glabrous yellowish often clustered stems that are almost concealed by closely appressed erect bracts that are triangular-ovate and 1.5-2 cm. long; flowers perfect, in a dense scaly-bracted terminal spike; calyx subtended by two bractlets, spathe-like, split on the lower side; corolla about 2 cm. long, with a curved tube and strongly bilabiate limb, the upper lip notched and arching, the lower lip shorter and 3-lobed; capsule subglobose-ovoid, about 15 mm. long, 1-celled, with 4 placentae, terminated by the persistent arcuate style and capitate stigma. In leaf litter and parasitic on *Pinus*, *Juniperus*, *Quercus* and possibly *Acer* in the mts. of the Trans-Pecos, May-June; uncommon in w. Tex., N.M., Ariz. and Mex.

3. OROBANCHE L.¹⁸¹ BROOMRAPE

Plants more or less glandular-pubescent throughout, the bracteate stem purplish to brownish or sometimes yellowish-white; flowers solitary or in simple or branched terminal spikes; calyx nearly equally 5-lobed; corolla purplish to reddish or yellowish, the tube slightly curved, the limb bilabiate, the lips often nearly erect; capsule 1-celled, with 4 placentae.

About 140 species, mainly subtropical and warm temperate regions.

1. Flowers solitary on long naked scapose pedicels (to 15 mm. long) that greatly exceed the corolla in length, without bracts at base of calyx; corolla lobes orbicular, not tapered or rounded at apex (Sect. *Gymnocaulis*) (2)
1. Flowers densely spicate, sessile (at least some) or on pedicels shorter than the corolla, with 2 bracts at base of calyx; corolla lobes tapered to the pointed or rounded apex (Sect. *Myzorrhiza*) (3)
- 2(1). Caudex somewhat woody, with 5 to 10 firm bracts and several axillary pedicels that are rarely longer than the caudices; calyx lobes equal to or shorter than the calyx tube 1. *O. fasciculata*.
2. Caudex soft, herbaceous, with 1 to several greatly elongated pedicels from the axils of the few basal bracts; calyx lobes longer than the calyx tube 2. *O. uniflora*.
- 3(1). Corolla lobes rounded, obtuse, the upper erect, the lower extended or slightly reflexed, purple to yellow; corolla tube much lighter than lobes (in color); style persistent on fruit until dehiscence; inflorescence thyrsoid or a dense spike; calyx (8-) 10-17 (-20) mm. long, usually exceeding the fruit in length 3. *O. multiflora*.
3. Corolla lobes triangular, acute, the upper erect or reflexed, dark-purple or lighter, lower lobes reflexed and lighter in color than upper; style deciduous; inflorescence spicate, often branched; calyx (8-) 10-12 (-14) mm. long, equaling or shorter than the fruit (4)

¹⁸¹ Section *Myzorrhiza* (species 3 through 5) contributed by L. Turner Collins.

- 4(3). Stigma peltate, discoid and/or crateriform; upper corolla lobes erect, the lower only slightly reflexed, with one prominently purple vein in each; inflorescence a dense spike, rarely branched, the flowers sessile; lower stem cream to light-tan when fresh, drying rusty-brown 4. *O. ludoviciana*.
4. Stigma bilobed or 2-parted, crateriform (often confused with the above); upper and lower corolla lobes usually reflexed, the lower with 3 prominently purple veins in each lobe; inflorescence a loose spike, frequently branched, the flowers with pedicels 1-3 mm. (-15 mm. long); entire plant dark-purple, the lower stem purple-brown when dry 5. *O. Cooperi*.

1. *Orobanche fasciculata* Nutt. Caudex forked, it or its branches extended above ground for 5-10 cm.; branches with 5 to 10 firm scale leaves and to 10 erect crowded naked axillary pedicels that are to 12 cm. long; calyx lobes triangular, shorter than or equaling the tube; corolla purple, to about 2 cm. long, the tube curved and with 5 small semiorbicular spreading lobes at its apex. In brushland and forests of w. and n.w. Tex., Mar.-May; from Mich. to Yuk., s. to n. Ind., Ill., Neb., Tex., N.M., Ariz. and Baja Calif.

The var. *subulata* Goodman, characterized by having calyx lobes 6-8 mm. long, has been collected on a bare limestone prairie in Montague Co. in n.-cen. Tex.

2. *Orobanche uniflora* L. Stem subterranean or nearly so, very short and scaly, often branched with each branch supporting 1 to several 1-flowered pedicels to 15 cm. tall; calyx lobes narrowly triangular-lanceolate, about 1 cm. long; corolla about 25 mm. long, whitish, provided with 2 yellow bearded folds in throat and sometimes with lavender lines, the small lobes obovate to broadly elliptic. *Aphyllon uniflorum* (L.) Gray. In woods and on breaks in isolated localities in e. and w. Tex., Apr.-May; from N.B. and Que., w. to Mont., s. to n. Fla., Miss. and Tex.

3. *Orobanche multiflora* Nutt. Plants stout, seldom slender, 1-5 dm. tall, viscidly pubescent, often grayish, glabrous below ground, frequently branched above and below; base of stem often enlarged; cauline scales lance-ovate, obtuse, 5-12 mm. long; inflorescence dense, thyrsoid or spicate, often branched, the axes often purple; flowers sessile or the lowermost on short pedicels to 5 mm. long; bracteoles adnate or adjacent to calyx; calyx 8-17 mm. long, the lobes lance-linear to attenuate, about equal in length, deeply five-cleft, the inner surface often purple; corolla 15-35 mm. long; lips 5-12 mm. long, pale-purple to yellow, the upper lip erect; tube pale-purple to yellow or whitish with rounded obtuse lobes; anthers white woolly or glabrous, the filaments extending to the mouth of the corolla tube or less; style about as long as the filaments; stigma peltate, discoid-crateriform; capsule longitudinally dehiscent, about as long as the calyx or slightly shorter; style persistent on capsule until dehiscence. *Aphyllon multiflorum* (Nutt.) Gray. Parasitic on members of the Compositae (*Varilla texana*, *Artemisia filifolia*, *Heterotheca* spp., *H. canescens*, *Baccharis salicina*, *Hymenopappus flavescens*, *Haploesthes Greggii*, *Aphanostephus* sp., etc.) in, dunes, river sand deposits, beaches, sandy prairies and some gypsum soils, generally over the state except for the extreme eastern quarter, Mar.-Sept.; from Wyo. to Wash., s. to Tex., n. Mex. and s. Calif.

We have the following varieties in Texas.

Var. *multiflora*. Calyx 12-17 mm. long; corolla 25-35 mm. long, the upper lip purple and 9-12 mm. long; anthers often pubescent.

Var. *Pringlei* Munz. Calyx 8-10 mm. long; corolla 20-25 mm. long, the lips rose-purple or lighter and 5-7 mm. long.

4. *Orobanche ludoviciana* Nutt. Plants slender or somewhat stout, 1-2 dm. tall; stems simple or rarely branched, viscid-pubescent aboveground, creamy-white belowground when fresh, drying rusty-brown, light-purple aboveground; cauline scales 5-10 mm. long, lanceolate to lance-ovate; inflorescence a spike; flowers sessile or the lower ones short-pedicelled; bracteoles adnate or adjacent to calyx; calyx 10-12 mm. long, the lobes lance-linear, somewhat unequal in length; corolla 15-20 mm. long, upper lip erect and dark-purple, 6-8 mm. long, lower lip pale with one prominently purple vein in each triangular acute lobe; anthers white, pubescent or glabrous; filaments extending to mouth of corolla tube or almost exerted; style about as long as the filaments; stigma

peltate, discoid-crateriform; capsule longitudinally dehiscent, as long as or longer than calyx; style deciduous from fruit before dehiscence. *Aphyllon ludovicianum* (Nutt.) Gray. Parasitic on *Artemisia filifolia*, *Baccharis salicina*, *Xanthium* sp., etc. in dunes and river sand bars in Panhandle and South Plains, June-Sept.

A Great Plains species that is probably not as common as previously indicated due to confusion with *O. multiflora* and *O. Cooperi*.

5. *Orobanche Cooperi* (Gray) Heller. Plants slender or stout, 1-5 dm. tall, simple or branching from a somewhat enlarged base, brownish viscid-pubescent aboveground, entire plant dark-purple or purple-brown; cauline scales 5-10 mm. long, obtuse or rounded; inflorescence a loose simple spike or with several axillary branches; lower flowers with pedicels to 15 mm. long, upper flowers sessile or on pedicels 1-3 mm. long; calyx 5-12 (-14) mm. long, 5-cleft, the lobes lanceolate and narrowly acute at apex, several times longer than the cup, purple; bracteoles free from calyx, often 1-3 mm. below calyx; corolla 15-30 mm. long, purple, puberulent, upper lip dark-purple, shallowly cleft, erect or reflexed, 4-8 mm. long, broadly acute, the lower lip usually strongly reflexed, pale-lavender, narrowly acute, deeply cleft, each lobe with 3 prominently purple veins; anthers white, pubescent or glabrous; filaments usually not extending to mouth of corolla; style equaling or exceeding the stamen; stigma bilobed, oval or intermediate, usually crateriform, margin more or less crenulate; capsule longitudinally dehiscent, usually exceeding the calyx in length; style deciduous; seeds usually blackish-brown at maturity. Usually parasitic on the roots of *Viguiera stenoloba* but also reported on *Nicotiana glauca* and *Leucophyllum frutescens*, flowering at almost any time of the year when moisture conditions are favorable, in mts., on hillsides and stream banks mostly in the Trans-Pecos, w. through N.M., Ariz. and Son. to Baja Calif.

Stem cross sections of this species show two cycles of vascular bundles, the outer ring being typical of a dicot, whereas the inner ring has the phloem oriented toward the pith. This contrasts with other members of the family (*Myzorrhiza*) thus far investigated in that they have only one cycle of vascular bundles and medullary bundles in the pith. *O. Cooperi* has a normal dicot pith free from medullary bundles.

FAM. 164. LENTIBULARIACEAE RICH.

BLADDERWORT FAMILY

Aquatic, amphibious or terrestrial annual or perennial plants, commonly possessing traps and insectivorous or carnivorous; leaves alternate, cauline or in a basal rosette, simple or dissected; flowers 1 to several on an erect scape; calyx bilabiate, 2- or 5-lobed; corolla deeply bilabiate, the lower lip often 3-lobed, spurred at base in front and with a conspicuous palate; stamens 2; ovary free, 1-celled, the placentation free-central; capsule ovoid to globose, 2- or 4-valved, often bursting irregularly; seeds minute.

About 170 species in 4 genera that are world-wide in distribution.

1. Plants mostly aquatic, rarely amphibious or terrestrial; leaves filiform-dissected and usually bladder-bearing; flowers yellow or purplish in *U. purpurea*; calyx 2-lobed 1. *Utricularia*, p. 1452.
1. Plants terrestrial in moist soil; leaves entire, in a basal rosette, not bladder-bearing; flowers whitish or pale-violet; calyx 5-lobed 2. *Pinguicula*, p. 1455.

1. UTRICULARIA L.

BLADDERWORT

Perennial herbs, strictly aquatic, amphibious or in wet soil; stems slender; leaves capillary-dissected and usually bearing bladderlike traps with a few flagellae at their orifice and a valvelike action for trapping micro-organisms; flowers 1 to several on slender scapes; calyx bilobed; corolla bilabiate, the lower lip usually 3-lobed and with a conspicuous projecting usually bearded palate that often closes the throat, the erect upper lip usually entire, spurred at the base in front; stamens 2, the anthers convergent; capsule 2-valved.

About 120 species that are cosmopolitan in distribution.

1. Leaves minute and linear or none, always inconspicuous; vegetative branches subterranean or horizontal and submersed, only the erect filiform flowering scape aerial; bladders minute or none (2)
1. Leaves once to several times finely dichotomously branched, usually conspicuous on the submersed stems, the flowers arising above the surface of the water (4)
- 2(1). Bracts at base of pedicels peltate, not accompanied by bractlets; pedicels filiform, several times longer than the bracts 1. *U. subulata*.
2. Bracts at base of pedicels basally attached, accompanied each by a pair of minute bractlets; pedicels stout, at most scarcely exceeding the bracts (3)
- 3(2). Flowers approximate, the expanding lower ones overtopping the unexpanded buds above; pedicels mostly exerted beyond the basal bracts; corolla (from tip of spur to tip of upper lobe) 15 mm. high or more .. 2. *U. cornuta*.
3. Flowers not crowded, the expanding lower ones not reaching the unexpanded buds above; pedicels exceeded by the basal bracts; corolla 15 mm. high or less 3. *U. juncea*.
- 4(1). Leaves (at least the upper ones) in whorls of 4 to 9, the petioles often inflated (5)
4. Leaves all alternate, the petioles never inflated (7)
- 5(4). Flowers rose-purple; petioles not inflated 4. *U. purpurea*.
5. Flowers yellow; scape provided about or below the middle with a whorl of inflated petioles that act as floats (6)
- 6(5). Flowers usually 9 to 14; pedicels recurved in fruit; corolla spur notched at tip; racemose bracts longer than broad, never lobed; each lateral foliar unit with its primary basal division comprised of 2 unequal forks; bases of floats tapering gradually from the expanded central portion toward the scape axis, terete in cross section, the tips much-curved ventrally and submersed 5. *U. inflata*.
6. Flowers usually 3 or 4; pedicels rarely recurved in fruit, mostly stiffly erect-ascending; corolla spur never notched at tip, rounded or with a small terminal papilla; racemose bracts as broad as long or broader, variable with respect to lobing; each lateral foliar unit with primary basal division comprised of 2 equal forks; bases of floats uniform in breadth, tapering abruptly only at the scape axis, flattened in cross section, their tips scarcely curved ventrally, usually straight 6. *U. radiata*.
- 7(4). Floral bracts 3-6 mm. long; scape stout, usually bearing more than 8 flowers; leafy stems floating beneath surface of water 7. *U. vulgaris*.
7. Floral bracts 3 mm. or less long; scape slender-filiform, bearing fewer than 8 flowers; leafy stems creeping at the bottom of shallow water, commonly 2 or more of them radiating from the base of a flowering scape (8)
- 8(7). Lower corolla lip 5-7 mm. long, distinctly exceeding the thick very blunt spur; body of seed smooth 8. *U. gibba*.
8. Lower corolla lip 8-10 mm. long, about equaling or slightly shorter than the conic spur (9)
- 9(8). Leafy branches from the base of the flower stalk dimorphic, some bearing twice-dichotomous leaves and numerous bladders, others with thrice-dichotomous leaves that lack bladders; body of seed rough-tuberculate .. 9. *U. fibrosa*.
9. Leafy branches all alike, bearing small dichotomous leaves with numerous bladders 10. *U. biflora*.

1. *Utricularia subulata* L. Plants terrestrial, with filiform subterranean branches and slender undissected leaves, the minute traps borne on separate underground branchlets; scapes filiform, to 2 dm. tall, bearing as many as 12 flowers; floral axis usually flexuous when several flowers are developed; flowers with elongate filiform pedicels to about 15 mm. long; bracts at base of pedicels attached at or slightly below their middle, tapering

to base and apex, 1-2 mm. long; sepals elliptic to suborbicular, blunt, about 2 mm. long; corolla yellow, 3.5-12 mm. long, the rounded-ovate upper lip smaller than the 3-lobed lower lip, the prominent palate 2-lobed, the compressed spur appressed to and about as long as the lower lip. In wet peat, sands and on seepage slopes and pond shores in e. Tex., also Winkler Co. in w. Tex., Mar.-June; from Fla. to Tex. and Ark., n. to L.I., s.e. Mass. and w. N.S.

Sometimes plants with cleistogamous flowers are found. These are known as f. *cleistogama* (Gray) Fern.

2. *Utricularia cornuta* Michx. HORNED BLADDERWORT. Plants terrestrial or on floating mats; stem delicate, usually creeping underground and bearing linear-filiform simple leaves (seen only by collecting sods and gently washing away the soil); traps minute, borne along the leaf margins; scapes erect, wiry, slender, to 35 cm. tall, 1- to several- or rarely as many as 9-flowered; flowers subtended by an acute sessile bract to 2 mm. long and 2 smaller included bractlets, very fragrant, at first approximate, the freshly expanding lower ones over-topping the unexpanded buds above; pedicels mostly exerted somewhat beyond the bracts; longer sepal yellowish, acuminate; corolla yellow, 15-25 mm. high (from tip of long spur to tip of upturned upper lip), nearly as broad; the larger lower lip helmet-shaped, with a projecting convex center and recurved sides; spur subulate, turned downward and outward, 7-12 mm. long; capsule covered by the beaked calyx. In wet peaty, sandy or muddy shores or bogs, sometimes on edge of water, in the e. half of Tex., May-Sept.; from Nfld. to n. Ont. and Minn., s. to Fla. and Tex.

3. *Utricularia juncea* Vahl. Very similar to *U. cornuta* but smaller in all its parts, the more slender scapes to 4 dm. tall and bearing as many as 12 flowers; flowers not crowded, the expanding ones not reaching the unexpanded buds above; pedicels mostly overtopped by the bracts; corolla 1-1.5 cm. high, to 1 cm. broad; the lower lip obovate, consisting mostly of the high-arched palate, without broad recurving margin; spur 5-7 mm. long; fruiting calyx 5-7 mm. long. In wet sand and on margin of ponds and streams in s.e. Tex., May-Sept.; from Fla. to e. Tex., n. to L.I.; also W.I. and S.A.

4. *Utricularia purpurea* Walt. PURPLE BLADDERWORT. Stems submersed, to about 1 m. long; leaves numerous, in whorls of 5 to 7 separated by internodes to 5 cm. long, verticillately branched into filiform segments that often bear a terminal bladder; scape to 15 cm. long, 1- to 4-flowered; corolla about 1 cm. long, rose-purple to violet, the upper lip flat or concave, the lower lip adorned with a yellow spot at base, 3-lobed with the lateral lobes strongly and separately elevated at base into a palate; spur shorter than lower lip and appressed to it. *Vesiculina purpurea* (Walt.) Raf. In pools of quiet water, May-Sept., s.e. Tex. (Hardin Co.); from Que. and N.S. to Minn. and n. Ind., s. along the Coastal Plain to Fla., La. and Tex.; also W.I.

5. *Utricularia inflata* Walt.¹⁵² FLOATING BLADDERWORT. Plants free-floating, the elongated submersed stems with alternate leaves that are 4 to 6 times dichotomous into delicate capillary segments and bearing small ovoid bladders; scape supporting a whorl of 4 to 10 leaves that have inflated petioles which serve as floats, from the whorl of floats to the lowest pedicel 7-25 cm. long, supporting as many as 14 (usually about 8) flowers; floats 4-9 cm. long, the petiole 4-8 mm. thick, the basal divisions of their pinnately dissected blades 0.5 mm. or more in diameter; floral bracts 3-4 mm. long; calyx lobes 4-7 mm. long; corolla yellow, about 2 cm. broad, to 25 mm. high, the lower lip 3-lobed and twice as long as the appressed spur; fruiting pedicels to 35 mm. long, spreading or recurved. In ditches, swamps, slow streams, lakes and ponds in e. Tex., Mar.-July; from Fla. to Tex., n. to Del. and N.J.

6. *Utricularia radiata* Small. Very similar in habit to *U. inflata*; floats several, 2-5.5 cm. long, with inflated petioles 2-4 mm. thick; peduncle 1.5-5 cm. long, supporting usually 3 or 4 flowers; calyx lobes 3-4 mm. long; corolla about 15 mm. broad; fruiting pedicels 1-2 cm. long. *U. inflata* var. *minor* Chapm. In lakes, ditches, slow streams and ponds in e. Tex., Mar.-June; Fla. to Tex., n. to N.S., Tenn. and Ind.

7. *Utricularia vulgaris* L. COMMON BLADDERWORT. Plants rather coarse, with elongated stems to 2 m. long and 0.5 mm. or more thick that are free-floating just beneath the surface of the water, the plumose branches of foliage to 12 cm. in diameter; leaves

¹⁵² Ref.: G. W. Reinert and R. K. Godfrey in Am. Jour. Bot. 49:213-220. 1962.

elliptic to ovate-elliptic, up to 4 cm. long, much-dissected, the coarser capillary segments slightly less than 1 mm. thick, the numerous bladders large; scape erect, stoutish, to about 8 dm. high, supporting as many as 20 flowers, naked at the base or producing slender small-leaved stolonlike divergent offshoots; bracts 3-6 mm. long; corolla yellow, with brown or orange vertical stripes on the large conspicuous palate, 15-25 mm. high, the broad lower lip somewhat 3-lobed and slightly shorter than the curved obtuse or acutish conical spur; fruiting raceme elongate, the arched-recurved pedicels to about 2 cm. long; winter buds ellipsoid, 1-2 cm. long, their crowded leaves hairy; seeds brown, lustrous, striate-reticulate. Incl. var. *americana* Gray, *U. macrorhiza* Le Conte. In deep or shallow quiet water, rare in s.e. Tex., reported from the Panhandle, Apr.-Aug.; from s. Lab. to Alas., s. to Va., O., Ind., Mo., Tex. and Mex.

8. *Utricularia gibba* L. CONE-SPUR BLADDERWORT. Plant with delicate filiform creeping or floating stems and branches, the sparsely leafy often intricately entangled plumes of foliage to 2 cm. in diameter and 3 dm. long; leaves usually with 2 filiform segments and with few scattered bladders; scapes to 1 dm. high, 1- to 3-flowered; larger sepal sub-orbicular, 2-3 mm. long; corolla yellow, 6-12 mm. high, 6-8 mm. broad, the nearly equal lips projecting forward, the oblong-conic obtuse spur much shorter than the lower lip; fruiting pedicels ascending, to 1 cm. long; capsule 2-3 mm. thick, about as long as the sepals; seeds broadly winged, the body smooth. In mud of marshes, bogs and seepage areas and on floating debris in shallow water mostly in the e. half of Tex., s. to Cameron Co. and w. to Val Verde Co., June-Aug.; from Fla. to Tex. and Mex., n. to e. Can., Mich., Wisc., Minn. and Okla., w. to Calif.

9. *Utricularia fibrosa* Walt. Plant closely resembling *U. gibba*; stems creeping on the bottom in shallow water, radiating from the base of the scape, dimorphic, some without bladders that have rather crowded thrice-forked leaves to about 15 mm. long, the other with smaller twice-forked leaves bearing numerous bladders; peduncles to about 15 cm. high, with 2 to 6 long-pedicelled flowers; corolla yellow, the lower lip 8-10 mm. long and with a prominent palate; spur equaling or slightly exceeding the lower lip; capsule globose; seeds broadly winged, the body rough-tuberculate. Floating on mats of debris and rooted in shallow water of slow streams, ponds and lakes in e. Tex., June-July; from Mass. to Fla., w. to Tex., Ark. and Okla.

This is our only *Utricularia* with dimorphic stems and leaves. The bladders are borne mostly on stems and only occasionally on the leaves.

10. *Utricularia biflora* Lam. Plant closely resembling both *U. gibba* and *U. fibrosa*; stems all alike, with bladders throughout, floating on mats of debris or creeping on the bottom in shallow water; leaves very delicate, rarely more than 5 mm. long, usually with 3 or more segments; scapes erect, to about 15 cm. long, usually much shorter, with 1 to 4 flowers; pedicels filiform, about 15 mm. long; sepals 2.5-4 mm. long; corolla yellow, very similar to those of *U. fibrosa*, to 17 mm. high; lower lip 8-10 mm. long, with a prominent palate; spur about as long as or much shorter than the lower lip; fruiting pedicels to 25 mm. long; capsule 3.5-4 mm. thick, slightly exserted. *U. pumila* Walt. In shallow water in s.e. Tex., June-July; from e. Mass. to Fla., Tex. and Okla.

2. PINGUICULA L.

About 35 species, widely distributed.

1. *Pinguicula pumila* Michx. SMALL BUTTERWORT. Perennial terrestrial scapose herb with fibrous roots; leaves in a basal rosette, soft-fleshy, greasy to the touch, elliptic to elliptic-obovate, obtuse to rounded at apex, narrowed at base, 1-3 cm. long; scapes one or usually several, 1-flowered, naked, very slender, erect, glandular-puberulent, to 2 dm. tall, usually much smaller; calyx 5-lobed, more or less united and bilabiate; calyx lobes oblong, obtuse, 2-4 mm. long; corolla whitish or pale-violet, sometimes marked with purple and yellow, somewhat bilabiate with the 5 lobes subequal, 1-2 cm. broad; corolla spur subulate, about 3 mm. long, usually shorter than the saclike base of the corolla, the palate (in ours) subulate or clavate, included in the tube; capsule 2- to 4-valved. In seepage and wet soils of savannahs and low pinelands on the Coastal Plain in s.e. Tex., Mar.-June; from Fla. to Tex. and S.C.; also Bah. I.

FAM. 165. ACANTHACEAE JUSS.¹⁸³

ACANTHUS FAMILY

Herbs or small shrubs, usually with cystoliths appearing as minute short lines on the vegetative parts; leaves simple, usually entire, opposite or sometimes (as in *Elytraria*) alternate or subopposite; flowers irregular to nearly regular, perfect; calyx persistent, inferior, the segments 5 or occasionally fewer; corolla gamopetalous, the limb 5-lobed or 2-lipped (rarely 1-lipped); stamens 4, didynamous, or 2 only; staminodes often present in the 2-stamened flowers; anther sacs 2 or 1, longitudinally dehiscent; ovary 2-celled, the ovules 2 to 10 in each cavity; style filiform, simple; stigmas 1 or 2; fruit a capsule, 2-celled, 2-valved; seeds usually flat, borne on funicles which are papilliform in a few genera but usually hook-shaped, the testa smooth or roughened, often mucilaginous when moistened.

A large pantropical family of about 2,500 species in 250 genera.

1. Funicle papilliform or lacking; vines or herbs with densely bracteate peduncles (2)
1. Funicle hook-shaped (retinaculate) (3)
- 2(1). Plants herbaceous; ovules many 1. *Elytraria*, p. 1456.
2. Plants vines; ovules 4 2. *Thunbergia*, p. 1457.
- 3(1). Corolla lobes contorted (convolute) at aestivation; stamens 4 (4)
3. Corolla lobes imbricate (6)
- 4(3). Corolla deeply bilabiate; flowers in axillary fascicles; capsule terete and 2-celled to the very base 3. *Hygrophila*, p. 1457.
4. Corolla scarcely or not at all bilabiate, the 5 lobes broad and rounded, spreading (5)
- 5(4). Anther cells mucronate at base; corolla tube short, the throat campanulate
..... 4. *Dyschoriste*, p. 1458.
5. Anther cells rounded at base; corolla tube long, the throat usually not campanulate
..... 5. *Ruellia*, p. 1459.
- 6(3). Stamens 4; anthers 1-celled 6. *Stenandrium*, p. 1466.
6. Stamens 2; anthers 2-celled (7)
- 7(6). Anther cells equal, parallel and contiguous; corolla lobes similar or nearly so;
stamens more or less exserted; plants shrubby (8)
7. Anther cells unequally inserted (9)
- 8(7). Interrupted spikes few- to many-flowered; corolla very open, less than 15 mm.
long 7. *Carlwrightia*, p. 1467.
8. Unilateral spikes with numerous flowers; corolla tubular-funnelform, more than 20
mm. long 8. *Anisacanthus*, p. 1469.
- 9(7). Placenta separating from the capsule wall at maturity; corolla with narrow
tube; anther cells usually rounded at base (10)
9. Placenta not separating (11)
- 10(9). Corolla almost or quite equally 4-lobed; flowers each covered by a single large
primary bract 9. *Tetramerium*, p. 1470.
10. Corolla deeply 2-lipped; flowers each covered by 2 or 4 bracts
..... 10. *Dicliptera*, p. 1471.
- 11(9). Corolla tube long, slender, cylindric 11. *Siphonoglossa*, p. 1472.
11. Corolla tube short, not cylindric (12)
- 12(11). Corolla subequally 4-lobed 12. *Yeatesia*, p. 1472.
12. Corolla deeply 2-lipped; lower anther cell mucronate or calloused at base
..... 13. *Justicia*, p. 1473.

I. ELYTRARIA MICHX.

SCALY-STEM

Cauliscent or acaulescent herbs; leaves alternate or sometimes subopposite, basal or crowded at the ends of the branches; flowers borne in dense peduncled spikes, both

¹⁸³ Adapted from Dieter C. Wasshausen in C. L. Lundell, *Flora of Texas* I:223-282. 1966.

spikes and peduncles bearing imbricate coriaceous bracts; calyx scarious, the narrow segments entire or toothed at apex; corolla white or blue, the tube slender, the limb 2-lipped, the lower lip 3-lobed; stamens 2, barely exerted; anthers 2-celled, the equal sacs parallel and sometimes awn-tipped at base; staminodes usually wanting; ovary 2-celled; ovules 6 to 10 in each cavity; capsules narrow, contracted at base, acute at apex.

A genus of 7 species, all native of temperate or tropical America, except 1 species found chiefly in Africa.

1. Floral bracts entire; plants acaulescent 1. *E. bromoides*.

1. Floral bracts bearing a pair of thin triangular or rhombic teeth; plants usually caulescent 2. *E. imbricata*.

1. *Elytraria bromoides* Oerst. **WHEATSPIKE SCALY-STEM**. Stems ascending or spreading, to 6 cm. long, simple or sparingly branched above, clothed with appressed acuminate scalelike leaves; normal leaves basal, sessile or short-petioled, oblong to oblong-spatulate, 2-6 cm. long, obtuse or rounded at apex, spreading, pale-green, sparingly pubescent especially on the nerves beneath; spikes 1-2.5 cm. long; bracts rigid, about 1 cm. long, entire, woolly above within; bractlets ciliate along the back; calyx lobes about 7 mm. long, attenuate, barely pubescent at the tip; corolla 5-6 mm. long, the lower lip notched; capsules 4-5 mm. long, each with a conic tip. In sandy soil, coast of Tex., summer-fall; also e. Mex.

2. *Elytraria imbricata* (Vahl) Pers. **PURPLE SCALY-STEM**. Plant acaulescent or (if caulescent) the leaves crowded at the tip of a glabrous or sparingly pilosulous stem to 3 dm. long; leaves ovate to oblong or obovate, rarely linear-lanceolate, to 18 cm. long and 6 cm. wide, blunt or acutish at apex, narrowed at base to a slender winged petiole, both surfaces appressed-pilose or glabrate, the margins undulate; scapes numerous, axillary, to 24 cm. long, simple or branched (sometimes leafy at tip), covered by tightly appressed ovate to subulate scales; spikes one to several, to 6 cm. long; bracts oblong or elliptic, 3-6 mm. long, 1-2 mm. wide, firm, awn-tipped and bearing near apex a pair of triangular or rhombic hyaline teeth; bractlets 3 mm. long; calyx segments thin, the upper bidentate; corolla blue, 5-8 mm. long; capsule oblong, glabrous. Dry brushy slopes, canyons and ledges in the mts. of the Trans-Pecos, Mar.-Oct.; from Tex. to n. S.A.

2. THUNBERGIA RETZ. CLOCK-VINE

About 200 species chiefly African with a dozen or more species occurring in tropical or subtropical America, either under cultivation or as escapes.

1. *Thunbergia alata* Sims. **BLACK-EYED SUSAN**. A pubescent trailing or climbing vine usually about 1 m. long; leaves with a wing-margined petiole as long as the blades or shorter, ovate to triangular-ovate, 4-8 cm. long, acute at apex, cordate or hastate at base, entire or remotely few-toothed, pubescent; flowers large, axillary or borne in terminal racemes; peduncles mostly longer than the petioles; bracts 2, foliaceous, ovate-lanceolate, acute to acuminate, pubescent, about 15 mm. long; calyx short, cupuliform, truncate or many-toothed; corolla 2.5-4 cm. long, yellow or orange and usually with a dark-purple eye; corolla with a slender tube enlarged into a spreading 5-lobed limb; stamens 4, didynamous, borne near the base of the corolla tube, the anthers with an apiculate connective, the lobes mucronulate at base; disk fleshy; capsule depressed-globose, coriaceous, pubescent, 8-10 mm. in diameter, loculicidal, its stout beak about 1 cm. long. In fields, along trails, edges of thickets, gardens and open waste places in s. and e. Tex., Mar.-Apr.; a species of trop. Am. that is cult. and occurs as an escape.

A plant of the East Indian *T. grandiflora* Roxb. recently volunteered in a yard in League City, Harris County, where it makes a luxuriant growth. It may eventually become established in our flora. It differs from *T. alata* primarily in lacking winged petioles and in having light- or dark-blue, rarely white, flowers about twice the width of those of that species.

3. HYGROPHILA R. BR.

The genus is cosmopolitan. Of the numerous species described, only about 80 are now considered as valid.

1. *Hygrophila lacustris* (Schlecht. & Cham.) Nees. Herb to 8 dm. high, sparingly hirtellous to glabrate; stems obtusely quadrangular, branching; leaves lanceolate, 5-12 cm. long, 5-25 mm. wide, acute at apex, entire; flowers sessile, clustered in the axils; bracts linear; calyx segments 5, lanceolate, about 5 mm. long, white-margined, pilose; corolla yellow, puberulent, the cylindrical tube 5 mm. long, the bidentate upper lip 2.5 mm. long, the lower lip 3-lobed; stamens 4, didynamous or 2 perfect stamens with 2 staminodes, the filaments of each pair united at base by a membrane; anthers 2-celled, muticous or mucronulate; posterior stigma lobe abortive; capsules narrowly oblong, 8-12 mm. long, glabrous, 16- to 18-seeded. In marshy regions along streams or on shores of ponds in s.e. Tex. where its rhizomes form colonies, June-Sept.; from Fla. to Tex.

4. DYSCHORISTE NEES

Herbaceous caulescent perennials, prostrate to ascending or erect, glabrous or pubescent; leaves opposite, sessile or petioled, usually entire; inflorescence cymose, capitate or spicate, terminal or axillary; flowers subtended by foliaceous bracts and bracteoles; calyx deeply 5-parted, the lobes usually subulate-setaceous, ciliate, lineolate; corolla tube usually erect, occasionally slightly ampliate at the base, the spreading oblique limb obscurely or distinctly bilabiate and 5-lobed; stamens 4, didynamous; filaments both long and short, united at the base and adnate to the base of the corolla tube, pubescent; anthers 2-celled, the oblong cells sharply mucronate at the base and parallel or slightly divergent, glabrous or occasionally pubescent; ovary 2-celled, glabrous, ovules 2 or occasionally 1 in each cell; style filiform, pubescent; posterior lobe of stigma rudimentary, anterior lobe oblique and slightly flattened; capsule included in the persistent calyx, oblong-linear, glabrous, 2- to 4-seeded, separating with difficulty at maturity into 2 valves, 1 to 2 seeds to each valve held in position by a retinaculum; seeds flattened, suborbicular, mucilaginous when wet.

About 100 species, mostly tropical and subtropical.

1. Leaves mostly linear; stem erect and strict, hirsute with rigid hairs 1. *D. linearis*.
1. Leaves ovate, other than linear (2)
- 2(1). Leaf margins entire, not crenulate; stems spreading mostly along the ground ... 2. *D. decumbens*.
2. Leaf margins distinctly crenulate; stems erect or ascending 3. *D. crenulata*.

1. *Dyschoriste linearis* (T. & G.) O. Ktze. Stem 18-42 cm. high, erect and strict, branched and diffuse, hirsute with both rigid and short hairs, sometimes sparsely pubescent or merely glabrous, not cinereous; leaves linear-oblong to oblong-spatulate, 18-65 mm. long, entire, lineolate, rather rigid, pubescent on midrib and veins, the margin ciliate; bracts foliaceous, frequently in short-leaved specimens equaling the length of the leaf; calyx 5-cleft, densely lineolate, giving the appearance of appressed hairs; calyx lobes 9-13 mm. long, subulate-setaceous, more or less hispid, ciliate; calyx tube 4.5-6 mm. long, in most cases one half the length of the lobes; corolla somewhat bilabiate, about 27 mm. long, pubescent on external surface, the tube 5-7 mm. long and slightly shorter than the abruptly amplified limb; anther-cells oblong; capsule 4-seeded; seeds flat. Rather ubiquitous but mostly on rocky-grassy slopes, silty flats or about caprock in most of w. two thirds of Tex., Apr.-Aug.; from Tex. and N.M. to n. Mex.

2. *Dyschoriste decumbens* (Gray) O. Ktze. Plant cinereous-puberulent throughout; stems mostly spreading on the ground from a ligneous base, occasionally erect, branched; leaves spatulate to oblanceolate, 2-3 cm. long, 5-11 mm. broad, entire, usually obtuse or sometimes slightly mucronate at apex, attenuated and often having the appearance of a petiole at base; flowers few, in foliose bracteate clusters; calyx 1.5-2 cm. long, at maturity exceeding the capsule by as much as 1 cm., 5-cleft, the tube 5-7 mm. long, the subulate-setaceous lobes scarcely twice the length of the tube; corolla purple, 1.8-2 cm. long, the tube a little longer than the throat and slightly amplified at the base; anther cells oblong, the filaments united at the base of the corolla throat; seeds 4, suborbicular and flattened. On dry clayey soil, w. Tex., May-Aug.; also Ariz. and the plateau region of n. Mex.

3. *Dyschoriste crenulata* Kobuski. Stems several, 1-2 dm. high, erect or ascending from a perennial ligneous base, pubescent; leaves more or less spatulate to obovate, 2-3 cm. long, 6-10 mm. broad, acute to obtuse at the apex, attenuate at the base, densely cinereous-pubescent, the margin crenulate; calyx 5-parted, about 18 mm. long, nearly equaling the length of the corolla, the tube and lobes of nearly equal length; calyx lobes subulate-setaceous, cinereous, ciliate; corolla about 19 mm. long, pubescent on the external surface, the throat slightly longer than the tube; anthers occasionally unequally didynamous; style about 1.2 cm. long, the stigma oblique; mature capsule not seen. In chaparral and brushlands in s. Tex., Mar.-May; s. into Tam.

5. RUELLIA L.

Perennial herbs or shrubs; leaves petioled, entire to undulate or rarely dentate; flowers usually large and showy, solitary or clustered in the axils or borne in terminal cymose panicles; calyx usually 5-parted, the segments often narrow; corolla red, yellow, white or purple (usually mauve), funnelform or salverform, sometimes saccate, the tube usually narrow below, the upper portion more or less campanulate, the limb of 5 obtuse spreading lobes; stamens 4, didynamous, the anther sacs blunt at base; stigma lobes unequal; capsule oblong or clavate.

A large genus containing upward of 200 species, a majority of which are tropical or subtropical. The geographic center of distribution in the Western Hemisphere is somewhere in southern Mexico or Central America.

1. Plants bearing a terminal panicle of flowers and usually lateral few-flowered panicles of cleistogamous flowers produced early that often have completely disappeared before the normal flowers have expanded (2)
 1. Inflorescences in axillary sessile or more or less peduncled glomerules or cymes; bracts foliaceous (11)
 - 2(1). Corolla 5 cm. long or more (3)
 2. Corolla less than 5 cm. long (5)
 - 3(2). Leaf blades oblong-lanceolate to narrowly ovate-oblong; leaves and stems shortly and sparsely hirsute; corolla white 1. *R. Metzae*.
 3. Leaf blades ovate to broadly ovate; leaves and stems subvelvety-puberulent to velvety-pilose and often somewhat viscid; corolla bluish-lavender (4)
 - 4(3). Inflorescence an ample terminal panicle; leaf blades large, 4-10 cm. long, 20-80 mm. broad 2. *R. occidentalis*.
 4. Inflorescence a compact or spikelike terminal panicle; leaf blades small, 3-6 cm. long, 15-35 mm. broad 3. *R. Davisiorum*.
 - 5(2). Corolla more than 4 cm. long (6)
 5. Corolla 4 cm. long or less (8)
 - 6(5). Plants not conspicuously long-white-hirsute, usually 25 cm. or more tall; stems with several leaf-bearing nodes; lateral panicles rarely producing chasmogamous flowers 5. *R. nudiflora*.
 6. Plants conspicuously long-white-hirsute, exclusive of the inflorescence very low (not exceeding 20 cm.); elongated internodes 1 or 2 (rarely 3); lateral panicles often producing chasmogamous flowers (7)
 - 7(6). Leaf blades ovate-lanceolate, 2.5-5 cm. long, 10-15 mm. broad; chasmogamous fruits not exceeding 15 mm. in length 4. *R. Drushelii* var. *Drushelii*.
 7. Leaf blades ovate to ovate-lanceolate, 4-11 cm. long, 15-35 mm. broad; chasmogamous fruits about 20 mm. long 4. *R. Drushelii* var. *macrocarpa*.
 - 8(5). Leaves oblong-elliptic to spatulate, the basal ones prominent and mostly rounded at base; stems usually with few leaf-bearing nodes near the base; horizontal-ascending basal cleistogamous cymes 8. *R. yucatanana*.
 8. Leaves lanceolate to oblanceolate or narrowly ovate (9)

- 9(8). Leaves and stems conspicuously hirsute; leaf blades oblanceolate to narrowly ovate, rounded or rarely subacute at apex; corolla 3 cm. long 6. *R. Corzoi*.
9. Leaves and stems not conspicuously hirsute; leaf blades lanceolate to oblong-ovate, acute to subacute at apex; corolla 3-4 cm. long (10)
- 10(9). Stem and leaves very sparsely and obscurely hirsute; calyx glandular-pubescent 7. *R. Runyonii* var. *Runyonii*.
10. Stem and leaves densely pilosulous but not velvety; calyx eglandular to glandular-pilosulous 7. *R. Runyonii* var. *Berlandieri*.
- 11(1). Main axis terminating in a flowerless leafy tip; flowers one to few at leafy-bracted summits of branches or on peduncles from the median or lower axils, or the cymose inflorescences much-branched, if with sessile or short-pedicellate solitary flowers in the axils the flowers then less than 5 cm. long (12)
11. Main axis bearing flowers in sessile or short-peduncled gloimerules or (if flowers borne singly in axils) the corolla 5-11 cm. long (17)
- 12(11). Bracts of the loose cyme linear to linear-lanceolate (13)
12. Bracts dilated; leaves lanceolate to oblong or elliptic to ovate (14)
- 13(12). Leaf blades chiefly linear-elongate 9. *R. Brittoniana*.
13. Leaf blades chiefly lanceolate 10. *R. malacosperma*.
- 14(12). Stems from a lignescent base, to 10 cm. high, if taller then shrubby; plants of the Trans-Pecos 11. *R. Parryi*.
14. Stems taller than above, not fruticose; plants east of the Trans-Pecos (15)
- 15(14). Calyx lobes lanceolate to linear-lanceolate, flat to the tip, 2-4 mm. broad; ovary and capsule glabrous; leaves petioled 14. *R. strepens* var. *strepens*.
15. Calyx lobes narrowly linear, with prolonged linear-acicular tips, 1-1.2 mm. broad (16)
- 16(15). Ovary glabrous; calyx closely covered with appressed and partially immersed slender cystoliths; leaves subsessile 12. *R. pinetorum*.
16. Ovary pubescent with short spreading hairs; calyx pilose with slender pointed hairs; leaves short-petioled 13. *R. pedunculata*.
- 17(11). Calyx lobes linear-lanceolate, flat to the tips, 2-4 mm. wide; flowers chiefly or wholly cleistogamous 14. *R. strepens* var. *cleistantha*.
17. Calyx lobes narrowly linear, the prolonged tips very slender to almost bristle-form; flowers rarely cleistogamous (18)
- 18(17). Leaves essentially sessile, erect-ascending (19)
18. Leaves distinctly petioled, spreading (23)
- 19(18). Stems filiform, mostly less than 2 mm. thick at base; branches usually decumbent at base and strongly ascending, glabrescent to sparsely pilose; flowers 4.5-6 cm. long; leaves thin, oblanceolate to lanceolate, puberulent, sparsely pubescent to sparsely pilose, usually not crowded on the stems ... 15. *R. humilis* var. *depauperata*.
19. Stems stout; leaves lanceolate to suborbicular, mostly crowded on the stems; branches suberect to strongly divergent, typically villous-hirsute (20)
- 20(19). Corolla 3-4.5 cm. long, its slender tube 12-25 mm. long (21)
20. Corolla usually 4.5-7 cm. long, its slender tube 30-45 mm. long (22)
- 21(20). Larger leaves of the main axis lanceolate, rarely broadly lanceolate, 1-2.5 cm. broad, obtuse to subacute at apex; stems villous-hirsute, the hairs about 1 mm. long 15. *R. humilis* var. *humilis*.
21. Larger leaves of the main axis ovate to oval-oblong or broadly elliptic, 1-4 cm. broad, mostly rounded at apex; stems strongly spreading-villous, the hairs about 2 mm. long 15. *R. humilis* var. *frondosa*.

- 22(20). Larger leaves of the main axis lanceolate, 1-2.5 cm. wide, subacute to acute at apex 15. *R. humilis* var. *longiflora*.
22. Larger leaves of the main axis ovate-oblong to broadly oval, 2-4.5 cm. wide, rounded at apex 15. *R. humilis* var. *expansa*.
- 23(18). Glomerules few, restricted to the upper internodes; leaves lanceolate (24)
23. Glomerules several to many, extending well downward on the stem and branches (25)
- 24(23). Stem mostly strongly divergent, branched from the lower and median axils; corolla 25-50 mm. long 16. *R. caroliniensis* var. *semicalva*.
24. Stem mostly simple or with few ascending branches; corolla 25-45 mm. long 16. *R. caroliniensis* var. *salicina*.
- 25(23). Leaves relatively narrow, serrate-undulate to undulate, linear to lanceolate; internodes at least twice as long as the leaves 16. *R. caroliniensis* var. *serrulata*.
25. Leaves relatively broad, entire to undulate, ovate to broadly elliptic; internodes not much exceeding the leaves 17. *R. Drummondiana*.

1. *Ruellia Metzae* Tharp. Stems branched from a subligneous base, to 6 dm. high, the branches spreading-ascending; secondary branches numerous, erect-ascending, more or less densely glandular-puberulent and sparsely to moderately hirsute; leaves 3-12 cm. long, 1-4 cm. broad, oblong-lanceolate to narrowly ovate-oblong, basally narrowed into and decurrent upon petioles 1.5-6 cm. long, acute to rounded at apex, short appressed-pubescent and grayish-green above, paler beneath, the margins undulate-dentate to obscurely undulate; bracted cleistogamous-flowered branches arising from many of the lower nodes; terminal inflorescence a narrow or broad ample panicle with sharply ascending to spreading branches, very viscid-glandular throughout; calyx lobes 1.6-2 cm. long, linear-subulate; corolla white, sometimes pale-blue-purple, 55-65 mm. long, very slightly curved, the tube 3-3.5 cm. long; filaments sparsely retrorse-hispidulous; capsule 16-22 mm. long, 4-5 mm. thick, broadest at or slightly above center, densely puberulent, glandular-viscid (particularly on upper half), the cartilaginous stipelike base 1 mm. high, brown; seeds brown, 9 or fewer in each cavity, orbicular, the hilum indented, the hygroscopic viscid pubescence apparent only on the margins. Incl. var. *Marshii* Tharp & Barkl., *R. Muelleri* Tharp & Barkl. In mesquite thickets and open oak woods, in gravel washes of stream beds, and on open grassy limestone slopes in w.-cen. and s. Tex., May-Oct.; also N.M. and n.e. Mex.

2. *Ruellia occidentalis* (Gray) Tharp & Barkl. Perennial herb from a cluster of tough fibrous-fusiform roots; stems erect or ascending, subligneous at base, to 7 dm. tall, softly pale-glandular-pubescent, often bearing a leafy branch and a leafless (but bracted) early-deciduous cyme from one or more of the lower nodes (sometimes 2 leafy or 2 floriferous branches at a node); leaves with glandular-pubescent petioles to 5 cm. long, ovate, 4-10 cm. long, 2-8 cm. broad, rounded at apex, rounded to subcordate or subtruncate and decurrent at base, relatively thin to thickish, abundantly puberulent above and beneath, with long hairs on the margins and usually prominent veins, the margins crenate-undulate to subentire; cleistogamous flowers with linear-attenuate calyx lobes 9-11 mm. long at anthesis and pale glandular-pilose to the sharply pointed curved tips, the corolla 4-5 mm. long and slightly swollen just above base; expanding flowers in an ample inconspicuously bracted panicle of forking cymes with ascending to divaricate branches and with a sessile bractless flower frequently in some of the forks, softly short-glandular-pilose to viscid; calyx lobes 22-25 mm. long, linear-attenuate, pilose to the tips, united only at the very base; corolla bluish-purple, about 7 cm. long and 4 cm. broad, the tube about 27 mm. long; fruits from cleistogamous flowers 13-15 mm. long (about equaling the calyx lobes), 3.5 mm. thick, densely short-pilosulous, sparsely glandular on the upper portion, the seeds 5 or fewer in each cavity; fruits from expanded flowers 1.6-2 cm. long (slightly to considerably shorter than the calyx lobes), 3-3.5 mm. thick, densely short-pilosulous, the seeds 5 to 7 in each cavity. *R. strictopaniculata* Tharp & Barkl., *R. nudiflora* var. *occidentalis* (Gray) Leonard. In dry rocky woods and chaparral hills and flats on the Edwards Plateau and in the Rio Grande Plains, May-Oct.; also n. Mex.

3. *Ruellia Davisiorum* Tharp & Barkl. Roots clustered, tough, coarsely fibrous; stems erect and herbaceous except the subligneous base or becoming ligneous and greatly elongated during mild winters and under the protection of other vegetation; leaves with densely pubescent and glandular petioles 1-3 cm. long, ovate, 3-6 cm. long, 15-35 mm. broad, subacute to rounded at apex, abruptly short-decurrent at base, relatively thickish, subvelvety-puberulent and somewhat glandular, the margins obscurely crenate-undulate to subentire or occasionally somewhat crisped; terminal spikelike panicle usually an admixture of a few normal and many cleistogamous flowers, the branches, pedicels and calyces abundantly glandular-pilosulous; cleistogamous flowers with calyx lobes 1-1.5 cm. long, linear-attenuate, pale glandular-pilosulous to the sharply pointed tips; corolla 35-45 mm. long, more or less swollen just above the base; normal flowers with calyx lobes about 2 cm. long, linear-attenuate, pilose to the tips; corolla 5-6 cm. long, about 35 mm. broad, the tube about 2 cm. long; cleistogamous fruits 11-13 mm. long, 2.5 mm. broad, the pubescence retrorse below; normal fruits 1-1.2 cm. long, 3 mm. thick, densely short-pilosulous, becoming glandular below the apex; seeds 5 to 7 in each cavity. In the Rio Grande Plains and Valley, July-Nov.; also adj. Mex.

4. *Ruellia Drushelii* Tharp & Barkl. Roots perennial, clustered, fibrous; stems low, to 2 dm. high, branched, pubescent with coarse crooked jointed hairs toward base, these usually mixed with a dense puberulence that becomes increasingly apparent and glandular toward and in the inflorescence; leaves with white-pilose petioles to 3 cm. long, ovate to lanceolate-ovate, 2.5-11 cm. long, 1-3.5 cm. broad, obtuse to acute at apex, rounded and abruptly acuminate-decurrent to subcuneate at base, more or less densely pubescent above and below with coarse hairs similar to those on the stem, the margins crisped and more or less crenate-undulate; inflorescences terminal on main stem and branched; flowers subsessile, 2 or 3 in dichotomous cymes, the peduncles densely glandular-puberulent; cleistogamous flowers few; normal flowers showy, pale-blue-lavender; calyx lobes 1-2 cm. long, linear-filiform, softly white-hirsutulous, the erect hairs tipped with viscid brown glands; corolla 4-4.5 cm. long, the tube 1-1.2 cm. long; cleistogamous fruits 12-18 mm. long, 3.5-5 mm. thick, densely retrorsely puberulent toward base, increasingly glandular toward apex; fruits of the normal flowers 1.4-2 cm. long, 7 mm. thick, puberulent to retrorsely hispid, scarcely glandular; seeds orbicular, about 3 mm. long and 2 mm. wide, margins crenate. On limestone hills in w. Edwards Plateau, Apr.-Aug.; also n. Mex.

Two variants in our region are designated as follows:

Var. *Drushelii*. Stems low, 5-15 cm. high; leaves ovate-lanceolate, 2.5-5 cm. long, 1-1.5 cm. wide; calyx lobes 1-1.7 cm. long; normal fruits not exceeding 15 mm. in length, retrorsely hispid except at apex.

Var. *macrocarpa* Tharp & Barkl. Stem to 2 dm. high; leaves ovate to ovate-lanceolate, 4-11 cm. long, 15-35 mm. wide; calyx lobes 17-19 mm. long; normal fruits to 2 cm. long and 7 mm. thick, puberulent toward apex.

5. *Ruellia nudiflora* (Gray) Urban. Perennial from a suffruticose base; stems at first to about 25 cm. high and densely puberulent and sparsely hirsute, with age to 7 dm. tall and becoming essentially glabrous, erect or ascending; basal and lower leaves in spring aspect oblong to narrowly oblong-ovate, 6 cm. long or less, 3 cm. broad or less, gray-green, strongly reticulate beneath, moderately densely short pubescent, distinctly crisped, undulate-dentate, with a narrow ciliate cartilaginous margin and subglandular callosities on marginal vein-tips, decurrent on petioles to 25 mm. long; leaves in the summer aspect about 12 cm. long or much-reduced above; cleistogamous flowers produced in the spring; normal flowers produced in the summer, terminal, paniculate; sepals subulate-attenuate, 11-15 mm. long in flower, slightly longer in fruit, densely glandular-puberulent but not at all viscid; corolla purplish-blue, conspicuously curved, about 55 mm. long, 3.5-4 cm. broad, opening about sunrise, falling during early afternoon, the tube 1.5-2 cm. long; capsules from cleistogamous flowers about 15 mm. long, 3.5-4 mm. thick, clavate, densely retrorse-puberulent; seeds 4 or 5 in each cavity, brown, about 3.5 mm. long, 3 mm. broad; capsules from normal flowers 1.6-2 cm. long, 4-4.5 mm. thick, densely fine-puberulent; seeds 18 or usually fewer, dark brown, about 3 mm. long, scarcely as broad, rounded or apiculate at apex. Rather ubiquitous, mostly in the s. half of Tex., n. to n.-cen. Tex., flowering throughout the year in some parts of its range; also in n.e. Mex.

Plants in north-central Texas with sepals hispid-pubescent to slightly scabrous and

without gland-tipped hairs have been segregated as var. *hispidula* Shinnery in contrast to var. *nudiflora* that has gland-tipped hairs on its sepals.

6. *Ruellia Corzoi* Tharp & Barkl. Roots fibrous and fusiform-thickened; stems erect or nearly so from a subligneous base, to 35 cm. high, branched throughout; branches more or less sharply ascending, conspicuously hirsute from base to inflorescence with spreading hairs that become increasingly interspersed with glandular puberulence in the inflorescence, quadrangular with increasingly manifest grooves on the faces from base to tip; leaves with petioles 1-2 cm. long, oblanceolate to narrowly ovate, rounded to subacute at base and apex, 4-6 cm. long, 15-25 mm. broad, the lower surface moderately hirsute, upper surface more densely so the margins obscurely crenate to subentire, scarcely crisped; inflorescences of two kinds: (1) trichotomous simple or compound leafless but bracted cymes of pedicelled cleistogamous flowers usually from one member of each pair of lower branches (the other member elongated, leafy and following the branching pattern of the main stem), and (2) narrow terminal panicles 5-10 cm. long, of normal essentially sessile flowers, the larger branches being each subtended by a leaflike bract; normal flowers with calyx lobes 11-14 mm. long, densely glandular-pubescent without, eglandular-puberulent within; corolla bluish-purple, about 3 cm. long; cleistogamous fruits clavate, densely retrorse-puberulent and glandless below middle to spreading or ascending puberulent and increasingly glandular toward apex, 16-18 mm. long, 3.5 mm. thick, thickest above middle. In and along arroyos and draws, in depressions and on limestone hills in s.w. and s. Tex., Apr.-Nov.; also n.e. Mex.

7. *Ruellia Runyonii* Tharp & Barkl. Plant perennial by short rhizomes, herbaceous or often subligneous at the base, to 75 cm. high, the branches ascending; cleistogamous flowering branches often opposite leafy branches, glabrate to densely pilosulous; leaves with petioles to 3 cm. long, lanceolate to broadly lanceolate or narrowly oblong-ovate to spatulate, moderately thick, the margins more or less crisped and finely undulate-serrate, acute to obtuse at apex, cuneate and decurrent at base, 4-7 cm. long, 1.4-3 cm. broad, glabrate to densely pilosulous beneath, less so above, inflorescence (1) a narrow to ample terminal panicle, sometimes panicles in the axils of the uppermost leaves, branches erect-ascending, except uppermost branchlets, these sometimes divaricate, and (2) pedunculate lateral cymes of 1 to 3 cleistogamous flowers in the axils of most of the lower and middle leaves; cleistogamous flowers with calyx 9-13 mm. long, somewhat viscid, eglandular-pilosulous to sparsely glandular-pubescent, the lobes filiform; corolla less than 4 cm. long, 15 mm. thick, the lobes 1 cm. long and broad, broadly rounded; fruits about 12 mm. long and 4 mm. broad, oblanceolate in outline, eglandular-puberulent throughout; normal flowers deep bluish-purple; calyx lobes 9-18 mm. long, subulate-attenuate to filiform, rather densely short-stalked glandular-pubescent to pilosulous, viscid; corolla 3.5-4 cm. long, the tube about 1 cm. long, abruptly expanded into the throat; fruits of normal flowers 1.3-2 cm. long, 2.5-4.5 mm. broad, tapering at both ends, moderately to densely glandular-puberulent, sometimes slightly viscid, particularly on upper portion. In arroyos, canyons and woodlands, mesquite thickets, along streams and in moist grasslands on the Edwards Plateau and Rio Grande Plains and Valley, Feb.-July; also adj. Mex.

Those plants with stems and lower surface of leaves densely pilosulous, with calyx eglandular to glandular-pilosulous, and with fruits densely glandular-puberulent have been segregated as var. *Berlandieri* Tharp & Barkl.

8. *Ruellia yucatanica* (Leonard) Tharp & Barkl. Herbaceous perennial with clustered tough slender fibrous-fusiform roots; stems to 35 cm. tall, from a subligneous base, usually several, more or less densely glandular-pilosulous and viscid toward and especially in the inflorescence; basal leaves radially spreading, clustered from crowded nodes, with petioles rarely more than 25 mm. long, oblong-elliptic to spatulate, obtusely rounded to rarely acute at apex, to 13 cm. long and 8 cm. broad, cuneate at base, the margins finely crenate-serrate to subentire and somewhat crisped, more or less hirsutulous to glabrate; stem leaves similar to basal ones but usually smaller; cleistogamous cymes usually several-flowered; calyx lobes at anthesis 4-9 mm. long, filiform-subulate, moderately to densely white pilosulous-glandular with pale to yellowish-brown viscid glands; corolla 3-3.5 cm. long, about 12 mm. broad; normal flowers in open or somewhat congested terminal panicles, intermixed with a varying number of cleistogamous ones; calyx lobes 7-13 mm. long, linear-attenuate, densely pilosulous with spreading viscid gland-

tipped hairs; corolla lavender-blue, 3-4 cm. long, the tube 6-8 mm. long; capsules from cleistogamous flowers 1-1.4 cm. long, 3-3.5 mm. thick, moderately retrorse-puberulent except the apex which is spreading-glandular-pubescent; capsules from expanding flowers 15-17 mm. long, 3-3.5 mm. thick, rather densely retrorse-puberulent except at apex which has spreading sparsely glandular-pubescent; seeds light-yellowish-brown, orbicular, slightly plump, 2-2.5 mm. in diameter, pale to white-margined. In grasslands, caliche hills, chaparral and on the edge of dense woods in the Rio Grande Plains and Valley, Mar.-Oct.; also Mex.

9. *Ruellia Brittoniana* Leonard. Stems usually several, to 1 m. high, subligneous, angled to subterete, essentially glabrous, subcorymbosely branched at the summit; leaves with petioles 1-2 cm. long, linear to linear-lanceolate, to 27 cm. long and 2 cm. broad, lowermost leaves acute to subacute, the others acuminate, narrowly cuneate at the base, entire to undulate, glabrous except for cystoliths; flowering branches in the axils of the upper leaves, cymose, rarely equaling the subtending leaves and bearing 3 or more flowers; bracts linear; calyx lobes subrigid, narrowly lance-attenuate, glabrous or essentially so except for pale cystoliths, 5-10 mm. long; corolla lavender, 25-45 mm. long, the tube 8-12 mm. long, the limb 25-35 mm. broad; capsule glabrous, 2-2.5 cm. long, about 4 mm. wide; seed suborbicular, 2-2.5 mm. in diameter. Nat. in e. Mex., but widely cult. and naturalized in the s. U.S. from Fla. to Tex.

10. *Ruellia malacosperma* Greenm. Stems to 8 dm. high, subquadrangular, glabrous or sparingly pilose, cystoliths minute and numerous; leaves with sparingly long-pilose petioles to 2 cm. long, chiefly lanceolate, acute to acuminate at apex, narrowed at base and decurrent on the petiole, to 13 cm. long and 38 mm. wide, rather firm, entire or undulate, glabrous or the costa and basal margins bearing a few white spreading hairs; flowers borne on once- to twice-dichotomously branched peduncles to 8 cm. long, their branches 2-4 cm. long, all subquadrangular and glabrous, bearing conspicuous cystoliths, the ultimate forks flower-bearing; bracts linear, about 1 cm. long and 1.5 mm. wide at base or the uppermost smaller, all glabrous; calyx about 14 mm. long, divided nearly to the base, the segments subulate, gradually narrowed to tip and bearing minute scattered hairs on or near the margins, some of the hairs gland-tipped; corolla 4-5.5 cm. long, the tube 9-11 mm. long, minutely pubescent, mauve; capsule narrowly clavate, 2-2.5 cm. long, 8- to 20-seeded, glabrous or the apical calluses puberulous, brownish, the solid basal portion about 6 mm. long and 2 mm. broad, the seed-bearing portion 6 mm. broad; seed suborbicular, about 3 mm. in diameter, silky with white appressed hairs when dry but mucilaginous-pilose when moistened; retinacula 2 mm. long, slightly curved. In shady areas in s. Tex., May-Sept.; also n.e. Mex.

Probably introduced; perhaps a hybrid taxon involving *R. Brittoniana* and another species.

11. *Ruellia Parryi* Gray. Shrub to 4 dm. tall, usually profusely branched from root or from exposed rhizomes; stem often branched above, such branches more or less appressed; branches at first green, then white and in age gray, retrorsely hirsutulous, the internodes shorter than the leaves; leaves with petioles one fourth to one third as long as the blade, spatulate to obovate or lanceolate to oblanceolate, hirsutulous and ciliolate on the margin, rounded to acute at apex, cuneate at base, entire, 1-2 cm. long, to 13 mm. broad; peduncles solitary in the axils of the leaves, each bearing two leaflike bracts and a solitary flower; calyx lobes flat, lanceolate, abruptly acute, 7-10 mm. long, about 1 mm. wide, puberulent, the margins ciliolate; corolla pale-lavender, 3-3.5 cm. long, the slender tube about 15 mm. long, the limb 15-25 mm. broad; capsule brownish, glabrous, somewhat constricted at the base, about 1 cm. long and 3 mm. broad; seeds brownish, flat, ovate, about 3 mm. long and 1 mm. wide. On limestone hills and ledges along arroyos in the Trans-Pecos, Mar.-July; also s.e. N.M. and adj. Mex.

12. *Ruellia pinetorum* Fern. Stem slender, to 4 dm. high, minutely pilose in lines and puberulent with closely appressed hairs, simple or often with spreading branches, the internodes longer than the leaves; leaves sessile, ovate to oblong or elliptic-lanceolate, subcoriaceous, minutely puberulent in lines or glabrate, broadly cuneate at base, subacute at apex, the margins usually undulate, the basal leaves small, the principal leaves to 45 mm. long and 2 cm. wide; flowers solitary at the tips of 2-bracted peduncles or cymose with 2 to several flowers; peduncles usually straight, to 3 cm. long; bracts lanceolate, shorter than the calyx lobes; calyx lobes linear-filiform, 1.5-2 cm. long, less

than 1 mm. broad at base, tapering to very slender tips, glabrate except for closely appressed hairs or elongated cystoliths; corolla bluish-lavender, about 35 mm. long, the tube longer than the throat, the limb 2-3 cm. broad; capsule glabrous, to 16 mm. long; seeds orbicular, about 3 mm. in diameter. In low pine barrens and prairies in e. Tex., Feb.-July; from Fla. to Tex., n. to S.C.

13. *Ruellia pedunculata* Torr. Stem to 7 dm. high, slender, erect, more or less puberulent, the internodes usually long, simple but mostly with ascending to spreading branches; leaves short-petioled, ovate to ovate-oblong or lanceolate, acuminate or rarely subacute at apex, cuneate at the base and decurrent, entire to undulate, puberulent, the principal leaves to 11 cm. long and 45 mm. wide, the smaller lower leaves obtuse to subacute and soon deciduous; flowers solitary at the tips of simple 2-bracted peduncles or loosely cymose; peduncles straight to somewhat curved, to 7 cm. long; bracts smaller than (but similar in appearance to) the principal leaves; calyx lobes linear-filiform, 1-3 cm. long, less than 1 mm. broad at the base, tapering to very slender tips, pilose with very slender hairs; corolla violet to purple or sometimes paler, 35-55 mm. long, the tube about equal to the narrow throat in length, the limb 2-3 cm. broad; capsule brownish, hirsutulous, to 2 cm. long, about 5 mm. broad, constricted for about a third its length; seeds sub-orbicular, about 3 mm. in diameter. In open woods and along streams in e. Tex., Apr.-Aug.; from s. Ill., Mo. and Okla. to La. and Tex.

14. *Ruellia strepens* L. Stem to about 1 m. high, simple or with few ascending branches, minutely pilose to glabrous; principal leaves membranaceous, ovate, rounded or tapering to slender petioles at base, acuminate at apex, entire to barely undulate, to 18 cm. long and 9 cm. wide, short-strigillose to glabrous; peduncles borne from 1 to 3 median nodes, to 9 cm. long, terminated by 2 dilated leafy bracts that subtend 1 to 3 showy flowers; calyx segments lanceolate to linear-lanceolate, flat to tip, 2-4 mm. wide, villous-ciliate, villous to glabrate on back; corolla pale-blue-violet, broadly expanding, 3-6 cm. long, with broadly funnelform throat; capsule glabrous, 1-2 cm. long, usually overtopped by calyx segments. In rich woods, talus slopes and low woodlands, commonly in calcareous areas in e. and n.-cen. Tex., Apr.-May; from Tex. to S.C., n. to N.J., Pa., O., Ind., Ill., Mo. and Kan.

The var. *cleistantha* Gray has smaller cleistogamous flowers usually in cymose clusters and from several of the axils, and a peduncle lacking or shorter than that of var. *strepens*.

15. *Ruellia humilis* Nutt. Stem coarse to slender, usually erect or rarely decumbent at base, to 8 dm. high, in clusters from knotty shortened rhizomes, often strongly 4-angled, villous-hirsute with whitish hairs or glabrescent, usually with slender elongate arched-ascending to horizontally divergent or reclining branches; leaves of the main axis as many as 36, coriaceous, to 8 cm. long and 45 mm. wide; main leaves with petioles to 3 mm. long, ovate to lanceolate or broadly elliptic, subacute to acute or mostly obtuse or rounded at apex, truncate to broadly cuneate and decurrent at base, entire or slightly undulate, hirsute to villous or sometimes pilose-ciliate on margins; bracts lanceolate to linear-lanceolate or oblanceolate to elliptic; flowers usually few in the axils of the median and upper leaves, on very short peduncles; calyx lobes linear-attenuate, 15-25 mm. long, villous-hirsute and conspicuously ciliate; corolla lavender to light-blue, 3-7 cm. long, the tube to 45 mm. long, the limb mostly 2 to rarely 4 cm. broad, in cleistogamous flowers the reduced corolla is tubular and closed; capsule brownish, to 15 mm. long and 5 mm. broad, glabrous, constricted at base; seeds few, ovate to suborbicular, 3 mm. in diameter. *R. ciliosa* of auth. In open forests, savannahs and old fields, primarily in e. fourth of Tex., rare on Edwards Plateau and in the Panhandle, Apr.-Oct.; from Pa. and W.Va. to Mich., Ia. and Neb., s. to Fla. and Tex.

Those variations in this species that are considered to be distinctive and that have been named are segregated in the key. They are here given further consideration.

Var. *depauperata* Tharp & Barkl. is characterized by its weak filiform stems that are glabrescent to sparsely pilose, and its more or less oblanceolate sparsely pubescent to sparsely pilose leaves.

Var. *frondosa* Fern. has internodes strongly villous-hirsute, the large usually obtuse leaves of the primary axis ovate to oval-oblong or widely elliptic and 3.5-8 cm. and 2-4 cm. wide, the corolla 3-5 cm. long with the tube 1.2-3 cm. long.

Var. *longiflora* (Gray) Fern. with stems villous-hirsute; leaves copiously villous-hirsute

on veins and margins; larger leaves of the main axis elliptic-oblong to oblong-lanceolate, 3-6 cm. long, 1-2.5 cm. wide, obtuse to subacute at the apex; corolla 5-8 cm. long, its tube 3-5 cm. long.

Var. *expansa* Fern. with stems to 85 cm. high, the internodes strongly villous-hirsute; larger leaves of the principal axis ovate to oval-oblong or broadly elliptic, obtuse at apex, 3-7.5 cm. long, 2.5-4 cm. wide, ciliate-hirsute; corolla 5-8 cm. long, the tube 3-5 cm. long.

16. *Ruellia caroliniensis* (Walt.) Steud. Stem erect, simple to divergently or strictly branched, to 9 dm. high, canescent-pilose, villous, hirsute, puberulent or rarely glabrescent, the upper nodes greatly abbreviated and with crowded leaves and glomerules, the lower nodes elongate; lower leaves more or less obovate and rounded at apex; middle and upper leaves distinctly petioled, ovate to lanceolate, oval, elliptic or oblong, commonly strigose above, strigose, hispid, pilose or glabrescent beneath; glomerules very short-peduncled to sessile, mostly crowded at the 1 to 4 upper nodes; bracts linear to lanceolate or ovate to elliptic, narrow, nearly equaling or shorter than calyx; calyx lobes linear-setaceous, to 25 mm. long, usually strigose-ciliate; corolla lavender to lilac-blue, 2-5 cm. long, the slender tube to 27 mm. long, the limb 15-25 mm. broad; capsule brownish, glabrous to pilose or hirtellous, to 17 mm. long, constricted below; seeds orbicular to oval, about 3 mm. long. In pinelands, thickets and prairies in e. Tex., May-Oct.; from N.J. to O. and s. Ind., s. to Fla. and Tex.

Those variations in this species that are considered to be distinctive and that have been named are segregated in the key. They are here given further consideration.

Var. *semicalva* Fern. is similar to var. *caroliniensis* but the stems are scarcely villous-hirsute, the leaves are glabrescent to sparsely strigose beneath, and the capsules are frequently glabrous.

Var. *salicina* Fern. has simple to sparingly branched canescent-puberulent to subvillous stems to 7 dm. high; leaves of upper nodes narrowly lanceolate to linear-lanceolate, 2 cm. wide or less, glabrescent to sparsely strigose beneath; calyx segments canescent-pilose to glabrescent and ciliate; corolla 2-3 cm. long, with the throat above 5-10 mm. in diameter.

Var. *serrulata* Tharp & Barkl. has filiform stems with elongate internodes and narrow dentate leaves.

17. *Ruellia Drummondiana* (Nees) Gray. Plant perennial from a short subligneous rhizome, many-rooted from the nodes of the rhizome; stems to 75 cm. high, somewhat four-angled, puberulent and sparsely softly pilose, slender-branched, with petioles to 3 cm. long, ovate to ovate-elliptic, to 15 cm. long and 9 cm. wide, tapering to the obtuse to subacute apex, somewhat abruptly cuneate at base, undulate-margined, dark-green and sparsely appressed-pubescent above, pale-green and sparsely pilose beneath; glomerules lateral, usually short-peduncled, with two oval bracts whose blades are about 7 mm. long and 5 mm. broad; flowers 2 to 7; calyx lobes gradually tapering into subulate tips, 12-35 mm. long, those of some flowers much longer than in others, white-pilose-pubescent; corolla 32-42 mm. long, lavender; fruit short-pedicellate, about 1 cm. long and 4 mm. broad, minutely canescent, the style base tending to be persistent as a long point; seed with white appressed pilosity, 5 mm. in diameter. Among boulders on slopes along streams and in canyons in s.-cen. Tex., June-Oct.; endemic.

6. STENANDRIUM NEES

Small perennial caulescent or acaulescent herbs; leaves often radical; flowers borne in spikes that are sessile to subsessile or pedunculate or are borne on slender scapes; peduncles and scapes simple or branched; bracts ovate to lanceolate, herbaceous, entire or occasionally toothed; calyx segments 5, narrow, subequal, usually striate-nerved; corollas pink to white or purple, the slender tube cylindrical and more or less incurved and briefly ampliate at throat, the oblique limb spreading and 5-lobed, the obovate lobes rounded or retuse and imbricate; stamens 4, didynamous, affixed in the throat of the corolla tube, included, the free parts of filaments very short; anthers oblong, 1-celled, conniving or subcohering in pairs, sometimes barbellate at tip, mucous at base; style subclavate at apex, scarcely 2-lobed; ovules 2 in each cavity; capsules oblong to subfusiform, subterete; seeds 4 or fewer by abortion, plano-compressed, orbiculate, minutely hispid or muricate, subtended by rather long retinacula.

Approximately 30 species that are widely distributed throughout tropical and subtropical regions of America.

1. Stems well-developed; leaves sessile, oblanceolate to narrowly spatulate, decurrent at base, to 45 mm. long; plants conspicuously white-pilose 1. *S. barbatum*.
1. Stems none or (if present) short and inconspicuous; leaves petiolate, ovate, to 15 mm. long; lower surface of petioles green 2. *S. fascicularis*.

1. *Stenandrium barbatum* T.&G. Dwarf multicapital plants to 6 cm. high, with a stout woody underground stem; leaves oblanceolate to narrowly spatulate, to 45 mm. long and 7 mm. wide, obtuse to acute at apex, gradually narrowed to an indistinct petiole, entire, puberulent with straight stiff hairs and bearing additional segmented hairs to 2 mm. long; spike densely flowered, at first shorter than and later slightly exceeding the leaves, to 3 cm. long; bracts oblong-lanceolate, about 15 mm. long and 3 mm. wide or the uppermost narrower, acuminate, puberulent and pilose, the long hairs mostly near the margins; bractlets subulate, 2-3 mm. long, 1-nerved, tipped by a white hairlike point 1-1.5 mm. long, ciliolate; calyx 6 mm. long; calyx lobes lance-subulate, 3-5 mm. long, 3-nerved, ciliolate; corolla about 15 mm. long, purple, glabrous or bearing a few minute hairs near the base, the throat 5-6 mm. wide and bearded within, the tube 6 mm. long and 2.5 mm. broad at base (narrowed above to 1.5 mm.), the obovate lobes notched at apex; ovary and style glabrous, the style 5-6 mm. long, the stigma 2-lobed, funnelliform; capsule oblong, 12 mm. long, 4-5 mm. in diameter, blunt at tip, glabrous; seed brown, densely pilose. On limestone slopes and ridges, and in clay shales and rubble in the Trans-Pecos, Mar.-June; also in s.e. N.M. and n. Mex.

This species is well-marked by its multicapital habit, stout roots and shaggy white pubescence.

2. *Stenandrium fascicularis* (Benth.) Wasshausen. Rootstock to 3 cm. long, the roots thick-fibrous; stems very short or none; leaves with puberulent-pilose petioles to 15 mm. long, ovate, to 3 cm. long and 2 cm. wide, rounded or obtuse at apex, glabrous to puberulent or sparingly pilose on the lower surface; spikes ovate, 1-2 cm. long, 8-15 mm. broad; bracts lanceolate, 9-12 mm. long, 2.5-3 mm. wide, the tips of the lower ones acute to obtusish, the upper acuminate or cuspidate, all faintly 3-nerved, ciliate with spreading hairs to 1.5 mm. long; bractlets subulate, 4.5 mm. long, 0.5 mm. wide, sparingly ciliolate; pedicels to 4 cm. long but usually much shorter, puberulent; calyx segments lanceolate, about 1 cm. long, sparingly ciliolate at apex, papillose on margins near base; corolla purple, puberulent, 1-1.2 cm. long, the tube 5-6 mm. long and 2 mm. wide at base (narrowed to 1 mm. near throat), the limb 8-10 mm. broad; corolla lobes obovate, the posterior slightly smaller than the anterior, 3-5 mm. long, 2-4 mm. wide, rounded; ovary 1.5 mm. long, the style 6 mm. long, both glabrous; capsule about 9 mm. long, 2-3 mm. in diameter, somewhat blunt at tip, glabrous; seeds 3.5 mm. long, 2 mm. wide, appressed-pilose with whitish hairs. *S. floridanum* of auth., *S. dulce* of auth. Rare in moist soil, river bottoms, and beneath brush on clay dunes and deltas, Calhoun to Willacy Co., also Webb. Co. on the Rio Grande Plains, summer; in Fla., Tex. and cen. Mex.

7. CARLOWRIGHTIA GRAY

Plants suffrutescent or herbaceous, minutely cinereous-puberulent or glabrate, sometimes glandular; branchlets slender; leaves small, narrow and entire; flowers usually small, loosely spicate or racemose, often paniculate; calyx 5-parted or -cleft; corolla purple to cream-colored, the tube slender, the throat not dilated, the limb nearly equally 4-cleft; stamens 2, the anther cells equal, inserted at the same height; capsule stipitate, 4-seeded.

A genus of about 20 species, chiefly in Mexico and southwestern United States.

1. Leaves linear or nearly so; pubescence nonglandular ... 1. *C. linearifolia*.
1. Leaves lanceolate to broadly ovate (2)
- 2(1). Flowers chiefly in long naked spikes; leaves nearly sessile, 6 mm. wide or less ..
..... 5. *C. arizonica*.
2. Flowers axillary or in short spikes (3)

- 3(2). Leaf blades oblong to lanceolate, at least 4 times as long as wide
 2. *C. parviflora*.
 3. Leaf blades lance-oblong to broadly ovate, about 2 times as long as wide (4)
 4(3). Pubescence all or chiefly nonglandular 3. *C. Torreyana*.
 4. Pubescence chiefly of gland-tipped hairs 4. *C. serpyllifolia*.

1. *Carlowrightia linearifolia* (Torr.) Gray. Plants suffrutescent or herbaceous, to 12 dm. tall; stems slender, branching, ascending, minutely scaberulous; leaves attenuate to the sessile base, linear to filiform-linear, to 35 mm. long, short-acuminate, firm, scaberulous or minutely puberulous; flowers borne in axillary pairs and terminal panicles, the scaberulous peduncle to 24 cm. long; bracts 2, subulate, about 1 cm. long, scaberulous, the lower bracts foliaceous and intergrading with the leaves; bractlets 2, 1-1.5 mm. long, subulate; calyx deeply 5-parted, the lanceolate divisions similar to and equaling the bractlets, about 2 mm. long and 0.5 mm. wide, puberulous; corolla purple, to 14 mm. long, the oblong lobes twice the length of the tube; anthers sagittate, the cells at base very obtuse or retuse; filaments hirsute-puberulent; capsule 22 mm. long, glabrous or sparingly scaberulous, clavate, the stipe as long as the body of the capsule. In sandy-gravelly soils and among rocks and boulders on slopes, along arroyos and in canyons in the Trans-Pecos, May-Oct.; from Tex. to Ariz. and n. Mex.

2. *Carlowrightia parviflora* (Buckl.) Wasshausen. Plants suffrutescent, to 45 cm. tall; stems quadrangular, slender, branching, ascending, almost subglabrous, the young branches glandular-pubescent; leaves subsessile or with petioles to 5 mm. long, oblong to lanceolate, attenuate at apex, obtuse at base, to 1 dm. long and 11 mm. wide, the margins revolute, the upper leaf surface turning olive-green upon drying, cystoliths clearly visible on both surfaces; flowers borne in curved terminal opposite sessile short-interrupted spikes, glandular-pubescent; bracts 2, subulate, to 3 mm. long, glandular-puberulent; bractlets 2, about 1 mm. long, subulate; calyx deeply 5-parted, the long-subulate segments about 3 mm. long and 0.7 mm. wide, glandular-pubescent; corolla blue or white, to 8 mm. long, the subulate lobes acuminate, the tube narrow, twice as long as the calyx, puberulous; anthers sagittate, the cells at base very obtuse or retuse; filaments subglabrous to sparsely puberulent; capsule 5-11 mm. long, ovoid, acute, the stipe as long as the body, glabrous; seeds flat, roughened, 3 mm. broad, turning dark-brown upon drying. *Dianthera parviflora* (Buckl.) Gray. In gravelly or sandy-loamy soils in chaparral in the Rio Grande Plains, Feb.-June; also n. Mex.

3. *Carlowrightia Torreyana* Wasshausen. Plants perennial with a stout root, to 35 cm. tall; stems erect or diffuse, often numerous and tufted, simple or branched, glabrous to pilose; leaves ovate to oval or suborbicular, 1-3 cm. long and to 12 mm. wide, acute to short-acuminate at apex, more or less abruptly contracted into short petioles, undulate to repand, finely to densely pubescent; petioles slender, to 6 mm. long, glabrate to pilose, the hairs spreading; flowers sessile, borne in interrupted more or less curved spikes to 1 dm. long, the rachises glabrate to pubescent with the hairs appressed or curved; bracts 2, subulate, about 3 mm. long, puberulous; bractlets 2, subulate, about 2 mm. long; calyx deeply 5-parted, the linear-subulate lobes acuminate, 2.5-3 mm. long and 0.4 mm. wide, puberulous; corolla white to purple, about 8 mm. long, the lips about as long as the tube, the glabrous upper lip obtuse or retuse, the puberulous lobes of the lower lip oblong and obtuse; anthers sagittate, the cells at base very obtuse or retuse; filaments hirsute-puberulent; capsule 9-13 mm. long, ovoid, acute, the stipe shorter than the body; seeds flattish, 3 mm. broad, black, roughened, with crenate margin. *Croftia parvifolia* (Torr.) Small, *Dianthera parvifolia* (Torr.) Gray. On ledges and in gravelly-silty soils and among loose rocks on slopes, along creeks and in chaparral on the Edwards Plateau and in the Rio Grande Plains and Trans-Pecos, Apr.-July; also N.M. and Mex.

4. *Carlowrightia serpyllifolia* Gray. Plants suffrutescent, to 28 cm. tall, loosely branched, the branches whitish; stems erect, ascending, simple or branched, glabrous to sparsely pilose; leaves oblong-lanceolate to ovate, to 15 mm. long and 4 mm. wide, acute to short-acuminate at apex, attenuate at base and more or less contracted into a short petiole, glandular-puberulent; flowers borne axillary and in short curved spikes to 5 cm. long, the rachises densely glandular-puberulous with the hairs straight; bracts 2, subulate, about 2 mm. long, glandular-puberulous; bractlets 2, subulate, about 1.5 mm. long; calyx deeply 5-parted, the linear-subulate acuminate lobes 3-4 mm. long and 0.4 mm. wide,

glandular-puberulous; corolla purplish, deeply parted with the acute lobes to 7.5 mm. long and at least twice as long as the tube, sparingly and finely pubescent; anthers sagittate, about 1 mm. long; filaments glabrous, to 9 mm. long; capsule about 18 mm. long, the stipe equaling the body of the capsule; seeds dark, flattish, about 4 mm. broad, the margins dentate. On bluffs, cliffs and open rocky slopes among boulders in the Trans-Pecos, July-Sept.; also adj. Mex. and probably s.e. N.M.

5. *Carlowrightia arizonica* Gray. Low diffusely branched perennial with a woody base, 5 dm. high or less, the cinereous branches minutely puberulent; leaves short-petioled, oblong to linear-lanceolate, to 3 cm. long and 4 mm. wide, acuminate; flowers white to cream-colored or purple, sparsely spicate on filiform branchlets; bracts subulate, longer than the calyx, the bractlets minute or none; calyx deeply 5-cleft, the subulate lobes to 2 mm. long, puberulent; corolla to 15 mm. long, the narrowly oblong lobes twice the length of the narrow tube or the posterior lobe broader above with a yellow spot on the face, contracted below; stamens exerted; anthers sagittate, oblong, the cells at base very obtuse or retuse; filaments attached in throat of corolla tube, 6 mm. long, glabrous; capsule to 1 cm. long, ovoid, acute, the stipe usually slightly longer than the body of the capsule; seeds 4, with a cordate profile, about 2.5 mm. and 3 mm. wide, the tip acuminate, surface unevenly covered with sharp-pointed papillae. In rocky dry soil in the Trans-Pecos, Mar.-Sept.; from Tex. to Ariz. and n. Mex.

8. ANISACANTHUS NEES

Branched shrubs; stems stout or slender, with brown or gray bark exfoliating in thin strips; leaves opposite, petiolate or sessile, lanceolate to linear, punctate, with cystoliths common on the upper surface; inflorescence spicate to racemose or paniculate; flowers borne singly or several at a node, secund or opposite; bracts and bracteoles mostly triangular to linear, usually caducous, pubescent; calyx subequally 5-lobed, the lobes triangular to linear-acuminate, pubescent to glabrous; corolla usually red, mostly pilose, tubular to funnel-shaped, more or less arcuate, somewhat inflated at the base around the ovary, 2-lipped, usually recurved, the posterior lip entire or slightly emarginate, the anterior lip 3-lobed; stamens 2, epipetalous anteriorly, usually at the base of the central lobe and alternate with the corolla lobes; filaments more or less thick and fleshy, colored, glabrous; style filiform, glabrous, about as long as the corolla, the simple stigma 2-lobed; fruit a subpyriform capsule, slightly beaked, usually narrowed at the base to form a relatively distinct stipe, glabrous and shiny; seeds 2 to 4, discoid, more or less tuberculate, each supported by a curved retinaculum usually at about the same height in the body of the capsule.

A small genus of about 15 species in southwestern United States and Mexico.

1. Corolla 4-5 cm. long; calyx 6-10 mm. long, the lobes linear-ligulate, somewhat attenuate, separate almost to the base 1. *A. insignis*.
1. Corolla 3-4 cm. long; calyx mostly 5 mm. long, the lobes ovate to lanceolate, 2-3 mm. long, acute 2. *A. Wrightii*.

1. *Anisacanthus insignis* Gray. Slender vinelike shrub to 25 dm. high; stems pubescent in lines; lower leaves lanceolate to ovate, to 7 cm. long and 3 cm. broad, slightly acuminate; upper leaves and those of the flowering branches sessile, linear to linear-lanceolate, to 4 cm. long and 5 mm. broad, essentially glabrous; flowers borne in short racemose clusters in the axils of fallen leaves; bracts and bracteoles puberulent, sometimes glandular, obovate to elliptic or ovate, reduced from about 1 cm. to about 2 mm. in length; pedicels 3-8 mm. long, glandular; calyx 6-10 mm. long, stipitate-glandular, the linear-ligulate lobes separate almost to the base and somewhat attenuate; corolla mostly 5 cm. long, curved, slightly infundibuliform, the linear lobes recurved and longer than the tube; stamens alternate, inserted at the base of the central anterior lobe; anthers 4 mm. long, the parallel anther sacs slightly oblique; disk at base of ovary about 1 mm. high; capsule 2 cm. long, stipe as long as or longer than the body; seeds 4, sometimes 1 or 2 aborted, about 5 mm. in diameter, slightly obliquely discoid, brown, more or less tuberculate. In canyons and arroyos in the Trans-Pecos, June-Nov., also n. Mex.

2. *Anisacanthus Wrightii* (Torr.) Gray. Shrubs, to about 1 m. high, the young branches dull-green and pubescent in 2 lines; lower leaves with pilose petioles to 1 cm. long,

lanceolate, to 5 cm. long and 2 cm. broad, hispid to glabrate; flowers usually borne singly or in pairs in second terminal spicate inflorescences, subsessile to short-pedicellate; bracts and bracteoles lanceolate, acuminate, 2-5 mm. long, puberulent; calyx about 5 mm. long, puberulent, glandular; calyx lobes ovate to lanceolate, acute, 2-3 mm. long, with few scattered hairs along margin and at tip; corolla 3-4 cm. long, the lobes narrowly ovate and obtuse, posterior lobe slightly emarginate, the nearly straight slender tube scarcely dilated at the throat and longer than the lobes; stamens epipetalous, inserted near sinuses of the central anterior lobe, the filaments about 1 cm. long; anthers 3 mm. long, the anther sacs connected nearly half their length from the tips; ovary extending about 2 mm. above the disk; capsule about 15 mm. long, the body about 6 mm. thick and shorter than the stipe; seeds 2, rarely 4, about 5 mm. in diameter. On rocky banks and floodplains of streams on the Edwards Plateau, June-July; also n. Mex.

9. TETRIMERIUM NEES

Fruticose or suffruticose plants; stems usually much-branched, the pubescence often disposed in 2 opposite lateral lines; leaves sessile or petioled, linear to ovate, entire, glabrous or pubescent; flowers borne in terminal or axillary 4-angled spikes; bracts conspicuous, usually closely imbricate, opposite, ciliate, cuspidate at tip; calyx 4- or 5-parted, the segments ciliate; corolla infundibuliform to tubular, the tube straight or slightly curved, the upper lip entire or emarginate, the lower lip 3-lobed with the lobes nearly equal; stamens 2, included, the anther sacs slightly converging toward the apex with one a little longer than the other; capsule obovate, apiculate, contracted below into a solid base, usually hispid and 4-seeded (sometimes 2-seeded); seeds flattened, tuberculate or muriculate.

About 25 species from the southern United States to Colombia and Ecuador.

1. Bracts hirsute-pubescent, strongly 3- to 5-nerved, spinulose-pointed, hispid 1. *T. hispidum*.
1. Bracts scabrous-puberulent, not at all hirsute, lightly 3- to 5-nerved and veiny 2. *T. platystegium*.

1. *Tetramerium hispidum* Nees. Suffruticose plant, decumbent to ascending, to 1 m. high; stems several, freely branched, slender, at first evenly hispid (later pubescent in lines) to glabrate; leaves with pubescent to glabrate petioles to 1 cm. long, lanceolate to lanceolate-ovate, occasionally ovate, to 5 cm. long and 25 mm. broad, usually acuminate to acute at the apex, cuneate to rarely subcordate at the base, at first scattered-pubescent on both surfaces but more conspicuously so on the midrib and nerves, later glabrate; inflorescences more or less loosely spicate, the spikes 1-5 cm. long; bracts lanceolate to lanceolate-ovate or occasionally ovate, acuminate to acute or occasionally obtusish at the apex, contracted below the middle to a subpetiolate base, 3- to 5-nerved, scattered-hispid on the outer surface but more conspicuously so on the nerves, hispid-ciliate, usually conspicuously recurved near the apex with a mucro 0.5-0.8 mm. long; bracteoles 1 to 5, linear-lanceolate, 1-3 mm. long, hispidulous; calyx lobes 4, linear-lanceolate, hispidulous; corolla 9-11 mm. long; middle lobe of the anterior lip oblong-obovate, about 5 mm. long and 1.3 mm. broad, obtusish at the apex, concave; lateral lobes of the anterior lip ovate-oblong, about 5 mm. long and 2 mm. broad; posterior lip obovate, about 5 mm. long and 2 mm. broad, subemarginate; capsules 4-5 mm. long, about 2 mm. broad, pubescent near the apex, the constricted base about 1.5 mm. long; seeds 4, 1.3 × 1.2 mm. On rocky walls of canyons in the Trans-Pecos, May-Sept.; also s. Ariz. and Mex.

2. *Tetramerium platystegium* Torr. Stems freely branched, slender, at first evenly short-hispid-pubescent, later pubescent in lines or glabrous; leaves with hispid to glabrous petioles about 1.5 mm. long, elliptic-lanceolate to elliptic-linear, to 5 cm. long and 12 mm. broad, acutish to obtuse at apex, cuneate at the base, sparsely hispid to glabrous on both surfaces but more conspicuously so on the midrib and nerves; inflorescences more or less loosely imbricated, the spikes 1-4 cm. long, the internodes 3-5 mm. long; bracts erect, ovate, acute at apex, mucronate, cordate at base, 1-2 cm. long, 8-15 mm. broad, inconspicuously hispidulous sparingly intermixed with minute gland-tipped hairs; calyx lobes 5, lanceolate, 2-3 mm. long, hispidulous; corolla 18-25 mm. long, the tube 1.3-1.8

mm. long; middle lobe of the anterior lip elliptic-ovate, 6-7 mm. long, about 3 mm. broad; lateral lobes of the anterior lip elliptic-ovate, 6-7 mm. long, 3 mm. broad; posterior lip elliptic-ovate, 6-7 mm. long, 2-2.5 mm. broad, emarginate; stigma exserted; capsule about 8 mm. long and 4 mm. broad, the constricted base 2 mm. long; seeds 2, muriculate, 3.2 × 3 mm. In the Rio Grande Plains and Edwards Plateau, summer; ? endemic.

10. DICLIPTERA Juss.

Stems more or less hexagonal in cross section; leaves petioled, mostly ovate, entire or undulate; flowers 1 to several, borne in often contracted cymes that form spikes or panicles subtended by an involucre of 2 to 4 pairs of conspicuous bracts; calyx 5-parted, hyaline; corolla narrow, slightly ampliate, the limb 2-lipped; stamens 2, the anther sacs often unequal with the longer one sometimes calcarate at base; staminodes none; capsules ovoid or subglobose, the placentae separating elastically from their walls and rupturing on dehiscence; seeds 2 or 4.

About 150 species in tropical and temperate regions of the world. The species are easily recognized by their hexagonal stems and flattened bracted reduced cymes.

1. Outer bracts obovate, 2 or less times longer than wide
 1. *D. brachiata*.
 1. Outer bracts oblong-spatulate, 3 times longer than wide
 2. *D. Vahliana*.

1. *Dicliptera brachiata* (Pursh) Spreng. Herb to 7 dm. high; stems erect or ascending, rather slender, with numerous spreading branches, from almost glabrous to pilose-pubescent, rarely spreading-villous or hirsute; leaves oblong-ovate to ovate-lanceolate, to 1 dm. long and 5 cm. wide, membranaceous, mostly acuminate at apex, narrowed at base and decurrent on a slender petiole to 3 cm. long, glabrous to pilose-pubescent; flowers clustered in the axils and more or less paniculate, short-peduncled to sessile; branches of the panicle subtended by leaves similar to but smaller than those of the main stem; bracts varying from broadly obovate to spatulate-oblong, to 7 mm. long and 4 mm. wide near the middle, rounded at summit, narrowed at base; calyx subhyaline, 3-3.5 mm. long, campanulate, papular-puberulous or glabrous toward base; corolla purple or flesh-colored, finely pubescent, 1.5-2 cm. long; stamens partly enclosed by the upper lip of the corolla and reaching to its apex, the filaments glabrous to minutely pilose toward base; capsule ovoid, 5-6 mm. long, the solid stipitate basal portion 1 mm. long, the tip of the capsule emarginate and apiculate, the surface of capsule ciliate toward apex, sparsely pilose elsewhere; seeds brown, oval, flattened, about 2 mm. long and broad, essentially glabrous. Incl. var. *glandulosa* (Scheele) Fern. and var. *Ruthii* Fern., *Diapedium brachiatum* (Pursh) O. Ktze. In shady and moist places mostly in cen. and s. Tex., July-Oct.; from Fla. to Tex., n. to Va., Ind. and Mo.

2. *Dicliptera Vahliana* Nees. Herb to 1 m. high; stems erect or ascending, thinly puberulous, the papular hairs interspersed with scattered amber or whitish disk-tipped ones; leaves with petioles 1-1.5 cm. long, oblong-lanceolate, to 5 cm. long and 2 cm. wide or the lowermost larger, obtuse to short-acuminate at tip, apiculate, narrowed at base and decurrent on the petiole, essentially glabrous; flowers usually solitary, subtended by a pair of oblong-spatulate bracts 1.5 mm. long and 0.75 mm. wide at base, more or less secund in lax spikes, these forming large much-branched panicles, the branches of the panicle subtended by leaves similar to those of the main stem but smaller, innermost bracts lanceolate, 2.5-3 mm. long, acuminate, densely papular-puberulous; calyx subhyaline, 2.5 mm. long, campanulate, the triangular segments about 1 mm. and papular-puberulous or glabrous toward base; corolla red, finely pubescent, 28 mm. long; stamens partly enclosed by the upper lip of the corolla and reaching to its apex, the filaments minutely pilose toward base; anthers 2.5 mm. long and 1.5 mm. broad, bearing a few minute marginal hairs; capsules ovoid, 5-6 mm. at tip, the solid stipitate basal portion 2 mm. long, the tip of the capsule emarginate and apiculate, the entire surface except the basal portion rather densely retrorsely pubescent; seeds light-brown, oval, flattened, about 2 mm. long and broad, sparingly puberulous, the hairs papular and retrorsely barbed. Rare in the lower Rio Grande Valley; in s. U.S. to n. S.A. and the W.I.

11. SIPHONOGLOSSA OERST.

TUBE-TONGUE

Shrubs or suffrutescent herbs; bracts none; bractlets small; leaf blades entire; flowers sessile, solitary or few, borne in the axils of the uppermost leaves or occasionally on short peduncles; calyx segments 4, narrow, short-acuminate; corollas white, blue or purple, the slender elongated tube terete, the limb 2-lipped, the upper lip entire or 2-lobed, the lower lip 3-lobed and spreading; stamens 2, adnate to the mouth of the corolla tube, included or exerted but not reaching beyond the upper lip of the corolla; anthers 2-celled, the cells more or less superposed; staminodes none; stigmas slightly 2-lobed; capsules clavate, usually 4-seeded.

A small genus of tropical and subtropical plants consisting of about 15 species, ranging from the southern United States to northern South America; also tropical and South Africa.

1. Stems with spreading evenly scattered hairs 1. *S. pilosella*.

1. Stems with reflexed hairs disposed in decussating lines . 2. *S. Greggii*.

1. *Siphonoglossa pilosella* (Nees) Torr. Plants low, branching from a suffrutescent base, to 3 dm. high; stems hirsute with scattered spreading hairs; leaves subsessile, ovate to oval, to 4 cm. long and 2 cm. wide, subacute at apex, the upper surface glabrous or sparingly hirtellous below; flowers one to several, solitary in the axils of the uppermost leaves or terminating densely hirtellous axillary peduncles to 4 mm. long; bractlets subtending the calyx to 2.5 mm. long, hirtellous, the segments gradually narrowed to a slender tip; corollas lavender, to 28 mm. long, hirtellous; corolla tube cylindrical, 2 mm. in diameter at base, reduced to 1 mm. at 4 mm. above base, thence gradually enlarged to 2.5 mm. at mouth; upper corolla lip ovate, about 1 cm. long and 2.5 mm. wide near base; lower corolla lip 3-parted, the elliptic lobes about 8 mm. long and 3 mm. wide; stamens inserted near the mouth of the corolla tube; filaments 5 mm. long, glabrous; anthers 1.5 mm. long, their lobes more or less superposed; style about 15 mm. long, glabrous, the stigma linear-lanceolate; capsule clavate, 8-9 mm. long, 3 mm. broad, about 3 mm. thick, glabrous, narrowed to a blunt tip, the solid basal stipe about 3 mm. long; seeds 4, about 3 mm. in diameter, somewhat flattened, tuberculate. *S. dipteracantha* (Nees) Heller. In rocky and gravelly soils in chaparral on hills, banks and along streams in the s. two thirds of Tex., Apr.-Oct.; also adj. Mex.

2. *Siphonoglossa Greggii* Greenm. & Thomps. Plants with suffrutescent base, to 2 dm. high; stems erect or ascending, subcylindrical and often quadrangular, pubescence of reflexed hairs disposed in decussating lines; leaves opposite, short-petioled, lanceolate to obovate, to 25 mm. long and 7 mm. wide, acute to obtuse or rounded at apex, entire at base, gradually narrowing, glabrous above, somewhat paler when young, the nerves and veins appressed-puberulent; upper flowers axillary, solitary, sessile, the bracts subspatulate; calyx deeply 5-parted, 4 mm. long; calyx lobes linear to lanceolate, glabrous; corolla white, lavender, 1.5-2 cm. long, bilabiate; lower corolla lip horizontal, spreading, trilobate; upper corolla lip suberect, notched; corolla tube slender, 9-14 mm. long, exterior pubescent; ovary and style glabrous; capsule about 7 mm. long, smooth; seeds suborbicular and compressed, the surface warted, approximately 2 mm. in diameter. In chaparral, on the edge of thickets and along streams in the Rio Grande Plains and Valley of s. Tex., Mar.-Oct.; also adj. Mex.

12. YEATESIA SMALL

A monotypic genus.

1. *Yeatesia viridiflora* (Nees) Small. Perennial to 6 dm. high, puberulent to almost glabrous; stem erect, simple or branched, slightly glaucous, when dry with a contracted ring above each node as if articulated; leaves large, to 12.5 cm. long and 5 cm. wide, bright-green, membranaceous, ovate-lanceolate to oval, acuminate at apex, gradually tapering into a short petiole, glabrous on lower surface, slightly hairy above; flowers numerous, axillary and terminal, in oblong and somewhat strobilaceous usually short-peduncled cylindrical compact spikes; bracts oval to obovate, with a narrowed base, about 15 mm. long, mucronate, hirsute-ciliate; bractlets similar to bracts but smaller,

about half the length of the capsule; calyx sessile, somewhat glumaceous, deeply 5-parted; calyx lobes setaceous-subulate, sparingly hirsute-ciliate, the innermost smaller; corolla white to flesh-colored, 3- or 4-toothed, almost salverform, about 15 mm. long, the spreading lobes about 5 mm. long; stamens 2, with oblong contiguous and similar anther cells that are mucicous, with rarely one or both mucronate at base; filaments slender, inserted and included within the tube of the corolla; capsule clavate-oblong, firm-coriaceous, 4-seeded, the body longer than the stipelike base; seeds glabrous, minutely rugulose. *Gatesia laetevirens* (Buckl.) Gray. In pinewoods, gulf prairies and marshes of e. Tex., July-Oct.; from Fla. to Tex., n. to Ga. and Tenn.

13. JUSTICIA L.

Herbs or shrubs; leaves opposite, petiolate, entire; flowers solitary or in spikes or panicles; bracts various, small, linear to subulate, distant, conspicuous and imbricate; calyx segments 5 or (in some species) 4, usually narrow and nearly equal; corollas usually white, pink or purple, sometimes with purple or white markings in throat, the tube usually rather narrow, the limb 2-lipped, the upper lip 2-lobed, the lower lip 3-lobed; stamens 2, often slightly exerted but usually not exceeding the corolla lips; anther cells 2, more or less superposed, one or both cells apiculate or tailed, the connective narrow to broad, the lobes parallel or obliquely affixed; capsules clavate, 4-seeded.

About 300 species, mostly tropical.

1. Flowers borne on long sterile peduncles (2)
1. Flowers borne in the leaf axils (3)
- 2(1). Flowers capitate, the heads dense, at length oblong 1. *J. americana*.
2. Flowers in spikes, lax on one side 2. *J. lanceolata*.
- 3(1). Flowers clustered in upper leaf axils; corolla nearly or quite 25 mm. long; roots diffusely branched 3. *J. Runyonii*.
3. Flowers borne sessile and solitary; corolla less than 10 mm. long; rootstock thick, ligneous (4)
- 4(3). Leaves slender or acicular, 3-15 mm. long, 1 mm. or less wide 4. *J. Warnockii*.
4. Leaves obovate, the upper ones linear-lanceolate, less than 12 mm. long, more than 1 mm. wide 5. *J. Wrightii*.

1. *Justicia americana* (L.) Vahl. AMERICAN WATER-WILLOW. Perennial glabrous plant, colonial by rhizomes, to 1 m. high; stem erect, sulcate-angled, slender, usually simple, often rooting below; leaves linear to lanceolate or narrowly oblong, gradually acuminate, narrowed at base into short petioles or sessile, to 16 cm. long and 25 mm. wide; flowers borne in capitate spikes to 3 cm. long at ends of slender axillary stiffly ascending peduncles that are to 15 cm. long; calyx 5-parted, longer than the internodes above it; calyx lobes linear-subulate, about 7 mm. long; corolla violet or nearly white, 1-1.2 cm. long, its tube shorter than the lips, the base of the lower lip rough and palatellike, marked with purple dots; stamens 2, the glabrous filaments attached at tip of corolla tube and 6 mm. long; anther cells separating and somewhat unequal, the terminal anther sac transverse; capsule about 12 mm. long, exceeding the calyx, its stipe about the length of the slightly compressed body; seeds 4, densely verrucose, 3 mm. long, 2 mm. wide. *Dianthera americana* L. and var. *subcoriacea* (Fern.) Shinners. In shallow water and mud in e. and s.e. Tex., also on the Edwards Plateau and in n.-cen. Tex., Apr.-Sept.; from Ga. to Tex., n. to Que., Vt., N.Y., Ont., Wisc., Mo. and Kan.

2. *Justicia lanceolata* (Chapm.) Small. LANCE-LEAVED WATER-WILLOW. Perennial herb to 3 dm. high; stems erect or spreading, more or less branched; leaves sessile or nearly so, linear to linear-elliptic or elliptic-lanceolate, somewhat acuminate, minutely puberulent, to 1 dm. long and 3 cm. wide; peduncles often branching, longer than the leaves; spikes slender, 3-10 cm. long, the numerous flowers scattered singly and quite evenly along one side; calyx segments narrowly linear, 5-7 mm. long and less than 1 mm. wide; corolla about 1 cm. long, lips nearly as long as the tube which is saccate near the base,

the upper lip truncate or retuse, the lower lip 3-lobed with middle lobe truncate or retuse and the lateral lobe obtuse; stamens slightly exerted, the glabrous filaments attached about midway in the tube and 3-4 mm. long; anther cells unequal, the upper lobe 0.8 mm. long, the lower lobe 1 mm. long and apiculate, the connective broad; ovary 1.5 mm. long, 2-celled, glabrous, ovules 2 in each cell; style 1 cm. long, puberulent at base, the small stigma 2-cleft; capsule 1-1.5 cm. long, the body as long as the stipelike base or shorter; seeds 4, disklike, 2 cm. in diameter, with thickened margins and smooth surface. *Dianthera lanceolata* (Chapm.) Small. In wet and swampy grounds in s.e. Tex., Mar.-June; from Fla. to Tex., n. to Va.

3. *Justicia Runyonii* Small. Plant woody, often with two or more stems from the top of diffusely branched roots; stems lax, irregularly spreading or reclining and ultimately prostrate, sometimes rooting at the nodes, irregularly and sparingly branched, slightly enlarged at the nodes, the internodes bright-green, very minutely pubescent; leaves more or less reflexed, lanceolate to linear-lanceolate or almost linear at the ends of the branches, somewhat cuneately narrowed into petiolelike bases, to 11.5 cm. long, acuminate at apex, minutely pubescent near the edges and on veins, dark-green above, pale-green beneath, veins rather prominent on both sides; flowers clustered in upper leaf axils, subtended by narrow ciliate bracts and bractlets that are less than 13 mm. long; sepals acuminate, about 1 cm. long, green and finely pubescent on the back, with the white margins ciliate; corolla reddish-purple and striped, about 25 mm. long, narrowed upward to a notched and 2-lobed apex, with sheathlike fold (including the style) running from a hairy orifice near base of tube up to apex; upper corolla lip minutely glandular-pubescent without and with revolute margins; lower corolla lip with thin broad rounded lobes above saccate lower part of tube, the lateral lobes plain reddish-violet, the middle lobe with deep white fold, with white forking out into purple ground-color; stamens arched up into the upper corolla lip, the curved filaments somewhat flattened and slightly enlarged near middle; anther sacs unequally attached to filament connective; ovary conic-cylindric, seated in cuplike disk, green; style filiform, curved, white, the wide stigma obscurely two-lobed; capsule stout-clavate, about 17 mm. long, puberulent, whitish, the body green, acute at tip, the stipe stout; seeds globose-reniform, black-shining, about 4 mm. long. In the s. Rio Grande Plains, June-Aug.; also Tam.

4. *Justicia Warnockii* B. L. Turner. Low much-branched glabrous shrubby perennial to about 4 dm. high, the main stem to 6 mm. thick and covered with gray bark; ultimate branches yellow-green, very slender and crowded, broomlike; leaves very slender or acicular, to 15 mm. long and 1 mm. wide; flowers few, solitary and sessile in the leaf axils or terminating the slender branches; bracts 3-4 mm. long, linear to almost filiform, exceeding the calyx; calyx 2.5-3 mm. long, 5-parted, the subulate lobes 2-2.5 mm. long; corolla fugacious, 2-lipped, lavender with purplish blotches in two rows in the throat (these extending on the lobes), 7.5-9 mm. long, the tube about 5 mm. long, 4-lobed; upper corolla lobe broad and straight, 2.5-2.7 mm. long, 1.3-2 mm. wide, notched at apex; lateral lobes of lower lip elliptic, 2.3 mm. long by 1.2 mm. wide, the concave central lobe 2 mm. long by 3 mm. wide; stamens slightly exerted; filaments attached about midway in the tube, 1.5-2 mm. long, glabrous; anther cells unequal, the upper cell 0.6 mm. long, the lower cell 0.7 mm. long with a curved tail, both cells calcarate and joined by a broad connective; ovary 1 mm. long, 2-celled, glabrous; ovules 2 in each cell; style 5.3 mm. long; stigma small, 2-cleft, reflexed; capsule glabrous, 7.5-8 mm. long, with a stipe 3-3.2 mm. long; seeds 4, muriculate, oval to elliptic, 2.6 mm. long by 2.4 mm. wide. In mts. and canyons of the Trans-Pecos, May-Oct.; endemic.

5. *Justicia Wrightii* Gray. Low much-branched perennial, to 2 dm. high; stems erect, ascending from a suffrutescent base, cinereous-puberulent; leaves rigid, sessile, less than 12 mm. long and 3 mm. wide, the lowest obovate, the upper linear-lanceolate, mucronate-acute at apex; flowers solitary and sessile in the upper axils; bracts similar to the subtending leaves; calyx small, 5-parted, the puberulous lobes 3-4 mm. long; corolla purplish, 8 mm. long, somewhat campanulate, with a short tube and rather ampliate throat seldom longer than the limb, upper lip with a broad emargination and two short narrow lobes, lower lip larger with oval-obovate lobes; stamens slightly exerted; filaments attached at tip of tube, about 2 mm. long, glabrous; anther cells oblique and disjointed, lower anther cell abruptly short-spurred, upper cell smaller and mucronate at base; ovules 4; capsule glabrous, to 8 mm. long, with a stipe 2 mm. long; seeds 4, mucronate, oval to elliptic,

2.5 mm. long by 3 mm. wide, puberulent. On the w. edge of the Edwards Plateau, Apr.-May.; endemic.

FAM. 166. PHRYMACEAE SCHAUER¹⁸⁴ LOPSEED FAMILY

Perennial herbs with slender simple or rarely branching stems and coarsely crenate-serrate opposite leaves; flowers opposite in slender, elongate long-pedunculate terminal spikes, each subtended by 3 subulate bracts, strictly reflexed in fruit; calyx cylindrical, 2-lipped, the upper lip composed of 3 reddish-brown bristly-subulate teeth, the lower lip much-abbreviated and 2-toothed; corolla 2-lipped, the upper lip notched, the lower lip much larger and 3-lobed; stamens 4, included, didynamous; style slender, the stigma 2-lobed; fruit achenelike, dry, ellipsoid, 1-celled and 1-seeded; seeds orthotropous, filling the fruit.

Only one genus known.

1. PHRYMA L. LOPSEED

Characters of the family. Composed of our species and 2 others in eastern Asia.

1. *Phryma leptostachya* L. Plant with a cluster of fleshy roots, erect, to 9 dm. tall, usually much smaller, glabrous to sparsely cinereous-pilose, the internodes irregular in length; petioles varying from up to 5 cm. long for the lowermost leaves to essentially lacking for the upper leaves; leaf blades thin, bright green on upper surface, paler on lower surface, triangular-ovate to broadly elliptic-lanceolate, truncate to broadly cuneate at base, bluntly acute to long-acuminate at apex, to 15 cm. long and 8 cm. wide, the margins often doubly serrate; calyx 5-7 mm. long, strongly ribbed, closed in fruit, the teeth hooked at the tip; corolla purplish or rose-color, scarcely exceeding the calyx; seed brownish, about 4 mm. long. In open woodlands and thickets in e. Tex., May-June; from w. N.B., w. to Man., s. to Fla. and Tex.

FAM. 167. PLANTAGINACEAE JUSS.¹⁸⁵ PLANTAIN FAMILY

Annual or perennial scapose herbs without or with an abbreviated stem; leaves all basal or nearly so; flowers small, perfect or unisexual, hypogynous, regular or slightly irregular in the calyx, in long-peduncled bracted terminal spikes; calyx and corolla 4-divided or -lobed, persistent, usually scarious or scarious-margined; stamens 4 or 2, distinct, inserted on the corolla tube; style filiform, stigmatic for most of its length; ovary superior, 2- to 4-celled; fruit a capsule, 1 to few seeds per cell.

A family of 3 genera and about 270 species, cosmopolitan in distribution.

1. PLANTAGO L. PLANTAIN

Flowers in spikes or heads, each sessile or subsessile in the axil of a bract; sepals 4, the 2 next to the bract often somewhat different from the 2 next to the axis; corolla salverform, long-persistent after anthesis, its tube covering the summit of the capsule, its lobes reflexed and spreading or erect and connivent; capsule circumscissile at or below the middle.

More than 250 species, widely distributed.

1. Bracts scarious except at base and in center, ovate and abruptly narrowed into a long scarious tip 9. *P. lanceolata*.
1. Bracts scarious-margined or wholly herbaceous, without slender scarious tips (2)

¹⁸⁴ Contributed by Helen B. Correll.

¹⁸⁵ Contributed by Helen B. Correll; key to species adapted from Lloyd H. Shinnars in Field & Lab. 18:113-114. 1950.

- 2(1). Sepals and bracts glabrous; spikes 2-4 mm. thick in flower (3)
2. Sepals and bracts pubescent or villous; spikes 3.5-12 mm. thick in flower (4)
- 3(2). Leaf blades elliptic to ovate, more than 1.5 cm. wide; stamens 4 1. *P. major*.
3. Leaf blades linear to narrowly oblanceolate, less than 1.5 cm. wide; stamens 2 (13)
- 4(2). Hairs on upper part of scape spreading at right angles (5)
4. Hairs on upper part of scape usually closely ascending or appressed (8)
- 5(4). Bracts at base of spike keeled and clasping; corolla lobes erect and folded together after as well as before flowering (6)
5. Bracts at base of spike not keeled nor clasping; corolla lobes spreading or reflexed after flowering (7)
- 6(5). Bracts 1-2.5 mm. long; corolla lobes 0.8-2.3 mm. long; mature seeds oblong, 1.25-1.75 mm. long by 0.7-0.8 mm. wide, yellow-brown to black, deeply grooved ventrally, not transparent-margined; distribution mainly in east Texas 2. *P. virginica*.
6. Bracts 3-4.5 mm. long; corolla lobes 2-3 mm. long; mature seeds oval or oblong-oval, 2.4-2.8 mm. long by 1.3-1.8 mm. wide, bright-red to reddish-black, shallowly concave ventrally, with pronounced transparent margin; distribution mainly west of Blackland Prairies 3. *P. rhodosperma*.
- 7(5). Corolla lobes 1-2 mm. long; bracts rigid, scarious with green or purple midrib; spike 6-8 mm. thick 4. *P. insularis*.
7. Corolla lobes 3-4 mm. long; bracts linear-subulate; spike 8-12 mm. thick 10. *P. Helli*.
- 8(4). Bracts triangular-ovate, broadly scarious-margined except at apex (each margin one fourth to one third entire width of bract) (9)
8. Bracts narrowly triangular-lanceolate to lance-linear, narrowly scarious-margined near base, otherwise herbaceous (10)
- 9(8). Leaves woolly-pubescent on both surfaces; corolla lobes suborbicular, 2 by 2 mm. or 2.2 by 2 mm., measuring length in center of lobe 5. *P. Hookeriana*.
9. Leaves glabrous on the upper surface, thinly pubescent on the lower; corolla lobes cordate-ovate, about 0.5 mm. longer than wide, 2 by 2.5 mm. to 2.5 by 3 mm. 6. *P. Wrightiana*.
- 10(8). Leaves glabrous on the upper surface; bracts in middle of spike 3 to 6 times as long as the calyces 7. *P. aristata*.
10. Leaves rather densely pubescent on the upper surface; bracts in middle of spike shorter than or up to 4 times as long as the calyces (11)
- 11(10). Scapes 1.3-6.5 cm. long; spikes 2-10 cm. long when half or more of the flowers have opened; most of the scapes shorter than their spikes (a few may be as long or slightly longer) 8. *P. patagonica* var. *breviscapa*.
11. Scapes 6-26 cm. long; spikes 2-11 cm. long when half or more of the flowers have opened; most of the scapes longer than their spikes (a few may be as long or slightly shorter) (12)
- 12(11). Bracts in the lower part of spike shorter or slightly longer than the calyces 8. *P. patagonica* var. *gnaphalioides*.
12. Bracts in the lower part of spike 2 to 4 times as long as the calyces 8. *P. patagonica* var. *spinulosa*.
- 13(3). Corolla lobes erect in age; capsule about twice as long as the calyx; seeds 10 to 30, somewhat asymmetrical 11. *P. hybrida*.
13. Corolla lobes becoming reflexed in age; capsule slightly surpassing the calyx; seeds (2 to) 4 (to 8), symmetrical 12. *P. elongata*.

1. *Plantago major* L. COMMON PLANTAIN, LANTEN. Glabrous or more or less sparsely pubescent stout perennial; leaves thickish, strongly ribbed, spreading, ovate to broadly elliptic, rounded at apex, broadly cuneate to subcordate at base, to 3 dm. long (including the broad channeled petiole), undulate to sinuate-dentate or angular-toothed; scapes curved-ascending or sometimes decumbent, commonly shorter than the leaves; spike dense, to about 2 dm. long and 8 mm. thick; bracts ovate, acute, shorter than to rarely longer than calyx, brownish with a slender green keel; calyx lobes broadly ovate to elliptic, 1.5-2 mm. long; corolla lobes 1-1.5 mm. long, reflexed; capsules ovoid, broadly conic to rounded at summit, brown or purplish, about 3 mm. long, circumscissile below tips of sepals; seeds 6 to 16, angulate, reticulated, 1-1.5 mm. long. Introd. from Eur. to become a weed in many places in the U.S. and Can. as well as elsewhere.

2. *Plantago virginica* L. PALE-SEEDED PLANTAIN. Annual with a slender taproot, glabrate or usually villous with septate hairs; leaves spreading or ascending, oblanceolate to obovate, obtuse to subacute, entire to coarsely but remotely repand-dentate, hirsutulous, to 2 dm. long and 4 cm. wide, usually much smaller; scape to 3 dm. long, usually noticeably exceeding the leaves, short-hirsute; spikes dense or interrupted, to 2 dm. long and 8 mm. thick; bracts lanceolate to linear-lanceolate, about 2 mm. long, mostly shorter than the calyx, hirsutulous, essentially without a scarious margin; calyx lobes oblong-obovate, 2-2.5 mm. long, rounded at apex, the brownish keel hirsutulous, the whitish scarious margin broad and glabrous; pistillate corolla lobes sharply acute, erect and connivent after anthesis; capsules ovoid, about as long as the calyx lobes; seeds 2, dull pale-brown to nearly black, to 2 mm. long, less than half as wide, with no differentiated margin, cymbiform, the hilum nearly as long as the seed. Incl. var. *viridescens* Fern. In thin soil over rocks, along roadsides, in open thickets and flat woods, salt marshes and dunes along the coast and dry open slopes, rarely on caliche outcrops in e. third of Tex., Mar.-June; from Mass. and N.Y., w. to Wisc., Ia. and Kan., s. to Fla. and Tex.; introd. farther w.

3. *Plantago rhodosperma* Dcne. RED-SEEDED PLANTAIN. Annual with slender taproot; leaves oblanceolate, long-cuneate at base, obtuse to acute at apex, to 35 cm. long and 5 cm. wide, usually much smaller, grayish-green, pubescent, entire to coarsely pectinate- or salient-dentate; scapes one to several, hirsute, shorter than to much-exceeding the leaves, hirsute; spikes to 2 dm. long and 1 cm. thick; bracts and floral segments similar to *P. virginica* but the acute to acuminate keels of calyx lobes extended beyond the scarious margin; seeds 2, bright-red to reddish-black, 2-3 mm. long, more than half as wide, nearly flat on both sides, with a thin pale margin, the central hilum less than a third as long as the seed. Usually in rocky soils in brushlands and on slopes, occasionally in sandy soils and on gravel bars of washes and streams, almost entirely w. of the Blackland Prairies, Mar.-May; from Mo. and Tenn., w. to Kan., Tex. and Ariz.; adv. farther w.

4. *Plantago insularis* Eastw. Low annual with short erect stem and abbreviated ascending branches, villous and tomentose throughout; leaves linear-lanceolate, acute, entire or with minute callous teeth, to about 1 dm. long and 8 mm. wide, villous to lanate; scapes numerous, axillary, erect or ascending, to 18 cm. high, more or less pilose to tomentose; spikes many-flowered, erect, short-cylindric, to 2 cm. long and 8 mm. thick, villous to heavily tomentose; bracts oblong to ovate, scarious with green or brown rigid glabrous to villous midrib, as long as the calyces or slightly shorter; calyx lobes ovate to obovate, the midribs green or brown; corolla lobes ovate, apiculate, concave, about 2 mm. long and 1.5 mm. wide, reflexed-spreading, with a brown spot at base of each; capsule twice as long as the calyx, oval, rounded at apex, about 4 mm. long and 2 mm. thick; seeds 2, brown, narrowly oblong, very finely pitted, about 2.8 mm. long and 1.3 mm. wide, rim of face thickened. Incl. var. *fastigiata* (Morris) Jeps. On gravel bars in stream beds and on cobbly slopes of canyons in s. Trans-Pecos, Feb.-May; from s. Calif., Ut. and Nev. to w. Tex. and n. Mex.

5. *Plantago Hookeriana* Fisch. & Mey. TALLOW WEED. Short-stemmed annual with a slender taproot; leaves linear to narrowly oblanceolate, entire or with small scattered denticulations, callous-tipped at the acute to obtuse apex, to 3 dm. long and 2 cm. wide, usually much smaller, glabrous to lanate; scapes erect or ascending, shorter than to mostly noticeably exceeding the leaves, glabrate to pubescent; spikes capitate to long-cylindric, to 12 cm. long and 8 mm. thick, rarely reduced to only 2 flowers; bracts broad at base, scarious-margined for one third to the entire length of midrib, equal to or shorter

than calyces, glabrate to villous; calyx lobes oblong, about 3 mm. long; corolla lobes suborbicular-ovate, whitish with a brown spot at base of each or brown stripes the entire length of each, to 4 mm. long; capsules oval, about 4 mm. long; seeds 2, cymbiform, dull-brown, finely pitted, about 3 mm. long and 1.3 mm. wide. In sandy, gravelly or rocky soils in open woods, dunes and savannahs, also on clay flats from e. Tex., along the coast to the Rio Grande Valley and inland w. to the Trans-Pecos, Mar.-June; possibly endemic.

6. *Plantago Wrightiana* Dcne. Dark green annual with an elongate taproot and short erect stem; leaves numerous, erect, linear to linear-oblong, obtuse to acute and callous at the flat or sometimes involute apex, entire, to 2 dm. long and 1 cm. wide, usually much smaller, 3- to 5-nerved, glabrous or sparsely pubescent; scapes solitary to several or many, rather stout, surpassing the leaves at maturity, appressed-pubescent; spikes conspicuous because of the large corollas, long-cylindrical, to 9 cm. long and 8 mm. thick, villous; bracts rigid, herbaceous with scarious margins, equal to or shorter than the sepals, triangular-lanceolate to ovate, obtuse, about 3 mm. long and 1 mm. wide; villous or less hairy; calyx lobes thick and rigid, pilose, narrowly obovate, rounded at apex, about 3 mm. long, herbaceous and dark-green or brownish; corolla lobes ovate, obtuse, spreading and reflexed, the 2 laterals deflexed, about 3 mm. long and 2.5 mm. wide; capsules ovoid, rounded above, about 4 mm. long and 2 mm. thick; seeds 2, brown, slightly constricted below the middle, finely pitted. In sandy, gravelly or rocky soils mainly on the Edwards Plateau or adj. to it, Apr.-July; w. to Ariz.

7. *Plantago aristata* Michx. ВУКТИЮРН. Dark-green annual with thickened tapering root and short erect stem; leaves linear to narrowly oblanceolate, to 2 dm. long and 1 cm. wide, more or less villous below; scapes rigidly ascending, pubescent to villous, to about 25 cm. high; spikes (excluding bracts) cylindrical, to 15 cm. long and 8 mm. thick, usually much shorter; bracts aristate to linear and foliaceous, more or less hirsute, the scarious margins narrow and at very base, the lowest to 3 cm. long, progressively reduced upward; sepals narrowly oblong-obovate, rounded at apex; petals about 2 mm. long, suborbicular-ovate, spreading after anthesis; stamens 4; capsule about 3.5 mm. long and 1.5 mm. thick, about one third longer than calyx; seeds 2, brown, elliptic, about 2.5 mm. long and 1.3 mm. wide, very convex on the outer side, concave on the inner side, the cavity surrounded by a pale stripe, the minute hilum resembling the figure 8. In dry sterile or sandy soils mainly in the e. fourth of Tex., May-Nov.; from Me. to Mich., N.D., Mont. and Ore., s. to Fla., Tex. and n. Mex.

8. *Plantago patagonica* Jacq. Annual, more or less woolly-villous throughout; leaves linear to narrowly oblanceolate, acute to acuminate and commonly with a callous apiculate tip, to about 2 dm. long and 15 mm. wide, usually much smaller; scapes shorter than to noticeably longer than the leaves; spikes very dense, cylindrical, to about 1 dm. long and 8 mm. thick; bracts linear to linear-subulate, shorter than to conspicuously longer than the flowers; sepals, petals and seeds essentially as in *P. aristata*. In sandy, gravelly or rocky soils on prairies, plains, hillsides and mt. slopes throughout Tex. except in the extreme e. part, Mar.-June; represented by several variants throughout much of the U.S. and Can., s. to S.A.

Closely allied to *P. aristata* but the usually dense gray pubescence and mostly shorter bracts readily distinguish it. We have the following varieties.

Var. *gnaphalioides* (Nutt.) Gray. Distinguished by having its bracts in the lower part of the spike shorter than to only slightly longer than the calyces. *P. Purshii* R. & S.

Var. *spinulosa* (Dcne.) Gray. The most extreme form of var. *spinulosa* has yellowish-gray pubescence, that on the upper part of the scape is widely spreading, and the bracts markedly longer than the calyces, somewhat intermediate between var. *gnaphalioides* and var. *breviscapa*. *P. Purshii* var. *spinulosa* (Dcne.) Shinners.

Var. *breviscapa* (Shinners) Shinners. Bracts slightly to much longer than the calyces, as in var. *spinulosa*. The plant is distinctive in its dwarf habit, short scapes, long bracts, yellowish-gray pubescence and often somewhat falcate leaf blades. *P. Purshii* var. *breviscapa* Shinners.

9. *Plantago lanceolata* L. ENGLISH PLANTAIN, RIBWORT. Glabrous or more or less pubescent perennial or biennial; leaves narrowly lanceolate to oblanceolate, acute at apex, long-tapering at the petiolar base, strongly several-ribbed, to about 5 dm. long

and 35 mm. wide, entire or remotely toothed, essentially glabrous or pubescent beneath; scapes exceeding the leaves, channeled, commonly strigose above; spikes very dense, ovoid when young to long-cylindric and to 1 dm. long and 8 mm. thick when mature; bracts broadly ovate, scarious, with a narrow herbaceous center and abruptly long-acuminate hyaline tip, conspicuously surpassing the calyx; outer 2 sepals united into a broadly obovate truncate lamina with 2 midveins, the inner sepals ovate; corolla lobes ovate, acute, with a prominent brown midrib, 2-3 mm. long, usually spreading; capsule ellipsoid, obtuse, 3-4 mm. long, circumscissile near the base; seeds 2, black, semiellipsoid, 2-3 mm. long, cymbiform. A common weed of lawns, roadsides, fields and waste places throughout much of the U.S. and Can.; introd. from the Old World.

10. *Plantago Helleri* Small. Acaulescent or short-stemmed annual, often dwarf, more or less villous throughout; leaves deep-green, rather numerous, linear and somewhat broadened upward to linear-oblongate, to 2 dm. long and 1 cm. wide, acute, entire, glabrate in age (except near the base); scapes solitary or several to many together, erect or ascending, shorter than to much-exceeding the leaves; spikes oblong-cylindrical, to 4 cm. long and 12 mm. thick, conspicuous because of the corolla lobes; bracts linear-subulate, surpassing the calyces; calyx lobes about 4 mm. long, broadly oblong or oval, the scarious margins much broader than the green midrib; corolla lobes orbicular-ovate to suborbicular, about 3.5 mm. long, spreading; capsules oblong, 3-4 mm. long; seeds 1 or 2, brown, oblong, cymbiform, about 3 mm. long and 1.5 mm. wide. In sand-gravel beds of dry washes, on limestone slopes and in sandy soils of flats from n.-cen. Tex. and the Edwards Plateau, w. to the Rio Grande Plains and Trans-Pecos, Mar.-June; undoubtedly in adj. Mex.

11. *Plantago hybrida* Bart. Annual with numerous lateral fibrous roots as well as a taproot; leaves linear to linear-subulate, narrowly obtuse to acute at the rigid callous tip, entire, to 15 cm. long and less than 5 mm. wide, not woolly at base; scape slender, slightly pubescent, shorter than to conspicuously longer than the leaves; spikes slender and elongate, cylindrical, to 13 cm. long and 5 mm. thick, rather loose to expose the axis, the lower spikelets remote; bracts acute, equal to or about twice as long as calyx; calyx lobes ovate, with narrow green midribs; corolla lobes triangular-ovate, erect and somewhat connivent with age, less than 0.5 mm. long; stamens only 2; capsule about twice as long as the calyx; seeds 10 to 30, blackish, asymmetrically angular, less than 1 mm. long. (♀) *P. heterophylla* Nutt. In wet sands and shallow soils in rocky areas, fallow fields and flat woods, occasionally in salt marshes, in the e. third of Tex., Apr.-May; rather widespread, especially in s. U.S.

12. *Plantago elongata* Pursh. Annual with prominent taproot; leaves narrowly linear, 3-10 cm. long; scapes several to many, commonly surpassing the leaves; spikes mostly 2-10 cm. long, loosely flowered so as to expose the axis; bracts ovate to triangular-ovate, mostly shorter than the calyx but sometimes equal to or barely surpassing it, glabrous to slightly hispid, the central herbaceous portion about as wide as the scarious margins, becoming saccate at base; anterior sepals inequilateral and with narrow midvein and wide scarious margins, the posterior sepals similar but conduplicate and sharply keeled; corolla lobes 0.5-1 mm. long, reflexed with age; stamens only 2; capsules ovoid, rounded to the summit, 1.5-3.5 mm. long; seeds normally 4 or more, from 1.5 mm. in length (if many seeds) to 2.5 mm. long (if only 4 seeds). *P. pusilla* Nutt. In moist or dry sandy soil, commonly shallowly covering flat rocks, rare in e., s. and n.-cen. Tex., spring; from N.E. to the Lake States, s. to Fla. and Tex.

FAM. 168. RUBIACEAE JUSS.

MADDER FAMILY

Trees, shrubs or herbs, rarely climbing; leaves opposite or whorled, simple, entire; stipules often united to form a sheath, rarely leaflike; flowers perfect or unisexual, regular, usually in panicles or cymes, sometimes solitary or aggregated into heads; calyx tube more or less united with the inferior ovary, the segments 4 to 8, crowning the ovary and commonly persistent in the fruit; corolla funnelform, salverform or rotate, the 3 to 5 segments with valvate, imbricate or contorted aestivation; stamens 3 to 5, inserted on the corolla throat or at the throat, the filaments free, the anthers introrse; ovary crowned by

a more or less developed disk, inferior or rarely half-inferior, 1- to several-celled; style filiform, often divided above; fruit a capsule, berry, drupe or schizocarp (in *Galium*).

Probably more than 6,000 species in about 500 genera, world-wide in distribution. An important family that includes coffee (*Coffea* spp.) and quinine (*Cinchona* spp.).

1. Leaves verticillate, with foliaceous or indistinct stipules; herbs or rarely subshrubs (2)
1. Leaves opposite or (if verticillate) large shrubs, with distinctive stipules (4)
- 2(1). Corolla rotate; calyx teeth minute or none 1. *Galium*, p. 1480.
2. Corolla funnelform (3)
- 3(2). Flowers in involucrate heads 2. *Sherardia*, p. 1485.
3. Flowers in panicles 3. *Asperula*, p. 1486.
- 4(1). Ovules few to many in each cell of the ovary (5)
4. Ovules solitary in each cell of the ovary (8)
- 5(4). Fruit berrylike, hard, indehiscent; shrub to 2 m. high; leaves typically cuneate-obovate 4. *Randia*, p. 1486.
5. Fruit capsular; herbs or small shrubs; leaves typically linear-lanceolate (6)
- 6(5). Corolla bright-red, tubular, 15-32 mm. long; seeds winged 5. *Bouvardia*, p. 1486.
6. Corolla white or variously colored, funnelform or salverform, less than 15 mm. long; seeds wingless (7)
- 7(6). Flowers 4-merous; top of capsule nearly always extending beyond the hypanthium 6. *Hedyotis*, p. 1487.
7. Flowers 5-merous; top of capsule included in hypanthium 7. *Pentodon*, p. 1490.
- 8(4). Erect or scandent shrubs with definite woody stems and branches (9)
8. Annual or perennial herbs (11)
- 9(8). Flowers in naked dense globular heads about 15 mm. in diameter; usually in wet places 8. *Cephalanthus*, p. 1491.
9. Flowers not as above; in moist or dryish soils (10)
- 10(9). Shrub with scandent branches; leaves typically ovate; stipules broad, with a hard point; flowers in simple or compound racemes 9. *Chiococca*, p. 1492.
10. Shrub with erect-ascending branches; leaves typically linear or linear-lanceolate; stipular sheath bristly; flowers in axillary or terminal clusters 10. *Borreria*, p. 1492.
- 11(8). Trailing glabrous evergreen herbs in shady woods; fruit a soft berrylike scarlet drupe 11. *Mitchella*, p. 1492.
11. Erect to ascending or rarely prostrate nonevergreen herbs mostly in weedy or waste areas; fruit capsular, with 2 or more carpels (12)
- 12(11). Capsule thin-walled, circumscissile 12. *Mitracarpum*, p. 1492.
12. Capsule with thin or hard walls; dehiscing vertically or rarely remaining closed (13)
- 13(12). Calyx teeth gamosepalous at base, circumscissile-deciduous as a whole at or before the separation of the carpels 13. *Richardia*, p. 1493.
13. One or more calyx teeth persisting on each of the separated carpels (14)
- 14(13). Capsule splitting when ripe into 2 carpels; one carpel open on the inner face, the other one closed 14. *Spermacoce*, p. 1494.
14. Capsule splitting when ripe into 2 or 3 carpels, if tardily splitting then conspicuously 6-ribbed 15. *Diodia*, p. 1495.

1. GALIUM L.

BEDSTRAW. CLEAVERS

Slender annual or perennial herbs with 4-angled slender stems and whorled sessile or short-petioled leaves, the roots often containing a red coloring matter; stipules foliaceous; flowers perfect or in some species unisexual, mostly in axillary or terminal cymes or panicles, occasionally solitary or few on simple branchlets, the pedicels usually jointed

with the calyx; calyx tube ovoid or globose, the teeth obsolete; corolla rotate, 3- or 4-lobed, valvate in the bud; stamens 4, rarely 3, short; styles 2; fruit dry or fleshy, globular or ellipsoid, twin, separating when ripe into the 2 seedlike indehiscent 1-seeded carpels.

About 400 species of wide geographic distribution.

1. Distribution in Trans-Pecos Texas (2)
1. Distribution east of the Trans-Pecos region (11)
 - 2(1). Plants forming a compact intricate mosslike mat appressed to the walls of smooth perpendicular cliffs; corolla white or creamy, tinged with purple 1. *G. Correllii*.
 2. Plants with spreading to ascending or erect stems; corolla white to yellow or brownish-red (3)
 - 3(2). Fruit smooth or (at most) granulose (4)
 3. Fruits ornamented with hairs or occasionally verrucose or muricate (5)
 - 4(3). Plants glabrous; leaves firm, with callous margins; flowers sessile in a whorl of bracteal leaves 2. *G. microphyllum*.
 4. Plants somewhat scabrous on stem-angles and on lower midrib and margins of leaves; flowers on slender usually scabrellous naked pedicels 3. *G. trifidum*.
 - 5(3). Fruits with bristles or hairs that are hooked at apex, rarely merely tuberculate (6)
 5. Fruits with straight or only curved hairs (8)
 - 6(5). Flowers and fruits essentially sessile or short-pedicelled, not exceeding the 2 subtending bracteal leaves; fruits deflexed; plants annual 4. *G. proliferum*.
 6. At least some of the flowers and fruits prominently pedicelled to surpass the leaves and bracteal leaves; fruits not strongly deflexed; plants perennial (7)
 - 7(6). Angles of stem and margins of typically oblanceolate leaves retrorse-scabrous; fruit tuberculate or minutely hispidulous 5. *G. mexicanum* var. *asperulum*.
 7. Plant densely pilose; fruit with conspicuous bristles; leaves typically elliptic 6. *G. uncinulatum*.
 - 8(5). Plants glabrous or (at most) sparsely puberulent or slightly scabrous on leaf margins (9)
 8. Plants usually densely hirsute or hispid (10)
 - 9(8). Stems stout, 2 mm. thick or more; primary leaves 20 mm. long or more, bluntly obtuse; flowers bright-white 7. *G. boreale*.
 9. Stems slender, less than 2 mm. thick; primary leaves usually less than 15 mm. long, cuspidate; flowers reddish 8. *G. Rothrockii*.
 - 10(8). Plants hispid; flowers sessile or on short stiff pedicels to form a compact cylindrical strict inflorescence 9. *G. frankliniense*.
 10. Plants pilose; flowers produced on slender branchlets to form a lax open inflorescence 10. *G. Wrightii*.
 - 11(1). Fruits smooth, glabrous (12)
 11. Fruit adorned with hairs or bristles that are hooked at the apex (15)
 - 12(11). Peduncles axillary, much shorter than the leaves, usually 1-flowered (13)
 12. Peduncles terminal on the branchlets or sometimes appearing to be axillary, exceeding the leaves, usually several-flowered; fruit dry (14)
 - 13(12). Fruit dry, grayish, strongly deflexed, sessile or essentially so; leaves oblong, thin, less than 1 cm. long 12. *G. virgatum* var. *leiocarpum*.
 13. Fruit succulent, purple-black, divergent on a definite peduncle and pedicel; leaves linear, subcoriaceous, more than 1 cm. long 11. *G. uniflorum*.
 - 14(12). Corolla 2-3 mm. broad, 4-lobed 13. *G. obtusum*.
 14. Corolla less than 2 mm. broad, usually 3-lobed 14. *G. tinctorium*.

- 15(11). Flowers and fruits essentially sessile or short-pedicelled (16)
15. Flowers and fruits noticeably pedicelled (18)
- 16(15). Flowers solitary in axils of the usually simple main stem 12. *G. virgatum*.
16. Flowers produced on floral branchlets (17)
- 17(16). Leaves less than 10 mm. long; flowers produced solitarily or at less than 1 cm. apart on short stiff lateral branchlets rarely to 4 cm. long 4. *G. proliferum*.
17. Leaves more than 15 mm. long; flowers produced at 1 cm. or more apart on elongate fractiflex branches usually much more than 5 cm. long 15. *G. circaezans*.
- 18(15). Plants densely pilose throughout or (if glabrescent) the leaves elliptic; leaves in fours (19)
18. Plants essentially glabrous to merely sparsely scabrous or ciliate; leaves in sixes to eights (21)
- 19(18). Flowers in a distinct elongate terminal panicle; leaves almost invariably punctulate on lower surface; in the eastern fourth of Texas 16. *G. pilosum*.
19. Flowers produced in short lateral branchlets; leaves not punctulate; on the Edwards Plateau and southward (20)
- 20(19). Plants perennial, on the upper Rio Grande Plains and western Edwards Plateau to Brewster County; leaves on middle portion of stems broadly to narrowly oval-elliptic to obovate-elliptic, mostly rounded and somewhat mucronate at apex, averaging 1 cm. long or more; pedicels short, stout, rigid, more or less puberulent 6. *G. uncinulatum*.
20. Plants annual, in eastern Edwards Plateau and somewhat to the north and south; leaves of the middle portion of stems ovate to oval, usually distinctly acute or occasionally obtuse, less than 1 cm. long; pedicels elongate, slender-filiform, flexible, mostly glabrous 17. *G. texense*.
- 21(18). Leaves mostly oblanceolate, the margins retrorsely bristly; stems retrorsely bristly on the angles, usually pubescent above the nodes; annual 18. *G. Aparine*.
21. Leaves mostly elliptic-lanceolate, the margins with ascending cilia; stems smooth; perennial, stoloniferous 19. *G. triflorum*.

1. *Galium Correllii* Dempst. CLIFF BEDSTRAW. Small gray-green matted perennial, woody only at base; stems and leaves densely hispid with spreading hairs; nodes about as long as leaves or sometimes a little longer; leaves 4 to a node, the true leaves a little larger than the stipules, commonly 4-6 mm. long, sessile, broadly lanceolate, 1-nerved, drawn to a delicate point tipped with one or more long slender hairs, both surfaces with stomata; steroid cells absent; flowers perfect, very short-pedunculate above a pair of reduced leaves; corollas white or creamy, tinged with purple, campanulate, the tube about 1 mm. long, the lobes a little longer, papillose (especially at tips); ovaries oblong, minutely papillose; fruits slightly fleshy, ellipsoid, maroon, glabrous, about 2.5 mm. long, separating when ripe and dry into 2 slender nearly black carpels. In crevices of vertical walls of canyon in Val Verde Co., Apr.-June; endemic.

2. *Galium microphyllum* Gray. Diffusely spreading or ascending perennial, smooth and glabrous but not shining; branches to 3 dm. long; leaves firm, shorter than the internodes and narrowly linear, usually mucronate, with narrow midrib prominent beneath and callous naked margins, to 12 mm. long, usually smaller; flowers solitary on a very short or on a longer and pedunclelike axillary branchlet and sessile in its whorl of involucrifoliate leaves, or this proliferous and bearing a second whorl and flower; ovary and young fruit scabro-puberulous or at length granulose, at maturity fleshy-baccate. *Relbunium microphyllum* (Gray) Hemsl. In canyons and rocky ravines and on ledges and talus slopes in mts. of the Trans-Pecos, May-Oct.; from Tex. to Ariz. and adj. Mex.

3. *Galium trifidum* L. Weakly erect perennial from a slender rootstock, often freely branching to form dense mats, to about 3 dm. high, smooth and glabrous except for the

retorsely scabrous angles of the stems and usually more hispidulous and sparse roughness of the midrib beneath and margins of the thin leaves; leaves mostly in fours, occasionally in fives or sixes, linear to oblanceolate or oblong-lanceolate, obtuse, to 2 cm. long; peduncles slender, scattered; flowers solitary or (when terminal) in threes on capillary scabrous peduncles or pedicels to 3 cm. long; corolla whitish, about 0.5 mm. long, its 3 or 4 lobes obtuse; fruit smooth, annular in cross section. In wet ground in mts. of the Trans-Pecos, summer; from Nfld. and Lab. to Aleutian Is., s. to (?) Tex., Ariz. and Calif.; also Euras.

This species is included here based on various reports of its occurrence in the state. We have seen no material referable to it but it may occur in the mountains of west Texas.

4. *Galium proliferum* Gray. Annual with stem and branches often stiffly ascending, somewhat hispidulous or glabrate; leaves thin, oval to oblong, the alternate ones rather small; flowers borne on pedunculiform axillary branchlets with 1 to 3 internodes (these divergent at right angles to the main stem), a flower borne at each node between 2 bracteal leaves, never produced directly in axils of leaves of main stems or (if on a short peduncle) not deflexed; fruit uncinat-hispid, barely surpassed by its pair of bracts, or one or even two more by proliferation from the bracts. On open rocky brushy slopes and mesas on the Edwards Plateau and upper Rio Grande Plains, rare in the Trans-Pecos, Mar.-June; also N.M. and Mex.

Typical material of this species occurs only in the Trans-Pecos. The material of the Edwards Plateau and southward shows some evidence of introgression with the more eastern *G. virgatum*.

5. *Galium mexicanum* H.B.K. var. *asperulum* (Gray) Dempst. Stems erect or diffusely ascending but weak, 3-6 dm. high, from a slender perennial rootstock, minutely retrorse-hispidulous to scabrous or nearly glabrous on the angles; leaves 5 to 8, usually 6, lanceolate to oblanceolate, rounded-apiculate to acute at apex, 1-2.5 cm. long, vernicose on upper surface, the margins and midrib beneath antrorsely or retrorsely hispidulous-ciliate or more or less naked; cymes twice- or thrice-dichotomous, with filiform peduncles and pedicels; corolla white or turning purplish, to 4 mm. broad; fruit less than 2 mm. in diameter, tuberculate, sometimes minutely hispidulous with slender hooked hairs. *G. asperrimum* Gray. In shaded moist areas in mts. of the Trans-Pecos, May-Oct.; from w. Tex. to Calif., Wash., Mont. and Ida.

6. *Galium uncinatum* Gray. Perennial herb to 3 dm. high, with spreading branches that form a dense procumbent mass, rather densely pilose to hirsute throughout; leaves in fours, narrowly to broadly elliptic to obovate-elliptic, mostly rounded and somewhat mucronate at apex, averaging 1 cm. long or more; pedicels short, stout, rigid, rarely more than 8 mm. long, more or less puberulent; corolla yellow or yellowish-white, 2-3 mm. broad, the ovate lobes pilose; bristles of the fruit hooked. Incl. var. *obstipum* (Schlecht.) Wats. In gravelly soil along streams, on steep hillsides, ledges and canyons in Brewster Co., e. to the upper Rio Grande Plains and w. Edwards Plateau; also n. Mex.

In vegetative characteristics those plants of the western Edwards Plateau and Rio Grande Plains fall into this species. The flowers, however, are more the size of the closely allied *G. texense*.

7. *Galium boreale* L. Plant erect, to 9 dm. high, perennial, mostly smooth and glabrous, very leafy; leaves in fours, linear to broadly lanceolate, blunt at apex, rather rigid, distinctly 3-nerved, often with fascicles of smaller leaves in the axils, the uppermost leaves reduced to pairs of small oblong or oval bracts; flowers in numerous close cymules that are collected in a terminal and ample thyriform panicle; corolla bright-white, 3-4 mm. wide; fruits small, typically villous-hirsute with long straight or slightly curved hairs. In shaded areas in mts. of the Trans-Pecos, from Can., s. to Pa., (?) Tex., Ariz. and Calif.; also Euras.

This species is included, based solely on reports of its occurrence in Texas. It perhaps occurs in the mountains of west Texas.

8. *Galium Rothrockii* Gray. Perennial, polygamo-monoecious; stems more or less woody at base, slender and diffuse or shorter and substrictly erect, sometimes trailing or pendent, glabrous and smooth to slightly puberulent, to about 6 dm. high; leaves in fours, linear-lanceolate to linear, rigid, glabrous to slightly puberulent, the midrib stout and prominent on lower surface; flowers pedicelled; corolla small, usually red to dark brown-purple, 1-2 mm. wide, the lobes long-acuminate; style and style branches very slender;

fruit small, sparsely covered with soft straight hairs that are not longer than the body of the fruit. *G. Wrightii* Gray var. *Rothrockii* (Gray) Ehrend. In rock crevices and among boulders in the Chisos and Sierra Vieja mts. of Trans-Pecos, May-Aug.; from Tex. to Calif. and adj. Mex.

9. *Galium frankliniense* Correll. Plant densely hispidulous throughout; main stems from a heavy woody base and often with a prostrate woody stem with brownish bark; aerial stems prominently 4-angled, usually rigidly erect or ascending, to 3 dm. high; leaves in whorls of 4, sessile, elliptic to elliptic-oblong, obtuse to acute and cuspidate at apex, to 8 mm. long and 3 mm. wide, the margins somewhat revolute, the central vein somewhat keeled below the middle on the lower surface; flowers sessile or essentially so, perfect, rarely on a short naked peduncle, usually on very short branches to form an inflorescence of compact branches that stand rigidly above the leafy portion of stem; corolla mostly brownish-purple, about 1.5 mm. across; fruits densely covered with straight whitish hairs that are about as long as the diameter of the fruit. In limestone soils and crevices in the Franklin Mts. of extreme w. Tex., Apr.-Sept.; endemic.

10. *Galium Wrightii* Gray. Plant a rather diffusely branched perennial, erect and bushy, to about 3 dm. high, short-pilose throughout or occasionally becoming glabrate above; stems more or less woody at base; leaves in fours, linear to linear-elliptic or lanceolate to somewhat oblanceolate, somewhat flaccid, spreading or ascending, to about 12 mm. long; flowers usually dimorphic, on slender peduncles; corolla 2-3 mm. across, with lobes leathery and incurved or thin and spreading, purplish to dark purple-brown, rarely pinkish; hairs of the fruit straight, soft, white, about as long as the diameter of the fruit. Crevices on rocks, on ledges and cliffs in mts. of the Trans-Pecos, June-Nov.; from Tex. to Ariz. and adj. Mex.

11. *Galium uniflorum* Michx. Slender glabrous perennial with filiform yellow rhizomes; flowering stems simple or sparingly branched, to 35 cm. high; leaves in fours, linear to linear-lanceolate, 1-2.5 cm. long, subcoriaceous, often evergreen, the revolute margin scabridulous; peduncles axillary, divergent, much shorter than the leaves, leafy-bracted, with 1 to few white flowers; corolla lobes blunt; fruit succulent, purple-black, smooth, drooping, 2-4 mm. in diameter. Rich woods in e. Tex., Apr.-Oct.; from Fla. to Tex., n. to e. Va.

12. *Galium virgatum* Nutt. SOUTHWEST BEDSTRAW. Slender erect annual, simple or forking below, to 4 dm. high; stem wiry, smooth; leaves oblong, mostly in fours, 4-10 mm. long, bristly; flowers solitary, sessile or subsessile, reflexed, white, shorter than the subtending bracteal leaves; fruit uncinat-hispid. Dry barrens, glades and rocky woods mainly on the Edwards Plateau and northw. in Tex., Mar.-June; from La. and Tex., n. to Tenn. and Mo.

The rare var. *leiocarpum* T.&G. has fruit smooth and glabrous, and the herbage almost so.

13. *Galium obtusum* Bigel. BLUNTLEAF BEDSTRAW. Stems erect, from capillary rhizomes, simple (not intricately) branched, to about 8 dm. high, smooth, stiffish; leaves mostly in fours, rarely in fives or sixes, elliptic-oblong to lanceolate or broadly linear, obtuse, those of the primary axis to 3 cm. long and 6 mm. broad, loosely spreading, slightly scabrous on the margins; cymes terminating stems and branches, their several flowers grouped in two or threes; the straight peduncles and pedicels ascending in anthesis, often divergent in fruit; corolla white, 2-3 mm. broad, commonly with 4 acute lobes; fruits globose, smooth, 2.5-3.5 mm. in diameter. *G. trifidum* var. *latifolium* Torr. In low woods, swamps and wet shores in e. Tex., Mar.-July; from Fla. to Ariz., n. to s.w. N.S., s. and w. N.E., s. Ont., Mich., Wisc., Minn. and Neb.

14. *Galium tinctorium* L. DYE BEDSTRAW, STIFF MARSH BEDSTRAW. Perennial with stiff ascending or reclining stems, the younger internodes retrorse-scabrous on angles; leaves of main axis mostly in fives or sixes, sometimes in fours, broadly oblanceolate to oblong-spatulate, firm, to 2 cm. long; peduncles stiff, straight or straightish, the longest ones 1-1.7 cm. long with 3 (sometimes more) nearly uniform smooth short (to 8 mm. long) straight divergent pedicels; corolla white, usually 3-lobed, less than 2 mm. broad; mature pairs of fruit 2-3 mm. across. In swamps and damp places in the e. fourth of Tex., Mar.-Aug.; from Nfld. to Ont. and Neb., s. to S.C., Ky., Mo. and Tex.

15. *Galium circaezans* Michx. WOODS BEDSTRAW, WILD LICORICE, CROSS CLOVER. Perennial with a short crown; stems wiry, very slender, smooth to hairy on the angles, mostly simple, to 45 cm. high; leaves in fours, ovate-oblong to ovate-lanceolate or occasionally

oval, obtuse, thin, ciliate, the larger blades mostly 15-25 mm. long and to 14 mm. broad, sometimes to 5 cm. long and 25 mm. wide, glabrous to appressed-pilose on the nerves and margins; peduncles usually once-forked, supporting a broad flattish cymose panicle, the flowers and fruits mostly sessile or very short-pedicelled on the elongate and widely divergent somewhat fractiflex stiff branches; corolla greenish, its acute or acuminate lobes usually hairy outside; fruits bristly, at length deflexed. In dryish or rich woods, mostly on the e. Edwards Plateau and in n.-cen. Tex., Apr.-Oct.; from Fla. to Tex., n. to Va. and locally to s. N.E., N.Y., Ky. and Mich.

Those coarser plants that are more pubescent and with leaves to 5 cm. long and 25 mm. wide are referred to var. *hypomalacum* Fern.

16. *Galium pilosum* Ait. HAIRY BEDSTRAW. Stems tufted from a perennial crown, stiff, erect or ascending, simple or forking, to about 9 dm. high, densely to sparsely spreading-pilose at least on the lower angles, rarely completely glabrous; leaves in fours, oval to elliptic or oblong-elliptic, rarely suborbicular, mostly obtuse-apiculate at apex, firm, hairy, almost invariably punctulose on lower surface, 15-25 mm. long; inflorescence paniculate, elongate, the peduncles 2 or 3 forked; flowers greenish-white to purplish, on distinct pedicels; fruits bristly. Incl. var. *punctulosum* T.&G. Dry woods, flatwoods, prairies and copses in the e. third of Tex.; from s. N.H. to s. Ont. and Mich., s. to N.C., Tenn., Mo., Okla. and Tex.

Those plants with completely glabrous stems are referred to var. *laevicaule* Weath. & Blake.

17. *Galium texense* Gray. TEXAS BEDSTRAW. Plants annual; stem hispidulous-hirsute or the upper part essentially glabrous, weak and slender, 3 dm. or less high; leaves in fours, ovate to ovate-lanceolate or oval, thin, one-nerved, rarely more than 8 mm. long, pilose, the sides and margins equally beset with straight bristly hairs; peduncles terminal on lateral branchlets and 1-flowered, the primordial peduncles (pedicels) naked and filiform, 8-20 mm. long; single axils proliferous into a similar shoot which bears an unequally 4-leaved small whorl and a short peduncle or pedicel; carpels about 2 mm. long, bristles of the fruit much shorter than the carpels, barely uncinulate. *G. texanum* (T.&G.) Wieg. On rocky slopes and bluffs, and in sandy open woodlands on e. part of Edwards Plateau, s. to Live Oak and Gonzales cos. and n. to Palo Pinto Co., Mar.-May; also Okla. and Ark.

18. *Galium Aparine* L. CATCHWEED BEDSTRAW, GOOSE-GRASS, CLEAVERS. Weak or reclining annual with a slender taproot; stem retrorsely hispid on the angles, hairy above the joints, to 1 m. long; leaves mostly 6 to 8 in a whorl, linear-oblongate, tapering at the base, chiefly 2-7 cm. long, bristle-tipped, the margins and lower midrib retrorsely hispid; peduncles 1- to 3-flowered; corollas white; fruit bristly, 2-4 mm. in diameter. Incl. var. *Vaillantii* Koch. In rich woods, thickets, prairies, seashores and waste ground in e., cen. and s. Tex., Mar.-May; from Nfld. to Alas., s. to Fla., Tex. and Calif., both nat. and introd.; also Euras.

19. *Galium triflorum* Michx. FRAGRANT BEDSTRAW. Weak perennial from slender creeping rootstocks; stems simple or remotely forking, to 1 m. long or more, smooth; leaves mostly in sixes, thin, elliptic-lanceolate to narrowly oblong, cuspidate, the primary ones 2.8-5 cm. long, the upper ones only slightly reduced, with minute ascending cilia on or near the margin; peduncles axillary, rather short, terminally 3-flowered, the flowers all pedicelled; corolla whitish or greenish-white, 4-lobed, 2-4 mm. in diameter; fruit densely bristly. Woods and thickets in e. and n.-cen. Tex., May-Sept.; from Nfld. to Alas., s. through e. Can. and the n. states and more sparingly to Va., Tenn., La., Tex., Calif. and Mex.

The herbage is usually sweet-scented in drying.

2. SHERARDIA L. FIELD-MADDER

A monotypic genus, native of the Old World.

1. *Sherardia arvensis* L. SPURWORT, HERB SHERARD. Annual with slender reddish roots and numerous prostrate or decumbent spreading stems to 4 dm. long, simple or branched, more or less glabrous, with 4 rough angles; leaves 4 to 6 in a whorl, obovate-cuspidate to elliptic-acute, to 18 mm. long, glabrous except for prickles on the margins and midrib on lower surface; flowers 4 to 8 in terminal heads, subsessile; involucre of 8 to 10 lanceo-

late leaflike bracts longer than the flowers; sepals 4 to 6, triangular-lanceolate, persistent and usually accrescent in fruit; corolla 4-5 mm. across, pale-lilac, with a long slender tube about twice the length of the 4 or 5 free lobes; stamens 4 or 5; style bifid with capitate stigmas; fruit 4 mm. long, crowned by the sepals, composed of 2 obovoid mericarps with a solitary ovule in each, with short appressed bristles. In fields, on road shoulders and thickets in e. Tex., Mar.-May; introd. from the Old World.

3. ASPERULA L. WOODRUFF

About 90 species that are natives of the Old World, commonly included in *Galium*.

1. *Asperula arvensis* L. Annual herb, with nearly glabrous branching 4-angled stem to about 3 dm. high; leaves 6 to 9 in a whorl at the nodes, linear, obtuse at apex, minutely scabrous on the margins and midvein beneath, to 25 mm. long; flowers bright blue, about 4 mm. long, numerous in involute sessile terminal heads, 4-merous, about as long as the hispid bracts; calyx inconspicuous, not persistent in fruit; corolla funnelform, its tube equaling or exceeding the 3 or 4 lobes; styles more or less connate, the stigmas capitate; fruit brown, smooth, leathery, about 2 mm. in diameter, the 2 mericarps with one seed each. In clayey soil along streams and in waste places in the Blackland Prairies, Mar.-May; introd. from the Old World.

4. RANDIA L.

Several hundred species mostly in the Old World tropics, with few in America.

1. *Randia rhagocarpa* Standl. CRUCILLO. Shrub to 2 m. high, bearing numerous pairs of spines scattered along the branches, the divaricate spines 5-12 mm. long, the twigs short-hirsute with white incurved hairs; stipules broadly ovate, apiculate, about 2 mm. long; leaves opposite, borne on short lateral spurs, with slender short-hirsute petioles about 1 cm. long, cuneate-obovate to cuneate-orbicular, rounded to truncate or shallowly notched at apex, to 5 cm. long and 3 cm. broad, usually smaller, chartaceous, persistently short-hirsute on both surfaces, the lateral veins 3 or 4 on each side; flowers solitary or clustered in axils, sessile, 4- or 5-parted; calyx 1.5-2 mm. long, glabrous or with a few subappressed hairs, the hypanthium oblong-ovoid; calyx teeth ciliate, about 0.5 mm. long, subacuminate, spreading or reflexed; corolla pale-green, funnelform, glabrous outside, villous in throat, 6-7 mm. long, the slender tube 3.5-4 mm. long, the 4 or 5 lobes ovate-elliptic and to 2.7 mm. wide; stamens usually 5, inserted on the corolla, the dorsifixed anthers exerted two thirds from throat, about 1.7 mm. long, apiculate; style slender, glabrous; stigma clavate, laminated; fruit globose, 2-celled, to 1 cm. in diameter, drying with a rugose surface, the pericarp hard; seeds compressed, immersed in pulp. *R. texensis* Lundell, *R. mitis* of auth. In open brushlands and thickets in Cameron, Willacy and Hidalgo cos., Feb.-June; also Tam., N.L., S.L.P. and Ver.

5. BOUVARDIA SALISB.

About 50 species that are primarily in Latin America.

1. *Bouvardia ternifolia* (Cav.) Schlecht. SCARLET BOUVARDIA, TROMPETILLA, GLAVILLO. Shrub to about 1 m. high, rarely subherbaceous, the usually numerous branches erect; stipular sheath short, long-cuspidate or several-aristate; leaves sessile or short-petiolate, mostly in verticils of 3 or 4, ovate to lanceolate, acuminate to long-attenuate at apex, hirtellous to scabrous or glabrate; cymes terminal, usually few-flowered; calyx limb 4-lobate; corolla tube red, 15-32 mm. long, puberulent to short-villous outside with coarse thick hairs, with a short densely white-villous ring within at the base, the 4 ovate to ovate-oblong lobes 2-3 mm. long; anthers subsessile, included, 2.5-3 mm. long; capsule 5-7 mm. broad, didymous-globose, 2-celled, loculicidally bivalvate, rounded at apex; seeds numerous, dark-brown, compressed, winged, about 3 mm. broad. In dry soil, on rimrock or among boulders in mts. of the Trans-Pecos, May-Nov.; nearly throughout Mex. highlands n. to Ariz., N.M. and Tex.

6. HEDYOTIS L.¹⁸⁶ BLUETS

Erect or prostrate herbs or rarely low shrubs; leaves opposite to infrequently fasciculate, either sessile or petiolate, often linear; flowers large and colored or small and white, 4-merous, heterostylous, homostylous or short-stylous only; corolla salverform, funnellform or infrequently rotate; style slender, 1; stigmas 2; ovary 2-celled; capsule didymous or less commonly globular or turbinate, opening loculicidally across the summit. *Houstonia* L.; *Oldenlandia* L.

A diverse, largely pantropic genus of about 300 species best developed in the Old World; occasional in temperate regions of the Western Hemisphere and Asia.

1. Corolla 4 mm. long or more and colored, if somewhat shorter than white and flowering in winter or spring (to fall in *H. intricata*); capsules usually one-fourth to three-fourths inferior; seeds crateriform or concavo-convex, few to 20; in various parts of the state (2)
1. Corolla to 2 mm. long, white, flowering in summer or fall; capsules usually wholly inferior; seeds angulate, very numerous and small; in east (rarely central) Texas (13)
- 2(1). Shrubs with at least some leaves fasciculate 1. *H. intricata*.
2. Herbs (stems occasionally suffruticose) with leaves opposite or verticillate (3)
- 3(2). Perennials (doubtful cases should be keyed under both alternatives) (4)
3. Annuals (7)
- 4(3). Leaves acerose, often verticillate; free portion of capsules hirtellous 2. *H. acerosa*.
4. Leaves linear to ovate, opposite; free portion of capsules glabrous or minutely papillose (5)
- 5(4). Roots fibrous; leaves ovate to elliptic below; rare in east Texas 3. *H. purpurea*.
5. Stout taproot; leaves linear to lanceolate, infrequently elliptic; throughout Texas (6)
- 6(5). Stems few or numerous, not often tufted; corolla funnellform; capsules erect, usually longer than broad and obovoid-turbinate, one-half to three-fourths inferior; seeds concavo-convex 4. *H. nigricans*.
6. Stems cespitose; corolla salverform; capsules on recurved peduncles, broader than long, subdidymous, about one-fourth inferior; seeds crateriform with a hilar ridge 5. *H. pygmaea*.
- 7(3). Long thin taproot sparingly branched; flowers axillary; capsules often on recurved peduncles; common in south and west Texas (8)
7. Branched fibrous roots (if more or less unbranched then short and very delicate); flowers terminal; capsules upright; common in east Texas (11)
- 8(7). Corolla funnellform, 5-8 mm. long; flowers heterostylous; stipules to 2.5 mm. long, setiferous 6. *H. humifusa*.
8. Corolla salverform, to 3 mm. long; flowers homostylous or short-stylous only; stipules to 0.5 mm. long, without bristles (9)
- 9(8). Corolla longer than the calyx lobes; stems hirtellous; capsules on recurved or refracted peduncles, hirtellous, rounded at the base (10)
9. Corolla equal to or shorter than the calyx lobes; stems glabrous or sparingly hirtellous; capsules upright, glabrous, turbinate 7. *H. Greenmanii*.
- 10(9). Cauline leaves linear, widest to 1 mm.; peduncles 3-8 mm. long; flowers homostylous; capsule about three-fourths inferior 8. *H. subviscosa*.
10. Cauline leaves lanceolate, widest over 1 mm.; peduncles very short (to 2 mm.); flowers short-stylous only; capsule one-fourth to one-half inferior 9. *H. Croftiae*.

¹⁸⁶ Contributed by Walter H. Lewis.

- 11(7). Corolla white, the tube and lobes each 1.5-2 mm. long with the tube about equaling the length of the calyx lobes10. *H. australis*.
11. Corolla pink to violet, rarely white, the tube and lobes each 2.5-6 mm. long with the tube exceeding the length of the calyx lobes (12)
- 12(11). Stems 3-12 cm. long; corolla blue-violet to lilac, rarely white, the tube and lobes each (2.5-) 3-4 (-5) mm. long11. *H. crassifolia*.
12. Stems commonly to 3 cm. long; corolla pink, infrequently white or light-violet, the tube and lobes each about 6 mm. long12. *H. rosea*.
- 13(1). Annual; stems usually hirsute; leaves ovate to ovate-elliptic
.....13. *H. uniflora*.
13. Perennials or rarely annuals; stems usually glabrous; leaves linear to lanceolate (14)
- 14(13). Perennial; flowers solitary or in small clusters, subsessile; capsules short-ciliate or glabrous; frequent in east Texas14. *H. Boscii*.
14. Annual; flowers in 3-flowered cymes, occasionally solitary, the peduncles and pedicels (when present) each to 15 mm. long; very rare
.....15. *H. corymbosa*.

1. *Hedyotis intricata* Fosb. Erect to diffuse shrub, 2-6 dm. tall; stems fruticose, much-branched, the younger grayish; leaves opposite, usually 3- to 4-verticillate or fasciculate, sessile, linear, 4-10 mm. long, 1 mm. or less wide, bisulcate below, usually glabrous; flowers in few-flowered terminal cymes, heterostylous; corolla salverform, white, 2.5-5 mm. long, the lobes recurved, pubescent within, equal or slightly longer than the tube; capsule about 2.5 mm. broad, about one-half inferior, scabrous, the seeds concavo-convex. *Houstonia fasciculata* Gray. Higher elev. on rocky exposed ledges, slopes and creeks in s. Trans-Pecos, June-Nov.; from Tex. to s. N.M.; also n. Mex.

2. *Hedyotis acerosa* Gray. Low erect or ascending suffruticose perennial, 5-30 cm. tall; stems numerous and much-branched from a stout taproot, scaberulous or hirtellous; leaves opposite or mostly 3- or 4-verticillate, sessile, acerosa, 5-12 mm. long, 1 mm. or less wide, revolute, usually scaberulous; flowers axillary or terminal, solitary, sessile or pedunculate, heterostylous; corolla more or less salverform, white, pink or violet, 8-12 mm. long, the lobes one half to two thirds as long as the tube, villous within; capsule 2.5-3 mm. broad, about two-thirds inferior, the seeds crateriform. *Houstonia acerosa* Gray. Sandy and rocky limestone slopes, crevices and cliffs in w.-cen. and Trans-Pecos Tex., May-Sept.; from Tex. to s. N.M.; also Mex. (to S.L.P.)

Var. *Bigelovii* (Greenm.) W. H. Lewis. Stems suffruticose below; leaves opposite; flowers mostly pedunculate. *Houstonia polyplemoides* Gray. Infrequent throughout the range of the var. *acerosa*.

3. *Hedyotis purpurea* (L.) T.&G. Perennial herb with fibrous roots, 1-3 dm. tall; stems erect to ascending, one to several, usually sparsely pubescent; leaves ovate and sessile (3-5 cm. long, 1-2.5 cm. wide) to elliptic, subsessile and smaller basally, sparsely pubescent especially on midveins below; flowers in few-flowered terminal cymes, heterostylous; corolla funnelform, white to usually pale-purple, 5-7 mm. long, usually pubescent within, the lobes about one half the length of the tube; capsule 2-4 mm. broad, glabrous, about one-half inferior, the seeds subcrateriform. *Houstonia purpurea* L. In open woods, rare in s.e. Tex. (only Newton Co.), Apr.-June; from Ga. to Tex., n. to s. Me., s.e. Mich. and s.w. Mo.

4. *Hedyotis nigricans* (Lam.) Fosb. Erect, ascending or procumbent perennials from a stout taproot, 5-50 cm. tall; stems few or numerous, occasionally cespitose, glabrous; leaves more or less sessile, linear-filiform to lanceolate, infrequently elliptic, 1-4 cm. long, 0.5-4 mm. wide, usually scaberulous along the margins and nerves below, the margins often revolute; flowers usually in leafy cymes, heterostylous, sessile or pedunculate; corolla funnelform, white, pink or purplish, 5-8 mm. long, the lobes equaling or shorter than the tube, villous within; capsule 2.5-3 mm. long, usually longer than broad and obovoid-turbinate or rarely more or less equal and globose, one-half to three-fourths inferior, the seeds concavo-convex. *Houstonia angustifolia* Michx., *H. nigricans* (Lam.) Fern., *H. salina* Heller. Highly variable and common throughout Tex., Apr.-Nov.; from Fla. to Ariz., n. to Ga., O., s. Mich. and Neb.; also Mex.

Var. *filifolia* (Chapm.) Shinn. Leaves linear-filiform; capsule somewhat smaller

than typical. *Oldenlandia angustifolia* var. *filifolia* Chapm. Occasional in s.-cen. Tex.; also s. Fla., rarely Ala. and Mo.

Var. *parviflora* (Gray) W. H. Lewis. Stems reduced, 5-15 cm. tall, much-branched below; capsule more or less equal and globose, about one-half inferior, the short calyx lobes more or less equaling the capsule. *Hedyotis stenophylla* var. *parviflora* Gray, *H. angulata* Fosb., *Houstonia rupicola* Greenm. Infrequent in rocky crevices and hillsides in w. Tex.

Var. *rigidiuscula* (Gray) Shinnars. Stems reduced, 5-15 cm. tall, much-branched below; capsule longer than broad, obovoid-turbinate, about three-fourths inferior, the calyx lobes often exceeding the capsule. *Houstonia angustifolia* var. *rigidiuscula* Gray. Frequent on hillsides, canyons and rocky escarpments in w. and n.w. Tex.; from Fla. (?) and Tex. to Ariz.; also Mex.

5. *Hedyotis pygmaea* R. & S. Cespitose perennial, 5-10 cm. high; numerous stems erect or spreading, scaberulous or papillose; leaves linear, the lowest often spatulate, 5-25 mm. long, 0.5-3 mm. wide, usually scaberulous; flowers axillary or usually in terminal cymes, the short peduncles recurved after anthesis; calyx lobes 1.5-2 mm. long; corolla salverform, white to pale-purple, 4-7 mm. long, the lobes equal to or commonly shorter than the tube, papillose within; capsule to 3.5 mm. in diameter, subdidymous, broader than long, minutely papillose, about one-fourth inferior, the seeds crateriform. *Houstonia Wrightii* Gray, *Hedyotis Wrightii* (Gray) Fosb. Open hillsides, rocky canyon slopes and sandy mt. streams, infrequent in cen. Trans-Pecos, June-July; from Tex. to cen. Ariz.; also Mex. (to Pue. and Ver.).

6. *Hedyotis humifusa* Gray. Erect or spreading annual; stems 3-10 cm. long, much-branched from a single long slender root, scaberulous; leaves linear, 10-15 mm. long, 0.5-3 mm. wide, rosette leaves oblanceolate and larger, mucronate; stipules to 2.5 mm. long, white, copiously setiferous; flowers showy, axillary, heterostylous, the peduncle recurved after anthesis; calyx lobes very narrow, 3-4 mm. long; corolla funnelform, 5-8 mm. long, white to pink, infrequently pale-purple or lavender, the lobes somewhat shorter than the tube, papillose within; capsule to 2.5 mm. in diameter, papillose. *Houstonia humifusa* Gray. Grasslands, plains, dunes and pastures in sandy soils, w., n., cen. and s. Tex., Mar.-Sept.; from Tex. to s.e. Ariz., n. to w. Okla.

7. *Hedyotis Greenmanii* Fosb. Low winter annual, much-branched from a single slender root; stems ascending to 2 dm., glabrous or sparingly hirtellous; leaves linear to lanceolate, to 15 mm. long, 1-2 mm. wide, larger basally, glabrous; flowers very small, short-stylous, on erect peduncles 5-15 mm. long; corolla salverform, white (tips of lobes often pink), 1-2 mm. long, about equaling the length of the calyx lobes; capsule glabrous with prominent calyx lobes, 2.5 mm. broad, turbinate, about three-fourths inferior, the seeds crateriform. *Houstonia parviflora* Greenm. Infrequent in grassy pastures in cen. and s. Tex., Feb.-Apr.; endemic.

8. *Hedyotis subviscosa* (Gray) Shinnars. Erect to spreading winter and spring annual; stems 4-15 cm. tall, hirtellous; leaves linear, to 2 cm. long, about 1 mm. wide, basally oblanceolate and broader and longer, hirtellous to glabrate; flowers axillary, small, homostylous, the peduncles 3-8 mm. long, recurved or refracted after anthesis; corolla salverform, white or rarely light-pink, 2-3 mm. long, exceeding the short calyx lobes; capsule hirtellous, rounded at base, to 4 mm. broad, about three-fourths inferior, the seeds open crateriform. *Houstonia subviscosa* (Gray) Gray. Sandy soils in open pastures, creek margins and dunes in cen., s. and Gulf Coast Tex., Mar.-May; also n.e. Mex. (?).

9. *Hedyotis Croftiae* (Britt. & Rusby) Shinnars. Low spreading winter annual; stems much-branched, hirtellous or ciliate; leaves linear to lanceolate, about 1 cm. long and 2 mm. wide, basally larger, the margins ciliate; flowers small, short-stylous, on very short (to 2 mm.) recurved or refracted axillary peduncles; corolla salverform, white, 2-3 mm. long, exceeding the calyx lobes; capsule minutely hirtellous, rounded at base, about 3 mm. broad, one-fourth to one-half inferior, the seeds broadly crateriform. *Houstonia Croftiae* Britt. & Rusby. Infrequent in sandy soils of open pastures and waste fields in Rio Grande Plains, Feb.-Apr.; endemic.

10. *Hedyotis australis* Lewis & Moore. Low winter annual, often cespitose; stems upright to spreading, 3-10 cm. long; lower leaves broadly spatulate to ovate, about 1 cm. long and 2-3.5 mm. wide, the margins glabrous; flowers terminal, solitary, short-stylous;

corolla salverform, white, the tube and lobes each 1.5-2 mm. long with the tube equaling the length of the calyx lobes. Frequent in pastures, waste fields and along roadsides in e. and s.e. Tex., Feb.-Apr.; cen. Ga., from e. Miss. to Tex. and s. Ark.

11. *Hedyotis crassifolia* Raf. SMALL BLUETS, STAR-VIOLET. Low winter annual, often cespitose; stems 3-12 cm. long, spreading; lower leaves broadly spatulate to ovate, about 1 cm. long and 4-5 mm. wide, the margins often pubescent; flowers terminal, showy, short-stylous; corolla salverform, blue-violet to lilac, rarely white, the narrow tube 3-5 mm. long, the lobes 2.5-4 mm. long. *Houstonia minima* Beck, *H. patens* Ell., *H. pusilla* Schoepf. Common in pastures, prairies, waste fields and along roadsides in e. third of Tex., (Jan.-) Feb.-Apr.; from Fla. to Tex., n. to Va., Ill. and Kan.

12. *Hedyotis rosea* Raf. Low winter annual to 3 cm. tall (when stems upright), somewhat longer when spreading; lower leaves narrowly spatulate, to 1 cm. long, commonly 1-2 mm. wide; flowers showy, terminal, short-stylous; corolla salverform, pink or less frequently white or light-violet, the tube and lobes each about 6 mm. long. *Houstonia pygmaea* Muell. & Muell., *Hedyotis Taylorae* Fosb. Pastures, waste fields and roadsides, infrequent in e. third of Tex., Feb.-Apr.; from e. Miss. to Tex., n. to Ark. and e. Okla.

13. *Hedyotis uniflora* (L.) Lam. Erect to usually spreading summer annual; stems often branched, 1-6 dm. long, white-hirsutulous along the angles to less frequently glabrate; leaves ovate to ovate-elliptic, 1-2.5 cm. long, the midveins and margins commonly white-hirsutulous, the petioles 1-2.5 mm. long or rarely absent; flowers very small, homostylous, axillary in small or large clusters or rarely solitary, subsessile; corolla rotate, white, about 1 mm. long, shorter than the calyx lobes; capsule to 2 mm. broad, usually densely white-hirsutulous, more or less wholly inferior, the seeds angular, very numerous. On wet sandy-loam banks in e. Tex., June-Sept.; from Fla. to Tex., n. to s. N.Y. and s.e. Mo.

Var. *fasciculata* (Bert.) W. H. Lewis. Stems, leaves and usually capsules glabrous; leaves sessile. Infrequent on Gulf Coast, Fla. to Tex.

14. *Hedyotis Boscii* DC. Prostrate or spreading perennial; stems branched and often cespitose, 1-3 dm. long, glabrous to infrequently hirtellous; leaves mostly linear, 10-25 mm. long, 1-3 mm. wide, glabrous, sessile or subsessile; flowers very small, homostylous, axillary in small clusters or solitary, subsessile; corolla rotate, white (lobes often tipped pink), about 1 mm. long, shorter than the calyx lobes; capsule to 2.5 mm. broad, glabrous or short-ciliate, more or less wholly inferior, the seeds angular and very numerous. *Oldenlandia Boscii* (DC.) Chapm. Edges of ponds and rivers in lowlands and savannahs of e. Tex., rare in s.-cen. Tex., May-Aug.; from Fla. to Tex., n. to s.e. Va., Tenn. and s.e. Mo.

15. *Hedyotis corymbosa* (L.) Lam. Erect or spreading summer annual; stems branched, glabrous; leaves linear to lanceolate, 1-3.5 cm. long, 1-5 mm. wide, the margins scaberulous; flowers small, homostylous, axillary, usually in 3-flowered cymes or solitary, the peduncles to 15 mm. long, the pedicels often as long; corolla more or less salverform, white, about 2 mm. long, equaling or exceeding somewhat the calyx lobes; capsule to 2 mm. broad, glabrous, more or less wholly inferior, the seeds angular and very numerous. *Oldenlandia corymbosa* L. Introd. in lawns rarely in e. Tex. (also Gulf Coast?), July-Sept.; occasional from Fla. to Tex., a widespread pantropic weed.

Hedyotis rubra (Cav.) Gray. Cespitose perennial from a long slender taproot; leaves oblanceolate-linear below to linear above; corolla deep-rose to purple, rarely white, salverform, 1.5-3 cm. long. *Houstonia rubra* Cav. Not yet known from Texas, but occasional in neighboring New Mexico and Mexico. It should occur in the Trans-Pecos region.

7. PENTODON HOCHST.

Two species; represented in both hemispheres.

1. *Pentodon pentandrus* (Schum. & Thonn.) Vatke. Annual glabrous herb, the 4-angled stems often diffusely branched and partly creeping; leaves petioled, ovate to

elliptic or elliptic-lanceolate, obtuse to acute, 2-5 cm. long, entire; flowers in axillary or terminal cymes; hypanthium clavate; sepals 5, triangular-lanceolate to lanceolate, about 1 mm. long; pedicels thick, 3-4 mm. long; corolla white, funnelform, the tube 2-3 mm. long, the abbreviated lobes ovate to lanceolate; stamens 5, the filaments adnate to above the middle of the corolla tube; style columnar; capsule included in the hypanthium, 2-lobed, 2-4 mm. long. *P. Halei* (T.&G.) Gray. In swampy ground in s.e. Tex., Aug.-Sept.; from Tex. to Fla.

8. CEPHALANTHUS L. BUTTONBUSH

Shrubs or small trees; leaves opposite or with some verticillate, petiolate; flowers white or yellowish, densely aggregated into spherical peduncled heads; calyx tube obpyramidal, the limb 4- or 5-toothed; corolla tubular-funnelform, the 4 or 5 teeth imbricated in the bud; stamens 4, inserted on the corolla throat; anthers bicuspidate at base; ovary 2-celled, with one ovule in each cell; style filiform, much-exserted; stigma capitate; fruit small, at length splitting from the base upward into 2 to 4 closed 1-seeded segments.

About 17 species that are natives of America and Asia; sometimes placed in the segregate family Naucleaceae.

- 1. Calyx glabrous outside or the tube with a few long white hairs at the base 1. *C. occidentalis*.
- 1. Calyx densely pubescent outside with short appressed hairs 2. *C. salicifolius*.

1. *Cephalanthus occidentalis* L. COMMON BUTTONBUSH, HONEY-BALLS, GLOBE-FLOWERS. Shrub or small tree, sometimes to 15 m. high, with a trunk rarely 3 dm. in diameter, the branchlets slender, brown or grayish, glabrous or short-pilose; stipules 2-4 mm. long, deltoid, acute to acuminate, usually with glands along the margins; leaves opposite or ternate, sometimes 4-nate (but this varies on a single plant), the stout or slender petioles to 3 cm. long, glabrous or pilose, ovate to ovate-oblong or narrowly lanceolate, to 19 cm. long and 85 mm. wide, subcordate to cuneate at the base, abruptly or subabruptly long- or short-acuminate at the apex, bright-green above, glabrous or pilose beneath, with prominent lateral veins; peduncles terminal and axillary, simple or branched, stout, to 1 dm. long, glabrous; heads about 15 mm. in diameter; bractlets filiform-clavate, pilose above; hypanthium and calyx together 2-3 mm. long, glabrous or sparsely long-pilose at the base; calyx about 1 mm. long, shallowly 4- to 5-dentate, densely pubescent within, the lobes rounded, usually glandular; corolla 5-9 mm. long, glabrous outside, the 4 or 5 lobes ovate or oval, sparsely pubescent within, with a small black gland in each sinus; capsule 4-8 mm. long; seed solitary, brown, with a large white aril. In swamps, about ponds and margins of streams throughout the state, June-Sept.; from Fla. to Mex., n. to e. Can., N.Y. and w. to Calif.

Those plants with branchlets and at least the lower leaf surfaces soft-pubescent are segregated as var. *pubescens* Raf., while those with short-petioled narrower leaves arranged in whorls of three are segregated as var. *californicus* Benth.

2. *Cephalanthus salicifolius* H. & B. Shrub or small tree, the branches reddish-brown, glabrous; stipules 2-3 mm. long, deltoid, acute or acuminate, often with marginal glands, glabrous; leaves opposite and ternate, the stout petioles to 4 mm. long, glabrous, narrowly oblong to elliptic-oblong or lanceolate, to 12 cm. long and 23 mm. wide, acute to subcordate at the base, rounded and apiculate to long-attenuate at the apex, glabrous or sparsely pilose beneath along the veins, bright-green above, lustrous; peduncles mostly simple, 2-4 cm. long, glabrous, the heads 6-8 mm. in diameter, the receptacle very densely setose; calyx and hypanthium 2-2.5 mm. long, densely white-sericeous with short hairs; calyx 1 mm. long or shorter, shallowly 4- to 5-dentate, densely pilose within, the lobes minute, rounded, often glanduliferous; corolla 6-7 mm. long, glabrous outside, the lobes oblong or ovate, sparsely pilose within, often with black glands in the sinuses; capsule 4-5 mm. long, densely and minutely sericeous; seeds brown, with a large white aril. In wet soil in Hidalgo Co., extreme s. Tex., Mar.-July; from s. Tex. to s.-cen. Mex., also Hond.

9. CHIOCOCCA L.

About 20 species that are native to the Americas.

1. *Chiococca alba* (L.) Hitchc. DAVID'S MILKBERRY, SNOW-BERRY, PERLILLA, CANICA. Shrub, tall and sometimes climbing, glabrous; branchlets 4-angled or terete; leaves petiolate, opposite, papery, ovate to ovate-oblong or lanceolate, usually narrowed at base, abruptly short-acuminate at apex, to 9 cm. long and 3 cm. wide; stipules (including the hard point) 2-2.5 mm. long; racemes rather lax, about as long as the leaves, usually branched, many-flowered; bracts awl-shaped, about 1 mm. long; pedicels slender, to 5 mm. long; calyx tube subglobose, to 2 mm. long, longer than the 5-toothed limb that is persistent in the fruit; corolla greenish-white or yellow, funnellform, glabrous in throat, the tube to 6 mm. long, the ovate to ovate-lanceolate lobes to 4 mm. long; stamens 5, included, the anthers to 3 mm. long, disk prominent; drupe globose, compressed, white, leathery, 4-5 mm. in diameter; seeds brown, 4 mm. long. In palm groves and brushlands in Cameron and Hidalgo cos., flowering throughout the year; also, Fla. and throughout trop. and subtrop. Am.

The flowers of our plant average smaller than those of plants in tropical America. Various medicinal properties have been attributed to the plant.

10. BORRERIA MEY.

About 150 species that are natives of warm and tropical regions.

1. *Borreria verticillata* (L.) Mey. BOLON BLANCO. Small shrubby perennial, the branches angled and erect-ascending, essentially glabrous or sparsely scabrous, to about 1 m. high; leaves opposite, nearly sessile, linear to linear-lanceolate, acute at apex, 2-5 cm. long, with tufts of somewhat smaller leaves in their axils; teeth of the stipular sheaths setaceous; glomerules terminal or also at one or two of the nodes, dense, globose, 1-1.5 cm. in diameter, many-flowered; calyx tube turbinate; calyx lobes 2, narrow, persistent, about 1 mm. long; corolla white, funnellform, about 2 mm. long, its 4 spreading lobes ovate and acute; stamens 4, adnate to the corolla tube; disk obsolete or cushionlike; styles wholly or partially united; capsule subglobose, leathery, about 1 mm. in diameter, glabrous, the 2 carpels opening along their inner face, each 1-seeded. *B. podocephala* of auth. In sandy loam in open areas along the Tex. coast, Mar.-May; throughout the W.I. and cont. trop. Am.

11. MITCHELLA L.

PARTRIDGE-BERRY

Two species, the other Japanese.

1. *Mitchella repens* L. TWO-EYED BERRY, RUNNING BOX. Small glabrous trailing evergreen herbs forming appressed mats of indefinite size; leaves petioled, opposite, ovate to orbicular, rounded to cordate at base, obtuse at apex, shining, pinnately veined and sometimes variegated with whitish lines, 15-25 mm. long; stipules triangular-subulate; peduncle short, terminal, bearing 2 flowers at its summit; flowers fragrant, white, often tinged with purple, in pairs with their ovaries united, occasionally 3- to 6-merous, always dimorphous, all flowers of some individuals have exerted stamens and included stigmas, all flowers of other individuals with included stamens and exerted style; calyx 4-toothed; corolla tube about 13 mm. long, densely bearded inside, surpassing the oblong spreading lobes; style 1; stigmas 4, linear; drupes edible, 4-6 mm. in diameter, bright-red or rarely white (f. *leucocarpa* Bissell), overwintering, crowned with the calyx teeth of the 2 flowers, with 4 small seedlike bony nutlets to each flower. On dry or moist knolls in woods in e. Tex., May-July; from Fla. to Tex., n. to e. Can., Ont. and Minn.

12. MITRACARPUM ZUCC.

Annual or perennial herbs or low shrubs, the stems and branches mostly 4-angled; leaves opposite; stipular sheaths with several bristles; flowers small, white, densely

capitate; calyx teeth 4 or 5, the lateral ones nearly subulate, the others smaller; corolla salverform or funnelform, its 4 spreading lobes valvate; stamens 4, the anthers oblong or linear; ovary usually 2-celled; ovules one in each cavity; style branches narrow; capsule didymous, thin-walled, circumscissile; seeds globose or oblong.

About 40 species, mostly in the American tropics.

- 1. Plants nearly glabrous to somewhat minutely scabrous (especially the leaf margins); corolla tube 1.5-2 mm. long 1. *M. breviflorum*.
- 1. Plants (especially stem and branches) more or less hirtellous throughout; corolla tube 2.5-3 mm. long 2. *M. hirtum*.

1. *Mitracarpum breviflorum* Gray. WHITE GIRDLEPOD. Annual to 4 dm. or more high, mostly branched from the base, nearly glabrous and smooth or with the stems and leaves somewhat serrulate and scabrous; flowers small, in axillary verticillate-capitate clusters and a terminal one; leaves lanceolate to oblanceolate, obtuse to acute at apex, 2-5 cm. long; the petiolar base often pubescent on lower surface; stipules with few setiferous appendages; two larger calyx lobes lanceolate-subulate, longer than tube, equaling or surpassing the small (1.5-2 mm. long) glabrous white corolla, the intermediate small calyx lobes dentiform and hyaline; capsule about 1.5 mm. in diameter, circumscissile about the middle. On flats near Boca Chica, Cameron Co., June-Aug.; from Tex. to Ariz. and adj. Mex.

2. *Mitracarpum hirtum* (L.) DC. Annual to about 4 dm. high, more or less hirtellous throughout; stems branched, the branches 4-angled; leaves sessile or very short-petioled, oblong to elliptic, narrowed at base, obtuse to acute at apex, 2-6 cm. long; stipular sheath 2-3 mm. long, the bristles about as long; flower heads terminal and axillary, subglobose, many-flowered, 6-12 mm. in diameter; lateral sepals linear-lanceolate, acuminate, about 2 mm. long; corolla 2.5-3 mm. long; capsule shorter than the calyx, circumscissile near the middle. Exceedingly rare in grassy places in the Tex. coastal prairies, inland to Bexar and Wilson cos., May-July; also in W.I. and cont. trop. Am.

13. RICHARDIA L.

Various pubescent annuals or perennial herbs, mostly diffusely branched, prostrate to ascending, with broadish short-petioled to subsessile leaves and setiferous stipules; flowers whitish, mostly in a terminal capitate cluster, involucre by the one or two uppermost pairs of leaves; calyx teeth 4 to 8 (commonly 5 or 6), lanceolate, gamophyllous at base, circumscissile-deciduous as a whole at or before the separation of the 2 to 4 closed or barely opening rough coriaceous carpels; corolla funnelform, with 4 to 8 lobes; stigmas 2 to 4, linear or spatulate; fruit separating longitudinally at maturity into 2 to 4 1-seeded cocci.

About 10 species that are natives of tropical America.

- 1. Flowers and fruits 4-merous; fruit separating into 4 almost smooth obovoid cocci, the scar broad and flat or somewhat tumid; stems and leaves densely white hirsute; plants prostrate 1. *R. humistrata*.
- 1. Flowers and fruits 3-merous; fruit more or less muriculate, separating into 3 cocci; plants usually with some ascending branches (2)
- 2(1). Cocci obovoid; coccus scar broad, open, excavate, with a central keel; leaves thick but not coriaceous, gray-green when dry, appressed-hispid on both surfaces; stems hirsute 2. *R. brasiliensis*.
- 2. Cocci nearly cylindrical; coccus scar closed to a narrow groove or sulcate; leaves subcoriaceous, yellow-green when dry, essentially glabrous except for scabrous margins and midrib of lower surface; stems somewhat villous 3. *R. scabra*.

1. *Richardia humistrata* (Cham. & Schlecht.) Steud. Prostrate herb, densely white-hirsute; stems rooting at the nodes, the internodes short; stipular sheaths much-abbreviated, the elongate bristles conspicuous; leaves ovate to oblong-elliptic, to at least 3 cm. long and 15 mm. wide, narrowed to a short petiolar base, acute to acuminate at

apex; flowers and fruits in dense involucrate heads at summit of branches; calyx lobes triangular, acute, about 1.5 mm. long, densely pilose; corolla about 2 mm. long, inconspicuous; cocci in fours, glabrous, usually loosely held together, obovoid to ellipsoid, about 2 mm. long, tan-color. This Brazilian species has recently been introduced on the coast in the Gulf States. It should be looked for in dry sandy places.

2. *Richardia brasiliensis* Gomes. Annual, becoming perennial, with deep thickened root and villous or pilose diffusely branched or matted stems, to 3 dm. high; stipular bristles about as long as the sheath; leaves broadly ovate to elliptic, tapering at the base to a short petiole, acute to subacute at apex, 2-4 cm. long, to about 2 cm. wide, densely covered with appressed roughish hairs; involucre 4-leaved, the flower heads to 15 mm. in diameter; calyx tube barely 1.5 mm. long; calyx lobes about 3 mm. long, connate at base, narrowly triangular, acute, hairy with ciliate margins; corolla tube 4-5 mm. long; corolla lobes spreading, narrowly ovate, acute, shortly hairy at tip; fruit obovoid, about 2.5 mm. long, muriculate-hispidulous, dull-red, the cocci keeled on the ventral surface; seed barely 2 mm. long, broadly ovoid to subrotund, brown, smooth. On dunes, coastal prairies, in sandy scrub oak areas, roadsides and waste places on the Rio Grande Plains and in s. Tex., May-Oct.; from Fla. to Tex. and Mex., n. to s.e. Va.

3. *Richardia scabra* L. More or less loosely branching short-pubescent or hirsute annual to about 8.5 dm. high; leaves ovate to elliptic-lanceolate, obtuse to acute at apex, roughish, fleshy, 2-6 cm. long; stipules with rather few setiform appendages; glomerules depressed; calyx lobes united only at base, three to four times length of ovary; corolla hypocrateriform, 5-6 mm. long, its tube exerted from the calyx, the usually 6 lobes much-exceeding the stamens; mature fruit 3-3.5 mm. long, muriculate-tuberculate, the cocci ventrally sulcate. Roadsides, cult. fields and waste places in e. half of Tex., June-Oct.; from Fla. to Tex., n. to s.e. Va., s. Ind. and Ark.; naturalized from trop. Am.

Said to be relished by cattle. The root, in South America, is used as an emetic and as a substitute for Ipecac.

14. SPERMACOCE L. BUTTONWEED

Low spreading annual or perennial herbs; leaves opposite, their bases or petioles connected by a bristle-bearing stipular membrane; flowers small, whitish to purplish-blue, crowded into sessile axillary and terminal whorled clusters or heads; calyx tube short, obovoid, the limb parted into 4 teethlike lobes; corolla funnellform or salverform, 4-lobed, valvate in the bud; stamens 4, inserted on the corolla tube; ovary 2-celled; ovules one in each cavity; style slender, the stigma 2-cleft; fruit a dry capsule, sessile, coriaceous or somewhat crustaceous, sometimes didymous, splitting when ripe into 2 carpels, one of the carpels usually carrying with it the septum and therefore closed, the other carpel open on the inner face.

About 100 species in the warmer parts of America.

- 1. Flowers numerous in a dense conspicuous head; corolla 2-3 mm. long, densely white-bearded in the throat; fruit 2-4 mm. long, smooth, capped by sepals 1.5-2 mm. long1. *S. glabra*.
- 1. Flowers few in inconspicuous heads; corolla less than 2 mm. long; fruit typically less than 3 mm. long, capped by sepals 1 mm. long or less (2)
- 2(1). Corolla somewhat pubescent at and above the throat; fruit didymous-obovate, mostly puberulent, 2-2.5 mm. long2. *S. tenuior*.
- 2. Corolla glabrous within or with few hairs in the throat; fruit subglobose, smooth, 1-1.5 mm. long3. *S. floridana*.

1. *Spermacoce glabra* Michx. SMOOTH BUTTONWEED. Glabrous perennial herb; stems simple or unbranched, spreading, 6 dm. long or more; leaves elliptic to oblong-lanceolate or oblanceolate, acute to acuminate at apex, to 8 cm. long; stipular sheaths with several filiform segments 2-3 mm. long; axillary heads many-flowered; corolla 2-3 mm. long, slightly exceeding the calyx, conspicuously white-bearded in the throat, bearing the anthers at its base; filaments and styles short; fruit somewhat turbinate, smooth, 2-4 mm.

long, crowned by the conspicuous triangular-lanceolate spreading calyx teeth. Damp shores, low woodlands and in openings in the e. third of Tex., May-Oct.; from Fla. to Tex., n. to O., Ind., Ill., Mo. and Kan.

2. *Spermacoce tenuior* L. **SLENDER BUTTONWEED**. Annual, glabrous or nearly so; stems simple and erect or more or less diffusely branched from the base, to about 4 dm. long; leaves linear to oblong or oblong-lanceolate, narrowed into short petioles, acute to acuminate at apex, more or less scabrous, 2-5 cm. long; axillary heads with few flowers; calyx teeth subulate to subulate-lanceolate; corolla white, about 1.5 mm. long, funnelform, somewhat pubescent at and above the throat; fruit didymous-obovoid, mostly puberulent or short-pubescent, 2-2.5 mm. long, somewhat crustaceous and crowned with the 4 calyx teeth. In clay soils along creeks in s. Tex., Sept.-Jan.; also Fla. and La., the W.I. and cont. trop. Am.

3. *Spermacoce floridana* Urban. Annual, smooth, and glabrous; stems more or less diffusely branched from the base, ascending or spreading, the branches to about 5 dm. long, slender and somewhat wiry; leaves slender-petioled, broadly to narrowly elliptic to elliptic-lanceolate, tapering to somewhat rounded at the base, acute to acuminate at apex, to about 7 cm. long and 3 cm. wide, usually much smaller; axillary clusters of few flowers less than 1 cm. thick; sepals subulate-lanceolate, 1-1.5 mm. long; corolla white, about 1 mm. long, glabrous within, the tube campanulate, the lobes ovate-oblong; fruit subglobose, smooth, 1-1.5 mm. long. In palm groves in Cameron Co., Feb.-Apr.; also Fla. and W.I.

15. DIODIA L. BUTTONWEED

Spreading, decumbent, prostrate or ascending annual or perennial herbs; leaves opposite, entire, mostly sessile; stipules sheathing, long-setiferous; flowers mostly solitary or several and sessile in leaf-axils, rarely aggregated at summit of branches; calyx teeth 2 to 5, often unequal; corolla funnelform or salverform, the lobes 3 or 4; stamens and style usually exserted, the stamens usually 4 and inserted on the corolla tube, the style filiform and simple or cleft; fruit composed of 2 or 3 crustaceous or leathery indehiscent carpels that usually separate.

About 50 species, mostly American and African tropics and subtropics.

1. Fruits leathery, strongly 6-ribbed, glabrous or villous, crowned by 2 prominent calyx teeth, the 2 carpels rarely separated; corolla salverform, the tube 7-10 mm. long 1. *D. virginiana*.
1. Fruits crustaceous, not ribbed, strigose to bristly-hirsute or rarely glabrous, crowned by usually 4 calyx teeth, the carpels readily separated; corolla funnelform, 2-6 mm. long (2)
- 2(1). Stems spreading or ascending, the internodes usually more than 2 cm. long; leaves usually 3 cm. long or more; flowers 1 or several in leaf axils; corolla 4-6 mm. long; fruits 2-carpellate, about 4 mm. long 2. *D. teres*.
2. Stems prostrate, the internodes rarely to 2 cm. long; leaves usually 2 cm. or less long; flowers almost entirely aggregated at summit of branches; corolla 2-4 mm. long; fruits 3-carpellate, about 2 mm. long 3. *D. tricoeca*.

1. *Diodia virginiana* L. Plant diffusely spreading or procumbent from a perennial root, the forking branches to about 6 dm. long, nearly glabrous to villous-hirsute; leaves sessile or essentially so, elliptic-oblong to elliptic-oblong-lanceolate or linear-lanceolate, usually tapering to base, obtuse to acute or acuminate at apex, the margins slightly serrulate, mostly bright green, to 9 cm. long and 2 cm. wide, usually much smaller; stipular bristles few, strong and flat, sometimes sparingly hirsute; corolla white, 7-10 mm. long, the slender tube abruptly expanded into the large limb; style 2-parted; fruit ellipsoid, bicarpellate, 5-8 mm. long, to 5 mm. in diameter, glabrous to villous, crowned with 2 or sometimes 3 lanceolate more or less pubescent calyx teeth; carpels suberose-crustaceous, 3-ribbed on the back, held together by a thin epicarp that rarely ruptures. In swamps, meadows, coastal prairies and in mud along streams in e. third of Tex., May-Oct.; from Fla. to Tex., n. to N.J., Ill. and Mo.

Plants in extreme southeastern Texas with short elliptic to elliptic-obovate leaves that do not taper noticeably to the base, and with fruits about 5 mm. long are sometimes segregated as var. *latifolia* T.&G. (*D. tetragona* Walt.)

2. *Diodia teres* Walt. POOR JOE, ROUGH BUTTONWEED. Plant diffusely spreading or ascending from an annual but sometimes lignescent root, rigid, puberulent to hirsute; stems and branches to about 8 dm. long, terete, rather quadrangular above; leaves linear to lanceolate, rounded to somewhat clasping at the sessile base, acute to acuminate at the apex, rather rigid and often with revolute margins, more or less scabrous, to 5 cm. long and 1 cm. wide, usually much smaller; stipular bristles numerous, filiform, often reddish-brown, usually equaling the flowers and surpassing the fruit; corolla funnelform, whitish to pinkish-purple, 4-6 mm. long; style undivided; fruit obovate-turbinate, not ribbed, commonly hispid or hispidulous, about 4 mm. long, bicarpellate, crowned with usually 4 somewhat unequal ovate ciliate calyx lobes, when carpels separate often 3 lobes on one carpel and 1 on the other. In sandy soils in woodlands and open areas in the e. two thirds of Tex., rare on the Edwards Plateau, May-Nov.; from Fla. to Tex., n. to N.E., O., Ill. and Mo.

Those plants with a slender apical seta on each young leaf are segregated as var. *setifera* Fern. & Griseb.

3. *Diodia tricoeca* T.&G. PRAIRIE BUTTONWEED. Plant diffusely branched from a perennial root, low and much-spreading or depressed to form mats of 3 dm. across or more, the internodes rarely as much as 2 cm. long; leaves sessile, linear to lanceolate, acute to acuminate at apex, 25 mm. long or less; stipular bristles slender, whitish; flowers clustered at summit of branches and rarely in uppermost leaf axils; calyx teeth 3 to 5, usually 4 and equal, lanceolate, more or less pubescent, usually longer than the fruit; corolla white, funnelform, 2-4 mm. long, the limb 3- or 4-lobed; stigmas short and broad; fruit obovate-globose, about 2 mm. long, usually partially or wholly hispidulous, sometimes essentially glabrous, tricarpetate; carpels flattened on the ventral face, separating from a weak carpophore, either closed or torn open ventrally. *Crusea tricoeca* (T.&G.) Heller, *C. allococca* Gray, *Richardia tricoeca* (T.&G.) Standl. In sandy or sandy-clay soils in brushy or open-wooded areas, primarily in s. Tex., Mar.-Nov.; also adj. Mex.

FAM. 169. CAPRIFOLIACEAE Juss.

HONEYSUCKLE FAMILY

Shrubs, vines or rarely herbs with opposite usually exstipulate entire leaves; flowers perfect, gamopetalous, regular or irregular; corolla tubular to funnelform or rotate; calyx tube adherent to the 2- to 5-celled ovary; stamens as many as the corolla lobes and inserted on corolla tube; fruit a berry, drupe or capsule, 1- to several-seeded; seeds anatropous.

About 12 genera and 450 species mostly in North Temperate regions and tropical mountains.

1. Corolla rotate to open-campanulate, regular, deeply 5-lobed; style abbreviated, the 1 to 5 stigmas sessile or nearly so; inflorescences terminal and cymose (2)
1. Corolla elongate, funnelform to campanulate, often more or less irregular; style 1, elongate, with a usually capitate stigma; inflorescences lateral or terminal (3)
- 2(1). Leaves simple; fruit a 1-seeded drupe 1. *Viburnum*, p. 1497.
2. Leaves pinnately compound; fruit a 3-seeded berry ... 2. *Sambucus*, p. 1499.
- 3(1). Erect coarse herbs with large leaves and sessile flowers in their axils; fruit drupaceous, with 2 to 5 stones 5. *Triosteum*, p. 1503.
3. Erect or climbing shrubs (4)
- 4(3). Corolla funnelform to tubular; ovary 2- or 3-celled; fruit a berry, many-seeded ..
..... 3. *Lonicera*, p. 1500.
4. Corolla short-campanulate to salverform; ovary 4-celled; fruit a berrylike drupe, with only 2 stones maturing 4. *Symphoricarpos*, p. 1501.

1. VIBURNUM L. VIBURNUM. ARROW-WOOD

Shrubs or small trees with simple leaves and numerous white or rarely pink flowers in compound cymes; petioles sometimes bearing appendages that are apparently stipules; leaf buds naked or with pairs of scales; calyx 5-toothed; corolla spreading, rotate to broadly campanulate, deeply 5-lobed; stamens 5, exserted, the anthers oblong and introrse; style none, the 1 to 3 stigmas sessile on summit of ovary; fruit a 1-celled 1-seeded soft-pulpy drupe with a thin-crustaceous tumid or flattened stone.

About 200 species in the North Temperate Zone.

1. Leaves with margins entire to undulate or only finely serrulate or rarely denticulate (2)
 1. Leaves coarsely dentate to crenate-dentate and sometimes lobed (5)
 - 2(1). Cymes definitely peduncled; leaves entire to undulate or rarely irregularly denticulate (3)
 2. Cyme sessile or essentially so; leaves serrulate with sharp teeth (4)
 - 3(2). Leaves somewhat lustrous above, the veins raised below and strongly curved, gradually tapering or rounded to the apex, the margin revolute, sometimes somewhat denticulate; twigs, petioles and lower surface of leaves rusty-scurfy; anthers elevated 4-5 mm. above corolla; pulp of drupe bitter; stone globose-obovate, smooth in cross section 1. *V. nudum*.
 3. Leaves dull dark-green above, the veins not noticeably raised below, usually long-acuminate at apex, the margin only slightly revolute; twigs smooth and glabrous; lower surface of leaves rusty-scurfy when young, becoming light-green with scurfy dots in age; anthers elevated 1-3.5 mm. above corolla; pulp of drupe sweet; stone oblong-ellipsoid, ridged and grooved in cross section 2. *V. nitidum*.
 - 4(2). Petioles, midribs beneath and rays of cyme more or less rufescent-scurfy or -tomentulose; leaves lustrous above, coriaceous; rather frequent 3. *V. rufidulum*.
 4. Petioles, midrib beneath and rays of cyme without rufescent tomentum; leaves not lustrous, membranous to subcoriaceous; rare 4. *V. prunifolium*.
 - 5(1). Leaves palmately 3-ribbed from the rounded to subcordate base, mostly 3-lobed (maplelike), copiously dotted beneath; slender petiole often stipulate at base 5. *V. acerifolium*.
 5. Leaves pinnately veined, with unlobed margins, not evidently dotted beneath (6)
 - 6(5). Distribution in mountains of Trans-Pecos Texas ... 6. *V. australe*.
 6. Distribution in forests of east Texas (7)
 - 7(6). Leaves narrowly ovate to ovate-elliptic or occasionally ovate-lanceolate, mostly less than 35 mm. wide; corolla and fruit glabrous .. 7. *V. dentatum* var. *dentatum*.
 7. Leaves broadly ovate to suborbicular-ovate, mostly more than 35 mm. wide; corolla and fruit more or less setose or hirsute 7. *V. dentatum* var. *scabrellum*.

1. *Viburnum nudum* L. POSSUM-HAW. Shrub spreading or somewhat erect and arborescent, to 5 m. tall; buds brown or fuscous; leaves with a petiole to 1 cm. long, lustrous above, usually dotted beneath, coriaceous, elliptic to obovate or oblanceolate, rarely ovate, rounded to abruptly acute at apex, the more or less crenate margin revolute, to about 15 cm. long and 75 mm. wide; cyme to 1 dm. wide, on a peduncle 15 mm. or more long; corolla about 5 mm. wide; stamens long-exserted, the filaments 4-5 mm. long; drupe subglobose, bluish-black, glaucous, the flesh usually bitter; stone typically globose-obovoid. Along streams in swamp forests, bogs and in wet pinelands in e. Tex., Mar.-June; from Fla. to Tex., n. to N.E., Ky. and Ark.

2. *Viburnum nitidum* Ait. WHITE-ROD. Shrub or small tree very similar to *V. nudum*, if not referable to that species, from which it differs primarily in the narrower, long-

acuminate, less coriaceous leaves. *V. nudum* var. *angustifolium* T.&G., *V. cassinoides* var. *nitidum* (Ait.) McAtee. In swamps and wet woods in e. Tex., Apr.-June; from Nfld. to Man., s. to Fla. and Tex.

3. *Viburnum rufidulum* Raf. SOUTHERN BLACK-HAW. Shrub or small tree to 10 m. tall and trunk to 1 dm. in diameter, with checkered blackish bark; winter buds, branchlets, petioles, lower leaf surfaces irregularly densely scurfy with a rufescent tomentum; leaves with somewhat wing-margined petioles rarely to 2 cm. long, elliptic to obovate or oblanceolate, rounded to obtusely pointed at apex, to 9 cm. long and 55 mm. wide, lustrous, coriaceous, serrulate; the 3- or 4-rayed cymes sessile, to 1 dm. wide, more or less scurfy; corolla 8-10 mm. wide; stamens long-exserted, the filaments 3-5 mm. long; drupe ellipsoid to subglobose, blue-black, glaucous, 1-1.5 cm. long, the pulp sweet and quite edible; stone flattish. *V. rufotomentosum* Small, *V. rufidulum* [var.] *Margarettae* Ashe. Rather frequent on the edge of woods, along streams and in open woods and thickets in e. and cen. Tex., Mar.-May; from Fla. to Tex., n. to Va., s. O., s. Ind., s. Ill. and Mo.

4. *Viburnum prunifolium* L. BLACK-HAW. Shrub or small tree very similar to *V. rufidulum* from which it differs primarily in lacking the conspicuous rufescent tomentum found on vegetative parts of that species. Also, the upper surface of the leaves are dull, instead of being glossy, and are usually thick-membranous instead of being coriaceous. In woods, thickets and along roadsides, in moist or dry soil, in e. Tex., Mar.-May; from n. Fla. to Tex., n. to N.E., N.Y., O., Mich., Ill., Ia. and Kan.

5. *Viburnum acerifolium* L. ARROW-WOOD, MAPLE-LEAF VIBURNUM. Shrub to 25 dm. tall, the new stems, petioles, lower leaf surfaces and inflorescences usually finely pale stellate-pubescent; leaves thin, with slender petioles to 2 cm. long, dark-green above, pale beneath, suborbicular in outline, to 1 dm. long and 8 cm. wide, typically 3-lobed above middle with the lobes acute to shortly acuminate, coarsely toothed, rounded to subcordate at base; the usually 7-rayed cymes 3-6 cm. wide, on terminal peduncles 25-35 mm. long; corolla about 5 mm. wide; stamens long-exserted, the filaments 3-4 mm. long; drupe purple-black when ripe, ellipsoid to subglobose, about 8 mm. long, the flesh disagreeable to taste; stone lenticular, with 3 shallow grooves on one face and 2 grooves on the other. Moist or dry woods in e. Tex., Apr.-May; from Que. and N.B., w. to Minn., s. to Fla., La. and Tex.

Plants with some or all leaves 2-lobed or unlobed are segregated as var. *ovatum* Rehd. Those plants having the interspaces between the leaf veins glabrous or nearly so have been segregated as var. *glabrescens* Rehd.

6. *Viburnum australe* Morton. Straggling shrubs to about 15 dm. tall, with dull-colored glabrous or sparsely glandular branchlets; leaves subcoriaceous, with glandular-hispidulous petioles to 1 cm. long and linear persistent glandular-hispidulous stipules (5 mm. long) borne on the petiole 1.5-2 mm. above its base, broadly ovate to suborbicular, to 9 cm. long and 7 cm. wide, coarsely toothed and ciliate, abruptly acute to shortly acuminate at apex, truncate to somewhat cordate at base, more or less glandular and hispidulous on the prominent veins beneath; inflorescences conspicuously glandular and sparsely pubescent, the linear basal bracts to 15 mm. long and 2 mm. wide; cymes 6- to 8-rayed, twice-compound, to 55 mm. wide, on peduncles to 3 cm. long; calyx tube densely glandular-stipitate, the lobes distinct almost to base, about 1 mm. long, ciliate with long simple hairs; corolla about 5 mm. wide; stamens slightly exserted, the filaments 3-4 mm. long; drupe ellipsoid, compressed, about 1 cm. long, fleshy; stone with 3 grooves on one face and 2 grooves on the other. *V. affine* Bush var. *australe* (Morton) McAtee. On mt. slopes and at base of high bluffs, in igneous soil, in the Trans-Pecos, Apr.-May; also n. Mex.

7. *Viburnum dentatum* L. SOUTHERN ARROW-WOOD. Shrub or small tree rarely to 75 dm. tall, usually to about 5 m. tall, with close gray-brown or reddish bark, the twigs usually densely stellate-pubescent; leaves membranaceous, with glabrous to stellate-pubescent petioles to 15 mm. long, ovate to ovate-lanceolate or suborbicular, to 15 cm. long and 1 dm. wide, usually much smaller, broadly rounded to sharply acute or short-acuminate at apex, coarsely serrate with triangular teeth and often with salient points, broadly cuneate to rounded or rarely subcordate at base, glabrous or nearly so above, glabrous or with some stellate pubescence below; the 5- to 7-rayed cyme 5-7 cm. wide, on peduncles 3-6 cm. long; corolla 5-8 mm. wide, it and the hypanthium glabrous to

sparsely glandular and/or setose; style pubescent; drupe blue-black when ripe, subglobose to ovoid or obovoid, 5-10 mm. long; stone plump, ellipsoid, deeply grooved on one face. *V. pubescens* (Ait.) Pursh. Moist and dry woodlands and thickets in e. Tex., Apr.-June; from N.E., s. to Fla. and Tex. We have two varieties in Texas.

Var. *dentatum* has narrow leaves and a glabrous or only glandular hypanthium.

Var. *scabrellum* T.&G. has broader leaves and the corolla and hypanthium are more or less setose or hirsute. *V. scabrellum* (T.&G.) Chapm. and its var. *Ashei* (Bush) McAtee.

2. SAMBUCUS L. ELDER-BERRY

Shrubby to arborescent or rarely herbaceous plants with a rank smell when bruised; bark with lenticles clearly evident; leaves pinnate or rarely with some bipinnate, the leaflets serrate and acuminate; flowers small, numerous in terminal compound cymes; calyx lobes minute or obsolete; corolla rotate, with a broadly spreading 5-cleft limb; stamens 5, inserted at base of corolla, the filaments slender; stigmas 3; fruit a berrylike juicy drupe that contains 3 small seedlike stones, usually edible.

About 40 species mainly in temperate and subtropical regions.

1. Distribution mainly east and central Texas 1. *S. canadensis*.

1. Distribution in Trans-Pecos Texas (2)

2(1). In high mountains; a many-stemmed shrub; leaflets typically narrowly lanceolate, gradually acuminate and markedly asymmetrical at base; cymes mostly more than 15 cm. broad 2. *S. caerulea*.

2. At lower elevations; usually arborescent; leaves typically elliptic-lanceolate, abruptly acuminate and not conspicuously asymmetrical at base; cymes mostly less than 15 cm. broad 3. *S. mexicana*.

1. *Sambucus canadensis* L. COMMON ELDER-BERRY. Stems scarcely woody, to 4 m. tall, with large white pith; leaflets 5 to 11, ovate-elliptic to lanceolate, acuminate, to 18 cm. long and 7 cm. wide, sharply serrate, glabrous to hirtellous or rarely canescent beneath (especially along the veins); cymes flat, to 35 cm. broad, the branches and pedicels glabrous or rarely hispidulous; flowers white, about 5 mm. broad, fragrant; fruit purple-black, 4-5 mm. in diameter. In wet soil in low places, especially along streams and on edge of swamps, mainly in e. and cen. Tex., rare in Panhandle, May-July; from N.S. and Que., w. to Man. and S.D., s. to Fla. and Tex.

The edible fruits are used in the making of jellies and wine. Those plants with leaflets densely canescent beneath have been segregated as var *submollis* Rehd.

2. *Sambucus caerulea* Raf. BLUE ELDER-BERRY. Shrub of clustered erect stems to 7 m. tall, rarely taller, sprouting freely from the base, the main stems usually less than 15 cm. in diameter, the young stems and branches brown and sometimes glaucous; leaflets 5 to 9, often long-petiolulate, oblong-lanceolate to narrowly lanceolate, tapering at the acuminate apex, rounded at the strongly asymmetrical base, to 16 cm. long and 35 mm. wide, pale beneath, rather thick, serrulate to serrate, glabrous or sparingly to densely tomentose; cymes flat-topped, to 3 dm. broad; flowers pale-yellow or creamy-white, 5-6 mm. wide; fruit 5-6 mm. in diameter, dark-blue or blackish, when fully ripe covered with a dense white bloom. On talus slopes among boulders at base of high cliffs in Chisos Mts., Apr.-June; in mts. from w. Tex. to Alta., Mont., Calif. and n. Mex.

3. *Sambucus mexicana* Presl. MEXICAN ELDER, TAPIRO, SAÚCO. Trees or shrubs to 10 m. tall, usually much smaller, with the main trunks furrowed and to 3 dm. in diameter, the smaller branches glabrous or white-tomentulose; leaflets 3 or 5 or sometimes 7, subsessile to petiolulate, ovate to ovate-lanceolate or oval, abruptly acuminate or sometimes cuspidate at apex, rounded to cuneate at base, to 12 cm. long, coarsely or finely serrate except at base and apex, firm, green on both surfaces, glabrous to densely tomentulose; cyme essentially flat, to 15 cm. broad; flowers pale-yellow or creamy-white, 5-8 mm. broad; fruits 5-7 mm. in diameter, dark-blue or blackish, when fully ripe covered with a dense white bloom. *S. caerulea* var. *arizonica* Sarg. and var. *mexicana* (Presl) L. Benson, *S. Rehderana* Schwerin. Along streams and river banks and on slopes in the Trans-Pecos, summer; from Tex. to Calif. and Mex.

3. LONICERA L. HONEYSUCKLE

Erect or climbing and twining shrubs; leaves entire or rarely toothed or lobulate; flowers showy and fragrant; calyx tube subglobose to ovoid, the teeth very short; corolla tubular to funnelform or somewhat campanulate, often gibbous at the base, irregularly or nearly regularly 5-lobed; ovary 2- or 3-celled; fruit several-seeded.

About 200 species in the Northern Hemisphere, mainly in eastern Asia.

1. Leaves all distinct; peduncles axillary, single, 2-flowered at summit
..... 1. *L. japonica*.
1. One or two pairs of upper leaves connate to form a cup or disk that encircles the stem; flowers sessile in whorled, axillary or terminal clusters, forming heads or interrupted spikes (2)
- 2(1). Corolla more than 25 mm. long, mostly deep-red or orange-color on outer surface; berries red; lower leaves distinctly petiolate (3)
2. Corolla less than 20 mm. long, white or creamy-white; berries bluish-green; lower leaves sessile or very shortly petiolate; in central and west Texas (4)
- 3(2). Leaves glabrous or at most minutely pilose beneath; in eastern third of Texas ..
..... 2. *L. sempervirens*.
3. Leaves with conspicuous spreading cilia; in mountains of the Trans-Pecos
..... 3. *L. arizonica*.
- 4(2). Leaves glabrous; mostly on Edwards Plateau of central Texas
..... 4. *L. albiflora* var. *albiflora*.
4. Leaves pubescent; in the High Plains and Trans-Pecos regions
..... 4. *L. albiflora* var. *dumosa*.

1. *Lonicera japonica* Thunb. JAPANESE HONEYSUCKLE. Trailing or high-twining viny shrubs with pubescent younger stems; leaves ovate to oblong-elliptic, firm, to 8 cm. long and 4 cm. wide, rounded to broadly cuneate at base, obtuse to subacute and apiculate at apex, the early leaves sometimes toothed or lobed; bracts leaflike but much smaller; corolla 3-4 cm. long, lobed to about or somewhat above middle, white or white tinged with purple, becoming yellow with age, very fragrant, the tube pubescent; berries black, about 7 mm. in diameter. In thickets, open woods, border of woods and along roadsides in e. and cen. Tex., Mar.-July; a nat. of Asia that has escaped from cult. to become a rampant pernicious weed that has endangered nat. vegetation from Fla. to Tex., n. to Mass., N.Y., O., Ind., Mo. and Kan.

2. *Lonicera sempervirens* L. TRUMPET HONEYSUCKLE. Twining shrub with glabrous or essentially glabrous branchlets; leaves glabrous on both surfaces or sometimes minutely pilose beneath, green above, white beneath, linear-oblong to elliptic or obovate, rounded to cuneate at base, obtuse at apex, to 7 cm. long and 4 cm. wide, firm, the 1 or 2 upper pairs connate to form a disk; flowers 4 to 6 in mostly 2 to 4 sessile remote whorls, forming interrupted spikes; corolla slenderly trumpet-shaped, nearly regular, with subequal short rounded erect lobes, deep-red or rarely orange or yellow on outer surface, 40-55 mm. long; stamens and style little-exserted or included; berries red; seeds about 4.5 mm. long and 3.5 mm. broad. *Phenianthus sempervirens* (L.) Raf. Woods and thickets in e. Tex., Mar.-June; from Fla. to Tex., n. to s. Me., Mass., N.Y., O., Ia. and Neb.

3. *Lonicera arizonica* Rehd. Straggly or clambering woody viny shrubs; leaves ovate to oval, rounded to broadly cuneate at base, rounded and minutely apiculate at apex, 2-7 cm. long, with strong spreading cilia, pale and often pubescent beneath, deep-green and glabrous above, only the uppermost 1 or 2 pairs perfoliate; petiole of lower leaves 6-12 mm. long; inflorescence distinctly pedunculate, the whorl of flowers single or the whorls crowded together in a subcapitate spike; corolla with nearly regular limb, 35-45 mm. long, glabrous, tinged scarlet outside, orange within; stamens inserted deep in corolla tube; fruits red at maturity. Evergreen forests in Guadalupe Mts., May-July; also N.M., Ariz. and Ut.

4. *Lonicera albiflora* T.&G. var. *albiflora*. WHITE HONEYSUCKLE. Plant entirely glabrous or essentially so, bushy, the branches sometimes twining, to 25 dm. tall; leaves

rather rigid, suborbicular to oval or obovate, rounded to broadly cuneate at base, broadly rounded at apex, usually less than 3 cm. long, rarely as much as 65 mm. long, glaucescent on both surfaces, usually only the upper pair perfoliate to form a disk that subtends the simple sessile glomerules; corolla white or yellowish-white, less than 2 cm. long, lobed to about the middle, scarcely at all gibbous; style and filaments nearly naked. On rocky slopes, cliffs and in sandy soils, commonly in cedar brakes, in cen. and n.-cen. Tex., Mar.-May; also Okla.

Var. *dumosa* Gray. Those plants with leaves pubescent, at least on the margins and lower surface, and with the corolla sometimes pilose on the outer surface fall into this category. The leaves of this plant are also commonly larger than those of var. *albiflora*. In n.w. and w. Tex.; from Okla. and Tex., w. to Ariz. and n. Mex.

4. SYMPHORICARPOS BOEHM.¹⁸⁷ SNOW-BERRY

Shrubs, with the older bark exfoliating; leaves opposite, simple, exstipulate, usually entire but sometimes sinuately toothed or lobed; flowers in axillary or terminal clusters or solitary in axils of upper leaves, regular or nearly so; corolla campanulate to funnelliform or salverform, 4- or 5-lobed, pink or white, often pubescent within, with 1 to 5 nectaries at base; ovary 4-celled, with 2 of the cells containing 1 large fertile pendulous ovule, the other cells containing several small abortive ovules; fruit an ovoid to ellipsoid or subglobose drupe; stones normally 2, more or less compressed.

About 20 species, all except one (in China) found in North America.

1. Distribution east of the Pecos River; corolla broadly campanulate, 3-4 mm. long; fruit red 1. *S. orbiculatus*.
1. Distribution west of the Pecos River; corolla campanulate to salverform or funnelliform, 6 mm. or more long (except in *S. guadalupensis*); fruit typically white (2)
- 2(1). Corolla 2-3 mm. long, campanulate; plants glabrous, the twigs reddish; leaves oval to broadly elliptic 2. *S. guadalupensis*.
2. Corolla 6 mm. or more long, salverform or funnelliform; plants glabrous to pubescent, the twigs and leaves various (3)
- 3(2). Corolla salverform, 11-13 mm. long, with only one small basal nectary, glabrous within; style 4-7 mm. long, usually pilose above the middle; anthers sessile; leaves typically oblanceolate to obovate, glaucous, 6-15 mm. long, 2-5 mm. wide 3. *S. longiflorus*.
3. Corolla funnelliform, 6-13 mm. long, with 5 basal nectaries; style 3-5 mm. long, usually glabrous; anthers equaling or somewhat shorter than the free portion of the filaments (4)
- 4(3). Young twigs completely glabrous; corolla sparsely pilose to nearly glabrous within 4. *S. oreophilus*.
4. Young twigs puberulent to pubescent; corolla densely pilose within (5)
- 5(4). Pubescence of young twigs dense, of straight spreading hairs; corolla tubular-funnelform, 8-10 mm. long; anthers reaching only to base of corolla lobes; leaves suborbicular-oval, dark-green, obtuse or obtuse-rounded at apex, soft-pubescent on both surfaces, 1-3 cm. long, 6-18 mm. wide 5. *S. rotundifolius*.
5. Pubescence of the young twigs not dense or (if so) then the hairs short and curved; leaves typically ovate-elliptic, commonly apiculate .. 6. *S. Palmeri*.

1. *Symphoricarpos orbiculatus* Moench. CORAL-BERRY, INDIAN-CURRENT. Shrub erect, to about 2 m. tall; branches leafy, erect or ascending, slender, light-brown to purplish; bark on the older branches gray and shreddy; young twigs densely villosulous-tomentulose to puberulent; leaves with petioles 2-4 mm. long, oval to ovate or suborbicular, rounded to slightly cuneate at the base, obtuse to acute at the apex, rarely to 6 cm. long, dull-green and glabrous to sparsely pilosulous on the upper surface, somewhat glauces-

¹⁸⁷ Adapted partly from G. N. Jones in Jour. Arnold Arb. 21:201-252. 1940.

cent and soft-pubescent on lower surface; flowers in short many-flowered densely crowded axillary spikes on the branches of the season; corolla broadly campanulate, villous within, pinkish, 3-4 mm. long, turned obliquely upward, slightly ventricose on the lower side, the lobes about as long as the tube; anthers 1 mm. long, shorter than the filaments; calyx teeth 5, triangular, ciliate, persistent on the fruit; style 2 mm. long, pilose; fruit a delicate coral-red varying to pink or sometimes purple-tinged, glaucous, ellipsoid, 5-7 mm. long, 4-5 mm. thick, the beak about 1 mm. long; stones oval, flattened, 2.5-3.5 mm. long, about 2 mm. wide, obtuse at each end. *S. vulgaris* Michx., *S. spicatus* Engelm. In woods and thickets, especially along streams, in e. third of Tex., Apr.-July; from N.Y., s. to Fla. and w. to Tex., n. Mex., Colo. and e. S.D.

2. *Symphoricarpos guadalupensis* Correll. Shrub, entirely glabrous; stems slender, with the bark thinly fibrous-shredded, the twigs reddish-brown; leaves with petioles about 1.5 mm. long, oval to elliptic, to 15 mm. long and 9 mm. wide, rounded-apiculate at apex, the margins entire or with few coarse teeth or lobules above the middle; pedicels thick, about 1.5 mm. long; floral bracts ovate-concave, about 1.5 mm. long; calyx 1.8 mm. long, the short lobes broadly rounded; corolla campanulate, 3-4 mm. long, the broadly rounded lobes concave; fruit unknown. In limestone soil at head of South McKittrick Canyon, Guadalupe Mts., Aug.-Sept.; apparently endemic.

3. *Symphoricarpos longiflorus* Gray. Shrub low and spreading-diffuse, the branches somewhat declined and to 2 m. long; young twigs glaucous, glabrous to sparsely pilosulous; bark of the older branches thin, whitish, fibrous, shreddy; leaves with petioles 1-3 mm. long, lanceolate to oval or oblanceolate, narrowed at the base, obtuse to acute at apex, entire, 6-15 mm. long, 2-5 mm. wide, completely glabrous to rarely sparsely pilosulous, thick, pale-green and glaucous; flowers very fragrant, solitary or in pairs in the axils of the upper leaves, sometimes in small terminal few-flowered racemes; calyx 5-lobed, glabrous and glaucous or somewhat pubescent, the lobes deltoid and about 1 mm. long; corolla 11-13 mm. long, salverform, symmetrical, pink or reddish, the narrow tube 3 to 5 times as long as the widely spreading lobes, glabrous, with one small basal nectary; stamens about as long as the tube of the corolla; anthers versatile, sessile or nearly so, 1.5-3 mm. long, the filaments scarcely if at all free; style 5-7 mm. long, usually pilose above the middle, the stigma capitate or slightly bilobed; fruit white, ellipsoid, 8-10 mm. long; stones oval, glabrous, 4.5-5 mm. long, 2.5-3 mm. wide, acute at base. On slopes, ledges and along streams in canyons of mts. in the Trans-Pecos, June-Aug.; from s.e. Ore., s. to Colo., Tex. and s.e. Calif.

4. *Symphoricarpos oreophilus* Gray. Shrub erect, to 15 dm. tall, divaricately branched; branches slender, spreading, the bark becoming brown and shreddy; young branchlets completely glabrous; leaves oval, rather thin, glabrous on both surfaces or very rarely with a few short scattered trichomes, usually acute at apex, entire or dentate, scarcely paler on lower surface, those of the flowering branches 1-2.5 cm. long, 8-16 mm. wide, tapering to the very short petiole; petioles about 2 mm. long, broader at the base to enclose the pointed buds; flowers rose-color, mostly in axillary pairs or in few-flowered terminal spikes; bracts oval, acute, connate at base, glabrous, 1 mm. long; calyx glabrous, the deltoid lobes 0.5-1 mm. long; corolla tubular-funnelform, 11-13 mm. long, symmetrical, the slender tube sparsely pilose to nearly glabrous within, with 5 small basal nectaries, the slightly spreading lobes 2-3 mm. long; anthers 2 mm. long, about as long as the filaments; style glabrous, 3 mm. long, the stigma capitate; fruit white, ovoid to ellipsoid, 8-10 mm. long; stones narrowly ovoid, flattened, 5-6 mm. long, 2-2.5 mm. wide, tapering to the acute base, somewhat obtuse at the apex. In canyons of mts. in the Trans-Pecos, spring-summer; from Colo. and Ut. to Ariz., Nev., N.M., w. Tex. and n. Mex.

5. *Symphoricarpos rotundifolius* Gray. Low straggling shrub with slender arching branches, less than 1 m. tall; young branches softly and densely pubescent with short straight spreading hairs; leaves with a short-villous petiole to 3 mm. long, grayish-green, suborbicular to broadly oval or ovate, obtuse to rounded or rarely acutish at apex, to 3 cm. long and 18 mm. wide, usually entire or some of the larger leaves repand or sinuately dentate or lobed, usually puberulous above, pilosulous and grayish beneath; flowers almost sessile in the axils of the upper leaves; bracts shorter than the ovary; calyx campanulate, the lobes about 1 mm. long; corolla light-pink, tubular-funnelform, symmetrical, 9-10 mm. long, the tube pilose within on the lower part, with 5 small glandular nectaries

in the base, the slightly spreading lobes 2 mm. long; anthers 2-2.5 mm. long, reaching only to the base of the corolla lobes, equaling or somewhat shorter than the free portion of the filament; style glabrous, 3-4 mm. long, about one third the length of the corolla; fruit white, ovoid or ellipsoid, about 1 cm. long and 7 mm. wide; stones oval, flattened, striate, pointed at each end, about 5 mm. long and 3 mm. wide. In canyons and on wooded slopes of mts. in the Trans-Pecos, spring-summer; from w. Tex. to Ariz. and Colo.

6. *Symphoricarpos Palmeri* G. N. Jones. Trailing shrub to 3 m. long, the short branches erect or ascending; young twigs tomentulose-puberulent with short curved trichomes; bark gray and shreddy on the older branches; leaf buds puberulent, acute, 1-2 mm. long; leaves with pilosulous petioles to 3 mm. long, oval to ovate, to 2 cm. long and 18 mm. wide (leaves of the sterile branches larger), acute to apiculate at apex, cuneate at base, the margins somewhat ciliate and usually more or less sinuate to lobulate or crenate; upper surface of leaves finely reticulate, dark-green, pilosulous or glabrescent, the veins obscure; lower surface of leaves pale, prominently reticulate, grayish pilosulous on the veins; flowers short-pedicelled, in axillary pairs or solitary; bracts lanceolate, acute, puberulent; bractlets oval, acute, puberulent; calyx glaucous, glabrous or nearly so, nearly regularly and very shallowly 5-toothed, the teeth about 0.3 mm. long; corolla pinkish, tubular-funnelform, symmetrical, 9-12 mm. long, the lobes one fourth to one third the length of the tube that is pilose within on the lower part; anthers 2-2.5 mm. long, shorter than the filaments, reaching about to the middle of the corolla lobes; style glabrous, 2-4 mm. long; stigma capitate; fruit white, ellipsoid, 6-8 mm. long; stones 2, oval or ellipsoid, flattened, plano-convex, whitish, rounded at the apex, somewhat acutish at the base, 4-5 mm. long, 2-3 mm. wide. In canyons of mts. in the Trans-Pecos, spring-summer; from w. Tex. to Ariz. and Colo.

5. **TRIOSTEUM L. FEVERWORT. HORSE-GENTIAN**

A small genus of about 6 species in North America and Asia.

1. *Triosteum angustifolium* L. Perennial slender herb to 8 dm. tall, the stem retrorse-setose with glistening hairs to 3 mm. long; leaves narrowly obovate to oblanceolate, tapering to base, acuminate at apex, strigose above with hairs to about 1.5 mm. long, glabrous or merely hispid on nerves beneath, to 15 cm. long and 6 cm. wide; flowers mostly solitary in axils, subtended by a pair of bracts that are similar to calyx lobes; calyx lobes linear to linear-lanceolate, foliaceous, persistent, about 1 cm. long and 2 mm. wide, hispid-ciliate on margin; corolla tubular, subequally 5-lobed, scarcely longer than calyx, loosely villous, greenish or yellowish-white; ovary 3-celled; drupes dry, strigose-hirsute, containing a 3-ribbed 1-seeded long stone. In woods and thickets in e. Tex. (Smith and Cass cos.), Mar.-May; from Tex. to Ala., n. to Conn., Pa., Ind., Ill. and Mo.

FAM. 170. VALERIANACEAE BATSCH
VALERIAN FAMILY

Herbaceous annuals or perennials with opposite exstipulate leaves; flowers small, in cymes or capitate, perfect or unisexual; calyx annular or variously toothed, often inrolled in flower and forming a feathery pappus in fruit; corolla funnelform to rotate or almost salverform, 4- or 5-lobed, the base often saccate or spurred on one side; stamens 1 to 4, inserted near the base of the corolla tube; ovary inferior, mostly 3-celled, with 1 cell fertile and the other 2 cells sterile or essentially wanting; ovule 1, pendulous; fruit dry, indehiscent.

About 13 genera and 400 species mostly in the Northern Hemisphere.

- 1. Plants perennial; distribution in mountains of the Trans-Pecos 1. *Valeriana*, p. 1504.
- 1. Plants annual; distribution east of the mountains of the Trans-Pecos 2. *Valerianella*, p. 1504.

1. VALERIANA L.¹⁸⁸

VALERIAN. TOBACCO-ROOT

Perennial herbs with thickened strong-scented roots or rhizomes and with leafy or scapose stems; leaves entire to pinnate; inflorescence determinate, the cymes clustered or paniculate; calyx at first involute, later spreading, the limb sessile, hyaline, membranaceous, becoming setose distally, the setae plumose or the limb short-cupuliform and more or less toothed or lobed; corolla rotate to funnellform, the tube straight or gibbous, the throat more or less hairy, the 5 lobes subequal; stamens usually 3; anthers sessile or on filaments, 2- to 4-lobed; ovary 3-celled, maturing 1 fertile adaxial carpel with 1 pendulous ovule, the other 2 abaxial carpels vestigial; style 1, the stigma 3-lobed; fruit an achene.

About 200 species in temperate and cold regions of the Northern Hemisphere. Dried plants of the species in this genus are persistently malodorous.

1. Plants from rhizomes or thickened stolons, with adventitious roots; leaves commonly pinnate to pinnatifid, petiolate, the blades of the undivided leaves more or less abruptly expanded; corolla infundibuliform, the tube gibbous; achenes plane adaxially1. *V. arizonica*.
1. Plants from conical taproots; leaves mostly lingulate-spatulate, gradually decurrent to the subpetiolar and clasping base; corolla rotate; achenes with relatively prominent adaxial ribs2. *V. texana*.

1. *Valeriana arizonica* Gray. Plant to 3 dm. high, with a rather slender rhizome to 4 mm. thick; stems glabrous, with the nodes puberulent; leaves petiolate, predominantly basal, forming a loosely tufted rosette with the several adventitious roots, undivided or sometimes pinnate, ovate to suborbicular or rarely subcordate, to 17 cm. long, the blade to about 8 cm. long and 4 cm. wide; inflorescence dense in anthesis, to 3 cm. wide but later expanding to 5 cm. wide; bracts 5-7 mm. long, glabrous; calyx limb 10- to 12-fid; corolla infundibuliform, 5-15 mm. long, white or pinkish, glabrous on outside, the tube gibbous, the lobes 2-2.5 mm. long; stamens and style exerted; achenes ovate to oblong-lanceolate, 2-5 mm. long, glabrous, tawny or purpurescent. In moist limestone soil near summit of Guadalupe Mts. (8,000 ft. alt.) in the Trans-Pecos, spring; from s. Colo., N.M. and w. Tex. to Ariz. and n. Chih.

2. *Valeriana texana* Steyerem. Plant to 3 dm. high, with a stout multicapital caudex and forked rugose conical taproots to 2 cm. thick and much contorted in age; stems several, subcapose, glabrous or sometimes sparsely pilosulous at nodes; leaves predominantly basal, undivided, elliptic to obovate-spatulate, narrowly obtuse to acute, to 16 cm. long and 3 cm. wide, tapering to the subpetiolar base, firmly membranaceous, glabrous, usually somewhat marginate, the stem leaves similar to but smaller than the basal leaves; inflorescence 2-6 cm. long in anthesis, later diffuse and to 12 cm. long and 7 cm. wide, the internodes glabrous or sometimes thinly pilosulous; bracts 3-4 mm. long, reduced above, glabrous to spreading-ciliate; calyx limb 6- to 8-fid; corolla rotate, 2.5-3 mm. long, whitish, thinly pilosulous at the base on outside, the ovate lobes equal to or shorter than the tube; stamens and style exerted; achenes oblong to linear-oblong, 2-2.5 mm. long and less than 1 mm. wide, smooth, brownish, more or less keeled abaxially, the adaxial ribs evident. On boulders in creek and on moist shaded limestone cliffs in canyons of Guadalupe Mts. in the Trans-Pecos, Apr.-July; endemic.

2. VALERIANELLA MILL.¹⁸⁹

CORN SALAD

Annual or sometimes biennial often disgustingly malodorous (when dry) herbs with erect dichotomously branched stems; leaves more or less succulent, the basal leaves tufted and entire, the stem leaves sessile and often dentate; flowers small, cymose-clustered, bracted; calyx limb obsolete or short-toothed; corolla funnellform or salverform, white or pale-blue, equally or unequally 5-lobed; stamens 3 or rarely 2; fruit 2-celled or 3-celled with 2 of the cells empty and sometimes confluent and the other 1-seeded.

¹⁸⁸ Ref.: F. G. Meyer in Ann. Missouri Bot. Gard. 38:377-503. 1951.

¹⁸⁹ Adapted from Sarah C. Dyal in Rhodora 40:185-212. 1938.

About 80 species in the Northern Hemisphere. In northern Europe, *V. locusta* (L.) Betsche is commonly used as a potherb in fall and spring.

1. Fertile cell of fruit about one third less than (often to one half) the combined width of the sterile cells, when viewed dorsally it does not completely conceal the 2 sterile cells that extend outward 1. *V. Woodsiana*.
1. Fertile cell of fruit usually about equaling or wider than the combined width of the sterile cells, when viewed dorsally it usually completely conceals the 2 sterile cells (2)
 - 2(1). Plants glabrous or sometimes with tufts of hairs on each side of the leaf base near the nodes; fruit always pubescent (3)
 2. Plants pubescent, sometimes only on the leaves and the lower part of the stem, in addition to tufts on each side of leaf bases near the nodes; fruit glabrous or sometimes puberulent or pubescent (4)
 - 3(2). Fruit white-hirsute, 1.5-2 mm. long, the hairs uncinata; corymb compact, the glomerate cymes many 2. *V. amarella*.
 3. Fruit only sparsely short-pubescent, 1.7 mm. long; corymb open, with few glomerules 3. *V. florifera*.
 - 4(2). Fruits laterally compressed, strongly carinate, less than 1 mm. long 4. *V. texana*.
 4. Fruit dorsiventrally compressed, never strongly carinate, more than 1 mm. long (5)
 - 5(4). Fruits ellipsoid; fertile cell rounded on the dorsal side (6)
 5. Fruits ovoid; fertile cell flattened on the dorsal side (7)
 - 6(5). Corolla 2-3 mm. long, conspicuous above the bracts .5. *V. stenocarpa* var. *stenocarpa*.
 6. Corolla 1.5 mm. long, not conspicuous above the bracts .5. *V. stenocarpa* var. *parviflora*.
 - 7(5). Sterile cells of fruit more or less divergent with a prominent groove between them, their combined width slightly less than or wider than the fertile 6. *V. radiata* var. *radiata*.
 7. Sterile cells more approximate with only a slight groove between them, their combined width about half the width of the fertile 6. *V. radiata* var. *Fernaldii*.

1. *Valerianella Woodsiana* (T.&G.) Walp. Stem 1.5-5 dm. tall, rather stout, pubescent along the angles; leaves hairy on the margin and on the midrib on the lower surface; the lower spatulate, entire, slightly connate; the upper oblong-ovate with several coarse teeth near the base, not connate; bracts elliptic-lanceolate, acute to acuminate, glabrous, usually weakly glandularly fimbriate-serrulate toward the tip; inflorescence lax to somewhat compact, corymbosely cymose; corolla white, 1.5 mm. long, funnelform; tube much shorter than the limb, a saccate gibbosity at base of throat on the ventral side; stamens and style exerted; stigma lobes short; fruit yellowish, subglobose, about 2 mm. long, glabrous or finely pubescent; fertile cell often short-beaked, narrowly oblong to oblong-lanceolate, weakly one-nerved and flattened on the dorsal side, much narrower than the inflated widely divergent sterile cells which have a wide groove between them. In moist low sandy or clayey soils in woods and on prairies in e. Tex., Mar.-May; also e. Okla.

2. *Valerianella amarella* Krok. Stem 1.5-3 dm. tall, glabrous; leaves glabrous except for tufts of hairs on each side of the base near the nodes, the lower obovate-spatulate, entire, the upper oblong-obovate, sessile; bracts glabrous, ovate-lanceolate to elliptic-lanceolate, rounded to acute at the apex, usually hyaline-margined; inflorescence compact, corymbosely cymose; corolla white, funnelform, 1.5-3 mm. long; limb usually as long as the throat and tube combined, a saccate gibbosity at the base of the throat on the ventral side; stamens and style usually long-exserted, sometimes either stamens or style short and abortive; stigma lobes short; fruit 1.5-2 mm. long, subglobose, ovoid, brownish, hirsute with rather long uncinata white hairs; sterile cells much smaller than the large fertile cell, contiguous, groove between them narrow and very shallow or inconspicuous. On rocky calcareous open or wooded hills and in prairies, low grounds and barrens, mostly in cen. Tex., Mar.-May; also e. Kan. and Okla.

3. *Valerianella florifera* Shinnery. Stem 9-18 cm. tall, glabrous; leaves entire, glabrous or the lower slightly scabrous-ciliate, especially toward apex; lower leaves oblong to oblong-spatulate, sessile, upper oblong to oblong-lanceolate or narrowly deltoid-oblong, sessile; bracts lanceolate or elliptic-lanceolate, acute, glandular-denticulate or even lacerate, glabrous; inflorescence rather open, the glomerules few but many-flowered; corolla white, funnelform, the lobes 1.8-2 mm. long, throat 1.3-1.5 mm. long, with basal gibbosity, the tube (below gibbosity) 1.4-1.5 mm. long; stamens and style exerted; fruit narrowly ellipsoid, 1.7 mm. long, 0.6 mm. wide, rather sparsely pubescent with straight erect hairs; fertile cell somewhat flattened dorsally, with noticeable median line toward apex; sterile cells not diverging, their combined width barely equaling that of the fertile cell. In sandy moist soil in post oak woods in s.-cen. Tex., Mar.-May; endemic.

4. *Valerianella texana* Dyal. Stem 1-3 dm. tall, rather frail, pubescent on the angles; leaves hairy on the margin and upper surface, the lower spatulate, the upper oblong-ovate, sessile; bracts lanceolate, ciliate; inflorescence loosely and corymbosely cymose; corolla white, funnelform, 2-2.5 mm. long; tube slender, about as long as the limb; throat rather wide without a conspicuous gibbosity at its base; stamens and style exerted; stigma lobes short; fruit yellowish, laterally compressed, less than 1 mm. long, with four lines of short capitate hairs, 2 down the dorsal side of the fertile cell and one down the ventral side of each sterile cell; fertile cell narrowly oblong, produced at apex into a prominent tooth, much narrower than the combined width of the sterile cells which have a narrow deep groove between them with a prominent nerve down the middle of the groove. Moist stream banks in the vicinity of Kini Creek, Gillespie Co., spring; endemic.

5. *Valerianella stenocarpa* (Engelm.) Krok var. *stenocarpa*. Stem 1-5 dm. tall, pubescent on the angles; leaves ciliate, the lower spatulate with their bases connate, entire, the upper usually ovate with a few teeth on each side near the base; bracts lanceolate, glabrous or rarely weakly glandularly fimbriate-serrulate toward the tip; inflorescence loose, corymbosely cymose; corolla white, 2-3 mm. long, funnelform; tube short, less than one half the length of the limb, a saccate gibbosity at the base of the throat on the ventral side; stamens and style exerted; stigma lobes short; fruit yellowish, narrowly ellipsoid, 1.5-2.3 mm. long, more than twice as long as wide, glabrous or pubescent; fertile cell wider than the combined width of the sterile cells, rounded on the dorsal side, sometimes with a weak nerve down the middle; groove between the slender sterile cells narrow, rarely with a rather prominent nerve down the middle. Rocky ledges and low moist grounds, often along rivers, in cen. and e. Tex., Mar.-May, (?) endemic.

Var. *parviflora* Dyal. Corolla white, funnelform, 1.5 mm. long; fruit slightly smaller than in var. *stenocarpa*. Light soils, barrens, and prairies in e. and s.e. Tex., west to Calhoun, Bexar and Dallas cos., Mar.-May; also Mo. and Okla.

6. *Valerianella radiata* (L.) DuRoi. var. *radiata*. Stem 1.5-6 dm. tall, rather stout and pubescent along the angles; leaves hairy on the margins and on the midrib on the lower surface, the lower oblong-spatulate, connate, entire, the upper oblong-ovate, often coarsely toothed at the base, not connate; bracts lanceolate, the outer ones slightly ciliate, the inner glabrous; inflorescence loose, corymbosely cymose; corolla white, funnelform, 1.5-2 mm. long; tube shorter than the limb, a saccate gibbosity at the base of the throat on the ventral side; stamens and style exerted; stigma lobes short; fruit yellowish, ovoid, about 2 mm. long, glabrous or pubescent; fertile cells as broad as or broader than the combined width of the sterile cells; groove between the sterile cells narrow to rather wide and often rather deep, with a slight groove on each side between the fertile and sterile cells. Low moist grounds in cen. and e. Tex., spring; from Pa. to Kan., s. to Fla. and Tex.

Var. *Fernaldii* Dyal. Corolla slightly larger than in var. *radiata*; fruit more elongate, usually pubescent; fertile cell rounded on the dorsal side, much wider than the combined width of the slender sterile cells; groove between sterile cells slight or wanting. Low moist places in e. Tex.; from Conn. and Pa., s. to N.C., w. to Mo. and Tex.

FAM. 171. CUCURBITACEAE JUSS.

GOURD FAMILY

Plants herbaceous, annual or perennial; stems with tendrils, trailing or climbing; leaves alternate, petiolate, simple or compound; flowers mostly unisexual, with male and female

leaves ovate to ovate-reniform and cordate-based, 15-30 cm. wide, usually not lobed, the margins apiculate-dentate; flowers solitary, 5-10 cm. across, white, the staminate flowers on long peduncles and commonly surpassing the leaves, anthers only slightly coherent; fruit to 3 dm. long or more, varying from disk-shaped to nearly globular and bottle-shaped, dumbbell-shaped, club-shaped, crooknecked or coiled, with a hard usually greenish or tan but sometimes striped or mottled durable shell, occasionally knobby or ridged; seeds tan to brown, ridged on the margins and cornered, oblong to squarish. *L. vulgaris* Sér. Commonly cult. for ornament and for the use of its fruit as containers and decoration; probably Old World origin but cult. throughout the world, sometimes spontaneous in e. and s. Tex.

2. MOMORDICA L.

Annual or perennial vines with simple (in ours) or forked tendrils; leaves with entire, lobed or pedately dissected blades; male and female flowers on the same or separate vines; staminate flowers solitary or clustered, with a bracted peduncle, the calyx and corolla 5-lobed, usually with 3 stamens; pistillate flowers solitary, the staminodia gland-like or wanting; corolla rotate or bell-shaped; style slender, the stigmas 3; fruit ovoid to ellipsoid, warty or spiny-tuberculate.

About 45 species in the Old World tropics.

1. Bract entire, ovate, cordate at base, attached at the middle or base of peduncle; leaf blades with obtuse to subacute teeth 1. *M. Charantia*.
1. Bract serrate, attached at the apex of the peduncle . . . 2. *M. Balsamina*.

1. *Momordica Charantia* L. WILD BALSAM-APPLE. Plant annual; stem creeping or climbing, often greatly elongated, more or less pubescent; leaves with petioles 3-6 cm. long, thin, reniform to suborbicular in outline, to 12 cm. wide, 5- to 7-lobed, the lobes obtuse to abruptly acute, often somewhat serrulate, villous to glabrate; sepals oval to ovate-oval, to 4.5 mm. long; corolla yellow, the segments obtuse or emarginate, to 2 cm. long; fruit to 12 cm. long, golden-yellow, bursting at maturity; seeds elliptic, flat, 9-12 mm. long. Naturalized in thickets and waste places in s.e. Tex.; from Fla. to Tex., throughout trop. Am.

2. *Momordica Balsamina* L. BALSAM-APPLE. Glabrous monoecious annual; stems mostly high-climbig, much-branched; leaves with usually puberulent petiole, thin, broadly triangular-ovate to orbicular in outline, cordate at base, to 1 dm. wide, 3- to 5-lobed, with broad sinuses, the lobes with acuminate teeth; sepals elliptic, about 6 mm. long; corolla golden-yellow and dark or black at the center, about 25 mm. wide; fruit to 6 cm. long, orange-color; seeds oval to ovoid, 10-12 mm. long. Cult. and escaped to sandy soils in e. and s. Tex.; La. and Tex., throughout trop. Am.

3. LUFFA L. VEGETABLE-SPONGE

Several species in the Old World tropics.

1. *Luffa cylindrica* Roem. ESTROPAJO. Strong vine with slender angled stems, with branched tendrils; leaves deltoid to nearly orbicular in outline, pointed, 12-30 cm. long, 3- to 7-lobed, with the base closed or open, dentate, scabrous but not pubescent; male and female flowers on the same vine; flowers 5-10 cm. across, light-yellow; staminate flowers racemose; pistillate flowers solitary on a short or elongate peduncle; corolla deeply 5-lobed; anthers free, ovary with 3 placentae, the stigmas 3 and bilobed, ovules many; fruit nearly or quite cylindrical, 3-6 dm. long, straight or curved, usually with light furrows and stripes but not ribbed or angled, the smooth rind becoming dry and papery, the interior fibrous; seeds flat, smooth, margined, black or nearly so, about 12 mm. long. Commonly cult, but occasionally found as an escape in s. Tex.

The fibrous interior of the fruit has been and can be used as sponge.

4. CUCUMIS L.

Annuals or perennials trailing or climbing, mostly pubescent; tendrils simple; leaves entire or somewhat dissected; male and female flowers usually on the same vine; flowers

yellow, solitary or the staminate flowers sometimes 2 or more in an axil, usually short-stalked and hidden by foliage; corolla bell-shaped to rotate, deeply 5-parted; anthers free; ovary with 3 to 5 placentae and stigmas, many-ovuled, the styles short; fruit fleshy and usually indehiscent, globular to elongated, glabrous, pubescent or echinate.

About 25 species in warm temperate regions, mostly African.

1. Ovary and fruit smooth or at most roughened, not spiny or bristly 1. *C. Melo*.
1. Ovary and fruit provided with scattered short prickles or densely bristly (2)
- 2(1). Leaves deeply divided into 3 main lobes; fruit with scattered short prickles, on elongated crooked peduncles 2. *C. Anguria*.
2. Leaves unlobed; fruit burlike, on short straight peduncles 3. *C. dipsaceus*.

1. *Cucumis Melo* L. MUSKMELON. Trailing or somewhat climbing softly pubescent vine with striate or angled stems; leaves orbicular-ovate to subreniform, to 13 cm. wide, angled but usually not distinctly lobed, rounded at apex, the margins sinuate-dentate, pubescent and somewhat scabrous; flowers about 25 mm. across, the staminate flowers sometimes 2 or more in an axil, the corolla lobes obtuse; fruit various, mostly globular or ellipsoid, more or less furrowed, at first pubescent but soon smooth or only with slightly raised ribs, with musky fragrance, the flesh usually yellow or green; seeds numerous, white, slender, about 12 mm. long. Nat. of Asia; cult. for its edible flesh and sometimes spontaneous; May-Oct.

The Dudaim melon, var. *Dudaim* Naud., is sometimes found along fence-rows and invading cultivated fields where it becomes a pest. It is a small rampant vine with hairy-setose slender angled stems; leaves ovate-oblong and unlobed, to 15 cm. long but usually smaller; fruit broadly ellipsoid, golden-yellow, marbled with rich-brown, extremely odoriferous, to 8 cm. long and 6 cm. broad.

2. *Cucumis Anguria* L. BUR GHERKIN. Slender rough-hairy trailing vine, with angled stems and small tendrils; leaves to 9 cm. long, with 3 prominent main lobes, the sinuses rounded, the lateral lobes usually again somewhat lobed, sinuate-serrate, very scabrous; flowers about 13 mm. across, the staminate flowers sometimes larger, on slender peduncles; fruit oval or oblong, on crooked peduncles, about 5 cm. long, furrowed, prickly; seeds numerous, white, smooth, less than 5 mm. long. Rare in n.-cen. and s. Tex., Aug.-Sept.; also Fla. to S.A.; occasionally cult.

3. *Cucumis dipsaceus* Spach. HEDGEHOG-GOURD. Slender trailing vine with strongly setose angled stems; leaves broadly ovate to reniform-ovate, unlobed, cordate at base, to 12 cm. wide, sinuate-serrate, setose to scabrous; flowers small, the staminate flowers on long peduncles and to 2 cm. across; fruit a firm bristly ellipsoid bur to 65 mm. long; seeds numerous, flat, white, about 5 mm. long. A nat. of Arabia; escaped from cult. and well-established in open brushlands in s. Tex., May-Aug.

5. CITRULLUS SCHRAD.

Several species in Africa and Asia.

1. *Citrullus vulgaris* Schrad. WATERMELON, SANDÍA. Pubescent annual with long-running prostrate leafy stems; leaves ovate to ovate-oblong in outline, to 2 dm. long, cordate at base, pinnately deeply divided into 3 or 4 pairs of lobes and these again lobed and toothed, the segments broad at the apex; tendrils 2- or 3-forked; peduncles much shorter than the leaves; male and female flowers on the same vine; flowers small, solitary in the axils; corolla about 4 cm. across, rotate, the 5 lobes obovate and obtuse; fruit globular or oblong, sometimes to 6 dm. or more long, glabrous, with a green or variously striped hard but not durable rind and sweet juicy red, yellow or greenish flesh; seeds numerous, black, white or reddish, flat, smooth, to 15 mm. long. A nat. of trop. and warm temp. Afr.; cult. for its edible flesh and sometimes spontaneous; May-Oct.

The citron or preserving melon, var. *citroides* Bailey, characterized by having a usually mottled rind and hard, white flesh (inedible until cooked) and tan or greenish seeds, occurs locally abundant in sandy soils in several localities, especially in e. and s. Tex.

6. CUCURBITA L.

Annual or perennial, with long-running prostrate or climbing stems that bear branched tendrils and entire or lobed leaves, usually rather coarse and hairy, often scabrous; male and female flowers usually on same vine; flowers solitary in axils, rather large, the staminate flowers long-peduncled; corolla yellow, lobed to about or above the middle; anthers united; ovary 1-celled, with 3 to 5 placentae, the 3 to 5 stigmas bilobed; fruit smooth, indehiscent, fleshy, mostly with a hard rind; seeds usually numerous, ovate to oblong-ovate, flat, white to tawny or black.

About 15 species confined to America.

1. Leaves typically triangular in shape, longer than broad, entire or only slightly angled, thick, grayish, scabrous 1. *C. foetidissima*.
1. Leaves typically ovate to subreniform in shape, usually about as broad as long, at least some distinctly lobed, thin, green, not noticeably scabrous
..... 2. *C. texana*.

1. *Cucurbita foetidissima* H.B.K. BUFFALO-GOURD, CALABACILLA LOCA. Plant rank-growing and rampant, with a frequently huge fusiform perennial root producing numerous widely running stems to 6 m. or more long; leaves coarse and thick, triangular-ovate, at most shallowly angulate-lobed, broadly rounded to cordate at base, acute to acuminate at apex, to at least 3 dm. long, nauseously ill-smelling (especially when bruised), commonly grayish-green, rough to the touch; corolla to 1 dm. long, flaring above the middle; fruit mostly globose, green with lighter stripes, lemon-yellow when ripe, to 75 mm. in diameter. *C. perennis* (James) Gray. In sandy or gravelly soils in waste places, especially along roadsides, primarily in the w. half of Tex., Apr.-July; from Mo. and Neb., s. to Tex., Ariz., s. Calif. and Mex.

2. *Cucurbita texana* Gray. TEXAS GOURD. Plant annual, producing slender long-running and climbing leafy stems with abundant tendrils; leaves broadly ovate to subreniform in outline, angled to distinctly lobed, pubescent, the margins sharp-serrate, to about 15 cm. long, nearly as wide as long; calyx lobes short and slender; corolla yellow, usually with prominent somewhat greenish veins, to about 7 cm. long, flaring above, the lobes acute and cuspidate; fruit obovoid, hard-shelled, green and usually with light-green stripes, to 9 cm. long and 6 cm. broad, the flesh bitter and inedible. *C. Pepo* of auth. In debris and piles of driftwood, often climbing into trees, along several rivers, especially the Guadalupe, that drains the Edwards Plateau in cen. Tex., rare but abundant where found, July-Oct.; endemic.

7. APODANTHERA ARN.

About 15 species in warm temperate regions of America.

1. *Apodanthera undulata* Gray. MELON-LOCO. Plant with wide-spreading somewhat scarious leafy prostrate branches (to 3 m. long) from a thick perennial root to 2 dm. thick; leaves with petioles 3 cm. or more long, reniform, to 15 cm. wide, strigose, sparsely dentate and very shallowly lobed or only with undulate-cripsed margins, cinereous on lower surface; the short simple or sparsely branched tendrils in pairs; male and female flowers on the same vine; staminate flowers racemose or corymbose from the lower axils; pistillate flowers solitary in the upper axils; calyx tube subcylindric; corolla lobes almost distinct, yellow, elliptic-oblongate, to about 4 cm. long and equal to the calyx tube; stamens 3; anthers distinct, sessile, one anther 1-celled, two anthers 2-celled; fruit oval, longitudinally ridged, hard-shelled, 6-10 cm. long; seeds numerous, suborbicular, light-brown, about 1 cm. in diameter. On gravelly terraces and dunes and in sandy soil among shrubs in the Trans-Pecos, May-Sept.; from w. Tex. to s. Ariz. and Mex.

8. MELOTHRIA L. MELONETTE

About 10 species in the warmer regions of the New World.

1. *Melothria pendula* L. MELONCITO. Slender climbing vine from a perennial root; leaves more or less orbicular in outline, with a cordate base, subentire to 5-angled or -lobed, more or less scabrous; tendrils simple; male and female flowers on the same vine;

flowers small, yellow or somewhat greenish, the staminate flowers racemose or corymbose, the pistillate flowers solitary or clustered; corolla rotate to campanulate, deeply 5-parted; filaments free or barely coherent; ovary contracted beneath the corolla, with 3 placentae and many horizontal ovules, the style short and with 3 stigmas; fruit ovoid to subglobose or ellipsoid, green or yellowish, becoming blackish, 1-2 cm. long. Incl. var. *chlorocarpa* (Engelm.) Cogn., *M. chlorocarpa* Engelm. In sandy and moist rich soils, climbing on shrubs and small trees, near the coast and in s. Tex., Mar.-Oct.; from Fla., w. to Tex. and Mex., n. to Va., s. Ind., s. Mo. and Okla.

The seeds are reputed to be purgative.

9. IBERVILLEA GREENE GLOBE-BERRY

Climbing glabrous herbs from a thickened napiform perennial rootstock; leaves reniform to broadly ovate in outline, pedately 3- to 5-parted with the divisions mostly lobulate or coarsely toothed; male and female flowers on separate vines; flowers greenish-yellow, the pistillate flowers solitary, the staminate flowers racemose to fascicled or sometimes solitary, the narrowly campanulate or cylindrical calyx tube with 5 short lobes; petals 5, oblong or linear; stamens 3, inserted in tube; stigma 3-lobed; ovary with 2 or 3 placentae; fruit globose; seeds swollen.

A small perplexing American genus in need of a thorough study.

1. Distribution west Texas; fruits less than 2 cm. in diameter; leaf blades deeply and completely dissected into linear lobes or segments mostly less than 5 mm. wide 1. *I. tenuisecta*.
1. Distribution east of the Trans-Pecos; fruits 2 cm. or more in diameter; leaf blades scarcely lobed to variously dissected, the segments mostly 10 mm. or more wide (2)
- 2(1). Calyx tube of staminate flowers cylindric, 6-8 mm. long; lobes of the leaf blades broadly cuneate or rhombic-ovate 2. *I. Lindheimeri*.
2. Calyx tube of staminate flowers campanulate, about 4 mm. long; the leaf blades usually irregularly and often narrowly lobed 3. *I. tripartita*.

1. *Ibervillea tenuisecta* (Gray) Small. Stem slender and branched; leaves to 6 cm. wide, with petioles to 2 cm. long, deeply 5-parted with the linear to filiform divisions lobulate or coarsely toothed; staminate flowers tubular, to 8 mm. long; fruit bright-red when ripe, about 15 mm. in diameter; seeds 5-6 mm. long. *Sicydium Lindheimeri* var. *tenuisectum* Gray, *Maximowiczia tripartita* var. *tenuisecta* (Gray) Wats. On rocky hills and along draws, climbing on shrubs, in w. Tex., June-Aug.; from w. Tex. to s.e. Ariz. and n. Mex.

2. *Ibervillea Lindheimeri* (Gray) Greene. Stems slender, branched; leaves to 12 cm. wide, with petioles to 35 mm. long, rough to the touch, mostly deeply 3-lobed but sometimes 5-lobed or essentially unlobed, the divisions 1 cm. or more wide and cuneate to flabellate or rhombic-ovate, toothed to lobulate; staminate flowers tubular, 5 to 8 in a raceme, somewhat glandular-puberulent, 6-8 mm. long, about 2 mm. thick; fruit 25-35 mm. in diameter, orange-color to bright-red when ripe; seeds about 6 mm. long. *Sicydium Lindheimeri* Gray, *Maximowiczia Lindheimeri* (Gray) Cogn. Usually in open dry woodlands or thickets, among brush, in fence rows and sometimes in open rocky soil, centered in s.-cen. Tex., Apr.-July; also s. Okla.

This species, in the broadest interpretation, may include *I. tripartita*.

3. *Ibervillea tripartita* (Naud.) Greene. Similar to *I. Lindheimeri* but with more narrowly lobed leaves and shorter campanulate staminate flowers. *Sicydium tripartitum* Naud., *S. tenellum* Naud., *Maximowiczia tripartita* (Naud.) Cogn., *M. tripartita* var. *tenella* (Naud.) Cogn., *Ibervillea tenella* (Naud.) Small. Usually in sandy soil, mostly in s. Tex. but extending n. to the lower Plains Country, Apr.-Oct.; endemic.

10. CAYAPONIA S. MANSO

About 50 species mainly in tropical and subtropical America.

1. *Cayaponia quinqueloba* (Raf.) Shinners. Climbing herbaceous vine from a perennial rhizome; stem slender, finely pubescent; leaves long-petiolate, thickish, cordate at

base, 5-10 cm. long, less than 1 dm. wide, 3-angled or -lobed, sparingly pubescent beneath, the petioles bristly-villous; tendrils simple or branched; male and female flowers on same vine; flowers rather large, in racemes or panicles; calyx campanulate, 5-cleft; corolla rotate or subcampanulate, greenish-white, 5-parted; *staminate flowers* 5-6 mm. across, with 3 distinct stamens, the anther sacs flexuous, the rudimentary ovary 3-lobed; *pistillate flowers* often with 3 rudimentary stamens; ovary 3-celled, with 1 or 2 ascending ovules in each cell; style 3-cleft, the stigmas dilated; fruit reddish, ovoid to ellipsoid, somewhat fleshy, 12-14 mm. long; seeds 6-8 mm. long and 2 mm. thick. *C. Boykinii* (T. & G.) Cogn. In river bottomlands and along streams in e.-cen. Tex., June-Aug.; from Ga. to Tex.

11. ECHINOPEPON NAUD.

WILD BALSAM-APPLE

A small American genus.

1. *Echinopepon Wrightii* (Gray) Wats. Climbing annual with forked tendrils, more or less pubescent throughout; leaves reniform, broadly cordate at base, shallowly lobed or angular, scarcely denticulate, to about 15 cm. wide; male and female flowers on same vine; flowers 5-merous, the staminate flowers in long racemes or panicles, the pistillate flowers solitary; calyx absent on staminate flowers; corolla rotate, 6-8 mm. wide, the lobes triangular-ovate and glandular; fruit obovoid, rostrate, to 35 mm. long, less than 15 mm. in diameter, opening by apical pores, spiny with the prickles to 15 mm. long and hirsute, 3-celled. *Echinocystis Wrightii* (Gray) Cogn. Climbing on shrubs in extreme w. Trans-Pecos, June-Oct.; from w. Tex., s. N.M., Ariz. and n. Mex.

12. ECHINOCYSTIS T.&G.

WILD MOCK-CUCUMBER

A monotypic genus in North America, as interpreted here.

1. *Echinocystis lobata* (Michx.) T.&G. High-climbing annual, essentially glabrous throughout; tendrils forked; leaves suborbicular-ovate in outline, to 12 cm. long and wide, usually with 5 sharply triangular serrulate cuspidate lobes; flowers 5- or 6-merous, greenish or white, the staminate flowers in long racemes or panicles, the short-peduncled pistillate flowers solitary or in small clusters and from the same axils as the staminate flowers; corolla rotate, about 1 cm. wide, the lobes narrowly lanceolate and acuminate; stamens 3, united by their filaments into a column, the nearly straight anthers connivent; ovary 2-celled, with 2 erect ovules in each cell; style with a broad-lobed stigma; fruit ovoid, 3-5 cm. long, to 25 mm. in diameter, bladderly-inflated, somewhat beaked at summit and with weak glabrous prickles to about 6 mm. long, bursting somewhat irregularly at the summit; seeds flat, dark. In moist soil in thickets of the Trans-Pecos, Aug.-Sept.; N.B. to Sask., s. to Fla. and w. to Tex. and Ariz.; escaped from cult. and sporadic in w. U.S.

13. CYCLANTHERA SCHRAD.

About 15 species in warm temperate and tropical regions of America.

1. *Cyclanthera dissecta* (T.&G.) Arn. Annual, glabrous, with slender climbing stems to 3 m. long or more, climbing over trees and shrubs; tendrils simple to trifid; leaves 3- to 7-foliolate, the elliptic-lanceolate divisions somewhat lobed or toothed and to about 6 cm. long; leaves and leaflets stalked; flowers of both sexes from the same axils, to 7 mm. across, white; staminate flowers in racemes or panicles; pistillate flowers solitary; corolla rotate, deeply 5-parted; stamens united into a central column and with solitary annular anthers; ovary 1- to 3-celled, with few erect or ascending ovules; fruit dryish, 2-3 cm. long, on peduncles 1-2 cm. long, narrowly ovoid, somewhat asymmetric, rostrate, armed with long slender smooth spines, bursting irregularly; seeds ovoid. Among boulders and in rocky soil mainly in cen. and s. Tex., rare in w. and n.w. Tex., May-Oct.; from Kan. to La., Tex., s. Ariz. and Mex.

4. *Sicyos parviflorus* Willd. Plants with slender striate stems to 6 m. long; leaves with a villous petiole to 15 cm. long, broadly ovate in outline, cordate at base, palmately 5-angled or lightly 5-lobed, the margin nearly entire to remotely denticulate, to 12 cm. long and wide, scabrous; calyx tube campanulate, about 1 mm. wide; corolla lobes about 1 mm. long; fruit ovoid, 5-6 mm. long and 4-5 mm. thick, tuberculate, shortly and densely villous. In canyons of mts. in the Trans-Pecos, summer-fall; from Tex. to s. Ariz. and Mex.

5. *Sicyos glaber* Woot. Plants with slender striate stems to 6 m. long; leaves with petioles to 5 cm. long, triangular-ovate in outline, to 8 cm. long and about as broad, cordate at base, 5-lobed or -angled, the lobes triangular-ovate and with coarsely sinuate-denticulate margins, scabrous; calyx teeth very small or wanting; corolla broadly campanulate, 4-6 mm. wide, the lobes ovate; fruit ovoid, grayish-green, slightly compressed, about 6 mm. long and 3.5 mm. thick, entirely glabrous. In canyons of mts. in the Trans-Pecos, Aug.-Oct.; also N.M.

15. COCCINEA WIGHT & ARN.

About 30 species, natives of the Old World.

1. *Coccinea cordifolia* (L.) Cogn. Ivy' courd. Perennial vines; stem glabrous, climbing; tendrils simple; leaves with slender petioles about half the length of the blade, ovate to orbicular in outline, 3- to 5-lobed, to 1 dm. long, cordate at base, broadly obtuse-apiculate at apex; male and female flowers on separate vines; pistillate flowers solitary, with 3 staminodia; sepals thick, subulate or linear-subulate, 3-4 mm. long, reflexed; corolla white, campanulate, 3-4 cm. wide, strongly veined; berry ellipsoid to obovoid, smooth, scarlet, 4-5 cm. long; seeds numerous. Along the coast in extreme s. Tex., Oct.-Nov.; a nat. of Asia that has become established in various parts of trop. and warm-temp. Am.

FAM. 172. CAMPANULACEAE JUSS.¹⁹⁰ BLUEBELL FAMILY

Perennial, biennial or annual herbs, mostly terrestrial but occasionally aquatic or epiphytic; leaves exstipulate, simple or very rarely dissected, alternate and usually spirally arranged; flowers usually perfect and 5-merous except the gynoeceium that consists of 2 to 5 united carpels possessing a common style with usually distinct stigmatic tips; ovary inferior, 2- to 5-celled or rarely unicellular; placentation axile or parietal in species with unicellular ovaries; calyx usually 5-parted to the summit of the ovary or its tubular portion forming a rim above the ovary, the lobes alternate with the corolla lobes and opposite the stamens; corolla gamopetalous at least at base, usually 5-parted or -lobed, only exceptionally with apparently free segments; corolla and stamens inserted around the periphery of the calyx tube at the summit of the rim; stamens as many as the corolla lobes and alternate with them, epipetalous; seeds mostly small and numerous, with fleshy endosperm.

About 2,000 species in 65 genera of world-wide distribution.

1. Flowers minute, sessile in dense leafless terminal spikes less than 1 cm. in diameter; corolla white, about 2.5 mm. long; stamens inserted about the middle of the corolla tube, distinct; capsule circumscissile 1. *Sphenoclea*, p. 1515.
1. Flowers rather large, pedicellate or (if sessile or essentially so) in spikes with foliaceous bracts; corolla typically more than 5 mm. long, red or of various shades of blue and purple to dull-white (or clear-white in albino forms); stamens inserted at the base of the corolla and free from it, distinct or united; capsule loculicidally dehiscent (2)

¹⁹⁰ Adapted from Rogers McVaugh in C. L. Lundell, *Flora of Texas* III:331-366. 1951.

- 2(1). Flowers bilaterally symmetrical; corolla strongly irregular, two-lipped, the tube cleft nearly to the base on one side; stamens united into a tube; capsule opening by apical valves; inflorescence indeterminate, racemose or spicate 4. *Lobelia*, p. 1518.
2. Flowers radially symmetrical; corolla regular, rotate or campanulate; stamens distinct; capsule opening on the sides by outwardly curled elastic valves or by longitudinal slits; inflorescence determinate but mixed, the lower flowers on any branch opening before the upper ones except the terminal one (3)
- 3(2). Inflorescence loosely branched, at least the terminal flowers of the main axes solitary and long-peduncled at the ends of the branches; cleistogamous flowers none, all the campanulate corollas normally open and expanded; capsule obconic or turbinate to subglobose 2. *Campanula*, p. 1515.
3. Inflorescence narrowly spiciform in the upper part, at least the upper and terminal flowers sessile; lower flowers usually cleistogamous, with vestigial rotate corolla and stamens; capsule slender-cylindric or -prismatic 3. *Triodanis*, p. 1516.

1. SPHENOCLEA GAERTN.

A monotypic genus of the Old World tropics; segregated by some authors as a distinct family, Sphenocleaceae.

1. *Sphenoclea zeylanica* Gaertn. CHICKEN SPIKE. Coarse glabrous branched annual herb to 10 dm. high or more, with fistulose stems; leaves entire, with a petiole to 2 cm. long, elliptic, somewhat pale on lower surface, to 12 cm. long and 5 cm. wide; spikes erect, dense, cylindric, naked, tapering at tip, to 8 cm. long and 9 mm. in diameter, on peduncles to 1 dm. long; floral bracts spatulate, 2-3 mm. long, about 1 mm. wide; flowers small, sessile, 5-merous; calyx lobes imbricate in bud, triangular to suborbicular, arose at the rounded scarious apex, to 2 mm. wide at base, deciduous with capsule; corolla white, about 2.5 mm. long, the lobes triangular and obtuse, deciduous with stamens after anthesis; stamens alternating with the corolla lobes, inserted below middle of tube; anthers roundish, appearing peltate; ovary wholly inferior; capsule bilocular, circumscissile; seeds ellipsoid, about 0.5 mm. long. In wet places of lowlands and flats, especially rice fields, in e. and s. Tex., Aug.-Nov.; an Old World species that has been introd. in warm regions of the W. Hemis.

2. CAMPANULA L. BELLFLOWER

Perennial or sometimes biennial or annual herbs of various habit; radical leaves often larger and more obtusely pointed with longer petioles than the cauline ones; calyx 5-fid, the sinuses often with reflexed appendages; corolla usually blue or purplish-blue, varying to white in the same species, 5-lobed at apex or 5-parted but usually not parted below the middle, typically campanulate but varying to rotate; stamens 5, distinct; filaments expanded and membranaceous at base; anthers linear; ovary 3- to 5-celled, opening by as many valves as there are cells, the valves varying in position from very base to near apex of capsule.

About 300 species widely distributed in the Northern Hemisphere.

1. Perennial with upright mostly simple stems; flowers and fruits nodding; confined to the Guadalupe Mts. in the Trans-Pecos 1. *C. rotundifolia*.
1. Annual with divaricately branched stems; flowers and fruits erect; endemic in the granite region of the Edwards Plateau 2. *C. Reverchonii*.

1. *Campanula rotundifolia* L. BLUEBELL, HAREBELL. Plant perennial, to about 1 m. high, usually much smaller, the rootstocks slender and elongated; stems erect or decumbent, scabrous, simple to freely branched; leaves often in rosettelike clusters at or near base, long-petioled, round-cordate to elliptic or oblanceolate, to 5 cm. long and wide, mostly toothed, early-withering; cauline leaves numerous, linear to narrowly lanceolate,

smooth, to 1 dm. long and 3 mm. wide; flowers as many as 15 in a lax raceme; calyx lobes narrowly triangular to linear-subulate, usually entire, with sharp slender tips, erect to spreading or reflexed in fruit, to 1 cm. long and 2 mm. wide; corolla violet-blue, mostly 12-25 mm. long, the tube 7-15 mm. long; corolla lobes ovate-oblong, abruptly pointed at tips, 5-8 mm. wide; filaments 2.5-4.5 mm. long, abruptly dilated and ciliate on the basal portion; anthers 4-6 mm. long; capsule pendent, obovoid to ellipsoid or subglobose, prominently ribbed, 4-8 mm. long, 2-4 mm. in diameter. Rocky wooded areas in canyons of mts. in the Trans-Pecos, June-Oct.; across the n.-cen. portion of N.A., s. in the mts. to Tex., and n. Mex.

Throughout its wide area of distribution this species is highly variable, but with us it is rather constant.

2. *Campanula Reverchonii* Gray. BASIN BELLFLOWER. Plant annual, hirsutulous below, glabrous above, to about 3 dm. high; stem erect, slender, cymosely and effusively much-branched, angular, usually scabrous on the angles; leaves sparingly dentate, to about 15 mm. long and 5 mm. wide, the radical ones spatulate, the cauline leaves lanceolate, those of the upper branches almost filiform and entire; flowers and fruits erect on almost capillary elongate peduncles; calyx lobes narrowly triangular to linear-subulate, glabrous, 2-4.5 mm. long, blunt-pointed with the tips slightly thickened; corolla light-blue, narrowly funnellform, 9-13 mm. long, the tube 4-7 mm. long, the ovate-lanceolate lobes shorter than the tube and 6-8 mm. wide; filaments 1.3-1.5 mm. long, the proximal third dilated and ciliate; anthers 1.6-2.3 mm. long; capsule ellipsoid or obovoid, 3.5-6 mm. long, glabrous, crowned with the erect calyx lobes, opening above the middle. On granite rocks and soils in the Llano region on the Edwards Plateau, May-July; endemic.

3. TRIODANIS RAF. VENUS' LOOKING-GLASS

Low annuals with axillary blue or purplish flowers, the earlier flowers small and cleistogamous; calyx 3- to 5-lobed; corolla of perfect flowers rotate, 5-lobed; cleistogamous and greatly reduced flowers often in the lower axils; stamens 5, separate; the membranaceous hairy-based filaments shorter than the anthers; stigmas 3; capsule prismatic or slender-cylindric to subulate, 1- to 3-celled, at maturity capped by the calyx lobes; pores of the capsule equal in number to the cells, borne laterally, usually opening from base toward apex by the curling outward of an indurated cartilaginous process; seeds numerous, brownish.

About a dozen species native to Europe, the Mediterranean region and North America and South America. Many authors unite this genus with *Specularia* Fabr.

1. Foliage leaves usually strigose or hispidulous on the upper surface; calyx lobes 5, mostly more than 1 cm. long; capsule 3-celled in all flowers, linear-oblong to clavate, opening from apex toward base 1. *T. coloradoensis*.
1. Foliage leaves glabrous on the upper surface; calyx lobes 3 in cleistogamous flowers or (if 5) commonly not all uniform, usually much less than 1 cm. long; capsule mostly 2-celled in cleistogamous flowers and 3-celled in open ones, opening from base toward apex (2)
 - 2(1). Floral bracts lanceolate to linear, 5 to 8 times as long as wide; capsule of cleistogamous flowers terete, subulate, curved and with more or less spreading tips, 8 mm. or more long, dehiscent by 1 pore or longitudinal slit at apex 7. *T. leptocarpa*.
 2. Floral bracts ovate or broader, rarely as much as 3 times as long as wide; capsule of cleistogamous flowers terete or flattened, oblong to ellipsoid or ovoid, straight and more or less appressed, mostly less than 8 mm. long, dehiscent by 2 or 3 pores on the sides or at the summit (3)
 - 3(2). Openings of the capsule linear, 0.2-0.4 mm. wide, the elastic cartilage covering most of the pores, provided with very narrow scarious margins; pores located between base and apex of capsule 6. *T. Holzingeri*.
 3. Openings of the capsule broadly elliptic to oval or rounded, 0.5-1.5 mm. wide, the narrow cartilage with broad scarious margins; pores located about midway between base and apex or near apex of capsule (4)

- 4(3). Pores at or very near the apex of the capsule; seeds highly polished (5)
 4. Pores at about the middle of the capsule; seeds mostly roughened and dullish (6)
- 5(4). Floral bracts usually longer than broad, mostly less than 1 cm. wide; seeds 0.5-0.6 mm. long2. *T. biflora*.
 5. Floral bracts often broader than long, usually more than 1 cm. wide; seeds 0.8-1 mm. long4. *T. lamprosperma*.
- 6(4). Seeds plumply lenticular, muriculate or smooth and lustrous
3. *T. perfoliata*.
 6. Seeds more or less quadrangular, the surface roughened with low anastomosing longitudinal ridges5. *T. texana*.

1. *Triodanis coloradoensis* (Buckl.) McVaugh. Stem erect, to 1 m. high, usually much smaller, simple or with ascending branches, retrorsely scabrous or hispid on angles near base, glabrous above; leaves and bracts hispid or scabrous on veins beneath, ciliate; upper and middle leaves sessile, oblanceolate to elliptic, somewhat toothed, to 7 cm. long and 15 mm. wide, the lower leaves broader and with a short petiole; bracts sessile, lanceolate, attenuate to the callose-glandular tip, to 4 cm. long and 5 mm. wide; flowers in a loosely spiciform arrangement, sessile, 1 to several at the upper axils, the lowest sometimes cleistogamous; calyx lobes lanceolate, with slender subulate tips, loosely spreading in fruit, scabrous-ciliate on the margins, to 17 mm. long and 1.8 mm. wide; expanded corolla blue with a violet tinge, white in the tube, 9-18 mm. long, the tube 2-5 mm. long, the lobes 3.5-8 mm. wide; capsule linear-oblong to clavate, scabrous-papillose at least near base, to 23 mm. long, deeply sulcate between the cells; pores opening from apex toward the base, broadly elliptic or rounded; seeds smooth, lustrous, more or less flattened, 0.8-1 mm. long. *Specularia coloradoensis* (Buckl.) Small, *S. Lindheimeri* Vatke. On dry rocky hillsides and bluffs, among shrubs, limestone ledges, gravel bars and floodplains, and in rich woods on the Edwards Plateau, Apr.-June; endemic.

2. *Triodanis biflora* (R. & P.) Greene. Stems simple or branching chiefly from below, erect or reclining, to 8 dm. high, more or less hirsute below with pale flaccid hairs; leaves and bracts hispid to completely glabrous beneath; leaves ovate to oblong, not clasping, to 3 cm. long and 12 mm. wide; bracts ovate, broader than leaves, sharply acute at apex, sessile or slightly clasping; cleistogamous flowers at most nodes; expanded flower terminal or wanting, its anthers 1.5-2.5 mm. long; capsule ellipsoid to obovoid or ovoid, to 9 mm. long and 2 mm. in diameter, its oval or nearly circular pores apical or subapical; seeds smooth and lustrous, biconvex, 0.5-0.6 mm. long. *Specularia biflora* (R. & P.) Fisch. & Mey. In fields, forests and prairies, on dry hills, river banks and in canyons, in most of Tex., Apr.-June; from Va. to Kan., Ariz., Tex. and n. Mex., w. to Ore. and Baja Calif.

3. *Triodanis perfoliata* (L.) Nieuw. Stem pilose or hispid below, retrorse-hispidulous or scabrous above, simple to loosely ascending-branched, to 1 m. high; leaves and bracts roundish to ovate, clasping by the cordate base, to 25 mm. broad, hirsute or the bracts glabrous, toothed; flowers 1 to several at a node, those at lower nodes cleistogamous and rarely 5 mm. long, those at upper nodes expanded and about 1 cm. long, with anthers 2.5-3.5 mm. long; capsule ellipsoid to obovoid, 4-10 mm. long, the 2 or 3 broadly elliptic to roundish pores 0.5-1.5 mm. broad and borne about midway up the capsule; seeds plump-lenticular, ellipsoid, 0.5-0.6 mm. long, smooth or variously pebbled, somewhat shining. *Specularia perfoliata* (L.) DC. Rather ubiquitous but mostly as a weed in disturbed areas, common in the e. two thirds of Tex., Apr.-July; from Fla. to Tex. and n. Mex., n. to N.E., s. Que., w. to Mont. and B.C.

4. *Triodanis lamprosperma* McVaugh. Stem pilose to scabrous below, retrorsely scabrous to entirely glabrous above, to 85 cm. high; leaves and bracts firm, scabrous or hispid beneath, finely and densely ciliate; leaves sessile or short-petioled, oval or obovate, to 12 mm. wide; bracts sessile and clasping, ovate to reniform, to 25 mm. wide; cleistogamous flowers at the lower and median nodes, the expanded flowers rather large; capsule obovoid to oblong, 4-7 mm. long (in the cleistogamous flowers), 7-10 mm. long (in the expanded flowers), in the expanded flowers often sulcate and the pores somewhat sunken;

pores of capsule subapical; seeds highly lustrous, biconvex or slightly flattened on the sides, 0.8-1 mm. long. *Specularia lamprosperma* (McVaugh) Fern. In rocky openings, glades or thin woods in n.e. Tex., May-June; also Mo., Ark. and Okla.

5. *Triodanis texana* McVaugh. Stem slender, erect or reclining at base, to 75 cm. high, usually much less, hirsute below; leaves sessile or attenuate at base, ovate to elliptic or obovate, rounded to obtuse at apex, hirtellous to hirsute, ciliate, crenate, to 4 cm. long and 15 mm. wide; bracts broader than leaves, ovate, sessile or somewhat clasping, obtuse to sharply acute; flowers 1 to 3 at the axils; expanded corollas lavender-purple, glabrous, 7-14 mm. long, the tube 1.5-4 mm. long, the lobes 2-5 mm. wide; capsule ellipsoid to ovoid or truncate and clavate, 4-7 mm. long; pores oval, at about the middle of the capsule; seeds lustrous, 0.4-0.6 mm. long, more or less quadrangular with usually concave or flat sides and obtuse angles, the surface roughened with low narrow anastomosing ridges in longitudinal rows. *Specularia texana* (McVaugh) Fern. In woodlands and plains, on open banks and in depressions, mostly in sandy soils, in e. Tex., Apr.-May; endemic.

6. *Triodanis Holzingeri* McVaugh. Stem erect, slender, to 85 cm. high, simple or with few branches, hispid or hirsute at base, hispid or merely scabrous above; leaves and bracts scabrous beneath or the bracts essentially glabrous; leaves sessile or the lower with attenuate bases, ovate to elliptic or obovate, undulate-cripsed and crenate, to 3 cm. long and 13 mm. wide; bracts broader than leaves, ovate, sessile and somewhat clasping, acute; flowers 1 to 3 in the axils; expanded corolla lavender-purple, the tube 1-2.5 mm. long, the lobes 2-5 mm. wide; capsule ellipsoid or oblong to obovoid and truncate, often strongly angled, to 12 mm. long, often deeply sulcate between the cells; pores sunken, linear, about the middle of the capsule, 1.4-2.5 mm. long, 0.2-0.5 mm. wide, the cartilage essentially filling the entire width of the pore; seeds lustrous, lenticular, 0.4-0.7 mm. long, minutely low-tuberculate in longitudinal lines. *Specularia Holzingeri* (McVaugh) Fern. In open prairies and plains, roadsides, pastures, river bottoms and canyons, in sandy or gravelly soils, in cen., s. and s.w. Tex., Apr.-July; from Wyo. to Mo. and Tex., also Tenn. and Ariz.

7. *Triodanis leptocarpa* (Nutt.) Nieuw. Minutely hirsute to scabrous or glabrous plants, to 75 cm. high; leaves sessile, narrowly elliptic to oblanceolate, inconspicuously callose-toothed or shallowly crenate, to 35 mm. long and 8 mm. wide; bracts lanceolate to linear, to 25 mm. long and 6 mm. wide; upper nodes with expanded or cleistogamous flowers, lower nodes with cleistogamous flowers only; calyx lobes subulate, falcate or divergent; capsules very variable; capsules of the cleistogamous flowers terete, often subulate, outwardly arching and with straight or spiraling summits, or straight and appressed, 8-20 mm. long, opening by longitudinal slits or by a pore at apex; capsules from expanded flowers straighter, erect, to 25 mm. long; seeds smooth, lustrous, lenticular, 0.7-1 mm. long. *Specularia leptocarpa* (Nutt.) Gray. Prairies, barrens, glades, rocky open slopes and ridges in e.-cen. Tex., Apr.-Aug.; from Ind. and Minn. to Mont., s. to Ark., Okla., Tex. and Mo.

4. LOBELIA L. LOBELIA

Perennial, biennial or annual herbs; leaves mostly of a lanceolate type; flowers axillary or chiefly in bracted racemes, usually inverted before anthesis, the pedicel twisted; calyx 5-cleft, regular, parted to the summit of the ovary or the calyx tube extending a little above the ovary; corolla variously colored, with relatively narrow tube and spreading lobes, the tube usually cleft nearly to base between the 2 lobes of the upper lip, the 3 lobes of the lower lip often somewhat united, broad and conspicuous; stamens 5, usually free from the corolla; filaments free at base, united distally into a tube; anthers united into a tube, the orifice of the tube usually partly closed by the incurved tips of the 3 longer anthers, the shorter anthers usually stiff-bearded at apex; corolla, stamens and style withering-persistent on the fruit; capsule 2-celled, many-seeded, opening by apical loculicidal valves, splitting at apex and the 2 halves recurved laterally.

A genus of perhaps 300 species, represented in the floras of all the continents and on many oceanic islands; about 80 species in North America.

- 1. Flowers bright-red; corolla 35-40 mm. long or more; filaments 20 mm. long or more; pedicels with a pair of green or yellowish glandular bracteoles near base; seeds very rough (2)
- 1. Flowers blue, lavender, purple or white; corolla mostly not over 25 mm. long; filaments 15 mm. long or less; pedicels and seeds various (5)
- 2(1). Filament tube 24-33 (usually 28-30) mm. long; anther tube 4-5.5 mm. long; leaves usually coarsely and irregularly toothed, the blades 3 to 5 times as long as wide; eastern Texas 10. *L. Cardinalis* var.
Cardinalis.
- 2. Filament tube 19-25 (rarely 30) mm. long; anther tube mostly 3.5-4.5 mm. long; leaves entire to coarsely toothed, the blades often 6 to 12 times as long as wide; western Texas (3)
- 3(2). Inflorescence appearing pedunculate, usually short, of 20 flowers or fewer, not leafy-bracted; cauline leaves mostly 8 to 12 times as long as wide, linear to linear-lanceolate; plants nearly glabrous; in the Trans-Pecos 10. *L. Cardinalis* var.
pseudosplendens.
- 3. Plants leafy up to the inflorescence, the latter not appearing pedunculate, usually many-flowered, often leafy-bracted; cauline leaves mostly 6 to 8 times as long as wide, lanceolate to oblong or ovate (4)
- 4(3). Plants densely short-pubescent throughout; leaves subtire to somewhat toothed; in the Trans-Pecos 10. *L. Cardinalis* var.
multiflora.
- 4. Plants glabrous or sparsely pubescent; leaves usually prominently toothed; chiefly west of the 100th meridian and east of the Pecos River 10. *L. Cardinalis* var.
phyllostachya.
- 5(1). Filaments 12-15 mm. long; pedicels with a pair of gland-tipped bracteoles at or above the middle; calyx lobes often 5-6 mm. wide, with leafy auricles 2-5 mm. long at base; seeds very rough; northeastern Texas .. 9. *L. siphilitica.*
- 5. Filaments 9 (rarely to 11) mm. long or less; pedicels, calyx and seeds various (6)
- 6(5). Filaments more than 5 mm. long; corolla tube 7 (rarely 6.5) mm. long or more; seeds rough (7)
- 6. Filaments less than 5 mm. long; corolla tube 6 mm. long or less; seeds rough or smooth (10)
- 7(6). Corolla short-pilose within at base of lower lip, the tube not (or very rarely) fenestrate laterally; plants totally glabrous or puberulent in the inflorescence (8)
- 7. Corolla glabrous within at base of lower lip, the tube fenestrate laterally near base; plants rather densely and uniformly pubescent or (in exceptional forms) nearly glabrous in the inflorescence (9)
- 8(7). Leaves all basal or with a few small ones above the base; pedicels with minute inconspicuous bracteoles at base 5. *L. floridana.*
- 8. Leaves mostly cauline, well-distributed along the stem; pedicels bibracteolate well above base (usually about the middle or a little below), the bracteoles often 1 mm. long or more, often green and denticulate 6. *L. flaccidifolia.*
- 9(7). Filaments mostly 6-7 mm. long; plants puberulent to glabrate or short-hirsute; flowers numerous, usually about 1 cm. apart; calyx lobes narrowly triangular-lanceolate, not densely pilose at base 8. *L. puberula.*
- 9. Filaments 8-11 mm. long; plants long-hirsute (especially the hypanthium); flowers few and distant; calyx lobes broadly ovate-cordate at base and abruptly tapered above, with a dense tuft of hair at the base 7. *L. Reverchonii.*
- 10(6). Corolla tube evidently fenestrate laterally; seeds smooth, polished; annual or biennial with a stout taproot and coarsely serrate leaves; in the Trans-Pecos 2. *L. fenestralis.*
- 10. Corolla tube not fenestrate laterally; seeds rough or smooth; annuals with the leaves entire to irregularly dentate (11)

- 11(10). Seeds smooth, polished; calyx lobes without any auricles at base; southern and southwestern Texas (12)
11. Seeds rough, cellular-reticulate; calyx lobes usually with at least some vestige of triangular or foliaceous auricles at base; eastern Texas (13)
- 12(11). Calyx lobes ciliate; leaves mostly cauline; pedicels nearly upright, 4-10 mm. long in fruit 1. *L. Berlandieri* var. *brachypoda*.
12. Calyx lobes glabrous; leaves mostly in basal rosette; pedicels often incurved, at least 10-12 mm. long in fruit 1. *L. Berlandieri* var. *Berlandieri*.
- 13(11). Calyx lobes usually ciliate; auricles broad, flat, membranaceous, scarious-tipped, usually ciliate, usually drying blue or purplish, to 5 mm. long but sometimes almost wanting; corolla pubescent within at base of lower lip; stems glabrous or chaffy-hirtellous on the angles near base; middle cauline leaves sessile or clasping, ovate to oblong 3. *L. appendiculata*.
13. Calyx lobes glabrous or ciliate near tips; auricles short and triangular or filiform, glabrous, never flat and membranaceous; stems more or less generally short-puberulent near base; middle cauline leaves narrowed to base, lanceolate to oblong 4. *L. spicata*.

1. *Lobelia Berlandieri* A.DC. Annual to about 6 dm. high; stems erect to decumbent, simple or with as many as 20 ascending branches, glabrous to sparsely pubescent near base; leaves without or with a marginal petiole to 25 mm. long, often near the base or in a basal rosette but also cauline, thin, broadly ovate to elliptic or lanceolate, to 5 cm. long and 35 mm. wide, rounded to cuneate at base, rounded to obtuse at apex, glabrous to ciliate near base, the margins subentire to coarsely and irregularly toothed; inflorescence to about 25 cm. long; pedicels to 2 cm. long in fruit, glabrous or slightly bristly, nearly upright or usually incurved above the middle, with a pair of tiny bracteoles at base; bracts linear to linear-subulate, 3-9 mm. long, glabrous or ciliate; flowers 1-1.3 cm. long; calyx lobes linear-subulate, entire, glabrous to sparsely ciliate, 1.5-3.5 mm. long; corolla pale- or bright-purplish-blue with a white eye, glabrous or hairy within at the summit of the tube; filament tube 2.5-3.5 mm. long; anther tube 1-1.5 mm. long, light-bluish-gray; capsules ellipsoid, 3-6 mm. long. In sandy, rocky or clay soils in fields, moist areas and along streams, spring-summer.

The var. *Berlandieri* occurs in the Rio Grande Plains of south Texas and south into Mexico. The var. *brachypoda* (Gray) McVaugh, with leaves mostly cauline, occurs in the Edwards Plateau and Trans-Pecos.

2. *Lobelia fenestralis* Cav. LEAFY LOBELIA. Annual or biennial from a taproot, to 14 dm. high; stems erect, leafy, simple or with several ascending branches, glabrous or sparsely pubescent on the angles; leaves sessile or somewhat clasping at base, lanceolate to oblong or oblanceolate, acute at apex, coarsely and sharply serrate, glabrous or somewhat pubescent, to 7 cm. long and 12 mm. wide; inflorescence spicate, about 25 cm. long; pedicels to about 5 mm. long, mostly concealed by the lanceolate bracts; flowers 12-14 mm. long; calyx lobes lanceolate to linear-subulate, often toothed, ciliate or smooth, 2.5-6.5 mm. long; corolla blue with a white eye, the tube 5-6 mm. long and long-fenestrate; filament tube 1.5-2.3 mm. long; anther tube 1.5-2 mm. long, dark-bluish-gray or blackish; capsules 3-8 mm. long. Moist grassy or gravelly areas in mts. of the Trans-Pecos, July-Oct.; also mts. of Mex.

3. *Lobelia appendiculata* A.DC. Annual or biennial; stem erect, to 9 dm. high, simple or with few upright axillary branches, glabrous except for sparse chaffy basal hairs; cauline leaves very thin, sessile or with broad to clasping bases, oblong to ovate, obtuse to acute at apex, essentially glabrous, to 8 cm. long and 3 cm. wide; raceme 1-sided, to 3 dm. long; pedicels 4-8 mm. long, puberulent, with a pair of bracteoles near base; bracts linear to narrowly lanceolate, callous-denticulate, exceeding the pedicels; flowers 1-1.5 cm. long; calyx long-campanulate in fruit, subinflated, its linear-lanceolate lobes bristly-ciliate, its conspicuous flat lanceolate auricles 1-3 mm. long, the auricles drying blue or purplish; corolla lilac or violet, pubescent at base of lip inside, the tube 4-5 mm. long; filament tube 2-4 mm. long; anther tube 2-2.5 mm. long, bluish-gray; capsule partially exerted, horizontal or nodding. In sandy open ground, often in moist places,

in prairies, pinelands and old fields in e. Tex., Apr.-June; from Ala. to Tex., Ark., Okla., Mo. and Ill.

4. *Lobelia spicata* Lam. **BALESPIKE LOBELIA, HIGHBELIA.** Stem strict, erect, simple or with few branches, to about 11 dm. high, densely short-pubescent at base, smooth above; lower leaves oblanceolate to obovate or oblong, with short margined petioles, strigose; middle and upper leaves sessile, lanceolate; with narrow decurrent bases; raceme virgate, slender, dense, to 6 dm. long, with smooth bracts; pedicels to 8 mm. long in fruit, puberulent, inconspicuously bracted at base; flowers 9-12 mm. long; calyx lobes subulate to linear-lanceolate, 3-6 mm. long, usually with 2 shortly triangular or filiform basal auricles; corolla light-blue to white, the lower lip pubescent at base within, the tube 3-4.5 mm. long; filament tube 2-4 mm. long; anther tube 1.7-2 mm. long, pale-bluish-gray; capsules short-hemispherical, partly exserted. In prairies, pastures and open woodlands, often in rich soils among herbs and grasses, in s.e. Tex., May-Aug.; from e. Can. to Minn., s. to Ark., Okla. and Tex.

5. *Lobelia floridana* Chapm. Stem erect, to 15 dm. high, simple or with several stout upright or spreading branches, glabrous; basal leaves oblanceolate to lanceolate, acute to obtuse at apex, tapered into a margined petiole, to 4 dm. long and 25 mm. wide, usually much smaller, entire to crenate or dentate with callose teeth; cauline leaves much smaller and narrower; raceme to 5 dm. long, loosely or densely flowered; pedicels stout, 3-6 mm. long in fruit, rough, with a pair of minute bracteoles at base; bracts linear, glabrous, shorter than the pedicels; flowers 1.3-2 cm. long; calyx lobes broadly lanceolate to deltoid, 2-6 mm. long, acute, glabrous, the triangular auricles very small; corolla pale-purplish to nearly white, pubescent without, the lower lip densely hirsute at base within, the tube 8-9 mm. long; filament tube 6-11 mm. long, strongly deflexed; anther tube about 3 mm. long, light-bluish-gray; capsule 5-7 mm. long. In savannahs in s.e. Tex., Apr.-Aug.; from N.C. to Fla., w. to e. Tex.

6. *Lobelia flaccidifolia* Small. Annual to about 1 m. high; stems erect, simple or with few ascending branches; leaves essentially sessile or the lower ones short-petiolate, thin, lanceolate to oblong or oblanceolate, to 11 cm. long and 15 mm. wide, often rather abruptly narrowed at base, rounded to acute at apex, the margins subentire to inconspicuously crenate or serrate; inflorescence racemose, to 3 dm. long; pedicels rough, slender, curved, 4-11 mm. long in fruit, with a pair of bracteoles near or below the middle; bracts linear, denticulate, glabrous or puberulent, about equaling the pedicels; flowers 14-22 mm. long; calyx lobes narrowly sagittate, 3-7 mm. long, acute or attenuate at apex, glabrous or puberulent, often glandular-toothed, the reflexed auricles rounded and about 1.5 mm. long or less; corolla lavender or bluish-lavender to nearly white, with a white eye, pubescent or glabrous, the tube 6.5-8.5 mm. long; filament tube lavender, 5-8 mm. long; anther tube 2-3 mm. long, bluish-gray; capsule 4-6 mm. in diameter. In low moist pinelands, savannahs and prairies, wet places along streams and in river swamps in s.e. Tex., Apr.-Aug.; from Fla. and Ga. in the Coastal Plain to Tex.

7. *Lobelia Reverchonii* B. L. Turner. Stems to 1 m. high, conspicuously pilose with white spreading hairs to 1.5 mm. long; leaf blade typically linear to linear-oblanceolate, prominently toothed, to 14 cm. long and 15 mm. wide, mostly 7 to 10 times as long as wide; flowers 2-2.7 cm. long, usually 10 or fewer, rarely as many as 15, the lower ones 2.5-5 cm. apart; calyx lobes ovate to ovate-lanceolate, deeply cordate with rounded basal lobes, 3-5 mm. wide, with a tuft of hairs at base; hypanthium and pedicels densely pilose with long white or brownish hairs; corolla tube 9-15 mm. long; lower corolla lobes recurved, with 2 white lenslike markings following the venation between the lobes; filament tube 8-11 mm. long; anther tube 3-4 mm. long, grayish-blue. *Lobelia puberula* var. *pauciflora* Bush. In bogs in e. Tex., autumn; e. to Ala.

8. *Lobelia puberula* Michx. **DOWNY LOBELIA, PURPLE DEWDROP.** Plant densely short-hirsute or puberulent throughout, rarely glabrate, mostly to 16 (rarely to 27) dm. high; stem usually simple; leaves oblong to lanceolate or narrowly obovate, sessile or tapering to base, obtuse to acute at apex, with callous-tipped teeth or subentire, to 12 cm. long and 4 cm. wide, the upper ones passing gradually into the floral bracts; raceme dense or somewhat interrupted below, to 5 dm. long, commonly 1-sided, with as many as 75 flowers, the distance between the lower flowers at most 25 mm.; pedicels stout, 3-5 mm. long in fruit, the bracteoles basal or nearly so; bracts usually lanceolate, to 25 mm. long and 8 mm. wide; flower 15-24 mm. long; pedicels and base of calyx lobes glabrous to

thinly pubescent; calyx lobes lanceolate to narrowly deltoid-acuminate, with revolute margins, to 15 mm. long and 4 mm. wide, the auricles small; corolla blue to purple or rarely whitish, pubescent, the tube 5-8 mm. long, the lower lobes not recurved, with a white eye extending across the venation; filament tube 6-7 mm. long; anther tube 3-3.5 mm. long, light-bluish-gray; capsule 4-7 mm. long. In swamps, wet woods, bogs, prairies and open fields, usually in wet places, often in strongly acid soils in partial shade, in e. Tex., Aug.-Dec.; in s.e. U.S., w. to Okla. and Tex.

9. *Lobelia siphilitica* L. BIG BLUE LOBELIA, GREAT LOBELIA, BLUE CARDINAL FLOWER, LOUISIANA LOBELIA. Perennial by basal offshoots, to 13 dm. high; stem simple, coarse, smooth or sparsely hirsute on the angles; leaves thin, ovate to oblong or broadly lanceolate, irregularly serrate, acute at both ends, strigose above, to 18 cm. long and 6 cm. wide, the upper merging into the floral bracts; raceme dense, to 5 dm. long, scarcely secund; pedicels 5-10 mm. long, with median bracteoles; bracts lanceolate, 1-2 cm. long; flowers 23-33 mm. long; calyx hirsute, with broad foliaceous lobes to 14 mm. long and broad basal auricles 2-5 mm. long; corolla blue, white-striped in throat, the tube 11-15 mm. long, fenestrate, base of lower lip white and with 2 tubercles; filament tube 12-15 mm. long; anther tube 4-5.5 mm. long, bluish-gray; capsule 8-10 mm. long, partly exserted. In moist woods and swampy places, low places in prairies, sandy or gravelly margins of ponds and streams, and wet meadows in n.-cen. Tex., late summer; from Me. to Minn., Man. and Colo., s. to Tex.

Our plants are referred to the var. *ludoviciana* A.DC. They are characterized by being glabrous or nearly so, the leaves are mostly 15 mm. wide or less, and the flowers are often fewer than 20.

10. *Lobelia Cardinalis* L. CARDINAL FLOWER. Perennial by short basal offshoots, smoothish, to 2 m. high; stem simple, erect, coarse, glabrous or pubescent; leaves numerous, thin, glabrous or hirtellous, ovate to lanceolate, irregularly serrate; raceme terminal, simple, to 5 dm. long, somewhat 1-sided; pedicels bristly-puberulent, much shorter than the leafy bracts, bibracteolate near base; bracts linear or broader; flowers 3-5 cm. long; calyx lobes foliaceous, ovate to broadly lanceolate, to 14 mm. long and 6 mm. wide, undulate or crisped, ciliate and serrate; corolla vermilion or deep-red, the fenestrate tube 1.5-2 cm. long; filament tube 24-33 mm. long, long-exserted; anther tube 4-5.5 mm. long, bluish-gray; capsule 8-10 mm. long. In wet or moist soil, open places along streams, in meadows and along roadsides, about springs and ponds, in swamps where shade is not too dense, throughout Tex., except the s. tip, May-Dec.; from Fla., n. to n.e. N.B., s. Que., S. Ont., Mich., Wisc. and Minn., w. to Nev., Calif. and Mex.

The subsp. *graminea* (Lam.) McVaugh is represented in Texas by three varieties of which two, var. *multiflora* (Paxt.) McVaugh and var. *pseudosplendens* McVaugh, occur in the Trans-Pecos region only. The remaining one, var. *phyllostachya* (Engelm.) McVaugh, is the prevailing cardinal flower across the central part of the state. Although the distinguishing characteristics of each are given in the key, many intermediate forms occur, and it is often not possible to assign individual plants definitely to any one variety; often only the extreme forms are recognizable.

FAM. 173. GOODENIACEAE R. BR.

GOODENIA FAMILY

Herbaceous or woody plants; leaves alternate or rarely opposite, simple, exstipulate; flowers perfect, irregular; calyx tubular, adnate to the ovary, with 5 partially united lobes or rarely obsolete; corolla of 5 equally or unequally united petals; stamens 5, alternate with corolla lobes, free or rarely slightly adnate to base of corolla; anthers 2-celled, opening longitudinally; ovary mostly inferior, 1- to 4-celled; style 1; stigma surrounded by an indusium; fruit drupaceous, baccate or capsular; seeds small, flat.

Several hundred species in about 14 genera, mainly Australian.

1. SCAEVOLA L.

Characters of the family. About 60 species, mainly Australian.

1. *Scaevola Plumieri* (L.) Vahl. Succulent shrub to 15 dm. tall, usually much smaller; stem spreading under sand to form large colonies; leaves obovate to oblanceolate or

broadly spatulate, subpetiolate, rounded at apex, glabrous, to 1 dm. long and 45 mm. wide above the middle; flowers few in pedunculate cymes that arise in axils of leaves; calyx lobes short, broadly rounded; corolla white or pinkish, 2-3 cm. long, woolly within, the lobes linear to lanceolate and subacute; corolla tube open to the base on one side, the lobes winged, with few slender processes on inner surface; style to 15 mm. long, somewhat twisted-sinuous; stigma with a ciliate cup-shaped indusium; fruit broadly oval to globular, 1-1.5 cm. long, black, juicy. Very rare if not extinct, coastal dunes of Padre Island, fall; Fla., Tex., Mex., W.I. and trop. Am.

FAM. 174. COMPOSITAE GISEKE SUNFLOWER FAMILY

Herbs, vines or shrubs; leaves alternate or opposite, exstipulate; flowers borne in dense involucrate heads (the number of flowers in the head occasionally as few as 1 or 2); axis and/or receptacle of the head usually thicker than its stem (peduncle), globose, cylindrical, conical, convex, flat or concave, near its base usually invested with 1 or more series of persistent or deciduous bracts ("phyllaries") which partly enclose the head as it develops (when 2 or more series of phyllaries are present, only the innermost subtend flowers; any similar bracteal structures subtending the inner flowers of the head are called pales), the receptacle either smooth or usually rough or pitted and in many genera chaffy, i.e. with persistent or deciduous pales subtending some or all of the flowers (note that bracteal structures subtending the most peripheral flowers are called phyllaries); flowers small, epigynous, protandrous, uni- or bisexual, fertile (producing a viable fruit) or infertile; calyx absent or represented by a pappus (a series of scales and/or bristles) at the tip of the achene near the base of the corolla if a corolla is present; corolla sympetalous (composed of 4 or 5 coalescent petals), rarely absent, quite diverse but usually taking one of the following forms or types: (a) more or less radially symmetrical with a basal tube and a more or less well-differentiated thicker (4- or) 5-toothed or -lobed limb; flowers with such corollas are usually bisexual and are called disk flowers because they form the central part ("disk") of the heads of the vast majority of the Compositae; (b) bilaterally symmetrical, with a short basal tube and a flat beltlike or straplike usually 3-toothed or -lobed ray-portion ("ray" is often used to mean the entire corolla); flowers with this kind of corolla are pistillate, lack stamens, and are called ray flowers because when present they are peripheral in the head, the rays projecting outward as extensions of the radiuses of the head, similar to spokes of a wheel; (c) bilaterally symmetrical and more or less 2-lipped, with 2 teeth and lobes on the ventral lip (the lip toward the center of the head) and 3 lobes or teeth on the dorsal; such flowers are usually bisexual and are found exclusively in the tribe Mutisieae (genera 136-139), which displays no other sort; (d) bilaterally symmetrical, with a basal tube or funnel and a flat beltlike or straplike 5-toothed ray-portion ("ray" is often used to mean the entire corolla); flowers of this kind are usually bisexual and are found exclusively in the tribe Cichorieae (genera 140-159), to the exclusion of other sorts of flowers; androecium of (4 or) 5 stamens, alternate with the corolla lobes or teeth; filaments separate, adnate to the lower part of the corolla limb and tube but free for part of the length above (lightly coalescent to each other in *Ambrosia*, *Xanthium*, *Iva* and *Hymenoclea*); anthers flat, elongate, 2-celled, coalescent to form a short tube around the style (loosely coherent or nearly free in *Ambrosia*, *Xanthium*, *Iva*, *Hymenoclea* and *Kuhnia*); pistil solitary, composed of 2 carpels (1 being abortive), the ovary inferior, uniloculate; style columnar and usually exerted late in anthesis, usually 2-branched, the branches often arcuate-diverging, usually each slightly dorsiventrally flattened and often with linear stigmatic areas (stigmatic lines) along proximal parts of the 2 thinner edges, and near the stigmatic lines often with a variously rough or hairy portion and occasionally distally from this an appendage (meaning that portion of the style branch, if any, distal to the stigmatic line); fruit an achene, either columnar or prismatic or conical or often flattened or compressed (the flattening or compression said to be "lateral" when the plane of the achene is radial and includes the axis of the head; "dorsiventral" when the plane of the achene is perpendicular to a plane passing through the axis of the head, and in a dorsiventrally compressed achene the side toward the center of the head is said to be "ventral", that toward the periphery of the head "dorsal"); ovule solitary, basally attached, anatropous; integument solitary.

This is the largest family of vascular plants and is the largest one in Texas, also. Not

only does it include the largest number of Texas taxa of any Texas family, but it probably competes with Gramineae for the highest number of individuals growing in the state each season.

KEY TO TEXAS TRIBES OF THE COMPOSITAE

1. Corollas all of type "d" described above XI. *Cichorieae*, p. 1534.
1. Corollas not of type "d" (2)
 - 2(1). Corollas all of type "c" described above (nearly regular in *Gochnatia*) X. *Mutisieae*, p. 1534.
 2. Corollas not of type "c" (3)
 - 3(2). Anthers with elongated cartilaginous mostly connate appendages at the tip and caudate-appendaged basally; receptacle hairy-bristly or naked IX. *Cynareae*, p. 1533.
 3. Plants not with combination of characters given above, occasionally with caudate anthers or with hairy receptacle but not both (4)
 - 4(3). Anthers caudate-appendaged basally (i.e., with slender tail-like appendages hanging from the thecae between the filaments); ray flowers (type "b" corollas) absent IV. *Inuleae*, p. 1528.
 4. Anthers not caudate-appendaged basally (in some genera such as in Tribe Vernonieae the anthers narrowly sagittate basally and simulating caudation); rays often present (5)
 - 5(4). Corollas all of type "a" described above, usually white, red or purple or blue, never yellow (see also *Marshallia*); stigmatic lines obscure, present (if at all) only below the middle of the style branch (6)
 5. Corollas either of type "a" or some of type "b", often yellow; stigmatic lines otherwise than above (7)
 - 6(5). Style branches long, slender, terete, threadlike, minutely hairy all over; leaves alternate, scattered or basal I. *Vernonieae*, p. 1525.
 6. Style branches thickened upward or clavate, obtuse, very minutely and uniformly pubescent or nearly glabrous; leaves opposite, whorled or alternate II. *Eupatorieae*, p. 1525.
 - 7(5). Style branches of the perfect flowers flattened and smooth, extended into lanceolate or elongate-deltoid hairy appendages; those flowers with type "a" corollas mostly yellow; receptacle essentially naked (except in *Xanthisma*) III. *Astereae*, p. 1525.
 7. Style branches of the flowers with type "a" corollas not appendaged or with a very short or slender appendage, or else the type "a" corolla not yellow (8)
 - 8(7). Pappus of soft very fine (capillary) bristles; involucre herbaceous, little or not at all imbricated (i.e., phyllaries equal in length); receptacle naked (except in *Bartlettia*); stem leaves when present mostly alternate VIII. *Senecioneae*, p. 1533.
 8. Pappus absent or of scales and/or awns and/or bristles (but when of bristles these not extremely fine and soft); involucre diverse; receptacle naked or not; lowermost stem leaves often opposite (9)
 - 9(8). Phyllaries mostly scarious or papery; pappus absent; style branch tips truncate; leaves alternate VII. *Anthemideae*, p. 1533.
 9. Phyllaries or at least some of them mostly herbaceous or membranous (occasionally with hyaline marginal zones) (10)
 - 10(9). Receptacle chaffy (merely with awns or bristles in *Eclipta*) V. *Heliantheae*, p. 1528.
 10. Receptacle naked or merely with persistent awns VI. *Helenieae*, p. 1531.

I. KEY TO TEXAS GENERA OF VERNONIEAE

1. Pappus of numerous coarse bristles 1. *Vernonia*, p. 1535.
 1. Pappus of 5 or 10 stiff awns which are basally dilated and indurated
 2. *Elephantopus*, p. 1538.

II. KEY TO TEXAS GENERA OF EUPATORIEAE

1. Achenes with 10 to 20 (rarely 6 to 9) ribs; phyllaries indefinite in number (2)
 1. Achenes normally with 5 (rarely 4 or 6) ribs or angles, prismatic or subprismatic,
 rarely compressed; phyllaries definite or indefinite in number (5)
 2(1). Pappus of scales, dilated basally; small shrubs with opposite leaves; young plants
 without rosettes; corolla rose-colored or white 3. *Carpochaete*, p. 1538.
 2. Pappus of bristles (3)
 3(2). Phyllaries not conspicuously striate; leaves alternate; corolla rose-colored to
 purple, rarely white; barbules of pappus indefinitely arranged along the axis
 4. *Liatris*, p. 1539.
 3. Phyllaries thin, striate, scarcely herbaceous; leaves alternate or opposite; corolla
 ochroleucous to yellow, rarely rose-colored; barbules of pappus bristles tending to
 be aligned vertically (4)
 4(3). Phyllaries imbricate in several series; shrubs and perennial herbs
 5. *Brickellia*, p. 1544.
 4. Phyllaries 2- to 3-striate; perennial herbs from long conical roots
 6. *Kuhnia*, p. 1547.
 5(1). Pappus a low irregular crown of connate scales 0.3 mm. long or less, or essentially
 absent (6)
 5. Pappus much longer than 0.3 mm., usually of awns or bristles (7)
 6(5). Pappus a low irregular crown of connate scales 0.3 mm. long
 7. *Ageratum*, p. 1549.
 6. Pappus essentially absent or of a very few minute fimbriate scales
 8. *Trichocoronis*, p. 1549.
 7(5). Pappus of a basal ring to which are attached 10 plumose bristles, the whole pappus
 deciduous as a unit 9. *Carminatia*, p. 1549.
 7. Pappus usually persistent, at least in part of separate nonplumose units (8)
 8(7). Pappus of 1 to 3 stiff awns (these absent in some flowers on the head in some
 species) 10. *Stevia*, p. 1550.
 8. Pappus of slender bristles (9)
 9(8). Phyllaries uniformly 4 per head 11. *Mikania*, p. 1551.
 9. Phyllaries more than 4 per head 12. *Eupatorium*, p. 1551.

III. KEY TO TEXAS GENERA OF ASTEREAEE

1. Heads unisexual; male and female heads on separate plants
 13. *Baccharis*, p. 1558.
 1. Flowers (at least disk flowers) perfect (2)
 2(1). Rays white, pink, violet or purplish, never yellow (see also *Ericameria austro-*
texana with pale-yellow rays) (3)
 2. Rays yellow, sometimes pale-yellow, or absent (25)
 3(2). Pappus of disk flowers absent or reduced to a mere vestige or paleaceous crown
 less than 0.5 mm. long (4)
 3. Disk flowers with a manifest nonvestigial pappus (8)

- 4(3). Receptacle flat or slightly convex 35. *Chaetopappa*, p. 1601.
4. Receptacle hemispherical, conical or beehive-shaped (5)
- 5(4). Achenes with true ribs extending from base to summit (6)
5. Achenes lacking true ribs, at most with incomplete superficial ridges (7)
- 6(5). Phyllaries 0.8-1.6 mm. broad; upper herbage densely viscid-pubescent with glandular-capitate hairs 42. *Egletes*, p. 1611.
6. Phyllaries 0.4-1.1 mm. broad; upper herbage pubescence not viscid nor glandular ..
..... 36. *Erigeron*, p. 1603.
- 7(5). Achenes columnar to quadrate or terete, truncate or cupped apically
..... 43. *Aphanostephus*, p. 1612.
7. Achenes slightly laterally compressed, shortly narrowed apically
..... 40. *Astranthium*, p. 1610.
- 8(3). Receptacle conical or hemispherical to beehive-shaped (9)
8. Receptacle flat to slightly convex (11)
- 9(8). Achenes with true ribs extending from base to summit, not winged
..... 36. *Erigeron*, p. 1603.
9. Achenes lacking true ribs but winged (10)
- 10(9). Perennial herbs 20-100 cm. tall; phyllaries in about 3 series, slightly imbricated
..... 38. *Boltonia*, p. 1609.
10. Taprooted annual 4-24 cm. tall; phyllaries in 2 series, equal
..... 41. *Dichaetophora*, p. 1611.
- 11(8). Pappus of disk flowers of numerous capillary bristles (12)
11. Pappus of disk flowers at least partly of scalelike members, if bristlelike then these
not capillary but relatively coarse and basally dorsiventrally flattened (23)
- 12(11). Pappus bristles manifestly in 2 series (13)
12. Pappus bristles in a single series or nearly so (15)
- 13(12). Leaves linear or slightly oblance-linear, about 3 cm. long, crowded over most of
the stem but in the lowest part of the stem reduced to mere scales
..... 33. *Ionactis*, p. 1600.
13. Foliage not as above (14)
- 14(13). Achenes with 2 definite ribs 36. *Erigeron*, p. 1603.
14. Achenes either unribbed or with several very weak ribs
..... 32. *Doellingeria*, p. 1600.
- 15(12). Phyllaries in 1 or 2 series (16)
15. Phyllaries in 3 to many series (17)
- 16(15). Tubular portion of ray corolla shorter than the remainder
..... 36. *Erigeron*, p. 1603.
16. Tubular portion of ray corolla longer than the remainder
..... 37. *Conyza*, p. 1607.
- 17(15). Pappus of ray flowers absent 28. *Machaeranthera*,
p. 1579.
17. Pappus present in ray flowers (18)
- 18(17). Base of plant distinctly woody 28. *Machaeranthera*,
p. 1579.
18. Base of plant not woody (19)
- 19(18). Taprooted annuals (20)
19. Rhizomatous or stoloniferous perennials (21)
- 20(19). Leaves deeply serrate or pinnatifid 28. *Machaeranthera*,
p. 1579.
20. Leaves or most of them entire 30. *Aster*, p. 1593.

- 21(19). Ericoid depressed plants about 10-15 cm. tall, the rhizomes placed well below ground level; pappus bristles definite in number (usually 25) 34. *Leucelene*, p. 1600.
21. Plants usually taller, the rhizomes nearer the ground surface; pappus bristles indefinite in number, numerous (22)
- 22(21). Rays more than 1 cm. long; involucre 1-2 cm. broad, about 1 cm. high; head-bearing portion of plant spiciform or subracemiform . 31. *Heleastrum*, p. 1599.
22. Rays usually shorter; involucre usually smaller; head-bearing portion of plant more diffuse and irregular 30. *Aster*, p. 1593.
- 23(11). Pappus of a single series of subulate broad (dorsiventrally flattened) basally scalelike unequal bristles 39. *Townsendia*, p. 1609.
23. Pappus double, the outer of scales, the inner of capillary bristles (or the latter rarely absent) (24)
- 24(23). Achene with 2 definite true ribs; pappus of about 10 bristles and 10 minute scales 36. *Erigeron*, p. 1603.
24. Achene not having 2 true ribs; pappus of fewer members 35. *Chaetopappa*, p. 1601.
- 25(2). Receptacle with a chaff of long subulate persistent scales 17. *Xanthisma*, p. 1569.
25. Receptacle not chaffy (26)
- 26(25). Pappus in both ray and disk flowers reduced to a microscopic ring or essentially absent; tube of ray corolla longer than the flat portion, the whole corolla usually not equaling the disk corollas; straggly shrubs 20. *Gymnosperma*, p. 1573.
26. Pappus either not reduced or if reduced in one kind of flower then plant not as above (27)
- 27(26). Pappus (at least that of disk flowers) caducous (28)
27. Pappus not caducous (or occasionally so in some ray flowers) (29)
- 28(27). Pappus of 2 to 10 awns which vary from slender to stout or even sometimes are scalelike 18. *Grindelia*, p. 1570.
28. Pappus of large number of coarse somewhat unequal bristles 19. *Prionopsis*, p. 1572.
- 29(27). Ray flowers absent (except in some populations of *Chrysothamnus*) (30)
29. Ray flowers present (34)
- 30(29). Pappus of 10 scales 21. *Thurovia*, p. 1573.
30. Pappus of bristles (31)
- 31(30). Perennial herbs with rigidly erect wiry almost naked stems; leaves crowded near the base 24. *Bigelowia*, p. 1576.
31. Shrubs with leafy twigs (32)
- 32(31). Corolla with a short basal tube which is sharply demarked from the abruptly flaring throat of the limb 27. *Isocoma*, p. 1578.
32. Corolla gradually ampliate, the tube and limb rather poorly delimited (33)
- 33(32). Phyllaries in well-marked vertical files; the 5 lobes of the disk corolla subequal 25. *Chrysothamnus*, p. 1576.
33. Phyllaries not in vertical files; the 5 lobes of the disk corolla unequal 26. *Ericameria*, p. 1577.
- 34(29). Pappus solely of short or elongate scales, with no bristlelike members either in ray or disk 22. *Xanthocephalum*, p. 1573.
34. Pappus with at least some bristlelike members (35)

- 35(34). Disk flowers infertile, with a pappus of 1 or 2 slender bristles or awns, quite different from the pappus of the fertile ray flowers .. 15. *Bradburia*, p. 1563.
35. Disk flowers fertile, with pappus often more similar to that of the ray flowers (36)
- 36(35). Leaf blades bristly-serrate, pinnatifid or pinnately parted 28. *Machaeranthera*,
p. 1579.
36. Leaf blades entire or merely toothed (37)
- 37(36). Pappus double in the disk flowers, the outer series much shorter than the inner 16. *Heterotheca*, p. 1563.
37. Disk pappus not differentiated into 2 distinct series (38)
- 38(37). Taprooted annuals with bristly stiff pubescence .. 14. *Croptilon*, p. 1562.
38. Perennials, not bristly (39)
- 39(38). Taprooted shrubs (some plants of *Chrysothamnus* may key down here also) ... 26. *Ericameria*, p. 1577.
39. Rhizomatous perennial herbs (40)
- 40(39). Stems strictly erect, topped by flat or roughly corymbiform aggregations of stems and heads, the heads 4-6 mm. high including the flowers 23. *Euthamia*, p. 1575.
40. Plants not corymbiform or if somewhat corymbiform the heads larger 29. *Solidago*, p. 1585.

IV. KEY TO TEXAS GENERA OF INULEAE

1. Heads unisexual; male and female heads on separate plants 48. *Antennaria*, p. 1617.
1. Heads bisexual (2)
- 2(1). Receptacle chaffy either nearly throughout or in a peripheral zone (3)
2. Receptacle not chaffy (occasionally with a few hairlike emergencies) (4)
- 3(2). Flowers nearly all fertile, the most peripheral achenes somewhat enfolded by the subtending pales and falling with them 45. *Stylocline*, p. 1614.
3. Central flowers usually infertile; peripheral achenes falling naked 44. *Evax*, p. 1613.
- 4(2). Phyllaries mostly scarious (5)
4. Phyllaries not mostly scarious (6)
- 5(4). Pappus bristles plumose 47. *Facelis*, p. 1617.
5. Pappus bristles not plumose 46. *Gnaphalium*, p. 1615.
- 6(4). Perennial herbs from woody crowns, growing in dry sandy uplands; leaves strikingly bicolored, dark above, white below, linear; heads borne in glomerules which are borne in a spiciform arrangement 49. *Pterocaulon*, p. 1617.
6. Herbs or weak shrubs usually growing in low poorly drained or even wet areas; foliage not so strikingly bicolored; heads borne otherwise (7)
- 7(6). Pappus members of the staminate (central) flowers of the head flattened, whitish, bristlelike, near the tip discolored brownish and about twice as broad as in the lower part 51. *Tessaria*, p. 1619.
7. Pappus members not broadened upward 50. *Pluchea*, p. 1618.

V. KEY TO TEXAS GENERA OF HELIANTHEAE

1. Ray flowers fertile but with corollas reduced to a vestige or a minute tube with oblique orifice, or fertile heads burlike and lacking staminate flowers (2)
1. Ray flowers when present with better developed corollas or else infertile (5)

- 2(1). Heads with both fertile ray flowers and staminate disk flowers, never burlike ...
..... 60. *Iva*, p. 1627.
2. Heads unisexual (3)
- 3(2). Phyllaries of staminate heads free from each other; pistillate heads burlike
..... 63. *Xanthium*, p. 1633.
3. Phyllaries of staminate heads coalescent partially (4)
- 4(3). Leaves linear or filiform 61. *Hymenoclea*, p. 1630.
4. Leaves otherwise 62. *Ambrosia*, p. 1630.
- 5(1). Disk flowers seemingly perfect but infertile (6)
5. Disk flowers fertile (14)
- 6(5). Achenes short and thick, not flattened (7)
6. Achenes markedly flattened (9)
- 7(6). Inner phyllaries merely subtending the achenes ... 52. *Polymnia*, p. 1620.
7. Inner phyllaries embracing the achenes (8)
- 8(7). Phyllaries persistent; fruit unarmed 53. *Melampodium*, p. 1620.
8. Phyllaries persistent; fruit armed with hooked prickles . 54. *Acanthospermum*,
p. 1622.
- 9(6). Ray flowers in 2 or 3 series 55. *Silphium*, p. 1622.
9. Ray flowers in 1 series (10)
- 10(9). Achenes not adnate to phyllaries or pales, some of them exceeding the involucre
..... 90. *Dicranocarpus*, p. 1665.
10. Achenes adnate to and falling away with 1 or more phyllaries and/or pales (11)
- 11(10). Rays very inconspicuous (0.5-1.5 mm. long), often whitish
..... 59. *Parthenium*, p. 1625.
11. Rays longer, often yellowish (12)
- 12(11). Ray flowers (4 or) 5; annual herbs 57. *Lindheimera*, p. 1625.
12. Ray flowers usually more numerous; perennial herbs (13)
- 13(12). Outer phyllaries linear 58. *Engelmannia*, p. 1625.
13. Outer phyllaries broader 56. *Berlandiera*, p. 1623.
- 14(5). Rays persistent on the achenes (15)
14. Rays falling from the achenes, or absent (17)
- 15(14). Achenes not flattened; leaf blades toothed 66. *Heliopsis*, p. 1636.
15. Achenes flattened or 3- or 4-angled; leaf margins entire or nearly so (16)
- 16(15). Receptacle conic 64. *Zinnia*, p. 1634.
16. Receptacle nearly flat 65. *Sanvitalia*, p. 1635.
- 17(14). Pappus a single series of 15 or 20 plumose bristles
..... 94. *Bebbia*, p. 1671.
17. Pappus not of plumose bristles (18)
- 18(17). Ray flowers absent; disk corolla white, cream or pale-lavender or pale-purplish,
deeply parted into 5 long linear obtuse lobes 92. *Marshallia*, p. 1670.
18. Plants not having the same combination of characters (19)
- 19(18). Disk pappus of 15 or 20 narrow minutely fimbriate persistent scales
..... 93. *Galinsoga*, p. 1671.
19. Disk pappus a mere crown or cap or of a few teeth, awns or bristles or absent, or
(if of scales) these fewer than 15 (20)
- 20(19). Achenes markedly dorsiventrally flattened (21)
20. Achenes (at least those of the disk) flattened laterally or not flattened at all (26)
- 21(20). Involucre uniseriate, green; depressed or sprawling yellow-headed perennial
herbs 85. *Calyptocarpus*, p. 1658.
21. Involucre at least seemingly double; usually erect herbs (22)

- 22(21). Principal (inner) phyllaries partially united 91. *Thelesperma*, p. 1665.
22. Principal phyllaries essentially separate (23)
- 23(22). Pappus of 2 barbless teeth, a mere crown or absent 86. *Coreopsis*, p. 1658.
23. Pappus mostly of retrorsely or antrorsely barbed or hispid awns or teeth (essentially absent in *Bidens aristosa* and *B. polylepis*) (24)
- 24(23). Achenes of ray and outer disk flowers narrowly wing-margined, apically blunt; achenes of central disk flowers not winged but subulate-beaked 89. *Heterosperma*, p. 1664.
24. Achenes not dimorphic in this manner (dimorphic in another form in *Bidens Bigelovii*) (25)
- 25(24). Achenes beaked 88. *Cosmos*, p. 1664.
25. Achenes not beaked 87. *Bidens*, p. 1661.
- 26(20). Outer involucre of 4 leaflike partially united phyllaries; inner involucre of several small phyllaries 67. *Tetragonotheca*, p. 1637.
26. Involucre otherwise (27)
- 27(26). Chaff of the receptacle merely awns or bristles 69. *Eclipta*, p. 1638.
27. Chaff of concavo-convex or folded pales (28)
- 28(27). Each achene closely invested by the pale which appears as an outer coat 68. *Sclerocarpus*, p. 1638.
28. Each achene merely subtended by a pale or loosely enfolded by it (29)
- 29(28). Ray flowers uniformly absent (30)
29. Ray flowers uniformly present (32)
- 30(29). Aromatic shrubs with resinous-verniceous herbage; west Texas deserts 80. *Flourensia*, p. 1653.
30. Herbs or low shrubs, not aromatic, not verniceous; southern Texas (31)
- 31(30). Spreading low shrubs with fleshy, alternate leaves 70. *Varilla*, p. 1638.
31. Erect, opposite-leaved annual herbs 71. *Isocarpha*, p. 1639.
- 32(29). Receptacle conic, subulate or columnar (33)
32. Receptacle flat or convex (38)
- 33(32). Ray flowers fertile and styliferous; style branches truncate or penicillate; leaves opposite 72. *Spilanthes*, p. 1639.
33. Ray flowers infertile and styleless; style branches of disk flowers with acute or obtuse appendages; leaves mostly alternate (34)
- 34(33). Receptacle conical (35)
34. Receptacle columnar, cylindrical or conic-cylindrical at maturity (36)
- 35(34). Corolla expanded into a bulblike base, contracted above into the cylindrical corolla tube; receptacular pales with stout subuliferous apices 73. *Echinacea*, p. 1639.
35. Corolla tubular; pales acute 74. *Rudbeckia*, p. 1641.
- 36(34). Receptacle cylindrical or conic-cylindrical; phyllaries 2- or 3-seriate, subequal 74. *Rudbeckia*, p. 1641.
36. Receptacle columnar; phyllaries 2-seriate, the inner ones half or less than half as long as the outer (37)
- 37(36). Mature achenes terete, transversely wrinkled; leaf blades entire 75. *Dracopis*, p. 1643.
37. Mature achenes compressed-rhomboidal or laterally flattened, smooth; at least some of the leaves pinnate 76. *Ratibida*, p. 1643.
- 38(32). Disk achenes often somewhat flattened but the two thin edges not sharp nor winged (39)
38. Disk achenes thin-edged, knife-edged or winged (41)

- 39(38). Ray flowers fertile; maritime rhizomatous subshrubs of saline habitats 77. *Borrchia*, p. 1644.
 77. *Borrchia*, p. 1644.
39. Ray flowers sterile (40)
- 40(39). Pappus always occurring but quickly deciduous, of 2 usually paleaceous awns (1 over each shoulder of the achene and rarely short intermediate scales present) ... 79. *Helianthus*, p. 1647.
 79. *Helianthus*, p. 1647.
40. Pappus persistent or absent, when persistent rather like that of *Helianthus* in form 78. *Viguiera*, p. 1645.
 78. *Viguiera*, p. 1645.
- 41(38). Subscapose desert perennial herbs; sharp edges of the achenes very pubescent 81. *Encelia*, p. 1654.
 81. *Encelia*, p. 1654.
41. Habitally otherwise (42)
- 42(41). Shrubs (sometimes small) with broad somewhat foliaceous phyllaries 83. *Zexmenia*, p. 1655.
 83. *Zexmenia*, p. 1655.
42. Herbs with usually narrower phyllaries (43)
- 43(42). Achenes winged; ray flowers fertile or infertile ... 84. *Verbesina*, p. 1656.
43. Achenes wingless; ray flowers uniformly infertile 82. *Simsia*, p. 1654.

VI. KEY TO TEXAS GENERA OF HELENIEAE

1. Leaves and/or involucre with translucent oil glands (2)
1. Leaves and involucre not having oil glands (often with resin-droplets visible under high magnification) (7)
 - 2(1). Style branches of the perfect flowers short, oblong; leaves simple, bristly-ciliate near the base 102. *Pectis*, p. 1684.
 2. Style branches of the perfect flowers elongate, appendiculate or truncate; leaves (if simple) not bristly-ciliate near the base (3)
 - 3(2). Pappus at least partly of scales (4)
 3. Pappus wholly of distinct bristles (6)
 - 4(3). Pappus of 2 awns and 2 scales 104. *Tagetes*, p. 1687.
 4. Pappus of more numerous members (5)
 - 5(4). Pappus double, the inner series of 5 awned scales, the outer of numerous bristles 101. *Nicolletia*, p. 1683.
 5. Pappus otherwise 99. *Dyssodia*, p. 1680.
 - 6(3). Ray flowers absent 103. *Porophyllum*, p. 1685.
 6. Ray flowers present 100. *Chrysactinia*, p. 1683.
 - 7(1). Phyllaries in 3 to 5 series, imbricated, the outer ones shorter than the inner; receptacle bristly around the sockets (8)
 7. Phyllaries in 1 or 2 series, nearly equal in length, rarely with 1 to 3 small outer calyculate ones (9)
 - 8(7). Phyllaries in about 3 series; rays 2 to 4 per head; weak shrubs or strong subshrubs 106. *Pseudoclappia*, p. 1687.
 8. Phyllaries in 4 or 5 series; rays about 12 per head; subshrubs 105. *Clappia*, p. 1687.
 - 9(7). Ray corollas persistent on the achenes and falling off with them, marcescent (10)
 9. Ray corollas deciduous from the achenes or absent (11)
 - 10(9). Pappus of 4 to 6 scales 117. *Psilostrophe*, p. 1700.
 10. Pappus absent 118. *Baileya*, p. 1701.
 - 11(9). Achenes laterally flattened and with only marginal ribs or veins (12)
 11. Achenes either distinctly 3- to 5-angled or if less distinctly so then obconic or 10-ribbed (13)

- 12(11). Phyllaries uniseriate; leaf blades caudately long-acuminate 109. *Pericome*, p. 1689.
12. Phyllaries biseriate; leaf blades but caudately long-acuminate 110. *Perityle*, p. 1689.
- 13(11). Achenes columnar, 10-ribbed, rarely slightly flattened (14)
13. Achenes distinctly 3- to 5-angled or if less distinctly so then obconic (15)
- 14(13). Ray flower solitary or absent 108. *Flaveria*, p. 1688.
14. Ray flowers 3 to 5 per head 107. *Sartwellia*, p. 1688.
- 15(13). Style branches long and filiform, stigmatic to near the apex, hispidulous down to the fork or below; both disk and ray corollas rose-purple or rose-pink; involucre from elongate-turbinate to almost cylindrical 111. *Palafoxia*, p. 1695.
15. Style branches either short or with a distinct appendage, not hispidulous to or below the fork; either disk or ray corolla or both yellow or if purple then the involucre not narrow (16)
- 16(15). Phyllaries with thin more or less scarious and colored margins (17)
16. Phyllaries wholly herbaceous or in some species somewhat chartaceous basally, without scarious margins (20)
- 17(16). Principal phyllaries 4 to 9, rarely with 1 or 2 smaller ones at the base; leaves impressed-punctate 114. *Schkuhria*, p. 1697.
17. Principal phyllaries 6 to 12; leaves (if at all) not conspicuously impressed-punctate (18)
- 18(17). Disk corollas deeply cleft into linear-oblong lobes at least 3 times as long as the funnellform throat 113. *Florestina*, p. 1697.
18. Disk corollas with ovate to oblong lobes which are not twice as long as the campanulate or cylindro-campanulate throat (19)
- 19(18). Disk corollas with cylindro-campanulate throat and erect lobes; phyllaries oblong; pappus scales narrowly linear-lanceolate with the midrib excurrent into a barbelate awn; ray flowers present 112. *Hymenothrix*, p. 1696.
19. Disk corollas with campanulate throat and spreading lobes; phyllaries obovate; pappus scales obovate or ovate, rarely with excurrent midrib; ray flowers absent 119. *Hymenopappus*, p. 1701.
- 20(16). Achenes narrowly obpyramidal, several times as long as broad; throat of disk corollas mostly campanulate or funnellform; phyllaries usually rather broad and appressed (21)
20. Achenes obpyramidal, only 2 or 3 times as long as broad; throat of disk corollas elongate-funnelform, trumpet-shaped or cylindrical, many times as long as the tube (22)
- 21(20). Involucre campanulate; outer phyllaries keeled; foliage conspicuously impressed-punctate 116. *Picradeniopsis*, p. 1699.
21. Involucre hemispheric or broadly turbinate; phyllaries flattish; foliage less conspicuously impressed-punctate 115. *Bahia*, p. 1698.
- 22(20). Involucre campanulate to hemispheric; phyllaries erect or ascending, not reflexed 98. *Hymenoxys*, p. 1676.
22. Involucre rotate; phyllaries spreading, wholly or at least the tips reflexed in age (23)
- 23(22). Receptacle with long setiform or small dentiform projections 95. *Gaillardia*, p. 1671.
23. Receptacle not with bristles or teeth (24)
- 24(23). Inner phyllaries scarious, resembling the pappus scales 96. *Amblyolepis*, p. 1674.
24. Inner phyllaries not scarious 97. *Helenium*, p. 1674.

VII. KEY TO TEXAS GENERA OF ANTHEMIDEAE*

1. Receptacle chaffy at least near the center (2)
1. Receptacle naked or hairy around the sockets (3)
- 2(1). Receptacle high-conic; disk corolla greenish-yellow; heads solitary 120. *Anthemis*, p. 1704.
2. Receptacle not high-conic; disk corolla whitish; heads in corymbiform aggregations 121. *Achillea*, p. 1704.
- 3(1). Heads spiny by the persistence and induration of the style; achenes winged; plants usually less than 1 dm. tall 123. *Soliva*, p. 1707.
3. Heads not spiny; achenes not winged; plants commonly taller 122. *Artemisia*, p. 1705.

VIII. KEY TO TEXAS GENERA OF SENECIONEAE

1. Most of the leaves opposite 129. *Haploesthes*, p. 1713.
1. Most of the leaves alternate (2)
- 2(1). Receptacle convex or conic; each achene with a persistent linear pale appressed to one side and attached at the base 124. *Bartlettia*, p. 1708.
2. Receptacle flat or merely slightly convex or with a small cone in the center; achenes not with persistent basal paleae (3)
- 3(2). Rays present 126. *Senecio*, p. 1708.
3. Rays in the usual sense absent (4)
- 4(3). Involucre hemispheric 125. *Psathyrotes*, p. 1708.
4. Involucre cylindric, campanulate or urceolate (5)
- 5(4). Marginal pistillate flowers present, their corollas filiform with a slight funnellform throat and 3- to 5-lobed summit; annuals 128. *Erechtites*, p. 1712.
5. Marginal pistillate flowers absent; perennials 127. *Cacalia*, p. 1712.

IX. KEY TO TEXAS GENERA OF CYNAREAE

1. Achenes usually oblique at the base where attached; peripheral flowers as compared to central ones enlarged and slightly raylike 130. *Centaurea*, p. 1713.
1. Achenes (at least the central ones) not oblique basally; peripheral flowers not enlarged or raylike (2)
- 2(1). Filaments united into a short tube slightly above the level of their insertion on the corolla tube and free only just below the bases of the anthers; leaves white-mottled along the veins; pappus several-seriate, not plumose 133. *Silybum*, p. 1719.
2. Filaments separate; leaves not or rarely white-mottled (3)
- 3(2). Pappus of several short scales in several series; outer phyllaries leaflike or ending in leaflike appendages; flowers yellow; receptacle with scaly chaff 134. *Carthamus*, p. 1719.
3. Pappus of elongate slender bristles, these in most of our species united at the base; outer phyllaries not leaflike; flowers yellow in only one or two species; receptacle either with hairlike bristles or essentially naked (4)
- 4(3). Receptacle bristles absent, the receptacle fleshy and deeply alveolate 135. *Onopordum*, p. 1720.
4. Receptacle with numerous bristles, not markedly fleshy or alveolate (5)

* See *Cotula* in Appendix.

- 5(4). Pappus bristles plumose, at least in the lower part 132. *Cirsium*, p. 1715.

 5. Pappus bristles not plumose, sometimes barbellate in the lower part 131. *Carduus*, p. 1715.

X. KEY TO TEXAS GENERA OF MUTISIEAE

1. Shrubs (2)
 1. Herbs (3)
 2(1). Leaves white-tomentose beneath, strongly contrasting with the dark-green upper surface 136. *Gochnatia*, p. 1720.
 2. Leaves nearly concolorous 137. *Trixis*, p. 1720.
 3(1). Leaves white-tomentose beneath 139. *Chaptalia*, p. 1721.
 3. Leaves nearly concolorous 138. *Perezia*, p. 1721.

XI. KEY TO TEXAS GENERA OF CICHORIEAE*

1. Pappus at least in part of plumose members (2)
 1. Pappus not plumose (5)
 2(1). Leaves lance-linear, entire, coarse, long-tapered to a fine point; stems basally (3-) 5-9 mm. thick 150. *Tragopogon*, p. 1729.
 2. Leaves pinnatifid or if entire then not long-tapered to a fine point; stems usually more slender basally (3)
 3(2). Achene not at all beaked; stems wiry; most of the leaves greatly reduced to mere subulate bracts 146. *Lygodesmia*, p. 1727.
 3. Achene beaked; some leaves well-developed (4)
 4(3). Perennials from stout underground parts; calyculum absent; midribs of phyllaries whitish; pappus bristles about 20, plumose to the tip 151. *Hypochoeris*, p. 1730.
 4. Winter annuals from taproots; calyculum present; pappus members about 10, plumose for most of the length but not at the extreme tip 147. *Rafinesquia*, p. 1728.
 5(1). At least some of the flowers subtended by chaffy scales on the receptacle (6)
 5. Receptacle naked (or with a few scattered hairs in some genera) (7)
 6(5). Flowers rosy-white or lavender-white; achenes 5-ribbed; pappus of bristles 140. *Pinaropappus*, p. 1722.
 6. Flowers blue; achenes not ribbed but obscurely striate; pappus a low crown of minute scales 142. *Cichorium*, p. 1724.
 7(5). Most of the pappus deciduous as a unit leaving a solitary persistent bristle on the achene 148. *Malacothrix*, p. 1728.
 7. Pappus otherwise (8)
 8(7). Entire pappus of a number of whitish slender bristles, deciduous as a unit 149. *Calycoseris*, p. 1729.
 8. Pappus otherwise (9)
 9(8). Pappus entirely of persistent scales each prolonged into a number of long awn-like bristles of unequal length 143. *Nothocalais*, p. 1725.
 9. Pappus otherwise (10)
 10(9). Pappus at least partly of scales or absent (11)
 10. Pappus wholly of bristles (13)

* See Appendix.

- 11(10). Pappus dimorphic, that of the peripheral achenes a scaly-fringed crown about 1 mm. high, that of the central achenes of several more elongate scales 152. *Hedypnois*, p. 1730.
11. Pappus otherwise (12)
- 12(11). Pappus of 5 nearly linear scales a little longer than the achene 144. *Microseris*, p. 1725.
12. Pappus otherwise 141. *Krigia*, p. 1723.
- 13(10). Achene beaked, i.e., rather abruptly attenuate upward into a slender apical portion which is of slightly different texture and/or color from the swollen body (14)
13. Achene not beaked, sometimes slightly attenuate upward but of nearly uniform color and texture through the full length (16)
- 14(13). Caulescent herbs (3-) 5-25 dm. tall; glandular spot near apex of phyllary rarely proliferating; achenes rather clearly flattened 154. *Lactuca*, p. 1731.
14. Herbs usually 1-5 (-8) dm. tall, the glandular spot near apex of phyllary proliferating after anthesis into a low crest or minute horn; achenes not or only obscurely flattened (15)
- 15(14). Pappus tawny-white or buffy-white; basal leaves not runcinate 145. *Pyrhopappus*, p. 1725.
15. Pappus white or yellowish-white; basal leaves runcinate 159. *Taraxacum*, p. 1736.
- 16(13). Pappus members dimorphic on each flower (of 50 to 100 extremely fine capillaries plus 6 to 10 dorsiventrally flattened caducous bristles) 153. *Sonchus*, p. 1730.
16. Pappus members alike in form though sometimes unequal in length (17)
- 17(16). Corollas white, rosy-white, pink, lavender or purplish, never yellow (18)
17. Corollas yellow or orange (19)
- 18(17). Leaves of stem well-developed, mostly obovate ... 156. *Prenanthes*, p. 1734.
18. Leaves of stem much-reduced to mere subulate bracts .. 146. *Lygodesmia*, p. 1727.
- 19(17). Achenes tri- or quadrangular in transection 157. *Youngia*, p. 1735.
19. Achenes subterete in transection (20)
- 20(19). Heads often nodding; lower stems with long spreading tawny hairs 155. *Hieracium*, p. 1733.
20. Heads usually not nodding; lower stems either glabrous or if pubescent then not with long spreading tawny hairs 158. *Crepis*, p. 1735.

I. VERNONIA SCHREB. IRONWEED

Perennial herbs; leaves alternate, pinnately veined, mostly narrow and willowlike; heads in terminal corymbiform aggregations, usually 5-14 mm. broad; receptacle flat or convex, essentially naked; involucre usually campanulate-cylindric; phyllaries in several series, strongly imbricated; ray flowers absent; disk flowers numerous, perfect, fertile, the corolla mauve or purple or rose-colored, rarely white but never yellow; anthers not caudate; style branches elongate, filiform-subulate (not thickened upward), hispidulous throughout, with stigmatic lines only near the base; achenes 6- to 10-ribbed commonly resin-dotted between the ribs; pappus fuscous-white or rusty-white, persistent, double, of numerous coarse bristles.

About 1,000 species in America, Africa, Asia and Australia. Our species show considerable evidence of genetic intercontamination; the determination of some specimens is thus difficult if not impossible.

1. Phyllaries whitish- or grayish-tomentose 7. *V. Lindheimeri*.
1. Phyllaries glabrous to variously pubescent or even tomentose but not whitish- or grayish-tomentose (2)

- 2(1). Outer pappus of bristles, irregular in length and not evidently differentiated from the inner bristles; leaves lance-linear or linear, nearly glabrous 3. *V. marginata*.
2. Outer pappus of scales (or if these very narrow the leaves pubescent beneath), nearly uniform in length and differentiated from the bristles of the inner series (3)
- 3(2). Pubescence of the lower leaf surface wholly or in part of crooked slender hairs, more or less tomentose at least along the veins (4)
3. Pubescence of the lower leaf surface absent or at most in part of short straight conical hairs, with or without longer hairs on the veins (5)
- 4(3). Scales of the outer pappus 1.5 to 2 times as broad as the inner pappus members; midvein of the principal phyllaries not prominent and the lateral areas not copiously covered by resin globules about 0.5 mm. thick, the apices blunt and appressed; flowers about 34 to 55 per head; achenes averaging about 4 mm. long 2. *V. missurica*.
4. Scales of the outer pappus 1 to 1.5 times as broad as the inner pappus members; inner phyllaries near the apex with slightly prominent narrow usually dark midvein and on each side of it a patch of yellowish shiny resin-globules about 0.5 mm. thick, the apices often acutish and very slightly spreading; flowers averaging fewer per head; achenes averaging only about 3 mm. long 1. *V. Baldwinii*.
- 5(3). Lower leaf surface essentially glabrous 4. *V. vulturina*.
5. Lower leaf surface with short straight conical projections and occasionally along the veins some narrow patches of longer curly hairs (6)
- 6(5). Leaves lanceolate to elliptic-lanceolate 5. *V. altissima*.
6. Leaves linear to lance-linear 6. *V. texana*.

1. *Vernonia Baldwinii* Torr. WESTERN IRONWEED. Erect, 6-15 (-20) dm. tall, nearly simple except in the uppermost head-bearing region, pubescent to tomentose; leaf blades firm-membranous, elliptic or elliptic-lanceolate to ovate-lanceolate, 8-15 (-20) cm. long, 2-6 cm. broad, acuminate, sharply serrate, narrowed to the base, glabrous or scabrellate to puberulent above, with variable pubescence below from almost glabrous to tomentose with multicellular curled hairs and under the tomentum (if any) dotted with resin-globules, sessile or nearly so; involucre narrowly campanulate to thick-cylindric; phyllaries regularly and closely imbricate, often purplish-green and darker along the margin and midvein, the apices of the inner phyllaries acutish and very slightly spreading, marginally pubescent, with a slightly prominent narrow midvein and on either side of it a broad patch of resinous globules that are yellowish when fresh, shiny and about 0.5 mm. thick; flowers usually 18 to 34 per head; achenes about 3 mm. long, with resin-globules in the furrows between the ribs. *V. interior* Small. Frequent in n.-cen. Tex., Edwards Plateau and the Plains Country, infrequent or rare in e. Tex., summer; Ill. to Minn., s. to La. and Tex.

Hybridizing extensively; the hybrids and backcross types of this species and *V. Lindheimeri* have been called *V. guadalupensis* Heller. Many specimens from east and south-east Texas show combinations of characters of *V. Baldwinii* and *V. missurica*; a strong case could be made for considering those two taxa to be conspecific. *V. Baldwinii* and *V. altissima* also show evidence of genetic intercontamination.

2. *Vernonia missurica* Raf. Erect, 10-15 dm. tall, branched in the upper parts, pubescent; leaves numerous, the blades spreading, firm-membranous, sessile to short-petioled, lanceolate to ovate-lanceolate, 6-15 cm. long, 15-50 mm. broad, long-acuminate, sharply and coarsely serrate to nearly entire, acute or rounded at base, dark-green and scabrellate above, tomentose beneath at least along the veins; involucre broadly campanulate, short-cylindric or hemispheric, 6-8 mm. high; phyllaries appressed, closely and regularly imbricate, purplish or greenish, broadly rounded-keeled (the midnerve not narrowly prominent) or flat, glabrous or pubescent (in genetically contaminated plants with some resin-globules), arachnoid-ciliate at the margins, rounded, obtuse usually; flowers about 34 to 55 per head; achenes about 4 mm. long, resinous in the furrows. *V. Drummondii* Shuttlew. Local or locally abundant in s.e. Tex., infrequent to rare in e.

Tex., summer; Ont. to Ia. and s.w. to Miss., La., Tex. and N.M.

See discussion under *V. Baldwinii*; hybridizes with *V. Baldwinii* and *V. altissima*.

3. *Vernonia marginata* (Torr.) Raf. PLAINS IRONWEED. Stems erect, simple or rarely branched below the head-bearing region, 4-10 dm. tall, glabrous or minutely puberulent; leaf blades firm-membranous, linear to linear-lanceolate, 5-10 cm. long, 3-8 mm. broad, acute or acuminate, entire or remotely denticulate, essentially glabrous, punctate underneath; involucre broadly campanulate to thick-cylindric, about 8 mm. broad, 7-10 mm. high; phyllaries appressed, closely and regularly imbricate, mostly acute, glabrous or nearly so except in some specimens on the margins; flowers about 18 to 21 per head; achenes 4-5 mm. long, glabrous, with resin-globules in the furrows. *V. tenuifolia* Small. Frequent in the Trans-Pecos and Plains Country, summer; Kan., Okla., Tex. and N.M.

Exceedingly closely related to *V. fasciculata* Michx. (with blunter phyllaries) which has been reported to occur in Texas; no doubt the two taxa should be considered conspecific.

4. *Vernonia vulturina* Shinn. Nearly glabrous perennial herb; stems virgately ascending, probably about 1 m. tall or less, nearly simple, internodes in the upper few dm. of the length about 1 cm. long; leaves not much reduced upward, dark-green, narrowly lanceolate, 12-15 cm. long, 12-17 mm. broad, ascending, on each side with 30 to 40 mucrolike teeth about 0.4 mm. long, beneath microscopically black-punctulate, above especially near the margins with minutely antrorse-appressed scabrous projections; heads borne fairly crowded in an irregular terminal aggregation about 1 dm. high and broad, the individual peduncles 1-9 mm. long; heads about 13 mm. high; involucre about 7 mm. high, hemispheric-campanulate; phyllaries herbaceous, in 4 (or 5) series, very strongly graduated, the inner ones oblong and rounded apically, about 2 mm. broad, dark-purplish-brown and glabrous except for the pale minutely fimbriate margins, outer ones more acute and about 1 mm. broad and long; receptacle strongly convex, rough; flowers perfect, fertile, about 25 in number; corollas purplish-red, about 8.5 mm. long, only slightly ampliate upward, the 5 narrowly deltoid lobes 2 mm. long, the undivided portion thus about 6.5 mm. long; style branch appendages short, subulate; anthers not caudate basally; achenes 1.7-2 mm. long, brown, 6- or 7-ribbed, glabrous; pappus double, of about 50 pale-purplish-brown dorsiventrally flattened marginally minutely serrulate bristlelike members about 6 mm. long, plus a smaller number of subulate, serrulate paleae 0.6-0.7 mm. long and 0.1 mm. broad. Moist sandy soil, near Buzzard's Spring in Dallas, Dallas Co., Aug.; endemic.

Exceedingly rare or perhaps now extinct, collected once about 80 years ago.

5. *Vernonia altissima* Nutt. Stems erect, 1-3 m. tall, branched above, glabrous or nearly so; leaf blades thin, narrowly elliptic to lanceolate or lance-ovate, 15-25 cm. long, 3-7 cm. broad, long-acuminate, gradually attenuate basally, sharply and irregularly serrate to nearly entire, essentially glabrous above, beneath with short straight conic projections or (in genetically contaminated plants) with some curly hairs along the veins; involucre campanulate, 4-5 mm. high or rarely larger; phyllaries appressed, regularly imbricate, ovate to oblong-ovate, glabrous or puberulent, sparsely ciliate or entire, obtuse or rounded to acute or short-cuspidate; flowers (13 to) 21 to 29 per head; achenes usually lacking resin-globules. Reported to occur in e. and s.e. Tex., but we have seen no specimens, summer; N.Y. to O. and Mo., s. to S.C., Ga. and La.

6. *Vernonia texana* (Gray) Small. Stems erect, simple except in the uppermost parts, 4-8 dm. tall, glabrous or minutely puberulent; leaves firm-membranous, ascending, linear-lanceolate, 6-12 cm. long, 1-2 cm. broad, acute, sharply dentate with low salient teeth to nearly entire, attenuate to a sessile base, scabrous above, puberulent especially along the veins and usually pitted beneath, the upper blades strongly reduced and narrowed compared to the lower ones, linear to subulate; involucre broadly campanulate, 5-6 mm. high; phyllaries irregularly imbricate, appressed or the upper slightly spreading, tinged with purple, puberulent or glabrate, acute, the outer ones ovate, the inner oblong; flowers 18 to 21 per head; achenes pubescent on the ribs, with resin-globules in the furrows, about 2.5 mm. long. Infrequent in e. Tex., rare in s.e. and n.-cen. Tex., summer; Ark., La. and Tex.

Rather closely related to *V. altissima*; some specimens may be intermediate to that species.

7. *Vernonia Lindheimeri* Gray & Engelm. WOOLLY IRONWEED. Stems erect, simple except in the uppermost parts, 2-8 dm. tall, tomentose or canescent; leaves numerous and crowded, the blades narrowly linear, 5-8 cm. long, entire, revolute, 1-nerved, either glabrous or whitish-tomentose above, densely white-woolly beneath; involucre campanulate, 7-9 mm. high; phyllaries loosely and irregularly imbricate, purple, densely gray-tomentose dorsally, the outer ones ovate-lanceolate and acute, inner ones narrowly oblong and obtuse to rounded or mucronulate; flowers 20 to 60 per head; achenes glabrous, 4 mm. long, in the furrows with or without resin-globules. Incl. var. *leucophylla* Larsen. Locally abundant in Edwards Plateau, rare in n.-cen. Tex., summer; also Coah. (has been reported in Ark.)

In the eastern part of the Edwards Plateau occur the populations with nearly glabrous upper leaf surfaces and fewer flowers per head; these hybridize extensively with *V. Baldwinii*; some of the intermediates have been called *V. guadalupensis* Heller.

2. ELEPHANTOPUS L. ELEPHANT'S-FOOT

Perennial herbs usually 2-5 (-9) dm. tall, usually coarsely pubescent, branched in the upper half; leaves alternate, mostly ovate or obovate or elliptic, the larger ones 7-15 cm. long, unlobed, serrate, sessile but often narrowed to subpetiolar bases, acute or blunt; heads sessile, about 1 cm. high, subcylindric, in very tight few-headed glomerules at the ends of the branches, each glomerule simulating a head 1-2 cm. thick by virtue of being closely subtended by about 3 reduced deltoid leaves about 1 cm. long; involucre about 1 cm. high, subcylindric; phyllaries in several series, very strongly graduated, stramineous, appressed; ray flowers absent; disk flowers 3 or 4 per head, perfect, fertile, the corollas 5-lobed apically, pinkish-white to lavender; achenes columnar, antrorsely pubescent, several-nerved near the base; pappus persistent, of 5 or 10 stiff awns which are basally dilated and indurated.

A genus of a dozen or so species in America. Ours may hybridize to a limited extent.

1. Leaves basal except for bracteal leaves in the upper branch system, about as broad as long 3. *E. tomentosus*.
1. Leaves cauline as well as basal; the bracteal leaves subtending the glomerules of heads manifestly longer than broad (2)
- 2(1). Basal leaves usually persistent until flowering time; cauline leaves only 2-3 cm. long at most 2. *E. nudatus*.
2. Basal leaves (if any) withered and absent by flowering time; cauline leaves mostly larger 1. *E. carolinianus*.

1. *Elephantopus carolinianus* Raeusch. Perennial herb 3-9 dm. tall, leafy; leaves oblanceolate-elliptic, mostly (3-) 5-15 cm. long, only gradually reduced upward; deltoid bracteoles subtending the heads often discolored-indurate basally and manifestly longer than broad. Frequent or infrequent in sandy forested areas, e. and s.e. Tex., rare w. to n.-cen. Tex., late summer-fall; s.e. U.S.

The author of the botanical name is sometimes given incorrectly as "Willd."

2. *Elephantopus nudatus* Gray. Perennial herb 2-4 dm. tall, with a persistent basal rosette of oblanceolate to narrowly obovate leaves 3-15 cm. long; stem leaves few and much-reduced, usually 2-3 mm. long and sometimes oblong; deltoid bracteoles subtending the heads longer than broad. Infrequent in open woods on sandy flats, s.e. Tex. (Chambers, Hardin and Jefferson cos.), Aug.-Oct., rarely in May also; s.e. U.S., mostly near the coast.

3. *Elephantopus tomentosus* L. TOBACCO-WEED, DEVIL'S-GRANDMOTHER. Perennial herb 2-6 dm. tall with a persistent basal rosette of narrowly obovate leaves 8-22 cm. long; cauline leaves essentially absent; bracteal leaves subtending the heads about as broad as long. Infrequent in wooded sandy lands, e. and s.e. Tex., Aug.-Sept.; s.e. U.S.

3. CARPOCHAETE GRAY BRISTLEHEAD

A genus of about 3 species in Mexico and southwestern United States.

1. *Carpochaete Bigelovii* Gray. Subshrub (1-) 2-5 dm. tall; leaves opposite (or often fascicled so that the true phyllotaxy is obscure), linear to linear-oblanceolate, firm, 1-2

(-3) cm. long, densely resin-dotted, entire, essentially sessile; heads solitary, sessile and terminal on the short branches, 2-3 cm. long (including pappus); involucre nearly cylindrical, 13-19 mm. high; phyllaries linear, firm and resin-dotted like the leaves, very strongly graduated, (the shortest (outer) ones about 3-4 mm. long, and all intermediate lengths represented), acutish, the inner ones nerved and scarious-margined; receptacle 0.5 mm. broad, flat, naked; ray flowers absent; disk flowers 4 to 6, perfect, fertile, at anthesis about equaling the involucre, later much-exserted, the corolla whitish or purple-white, 5-lobed apically; achene about 1 cm. long, columnar, 10-ribbed, minutely pubescent; pappus persistent, about 15 mm. long, of about 10 subulate stiff bristlelike scales which are scarious-margined for most of their length and a few much shorter scarious outer paleae. Infrequent in the Chisos, Davis and Franklin mts. in the Trans-Pecos, Mar.-May (-June); Tex., N.M., Ariz. and Chih.

4. LIATRIS SCHREB.¹⁹¹

GAY-FEATHER. BUTTON-SNAKEROOT.

BLAZING-STAR

Perennial herbs from underground corms; leaves elongate, linear to ovate-lanceolate, sessile, more or less conspicuously punctate with impressed and resinous dots or not so punctate, the radical leaves usually much longer than the stem leaves that diminish in length upward; heads disposed in various ways, usually in spiciform or racemiform arrangements, each head with few to many flowers; ray flowers absent; disk flowers usually numerous, rarely as few as 4; receptacle naked, essentially flat; involucre of several series of imbricated phyllaries; phyllaries variously shaped, usually firm throughout, often marginally ciliate or erose; corolla typically purple, rarely white, never yellow, radially symmetrical, the cylindrical tube usually exceeding the pappus or twice as long as the pappus, the throat scarcely or slightly perceptible as opposed to the tube; corolla lobes 5, equal, ovate, acute, erect or more or less spreading; stamens 5; filaments uniform, equally inserted in the middle of the corolla tube, glabrous or with tiny outgrowths; anthers short, oblong, about half as long as the filaments; style stiff, bifid, exserted late in anthesis, the style branches club-shaped; achenes somewhat cylindrical but pointed basally, about 10-ribbed, pubescent on the ribs and more finely between the ribs; pappus of 12 to 40 bristles, sessile, in one or more series, plumose or barbellate.

About 40 species confined to North America.

1. Pappus units barbellate, the length of the lateral hairs only 3 to 6 times as great as the thickness of the central axis (hairs scarcely visible without a lens) (2)
1. Pappus units plumose, the length of the lateral hairs 15 times or more as great as the thickness of the central axis (7)
- 2(1). Heads 15- to 40-flowered, subglobose to campanulate, the numerous broad phyllaries appressed or erect or bullate or partly recurved (3)
2. Heads 3- to 20-flowered, oblong or cylindrical, the phyllaries mostly erect with their erect tips spreading or recurved (4)
- 3(2). Heads subglobose, 25- to 40-flowered; inner phyllaries usually strongly bullate ..
.....1. *L. aspera*.
3. Heads campanulate, 15- to 25-flowered; inner phyllaries not bullate
.....2. *L. squarrosula*.
- 4(2). Phyllaries obtuse to acuminate, appressed and never recurved (5)
4. Phyllaries acuminate and recurved at the tips (6)
- 5(4). Each head with about 12 flowers3. *L. lancifolia*.
5. Each head with 3 to 5 flowers4. *L. acidota*.
- 6(4). Stems 3-5.5 dm. tall; leaves above midstem becoming abruptly smaller than those below5. *L. tenuis*.
6. Stems 6-15 dm. tall; leaves gradually decreasing in length upwards
.....6. *L. pycnostachya*.

¹⁹¹ Adapted largely from L. O. Gaiser in Rhodora, Vol. 48. 1946.

- 7(1). Heads 4- to 14-flowered, slender-cylindrical; head-bearing region spiciform (8)
 7. Heads 15- to 60-flowered, more nearly globose or thick-cylindrical; head-bearing region like a loose cyme or cylindrical-racemose (11)
 8(7). Phyllaries with prolonged petaloid tips; corolla not at all pilose within
 7. *L. elegans*.
 8. Phyllaries herbaceous and appressed or with only the tips free; corolla quite pilose within the tube (9)
 9(8). Plants with a long underground rootstock 8. *L. punctata*.
 9. Plants with a somewhat globular corm (10)
 10(9). Heads 4- to 6-flowered 9. *L. mucronata*.
 10. Heads 10- to 14-flowered, few and distant on few-branched stems; leaves narrow, rather channeled and bractlike 10. *L. bracteata*.
 11(7). Phyllaries appressed 11. *L. cymosa*.
 11. Phyllaries recurved or loosely spreading 12. *L. squarrosa*.

1. *Liatris aspera* Michx. Corm rounded, irregular, subglobose, 2-5 cm. thick; stems often solitary, sometimes several, 4-11 (-15) dm. high, glabrous below and with scattered hairs above on the axis of the flower region or rough over the entire stem length; leaves mostly linear-lanceolate though frequently almost linear, the basal ones 10-15 cm. long, 1-2 cm. broad, rhombic-lanceolate, narrowed into subpetiolar bases in the lower half, glabrous on both surfaces and lacking any roughness on the margins or rough on one or both surfaces; upper leaves sessile, reduced to less than the length of the heads they subtend; head-bearing regions spiciform; heads sessile to pedunculate, somewhat globose, each with 25 to 40 flowers, 15-25 mm. thick; phyllaries all glabrous with exposed tips rounded and with broad scarious margins and slightly bullate, the middle and inner ones oblong-spatulate to rounded and strongly bullate (giving the globose head a puckered appearance); corolla usually purple, pilose within the tube at the base of the stamens, the tube 8-10 mm. long; pappus 7-8 mm. long, the barbellate units 4-6 mm. long. Frequent in sandy soils of e. and s.e. Tex., infrequent w. to Grayson, Henderson, Bastrop and Gonzales cos., July-Oct.; e. N.A., n. to Ont. and w. to N.D., Neb., Kan., Okla. and Tex.

Two superficial varieties are distinguished in Texas by some authors, the var. *aspera* [var. *intermedia* (Lunell) Gaiser] with heads obliquely ascending to horizontal, and var. *salutans* (Lunell) Shinnars, with heads horizontal to reflexed.

2. *Liatris squarrosa* Michx. Corm small, subglobose, about 2 cm. thick; stem usually solitary, 4-9 dm. high, often somewhat virgate, softly and densely pubescent or rough with short white hairs, or even almost glabrous; leaves glabrous, softly pubescent and rough on the margins only or more rarely scabrous, the basal ones sharply lanceolate, 1-2 dm. long, 5-15 mm. broad, narrowing to a short or winged subpetiolar base from one half to one third the length of the blade; upper leaves rigid, sharp-pointed, narrowly lanceolate or linear, reduced from 6-8 cm. long to narrow bracts less than 1 cm. long that subtend the heads; head-bearing region narrowly racemose, of 20 to 50 subsessile heads on erect or depressed peduncles about as long as the heads, or more rarely becoming branched and paniculate by the elongation of the peduncles into slender branches bearing several heads each; heads with 15 to 25 flowers, somewhat turbinate or campanulate, 10-15 mm. long, about 1 cm. thick at anthesis; phyllaries appressed or sometimes recurved, herbaceous, green and softly pubescent; outer phyllaries subulate, middle and inner ones oblong-spatulate, 7-8 mm. long, 2-3 mm. broad, herbaceous and usually finely pubescent, sometimes purplish with ciliolate margins; corolla tube 7-9 mm. long, scantily to moderately pilose at the base of the tube; mature achenes 3-4 mm. long; pappus about 6 mm. long, barbellate. Infrequent or rare in n.e. and e. Tex. in sandy soils, Sept.-Oct.; s.e. U.S. n. to N.C., Tenn. and Ind., w. to Tex.

Many authors use the name *L. Earlei* (Greene) K. Schum. for this species.

3. *Liatris lancifolia* (Greene) Kittell. GAY-FEATHER. Glabrous perennial to 6 dm. tall or more; leaves numerous, broadly linear, the basal ones 2-3 dm. long, 10-15 mm. broad near the center (tapering to base and to apex), upper ones shorter and bluntly lanceolate; heads in dense or loose spiciform arrangement 15-30 cm. long, 2-3 cm. thick, each head with about 12 flowers; phyllaries erect, glabrous, the outer deltoid-ovate, the inner oblong and acute, mostly herbaceous, with narrow purplish ciliolate margins; corolla purple, 6

mm. long, glabrous within; achene 3 mm. long or more; pappus barbellate, about 5 mm. long. Rare in meadowlands and on open slopes in the Panhandle (Hemphill and Oldham cos.), June-Aug.; S.D., Neb., Kan., Wyo., Colo., N.M. and Tex.

Exceedingly closely related to *L. spicata* (L.) Willd. which has more narrowly linear leaves and occurs over most of the eastern United States but has not yet been found in Texas.

4. *Liatris acidota* Engelm. & Gray. Corm globose, slightly elongated, usually not more than 3 cm. thick, bearing the remnants of previous basal leaves; stems slender, stiffly erect, 5-8 dm. tall, glabrous or puberulent, solitary or in 3's or 4's; basal leaves very long, glabrous, linear-lanceolate, 2-4 dm. long, 3-5 mm. broad; leaves of the slender spikes narrowly linear, becoming abruptly shortened, erect and bractlike; heads numerous, loosely covering 1-2 dm. of the erect spikelike head-bearing region, with 3 to 5 flowers, cylindrical but narrowed acutely to the tip when in bud, about 1 cm. long; phyllaries few, glabrous, appressed, the outer ovate, the inner oblong-lanceolate, sometimes becoming purplish; corolla about 8-10 mm. long, purple, lacking any pilosity within the tube; achene 4-5 mm. long; pappus about 7 mm. long, barbellate. Frequent in often wet areas, e. and s.e. Tex., w. to Austin Co. and s. to Calhoun Co., July-Dec.; also La.

5. *Liatris tenuis* Shinners. Corm 1-2 cm. thick, round or somewhat like an inverted carrot; stems 1 to few, 30-55 cm. tall, toward the base with spreading or ascending hairs, strigillose upward; leaves rather crowded, linear, punctulate, more or less pilosulous along the margin and the single nerve, acute, the stem leaves to 15 cm. long and 4.2 mm. broad, those of midstem becoming abruptly much smaller than those below, the uppermost leaves reduced to bracts 1-3 cm. long and 1-1.5 mm. broad; head-bearing region 15-25 cm. long, slender, spiciform or racemiform, interrupted, the internodes 7-15 mm. long; head usually solitary in the axils of the bracteiform upper leaves; peduncles to 3 mm. long; involucre cylindrical-campanulate, 10-13 mm. long; phyllaries in 4 or 5 series, narrowly ovate, acuminate, apically attenuate and spreading or subrecurved, ciliate, dorsally glabrous or at the very base pilosulous; flowers 10 or 11 per head; corolla about 7 mm. long, glabrous within the tube; pappus bristles barbellate, 4-7 mm. long; achenes 4.2-4.5 mm. long, prominently pilosulous along the ribs. Infrequent or rare in open pine woods on sandy soil, e. Tex. (Angelina, Jasper, Sabine and Tyler cos.), June-Aug.; endemic.

6. *Liatris pycnostachya* Michx. Corm globose or more elongate and resembling a rhizome, often 1 dm. thick in mature plants; stems 1 to many, 6-15 dm. tall, stiff, striate, generally hirsute, sometimes glabrous; leaves numerous, linear, punctate, the lower ones 1 dm. long and 4-5 mm. wide, hirsute or glabrous, gradually decreasing in length upward and passing into bracts subtending the heads; heads with 5 to 12 flowers, cylindrical, about 1 cm. long, sessile, crowded in a very dense spiciform arrangement that is 15-30 cm. long and 2-3 cm. thick with a generally hirsute axis; phyllaries herbaceous or purplish, lanceolate-acuminate or oblong, with more or less acute tips markedly squarrose and scarcely reflexed or merely lax and spreading, the margin mostly ciliate when herbaceous but frequently merely crisped and sometimes petaloid; corolla phlox-purple, occasionally white, 7-9 mm. long, the tube nonpilose or with very few hairs within; achenes 4-7 mm. long; pappus 6-7 mm. long, barbellate. Frequent in open sandy areas, often in or around moist bogs, e. and s.e. Tex., June-Oct.; Ind. to S.D., s. to La. and Tex.

A local race in the east Texas piney woods with extremely hairy leaves and flowering, on the average, later than the var. *pycnostachya* is called var. *lasiophylla* Shinners.

7. *Liatris elegans* (Walt.) Michx. Corm globose, 1-3 cm. thick or sometimes elongate to 15 cm. long; stems 1 or 2, 3-12 dm. tall, finely pubescent and leafy; leaves sessile, glabrous, punctate, linear to linear-lanceolate, reduced upward from the basal ones which are not more than 1 dm. long and 5 mm. broad, the uppermost bracteate leaves subtending the long heads and commonly soon deflexed; head-bearing region cylindrical to pyramidal, 15-50 cm. long, basally usually with short peduncles or with subsessile heads or (in some plants) with longer branches each bearing a number of peduncles; heads usually 5-flowered, 25-30 mm. long; outer phyllaries short, lanceolate, herbaceous; inner phyllaries prolonged into dilated lanceolate and reflexed or truncate and rounded petaloid serrulate tips, phlox-pink or white and surpassing the corolla and pappus; corolla 9-11 mm. long, as frequently white as purple, nonpilose within; achenes 4-6 mm. long; pappus long-plumose, 9-11 mm. long. Frequent in deep fine pure sandy soil in e., s.e. and n.-cen. Tex.

and the Rio Grande Plains, Aug.-Oct.; Coastal States, S.C. to Tex., inland to Ark. and Okla.

The plants of Bexar, Medina and Wilson counties are reported to be relatively robust with elongate corms as opposed to the globose corms of the var. *elegans*, and they have been given the name var. *carizzana* Gaiser; this variety is also reported to grow in deep sandy soils near Sierra Blanca, Hudspeth County, in the Trans-Pecos.

8. *Liatris punctata* Hook. Corm elongate, somewhat like a rhizome, often extensive; stems numerous, glabrous, striate, 15-80 cm. tall; leaves numerous, glabrous, rigid, linear, conspicuously punctate; basal leaves 8-15 cm. long, 1.5-6 mm. broad with a cutinous margin bearing prominent cilia or only scantily so provided, gradually diminishing; arrangement of heads generally densely (sometimes loosely) spiciform, 6-30 cm. long, 2-3 cm. thick when the flowers are open, the usually crowded heads 15-20 mm. long and 8-10 mm. thick with 4 to 8 flowers; phyllaries herbaceous, thick, punctate and closely appressed except for the free tips, the short outer ones rigidly ovate and acuminate or cuspidate, the inner ones oblong with acute or mucronate to lanceolate-acuminate tips, 10-14 mm. long, 1.5-2 mm. broad, prominently ciliate-margined in individuals having cilia on the margin of the leaves and correspondingly less ciliate to merely membranous in others; corolla purple (rarely white), 9-12 mm. long, the tube quite pilose inside; pappus distinctly plumose, 9-11 mm. long, usually slightly exceeded in length by the corolla; achenes 6-7 mm. long, ribbed and hairy.

We have the following two varieties.

Var. *punctata*. Stems 15-30 cm. long, stiff; basal leaves 8-10 cm. long, 3-5 mm. broad, with prominent cilia along the cutinized margin; inflorescence shortly spiciform, 6-20 cm. long; heads crowded, about 2 cm. long, containing 5 to 8 flowers each; phyllaries prominently margined by long white cilia, inner ones lanceolate-acuminate or oblong with acute or mucronate tips. Very likely rare on calcareous uplands of the n. part of the higher elev. in the Plains Country and possibly also in the Guadalupe Mts. in the Trans-Pecos, late summer; from Man. to Sask. and s. to Ia. and Kan., and from Alta. s. along the e. Rocky Mts. into N.M.

Var. *mexicana* Gaiser. Plants 50-85 cm. tall with few stems; corm thick, ovate or subelongate; leaves few, commonly completely glabrescent, shining, remote, 125-150 mm. long, 4-6 mm. broad; head-bearing region lax, with internodes 1-2 cm. long; heads 15-20 cm. long, with 5 or 6 flowers; phyllaries from ovate-acuminate to mucronate, marginally ciliate or not. Infrequent to locally abundant on calcareous uplands in the w. part of the Edwards Plateau and in the mts. of the Trans-Pecos, generally at about 4,000 ft. elev., Aug.-Sept.; also S.L.P., Tam. and Coah.

Some of the plants from the Panhandle and the Guadalupe Mts. seem to be intermediate between var. *punctata* and var. *nebraskana* Gaiser, of central United States. The latter variety is distinguished by its narrower leaves, 2-3 mm. broad, proportionally longer, and the leaves and phyllaries being without prominent ciliate margins.

9. *Liatris mucronata* DC. Corm globose, 2-4 cm. thick; stems few to numerous, 3-8 dm. tall, often reddish in color; leaves narrowly linear, punctate or not, the basal ones 5-10 cm. long and 1-5 mm. broad, progressively diminishing upward to become short bracts in the head-bearing region; head-bearing region spiciform, dense, 8-60 cm. long; heads cylindrical, 8-18 mm. long, usually sessile, each with 3 to 6 flowers; phyllaries herbaceous, the short outermost ones ovate-lanceolate with mucronate tips becoming longer, the innermost ones lanceolate and acuminate, thin-papery, glabrous with merely membranous or slightly ciliolate margins in exceptional cases, somewhat glutinous or the phyllaries merely acute or rounded and mucronate; corolla purple, 9-10 mm. long, slightly pilose to moderately pilose at the base of the tube; pappus 6-7 mm. long, plumose, the lateral cilia more than 15 times as long as the thickness of the central axis; achenes 5-7 mm. long, ribbed and hairy. Incl. var. *interrupta* Gaiser, *L. angustifolia* (Bush) Gaiser. Abundant in well-drained calcareous uplands, n.-cen. Tex., Edwards Plateau and Plains Country, less abundant on caliche cuerdas in the Rio Grande Plains and rather rare in e. Tex., Aug.-Dec.; Mo., Kan., Okla., Neb., Coah. and Tam.

The species is rather closely related to *L. punctata* and possible intermediates between the two have been found in Missouri and Oklahoma and are to be expected in Texas.

10. *Liatris bracteata* Gaiser. Corm subglobose, about 4 cm. thick; stems glabrous, few

to several; leaves linear, glabrous, punctate, rigid, slightly channeled, the basal ones 7-12 cm. long and 2-3 mm. broad, somewhat rigid, diminished above until in the head-bearing region they are mere bracts; head-bearing region spiciform, extremely lax; internodes of the spiciform head-bearing region 1-3 cm. long; heads few, subturbinate, 2 cm. long (including the pappus), 15 mm. thick, each with 8 to 10 flowers; lower phyllaries ovate, acuminate, the interior ones broader, lanceolate, commonly cuspidate, 10-12 mm. long, 3-4 mm. broad, commonly purplish, long-ciliate on the margins; corolla purple, 9-11 mm. long, sparsely pilose within the tube; pappus 10-15 mm. long, plumose; achenes 8-12 mm. long. Frequent in prairies of s.e. Tex. (Harris, Galveston and Matagorda cos.), Oct.; endemic.

This species is distinguished from *L. mucronata* on the basis that some of the upper heads are commonly 10- to 14-flowered, all the heads are few and very distant on few-branched stems, the narrow leaves rather channeled and bractlike.

11. *Liatris cymosa* (H. Ness) K. Schum. Corm rounded, to 3 cm. thick; stems stiff, upright, 25-60 cm. tall, dichotomously cymosely branched above; leaves mostly glabrous, punctate, linear-lanceolate, the radical leaves 15-20 cm. long and 5-15 mm. broad, tapering to a clasping subpetiolar base, the stem leaves linear and gradually reduced upward; head-bearing region a simple or compound cymose aggregation; heads 20-25 mm. long, 7-10 mm. thick, each with about 20 flowers; phyllaries appressed, closely imbricated, in about 6 series, slightly hirsute, ciliate-margined, the outer phyllaries almost orbicular with rounded or truncate apices, the inner ones oblong with mucronate tips, often colored; flowers purple; corolla 15 mm. long, the inner surface of the lobe of the corolla and the tube smooth; pappus about 8-10 mm. long, plumose; achenes 8-15 mm. long, hispid on the ribs. Infrequent or rare in tight clay-loam soil, e. Tex. (Brazos, Walker and Washington cos.), Aug.-Nov.; endemic.

12. *Liatris squarrosa* (L.) Michx. Corm rounded, to 4 cm. thick; stems several to numerous, 3-6 dm. tall, variously pubescent; leaves linear and rigid, punctate, glabrous or hirsute, the radical ones 15-25 cm. long and 4-7 mm. broad, the cauline leaves 10-15 cm. long; head-bearing region with 1 to few heads and racemelike or with many heads, branched and paniculate; heads elongate or almost isodiametric, sessile or on short pedicels, 15-30 mm. long, each with 25 to 40 flowers, the terminal heads often greatly exceeding the rest (up to 60 flowers), the heads varying in their thickness according to the spread of the phyllaries; phyllaries foliaceous, glabrous or hirsute, ciliate-membranous or callous-margined; inner phyllaries in all varieties narrowly linear with acute tips, 15-20 mm. long, 1-2 mm. broad; outer phyllaries elongate, triangular or lanceolate, often like reduced leaves, ciliate-margined, linear; middle phyllaries similar, acuminate and spreading or broader, more closely appressed basally, mucronate and squarrose at the tip; corolla phlox-purple, 9-15 mm. long, inner surface of corolla lobes conspicuously hairy, outer flowers of the head tending to be bent outward (approximately at mid-corolla) to give to the head a broad flat top; stigmas sometimes white; achenes 5-6 mm. long; pappus 7-12 cm. long. From Del. to Ill. and S.D., s. to the Gulf States.

Our material is represented by the following three varieties.

Var. *alabamensis* (Alex.) Gaiser. Stems, leaves and outer phyllaries glabrous or softly pubescent; outer phyllaries spreading or slightly squarrose, triangular-lanceolate, acuminate, 5-8 mm. long, 3-5 mm. broad, ciliate-margined; middle phyllaries glabrous, more sharply pointed and cellular-margined, 10-15 mm. long, 5 mm. broad; heads 15-20 mm. long and 10-15 mm. broad, of about 30 flowers; corolla 10-12 mm. long; pappus about 1 cm. long. *L. glabrata* Rydb. var. *alabamensis* (Alex.) Shinnery. Frequent in sandy uplands in e. and s.e. Tex. and n. extreme of Rio Grande Plains, s.w. to Bastrop and DeWitt cos., July-Sept.; also Ala., Miss. and La.

Var. *hirsuta* (Rydb.) Gaiser. Plants with hirsute stems and hirsute narrow 1- to 3-veined leaves and long ciliate-margined phyllaries; few outermost phyllaries may be narrowly lanceolate but most are broadly oblong, narrowing abruptly into long tusklike tips that alone are strongly reflexed to give the head of about 20 flowers a more compact narrow cylindrical appearance (averaging 13 mm. long by 1 cm. thick); outer phyllaries 7-10 mm. long, 4-5 mm. broad; middle phyllaries 10-13 mm. long, 3-4 mm. broad; corolla about 1 cm. long; pappus 8 mm. long. Infrequent in open sandy areas, e. and s.e. Tex., late summer-early fall; also Ky., Miss., Mo., Ark., La., Neb., Kan. and Okla.

This variety is often considered to be a separate species, *L. hirsuta* Rydb.

Var. *glabrata* (Rydb.) Gaiser. Plants entirely glabrous with rigid narrow 1- to 3-veined leaves; phyllaries narrower than in var. *hirsuta*, short-acuminate or cuspidate, callous-margined and recurved after flowers are opened though they may be quite erect before that time; outer phyllaries triangular-lanceolate and 7-10 mm. long; middle phyllaries 10-15 mm. long and 4 mm. broad; heads trim, without the long foliaceous outermost bracts of var. *compacta* and var. *squarrosa* (averaging 13 mm. long and 1 cm. thick), each with 20 to 30 flowers; corolla about 1 cm. long; pappus 7-8 mm. long. Frequent in open sandy lands, n.-cen. Tex., rare e. into e. Tex., late summer-fall, rarely in May; also Mo., Ark., S.D., Neb., Kan., Okla. and Colo.

This is sometimes considered along with var. *alabamensis* to constitute a separate species, *L. glabrata* Rydb.

5. BRICKELLIA ELL.¹⁹²

Perennial herbs, subshrubs or shrubs; leaves opposite or alternate; inflorescence various but basically paniculate; heads discoid, white, greenish-yellow or orange; involucre of numerous graduated bracts with longitudinal striations; florets slender, somewhat contracted above with 5 inconspicuous erect teeth at the summit; achenes 10-ribbed (5-ribbed in *B. Fendleri* and *B. Shineri*), cylindrical, usually densely pubescent; pappus of numerous scabrous (rarely smooth or plumose) bristles. Flowering mostly in late summer and fall.

A New World genus of about 100 species, mostly in western North America.

1. Petioles less than a fifth as long as the blade (2)
1. Petioles more than a fifth as long as the blade (9)
- 2(1). Achenes glabrous or glabrate 7. *B. dentata*.
2. Achenes variously and usually densely pubescent (3)
- 3(2). Leaf bases narrowly cuneate; stems densely leafy .. 8. *B. laciniata*.
3. Leaf bases obtuse or truncate; stems not densely leafy (4)
- 4(3). Leaf blades mostly 10-15 mm. long 2. *B. parvula*.
4. Leaf blades mostly more than 15 mm. long (5)
- 5(4). Leaves lance-oblong, margins somewhat revolute .. 6. *B. venosa*.
5. Leaves lanceolate to ovate, margins not revolute (6)
- 6(5). Leaf blades more than 6 cm. long, the bases oblique 5. *B. viejensis*.
6. Leaf blades less than 6 cm. long, bases not oblique (7)
- 7(6). Pappus bristles plumose (if merely scabrous, then plants glandular-pubescent); leaf blades thin, not reticulate-veined 1. *B. brachyphylla*.
7. Pappus bristles scabrous or smooth; leaf blades subcoriaceous, usually reticulate-veined beneath (8)
- 8(7). Leaves lanceolate to lance-ovate; inflorescence usually somewhat congested 3. *B. cylindracea*.
8. Leaves ovate, usually broadly so; inflorescence usually open, of fewer heads 4. *B. conduplicata*.
- 9(1). Larger leaf blades less than 15 mm. long; heads on very short peduncles 10. *B. veronicaefolia* var. *petrophila*.
9. Larger leaf blades more than 15 mm. long (if shorter, then heads on peduncles about 1 cm. long) (10)
- 10(9). Stems with deciduous papery outer bark; alternately branched (11)
10. Stems without papery outer bark (bark occasionally membranaceous in *B. Coulteri*, which is oppositely branched) (12)

¹⁹² Contributed by Lowell David Flyr.

- 11(10). Leaf bases cuneate; blade outline somewhat rhomboid
 11. *B. baccharidea*.
11. Leaf bases truncate or cordate; blade outline not rhomboid
 9. *B. californica*.
- 12(10). Stems brittle, oppositely branched; heads not in terminal clusters
 12. *B. Coulteri*.
12. Stems simple or variously branched, usually from near the base, not brittle; heads in
 terminal clusters (13)
- 13(12). Achenes 10-ribbed; outer involucre bracts with caudate-acuminate tips
 15. *B. grandiflora*.
12. Stems simple or variously branched, usually from near the base, not brittle; heads in
 bracts acute to acuminate (14)
- 14(13). Involucres about as broad as high; shrubs without glandular-viscid stems
 14. *B. Fendleri*.
14. Involucres 0.5 to 0.7 times as broad as high; herbs with glandular-viscid stems
 13. *B. Shineri*.

1. *Brickellia brachyphylla* (Gray) Gray. Perennial herb, usually much-branched from a woody base; leaves opposite or alternate, short-petioled, lanceolate, the margins serrate or entire, apices acute to acuminate; inflorescence an elongate raceme or panicle or the heads rarely solitary; involucre of 15 to 20 acuminate bracts; achenes densely pubescent; pappus bristles plumose in the typical variety, otherwise scabrous or barbellate. The species ranges through much of w. Tex. (July-Oct.) and is represented with us by 3 varieties as follows:

Var. *brachyphylla*. Stems with stipitate glands; heads about 8 mm. across. Higher elev. in the Trans-Pecos and along caprock in the Plains Country; also the Okla. Panhandle, N.M., s. Colo. and e. Ariz.

Var. *terlinguensis* Flyr. Stems without stipitate glands; heads about 5 mm. across; leaves narrowly lanceolate; plants densely glandular. Lower, more arid places from s. Brewster Co. to Hudspeth Co.; endemic.

Var. *Hinckleyi* (Standl.) Flyr. Stems without stipitate glands; heads about 5 mm. across; leaves broadly lanceolate; plants sparsely glandular. *B. Hinckleyi* Standl. Known only from the n. slope of Mt. Livermore, Jeff Davis Co.

2. *Brickellia parvula* Gray. Much-branched perennial herb from an elongate woody base, usually less than 3 dm. tall; leaves opposite below, short-petioled, about 15 mm. long, ovate, thin, acute at the apices, margins serrate; inflorescence a loose corymbose panicle, the heads long-pedunculate; involucre 8-9 mm. high, of about 15 bracts; achenes densely pubescent; pappus of about 30 somewhat barbellate bristles. Franklin Mts., El Paso Co. and Guadalupe Mts., Culberson Co., Sept.-Oct.; also s. Ariz.

3. *Brickellia cylindracea* Gray & Engelm. Perennial herb or subshrub to 1 m. tall, from a compact woody base, stems usually several; leaves opposite or alternate, sessile or with a petiole 1-3 (-5) mm. long, lanceolate to narrowly ovate, usually coriaceous and reticulate-veined beneath (less often thin with veins obscure), margins crenate to serrate, apices obtuse or acute; inflorescence racemose to paniculate, often very dense, with leafy bracts intermixed; involucre usually reddish-tinged, of about 20 bracts, the outer bracts much shorter than the inner; pappus of about 30 to 35 scabrous bristles; achenes sparsely to densely pubescent. Various habitats from Bell and Travis cos. w. to Jeff Davis and Presidio cos., Aug.-Nov.; also n. Mex.

An extremely variable species in leaf size, shape and texture as well as inflorescence; not easily distinguished from the next species.

4. *Brickellia conduplicata* (Robins.) Robins. Perennial herb with few mostly simple stems arising from a compact woody rootstock; leaves mostly opposite, with a distinct petiole about 3 mm. long, ovate (often broadly so), flat or conduplicate, often reticulate veined below, margins crenate to somewhat serrate, apices acute or obtuse; inflorescence usually a panicle or sometimes a raceme but heads not densely crowded; involucre occasionally reddish-tinged, bracts acute to acuminate; achenes usually densely pubescent. Higher elev. in s. Brewster and Presidio cos., Aug.-Nov.; also n. Mex.

Many of the plants referred here may be only extreme variants of the preceding species.

5. *Brickellia viejensis* Flyr. Coarse perennial herb about 6 dm. tall; stems longitudinally furrowed, pubescent and somewhat glandular; internodes about 5 cm. long; leaves subopposite, 6-8 cm. long with a petiole to 1 cm. long, the leaf bases oblique, margins coarsely serrate, apices acute, the blades pubescent and glandular-punctate; inflorescence an open panicle; involucre about 14 mm. high, of about 18 linear bracts acute at the apices; achenes with dense fine pubescence; pappus of about 35 scabrous bristles. Sierra Tierra Vieja, Presidio Co.; endemic.

6. *Brickellia venosa* (Woot. & Standl.) Robins. Perennial herb or subshrub, much-branched from near the base; stems slender, brittle, pubescent; leaves opposite, sessile or with a short petiole, narrowly lance-oblong, margins entire or crenulate and somewhat revolute, reticulate-veined, apices obtuse; inflorescence a loose panicle; heads about 7 mm. across; involucre bracts about 25, reddish-tinged, the outer mucronate; achenes sericeous, the ribs obscure; pappus of about 30 to 40 shining bristles. *Coleosanthus venosus* Woot. & Standl. Rocky slopes and arroyos, in Tex. only from the Franklin Mts., El Paso Co., Aug.-Oct.; also s. N.M., s. Ariz., n. Mex. (Son., Chih.).

7. *Brickellia dentata* (DC.) Sch. Bip. Shrubs about 1 m. tall, much-branched from near the base; stems ascending, with pale bark; leaves alternate, short-petioled, densely crowded, lanceolate, margins dentate or sometimes nearly entire above, apices acute; inflorescence an elongate leafy panicle with heads less than twice as high as broad; involucre bracts minutely pubescent near the obtuse to acute apices; achenes glabrous or very slightly puberulent; pappus of 30 to 35 barbellate bristles. *B. Riddellii* (T.&G.) Gray. Limestone streambeds, s.e. Edwards Plateau, Aug.-Nov.; endemic.

8. *Brickellia laciniata* Gray. Shrub, usually 1-2 m. tall, with bright-green foliage and very numerous closely-ascending branches; young stems glandular-pubescent with papery white outer bark that soon peels away to reveal tan smooth inner bark; older stems usually leafless; leaves alternate, crowded, oblong or ovate but irregularly toothed or cleft, narrowly cuneate at the base to a slender petiole, vernicose and punctate; inflorescence an elongate leafy panicle with heads about twice as high as broad; involucre bracts about 20, acutish, somewhat glutinous; achenes sparsely pubescent; pappus of about 25 minutely-scabrous bristles; reflexed involucre bracts often persisting long after achenes have fallen. Dry streambeds and rocky places from Kimble and Val Verde cos. westw. through the Trans-Pecos, Aug.-Nov.; also s. N.M. and n. Mex. to S.L.P., Zac. and Dgo.

A very common weedy shrub through much of its range. This species almost certainly hybridizes with *B. californica* in the Davis Mts.

9. *Brickellia californica* (T.&G.) Gray. Shrub, usually more than 1 m. tall, divaricately branched; stems somewhat tortuous, with glandular-puberulent deciduous papery outer bark; leaves alternate, with a petiole equaling a third to half the punctate somewhat scabrous blade which is broadly ovate to deltoid and truncate or cordate at the base, margins dentate, crenate, somewhat lobed or rarely nearly entire, apices acute or obtuse; inflorescence a leafy panicle or a series of terminal ascending branches, each of these a raceme; involucre bracts about 3 mm. across, 9 mm. high, of about 20 acute to acuminate bracts, often reddish-tinged; achenes tawny-pubescent; pappus of about 30 scabrous bristles. *B. Wrightii* Gray [including var. *reniformis* (Gray) Robins.]. Rocky places from about 4,000 to 7,500 ft. alt. in the Trans-Pecos, and in the Panhandle near the caprock, Aug.-Nov.; also the Okla. Panhandle, Colo., Ut., Ida., s. to n.w. Mex. (incl. Baja Calif.).—Cf. note under *B. laciniata*.

10. *Brickellia veronicaefolia* (H.B.K.) Gray var. *petrophila* (Robins.) Robins. Shrub usually less than 5 dm. tall, much-branched from near the base; stems reddish, glandular-pubescent; leaves subopposite, with a petiole about 3-4 mm. long, broadly ovate to reniform, usually less than 15 mm. long, margins crenate, minutely pubescent and punctate, obtuse at the apex; inflorescence a leafy panicle; involucre bracts about 7 mm. across, reddish-tinged, the bracts 35 to 40, acute to acuminate; achenes 10-ribbed, glabrate; pappus of about 25 scabrous bristles. Known in Tex. (and the U.S.) only from higher elev. of the Chisos Mts.; this and other varieties of the species common over much of the Mex. Plateau.

11. *Brickellia baccharidea* Gray. Shrub with slender mostly ascending branches; leaves alternate, disposed mostly at the ends of the branches, with a petiole about 5-7 mm. long, rhomboid-ovate with a cuneate base, rather thick, reticulate-veined, punctate,

margins coarsely toothed, acute at the apices; inflorescence a loose leafy panicle, the heads mostly crowded on the terminal 1 dm. of each branch; involucre about 3 mm. broad, 7 mm. high, of about 25 mostly obtuse bracts, the outermost bracts very short; achenes appressed-pubescent; pappus of about 20 minutely scabrous bristles. Known in Tex. only from the Franklin Mts., El Paso Co.; also s. Ariz.

12. *Brickellia Coulteri* Gray. Diffuse sprawling shrub to about 1 m. tall, oppositely branched; stems very brittle, with crisped-glandular pubescence; leaves opposite, with petioles about a third the length of the broadly ovate-deltoid blade, minutely pubescent, margins coarsely toothed or rarely entire, attenuate at the apices; inflorescence a diffuse panicle; involucre about 20, acute to acuminate; florets about 17; achenes sparsely glandular-pubescent, the ribs obscure; pappus of 35 to 40 minutely scabrous bristles. In sand and among rocks at lower elev. in the Trans-Pecos near the Rio Grande, late spring-fall; also s. Ariz., n.w. Mex. (incl. Baja Calif.).

13. *Brickellia Shineri* Flyr. Viscid perennial herb to 6 dm. tall from a compact woody rootstock; stems striate, glandular-pilose; leaves opposite below, subopposite to alternate above, with a petiole about equaling the ovate to deltoid thin blade, margins coarsely crenate-dentate, apices acute to slightly acuminate, thin; inflorescences corymbose or with smaller clusters of heads disposed along the stems in addition; involucre about 4 mm. across, the bracts several-seriate, 15 to 20, acuminate; achenes 5-ribbed (or with a few additional indistinct ribs), sparsely pubescent; pappus of about 30 scabrous bristles. *Eupatorium Parryi* Gray. Higher elev. in the Chisos Mts. and in canyons in Val Verde Co., late spring-fall; also n. Mex., but rare.

14. *Brickellia Fendleri* Gray. Shrub usually less than 1 m. tall, much-branched from near the base; stems with crisped hairs; leaves alternate, with a petiole a third to one half as long as the broadly ovate to deltoid blade, margins crenate-dentate, attenuate at the apices; inflorescence a panicle but the heads usually densely clustered, somewhat nodding; involucre nearly as broad as high, bracts about 20 to 25, conspicuously unequal, minutely pubescent especially near the margins, obtuse to acute at the apices; achenes 5-ribbed (or occasionally with a few intervening between these), coarsely puberulent; pappus of about 25 scabrous bristles. *Eupatorium Fendleri* (Gray) Gray. Moist places at higher elev. in the Guadalupe, Davis and Chisos mts., July-Oct.; also N.M. and Ariz.

15. *Brickellia grandiflora* (Hook.) Nutt. Perennial herb, usually much less than 1 m. tall, from a fusiform rootstock; stems few, erect, crisped-puberulent; leaves opposite below to alternate above, triangular or somewhat hastate, with a petiole more than half as long as the crenate-dentate blade, apices long-attenuate; inflorescence more or less paniculate but heads crowded at the tips of the branches; involucre about 7-8 mm. broad, the outer bracts with caudate-acuminate tips, the inner acute; florets with slightly enlarged throats; achenes somewhat constricted near the apex, 10-ribbed (obscurely), minutely puberulent; pappus bristles about 25 to 30, scabrous, somewhat caducous. In high forests in the Guadalupe, Davis and Chisos mts., July-Oct.; also Mo., Ark., Neb. and Colo. w. and n. to Calif. and B.C., and in n. Mex. (incl. Baja Calif.)

6. KUHNIA L. FALSE BONESET

Perennial herbs from vertical obconical woody taproots, the crowns usually several; stems 1 to several, simple or branched, erect to decumbent; leaves alternate (in young plants or young stems the lowermost leaves sometimes opposite); heads solitary or few and long-peduncled or in subcorymbose or paniculate aggregations; involucre subcylindric to turbinate or campanulate; phyllaries firm (often chartaceous in age), in 4 to 7 series (but only the outer 2 to 4 series distinctly graduated in size), the outer ones lanceolate to deltoid, acute or acuminate, the inner ones linear or narrowly oblong or oblanceolate; receptacle flat or slightly convex, naked; ray flowers absent; disk flowers perfect, fertile; corollas regularly 5-lobed at summit, whitish to yellowish or reddish; style tips flattened, clavate, long; achenes columnar or slightly clavate, 10-ribbed (or also in some specimens with extra intermediate weaker ribs); pappus of 10, 15 or 20 equal uniseriate plumose bristles slightly shorter to slightly longer than the corollas.

A North American genus of about half a dozen species.

1. Stem leaves all narrowly linear and entire, not more than 3 mm. broad (2)
1. Stem leaves linear-lanceolate to broadly rhombic, at least the middle and lower ones more than 3 mm. broad (3)
- 2(1). Leaves narrowly linear, 0.5-1 mm. broad, very numerous and crowded, the upper ones little reduced; stems simple up to the narrow part of the plant where the heads are borne on ascending branches 1. *K. leptophylla*.
2. Leaves linear to lanceolate, the larger ones 1-3 (-8.5) mm. broad, scattered, the upper considerably smaller; branching usually profuse and spreading 2. *K. chlorolepis*.
- 3(1). Leaves sessile or subsessile, entire or rarely with a single pair of prominent teeth near the base, the larger blades 1.5-8.5 mm. broad; heads solitary or in loose clusters of 2 to 5, on peduncles or branchlets 5-30 (-120) mm. long 2. *K. chlorolepis*.
3. Leaves subsessile or short-petioled, the petioles to 1 cm. long, the blades entire or coarsely and deeply toothed with the larger ones 5-45 mm. broad; heads mostly in rather dense clusters of 3 to 8, on peduncles 3-20 mm. long, or a few solitary or in pairs on peduncles as much as 40 mm. long 3. *K. eupatorioides*.

1. *Kuhnia leptophylla* Scheele. Stems 2-7 dm. tall; leaves very numerous, often with axillary fascicles, sessile, the upper ones little-reduced, the narrowly linear blades to 5 cm. long and 1 mm. broad, entire and with revolute margins, scabrous above, punctate beneath, falcate or twisted; branches in the head-bearing region closely ascending so that the stem with heads is rather narrowly cylindrical; involucre 7.8-9 mm. high; flowers 17 to 25; phyllaries linear; corollas about 6.3 mm. long; achenes 10-ribbed, 5-6 mm. long; pappus conspicuously plumose, brown, 4.5-5.5 mm. long. Local on limestone slopes and in stream beds, s. part of Edwards Plateau, Sept.-Nov.; endemic.

2. *Kuhnia chlorolepis* Woot. & Standl. Stems 30-75 cm. tall, usually bushy-branched in the upper third or nearly from the base, minutely pubescent; stem leaves sessile or subsessile, linear or narrowly oblong to lanceolate, entire or very rarely with a basal pair of salient teeth, green and scabrous above, paler, punctate and glabrous beneath, 1- or the larger 3-nerved; middle and lower leaf blades 25-55 (-75) mm. long, 1.5-8.5 mm. broad; heads solitary and terminal on the branchlets or in small loose clusters of 2 to 5; peduncles 5-30 mm. long; involucre 8-12 mm. high; flowers 15 to 34; phyllaries linear to oblong or oblong-lanceolate, obtuse and apiculate; corollas 6.3-7.5 mm. long; achenes 4.8-5.2 mm. long, blackish-brown; pappus bristles 5-6.3 mm. long. Infrequent in the Trans-Pecos and w. part of Edwards Plateau, late summer-fall; Chih., Coah., Dgo., N.L., Son., Zac., Ariz., Colo., N.M., Tex., (Ut.?).

3. *Kuhnia eupatorioides* L. Stems solitary or few, 4-13 dm. tall, erect, simple below the head-bearing region; stem leaves narrowly lanceolate to broadly rhombic-lanceolate, the largest ones 25-100 mm. long and 5-40 mm. broad, minutely scabrous and resin-dotted above, paler and reticulate-veiny and resin-dotted beneath, marginally entire to sparingly and shallowly dentate; petioles of largest leaves to 1 cm. long; branching in the head-bearing region rather spreading and loose; heads corymbosely clustered; involucre 7-14 mm. high; flowers 7 to 33; phyllaries in about 4 series, striate, hirsutulous, more or less resin-dotted, the outer subulate-deltoid to lanceolate with acute to very narrowly linear tips, 0.6-1.1 mm. broad; corollas creamy or yellowish, 4.5-5.8 mm. long; achenes 10-ribbed, 4.5-5.2 mm. long; pappus bristles 20, white to brownish, 4.5-5.5 mm. long. Widespread e. of Trans-Pecos, flowering in very late summer and fall, with 3 varieties in Tex. as follows:

Var. *eupatorioides*. Middle and outer phyllaries acute or acuminate, usually all considerably less than three fourths as long as the inner and erect and appressed; flowers 7 to 14 per head; involucre 7-10.5 mm. high. In deep sandy soils of e. Tex., s.w. to Bexar and Wilson cos.; widespread in e. U.S., n. to Ind., Pa. and N.J.

Var. *texana* Shinn. Middle and outer phyllaries with conspicuous elongate falcate or twisted filiform tips, usually at least some of them from three fourths to fully as long as the inner. Calcareous soils of n.-cen. Tex. and e. part of Edwards Plateau and rare in the Plains Country; also known in Okla.

Var. *corymbulosa* T.&G. Outer phyllaries much as in var. *eupatorioides* but involucre

8.7-14 mm. high and heads with 14 to 33 flowers. Plains Country; also midwest. U.S. from O. to N.M. and Mont. Another variety, var. *ozarkana* Shinnars, is known from Ark., Ill. and Mo.

7. AGERATUM L.

An American genus of about 3 dozen species.

1. *Ageratum corymbosum* Zuccag. Subshrubs or perennial herbs 3-7 dm. tall, the culms often partly decumbent, often rather freely branched; leaves opposite (or those bracteals in the upper head-bearing extremity not), firm-membranous; blades ovate to rhomboid-lanceolate, 3-6 cm. long, 14-35 mm. broad, acute, basally rotund or cuneate, marginally crenate to dentate, rarely serrate, from the base 3- (to 5-) nerved, pubescent, more densely so below; petioles 4-8 mm. long; heads about 7 mm. thick, in tight corymbiform aggregation at the ends of the branches; involucre campanulate to hemispheric; phyllaries linear-lanceolate, attenuate, hispidulous, 2-ribbed, in 2 or 3 series, well-imbricated and graduated; receptacle essentially flat, naked; ray flowers absent; disk flowers perfect, fertile, the corolla blue and 5-toothed terminally; achenes 2.2 mm. long, black-brown to black, glabrous, 5-ribbed; pappus a low irregular crown of connate scales 0.3 mm. long, persistent. Reported to occur in the Trans-Pecos, apparently through the mistaken assumption that Wright's collection locality "Guadalupe Pass" is in Tex.; actually it is in s.w. N.M. near the Ariz. border; widespread in Mex. highlands.

8. TRICHOCORONIS GRAY

Annual (?) glabrous herbs 5-30 cm. tall, freely branching from the base and rooting at the lower nodes; most of the leaves opposite, only a few upper ones becoming alternate, sessile, 1-3 (-6) cm. long, often shallowly to deeply incised into 3 lobes nearly to the tip but otherwise entire and oblong to cuneate; heads singly terminating the branches; involucre hemispheric, 2-6 mm. high; phyllaries linear or oblong, in roughly 2 subequal series, weak and thin and each obscurely 3-nerved; receptacle slightly convex, naked; ray flowers absent; disk flowers perfect, fertile, numerous, the corollas whitish or purplish-white, sharply divided into a minute glandular-pubescent tube and an abruptly flaring 5-toothed limb; achenes 1-2 mm. long, slightly flattened, 5-ribbed at maturity, glabrous, linear, dark; pappus essentially absent or of a few very minute fimbriate scales.

A genus of 2 species, both occurring in Texas.

1. Achenes about 1 mm. long and involucre about 2 mm. high 1. *T. Wrightii*.
 1. Achenes about 2 mm. long and involucre about 5 mm. high 2. *T. rivularis*.

1. *Trichocoronis Wrightii* Gray. Depressed annuals (?) with fibrous roots, usually spreading so that the diameter of the clump is greater than the height of the plant; leaves usually oblong, only obscurely toothed near the apex; involucre about 2 mm. high; corolla about 1 mm. long; achenes about 1 mm. long. Local in moist swales, calcareous clay soil, Rio Grande Plains and s. part of s.e. Tex. (also Gonzales Co.), spring; also Tam.; adv. in Calif.

2. *Trichocoronis rivularis* Gray. Much-branched and rooting at the nodes, spreading or sprawling; leaves often flaring and slightly lobed apically; involucre usually 5-6 mm. long; corolla 2-3 mm. long; achenes about 2 mm. long. *Shinnarsia rivularis* (Gray) King & Rob. Very rare and local in moist spring-fed swales and rooted and submersed in streams in n.e. part of Rio Grande Plains and s. part of Edwards Plateau, spring; also Coah.

9. CARMINATIA DC.

PLUME-WEED

A monotypic genus.

1. *Carminatia tenuiflora* DC. Taprooted annual; stems usually subsimple or few-branched, (1-) 2-5 dm. tall; most of the leaves opposite or the uppermost few alternate;

blades thin, deltoid to ovate-deltoid, 2-5 cm. long, coarsely serrate, acutish, petioles about as long as the blades; heads often in interrupted-spiciform arrangement in the upper parts of the stem (or branch); involucre 10-15 mm. high, nearly cylindrical when young or at fruiting time narrowly obconic; phyllaries in about 4 rough series and strongly unequal or often extremely strongly graduated and no two of the same length, subulate or lanceolate, few-nerved, glabrous, the outermost only 2 mm. long; receptacle about 1 mm. broad, essentially flat, naked; *ray flowers* absent; *disk flowers* few, perfect, fertile, the corolla white or greenish-white, extremely shallowly 5-toothed terminally; achenes columnar, 5-ribbed; pappus deciduous as a unit, composed of a basal ring to which are attached about 10 dorsiventrally flattened plumose bristles. Rare in moist canyons, Davis, Chisos and Chinati mts. in the Trans-Pecos, Aug.-Oct.; C.A. n.w. to Ariz. and Tex.

10. STEVIA CAV.

Perennial herbs, subshrubs or shrubs, or much-branched above the base, usually 5-10 dm. tall; leaves opposite (or subopposite, scattered or alternate in *S. serrata*), usually elongate, unlobed, often serrate, usually short-petiolate, minutely resin-dotted; heads in tight corymbiform aggregations at the top; involucre nearly cylindrical; phyllaries 5 (or 6), usually nearly linear or oblanceolate-linear, occasionally 1 or 2 narrow shorter leaflike bracts also present near the base; receptacle flat, naked; ray flowers absent; disk flowers 5 (or 6), perfect, fertile, the corolla white or purplish-white and 5-toothed terminally; achenes columnar, 5-ribbed, black; pappus usually of 1 to 3 stiff awns (these absent in some flowers of the head in some species) and minute intermediate scales.

A genus of perhaps 100 species of the Americas from Argentina and Chile to southwestern United States.

1. Distinctly shrubby plants of branched habit or ligneous only near the base (2)

1. Herbaceous or nearly so (3)

2(1). Leaves pubescent on both surfaces 3. *S. rhombifolia*.

2. Leaves entirely glabrous or at most obscurely hirtellous
..... 1. *S. salicifolia*.

3(1). Leaves alternate or scattered 2. *S. serrata*.

3. Leaves (at least the main cauline) opposite 3. *S. rhombifolia*.

1. *Stevia salicifolia* Cav. **HIERBA DEL AIRE**. Slender-stemmed viscid vernicose shrubs 2-8 dm. tall; leaves opposite, narrowly lanceolate to usually linear, alternate on the upper and lower part of stem, sharply serrate to nearly entire, penninerved; heads about 1 cm. long; phyllaries acute; most of the achenes awned. *S. foliosa* Small. Reported to occur in Tex. but we have not seen any Tex. collections, fall (?); widespread in the highlands of Mex. s.e. to Ver. and Pue.

2. *Stevia serrata* Cav. Erect perennial 4-8 dm. high; stem usually virgate, very leafy; leaves alternate or scattered or merely subopposite, often oblanceolate to spatulate-linear but variable, usually strongly serrate in the distal half, 3-5 cm. long, usually 2-8 mm. broad, attenuate and sessile basally, green and resin-dotted above and below; heads 8-10 mm. long; phyllaries resin-dotted; pappus a corona of short scales, some of the flowers also with 2 or 3 long awns. Incl. var. *ivaefolia* (Willd.) Robins. Rare in Trans-Pecos mts., Aug.-Oct.; Tex., N.M. and Ariz. s.e. to Ecu. and Venez.

3. *Stevia rhombifolia* H.B.K. Erect herbaceous perennial or subshrub, or even at times distinctly fruticose, 6-12 dm. tall, single-stemmed at base, sometimes virgate but usually having several pairs of opposite branches above the middle; leaves opposite (or in the upper few cm. of the head-bearing portion alternate), acutish to acuminate, crenate-serrate from below the middle, entire toward the gradually narrowed sessile or short-petioled base, hirtellous to rather copiously pubescent on both surfaces at least near the veins, 2-6 (-9) cm. long, 15-25 (40) mm. broad; heads 6-9 mm. long; phyllaries minutely resin-dotted, 4-5.7 mm. long; pappus of a crown of short erose scales and most of the achenes also with 1 (or 2) long awns. Rare in the Trans-Pecos (Chisos Mts.), late summer; highlands of Mex. and C.A.

11. MIKANIA WILLD.

An American genus of about 175 species.

1. *Mikania scandens* (L.) Willd. CLIMBING HEMP-WEED. Perennial twining vine; leaves opposite; blades elongate-deltoid, acute, (2-) 3-10 cm. long, marginally undulate or shallowly lobed, basally often slightly cordate; petioles about half as long as blades; heads in corymbiform aggregations at the ends of the branches; phyllaries 4, lanceolate, a few mm. long, equal, often with a fifth one attached in an outer "series;" receptacle less than 1 mm. broad, essentially flat, naked; ray flowers absent; disk flowers uniformly 4 per head, perfect, fertile, the corolla whitish and 5-toothed terminally; achenes short-columnar or slightly obconical, 5-ribbed; pappus persistent, of about 30 rather stiff bristles. Incl. var. *pubescens* T.&G. Infrequent in river bottoms and other moist woods, e. and s.e. Tex., rare in Rio Grande Plains and n.-cen. Tex., late summer-fall; warmer parts of Am., n. to Sin., and to N.E. and s. Ont.

12. EUPATORIUM L.

BONESET. THOROUGHWORT

Usually perennial herbs, also fairly commonly scandent elongate perennial herbs, or a few species of shrubs; leaves opposite; heads often in roughly corymbiform aggregations either at the top of the plant or terminal on the branches; involucre hemispheric or campanulate to essentially cylindrical; phyllaries more than 4, in 2 to 6 series, either subequal (when few-seriate) or strongly imbricated, usually with 1 or more vertical nerves, usually herbaceous (rarely papery) in texture, occasionally somewhat indurate basally; receptacle flat to conic, naked; ray flowers absent; disk flowers few to numerous, perfect, fertile, the corolla equally 5-toothed terminally, whitish, bluish, purplish or roseate; style branches long and clavate; achenes usually blackish, subcolumnar or gently narrowed to the base, 5-ribbed (occasionally fainter intermediate stripes visible); pappus of slender bristles, persistent. *Osmia* Sch. Bip.; *Conoclinium* (L.) DC.

Primarily an American genus of about 1,000 species, a few in Europe, Asia and Africa. *Eupatorium* is exceedingly closely related to *Brickellia*, and the two genera could easily be united with no violence to their taxonomy. *Mikania* could even more easily be submerged in *Eupatorium*.

1. Leaf blades dissected into linear or filiform segments less than 2 mm. broad or if entire then linear or filiform, not more than 2 mm. broad (2)
1. Leaf blades simple and broader than 2 mm. or dissected but the divisions broader than 2 mm. (3)
- 2(1). Leaves or their segments filiform, 0.5 mm. broad or narrower 1. *E. capillifolium*.
2. Leaves or their segments 1-2 mm. broad 2. *E. compositifolium*.
- 3(1). Leaves connate-perfoliate 8. *E. perfoliatum*.
3. Leaves not connate-perfoliate (4)
- 4(3). Most of the leaves deeply palmately 3-lobed and the 3 lobes again pinnately dissected 15. *E. Greggii*.
4. Most of the leaves unlobed (5)
- 5(4). Involucres cylindric and the phyllaries in a number of series and very strongly imbricate (6)
5. Involucres usually obconic to hemispheric and the phyllaries in 2 to 4 series and weakly if at all imbricate (8)
- 6(5). Leaves whorled 11. *E. fistulosum*.
6. Leaves opposite (7)
- 7(6). Leaves lance-linear; achene about 2-2.4 mm. long .. 13. *E. ivaeifolium*.
7. Leaves deltoid-ovate to rhombic-ovate; achene about 4 mm. long 14. *E. odoratum*.

- 8(5). Petioles less than 2 mm. long, or absent (9)
8. Petioles 2 mm. long or more (14)
- 9(8). Leaves deltoid-ovate 7. *E. rotundifolium*.
9. Leaves elliptic or oblong to linear (10)
- 10(9). Inner phyllaries with acute white tips; involucre about 7 mm. high 6. *E. leucolepis*.
10. Inner phyllaries blunt or if acutish then not white except in a very thin marginal zone (11)
- 11(10). Principal leaves prominently 3-nerved at the base, narrowed to a narrowly marginal subpetiolar base 1-2 mm. long; inner phyllaries narrowly obovate, broadly rounded apically; north-central Texas 9. *E. altissimum*.
11. Principal leaves only faintly if at all 3-nerved; inner phyllaries mostly narrowly oblong to lanceolate or linear; east and southeast Texas (12)
- 12(11). Involucre 3-4 mm. high 3. *E. glaucescens*.
12. Involucre 4-7 mm. high (13)
- 13(12). Principal leaves 3-11 cm. long, usually 1-3 mm. broad 4. *E. hyssopifolium*.
13. Principal leaves 2-5 cm. long, usually 3-8 mm. broad .. 5. *E. linearifolium*.
- 14(8). Whitish flowered shrubs (15)
14. Herbs, subshrubs or lianes or if approaching a shrubby habit then flowers not whitish (16)
- 15(14). Leaf blades 1-2 cm. long; petioles (2-) 3-5 mm. long; Trans-Pecos Texas 24. *E. Wrightii*.
15. Leaf blades (2-) 3-5 (-7) cm. long; petioles 3-10 (-15) mm. long; east of Trans-Pecos Texas 23. *E. havanense*.
- 16(14). Receptacle markedly convex to usually beehive-shaped; corollas bluish or purplish, rarely whitish (17)
16. Receptacle essentially flat; corolla whitish varying to pink or lilac-white, rarely or never blue or purple (19)
- 17(16). Scandent shrubs or woody nontwining vines of extreme south Texas woodlands 18. *E. azureum*.
17. Stems always herbaceous (18)
- 18(17). Blades deltoid; stems scandent-climbing to 2 m. tall 17. *E. coelestinum*.
18. Blades oblong, usually 2 to 3 times as long as broad, the lower corners often prolonged parallel to the petioles (subcordately); stem not scandent, not more than 1 m. tall, much of it reclining and node-rooting 16. *E. betonicifolium*.
- 19(16). Involucre densely and softly pubescent and resin-dotted 10. *E. serotinum*.
19. Involucre glabrous to granular-puberulent, rarely resin-dotted (20)
- 20(19). East of Trans-Pecos Texas (21)
20. Trans-Pecos Texas (22)
- 21(20). Corolla glabrous 19. *E. incarnatum*.
21. Tips of corolla lobes dorsally pubescent 20. *E. rugosum*.
- 22(20). Blades broadly lanceolate; phyllaries very acute .. 12. *E. solidaginifolium*.
22. Blades proportionately broader, ovate or deltoid-ovate (23)
- 23(22). Rhizomes slender, rarely woody; leaf blades rarely cordate; whole plant never yellow-green; tips of corolla lobes dorsally pubescent; involucre essentially glabrous 21. *E. Rothrockii*.
23. Rhizomes woody, with thicker woody crowns at intervals; leaf blades usually slightly cordate; whole plant usually grayish-yellow-green; tips of corolla lobes glabrous; involucre usually granular-puberulent 22. *E. herbaceum*.

1. *Eupatorium capillifolium* (Lam.) Small. DOG-FENNEL. Coarse rhizomatous perennial (reported to be annual elsewhere) erect herb to 3 m. tall; stems scabrous-hirsute; leaves crowded, mostly alternate, 1- or 2-pinnately divided into many segments, the divisions 0.5 mm. broad or narrower, on the upper leaves entire; heads in an elongate leafy much-branched wandlike or thyriform or paniclelike arrangement, very numerous, green to bronze, 3- to 5-flowered, 2-3 mm. long; involucre obconic, about 3 mm. high, nearly glabrous; phyllaries roughly biseriate, the principal ones subequal, few, oblong, about 3 mm. long, mostly green with whitish margins, often with 4 green veins visible under high magnification; outer phyllaries very few, much shorter; corolla white; achenes about 1 mm. long. Infrequent or rare in sandy soil, e. and s.e. Tex., Oct.; s.e. U.S.

Intergrading completely with *E. compositifolium* and scarcely deserving separate recognition. Possibly our plants are not true *E. capillifolium* of the eastern coast (Va. to Fla.) which is described in some manuals as an annual.

2. *Eupatorium compositifolium* Walt. YANKEE WEED. Identical to *E. capillifolium* but with coarser, harsher pubescence; leaf segments or leaves 1-2 mm. broad; involucre 3, 3-4.5 (-5) mm. high; achenes about 1.5 (-2) mm. long; the other parts correspondingly averaging larger. Exceedingly abundant in overgrazed pastures and disturbed areas of sandy soil, e. and s.e. Tex. and coastal parts of Rio Grande Plains, Sept.-Oct. (rarely as late as Jan.); s.e. U.S.

Apparently hybridizing occasionally with *E. perfoliatum*, the hybrids having been called *E. pinnatifidum* Ell.

3. *Eupatorium glaucescens* Ell. Perennial herb from short ligneous rhizomes; stems few, mostly simple from the base, (3-) 5-8 dm. tall; leaves opposite, narrowly oblong to oblong-lanceolate or oblong-oblongate, 3-5 (-8) cm. long or essentially absent; heads in a roughly corymbiform cluster at the top; involucre 3-4 mm. long, obconic; phyllaries in 2 distinct size-classes (the outer extremely short), softly and usually copiously pubescent, often resin-dotted, with a very narrow white border all around; flowers whitish or brownish-white. *E. cuneifolium* Willd., *E. semiserratum* DC., *E. semiserratum* DC. var. *lancifolium* T.&G. Frequent in sandy soil, e. and s.e. Tex. (s. to Aransas Co.), Aug.-Sept.; s.e. U.S.

4. *Eupatorium hyssopifolium* L. Perennial herb from short rhizomes; stems few, ascending (2-) 3-5 (-7) dm. tall; leaves opposite, often with fascicles of smaller leaves in the axils, the principal ones 3-11 cm. long, usually subentire or with obscure appressed teeth in the distal half, linear or lance-linear, 1-3 (-10) mm. broad; heads 3- to 7-flowered; involucre 4.5-5.5 mm. high, subcylindric, canescent-pilose; inner phyllaries narrowly oblong, round-tipped or blunt, the narrow margins thinner, whitish; flowers white, exserted. Incl. var. *calcaratum* Fern. & Schub. Said to occur in e. Tex., but we have seen no specimens, late summer and early fall; s.e. U.S. and Coastal States n. to Mass.

The complex including *E. glaucescens*, *E. linearifolium* and *E. hyssopifolium* needs much further taxonomic evaluation.

5. *Eupatorium linearifolium* Walt. Perennial herb, the stem loosely bushy-branched from near the base, 4-10 dm. tall, pilose above; leaves narrowly oblanceolate to linear-spatulate, entire, tapering to a slender base, obtuse, minutely pilose, the larger ones 2-5 cm. long and 3-8 mm. broad, usually with shorter leaves fascicled in the axils; involucre 4-7 mm. high; phyllaries in 2 (or 3) series, pilose, the inner ones subequal, acutish, outer ones much shorter than the inner ones. *E. tortifolium* Chapm. Reported to be present in e. Tex., but we have seen no specimens, late summer-fall (?); coastal states, Va. to Tex.

6. *Eupatorium leucolepis* (DC.) T.&G. JUSTICE-WEED. Perennial herb from a short knotty fibrous-rooted stock; stems erect, 8-12 dm. tall, minutely gray-puberulent; leaves opposite, firm and fairly thick, nearly sessile, those of midstem 3-8 cm. long and 5-9 mm. broad, broadly linear or narrowly oblong, dull-gray, bluntish, on each side in the upper two thirds to five sixths the length with 7 to 12 appressed teeth; heads dirty-white, in a roughly corymbiform arrangement at the tip; involucre inverted-conical, about 7 mm. high; phyllaries in 2 or 3 series, sharply differentiated with a minute outer series and the longer inner series, the longer ones subulate, acute, mostly herbaceous, with a narrow white margin and white tip-portion (often as much as a third the total length). Rare in e. and s.e. Tex. (Hardin, Jasper, Orange and Tyler cos.) in sandy or boggy woods, Oct.; near the coast, N.Y. to Tex.

Apparently intergrading or introgressing in Texas with *E. glaucescens* which is extremely closely related.

7. *Eupatorium rotundifolium* L. Perennial herb from short rhizomes with thick masses of fibrous roots; stems one or few, nearly simple, erect, (3-) 5-12 dm. tall, hispid, often scaberulous; leaves deltoid-ovate to ovate-deltoid, serrate, blunt or rarely acutish, basally truncate or less commonly shortly narrowed (very broadly cuneate), 3-nerved basally; heads few-flowered; involucre softly pubescent, obconic, 4.5-5.5 mm. long, often resin-dotted; phyllaries in roughly 2 size-classes (the outer ones much less than half as long as the inner), linear, nerveless, grayish, with narrow whitish margins all around, blunt or rarely acutish with whitish tips; receptacle essentially flat; corollas whitish. *E. scabridum* Ell. Frequent in (often moist) sandy loam, forested areas, e. and s.e. Tex., rare inland to n.-cen. Tex., (July-) Aug.-Sept.; s.e. U.S. and near the coast n. to N.Y.

8. *Eupatorium perfoliatum* L. ТНОРОУСНВОРТ. Rhizomatous perennial forming colonies; aerial stems (3-) 5-15 dm. tall, simple below, branched in the upper part; leaves opposite, lanceolate, sessile, perfoliate, (3-) 5-15 cm. long, serrate, softly pubescent especially on the underside; heads numerous and crowded, 10- to 20-flowered; involucre obconic, 3-5 mm. high, softly grayish-pubescent; phyllaries in 2 or 3 size-classes, the outer much shorter than the inner, oblong-linear, blunt (outer) to acutish (inner), the margins and tips thin and whitish; flowers whitish. Infrequent in moist sand, e. Tex., late summer-fall; most of e. U.S.

9. *Eupatorium altissimum* L. Rhizomatous perennial, 5-20 (-27) dm. tall, aerial stems nearly simple except in the uppermost head-bearing region; leaves mostly opposite, those of midstem narrowly elliptic, 4-10 cm. long, 6-12 (-30) mm. broad, antrorsely appressed serrate in the upper third to half with 7 to 15 teeth on each side, definitely 3-nerved; fascicles of smaller leaves often present in the axils; petioles absent or only 1-2 mm. long; heads dirty-white, subcorymbosely arranged, about 5- to 7-flowered; involucre obconic, 3.8-4.3 mm. high; phyllaries graduated, narrowly obovate, mostly herbaceous but with narrow hyaline margins, quite blunt; flowers whitish. Infrequent in open plains, n.-cen. Tex. (Collin, Denton, Fannin, Grayson, Lamar and Tarrant cos.), Aug.-Oct.; most of e. U.S. (but not near the coast.)

10. *Eupatorium serotinum* Michx. Rhizomatous perennial forming colonies; stems scattered, (3-) 5-12 (-15) dm. tall, simple below, branched above; leaves opposite for most of the length, approximate; blades narrowly ovate to lance-ovate or ovate-lanceolate, (3-) 5-10 (-15) cm. long, serrate most of the length, 3-nerved basally, softly and minutely pubescent at least beneath, acute, basally rounded or cuneate (rarely somewhat truncate); petioles 1-3 cm. long; heads densely crowded in rather flat-topped terminal arrangements, with 12 to 15 flowers; involucre obconic, softly pubescent and resin-dotted, 3.5-5 mm. high; phyllaries in roughly 2 (or 3) size-classes (the outer ones about a third as long as the inner), linear, blunt, the margins and tips whitish; receptacle slightly convex; flowers whitish. Frequent in open places, e., s.e. and n.-cen. Tex., s. to Kleberg Co. and w. to Llano region, also Val Verde Co., (Aug.-) Sept.-Nov.; s.e. U.S. n. to N.J., O., Ind., Wisc. and w. to Kan., Okla., Tex.; also n.e. Mex.

11. *Eupatorium fistulosum* Barr. JOE-PYE-WEED, TRUMPET-WEED. Coarse subrhizomatous perennial herb 1-3 m. tall; stems mostly simple, virgately ascending, often purplish-green, some of the internodes hollow; leaves whorled, lance-ovate to ovate-elliptic, 1-2 dm. long, coarsely crenate-serrate, about 2 to 3 times as long as broad, penninerved, acute or very slightly acuminate; petioles (1-) 2-3 cm. long, blackish; heads in a usually round-topped or domed mass at the top; involucre cylindrical, about 1 cm. high; exterior phyllaries closely imbricated in about 4 series, the outermost extremely short, all usually purplish-striate but mostly pale or whitish and not herbaceous (except the shorter outer ones); receptacle flat; flowers 5 to 8 per head; corollas purple to lilac-pink to rosy-brownish-lavender, 3.5-4.8 mm. long, scarcely exerted. Infrequent to rare in sandy forested areas, e. Tex. (Houston, Newton and San Augustine cos.), July-Aug.; e. U.S. w. to Ia., Okla. and Tex.

At times confused with *E. purpureum* L. which has not been found in Tex. but is to be expected; *E. purpureum* has creamy-white to pale-purple corollas 5.5-7.5 mm. long that are strongly exerted.

12. *Eupatorium solidaginifolium* Gray. Subshrub with a number of rigidly ascending stems (or branches) (3-) 4-6 (-10) dm. tall; leaves opposite; blades broadly lanceolate, 25-60 (-90) mm. long, basally shortly rounded to truncate, apically long-attenuate and

slightly acuminate, subentire or the larger ones often with 3 to 5 obscure appressed teeth on each side, essentially glabrous, 3-nerved; petioles 2-4 (-6) mm. long; upper leaves suppressed; the short bracteate upper branches bearing rounded masses of heads, the entire end of the stem with its several "corymb"-bearing short branchlets forming a sort of elongate thyse; heads usually with only 3 to 5 flowers; involucre obconic, about 5 mm. long; phyllaries essentially uniseriate (occasionally the bracteal leaves of the peduncles so close to the involucre as to resemble outer phyllaries), lanceolate, very acute, mostly thin and stramineous except for the three darker nerves; corollas apparently lilac-white or pinkish-white, scarcely exerted from the involucre. Frequent in mts. of the Trans-Pecos, usually in mesic canyons, (Aug.-) Sept.-Nov.; Chih., Coah., Dgo., Ariz. and Tex.

13. *Eupatorium ivaefolium* L. Perennial (rarely suffruticose) from fibrous root system; stems to 2 m. high, weak and semiscandent usually; leaves opposite, lance-linear, 3-nerved, essentially entire or obscurely serrate, acute, pubescent, 3-7 cm. long, 5-22 mm. broad; petioles about 1 mm. long; heads numerous, in subcorymbiform clusters at the ends of the ascending branches, subcylindric, about 8 mm. high and 3-4 mm. thick; involucre 5-8 mm. high, half as thick; phyllaries strongly graduated in about 5 series, appressed, blunt, firm, stramineous, with several strong purplish nerves near the tip, the outer ones with purplish-pubescent tip-splotches; receptacle low-convex, naked; ray flowers absent; disk flowers about 20 to 25, perfect, fertile, the corolla pale-blue or pink and terminally 5-toothed; achene about 2-2.4 mm. long, black, columnar, 5-ribbed; pappus persistent, of about 30 slender stiffish bristles. *Osmia ivaefolia* (L.) Small. Rare in s.e. Tex., fall; warmer parts of Am. n. to Miss., La., Tex. and Cuba.

14. *Eupatorium odoratum* L. CRUCIFERA. Subshrub at our latitude (shrubs in the tropics), 1-2 m. tall, suberect or scandent; stems spreading-villous; internodes often 1 dm. or more long; branches opposite, divaricate, often curved upward; leaves deltoid- or rhombic-ovate, 3-10 cm. long, 1-3 cm. broad, long-acuminate, subentire to few-toothed, basally narrowed and often acutish, sparingly villous above, moderately pubescent to velvety beneath, 3-nerved from the base; petioles 3-12 mm. long; heads in numerous showy corymbiform aggregations; involucre subcylindric, 8-10 mm. high, about half as thick; phyllaries in about 5 series, strongly graduated, the blunt discolored apexes appressed; receptacle convex, naked; ray flowers absent, disk flowers 20 to 35, the corollas lilac to bright-purplish-blue, usually fragrant; achenes columnar, black, 5-ribbed, about 4 mm. long; pappus of stiffish bristles, persistent. *Osmia odorata* (L.) Sch. Bip., *O. conyzoides* Vahl. Infrequent in s.e. Tex. and Rio Grande Plains, (late summer-) fall; warmer parts of Am., n. to the Gulf States.

15. *Eupatorium Greggii* Gray. Perennial herb, the bases fibrous-rooted and occasionally subrhizomatous; aerial stems weak, 3-8 (-12) dm. tall, often tortuous, sometimes semiscandent, the uppermost 1-2 dm. of the branches few-noded; leaves opposite, nearly sessile, ovate or deltoid in over-all outline but deeply palmately 3-lobed with the 3 main lobes again pinnately dissected, pubescent and minutely resin-dotted; heads in tight subcorymbiform clusters terminating the branches; involucre hemispheric, 4-6 mm. high; phyllaries in about 3 subequal series, linear-subulate, pubescent, obscurely 3-nerved; receptacle conical, naked; flowers numerous, the corollas blue or purplish-blue; achenes black, columnar, 5-ribbed; pappus persistent, of a number of stiffish bristles. *Conoclinium Greggii* (Gray) Small. Frequent along stream beds and in overflow areas in the Trans-Pecos, infrequent e. to Edwards Plateau and Rio Grande Plains, spring-fall; Tex., N.M., Ariz. and n. Mex.

16. *Eupatorium betonicifolium* Mill. Rather similar to *E. coelestinum* but plants usually not scandent, not more than 1 m. tall, much of the stem reclining (and node-rooting), only the last 2-3 dm. of the flowering branch ascending and it having very few scattered nodes; blades slightly fleshy, not deltoid but oblong, usually 2 or 3 times as long as broad and rather blunt, the lower corners often prolonged parallel to the petiole. *Conoclinium betonicum* DC. and var. *integrifolium* Gray, *C. betonicifolium* (Mill.) King & Rob. Subsaline marshes and poorly drained areas, s.e. Tex. (n. to Refugio Co.), and Rio Grande Plains, n.w. to Val Verde Co.

The plants farther inland (Val Verde Co., etc.) have less distinctly serrate leaves, and perhaps deserve varietal recognition.

17. *Eupatorium coelestinum* L. MIST-FLOWER. Rhizomatous perennial; stems weak, scandent, to 2 m. tall; leaves opposite; blades pubescent, minutely resin-dotted, deltoid,

2-7 cm. long, serrate; petioles 3-20 mm. long; heads in roughly corymbiform aggregations at the ends of the branches; involucre hemispheric, 3-5 mm. high; phyllaries in roughly 3 series (the 2 inner series about equal, the outer a little shorter), linear-subulate, pubescent, obscurely 3-nerved; receptacle conical, naked; flowers numerous, the corollas blue or purplish-blue. *Conoclinium coelestinum* (L.) DC. Frequent in moist sandy wooded areas, e. and s.e. Tex. (s. to Kleberg Co.), less frequent w. to n.-cen. Tex., summer-fall; N.J. to Kan. s. to Gulf States.

18. *Eupatorium azureum* DC. BLUE BONESET. Scandent shrub or woody nontwining vine, much-branched, to 2-3 m. tall with long, nearly glabrous internodes, basally with a thick fibrous root system; leaves opposite; blades deltoid, (15-) 20-50 (-60) mm. long, (10-) 15-40 (-45) mm. broad, truncate or narrowed basally, coarsely crenate or crenate-serrate in the distal two thirds or less commonly nearly entire, acute or often acuminate, apically thin, puberulent to thinly velutinous beneath, 3-nerved near the base; petioles 5-20 (-30) mm. long; heads in small rounded clusters at the ends of the branches; involucre campanulate-obconic, 6-8 mm. high; phyllaries numerous, membranous, in about 3 or 4 series (the outer about half as long as the inner), lance-subulate, obscurely nerved, puberulent, green or purple-green; receptacle convex to beehive-shaped; flowers about 30 to 50 per head; corollas bluish or blue-lavender (a white-flowered form also exists), exerted from the involucre. *E. ageratiforme* var. *acuminatum* Coult. Local in dense thickets, Brownsville region (Cameron Co.; collected once also in Willacy Co.), Feb.-May (-July); S.L.P., N.L., Tam. and Tex.

19. *Eupatorium incarnatum* Walt. Perennial from fibrous-rooted crowns; stems sprawling or scandent through shrubbery, to 2 m. long or more; branches numerous, often minutely pubescent with curled hairs; leaves opposite; blades deltoid, 1-5 cm. long, acute, coarsely serrate or crenate-serrate on the 2 distal sides, usually 3-nerved, basally usually truncate, less commonly or rarely narrowed, beneath more or less densely pubescent with minute curled hairs, apically usually acute, rarely acuminate; heads in small rounded clusters at the ends of the branches; involucre obconic, 5-6 mm. long; phyllaries in roughly 2 size-classes (the outer about half as long as the inner), lance-subulate, glabrous or with some pubescence of minute curled hairs, with 2 (or 3) thickish whitish or stramineous longitudinal nerves, the green internerve portions and narrow whitish marginal areas being thinner; receptacle flat or slightly convex; flowers about 20 to 25 per head; corollas mostly whitish but the distal portion pink or rarely lilac. *Fleischmannia incarnata* (Walt.) King & Rob. Frequent in thickets on loamy soil, Rio Grande Plains and s.e. Tex., rare inland to n.-cen. Tex., Oct.-Dec. (rarely to Feb. in extreme s.) or at other times following injury; Mex. n. to W.Va., O., Ind., Ill., Mo., Okla. and Ariz.

Related to *E. coelestinum* and *E. azureum*.

20. *Eupatorium rugosum* Houtt. WHITE SNAKEROOT. Perennial herb from a small fibrous-rooted crown, occasionally with short rhizomes; stems few, ascending, often branched, occasionally semi-scandent, (3-) 5-8 (-12) dm. tall, often with a pubescence of minute crisped hairs on the younger parts, especially dense on the peduncles; leaves opposite; blades deltoid-ovate or ovate or less commonly lance-ovate, usually acuminate, rounded basally, rather coarsely and somewhat doubly-incised-serrate with (on each side) 10 to 20 (counting the smaller ones, too) salient usually sharp teeth, 3-nerved basally; petioles about a third as long as the blades; heads mostly in small rounded clusters at the ends of the branches, with about 15 to 20 flowers each; involucre obconic, 4-5 mm. long; phyllaries in roughly 2 size-classes (but the outer nearly as long as the inner), linear, mostly green with narrow paler margins and tips apically blunt; corolla white, tips of corolla lobes often with a few hairs as seen with the lens. *E. urticaefolium* Reich., "*E. ageratoides* L.f." of old manuals and *E. ageratoides* var. *angustatum* Gray. Local in e., s.e. and n.-cen. Tex. and Edwards Plateau, Sept.-Nov.; most of e. N.A.

When only short branches are collected, the specimens are exceedingly similar to poor specimens of *E. havanense*, but the number of teeth on the leaves affords a confident determination, usually.

21. *Eupatorium Rothrockii* Gray. Perennial herb; rhizomes only slightly if at all ligneous, only a few mm. thick, heavily fibrous-rooted; stems several, ascending, often arcuate, (2-) 4-7 (-12) dm. tall, branched in the upper half, the branches also ascending and arcuate; leaves opposite; blades thin, ovate or deltoid-ovate, those of midstem and

lower parts of the branches (4-) 5-7 (-11) cm. long, usually bright- or dark- (nearly olive-) green, less commonly slightly yellowish-green, nearly glabrous, basally 3-nerved and rounded or rarely truncate, never cordate, apically acute and commonly very slightly acuminate, on each side with 10 to 15 (to 20) teeth (including even the minutest intermediates and basals), these teeth slightly antrorse, usually sharp and each with a minute gland visible under a strong lens; petioles (6-) 10-40 (-50) mm. long; the loose irregularly corymbiform aggregations of heads (2-) 4-10 cm. across, the individual peduncles usually (4-) 6-12 mm. long, densely puberulent with minute curved hairs; involucre broadly obconic, 5-6.6 mm. high, glabrous, never resin-dotted; phyllaries in roughly 2 size-classes (the outer ones blunt and only slightly shorter than the inner), linear or oblance-linear, very thin and faintly greenish except for the 2 (rarely 3) prominent paler stramineous nerves, the inner ones acutish and the margins near the tip sometimes microscopically ciliate; receptacle essentially flat; flowers about 20 to 25 per head; corollas rather pure-white, the extreme tip of each of the 5 short lobes dorsally with about a dozen whitish hairlike projections 0.1-0.2 mm. long; achenes gradually narrowed basally, maturing black, about 2.5 mm. long, antrorsely hispid on the 5 ribs and also in median strips between the ribs, each of the 5 inter-rib areas distally with a weak median nerve (visible under 25 \times magnification), apically the achene abruptly constricted and above the constriction supporting a whitish subcartilaginous cup with a diameter slightly less than the maximum thickness of the achene itself, this cup being the pedestal for the pappus members which are attached at its rim. *Ageratina Rothrockii* (Gray) King & Rob. Locally abundant in the higher parts of Trans-Pecos mts. (Chisos, Guadalupe and Davis), (Aug.-) Sept.-Oct.; Ariz., N.M., Tex. and Chih.

The species is closely related to and perhaps conspecific with, *E. rugosum*. The latter has been reported to occur in Trans-Pecos Texas also but the specimens so determined are closer to *E. Rothrockii*.

22. *Eupatorium herbaceum* (Gray) Greene. Perennial herb or subshrub; crowns quite woody, sometimes irregular in shape and often 2-3 cm. thick at the nodes, with woody horizontal rhizomelike organs as much as 3 dm. long and 5 mm. thick; stems several from the crown or from the nodes (crowns) of the underground organs, (2-) 3-6 (-8) dm. tall, usually 2-3 mm. thick, pale-grayish-yellow-green, rather stiffly erect, usually freely branched, minutely granular-puberulent (glabrate on the oldest parts), the internodes (2-) 3-5 (-6) cm. long, the branches spreading and then ascending toward the ends; leaves opposite, deltoid to ovate-deltoid, firm-membranous, those of midstem and the lower parts of the branches (25-) 30-50 (-60) mm. long, definitely yellow-green or grayish-yellow-green, on the veins and margins minutely scabrous-hispid, basally truncate or often slightly cordate, apically acute, on each side with 9 to 13 teeth (including the intermediate as well as the principal teeth), these being slightly antrorse, usually sharpish, each with a microscopic gland; petioles (4-) 6-15 mm. long; the tight crowded rounded masses of heads (1-) 2-4 cm. across, the individual peduncles (2-) 3-5 (-8) mm. long, densely granular-puberulent; involucre hemispheric-obconic, 3.5-4.5 (-5) mm. high, densely (rarely sparsely) granular-puberulent, often resin-dotted, gray-green to yellow-green; phyllaries in roughly 2 size-classes; outer phyllaries oblong or linear-oblong, blunt, half to two thirds as long as the inner; inner phyllaries lanceolate, acute, often nearly 1 mm. broad in the lower half, with 2 (or 3) obscure nerves, the margins very narrow, thin, whitish; receptacle essentially flat; flowers about 12 to 20 per head; corollas whitish or usually off-white, glabrous, often with a few microscopic bumps or resin-globules on the lobes; achenes gradually narrowed basally, maturing black, about 3 mm. long, antrorsely setulose-hispid on the 5 ribs and also in a median strip between the ribs, each of the 5 intercostal areas with a weak median nerve, apically the achene scarcely or very slightly constricted and above the constriction supporting an extremely minute stramineous cup about 0.4 mm. long with a diameter as great as the greatest thickness of the achene below the constriction, this cup being the pedestal for the pappus members which are attached at its rim. *Ageratina herbacea* (Gray) King & Rob. Locally abundant in Trans-Pecos mts. (Chisos, Guadalupe, Franklin, Cornudas and Davis), Sept.-Oct.; Ariz., Ut., Colo., N.M., Tex. and Chih.

Superficially resembling both *E. Rothrockii* and *E. havanense*.

23. *Eupatorium havanense* H.B.K. Rounded shrub (3-) 6-15 (-20) dm. tall, much-branched, the younger parts (especially peduncles) usually rather densely pubescent

with minute curved hairs; leaves opposite; blades deltoid, (2-) 3-5 (-7) cm. long, 3-nerved, basally truncate or extremely broadly cuneate, on each of the 2 distal sides with 6 to 8 (to 9, rarely 10) rounded and subappressed teeth, apically acute to less commonly very slightly acuminate; petioles 3-10 (-15) cm. long; heads in rounded masses at the ends of the branches, usually with 15 to 20 flowers each; involucre obconic to hemispheric-obconic, 4-6 mm. long; phyllaries roughly in 2 size-classes (but the outer fully two thirds as long as the inner), linear, green but with paler margins and tips, usually blunt; corolla pinkish-white to nearly pure-white. *E. ageratifolium* DC., *E. ageratifolium* var. *texense* T.&G., *Ageratina havanensis* (H.B.K.) King & Rob. Frequent in limestone hills, Edwards Plateau, (Sept.-) Oct.-Nov.; Tam., N.L., Coah., Tex., Ver., S.L.P.; Cuba, Bah. I.

24. *Eupatorium Wrightii* Gray. Rounded shrub (2-) 3-5 (-10) dm. tall, intricately branched; leafy branches usually only 5-10 cm. long, usually minutely granular-puberulent or glandular-puberulent; leaves opposite or subopposite; blades usually ovate-deltoid, 1-2 cm. long, usually almost as broad as long, granular-puberulent, entire or with 3 to 7 small teeth on each side, often truncate basally, 3-nerved, blunt apically; petioles (2-) 3-5 mm. long, often in its upper part bordered by a very narrowly decurrent strip of blade tissue; heads in small rounded masses at the ends of the twigs, each usually about 10- to 12-flowered; involucre obconic, about 3.5-4 mm. high, granular-puberulent; phyllaries lance-oblong, in roughly 2 (or 3) series (the outer about half as long as the inner), acutish, the inner with 2 or 3 nerves; corollas whitish. *Ageratina Wrightii* (Gray) King & Rob. Frequent in the Trans-Pecos at moderate elev., in dry places, Oct.- Nov.; Chih., Coah., S.L.P. and Tex.

13. BACCHARIS L.¹⁹³

GROUNDSEL-TREE

Unisexual shrubs or subshrubs, glabrous or hispid; branchlets usually striate-angled or slightly striate and terete, smooth to glandular-scabrous; leaves subulate to obovate, alternate, crowded to sparse, entire to serrate or dentate, 1- to 3-nerved, sessile or petioled, usually reduced within the inflorescence (sometimes to bractlike leaves); male and female heads on separate plants; heads in somewhat paniclelike, corymbiform or racemose aggregations; *pistillate involucre* hemispheric to narrowly cylindrical with outer phyllaries ovate to lanceolate; inner phyllaries lanceolate to narrowly linear and obtuse to acuminate, usually scarious-margined, the midrib evident or obscure; receptacle pitted to nearly smooth, naked or fimbriate, flat; ray flowers absent; corolla filiform with 5 minute distinct lobes or teeth, yellowish-white to brown in color; style bifurcate, style branches usually glabrous; achene 5- to 10-ribbed, yellow to reddish, glabrous or hispid, smooth or glandular; pappus of 1 to several series of numerous bristles, flaccid or rigid, equaling or greatly exceeding the style; *staminate involucre* hemispheric to cylindrical with outer phyllaries ovate to lanceolate; inner phyllaries lanceolate to linear and obtuse to acuminate, usually scarious-margined, the midrib dilated and smooth or absent; receptacle pitted to nearly smooth, naked or fimbriate and flat; ray flowers absent; corolla filiform basally and either abruptly or gradually enlarged and funnellform, white to yellowish-brown, its 5 lobes lanceolate; style clavellate or bifurcate, its branches hispid; pappus not exceeding style, usually one series of numerous bristles, rigid, more or less plumose-tipped, the bristles more or less barbed, usually crisped; ovary abortive.

Plants of this large genus (about 400 species, all American) unfortunately often superficially resemble plants of other asterean genera, and their determination is enigmatic until the unisexuality of the plants and flowers is discovered.

1. Plants hispid 1. *B. brachyphylla*.
1. Plants glabrous or essentially so (2)
- 2(1). Branches terete, slightly striate, glandular-scabrous; heads appearing racemosely arranged on short lateral branchlets 2. *B. pteronioides*.
2. Branches striate-angled, essentially not glandular-scabrous (3)
- 3(2). Pappus of pistillate flowers many-seriate, rufous-tinged; achenes 3-5 mm. long, slightly to prominently glandular-scabrous (4)
3. Pappus of pistillate flowers in 1 or 2 series, white to sordid; achenes usually less than 3 mm. long, glabrous (5)

¹⁹³ Adapted from W. F. Mahler and U. T. Waterfall in Southwest. Nat. 9:189-202. 1964.

- 4(3). Pistillate involucre usually 9 mm. long or less; phyllaries keeled, their midribs dilated; most leaves more than 1 cm. long, their margins undulate 3. *B. texana*.
4. Pistillate involucre (9-) 10-12 mm. long; phyllaries flat to partially keeled; most leaves less than 1 cm. long, marginally not undulate 4. *B. Wrightii*.
- 5(3). Achenes 8- to 10-ribbed; pappus exceeding the corolla by 5 mm. or more (6)
5. Achenes 4- or 5-ribbed; pappus exceeding the corolla by 4 mm. or less (8)
- 6(5). Leaves elliptic to rhomboid; involucre 4-6 mm. long 6. *B. halimifolia*.
6. Leaves narrowly elliptic to linear or oblanceolate; involucre 4-8 mm. long (7)
- 7(6). Pistillate involucre 5 mm. or less long; leaves narrowly linear to very narrowly elliptic 7. *B. neglecta*.
7. Pistillate involucre 6 mm. or more long; leaves oblanceolate 8. *B. salicina*.
- 8(5). Leaves oblong, irregularly incised to serrate 9. *B. Bigelovii*.
8. Leaves lanceolate to narrowly elliptic or linear to spatulate, not irregularly incised to serrate (9)
- 9(8). Leaves linear or spatulate, saliently incised to entire 10. *B. Havardii*.
9. Leaves lanceolate or narrowly elliptic, remotely serrate to nearly entire (10)
- 10(9). Heads in a terminal large corymbiform aggregation; leaves 3-8 (-11) cm. long, 10 (-20) mm. broad, not crowded 5. *B. glutinosa*
10. Heads in several smaller corymbiform aggregations terminating lateral branches, leaves 3-5 cm. long, 5 mm. broad, usually crowded .. 11. *B. viminea*.

1. *Baccharis brachyphylla* Gray. Subshrub about 6 dm. tall, erect, slender; branches striate-angled, hispid; leaves sparse, sessile, linear, acute, less than 1 cm. long and 2 mm. broad, 1-nerved, gradually reduced upward to subulate bracts in the head-bearing region, the latter an elongated paniclelike aggregation or appearing racemose but with several heads to each lateral branch; heads with 10 to 15 flowers; *pistillate involucre* campanulate, about 5 mm. high; phyllaries lanceolate, acute to acuminate, scarious-margined with hispid dark-brownish-green midrib; receptacle flat, nearly smooth, naked; corolla filiform, 1.5-2 mm. long, its 5 teeth truncate or triangular; style exerted, as long as pappus; bristles in several series, rigid, slightly barbellate, about 4 mm. long; achene 4- or 5-ribbed, about 1 mm. long, pubescent; *staminate involucre* campanulate, about 5 mm. long; phyllaries lanceolate, acuminate, scarious-margined, with hispid dark-greenish-brown midrib; receptacle flat, nearly smooth, naked; corolla filiform, the upper half dilated and funnelliform, its 5 lobes lanceolate; pappus bristles rigid, uniseriate, plumosely tipped, about 4 mm. long; ovary abortive. Locally frequent in sandy deserts, El Paso region, July-Aug.; Calif., Son., Ariz., N.M. and Tex.

2. *Baccharis pteronioides* DC. YERBA DE PASMO. Shrub; branches terete, only slightly striate, glandular-scarious; leaves fascicled, crowded, sessile, linear or spatulate with attenuate bases, entire to 5-toothed, larger leaves about 10 mm. long (rarely to 20); heads racemosely arranged, 2-4 (-8) mm. thick, terminating very short leafy branches; *pistillate heads* 15- to 20-flowered; involucre campanulate, 5-6 (-7) mm. long; phyllaries lanceolate-oblong, acute to obtuse, stramineous, with scarious wings; receptacle slightly alveolate, flat; corolla filiform, 3.6-5.3 mm. long, 5-lobed; pappus 8-10 mm. long, rigid, not exceeding styles by more than 3-4 (-5) mm.; achenes 1.8-2.6 mm. long, 4- to 8-ribbed, sparsely glandular, the hairs few; *staminate heads* 15- to 20-flowered; involucre hemispheric, 4-5 mm. long; phyllaries loosely imbricated, lanceolate-oblong, acute to obtuse, scarious-margined; receptacle slightly alveolate, flat; corolla with lower half of tube filiform, upper half enlarged and funnelliform, about 4 mm. long, the 5 lanceolate lobes 1-3 mm. long; pappus about 4 mm. long, not greatly surpassing the style, plumosely tipped, crisped; ovary abortive. *Baccharis ramulosa* (DC.) Gray. Local in dry mt. areas, 4,500-6,000 ft. elev., in the Trans-Pecos, Apr.-June; Tex., N.M., Ariz., s.e. to Pue.

This plant is known to be toxic to cattle and sheep.

3. *Baccharis texana* (T.&G.) Gray. Shrub or subshrub from rhizomes, branched at base, 25-60 cm. tall; stems striate-angled; lower leaves punctate, sessile, linear to narrowly lanceolate, minutely undulate, 2-4 (-5) cm. long, 2-4 mm. broad, 1-nerved; upper leaves alternate, sessile, linear, acute, undulate, about 10 mm. long, 1 mm. broad, 1-nerved, usually punctate, sometimes crowded; bractlike leaves in the head-bearing region slightly scarious-margined, ciliate; heads corymbosely arranged, each terminating a peduncle; *pistillate head* with about 20 to 30 flowers; involucre campanulate, 7-9 (-10) mm. long; phyllaries lanceolate, acute to acuminate, keeled, the midrib dilated, margins narrowly scarious, usually ciliate; receptacle flat, naked, pitted; corolla filiform, 3.5-4 mm. long, truncate, the 5 teeth obscure and erose, about 0.2 mm. long; pappus 11-13 mm. long, copious, in several series, antrorsely barbellate; achene 3-4.5 mm. long, subglandular, 5- or 6-ribbed; *staminate involucre* campanulate, 6-7 mm. long; phyllaries lanceolate, acute or obtuse, keeled, the midrib dilated, margins narrowly scarious and usually ciliate; receptacle flat, naked, pitted; corolla tube filiform, abruptly enlarged at about the middle, about 5 mm. long, the 5 lanceolate lobes 1.6-2 mm. long; pappus equal to the corolla in length, usually plumose-tipped and crisped; ovary abortive. Local, Edwards Plateau, Rio Grande Plains, Plains Country, Trans-Pecos, n.-cen. and s.e. Tex., late Aug.-Nov.; Okla., Tex., Tam., N.L. and Coah.

4. *Baccharis Wrightii* Gray. Subshrub 10-75 cm. tall, glabrous, slender and erect or short and freely branched; branchlets striate-angled; leaves sparse, sessile, punctate, linear to lanceolate; lower leaves oblanceolate to oblong, 10 mm. long or less (rarely to 25 mm.), 1-2 (-7) mm. broad; upper leaves usually subulate with apexes recurved, entire or with colorless serrations from a narrow colorless margin, 1-nerved; *pistillate involucre* hemispheric, 9-12 mm. long; phyllaries lanceolate, acute or acuminate, green- or brown-veined, the margins scarious and erose; receptacle flat, naked and smooth; corolla filiform, 3.7-4.7 mm. long, its 5 linear lobes 0.3 mm. long or shorter, erose; style exerted beyond corolla lobes; pappus copious, multiseriate, antrorsely barbellate, to 15 mm. long, rufous; achene 3-5 mm. long, glandular, 5- to 10-ribbed, transversely ridged; *staminate involucre* hemispheric, 8-9 mm. long; phyllaries linear to lanceolate, with acute apexes, margins slightly serrate to entire, scarious; receptacle flat, naked, smooth; corolla filiform, 4.6-5 mm. long, with upper half gradually to abruptly funnellform, the 5 lanceolate lobes 1-1.6 mm. long; pappus about as long as corolla, plumose-tipped, crisped; ovary abortive. Local, Plains Country and Trans-Pecos, May-June; Kan., N.M., Okla., Tex., Ariz., Chih. and Dgo.

5. *Baccharis glutinosa* (R. & P.) Pers. JARA, SEEPWILLOW, WATER-WALLY. Shrub 10-35 dm. tall; branchlets striate-angled, glabrous, glutinous; leaves punctate, sessile to indistinctly petioled, lanceolate to narrowly elliptic, tapering from middle to apex and to base, nearly entire to prominently serrate (teeth of larger leaves usually 3-5 mm. apart), 3-8 (-10) cm. long, 1 (-2) cm. broad, distinctly 3-nerved; heads in a terminal corymbiform aggregation, often on several branches; *pistillate heads* with about 50 flowers or more; involucre hemispheric, about 4 (-4.5) mm. high; phyllaries ovate or lanceolate, obtuse (inner may be acute), stramineous, brown-purplish-tipped, the midrib distinct with its margins scarious and erose; receptacle flat, nearly smooth, naked; corolla filiform, 2-2.3 mm. long, with 5 narrow linear lobes 0.2 mm. or less in length; style exerted, bifurcate; pappus uniseriate, flaccid, 4-5 mm. long; achenes about 1 mm. long, glabrous, 5-ribbed; *staminate heads* 10- to 20-flowered; involucre campanulate, about 4 mm. high; phyllaries ovate-lanceolate, obtuse to acute, marginally scarious and erose; receptacle flat, slightly pitted, naked; corolla 3-4 mm. long, filiform, upper half funnellform, its 5 lobes lanceolate and about 1.2 mm. long; pappus 3-4 mm. long, plumose-tipped, crisped, not exceeding corolla; ovary abortive. Along sandy watercourses in dry areas, especially along the Rio Grande, in the Trans-Pecos, Edwards Plateau and Rio Grande Plains, local, summer-fall; widespread in Am., n. to Calif., Colo. and Tex.

6. *Baccharis halimifolia* L. SEA-MYRTLE, CONSUMPTION-WEED. Shrub 1-2 (-6) m. tall; branchlets striate-angled, glabrous; leaves punctate, distinctly petioled or sessile, elliptic to rhomboid or obovate, with acute to obtuse or rounded apexes, cuneate to attenuate-based, lower half of blade entire, upper half entire or with few to several teeth, the upper leaves gradually reduced and becoming entire; larger leaves 3-5 (-7) cm. long, 22-30 mm. broad, prominently 1-nerved with 2 lateral nerves extending from midrib

above leaf-base; inflorescence widely paniculate; head about 20-flowered; *pistillate involucre* campanulate, 4-6 mm. high; phyllaries ovate-lanceolate, obtuse to acute, greenish-brown-tipped, scarious-margined, with a not-always-distinct midrib; receptacle flat or slightly convex, alveolate, naked; corolla filiform, 2.5-3.5 mm. long, with 5 minute linear lobes about 0.1 mm. long; style exserted; pappus biseriata, flaccid, (9-) 10-12 (-14) mm. long; achene 8- to 10-ribbed, 1-1.7 mm. long, glabrous; *staminate head* about 20-flowered; involucre hemispheric, 4-4.5 mm. high; phyllaries ovate-lanceolate, obtuse to acute, scarious-margined; receptacle flat to convex, alveolate, fimbriate to naked; corolla filiform, gradually funnelform, 3-3.5 mm. long, with 5 lanceolate lobes about 1 mm. long; style clavellate; pappus 3-4 mm. long, crisped, plumose-tipped, flaccid; ovary abortive. Often abundant in open sandy places, e. and s.e. Tex., less common w. to n.-cen. Tex.; Coastal States, Mass. to Tex., inland to Okla.

7. *Baccharis neglecta* Britt. ROOSEVELT WEED, NEW DEAL WEED, JARA DULCE. Shrub 1-3 m. tall; branchlets striate-angled, glabrous; leaves sessile, punctate, partially glutinous, narrowly linear to narrowly elliptic, acute, upper entire, lower entire to serrate, prominently 1-nerved with an obscure lateral nerve on each side parallel to the margins; blades 2-4 (-5) mm. broad, the lower ones 3-5 (-8) cm. long; bract leaves reduced; some of the heads aggregated closely in clusters, others nearly solitary; *pistillate heads* with about 15 to 30 flowers; involucre campanulate, about 5 mm. high; phyllaries ovate to lanceolate, obtuse or acute, green or tipped with reddish-brown, erose; receptacle flat, naked and pitted; corolla filiform, 2.5-3.3 mm. long, minutely 5-toothed, the lobes to 0.3 mm. long; style exserted; pappus in 1 to 2 series, 7-12 mm. long, exceeding style by 1-8 mm.; achenes 1.1-1.3 mm. long, glabrous, 10-ribbed; *staminate heads* with about 10 to 15 flowers; involucre hemispheric to subhemispheric, 3.5-4 mm. high; phyllaries ovate-lanceolate, obtuse to acute, scarious-margined, their tips stramineous or green or reddish-brown; receptacle flat, naked, pitted; corolla gradually funnelform, 2.7-3.3 mm. long, its 5 lanceolate lobes about 1 mm. long; pappus not exceeding the style, plumose-tipped, crisped; ovary abortive. Roadsides and other disturbed habitats, usually in calcareous soil, nearly throughout except the dense forests of e. Tex. and the higher elev. of the Plains Country, late summer-fall; N.C. to Ariz. and s. to Dgo. and Coah.

This species and *B. salicina* have been confused; they are extremely closely related. Texas plants of *B. neglecta* have often been incorrectly referred to *B. angustifolia* Michx., a closely related plant of eastern United States.

8. *Baccharis salicina* T.&G. Shrub 1-3 m. tall; branchlets striate-angled, glabrous; leaves nearly sessile, oblanceolate-oblong, obtuse to acute, 3-4 (-6) cm. long, 4-8 (-15) mm. broad, serrate with salient teeth about 5 mm. apart, the broader leaves distinctly 3-nerved; *pistillate heads* with 25 to 30 flowers; involucre campanulate, 6 (-8) mm. long; phyllaries ovate-lanceolate, obtuse to acute, reddish-brown-tipped, marginally scarious, erose, spreading at maturity; receptacle flat, naked and slightly pitted; corolla filiform, 3-4 mm. long, its 5 minute linear lobes to 0.3 mm. long; pappus biseriata, flaccid, to 12 mm. long, basally united into a ring; achenes 1.2-2 mm. long, glabrous, 8- to 10-ribbed; *staminate involucre* hemispheric, 3.5-4.5 mm. long; phyllaries ovate-lanceolate, obtuse to acute, marginally scarious and erose; receptacle flat, naked, pitted; filiform corolla gradually funnelform, 3.3-4.3 mm. long, its linear lobes about 1 mm. long; pappus equal to corolla, plumose-tipped, 3-4.5 mm. long, crisped; ovary abortive. Abundant in the higher parts of the Plains Country, less so in the lower parts, and in the Trans-Pecos, usually in disturbed places, often in sandy subsaline soil, summer-fall; Okla., Tex. and N.M.

9. *Baccharis Bigelovii* Gray. Glabrous shrub a few dm. tall; branchlets striate-angled; leaves punctate, oblong-obovate, obtuse, cuneate to short-petiolate at base, irregularly incised to coarsely serrate, 2-3.5 cm. long, 3-15 mm. broad, 1-nerved or obscurely 3-nerved; heads usually in a somewhat corymbiform aggregation; *pistillate involucre* campanulate, 5 mm. high; phyllaries loosely imbricate, lanceolate, acute, marginally scarious, the midrib green to brownish; receptacle slightly alveolate, flat, naked; corolla filiform, 2-2.6 mm. long, each of the 5 teeth about 0.2 mm. long; pappus antrorsely barbellate, slightly rigid, uniseriate, 3-4.5 mm. long, only slightly exceeding style; mature achenes about 1.6 mm. long, yellow, brown or reddish, glabrous, 5-ribbed; *staminate involucre* campanulate, 4-5 mm. long; phyllaries loosely imbricate, lanceolate, acute,

scarios marginally, erose, the midrib green to brownish; receptacle slightly alveolate, flat, naked; corolla about 3.6 mm. long, filiform, enlarging to a funnellform throat, its 5 lanceolate lobes about 1.3 mm. long; pappus about 3.5 mm. long, not exceeding the style, plumose-tipped, crisped; ovary abortive. Mts. of the Trans-Pecos, 4,500-6,500 ft. elev., Aug.-Nov.; Chih., Coah. and Tex.

10. *Baccharis Havardii* Gray. Glabrous glutinous subshrub 15-70 cm. tall; branchlets striate-angled; leaves 1-nerved, sessile, spatulate to narrowly linear, to 4 cm. long and 3 mm. broad, upper margins with irregular teeth to 2 mm. long or entire and leaves spatulate, upper leaves bracteiform; inflorescence broadly paniculate; *pistillate involucre* campanulate, 4 (-4.5) mm. high; heads pedunculate from axils of leafy bracts; phyllaries oblong or lanceolate with obtuse to acuminate apices, their midribs green or brownish, margins scarios and slightly erose; receptacle flat, naked and nearly smooth; corolla filiform, about 2.8 mm. long, truncate or with 5 lobes to 0.3 mm. long; pappus uniseriate, 4 mm. long, rigid, minutely antrorsely barbed; achenes about 2.3 mm. long, glabrous, 5-nerved; *staminate involucre* semicampanulate, 3 mm. high; phyllaries oblong or lanceolate with obtuse or acute apices, green or brownish midribs and scarios margins; receptacle flat, naked, nearly smooth; corolla 3 mm. long, filiform and abruptly funnellform, its 5 lobes about 1.1 mm. long; pappus nearly 3 mm. long, rigid, plumose-tipped and antrorsely barbellate; ovary abortive. Mts. of the Trans-Pecos, 5,000-7,500 ft. elev., local, July-Aug.; also Coah.

11. *Baccharis viminea* DC. Shrub; branchlets glabrous or glandular; leaves crowded, punctate, narrowly elliptic, entire to minutely serrate, tapering acutely at both ends, 3-5 cm. long, 5 (-10) mm. broad, 1-nerved with 2 indistinct lateral nerves narrowly paralleling the margin; heads in small corymbiform aggregations terminating numerous lateral branches; *pistillate heads* with 50 or more flowers; involucre campanulate to semi-hemispheric, about 4 mm. high; phyllaries ovate to lanceolate, obtuse to acute, stramineous to brown-purplish-tipped, scarios-margined and erose; receptacle flat, smooth, naked; corolla filiform, with 5 small lobes; pappus uniseriate; achene glabrous; *staminate heads* with about 20 flowers; involucre broadly hemispheric, about 3 mm. high, to 5 mm. thick; phyllaries ovate to lanceolate, obtuse to acute, marginally scarios and erose; receptacle flat, naked; corolla-tube filiform, the limb funnellform, with 5 lanceolate lobes; pappus 3 mm. long, plumose-tipped, crisped; ovary abortive. Rare and local near El Paso, Apr.; Baja Calif., Calif., Wash., Ariz., N.M. and Tex.

14. CROPTILON RAF.

SCRATCH-DAISY

A small North American genus, possibly monotypic. We have a single species represented by 3 varieties. *Croptilon* is often treated as a section [*Isopappus* (T.&G.) Benth. & Hook. f.] of *Haplopappus*, but it has a number of peculiarities that distinguish it adequately.

1. *Croptilon divaricatum* (Nutt.) Raf. Annual, rarely overwintering, 3-40 cm. tall; stems often pubescent or glandular-pubescent; leaves alternate, sessile, oblanceolate (in 2 varieties somewhat reduced in the head-bearing region), the margins (especially in the lower half) provided with a comb of stiff spreading setae 1-3 mm. long and in the distal half often saliently serrate or the teeth obsolete in one variety; heads scattered in a widely-branched nearly naked paniculiform aggregation or solitary, never closely bunched, narrowly turbinate, with both ray and disk flowers; receptacle 2-5 mm. broad, flat or slightly convex, often very rough; involucre 5-8 (-9) mm. high, of a few series of strongly graduated rigidly erect linear-subulate phyllaries, each phyllary with scarios margins and a narrow herbaceous median stripe which basally gives way to the broadening pale midvein; *ray flowers* 5 to 29, pistillate, fertile; *disk flowers* 10 to 40, perfect, fertile, with a 5-toothed yellow corolla; style appendages linear-acute, exceeding the stigmatic portion; achenes dark, linear, cylindric-turbinate or subprismatic, not ribbed, 2-3 mm. long; pappus a single series of persistent subequal off-white or rusty-white bristles.

Var. *hirtellum* (Shinners) Shinners. Usually low-growing or rosetted, with fairly well-developed leaves (even in the head-bearing region); stems often glutinous but capitate hairs absent. *Haplopappus rigidifolius* E. B. Sm. Frequent in Rio Grande

Plains, n. to s. part of e. Tex. and s. part of s.e. Tex., various times of the year; also N.L.

Var. *divaricatum*. Diffuse, ascending head-bearing region; stems with capitate hairs; 5 to 11 rays per head; receptacle 2.5-4 mm. across. *Haplopappus divaricatus* (Nutt.) Gray. Frequent in e. Tex., rarely w. to n.-cen. Tex., mostly fall; Gulf States, n. to N.C., Ark. and Okla.

Var. *Hookerianum* (T.&G.) Shinn. Diffuse, ascending head-bearing region; stems with capitate hairs; rays 10 to 29 per head; receptacle 3.5-7 mm. across. *Haplopappus validus* (Rydb.) Cory and subsp. *Torreyi* E. B. Sm. and subsp. *graniticus* E. B. Sm. Frequent in Plains Country and n.-cen. Tex., infrequent s.e. to s. part of s.e. and e. Tex., n. part of Rio Grande Plains and the Central Mineral Region of the Edwards Plateau, summer-fall; Kan., Okla. and Tex.

15. BRADBURIA T. & G.

A monotypic genus that is very closely related to *Heterotheca*. *Mauchia* O. Ktze.

1. *Bradburia hirtella* T.&G. Taprooted annual 1-7 dm. tall, rather freely branched, sparsely pilose-hispid; leaves alternate, essentially sessile, pilose-hispid; leaves of base and lowermost stem (usually withered before flowering time) oblanceolate, in the outer half coarsely toothed or short-lobed; cauline leaves (mostly) linear to linear-oblanceolate, entire, ascending; upper parts of the stem (5-10 cm.) essentially nude-pedunculiform; heads solitary at the ends of the branches; involucre hemispherical, about 1 cm. across; phyllaries in 4 or 5 series, ovate-lanceolate, acute, appressed, mostly scarious but with a median green or dark stripe (the midvein often appearing as a very narrow pale stripe within the median dark strip); ray flowers pistillate, fertile, with prominent often ascending yellow rays; achenes obpyramidal, pubescent; pappus of several very unequal rigid thick somewhat dorsiventrally flattened bristles; disk flowers present, perfect but infertile; corolla yellow, the pappus quite different from that of the rays (merely 1 or 2 longer slender bristles or awns). Local in open sandy usually gravelly areas in e., s.e. and n.-cen. Tex. and n. part of the Rio Grande Plains, spring-early summer; endemic.

16. HETEROTHECA CASS.¹⁹⁴

GOLDEN ASTER. CAMPHOR WEED

Annual or perennial herbs, more or less densely and conspicuously pubescent, often strongly aromatic; leaves alternate, simple, entire to dentate; lower leaves mostly petiolate; upper leaves cuneately sessile to clasping; inflorescence corymbiform to cymose-paniculate; involucre cylindrical-turbinate to broadly campanulate; phyllaries imbricated in 3 to 9 graduated series, at least the inner ones with scarious-stramineous margins; receptacle naked, flat or slightly convex; heads radiate (in Texas species); ray florets pistillate, sometimes abortive, the yellow ligules spreading and linear to oblong-elliptic; disk flowers numerous, perfect, fertile; disk corollas yellow, tubular with 5-lobed limb; ray and disk florets with slender glabrous styles, bifid stigmas with flattened puberulent lobes and syngenesious anthers with lanceolate terminal appendages usually exerted beyond the corolla tube at anthesis; pappus double (absent in ray florets of Sect. *Heterotheca*), with an inner series of numerous elongated barbellate-setose stiffish capillary bristles and an outer series (in Texas species) of numerous to few short fimbriate-squamellate or squamellate-setose appendages. *Chrysopsis* (Nutt.) Ell.; *Pityopsis* Nutt.

A North American genus of about three dozen species.

1. Pappus of ray florets absent; the sequence from the lower petiolate leaves to the sessile clasping upper leaves marked by a progressive petiole lamination from basal lobes (except in certain spring forms lacking sessile upper leaves); herbage markedly aromatic, with stipitate glands; plants annual or rarely weakly perennial (Sect. *Heterotheca*) (2)
1. Pappus of ray florets present; the sequence from lower to upper leaves not involving progressively expanded petiole basal lobes; plants perennial (except annual in *H. pilosa*) (4)

¹⁹⁴ Contributed by Vernon L. Harms.

- 2(1). Height usually less than 1 m.; stems scabrous to short-hirsute; leaves scabrous on both surfaces, with distinctly greenish aspect; lower leaves mostly narrower than 15 mm., with petioles shorter than 3 cm.; phyllaries densely short-hirsute, especially along midrib, glandular; Gulf Coast Texas . . . 1. *H. subaxillaris*.
2. Height to 2 m.; lower stem portions densely long-hirsute; leaves pilose-hirsute at least below, with grayish-green aspect; lower leaves often broader than 15 mm.; phyllary pubescence less densely short-hirsute, more glandular (3)
- 3(2). Lower stems less than 1 cm. thick; lateral branches usually slender; upper leaves only semiclasping, not conspicuously cordate-clasping; peduncles foliate, pubescent, not greatly elongated; involucre less than 12 mm. wide and 8 mm. high; phyllaries more pubescent than glandular; disk corollas shorter than 4 mm.; inner pappus bristles shorter than 6 mm. 2. *H. latifolia*.
3. Lower stems mostly thicker than 1 cm.; lateral branches robust; upper leaves conspicuously cordate-clasping; peduncles elongate, relatively leafless, densely glandular, scarcely at all pubescent; disk corollas longer than 4 mm.; inner pappus bristles longer than 6 mm.; Trans-Pecos Texas 3. *H. psammophila*.
- 4(1). Leaves graminiform, parallel-nerved; leaves and stems with long soft silvery-white sericeous pubescence; achenes narrowly cylindrical to fusiform (Sect. *Pityopsis*) (5)
4. Leaves not graminiform nor parallel-nerved; achenes obovoid or conical, usually conspicuously compressed radially (Sect. *Chrysopsis*) (6)
- 5(4). Peduncles and stems nonglandular; phyllaries nonglandular or more or less glandular, grading into the peduncular bracts below; east Texas 4. *H. graminifolia*.
5. Stems, peduncles and involucre glandular throughout; heads fewer than 8, large, with involucral height mostly exceeding 8 mm.; phyllaries not grading into peduncular bracts below 5. *H. oligantha*.
- 6(4). Leaves thin, pliant; pubescence soft, nonrigid, silky-arachnoid or pilose; east Texas (7)
6. Leaves thicker, less pliant; pubescence coarser, rigid at least near hair bases; stem pubescence of two size-classes, with the primary pubescence more or less spreading; plants perennial; central and west Texas (*H. villosa* complex) (8)
- 7(6). Plant perennial, with thick woody taproot and caudex; herbage pubescence silky-arachnoid, becoming glabrate; inflorescence branches and peduncles minutely but densely glandular; achenes only 2- to 4-ribbed 6. *H. mariana*.
7. Plant annual, with slender taproot; pubescence pilose, persistent; inflorescence branches and peduncles not glandular; achenes conspicuously 10-ribbed 7. *H. pilosa*.
- 8(6). Upper stems, leaves and involucre densely hirsute to sericeous-strigose-pubescent, canescent, nonglandular or with only small inconspicuous sessile glandular-punctations; upper leaves not markedly coarse and rigid; secondary pubescence of stem mostly appressed (in Texas material); outer pappus inconspicuous, of narrow setaceous squamae (9)
8. Herbage less densely pubescent (at least in upper plant portions), distinctly greenish, copiously covered with conspicuous large sessile and stipitate glands or if more densely pubescent or less conspicuously glandular than upper leaves markedly coarse and stiff, and peduncular leaves broad and closely subtending heads; phyllaries more or less glabrate; outer pappus conspicuous, of lanceolate fimbriate squamae (10)
- 9(8). Phyllaries, peduncles, secondary pubescence of stems and leaves densely white appressed-sericeous; primary pubescence of stems sparsely fine hirsute, not harsh; upper leaves oblance-linear, acute, mostly over 5 times longer than broad; the petiolate oblanceolate or spatulate lower leaves very early deciduous; heads closely subtended by narrow peduncular leaves distinctly longer than the phyllaries; heads small, with involucre generally narrower and shorter than 7 mm.; ligule-

- length mostly less than 8 mm.; plants mostly lower than 35 cm., markedly rhizomatous, often forming large clones 9. *H. canescens*.
9. Phyllaries, peduncles, stems and leaves less densely and more coarsely pubescent; primary pubescence of stems more densely and more harshly hirsute to hispid with pustulate-based hairs; upper and middle leaves usually broader, acute or obtuse; heads tending larger with involucre mostly broader and higher than 7 mm.; peduncular leaves usually not closely subtending heads, often reduced and grading into phyllaries; ligules mostly longer than 8 mm.; plants often higher than 35 cm., only short-rhizomatous if at all 8. *H. villosa*.
- 10(8). Heads more or less sessile, closely subtended by peduncular leaves not grading into the phyllaries (11)
10. Heads appearing pedunculate; peduncular leaves distant from heads or (if closer) reduced and grading into the phyllaries; middle and upper leaves less than 5 times longer than broad, often semiclasping; both primary and secondary pubescence of stem usually divergent (12)
- 11(10). Middle and upper stem leaves linear to narrowly oblanceolate, over 5 times longer than broad, cuneately sessile; peduncular leaves linear, harshly hispid-ciliate; stems slender, brittle, glandular, with sparsely hispid-strigose primary pubescence and minute appressed secondary pubescence; lower stems early-defoliate, becoming glabrate and appearing smooth-varnished with age; Texas Plains Country 10. *H. stenophylla*.
11. Middle and upper stem leaves broader, often semiclasping; peduncular leaves broadly to narrowly oblanceolate or oblong; plants coarser, with thicker lower stems; primary pubescence of stems dense, long, often retrorsely hirsute-hispid; secondary pubescence of stems short-hirsute and often stipitate-glandular; lower stems becoming more or less defoliate but retaining some pubescence; Trans-Pecos Texas 11. *H. fulcrata*.
- 12(10). Middle and upper stem leaves broad, obovate or elliptical, only about twice as long as wide, not markedly reduced upward, coarsely ciliated, only sparsely hispid, densely covered with stipitate glands; peduncular leaves distant from heads, not reduced or the closest abruptly narrower than those below; heads few, large, with involucre wider and usually higher than 8 mm., in open cymose inflorescences; Trans-Pecos Texas 12. *H. viscida*.
12. Middle and upper stem leaves oblanceolate or oblong, over twice as long as broad, markedly reduced and stiffish in inflorescence, hirsute, resinous with mostly sessile glandular-punctations; peduncular leaves progressively reduced upward, grading into the phyllaries; heads usually numerous, in subumbellate-corymbiform inflorescences; High Plains 13. *H. horrida*.

1. *Heterotheca subaxillaris* (Lam.) Britt. & Rusby. CAMPHOR WEED. Annual aromatic herbs, rarely overwintering; stems slender, procumbent to erect, rarely over 1 m. high, scabrous or short-hirsute; basal and lower stem leaves petiolate, ovate to elliptical, (1-) 3-7 (-10) cm. long, 4-15 (-30) mm. wide, entire to dentate; upper leaves sessile, ovate to lanceolate, 10-25 mm. long, 3-18 mm. wide, entire or serrate; leaves scabrous on both surfaces; inflorescence a loose corymbose panicle; involucre turbinate to campanulate, 6-15 mm. wide, 4-8 mm. high; phyllaries in 4 to 6 series, the inner about twice as long as the outer, usually densely short-hirsute especially along distal part of midrib and glandular; rays 15 to 35, 3-5 mm. long; disk florets 35 to 40, with corolla tubes 2-4 mm. long; inner pappus bristles 3.5-5.5 mm. long; outer pappus conspicuous, composed of short narrow squamae about 0.5 mm. long; disk achenes obovate, compressed, 1.5-3 mm. long, densely sericeous; ray achenes epappose, nearly glabrous. Chromosome no.: $n = 9$. *Inula subaxillaris* Lam., *Heterotheca Lamarckii* Cass., *H. scabra* (Pursh) DC. Coastal sands of e. and s. Tex. (Brazoria, Cameron, Chambers, Galveston, Kleberg and Nueces cos.), spring-fall; Coastal States, N.J. to Tam.

A procumbent form with entire to only remotely serrate leaves and obscure lateral veins has been distinguished as var. *procumbens* Wagenkn., but may represent only an environmental response to a coastal sand dune habitat.

2. *Heterotheca latifolia* Buckl. Similar to *H. subaxillaris* but height to 2 m., at least lower stem portions densely long-hirsute; basal leaves tending to be broader, 5-40 (-60) mm. wide, with longer petioles; leaves more distinctly toothed, serrate to mostly strongly dentate, longer pilose-hirsute at least on under surfaces; phyllaries less densely hirsute and more glandular than the previous species. Chromosome no.: $n = 9$. A weedy species, primarily on sandy soil, abundant and widespread throughout most of Tex., spring-fall; a species of the interior, w. to Ariz. and Son., s. to Coah. and N.L., n. to Kan. and e. Colo., recently expanding its range in s.e. U.S. to N.C., also a weed adv. elsewhere in cen. and e. U.S.

Most Texas plants belong to var. *latifolia* with longer, more coarsely toothed leaves with scabrous upper surfaces and generally taller stature, but many of the Plains Country plants are of the more northern var. *Macgregoris* Wagenkn. with denser and longer hirsute pubescence of both upper and lower surfaces of leaves, less toothed leaves and generally shorter stature. The poorly marked var. *arkansana* Wagenkn., reported from extreme northeast Texas, is characterized by its more robust habit, coarser lateral branches, more prominent lateral veins of leaves and larger heads.

3. *Heterotheca psammophila* Wagenkn. Similar to *H. latifolia* and *H. subaxillaris* but showing a general gigantism of most characters; stems to 2 m. high and 15 mm. thick, densely long-hirsute below; upper leaves conspicuously cordate-clasping; both leaf surfaces densely long hirsute; herbage with a distinctive leaden-gray aspect; peduncles elongate, leafless, highly glandular; involucre over 12 mm. wide and over 8 mm. high; phyllaries densely glandular, scarcely at all pubescent; outer phyllaries usually over 3 mm. long and inner phyllaries over 7 mm. long; disk corolla tubes usually longer than 4 mm.; inner pappus bristles longer than 6 mm. Chromosome no.: $n = 9$ (based on an Ariz. report). Infrequent on sandy river banks and bars in the Trans-Pecos, summer; also Ariz. and Son.

Most closely related to *H. latifolia* with which it should perhaps be considered conspecific.

4. *Heterotheca graminifolia* (Michx.) Shinn. SILK-GRASS. Perennial stoloniferous herb with 1 to several slender erect stems 2-6 (-10) dm. tall, with soft appressed silvery-white sericeous-pubescent throughout; leaves narrow, elongate, gramineous, flexible, with 3 to 5 (to 7) parallel nerves and appressed silver-white silky-pubescent; basal leaves 1-3 dm. long, the upper leaves progressively reduced with those of the inflorescence bractlike and grading into the phyllaries; inflorescence an open cymose-panicle with several to usually numerous heads each terminating a distinct peduncle; involucre turbinate to turbinate-campanulate, 8-10 (-13) mm. high, 7-10 (-14) mm. wide; phyllaries in 5 to 10 series, narrowly lance-linear, the inner usually over 5 times longer than the outer, loosely white-hairy, nonglandular to often somewhat glandular especially toward tips; rays narrow, (7-) 8-10 (-12) mm. long; disk corollas 5-8 mm. long; inner pappus bristles 5-7 mm. long; outer pappus composed of inconspicuous narrow setaceous squamae about 0.5 mm. long; achenes narrowly fusiform, strongly ribbed, appressed-sericeous-pubescent, about 3 mm. long. Chromosome no.: $n = 9$ (based on 2 non-Texas reports). *Inula graminifolia* Michx., *Erigeron nervosum* Willd., *Chrysopsis nervosum* (Willd.) Fern., *C. argentea* (Pers.) Ell., *C. microcephala* Small, *C. Tracyi* Small, *C. Correllii* Fern., *C. graminifolia* (Michx.) Ell., *Heterotheca nervosa* (Willd.) Shinn. E. Tex., on Coastal Plain, n. to Cass Co., s. to Matagorda Co. and w. to Bastrop Co., spring-fall; s.e. U.S., from Fla. and Del. to n.e. Okla. and Tex.; disjunctly in Guat., s. Mex. and Bah. I.

Closely related to *H. aspera* (Small) Shinn. and often considered conspecific with it but separable by its completely nonglandular stems and peduncles and peduncular bracts grading into the phyllaries.

5. *Heterotheca oligantha* (Chapm.) Harms. Much like *H. graminifolia* but stems and peduncles copiously stipitate-glandular throughout, upper portions not otherwise pubescent; peduncular bracts not grading into the phyllaries; heads fewer than 8, averaging larger; rays longer. *Chrysopsis oligantha* Chapm., *Pityopsis oligantha* (Chapm.) Small. A Coastal Plain species of the *H. graminifolia* (*sens. lat.*) complex in s.e. U.S., from Fla. to s.e. Okla.; not yet noted from Tex. but possibly to be encountered in extreme e. cos.

6. *Heterotheca mariana* (L.) Shinn. Perennial herb with one to several stems from a thick rootstock; stems erect, stout, (1-) 3-6 (-7) dm. high, loosely silky or arachnoid-

floccose, becoming more or less glabrate with age; peduncles and inflorescence branches minutely but densely glandular; leaves numerous, thin, green, soft silky-arachnoid, becoming glabrate; lower leaves spatulate to oblanceolate, 5-10 (-18) cm. long, 1-3 cm. wide, generally obtuse, narrowed to a petiole; upper leaves smaller, oblong or elliptic to lanceolate, 2-5 cm. long, acute to obtuse, sessile; heads several, rather large and showy in congested terminal corymbs; involucre hemispheric, 7-10 mm. high, (10-) 15-20 (-25) mm. wide; phyllaries linear, acute, short-stipitate-glandular and ciliate but otherwise glabrous; achenes obovate, radially compressed, with 2 to 4 glandular ribs. *Inula mariana* L., *Chrysopsis mariana* (L.) Ell. Infrequent in open pine-grassland formation in extreme e. and s.e. Tex. along the La. border (Hardin, Jasper, Jefferson, Newton, Sabine, San Augustine and Tyler cos.), spring-fall; Tex., e. to Fla. and n. to s. O. and N.Y.

7. *Heterotheca pilosa* (Nutt.) Shinners. Taprooted annual with single stems, (2-) 3-6 (-9) dm. tall, usually branched only above the middle, with double pubescence (the primary hairs long, soft, pilose and the secondary pubescence spreading short-puberulent and glandular); leaves numerous and crowded, flexible, soft-textured, distinctly green, soft-pilose, narrowly to broadly oblong-lanceolate, mostly acute, sessile or the lowermost with short petioliform bases; lower leaves oblanceolate, (2-) 3-6 (-8) cm. long, usually denticulate to incised; upper leaves smaller, 1-2 cm. long, entire; inflorescence irregular, with several showy heads each terminating separate branches; involucre hemispherical, (7-) 10-20 mm. wide, (5-) 6-12 (-15) mm. high; phyllaries in 3 or 4 only loosely imbricated series, the inner only slightly longer than the outer, linear-lanceolate, acuminate, with green elliptical midrib area and stramineous-scarious edges, pilose and somewhat glandular; inner pappus tawny; outer pappus conspicuous, composed of broad white squamae; achenes fusiform, distinctly 10-nerved, sparsely silky-pilose. Chromosome no.: $n = 4$. *Chrysopsis pilosa* Nutt. [not *C. pilosa* (Walt.) Britt.], *C. Nuttallii* Britt. Abundant in dry open sandy places, e., s.e. and n.-cen. Tex., summer-fall; Mo. and Kan. to La. and Tex.

8. *Heterotheca villosa* (Pursh) Shinners. Perennial herb with thick woody taproot and caudex, sometimes rhizomatous; stems several to numerous, erect to ascending (in Texas material), (1-) 2-5 dm. tall, simple to usually branched; primary pubescence of stems pustulate-based hirsute to hispid, elongated and relatively persistent on lower stems; secondary pubescence of stems with hairs divergent to usually appressed in Texas material; leaf pubescence appressed to ascending, coarse bulbous-based hirsute to finely strigose-sericeous; lower leaves petiolate, spatulate or oblanceolate; middle leaves oblanceolate, 1-3 cm. long, 3-8 mm. wide; upper leaves linear to oblanceolate, cuneately sessile; inflorescence subumbellate-corymbiform to cymose-paniculate, congested to open; heads 3 to 30 (to 63) per aerial stem, with (35 to) 50 to 100 florets; involucre turbinate to hemispherical, (6-) 7-12 mm. high, (5-) 7-15 mm. wide; phyllaries narrowly lance-linear, closely imbricated in 4 to 9 series, the inner 4.5-7.5 mm. long, about 2 to 3 times the length of the outer, with pubescence usually dense and appressed in Texas material; rays (15 to) 20 to 35, (6-) 8-14 mm. long; disk corolla tubes 5.5-8 mm. long; inner pappus bristles (0.5-) 7-9 mm. long; outer pappus composed of uneven narrow setaceous to fimbriate squamae, the longest 0.5-1 mm. Chromosome no.: $n = 18$. *Amellus villosus* Pursh, *Chrysopsis villosa* (Pursh) Nutt., *C. hispida* (Hook.) DC., *C. foliosa* Nutt., *C. pumila* Greene, *C. Bakeri* Greene, *H. hirsutissima* Greene, *C. imbricata* A. Nels., *C. angustifolia* Rydb., *C. Ballardii* Rydb. Throughout w. Tex., spring-fall; widespread in w. U.S. from Wisc., Neb. and Tex., w. to Pac., n. to s. Can., s. to cen. Mex.

A markedly polytypic species of many intergrading tetraploid races and forms. Most Texas material belongs to var. *foliosa* (Nutt.) Harms (characterized by dense canescent appressed pubescence of involucre and herbage, and larger heads) or to var. *angustifolia* (Rydb.) Harms (characterized by narrower leaves, coarser and sparser herbage pubescence and smaller heads); these varieties intergrade on a broad scale, and much Texas material appears more or less intermediate between them.

9. *Heterotheca canescens* (DC.) Shinners. Similar to *H. villosa* but differing in its denser, softer, white, appressed-sericeous pubescence of phyllaries, peduncles, leaves and stems (secondary hairs), its hirsute but never harsh primary pubescence of stems, its smaller heads and the reduced size of most other quantitative characters; plants lower, 15-35 (-40) cm. high, often highly rhizomatous, frequently with markedly white-sericeous reduced axillary shoots, later becoming highly and finely branched; lower leaves oblanceo-

late to spatulate, petiolate, early-deciduous; middle and upper leaves linear to linear-oblongate, mostly over 5 times longer than broad; heads more or less closely subtended by narrow peduncular leaves longer than the phyllaries; inflorescence loose, rather indefinite, the heads smaller; involucre cylindrical to turbinate, 4-7 mm. wide, 5-7 mm. high; phyllaries closely imbricated in 3 to 5 series, the inner phyllaries less than 6 mm. long; rays usually fewer than 20, shorter than 10 mm.; disk corolla tubes 5-7 mm. long; inner pappus bristles 5-7 (-8) mm. long; outer pappus inconspicuous, composed of narrow setaceous squamae seldom exceeding 0.6 mm. in length. Chromosome no.: $n = 9$. (*H*)*Aplopappus canescens* DC., *Chrysopsis canescens* (DC.) T.&G., *C. villosa* var. *canescens* (DC.) Gray, *C. Berlandieri* Greene. Cen. Tex., e. to Dallas Co., n. to Wichita and Childress cos., s. to Kleberg and Uvalde cos., w. to Swisher, Scurry, Crockett, Brewster and Jeff Davis cos., summer-fall; Tex., w. Okla. and s.-cen. Kan.

Trans-Pecos material seems to represent a more robust race with thicker caudices. In Texas, it sometimes is difficult to clearly distinguish herbarium specimens of this species from certain canescent, strigose-sericeous, smaller-headed, more narrow-leaved forms of *H. villosa*.

10. *Heterotheca stenophylla* (Gray) Shinnery. Perennial herb with thick woody taproots and caudices, often short-rhizomatous; stems several to numerous, slender, erect, brittle, simple or branched above, (1-) 2-4 dm. high, sparsely hispid-strigose and copiously covered with stipitate or sessile resin-glands; lower stem portions early-defoliate, becoming glabrate with a smooth varnished appearance; lower leaves long-petiolate, oblongate to spatulate, early-deciduous; middle and upper leaves rigidly ascending, linear to oblong-linear, 1-4 cm. long, 1-7 mm. wide, usually over 5 times longer than broad, acute, sparsely hispid-strigose and densely beset with large sessile or short-stipitate glands often exceeding 0.1 mm. diameter; proximal leaf portions conspicuously hispid-ciliate; heads closely subtended by several narrow harshly hispid-ciliate peduncular leaves often exceeding the involucre, (1 to) 3 to 20 (to 50) in rather compact clusters, showy, with 40 to 80 (to 100) florets; involucre cylindrical to campanulate, 5-7 (-10) mm. high, 4-8 (-12) mm. in diameter; phyllaries lance-linear, in 3 or 4 imbricated series, the inner about twice as long as the outer, copiously glandular-viscid, only sparsely hispid-strigose; rays 15 to 30, bright-yellow, (5-) 7-15 mm. long, 1.8-2.5 mm. wide; disk corollas (4.5-) 5.5-7 (-8) mm. long; inner pappus (4.5-) 5.3-7 (-9) mm. long; outer pappus conspicuous, composed of uneven narrow squamae, the longest 0.5-1 mm.; achenes densely appressed-villous. Chromosome no.: $n = 9$. *Chrysopsis hispida* DC. var. *stenophylla* Gray, *C. villosa* var. *stenophylla* (Gray) Gray, *C. stenophylla* (Gray) Greene, *C. scabrifolia* A. Nels. On sandy or granitic soils, from Tex. Panhandle Plains, s.e. through the hill country as far as Clay and Hays cos., spring-fall; Tex., Okla., Kan. and disjunctly in n. Neb.

Apparently quite distinct in Texas, but a tetraploid ($n = 18$) chromosome race, known along the eastern edge of the species' range from s.-cen. Kan. to the Wichita Mts. of Okla., tends to intergrade with *H. villosa*.

11. *Heterotheca fulcrata* (Greene) Shinnery. Perennial taprooted herb with thick woody caudices; stems several to numerous, decumbent to erect, 1-8 dm. high, simple to usually divaricately branched at least in the inflorescence; primary stem pubescence dense, long and often retrorsely hirsute-hispid, with at least the hair bases persistent on lower stems; secondary pubescence densely short-hirsute, usually stipitate-glandular; leaves sparsely to densely hirsute to rarely strigose, usually densely short-stipitate-glandular; lower leaves oblong-spatulate, 2-6 cm. long, 5-20 mm. wide, with petioles 5-25 mm. long; middle and upper leaves sessile to clasping, oblongate or oblong to sometimes obovate, 2 to 4 (rarely 7) times longer than broad; heads 1 to 10 (to 25) in loosely cymose to sometimes subumbellate-corymbose or compactly globose inflorescences, appearing sessile, closely subtended by several peduncular leaves distinctly larger than the phyllaries and 3 to 5 (rarely 7) times longer than broad; involucre cylindrical-turbinate to broadly hemispherical, 6-15 mm. wide, 6-13 mm. high; phyllaries lance-linear, in 3 to 5 imbricated series, the outer 2-4 mm. long, the inner 2 or 3 times longer than the outer, more or less glandular, glabrate to sparsely (or rarely quite densely) strigose-hirsute; florets (35 to) 45 to 75 (to 90) per head; rays linear to elliptical, 5-13 mm. long, 1.8-3 mm. wide; disk corolla tubes 5-7 (-8) mm. long; inner pappus bristles

4-9 mm. long; outer pappus conspicuous, composed of lanceolate fimbriate squamae. Chromosome no.: $n = 9$. *Chrysopsis fulcrata* Greene, *C. resinolens* A. Nels., *C. cryptocephala* Woot. & Standl., *C. senilis* Woot. & Standl. Mts. of the Trans-Pecos, spring-fall; generally a higher elev. species of the southwest U.S. and s. Rocky Mts.

A problematic, highly variable group broadly interpreted here to include several semidistinct races. Much of the Trans-Pecos Texas material belongs to a smaller, less glandular race somewhat similar to the type of *Chrysopsis senilis*, but at least two other racially different forms also occur here. Discussion of possible infraspecific distinctions must be deferred pending further investigation.

12. *Heterotheca viscida* (Gray) Harms. Perennial taprooted herb with thick woody caudices; stems several to numerous, decumbent to erect, 1-3 dm. tall, more or less branched; primary pubescence of stems long-hirsute-hispid to 2 mm., often sparse, the secondary pubescence densely stipitate-glandular and short-puberulent (as in Sect. *Heterotheca*); leaves densely stipitate-glandular, sparsely hispid at least on veins; lower stem leaves broadly spatulate, with petioles shorter than 2 cm.; middle and upper leaves obovate to broadly elliptic or oblong, 15-40 mm. long, 7-25 mm. wide, usually about twice as long as broad, with sessile blades obtusely-based to cordate-clasping; heads distinctly pedunculate with peduncular leaves distant and scarcely reduced or else the closest abruptly narrower than those below; inflorescence open-cymose with a few large heads; involucre turbinate to hemispherical, 7-12 mm. high, (7-) 8-12 (-15) mm. wide; phyllaries linear-lanceolate, the inner about 3 times longer than the outer; outer phyllaries stipitate-glandular and sparsely strigose-hirsute to glabrate; rays 8-15 mm. long; disk corolla tubes 5-7 mm. long; inner pappus bristles 4.5-7 mm. long; outer pappus conspicuous, of irregular lanceolate fimbriate squamae 0.5-1.5 mm. long; achenes 3-4 mm. long, sericeous. *Chrysopsis villosa* var. *viscida* (Gray) Greene, *C. viscida* (Gray) Greene. Rare on rocky slopes, ledges and igneous soil in mts. of the Trans-Pecos where it is known from Culberson Co. (Guadalupe Mts.), Jeff Davis Co. (Davis Mts.) and Presidio Co. (Chinati Mts.), summer-fall; Trans-Pecos Tex., N.M. and Ariz.

A rare, little recognized entity with affinities to *Chrysopsis fulcrata* but appearing amply distinct from the latter. In the southwest U.S., the name, *H. viscida*, has most frequently been applied to plants belonging to *H. horrida* or *H. fulcrata*.

13. *Heterotheca horrida* (Rydb.) Harms. Similar to and apparently most closely related to *H. fulcrata*, from which it differs primarily in its distinctly pedunculate-appearing heads, progressively reduced distant peduncular leaves grading into the phyllaries, and heads with cylindrical to cylindrical-turbinate involucre less than 8 mm. wide and 8 mm. high (numerous in subumbellate-corymbose inflorescences). Chromosome no.: $n = 9$. Ariz. and Ut., e. to s. Wyo., w. Neb., e. Colo., w. Okla. and e. N.M., summer.

A low elevation species of the southern Rocky Mts., extending eastward onto the High Plains and the Colorado and Cheyenne Piedmont; not yet noted from Texas but may possibly be found in extreme northwest Texas Panhandle Plains or Trans-Pecos. In the southwest U.S., this entity has most frequently been referred to as *Chrysopsis hispida* but the type of the latter belongs to a common, more northern, tetraploid race of *H. villosa*.

17. XANTHISMA DC. SLEEPY-DAISY

A monotypic genus.

1. *Xanthisma texanum* DC. Taprooted annual herb 2-10 dm. tall, branched near the middle, the branches rather rigidly ascending; leaves alternate, essentially sessile, the basal ones deeply pinnately lobed and those of lower stem oblanceolate in outline but often shallowly pinnately lobed or dentate; leaves of midstem nearly entire, linear or lance-linear, 1-3 cm. long, 2-3 cm. broad, becoming smaller and appressed upward on the pedunculiform upper portion of the branchlets; heads solitary, not crowded; receptacle nearly flat, with long subulate persistent chaffy scales; involucre broadly hemispheric, 5-10 mm. high; phyllaries about 2-3 mm. broad, in several series, very firm, mostly stramineous but with a prominent basally truncate somewhat deltoid dark tip-patch, strongly graduated; ray flowers several, pistillate, fertile, with yellow rays often as much as 1 cm. long; disk flowers numerous, perfect, fertile; corolla yellow, with a basal tube

scarcely distinguished from the long scarcely ampliate shallowly 5-lobed limb; achene narrowly obpyramidal, rather densely covered with stiffish ascending whitish pubescence; pappus alike in disk and ray, double, of an inner series of long lance-acuminate scales and an outer series of linear-subulate scales more or less alternating with the inner series.

We have 2 varieties.

1. Phyllaries oblong to oblong-ovate, with rounded tips ..var. *texanum*.
1. Phyllaries oblong-lanceolate to ovate-lanceolate, abruptly contracted to a sharp stiff pointvar. *Drummondii*.

Var. *texanum* is frequent in sandy open places, Rio Grande Plains, Apr.-Nov.; endemic.

Var. *Drummondii* (T.&G.) Gray is infrequent in open sandy places, Plains Country and the Llano region of the Edwards Plateau, rare e. to n.-cen. Tex., Apr.-Nov.; also Okla.

18. GRINDELIA WILLD.¹⁹⁵

GUMWEED. TARWEED

Taprooted herbs with leafy stems (or in *G. oolepis* stoloniferous), often sticky, usually with numerous ascending branches; leaves alternate, sessile, not deeply lobed, usually serrate; heads mostly about 1-2 cm. broad, hemispherical; phyllaries in 4 to 8 series, usually linear to linear-subulate, the lower part usually pale and very firm and appressed, the upper portion firm and often darker in color and either ascending or usually spreading or even squarrose-reflexed; receptacle nearly flat or slightly convex, rough; *disk flowers* perfect, the central ones usually sterile, the peripheral ones usually fertile, with yellow corollas that consist of a slender basal tube sharply differentiated from the ampliate limb that is equally 5-toothed; *ray flowers* 0 to 45, pistillate, fertile; pappus of ray and disk alike, of 2 to 10 caducous awns that vary from slender to stout or even sometimes scale-like; achenes glabrous, oblong-obovoid, slightly laterally compressed.

About 60 species found in western North America and South America.

1. Upper portions of phyllaries erect, ascending, horizontally spreading or slightly reflexed-squarrose (2)
1. Upper portions of phyllaries revolute, strongly recurved or strongly reflexed-squarrose (10)
- 2(1). Pappus awns filiform or if somewhat scalelike then the upper portion of the phyllary subcoriaceous, firm and thick (3)
2. Pappus awns slightly scalelike or if linear-filiform then the achenes not wrinkled (6)
- 3(2). Rays absent; perennial with rhizomes 8. *G. oolepis*.
3. Rays present; annual or biennial (4)
- 4(3). Leaves not much-reduced toward the heads, the uppermost ones subtending the heads in the manner of auxiliary bracts; mature achenes about as broad as long ..
..... 2. *G. microcephala*.
4. Leaves gradually reduced toward the heads, the uppermost leaves not closely clustered around the heads; mature achenes longer than broad (5)
- 5(4). Upper and middle cauline leaves dentate to setuliferous or spinulose-denticulate; achenes smooth to striate or somewhat coarsely ribbed, 2.5-4 mm. long
..... 6. *G. scabra*.
5. Upper and middle cauline leaves finely and closely crenulate; achenes with 9 to 10 slender ribs, 2-2.3 mm. long 1. *G. grandiflora*.
- 6(2). Ray flowers absent (7)
6. Ray flowers present (8)
- 7(6). Upper and middle cauline leaves entire to remotely or closely crenulate-serrate to -denticulate; pappus awns remotely to moderately setulose-serrulate; mature achenes deeply ribbed or furrowed 5. *G. aphanactis*.
7. Upper and middle cauline leaves closely and evenly crenate or crenate-serrate, the teeth obtuse; pappus awns mostly entire; mature achenes merely striate at the angles 4. *G. squarrosa*.

¹⁹⁵ Adapted from J. A. Steyermark in Ann. Missouri Bot. Gard. 21:433-608. 1934.

- 8(6). Leaves entire or with short salient acute or bristle-tipped teeth
7. *G. lanceolata*.
8. Leaves saliently toothed (9)
- 9(8). Stems minutely puberulent in part; leaves minutely scabridulous in part; pappus awns 4-7 mm. long, equaling the corolla in the disk; Trans-Pecos Texas
3. *G. Havardii*.
9. Stems and leaves glabrous; pappus awns 3-5 mm. long, shorter than the disk corollas; east of Trans-Pecos Texas4. *G. squarrosa*.
- 10(1). Ray flowers absent (Return to couplet 7 above).
10. Ray flowers present4. *G. squarrosa*.

1. *Grindelia grandiflora* Hook. Robust annual to 15 dm. tall, freely branched in the upper part, the branches ascending; upper and middle cauline leaves finely and closely serrulate-crenulate, each side with 20 to 50 crenulae, reduced upward on the stems and appressed so that the upper part of the branches are somewhat penduculiform; heads solitary, not crowded; upper portions of phyllaries erect or spreading; rays orangish or golden-yellow; achenes with 9 to 10 slender ribs, about 2 mm. long. Local in w. part of Edwards Plateau (Crockett, Edwards, Schleicher, Sutton and Val Verde cos.), Aug.-Sept.; also Coah. and N.L.

2. *Grindelia microcephala* DC. Taprooted annual, 1-15 dm. tall, often branched above; leaves usually somewhat oblong, those of midstem on each side with 25 to 60 closely set small teeth, those of upper part of stem not much reduced towards the heads, the uppermost leaves subtending the head in the manner of auxiliary bracts; upper portions of phyllaries ascending or spreading; rays present; mature achenes about as long as broad. Frequent, often in poorly drained clay, in Rio Grande Plains, n.-cen. Tex. and less frequent in s. part of e. Tex. and e. and s. parts of Edwards Plateau, late spring-summer; also Tam.

In the Rio Grande Plains the plants are often of low stature and have some glandular-pubescent (var. *microcephala* and var. *pusilla* Steyererm.) whereas in the northern part of the distribution, especially in north-central Texas, the plants average taller and lack the glandular-pubescent (var. *adenodonta* Steyererm. and f. *angustior* Steyererm.)

3. *Grindelia Havardii* Steyererm. Apparently biennial or weak perennial with several stems (that often bear minute scabridulous pubescence) from the base, erect, 3-5 dm. tall, each stem simple in lower part and with some ascending branches above (each topped by a head); leaves of midstem firm, mostly oblong, varying to slightly ovate or obovate, on each side with 5 to 10 small but rather sharp salient (or slightly antrorse) teeth; some of the lower leaves often with sparse and microscopic scabridulous pubescence, especially near the margin; upper portion of phyllaries ascending or spreading; rays present; pappus 4-7 mm. long, equaling the corolla of the disk flowers; achenes about 3 mm. long, smooth. Infrequent in open places in the Trans-Pecos (to 6,000 ft.) in Chisos and Guadalupe mts., rare in w. part of Edwards Plateau (Crockett Co.), July-Sept.; also N.M.

4. *Grindelia squarrosa* (Pursh) Dun. CURLY-CUP GUMWEED. Taprooted annual, occasionally overwintering; leaves of midstem mostly approaching an oblong shape, firm, on each side with 13 to 30 salient or slightly antrorse teeth, somewhat reduced in size upwards on the stem, not forming auxiliary bracts to the head; upper portions of phyllaries rarely ascending, usually spreading or even strongly reflexed-squarrose; rays rarely present, usually absent; pappus awns narrowly linear, in the disk slightly shorter than the corolla; achenes oblong, 2.3-3 mm. long, usually with 4 angles and with a few shallow striations, but usually smooth. Frequent in open areas in Plains Country, infrequent e. to n.-cen. Tex., s. to Edwards Plateau and s.w. to Trans-Pecos, summer-fall; in most of U.S. (except S.E. states.)

The var. *squarrosa* (with rays) is rare in the Plains Country of Texas; most of our plants are of the var. *nuda* (Wood) Gray (rayless), including f. *angustior* Steyererm.

5. *Grindelia aphanactis* Rydb. Taprooted herb (said to be perennial) with one to several erect stems sparingly branched and each erect branch head-tipped; leaves of midstem membranous, mostly oblanceolate, 2-4 cm. long, 4-8 mm. broad, with about 5 to 8 remote salient teeth on each side, the upper leaves reduced and more nearly linear with nearly entire margins; upper portions of phyllaries ascending or spreading; ray flowers

absent; pappus awns slender, subentire to microscopically serrulate-roughened toward the apex, shorter than the corolla; achenes dark, the four angles prominent and marked on each side by prominent furrows, the ridges sometimes rugulose. Rare in Davis Mts. in the Trans-Pecos, summer; Ut., Ariz., Colo., N.M. and Tex.

6. *Grindelia scabra* Greene. Taprooted annual or biennial herb, several dm. tall, sparingly branched with each branch head-tipped; leaves of midstem approaching oblong in shape, about 2-3 cm. long, on each side with 10 to 25 salient or usually slightly antrorse teeth, upward on stem the leaves slightly reduced and not at all crowded below the head; upper portion of phyllaries ascending or spreading; rays present; achenes 2.5-3 mm. long, longer than broad, pale-brown, smooth or often with some few broad ribs; pappus awns filiform, shorter than the disk corolla. Incl. var. *neomexicana* (Woot. & Standl.) Steyerl. Infrequent to rare in Davis Mts. in the Trans-Pecos, Aug.-Oct.; also N.M.

7. *Grindelia lanceolata* Nutt. Perennial herb from woody crowns (in the extreme n. portion of the range short-lived perennials); stems one to several, ascending, branched in the uppermost portion where each branch terminates in a head; leaves firm, lanceolate to deltoid, rarely oblong-deltoid, tapered nearly the full length to the acute apex, those of midstem 2-5 (-6) cm. long and on each side with 7 to 15 sharp pronounced somewhat antrorse-salient teeth (teeth occasionally bristle-tipped); upper portions of phyllaries ascending or spreading; rays present; pappus awns filiform to linear, nearly as long as the disk corolla; achenes oblong to obovate, 2-5 mm. long, smooth or weakly striate. Incl. var. *texana* (Scheele) Shinnars, *G. littoralis* Steyerl., *G. texana* Scheele. Frequent in open calcareous soil, Edwards Plateau and n.-cen. Tex., local in calcareous soil near Galveston, summer (-fall); Mo. and Tenn., s. to Ala. and s.w. to Tex.

The plants from most of Texas have rather large achenes and mostly deltoid leaves (*G. texana*), but in north-central Texas this type grades northward into a type (true *G. lanceolata*) with shorter achenes, shorter duration (biennial?) and more elongate leaves.

8. *Grindelia oolepis* Blake. Perennial forming clumps from slender branched rhizomes; aerial stems 1-4 dm. long, ascending, mostly simple; leaves membranous, mostly oblanceolate (the lower ones occasionally pinnately lobed), those of midstem 2-6 cm. long, nearly entire or usually on each side with about 6 to 8 small appressed teeth; heads solitary, remote from each other; the broadly deltoid dark tips of the phyllaries erect; ray flowers absent. Infrequent in tight black clay-gumbo soil, coastal part of Rio Grande Plains and s. part of coastal Tex. (Bee, Cameron, Nueces and San Patricio cos.), May, Sept.-Dec.; endemic.

A singular species that is quite distinctive.

19. PRIONOPSIS Nutt.

A monotypic genus whose solitary species is often considered as merely a species of *Haplopappus*. It is closely related to *Grindelia* to which genus it probably should be referred.

1. *Prionopsis ciliata* (Nutt.) Nutt. Stout essentially glabrous annual herb 5-15 dm. tall; stems erect, mostly simple except in the upper 1-2 dm. where numerous short branches arise (each terminating in a head); leaves alternate, simple, sessile, oblong to narrowly or broadly obovate, with coarse salient teeth (each mucronate or with a short bristle), not much reduced upward, the uppermost leaves clustered at the base of the head as auxiliary bracts; heads 15-40 mm. broad; involucre hemispherical, 10-15 mm. high; phyllaries in 3 or 4 series, not strongly graduated, linear-subulate, the lower portion dark-stramineous and very firm, appressed, the upper portion firm, darker and spreading or even squarrose; receptacle flat or slightly convex, roughish; *disk flowers* numerous, perfect, the central ones sterile, the outer fertile, the corolla yellow, the tube weakly differentiated from the equally 5-toothed limb; *ray flowers* pistillate, fertile, the ray yellow; achene glabrous, turgid, oblong or ellipsoid, somewhat laterally compressed, basally attached at a whitish cartilaginous ring; pappus of ray and disk similar, of several somewhat unequal brownish-white slender bristles, the longer ones slightly dorsiventrally flattened; pappus of fertile achenes disposed to be deciduous as a unit. *Haplopappus*

ciliatus (Nutt.) DC. Frequent in open ground, Plains Country and n.-cen. Tex., less common in s.e. Tex., rare in e. Tex. and the Trans-Pecos, Aug.-Oct.; Mo., Kan. and Colo., s. to Tex. and N.M.

20. GYMNOSPERMA LESS.

A monotypic genus; included in *Xanthocephalum* by at least one author.

1. *Gymnosperma glutinosum* (Spreng.) Less. TATALENCHO. Straggly shrub 5-20 dm. tall; leaves alternate, sessile or essentially so, linear or lance-linear, entire, membranous, glutinous, often 2-5 cm. long, 2-6 mm. broad; heads borne in dense terminal corymbiform masses often several cm. across; receptacle nearly flat or somewhat convex, essentially naked; involucre turbinate, usually 3-5 mm. long, glutinous; phyllaries in about 3 series, strongly imbricated, mostly firm and stramineous except for a darker patch at the tip; ray flowers few, the corolla yellow with a relatively long tube and a very short ascending ray shorter than the tube and usually not equaling the adjacent disk corollas; disk flowers few, corolla yellow, with a basal tube and a 5-lobed limb; achene pubescent; pappus in both kinds of flowers reduced to a microscopic ring or essentially absent. *Xanthocephalum glutinosum* (Spreng.) Shinners. Frequent in dry brushy or grassy areas, Rio Grande Plains, Edwards Plateau and in the Trans-Pecos up to 6,500 ft. elev., (spring-) summer-fall; Tex., N.M. and Ariz., s. to Guat.

21. THUROVIA ROSE

A monotypic genus.

1. *Thurovia triflora* Rose. Taprooted ericoid-scoparioid annual 1-3 dm. tall, profusely branched (especially in the upper half); leaves alternate, entire, glutinous, appressed, (1-) 2-4 mm. long, about 1 mm. broad, not much diminished upward, the uppermost often subtending a head as an auxiliary bract; heads numerous, borne in very short leafy branchlets; receptacle essentially flat and naked; involucre 3-4 mm. long, urceolate-turbinate; phyllaries few, in about 3 series, strongly graduated, mostly stramineous but each with a small darker patch at the tip; ray flowers absent; disk flowers usually about 3 in number, perfect, fertile, the corolla cream-colored or very pale-yellow with a short basal tube and a broadly flaring equally 5-lobed limb; pappus of about 10 acute scales nearly as long as the corolla; achene narrowly obpyramidal, rather densely covered with ascending stiff white pubescence. Rare and local in s.e. Tex. (Aransas, Brazoria, Calhoun, Harris, Jackson and Refugio cos.), Sept.-Nov.; endemic.

Closely related to *Xanthocephalum texanum*; this doubtless should be included in that genus.

22. XANTHOCEPHALUM WILD.¹⁹⁶

BROOMWEED. SNAKEWEED

Herbs or low shrubs with taproots; leaves alternate, unlobed, entire, usually resinous; heads either solitary or in fascicles, relatively small; receptacle flat or convex, rarely conical, naked; involucre campanulate to usually turbinate or urceolate, or even nearly spherical or cylindrical; phyllaries in about 3 series, strongly graduated, mostly firm and rather thick and stramineous, closely appressed, often at the very tip with a somewhat darker splotch, often resinous; ray flowers pistillate, usually fertile, the rays yellow and longer than the corolla tube and usually longer than the disk corollas; pappus either absent or a low rough crown or of small paleae; disk flowers perfect, fertile or infertile, the corollas yellow, with a basal tube and a 5-lobed limb; pappus either reduced to a minute crown or else with well-developed scales or (in one species) with a few linear or strap-shaped scales which basally are united; achene obpyramidal, usually rather densely covered with ascending stiffish white hairs or rarely nearly glabrate. *Gutierrezia* Lag.; *Amphiachyris* (DC.) Nutt.

Some of the species are extremely common weeds that increase enormously under the

¹⁹⁶ Adapted partly from O. T. Solbrig in *Rhodora* 62:43-54. 1960; 63:151-164. 1961.

prevalent regime of abusive overstocking. The herbage of several species is known to be toxic to livestock. The annual species are called "broomweed" and the shrubby species "snakeweed." An American genus of perhaps 30 species.

1. Pappus of both ray and disk flowers composed of several well-developed paleae (except these nearly absent in the ray flowers of *X. texanum*) (2)
1. Pappus of both ray and disk flowers of linear or strap-shaped scales and/or merely a low toothed crown, or absent (5)
- 2(1). Plants shrubby or subshrubby perennials (3)
2. Plants taprooted annuals with one stem at base (4)
- 3(2). Each head with 3 to 7 ray flowers and 2 to 6 disk flowers, the latter fertile 2. *X. Sarothrae*.
3. Each head with only 2 or 3 (rarely 4) fertile (ray) flowers; involucre very narrow; achenes of disk flowers aborted 3. *X. microcephalum*.
- 4(2). Involucre campanulate; heads terminal on the secondary branches; pappus present in both ray and disk; disk flowers 20 to 40 per head 4. *X. sphaerocephalum*.
4. Involucre turbinate to campanulate; heads terminal on ascending tertiary pedunculiform branchlets; pappus of ray flowers absent or reduced; disk flowers 10 to 20 per head 5. *X. texanum*.
- 5(1). Rays 50 to 70; pappus of disk flowers merely a crown of minute scales or with 2 or 3 squamellae 1. *X. gymnospermoides*.
5. Rays fewer than 20; pappus of disk flowers of a few strap-shaped scales which at the base are dilated and united 6. *X. dracunculoides*.

1. *Xanthocephalum gymnospermoides* (Gray) Rothr. Stout annual to 2 m. tall; branchlets often with stipitate glands; leaves lanceolate, 3-15 cm. long, 5-30 mm. broad, glabrous, with entire or serrate margins, acute, above shiny and somewhat glutinous; heads solitary at the ends of the branchlets but clustered in subcymose aggregations; involucre campanulate, glutinous, 3-7 mm. thick, 3-6 mm. high; phyllaries numerous in 2 loose series, glabrous, appressed, usually with green midrib and tips, apically spreading; receptacle flat or slightly convex, alveolate; ray flowers 50 to 70, the yellow rays 2-4 mm. long and 1-1.5 mm. broad, about the same length as the tube; disk flowers 150 to 200, 2 to 3 times as many as the ray flowers; corolla about 4 mm. long, with a narrow tube and expanded throat; style with pointed collecting hairs and these restricted to the short deltoid tips; pappus in some plants a low crown, in others a few irregular awns up to half as long as the disk corollas; achenes terete, glabrous or slightly pubescent, 1-2 mm. long. Infrequent or rare in Davis Mts.; Ariz., Son., Chih., Dgo. and Tex.

2. *Xanthocephalum Sarothrae* (Pursh) Shinn. Shrublet 15-90 cm. tall, much-branched at the base and above; leaves linear, 5-70 mm. long, 1-3 mm. broad, resinous, usually glabrous; the entire plant usually more or less corymbiform with numerous heads borne at the densely branched rounded top; involucre 3-10 mm. high, turbinate; phyllaries narrow, acute; ray flowers 3 to 7, fertile, with pappus about half as long as that of the disk; disk flowers 2 to 6, fertile, the pappus of 8 to 10 acute paleae, shorter than the achene. *Gutierrezia Sarothrae* (Pursh) Britt. & Rusby, *G. tenuis* Greene. Locally abundant in open calcareous areas in the Trans-Pecos, Rio Grande Plains and Plains Country, rarely e. to n.-cen. Tex. and s. part of s.e. Tex., usually summer and fall; Man., Sask. and Alta., s. to Chih., N.L. and Tam.

3. *Xanthocephalum microcephalum* (DC.) Shinn. Shrublet 3-10 dm. tall, much-branched; leaves linear, 1-5 cm. long, 1-4 mm. broad, resinous, usually glabrous; the entire plant usually corymbiform with very numerous heads densely crowded all over the rounded top; involucre 3-4 mm. high, narrowly turbinate to nearly cylindroid; ray flowers 1 to 3 (to 4), fertile, with pappus of a few scales shorter than those of the disk; disk flowers 1 to 3, perfect but not fertile; pappus of a number of acute scales 2-3 mm. long. *Gutierrezia microcephala* (DC.) Gray, *G. longipappa* Blake. Locally abundant in the Trans-Pecos, rarely e. to w. part of Edwards Plateau and the Plains Country, usually summer-fall; Calif., Ut., Colo., Ariz., Son., N.M., Chih., Coah. and Tex.

4. *Xanthocephalum sphaerocephalum* (Gray) Shinners. Annual 2-60 cm. tall, much-branched in the upper two thirds; leaves lance-linear, 2-3 mm. long, 2-3 mm. broad, glabrous, glutinous; heads not crowded, terminating leafy secondary branches; involucre broadly campanulate, 3-5 mm. high; *disk flowers* 20 to 40, fertile, with a pappus of several pointed scales usually 1-2.5 mm. long; *ray flowers* 10 to 20, fertile, with a pappus of several scales similar to but shorter than that of the disk. *Gutierrezia glutinosa* Gray, *G. eriocarpa* Gray. Widespread and frequent nearly throughout except the extreme e. and n. parts of Tex., summer-fall; N.M., Tex. and Chih., s. to Qro.

5. *Xanthocephalum texanum* (DC.) Shinners. Annual 1-8 dm. tall, much-branched in the upper half; leaves lance-linear, 1-5 cm. long, 1-5 mm. broad, glabrous, glutinous; heads not crowded, terminating relatively short ascending pedunculiform branchlets; involucre turbinate to campanulate, 3-4 mm. high; *disk flowers* about 10 to 20, fertile, with a pappus of several pointed scales 0.4-1.2 mm. long; *ray flowers* 10 to 15, fertile, with the pappus greatly reduced or nearly obsolete. *Gutierrezia texana* (DC.) T.&G. Widespread and abundant, nearly throughout, summer-fall; Okla. s. to S.L.P.

6. *Xanthocephalum dracunculoides* (DC.) Shinners. Annual 1-12 dm. tall, much-branched in the upper two thirds; leaves lance-linear, 1-5 cm. long, 0.6-2 mm. broad, glabrous, glutinous; heads sometimes a little crowded, terminating fairly short pedunculiform tertiary branchlets; involucre urceolate-turbinate, about 3-5 mm. high; *disk flowers* 10 to 35, perfect but not fertile, the pappus a short thin white cylindrical crown from which emerge about 5 white linear strap-shaped projections equaling the corollas; *ray flowers* 7 to 15, fertile, the pappus of several separate acute scales. *X. amoenum* Shinners and var. *intermedium* Shinners, *Amphiachyris dracunculoides* DC., *Gutierrezia dracunculoides* (DC.) Blake. Local nearly throughout, abundant in n.-cen. Tex., summer-fall; also Okla.

23. EUTHAMIA Nutt.

Essentially glabrous often slightly glutinous rhizomatous perennials; stems erect, 4-8 dm. tall, 2-4 mm. thick basally, freely branching in the upper half, the branches rather stiffly ascending, the entire branch-system then forming a flat or somewhat corymbiform top to the plant, rather densely leafy even up to the top with some diminution of the upper leaves; leaves usually ascending, linear to linear-lanceolate, those of the middle of the plant usually at least 10 times as long as broad, membranous, essentially entire, smooth (except the minutely roughened margins), dark-green, (3-) 4-6 (-8) cm. long, with very minute areolate nervation, otherwise only the midvein visible usually or with two obsolescent longitudinal secondary nerves, often with minute dark punctations and somewhat glutinous; head-bearing region nearly plane or roughly corymbiform at top of plant; heads essentially sessile or very short-pedunculate, solitary or borne in fascicles of 2 to 4 on the ultimate branchlets; involucre turbinate to rarely hemispheric, about 4-6 mm. high, often glutinous; receptacle about 2 mm. across, convex, very rough; phyllaries in about 3 to 5 series, oblong, usually blunt, about 0.6-1.3 mm. broad, mostly stramineous, very firm except the extremely narrow scarious margins, the only dark-herbaceous portion being the extreme tip (this area basally truncate and not at all extending below into the midnerve area); *ray flowers* few, pistillate and fertile, the rays yellow, minute, not exceeding the disk corollas; *disk flowers* perfect, fertile, about 10 to 15 per head, with 5-toothed yellow corollas, only slightly exceeding the involucre; pappus alike in disk and ray, of a single series of more or less equal whitish capillary bristles.

We have three species, based on a somewhat narrow view of each. *Euthamia* is often considered a section of *Solidago*, but the relationship is not as close as this treatment would imply. The genus, entirely American, is considered to consist of about 6 species.

1. Leaves of midstem 1-1.5 (-2) mm. broad, only the midnerve visible even under a lens; involucre about 5-6 mm. high; ligules 2-4 mm. long 3. *E. pulverulenta*.
1. Leaves of midstem 3-5 mm. broad, usually 2 longitudinal secondary nerves visible under a lens in addition to the midnerve; involucre about 4-5.5 mm. high; ligules about 2 mm. long (2)

- 2(1). Middle phyllaries 0.9-1.2 mm. broad; Plains Country 1. *E. camporum*.

 2. Middle phyllaries 0.5-0.9 (-1) mm. broad; mostly eastern half of Texas
 2. *E. leptcephala*.

1. *Euthamia camporum* Greene. As in the key. *Solidago camporum* (Greene) A. Nels. Infrequent in Plains Country (Lipscomb, Wheeler and Wichita cos.), in sandy floodplains of creeks and rivers, Aug.-Sept.; Kan., Okla., Tex. and Colo., probably farther n. and e.

Our plants have been called *E. gymnospermoides* Greene by some authors, apparently incorrectly.

2. *Euthamia leptcephala* (T.&G.) Greene. As in the key. *Solidago leptcephala* T.&G. Frequent in open sandy areas, s.e. Tex., less frequent inland into e. Tex., rare along the coast as far s. as Cameron Co., Sept.-Nov.; Gulf States, n. to N.C., Ky. and Mo.

3. *Euthamia pulverulenta* Greene. Less densely leafy, on the average, than the others, with longer heads and rays and narrower leaves. *Solidago texensis* Friesner. Local near the coast in s.e. Tex. (Calhoun, Galveston, Harris, Jackson, Matagorda, Refugio, San Patricio and Waller cos., rare inland to Austin and Newton cos. and s.w. to Brooks Co.); also La.

There is a superficial and perhaps more than superficial resemblance of this to *Ericameria austrotexana*, but in that species the narrow midribs of the phyllaries are dark.

24. BIGELOWIA DC.

Of the approximately 40 species that occur from North America to Ecuador, we have one. A genus closely related to *Chrysothamnus* and through it to *Ericameria*.

1. *Bigelowia virgata* (Nutt.) DC. Perennial herb from rhizomes or woody branched caudexes, 5-10 dm. tall, rigidly erect, each wiry stem essentially simple except in the upper 4-8 cm. (head-bearing portion); leaves alternate, sessile, linear, entire, firm, often resinous, mostly densely crowded at the very base, becoming extremely remote or absent for most of the length of the scapelike stem; heads densely crowded in a somewhat corymbiform aggregation at the top; involucre nearly cylindrical, 6-8 cm. long; phyllaries in 3 or 4 series, strongly imbricated, often in fairly distinct vertical ranks, firm, resinous-glutinous, mostly stramineous except the darker-colored tip-patch which is not continuous downward on the midrib area; receptacle flat or very slightly convex; ray flowers absent; disk flowers 4 to 6, the corolla yellow, the tube not sharply distinguished from the gradually ampliate deeply 5-lobed limb; achenes narrowly obpyramidal to nearly prismatic, rather densely coated with antrorse stiff white hairs; pappus copious, of numerous slightly unequal bristles that are very slightly dorsiventrally flattened basally. *Chondrophora virgata* (Nutt.) Greene. Infrequent in open sandy places, gravelly clays and rock outcrops, e. Tex., rare in s.e. Tex., fall; Coastal States, N.C. to Tex.

25. CHRYSOTHAMNUS NUTT.¹⁹⁷

RABBIT-BRUSH

Much-branched rounded shrubs 4-18 dm. tall; leaves alternate, simple, linear to narrowly spatulate-oblongate, 1-5 cm. long, 1-4 mm. broad, glabrous to finely puberulent or tomentose, margins smooth or minutely pectinate-ciliate; heads borne in dense irregularly subcorymbose clusters; receptacle flat or somewhat raised in the center; involucre cylindrical, 6-15 mm. long; phyllaries coriaceous, mostly stramineous, strongly graduated in 4 or 5 series and in distinct vertical files, carinate with a slightly discolored midrib which expands into a subrhombic spot near the tip; ray flowers yellow, rarely present (only in *C. spathulatus*), if present 1 per head, inconspicuous; disk flowers 4 or 5, yellow; corolla 6-12 mm. long, tubular, gradually amplified upwards with 5 lobes; achenes narrowly cylindrical, terete or slightly angled, glabrous or pubescent; pappus of several unequal capillary bristles, dull-white.

Chrysothamnus consists of about a dozen species in western North America. It is closely related to *Macronema* Nutt. and *Ericameria* Nutt.

¹⁹⁷ Contributed by Loran C. Anderson.

1. Twigs white-tomentose (2)

1. Twigs not white-tomentose (3)

2(1). Achenes pubescent 1. *C. nauseosus* subsp.

graveolens.

2. Achenes glabrous 2. *C. nauseosus* subsp.

Bigelovii.

3(1). Involucre 5-6 mm. high 3. *C. spathulatus.*

3. Involucre 10 mm. high or more 4. *C. pulchellus.*

1. *Chrysothamnus nauseosus* (Pall.) Britt. subsp. *graveolens* (Nutt.) Piper. Shrub 5-12 dm. tall; younger branches densely white-tomentose; leaves linear, 2-4 cm. long, 1-2 mm. wide, glabrescent to densely tomentose; involucre 7-8 mm. long; phyllaries glabrous, acute; corollas 7-8 mm. long, the lobes 1 mm. long; achenes pubescent. Infrequent in draws on Rolling Plains of Panhandle, 3,000 ft. elev., Sept.-Oct.; from Ariz. and Ut. to N.D., Kan. and Tex.; the species (as a whole) over most of w. U.S.

2. *Chrysothamnus nauseosus* subsp. *Bigelovii* (Gray) Hall & Clem. Shrub 5-6 dm. tall; younger branches tomentose; leaves linear, 2.5-3.5 cm. long, 1-2 mm. wide, glabrescent; involucre 9-10 mm. long; phyllaries pubescent, acuminate; corollas 9-10 mm. long, the lobes 1 mm. long; achenes glabrous. Infrequent in Guadalupe Mts. at 5,000-6,000 ft. elev., Sept.-Oct.; Ariz., Colo., N.M. and Tex.

3. *Chrysothamnus spathulatus* L. C. Anderson. Shrub 5-10 dm. tall; younger branches puberulent; leaves linear-oblongate, 2.5-4 (-5) cm. long, 1-3 mm. wide, glabrous or finely puberulent; involucre 5-6 mm. long; phyllaries obtuse to acute; *ray flowers* rare, 5.5 mm. long, the limb 3 mm. long, somewhat involute and appearing like a tubular corolla; *disk flowers* with corollas 5-6 mm. long, the lobes 2.5-3 mm. long; achenes sparsely pubescent, nearly glabrous at maturity. *C. viscidiflorus* (Hook.) Nutt. var. *ludens* Shinn. Rare in Guadalupe Mts. at 5,500-6,000 ft. elev., Aug.-Sept.; also mts. of adj. N.M.

4. *Chrysothamnus pulchellus* (Gray) Greene. Shrub 6-12 (-18) dm. tall; branches glabrous or rarely puberulent; leaves mostly linear, 1.5-3 cm. long, 1-2 (-4) mm. wide, usually glabrous, rarely finely puberulent, the margins smooth or finely scabrous-ciliate; involucre 10-15 mm. long; phyllaries strongly ridged, tips acuminate or cuspidate; corollas (8-) 10-12 (-14) mm. long, lobes 1 mm. long; achenes glabrous. *C. Baileyi* Woot. & Standl. Frequent in sandy soil, Panhandle, High Plains and Trans-Pecos, 2,000-6,000 ft. elev., Aug.-Oct.; Ariz., N.M., Kan., Tex. and Chih.

26. ERICAMERIA NUTT.

Rounded shrubs from taproots, much-branched, 2-10 dm. tall, essentially glabrous, glutinous, at least slightly aromatic; leaves firm, dark-green, often with pellucid dots or minute craters (visible with a lens), glutinous, linear, 5-20 mm. long, 1-2 mm. broad, flat or often seemingly nearly terete but then with a ventral channel, entire, often ascending; heads 5-10 mm. long; borne at the ends of branches in a subcorymbiform zone near the top of the plant or 2 or 3 often so close as to seem fascicled, or solitary; involucre 3.5-7 mm. long, narrowly turbinate to campanulate, of several (3 or 4) series of graduated phyllaries; receptacle about 2 mm. across, fimbriate, very slightly if at all convex; phyllaries usually resinous, mostly stramineous in color; *ray flowers* present or absent, when present few (1 to 5) and inconspicuous, pistillate and fertile, 3-5 mm. long, yellow (sometimes very pale yellow but never with any bluish cast); *disk flowers* perfect, fertile, 10 to 20 (to 35), exceeding the involucre; corolla yellow, with a cylindrical tube from which the very gradually ampliate throat is not at all sharply delineated; pappus alike in disk and ray, composed of numerous somewhat unequal brownish-white stiff subcapillary bristles, these being very slightly dorsiventrally flattened toward the base; achene usually prismatic, rather densely hirsute with ascending whitish hairs.

Ericameria, an American genus of perhaps 12 species, is often treated as a section of the dustbin genus *Haplopappus*. It is closely related to *Chrysothamnus*, with which it possibly should be merged. If *Ericameria* is placed in *Haplopappus*, *Chrysothamnus* should be too.

1. Shrublets only about 3 dm. tall; lobes of disk corolla equal in length; phyllaries subulate, acute, with a long very narrow dark median strip running nearly their full length and not expanded near the tip 1. *E. laricifolia*.
1. Shrubs usually 3-10 dm. tall; lobes of disk corolla unequal in length; phyllaries linear, bluntish, the darkish median strip confined to the upper half and roughly rhombic (2)
- 2(1). Rays present; disk corolla with the shorter lobes 0.9-2.7 mm. long, the longer lobe(s) 1.7-3.3 mm. long; southern half of Texas east of the Pecos River 2. *E. austrotexana*.
2. Rays apparently absent; disk corolla with the shorter lobes 0.5-1 mm. long, the longer lobe(s) 1.4-1.5 mm. long; in Trans-Pecos Texas 3. *E. triantha*.

1. *Ericameria laricifolia* (Gray) Shinn. Rounded much-branched resinous-aromatic shrub 3-8 dm. tall; internodes of twigs 1-3 cm. long; leaves 4-10 (-20) mm. long, 1-2 mm. broad, rather conspicuously dotted with "glands," the upper ones often with smaller leafy twigs in the axils; heads 9-10 mm. long, broadly turbinate to campanulate; phyllaries subulate, not strongly graduated and not in distinct vertical rows (shortest ones about half as long as the longest), relatively thin and chaffy, brownish-stramineous, each with a very thin darker median strip running essentially the full length and essentially unexpanded toward the apex; disk corolla about 5.5-5.6 mm. long, with a tube 2.6 mm. long, a throat 1.9-2 mm. long and 5 equal lobes 0.9-1 mm. long; ray flowers 0 to 6. *Haplopappus laricifolius* Gray. Infrequent in desert mts. in the Trans-Pecos (Franklin and Hueco mts. of El Paso Co.; Chinati Mts. of Presidio Co.), Oct.-Nov.; Ariz., N.M., Son., Chih. and Tex.

2. *Ericameria austrotexana* M. C. Johnst. Rounded shrub (3-) 5-15 dm. tall, somewhat aromatic, much-branched; internodes of twigs 2-6 mm. long; leaves 1-2 (-3) cm. long, 1-2 mm. broad, the glandularity perceptible only under a strong lens; upper leaves rarely with axillary fascicles; heads 6-9 mm. long; involucre usually turbinate, 4-5 mm. long; phyllaries rarely in noticeable vertical rows, strongly graduated, linear, blunt or very slightly acute, thick, firm, sticky, mostly stramineous but in the upper half with a narrowly rhombic dark patch occupying much of the tip-region; rays only about 2-3 mm. long, very pale yellowish; disk corolla pale, 3.6-5.5 mm. long, with a tube 1-1.8 mm. long and poorly differentiated from the limb which is asymmetrically 5-lobed, most of the lobes 0.9-2.7 mm. long but 1 or 2 of them on one side 1.7-3.3 mm. long. *Aster Palmeri* Gray, *Isocoma Palmeri* (Gray) Shinn. Frequent in open ground, coastal part of Rio Grande Plains and s. part of s.e. Tex., n. to San Patricio, Atascosa and Maverick cos., (spring) summer-fall; Tex., N.L. and Tam.

3. *Ericameria triantha* (Blake) Shinn. Rounded shrub about 1 m. tall, aromatic, much-branched; internodes of twigs 2-6 mm. long; leaves 5-10 (-18) mm. long, the glandularity perceptible under a lens, the upper ones very rarely with axillary fascicles; heads about 7-8 mm. long; involucre turbinate, (3.3-) 4-5 mm. long; phyllaries strongly graduated, often in vertical rows, linear, blunt or very shortly acute, thick, firm, sticky, mostly stramineous but in the upper half with a rhombic dark patch occupying much of the tip-region; rays absent; disk corolla pale-yellow, 4.1-5.4 mm. long, with a tube 1.7-2.4 mm. long and poorly differentiated from the limb which is asymmetrically (4- or) 5-lobed, most of the lobes 0.5-1 mm. long but 1 or 2 of them on one side 1.4-1.5 mm. long. *Haplopappus trianthus* Blake, *H. pseudobaccharis* Blake. Local in deserts in s. Trans-Pecos (s.w. Brewster Co.), late Aug.-Sept.; Tex., Chih., Coah. and Dgo.

27. ISOCOMA NUTT.

Glabrous glutinous subshrubs with woody taproots, 2-8 dm. tall, much-branched (especially at the base and again in the upper head-bearing region), the main (woody) branches often partly reclining; leaves either linear or oblanceolate-linear, nearly entire or rarely saliently toothed or rarely obovate in outline but deeply cut into linear lobes, the nervation inconspicuous, finely areolate, marked by slightly sunken usually dark-pellucid "resin-pits" or "glandular punctations" visible under a lens; heads in glomerules of 2 to 6 or less commonly solitary at the tips of the branches, the whole plant thus often essentially corymbiform or a round-topped mass of heads; heads campanulate to narrowly so, 8-15 mm. long; receptacle very slightly convex, rough, a few mm. across;

involucre 4-12 mm. high, of about 3 or 4 series of strongly graduated phyllaries; phyllaries firm, extremely glutinous, mostly whitish-stramineous but the entire tip herbaceous, this darker tip-color *not* extending down in the median midnerve strip but truncate below; *ray flowers* absent; *disk flowers* usually 10 to 40 per head; corolla yellow, 4-9.5 mm. long, divided into a basal cylindrical tube and a rather abruptly dilated throat plus 5 equal teeth; achenes 2-3 mm. long, narrowly obpyramidal, with about 4 angles, covered rather completely with stiffish whitish ascending pubescence; pappus persistent, copiously provided with coarse brownish-white bristles that are rather unequal but do not fall into 2 size-classes.

Though this American genus of about 25 species is well-defined and internally homogeneous, it is by some authors included in the sack-genus *Haplopappus*. These plants that are nonpalatable to grazing animals increase in abundance because of the prevailing range-regime of ruthless and destructive overstocking in much of southern and western Texas.

1. Involucres 4-5.3 (-6.6) mm. high; corollas 4.1-6 mm. long, the basal tube 2.2-3.3 mm. long and the throat 1-1.5 (-2) mm. long; in the Trans-Pecos and Plains Country3. *I. Wrightii*.
1. Involucres (5-) 6-12 mm. high; corollas 6-9.4 mm. long, the basal tube 3-6.2 mm. long and the throat 1.3-2.8 mm. long; east of the Pecos River (2)
- 2(1). Involucre (5-) 6-7 mm. long; leaves (at least some of each plant) deeply lobed, often with fascicles of small leaves in their axils1. *I. coronopifolia*.
2. Involucre (6.6-) 7-12 mm. long; leaves entire or rarely lobed, even more rarely toothed, very rarely with fascicles in the axils2. *I. Drummondii*.

1. *Isocoma coronopifolia* (Gray) Greene. Leaves to 4 cm. long, sometimes rather regularly pinnately lobed with as many as 3 or 4 lobes on each side, the whole leaf 15-20 mm. long but usually there are fewer and longer lobes; involucres (5-) 6-7 mm. long; corollas 6-6.8 mm. long, divided into a tube 3-4 mm. long, a throat 1.5-2.8 mm. long and lobes (0.6-) 0.8-1.3 mm. long. The Texas plants have often incorrectly passed under the name *Haplopappus fruticosus* (Rose & Standl.) Blake or *H. Hartwegii* (Gray) Blake. Frequent locally in Rio Grande Plains, dry open calcareous places (Atascosa, Bexar, Brooks, Maverick, Webb and Zapata cos.), Sept.-Nov. (rarely at other seasons); also N.L.

Plants of this species at a very few places occur with plants of *I. Drummondii*, which is closely related; the former are easily distinguished by the lobed leaves and smaller involucres and corollas. Usually *I. coronopifolia* flowers later than *I. Drummondii* but there is some overlap. Probably the variability in foliage and in head- and corolla-size of *I. coronopifolia* can be traced to genetic "swamping" or dilution in the direction of *I. Drummondii*, which is a more aggressive, weedy species greatly increasing in abundance.

2. *Isocoma Drummondii* (T.&G.) Greene. Leaves usually (slightly oblanceolate-) linear, several cm. long, (1-) 2-3 (-4) mm. broad, usually entire, rarely with a few salient teeth; involucres (6.6-) 7-12 mm. long; corollas 6-9.4 mm. long, divided into a tube (3.2-) 4-6.2 mm. long, throat 1.3-2.3 mm. long and lobes 0.8-1.1 mm. long. *Haplopappus Drummondii* (T.&G.) Blake, *Isocoma megalantha* Shinnars. Locally abundant, coastal half of Rio Grande Plains and s. Tex. (Atascosa, Austin (?), Cameron, Jim Wells, Karnes, Kenedy, Kleberg, LaSalle, McMullen, Nueces and Willacy cos.), spring-fall; also Tam.

3. *Isocoma Wrightii* (Gray) Rydb. JIMMY-WEED. Leaves usually (slightly oblanceolate-) linear, several cm. long, 2-4 mm. broad, entire; involucres 4-5.3 (-6.6) mm. long; corollas 4.1-5.9 mm. long, divided into a tube 2.2-3.3 mm. long, a throat 1-2 mm. long and lobes 0.8-1.1 (-1.4) mm. long. *Haplopappus heterophyllus* (Gray) Blake. Locally abundant, often in open alkaline places, Trans-Pecos and Plains Country, July-Sept.; Ariz., N.M., Tex., Chih. and Son.

Our plants have been referred, perhaps incorrectly, to *I. pluriflora* (T.&G.) Greene, of southeastern Colorado. This plant is known to be toxic to cattle, horses and sheep.

28. MACHAERANTHERA NEES

Herbs; leaves alternate, essentially sessile (especially the basal ones), often pinnately or bipinnately lobed but in some species merely toothed or essentially entire; heads

about 1-2 cm. in diameter, usually borne more or less solitary at the ends of branches though occasionally the whole plant subcorymbose or rarely the heads nearly sessile in the upper axils; involucre mostly hemispheric; phyllaries usually linear to lanceolate or subulate, basally and laterally stramineous, the midrib in the upper half herbaceous-green (or at least darker than the stramineous base) and expanded into a somewhat rhombic patch that in some species occupies essentially the entire tip-region, the tip either erect or in some species spreading or even squarrose and apically acute to very shortly acute or even blunt; receptacle 3-10 mm. wide, rough, flat or very slightly convex; ray flowers pistillate, fertile; rays yellowish or white and often tinged with blue, violet and/or red; disk flowers numerous, perfect, fertile; corollas yellowish, with a cylindrical tube that is not distinctly delimited from the greatly ampliate limb (which is composed of a throat and 5 usually short teeth); style appendages various; achenes narrowly turbinate to broadly linear or clavate (compressed in species 1 to 5), rather densely antrorsely pubescent; pappus persistent, in some species absent from the ray flowers but present in the disk flowers, in other species present and alike in both disk and ray, composed of numerous somewhat unequal usually sordid-white slender bristles, the larger ones often slightly dorsiventrally flattened at the base. *Haplopappus* Sect. *Blepharodon* DC.; *Psilactis* Gray; *Eriocarpum* Nutt.; *Xylorhiza* Greene.

The first four species show evidence of intergradation, some specimens being identifiable with one or another species only on arbitrary grounds; possibly extensive introgression has occurred. An American genus of about 50 or 60 species.

1. Ray flowers without pappus (*Psilactis*) (2)
 1. Ray flowers and disk flowers with pappus of the same kind (4)
 - 2(1). Ligules of ray flowers 2-4 (-5) mm. long; involucre 2-4 mm. high; achenes 1-2 mm. long 17. *M. brevilingulata*.
 2. Ligules of ray flowers (4-) 5-7 mm. long; involucre 3-5 mm. high; achenes 2-3 mm. long (3)
 - 3(2). Involucre broadly turbinate, 5-7 mm. across; flowers 30 to 75 (to 90) per head; stems and leaves with crisp spreading hairs; phyllaries 0.5-0.7 mm. broad 16. *M. tenuis*.
 3. Involucre hemispheric, 5-10 mm. across; flowers 75 to 100 per head (fewer in late-flowering heads); stems with glandular-pubescent above or glabrate; leaves with appressed hairs or glabrate; phyllaries 0.75-1 mm. broad 15. *M. Boltoniae*.
 - 4(1). Rays white or white with more or less strong reddish, violet or purplish pigmentation, never yellow (*Machaeranthera sens. str.*, *Xylorhiza*) (5)
 4. Rays yellow, occasionally with tinges of reddish, violet or purplish (*Blepharodon*) (9)
 - 5(4). Leaves pinnately dissected (6)
 5. Leaves merely toothed (7)
 - 6(5). Involucre 6-11 mm. high; disk 10-25 mm. broad; achenes 2-3 mm. long 13. *M. tanacetifolia*.
 6. Involucre 4-6 mm. high; disk 6-10 mm. broad; achenes 1.5-2 mm. long 14. *M. parviflora*.
 - 7(5). Involucre 20-30 mm. high (*Xylorhiza*) 10. *M. Wrightii*.
 7. Involucre 6-11 mm. high (8)
 - 8(7). Achenes about 1 to 2 times as long as thick; each leaf on each side with 15 to 30 teeth 11. *M. blephariphylla*.
 8. Achenes linear, about 5 times as long as thick; each leaf on each side with 5 to 10 teeth 12. *M. linearis*.
 - 9(4). Annuals, some plants occasionally living over one winter (10)
 9. Perennials, usually with a woody crown (14)
 - 10(9). Largest phyllaries of the head 1.3-1.7 mm. broad .. 7. *M. phyllocephala*.
 10. Largest phyllaries of the head 0.5-1.1 mm. broad (11)

- 11(10). Leaves linear, 13-40 mm. long, 1-2 mm. broad, membranous and spreading; southeast Texas 9. *M. aurea*.
11. Leaves not linear or if approaching linear then shorter than 13 mm. and ascending (12)
- 12(11). Involucre of mature head about 15 mm. broad; broadly spreading or squarrose herbaceous tips of phyllaries about 0.9-1 mm. broad . 8. *M. annua*.
12. Involucre of mature head about 8-10 mm. broad; tips of phyllaries erect or slightly spreading, the herbaceous portion 0.3-0.7 mm. broad (13)
- 13(12). Leaves 1-3 mm. broad, canescent-pubescent, rather stiffly ascending, the apex and each tooth bristle-tipped 5. *M. gracilis*.
13. Leaves pubescent but not grayish, slightly ascending or spreading, the apex and teeth not bristle-tipped 6. *M. Havardii*.
- 14(9). Upper 5 or 6 leaves nearest the head reduced, appressed and remote, nearly entire and entire-margined, the head-bearing branch thus distinctly pedunculiform and several cm. long; leaves farther down the stem ascending or appressed, toothed or slightly pinnately lobed, only those at the extreme base of the plant (if any) elaborately pinnately lobed 1. *M. scabrella*.
14. Upper 5 or 6 leaves nearest the head not much-reduced, pinnately lobed, appressed or usually spreading; leaves farther down stem various (15)
- 15(14). Stems rather simple, rigidly erect in the lower two thirds of the height, much-branched only in the upper 3-7 cm. of the length where each branch terminates in a head; leaves ascending to appressed, usually quite green and nearly glabrous, rarely elaborately bipinnate (except the extreme basal leaves which wither before flowering time), usually simply pinnate, the central portion usually at least twice as broad as the lateral lobes 2. *M. pinnatifida*.
15. Stems usually freely branched at several levels; leaves usually spreading, variously pubescent, variously lobed (16)
- 16(15). Plants (20-) 30-50 (-70) cm. tall, dark grayish-green; leaves rarely bipinnately lobed; Rio Grande Plains 3. *M. texensis*.
16. Plants (5-) 10-20 (-30) cm. tall, usually pale-green to canescent or even whitish-tomentose; leaves of midstem usually elaborately bipinnately lobed; Plains Country, rarely as far south as northern Rio Grande Plains . . 4. *M. australis*.

1. *Machaeranthera scabrella* (Greene) Shinn. Perennial herb from woody crowns, (1-) 2-4 dm. tall; extreme basal leaves pinnately or bipinnately lobed; cauline leaves (even those of the lower half of the stem) ascending or appressed, toothed or slightly pinnately lobed, each tooth with a short bristle-tip; upper 5 or 6 leaves nearest the head reduced, appressed and remote, nearly entire and entire-margined, the head-bearing branch thus distinctly pedunculiform and several cm. long; heads solitary, terminal, not crowded; involucre broadly turbinate to broadly campanulate; phyllaries in 4 or 5 series, strongly graduated, ascending, the larger ones about 0.5-0.7 mm. broad, linear, often at the very tip shortly acute or even blunt, the midrib and margins mostly stramineous but the upper half of the phyllary mostly occupied by a roughly elliptical dark (often green) patch which is vertically oriented and which takes up most of the width, displaces the midrib and is covered by microscopic glandular tubercles; disk yellow; rays yellow; style branch appendages conical, much shorter than the stigmatic portion; pappus of ray and disk similar; achene 2-2.5 mm. long, 0.5-0.7 mm. thick, linear, densely fuzzy with short ascending hairs. *Eriocarpum scabrellum* Greene, *E. Wootonii* Greene, *Haplopappus spinulosus* var. *canescens* Gray and subsp. *scabrellus* (Greene) Hall. Included here are many plants which have erroneously been called *Haplopappus spinulosus* var. *turbinellus* (Rydb.) Blake. Abundant, more or less weedy in a number of habitats, in the Trans-Pecos, less frequent e. to Val Verde Co. on the Edwards Plateau, in genetically dilute form n. to the s. Plains Country, spring-fall; Tex., N.M., Ariz., Baja Calif., s. to Hgo., Gto., Gro. and Zac.

On a broad scale this intergrades with *M. pinnatifida* and to a lesser extent with *M. australis*.

2. *Machaeranthera pinnatifida* (Hook.) Shinners. Perennial herb from woody root-stocks, mostly glabrous, (2-) 3-5 (-6) dm. tall, rather simple and rigidly erect in the lower two thirds, much-branched only in the upper 3-7 cm. of the length where each short leafy branch terminates in a head; leaves (even those at the very base of the plant) rarely bipinnately lobed, usually simply pinnately lobed with the central portion along the midrib much broader than the lobes, the leaves rather strongly ascending or often even appressed, not much reduced upwards, those 5 or 6 nearest the head almost as large as those of the midstem; heads not crowded; involucre mostly hemispheric; phyllaries in about 4 series, graduated, the larger ones about 0.7-1 mm. broad, linear, often apically acute and minutely bristle-tipped (the short bristles often spreading but the phyllary otherwise ascending), the midrib and margins stramineous but the upper third to half of the phyllary with a very narrowly elliptical dark often green vertically oriented patch which takes up about half the width (displacing the midrib) and usually not microscopically glandular; disk and rays yellow; style branch appendages narrowly conical, somewhat shorter than the stigmatic portion; pappus of ray and disk similar; achene as in *M. scabrella*. *Machaeranthera pinnata* (Nutt.) Shinners (an illegit. name), *Haplopappus spinulosus* (Pursh) DC. and var. *glaberrimus* (Rydb.) Blake, *Sideranthus glaberrimus* Rydb., *S. turbinellus* Rydb. Locally frequent in High Plains Country, rare e. to the lower Plains Country and in the limestone mts. of the Trans-Pecos (Glass Mts., Brewster Co.), late May-Sept.; cen. prairies and plains of the continent n. to Alta., Sask. and Minn.

Intergrading on a broad scale with both *M. scabrella* and *M. australis* but, locally, populations adjacent to each other retain their distinctions. *Sideranthus glaberrimus* may eventually prove to be the more correct name for our plants.

3. *Machaeranthera texensis* (R. C. Jackson) Shinners. Erect perennial herb from woody crowns, (2-) 3-5 (-7) dm. tall, dark-grayish-green, with patches of floccose tomentum on the stems (and lower sides of the leaves), freely branched near the base, near the middle and again near the top of the plant; basal leaves always withered prior to flowering, lowermost stem leaves occasionally very slightly bipinnately lobed (the pinnae with very short pinnules), almost all the leaves spreading and simply pinnately lobed, the median portion near the midrib not much broader than the lobes (each of which has a minute sharp mucro), the upper 5 or 6 leaves nearest the heads only slightly reduced as compared to those of midstem; heads solitary, terminal, not crowded; involucre broadly hemispheric, 6-8 mm. high; phyllaries in about 4 series, graduated, ascending except at the very tip, the larger ones 0.8-1 mm. broad, linear, apically acute, the midrib (at the base) and margins mostly pale-stramineous but the upper half to two thirds of phyllary with a dark midrib which greatly expands near the tip into a narrowly rhombic dark patch (this often thinly floccose), the extreme tip spreading and with a spinose mucro; disk and rays yellow; style branch appendages considerably shorter than the stigmatic portion; pappus of ray and disk similar; achene as in *M. scabrella*. *Haplopappus texensis* R. C. Jackson. Infrequent in sandy loam, coastal part of Rio Grande Plains (Brooks, Jim Hogg, Jim Wells, Kleberg and San Patricio cos.), Aug.-Nov.; endemic.

A characteristic of this species which may prove reliable in its determination is the unusual roughness of the receptacle, which bears projections nearly as high as or higher than the achenes at least in some specimens.

4. *Machaeranthera australis* (Greene) Shinners. Perennial herb from woody crowns, (5-) 10-20 (-30) cm. tall, often whitish-tomentose or canescent or less frequently pale-green and glandular-puberulent or glabrous; leaves usually spreading, those of the lower half or even the lower two thirds of the stem bipinnately lobed, the upper 5 or 6 leaves below the head not much reduced in size and usually only pinnately lobed, the median portion of all the leaves only slightly or not at all broader than the lobes; heads solitary, terminal, not crowded; involucre turbinate to hemispheric; phyllaries in 3 or 4 series, graduated, ascending except at the very tip, the larger ones 0.5-0.7 mm. broad, linear, acute, spinulose-mucronate, the midrib and margins mostly stramineous, the midrib in the upper 2 mm. of the length displaced by a roughly rhombic dark-green or brown patch and this continuing as a narrow dark line about half way down the midrib; disk and rays yellow; pappus of ray and disk similar; style branch appendages conical, shorter than the stigmatic portion; achene as in *M. scabrella*. *Eriocarpum australe* Greene,

Haplopappus spinulosus subsp. *australis* (Greene) Hall. Abundant in Plains Country, less common and usually genetically dilute s. to the Trans-Pecos and Edwards Plateau, rare to Rio Grande Plains, spring-summer; Colo. and Okla. s. to Tex. and Coah.

In many plants (about a third of the populations) of this species the apical phyllary patch is tomentose.

5. *Machaeranthera gracilis* (Nutt.) Shinners. Annual taprooted herb, rarely if ever overwintering, 15-35 cm. tall, usually erect, branched at various levels including the base, the stems and leaves rather densely covered with antrorsely appressed whitish hairs so the plant appears gray-green; very lowest leaves of the main stem occasionally pinnately lobed and oblanceolate in outline but nearly all leaves appressed, linear, 3-15 mm. long, 1-3 mm. broad, apically and at each tooth bristle-tipped; heads solitary, terminal, not crowded; involucre 6-7 mm. high, broadly turbinate; phyllaries in about 5 series, strongly graduated, linear, the longer ones 0.5-0.8 mm. broad, appressed except at the extreme tip, acute, stramineous only at the very narrow margins, the upper half mostly occupied by the elongate (rhombic to nearly linear) dark (usually green) tip-patch; disk and rays yellow; pappus of ray and disk similar; style branch appendages conical, shorter than the stigmatic portion; achenes as in *M. scabrella*. *Haplopappus gracilis* (Nutt.) Gray. Infrequent in open places in Trans-Pecos at elev. of 4,000-5,000 ft., Aug.-Oct.; Calif., Nev., Ut., Colo., s.e. to Dgo., Coah. and Tex.

Closely related to *M. scabrella*. Often each phyllary of *M. gracilis* has a distinctive narrow stramineous margin extending completely around the darker apex as well as the lower portions.

6. *Machaeranthera Havardii* (Waterfall) Shinners. Annual taprooted herb, erect, 2-4 dm. tall, branched in the upper half to two thirds or less commonly at the base, the branches ascending; leaves firm, oblong to narrowly obovate, those of the lower half of the plant 15-35 mm. long and 5-12 mm. broad, those higher up becoming less than half that size, those in the upper part mostly about 10 × 3 mm., clasping, apically blunt, on each side with 3 to 8 shallow teeth; the smaller leaves rather crowded, continuing up all the way to the base of the head; heads more or less solitary on branches 1-5 cm. long; involucre about 7 mm. high, hemispheric; phyllaries in about 4 series, graduated, linear, the largest about 0.5 mm. broad, firm, with stramineous margins and bases, the upper part of the midrib green and very near the tip expanded into a narrowly rhombic dark patch; disk and rays yellow, sometimes rather pale-yellow; pappus of ray and disk similar; style branch appendages conical, shorter than the stigmatic portion; achenes 2-2.5 mm. long, linear, somewhat compressed, sericeous-pubescent or nearly glabrous. *Haplopappus Havardii* Waterfall. Rare in calcareous (perhaps sometimes gypseous) soil in Trans-Pecos (Culberson Co.) and s. part of Plains Country (Ector Co.), July-Nov.; also N.M.

7. *Machaeranthera phyllocephala* (DC.) Shinners. CAMPHOR DAISY. Aromatic often glutinous annual herb, sometimes living over one winter, either erect or near the coast usually prostrate, freely branched especially near the base; leaves usually oblanceolate to narrowly obovate, firm or even fleshy, 15-50 mm. long, on each side with 5 to 8 prominent salient teeth or short lobes, only slightly reduced toward the head, crowded even up to the base of the head; heads solitary; involucre 9-11 mm. high, hemispherical; phyllaries in about 3 series, not much-graduated, the largest ones in any mature head 1.3-1.7 mm. broad, the tip-region often of a different texture from the base being more herbaceous and sometimes spreading; disk and rays yellow; style branch appendages subclavate, shorter and thicker than the stigmatic portion; pappus of ray and disk similar; achene columnar, thick, about 2 mm. long, slightly compressed to plump and subcylindric, fuzzy with whitish ascending pubescence. *Haplopappus phyllocephalus* DC., *H. rubiginosus* T.&G., *Eriocarpum megacephalum* Nash. Abundant in subsaline areas near the coast, s.e. Tex. and Rio Grande Plains, spring-fall; coastal areas, La. to Tam.

Represented by another variety in the highlands of Mexico.

8. *Machaeranthera annua* (Rydb.) Shinners. Annual taprooted herb, somewhat glutinous, erect, 3-6 dm. tall, with ascending branches in the upper part (never near the base), the ultimate branches (which are 1-4 cm. long) somewhat crowded and pedunculiform; leaves oblanceolate to narrowly obovate, firm, 2-5 cm. long, 3-14 mm. broad, on each side with 7 to 10 prominent salient teeth with each tooth mucronate or even with a short bristle; uppermost leaves much-reduced; involucre hemispheric, 7-8 mm. high; phyllaries

in a few series, somewhat graduated, linear, acute, the broadest on any head 0.5-1.1 mm. wide, mostly stramineous but the upper third to half occupied mostly by the dark (often green) roughly rhombic tip-splotch; disk and rays yellow; style branch appendages subclavate, thicker and shorter than the stigmatic portion; pappus of ray and disk alike; achenes as in *H. phyllocephala*. *Haplopappus annuus* (Rydb.) R. C. Jackson, *M. phyllocephala* var. *annua* (Rydb.) Shinn. Infrequent in open places, Plains Country, rare in s. part of e. Tex. (Gonzales Co.) and in the Trans-Pecos, Aug.-Oct.; Colo. and Kan., s. to N.M. and Tex.

9. *Machaeranthera aurea* (Gray) Shinn. Annual taprooted herb, nearly glabrous, ascending, 15-30 cm. tall, freely branched, the branches arcuate-ascending and nearly simple except in the upper 2-5 cm., again branched and each branch bearing a head, the whole plant thus subcorymbiform; leaves linear-oblongate, 1-4 cm. long, 1-2 mm. broad, entire or on each side with 2 to 4 remote salient teeth; involucre about 8 mm. high, hemispheric; phyllaries in about 4 series, graduated, the largest on any head about 1 mm. broad, each with a very prominent dark rhombic tip-splotch which does not extend down onto the midrib; disk and rays yellow; pappus of ray and disk alike; style branch appendages subclavate, shorter than the stigmatic portion; achene about 2 mm. long sericeous-pubescent. *Haplopappus aureus* Gray. Rare near Houston, Harris Co., Oct.; local endemic. Related to *M. annua*.

10. *Machaeranthera Wrightii* (Gray) Cronq. & Keck. Strongly perennial herb with short woody crowns, 15-40 cm. tall; leaves narrowly obovate, 2-5 cm. long, firm, nearly entire or with a few salient teeth; upper leaves remote and reduced, the long upper branches thus distinctly pedunculiform; heads relatively enormous for this genus, 3-5 cm. broad; phyllaries not strongly graduated, mostly herbaceous except the very narrow scarious margins; disk yellow; rays usually bluish to bluish-violet or so pale as to be almost white but never yellow; pappus of ray and disk similar. *Aster Wrightii* Gray, *Xylorhiza Wrightii* (Gray) Greene. Infrequent but conspicuous in desert areas in the Trans-Pecos, Mar.-Apr. (-June); also Chih.

11. *Machaeranthera blephariphylla* (Gray) Shinn. Strong nearly glabrous perennial herb with stout woody crowns; many stems 15-35 cm. long, erect, usually simple in the lower half and sparingly branched above, the branches stiffly ascending and each terminating in a head; leaves oblong to narrowly obovate, 1-4 cm. long, 5-13 mm. broad, blunt apically, sessile and subclasping, on each side with 10 to 15 sharp teeth (each often bristle-tipped), the upper leaves somewhat reduced so that the heads are somewhat pedunculate; involucre hemispheric, 8-10 mm. high; phyllaries in several series, graduated, mostly stramineous except for the elongate-deltoid dark (green or usually purplish) terminal patch; disk yellow; rays white, occasionally on the undersurface bluish, never yellow; pappus of ray and disk similar; style branch appendages subulate, longer than the stigmatic portion; achene about 2 mm. long, stout and tumid, fuzzy. *M. Correllii* Shinn, *Haplopappus blephariphyllus* Gray. Local in limestone mts. (Diablo, Glass and Guadalupe) in the Trans-Pecos at about 5,000-7,000 ft. elev., spring-fall; N.M., Tex. and Coah.

Our plants have been known incorrectly as *H. gymnocephalus* DC.

12. *Machaeranthera linearis* Greene. Robust taprooted annual 3-10 dm. tall, erect, often nearly simple in the lower half, barely branched with ascending branches, the upper branches 2-7 cm. long and pedunculiform; pubescence of leaves and stems microscopic, appressed; leaves lanceolate to oblong-lanceolate, acute to blunt, sessile, the ones of midstem usually 2-5 cm. long and 6-11 mm. broad, rather bright green, on each side with 3 to 6 small but salient teeth; upper leaves much-reduced, ascending; heads essentially solitary, not crowded; involucre 6-9 mm. high, hemispheric; phyllaries in 5 or 6 series, strongly graduated, the largest on any head 0.9-1.3 mm. broad, mostly whitish or stramineous but with a large roughly rhombic green or dark patch almost completely occupying the tip-region, appressed except at the very tip; disk yellow; rays white or occasionally bluish- or violet-tinged, never yellow; pappus of ray and disk similar; style branch appendages subulate, nearly as long as the stigmatic portion; achene linear, 2-2.5 mm. long but only 0.2-0.3 mm. thick, with antrorsely appressed sordid pubescence. *Aster linearis* (Greene) Cory. Local in open places, Trans-Pecos deserts (El Paso, Hudspeth and Winkler cos.), rare in s. Plains Country (Hockley Co.), Sept.-Oct.; Ut., Colo., Ariz., N.M., Chih. and Tex.

13. *Machaeranthera tanacetifolia* (H.B.K.) Nees. ТАХОКА DAISY. Annual herb; stems erect or often partially reclining, 1-4 dm. long, nearly glabrous, densely leafy; leaves membranous and most of them elaborately bipinnately parted; heads solitary and not crowded, showy, on peduncles 5-30 mm. long, (3-) 4-6 cm. broad when the rays are fully expanded; involucre hemispheric, 6-7 mm. high; phyllaries in several series, mostly stramineous, appressed but with spreading-subulate or elongate-deltoid green tips; disk yellow, 10-25 mm. broad; rays whitish or usually rather strongly violet-blue, never yellow; pappus of ray and disk similar; achenes 2-3 mm. long, oblong or broadly linear, compressed, densely covered with short antrorse appressed whitish hairs. *Aster tanacetifolius* H.B.K. Abundant in sandy soils, Plains Country and Trans-Pecos, rarely e. to stream beds of Edwards Plateau, late spring-summer; S.D. to Alta., s. to n.-cen. Mex.

14. *Machaeranthera parviflora* Gray. Annual herb; stems erect or partially reclining, 1-4 dm. long, nearly glabrous, leafy; leaves membranous, 1-3 cm. long, 2-5 (-10) mm. broad, usually merely pinnately parted, rarely the pinnae with shorter lobes, the upper leaves reduced and appressed; head solitary and not crowded; involucre hemispheric, 4-6 mm. high; phyllaries in a few series, weakly graduated, mostly stramineous, appressed even up to the herbaceous deltoid-acute microscopically glandular-puberulent tips; disk yellow, 6-10 mm. broad; rays rarely whitish, usually violet-blue, never yellow; pappus of ray and disk similar; achene 1.5-2 mm. long. *Aster parvulus* Blake. Infrequent or rare in sandy soil along the Rio Grande in the Trans-Pecos, summer-fall; Ut., Ariz., N.M., Tex. and Chih.

15. *Machaeranthera Boltoniae* (Greene) Turner & Horne. Annual taprooted herb, erect and nearly simple below, to 1 m. tall or more, with glandular-pubescent above or glabrate; leaves essentially entire, oblanceolate to linear, reduced above, with appressed hairs or glabrate; heads solitary, not crowded; involucre hemispheric, 5-10 mm. across, 3-5 mm. high; phyllaries 0.75-1 mm. broad; flowers 75 to 100 per head (fewer in late-flowering heads); disk yellow and pappus present; rays light-blue or violet-blue to white, never yellow, (4-) 5-7 mm. long; pappus of ray flowers absent; achenes 2-2.4 mm. long. *Psilactis asteroides* Gray, *P. lepta* Shinnars. Infrequent in alluvial sandy soil, 3,000-4,000 ft. elev. in the Trans-Pecos (El Paso, Hudspeth and Presidio cos.), June-Nov.; Ariz., N.M., Tex., s.e. to Michoac. and Pue.

16. *Machaeranthera tenuis* (Wats.) Turner & Horne. Annual taprooted herb, erect and nearly simple below, with ascending branches above; stems and leaves with crisp spreading hairs; leaves linear to oblanceolate, nearly entire, the upper ones reduced; heads solitary; involucre broadly turbinate, 5-7 mm. across, 3-5 mm. high; phyllaries 0.5-0.7 mm. broad; flowers 30 to 75 (to 90) per head; disk yellow, pappus present; rays blue-violet to white, never yellow, 5-7 mm. long; pappus of ray flowers absent; achenes 2-3 mm. long. *Psilactis tenuis* Wats. Local in Davis Mts., Jeff Davis Co., at elev. above 4,000 ft., Aug.-Oct.; Chih., Coah., N.L. and Tex.

Near Sinton, San Patricio Co., collections have been made in October and November that are doubtfully referred to *M. tenuis*; they are distinguished by their appressed pubescence, nearly glabrous strongly 8-ribbed achenes and small linear leaves.

17. *Machaeranthera brevilingulata* (Hemsl.) Turner & Horne. Annual herb, rather freely branched, to 1 m. tall or more, the branches ascending; leaves linear to oblanceolate, 6-30 mm. long, the lower larger ones weakly pinnately lobed, the higher ones merely toothed or usually essentially entire; heads small, solitary; involucre 2-4 mm. high; disk yellow, pappus present; rays white to violet, never yellow, 2-4 (-5) mm. long; pappus of ray flowers absent; achenes 1-2 mm. long. *Psilactis brevilingulata* Hemsl. Infrequent in the Trans-Pecos at 4,000-6,000 ft. elev., July-Sept.; Tex. and Chih., s.e. to Chis.; also Col.

29. SOLIDAGO L. GOLDENROD

Rhizomatous perennials; rhizomes sometimes short and forming merely a crown or sometimes extensively creeping; aerial stems usually long and slender, ascending gracefully, branched in the upper head-bearing portion, the branches in turn bearing very many short head-bearing branchlets which are often ascending; leaves alternate, sessile, not lobed, the lower portions occasionally narrowed to a subpetiolar base; heads rarely more than 1 cm. long; receptacle flat or slightly convex, not chaffy; involucre usually

narrowly campanulate; phyllaries in a few series, graduated, usually linear-lanceolate or linear, mostly stramineous and chaffy in texture with a slightly darker more herbaceous median strip which is slightly dilated near the tip (in Sect. *Oligoneuron*, comprising *S. rigida* and *S. nitida*, each phyllary oblong and blunt with a broad herbaceous median zone which is composed of vertical nerves); ray flowers pistillate and fertile, several in number (in one species only 2 per head), with yellow rays; disk flowers perfect and fertile, with yellow corollas; pappus simple, of numerous essentially equal capillary bristles; achenes many-ribbed, nearly terete.

Solidago is a large North American genus (with one species also in Europe). It is one of our more difficult genera probably because of rampant hybridization. Our species 7 through 18 are particularly apt to hybridize. Often hybrids or genetically contaminated individuals are more common than "pure" plants at disturbed sites. Only complete specimens with lower stem leaves and mature heads can be determined with any degree of confidence. The descriptions do not attempt to account for all the variability due to contamination, but only for the "purer" genetic states. Some writers treat the Sect. *Oligoneuron* as a separate genus while others include not only Sect. *Oligoneuron* but the genus *Euthamia* as well.

1. Head-bearing branchlets few, borne on short branches about as long as to shorter than the remote upper serrate leaves from whose axils they arise 1. *S. caesia*.
1. Head-bearing branchlets usually borne on branches longer than the leaves from whose axils they arise or if (as in, for example, *S. petiolaris*) the branches shorter than their subtending leaves then the leaves only obscurely serrate and/or crowded (2)
- 2(1). Head-bearing branchlets only slightly if at all upwardly secund on ascending branches which are so graded in length as to form a roughly flat-topped or corymbiform aggregation about as broad as long at the top of the plant (aberrant forms of *S. petiolaris* might also be sought under this lead) (3)
2. Head-bearing branchlets definitely secund on the branches and/or the entire aggregation of heads longer than it is thick (5)
- 3(2). The entire terminal aggregation of heads only about 3-6 (-9) cm. long and broad; Trans-Pecos mountains 19. *S. Wrightii*.
3. The terminal aggregation of heads usually 6-20 cm. long and/or broad; east of the Trans-Pecos (Sect. *Oligoneuron*) (4)
- 4(3). Leaves of midstem only 2 to 3.5 times as long as broad, usually a little rough 20. *S. rigida*.
4. Leaves of midstem 5 to 10 times as long as broad, usually smooth 21. *S. nitida*.
- 5(2). Stems strict, the terminal head-bearing portion loose or dense, spicoid to cylindrical or rarely rhomboid, not one-sided, several times longer than thick, with leaves crowded so that the axillary ascending branches (which bear the head-bearing branchlets and are not curled at the tips) overlap each other at least slightly, the head-bearing branches not markedly secund (6)
5. Stems rarely strict, usually merely virgate and arcuate, the terminal head-bearing portion usually irregularly ovoid or more elongate but rarely more than twice as long as thick (except in *S. sempervirens*), often one-sided and/or loosely branched and/or with the branches spreading and terminally curled under (7)
- 6(5). Leaves usually smooth on the surface (not the margins!), 3 to 7 times as long as broad, usually with 2 of the lower secondary veins strongly ascending and more prominent than the rest (thus the leaves "triplinerved"), in the basal third of the length acuminate strongly narrowed to a subpetiolar base; phyllaries usually erect 17. *S. speciosa*.
6. Leaf surfaces at least slightly rough to the touch, 1.5 to 4 (or 5) times as long as broad, usually merely penninerved, in the basal third rarely strongly narrowed, usually merely acute or even rounded; phyllaries often spreading 18. *S. petiolaris*.

- 7(5). Plants perfectly smooth and glabrous, virgate; leaves fleshy or thinner, perfectly entire and with inconspicuous venation or merely with finely reticulate pattern, rarely with readily discernible secondary nerves; basal leaves ascending, often long, grasslike, terminally rounded and narrowed to the subpetiolar base for most of the length; stem leaves much smaller, grasslike to narrowly elliptic, often ascending or appressed and apically acute or rarely blunt; leaves of the head-bearing portion usually reduced; head-bearing portion of the plant often elongate and slender but definitely one-sided and its branches nearly always curly at the tips 6. *S. sempervirens*.
7. Plants usually pubescent, if nearly glabrous then the leaves usually with 2 fairly conspicuous lower secondary nerves and/or not entire marginally and/or not at all grasslike (8)
- 8(7). Leaves of midstem or lower midstem narrowly lanceolate or linear-lanceolate, broadest in the lower half, apically and basally acute, 25-90 mm. long, 2.5-10 mm. broad, 7 to 15 times as long as broad; plants of eastern half of Texas (varieties of *S. altissima* from the western half of Texas might also be sought here as well as *S. missouriensis* of the Plains Country) (9)
8. Leaves of midstem usually proportionately shorter and broader, if as much as 7 times as long as broad then broader than 10 mm. or broadest in the upper half (10)
- 9(8). Leaves as seen under a lens pubescent12. *S. tortifolia*.
9. Leaves as seen under a lens glabrous on the surfaces (not always on the margins) and with pellucid dots11. *S. odora*.
- 10(8). Upper half of the stem roundly quadrangular, the ridges usually narrowly winged 2. *S. salicina*.
10. Upper half of stem not quadrangular nor 4-winged (11)
- 11(10). Lower stem leaves with a dilated auriculate-clasping base 3. *S. auriculata*.
11. Lower stem leaves not amplexicaul (12)
- 12(11). Leaves of midstem ovate, 1.3 to 2.5 times as long as broad, the lower surfaces with conspicuous and prominent pale network of nerves, each side with 10 to 20 rather evenly spaced conspicuous marginal serrations 7. *S. rugosa*.
12. Leaves of midstem mostly proportionately longer and narrower or if only 2.5 times as long as broad then broadest in the upper half and/or the lower surfaces with less prominent nervation, the margins usually with fewer teeth or if as many then these concentrated in the outer two thirds the length (13)
- 13(12). Midstem leaves rather dark-olive-green, mostly obovate to lance-obovate, usually with a few weak marginal serrations in the terminal third to half the length, the surfaces not closely pubescent but with scattered mostly antrorse microscopic barbs which make the surface exceedingly raspy to the touch16. *S. radula*.
13. Midstem leaves usually bright-yellowish-green to cinereous, varying in shape but rarely obovate, the surface occasionally roughish but not raspy (14)
- 14(13). Most of foliage and stems glabrous and yellowish or pale-green with the exception of the margins of the leaves and often scattered pubescence in narrow vertical lines on the upper part of the stems (15)
14. Most of foliage and stems closely pubescent with microscopic hairs, making parts of the plant at least slightly cinereous or sordid (18)
- 15(14). Upper leaves just below the head-bearing region 2 to 3 times as long as broad; leaves of midstem not triplinerved (16)
15. Upper leaves just beneath the head-bearing region 4 to 8 times as long as broad; leaves of midstem usually with 2 of the lower lateral nerves more prominent than the rest (17)

- 16(15). Leaves membranous, the lowest ones withering and disappearing long before flowering times; lower stem leaves when present mostly 4-7 cm. long and with subpetiolar bases to 3 cm. long 4. *S. delicatula*.
- 16. Leaves firm, the lowest ones usually withered but often still attached at flowering time; lower stem leaves (5-) 7-20 cm. long, distinctly divided into an upper expanded bladelike portion and a long subpetiolar base 5. *S. Boottii*.
- 17(15). Stems 2-4 (-6) dm. long from the rhizome, 2-3 mm. thick basally 10. *S. missouriensis*.
- 17. Stems 5-25 dm. long from the rhizome, 3-8 mm. thick basally 9. *S. gigantea*.
- 18(14). Leaves of midstem broadest at or usually slightly below the middle (19)
- 18. Leaves of midstem broadest in the distal half (20)
- 19(18). Stems 6-25 dm. long; heads usually several hundred per stem 8. *S. altissima*.
- 19. Stems 3-4 dm. long from the rhizome; heads 50 to 130 per stem 13. *S. mollis*.
- 20(18). Trans-Pecos area; leaves of lower stem usually more than 1 cm. broad 15. *S. sparsiflora*.
- 20. East of the Trans-Pecos area; leaves of lower stem usually about 1 cm. broad or narrower 14. *S. nemoralis*.

1. *Solidago caesia* L. BLUE-STEM GOLDENROD. Glabrous perennial; stems slender and often slightly zigzag, the internodes even in the head-bearing portion of the plant 1-3 cm. long; branches about as long as to usually shorter than the upper leaves in the axils of which they are borne and in turn bearing a few head-bearing branchlets; upper leaves remote, spreading, mostly broadly lanceolate, very thin, serrate most of the length. Rare, rich woods in e. Tex., Sept.-Oct.; e. U.S. and s.e. Can., w. to Wisc. and Tex.

2. *Solidago salicina* Ell. Plant coarse, glabrous, about 1 m. tall; upper half of stem roundly (obscurely) quadrangular, often with narrow wings on the ridges; leaves of midstem membranous, broadly lanceolate, to 14 cm. long and 4 cm. broad, about 3.5 times as long as broad, in the basal third of the length narrowed to a subpetiolar (but broadly winged) base, marginally closely serrate on the upper two thirds of the length; terminal head-bearing portion diffuse, somewhat one-sided, with long whiplike branches, the glomerules of head-bearing branchlets (or occasionally tertiary branches) definitely secund on the outer half to two thirds of these whiplike branches. Rare in moist loam, e. Tex. (Nacogdoches Co.), Oct.; Coastal States, Va. to Tex.

3. *Solidago auriculata* Shuttlew. Plant 5-13 dm. tall; stems finely and densely pubescent; basal leaves contracted basally into a long linear subpetiolar base which expands into an auriculate-clasping base; lowest stem leaves about 8-9 cm. long and 3-4 cm. broad, membranous, reticulate-veiny, softly pubescent beneath, roughish above, sharply and coarsely serrate, acute, the ovate terminal portion abruptly narrowed to a linear subpetiolar base which is at its base auriculate-clasping; uppermost leaves usually entire; head-bearing region diffuse, somewhat one-sided, with long branches which bear the secund head-bearing branchlets; involucre narrowly turbinate, 3.5-4.5 mm. long, 2-2.5 mm. thick; phyllaries acute; disk flowers 5 to 8; ray flowers 1 or less commonly 2; achenes pubescent. *S. amplexicaulis* of many auth., not of Martens, *S. notabilis* Mack. Rare in wooded ravines (Harrison, Jasper and Newton cos.) in e. Tex., July-Aug.; apparently also Gulf States plus Tenn. and Ark.

4. *Solidago delicatula* Small. Mostly glabrous with the exception of the margins of the leaves and pubescent striation in the head-bearing region; leaves thin-membranous and smooth; lowest stem leaves always withered and absent by flowering time and therefore unknown; leaves just below the middle of the stem narrowly elliptic, 2.5 to 4 times as long as broad, broadest near the middle, about 4-7 cm. long including the broad subpetiolar base which is to 3 cm. long, with the secondary nerves all equally obscure, marginally serrate in the outer two thirds the length; upper leaves just below the head-bearing region 2 to 3 times as long as broad, usually elliptic; head-bearing region some-

what one-sided, extremely diffuse with long ascending leafy branches which in their outer portions usually bear tertiary branches which in turn bear the decidedly secund head-bearing branchlets, the secondary and tertiary branches arcuate distally. *S. ulmifolia* var. *microphylla* Gray, *S. microphylla* Small, *S. Helleri* Small. Frequent in loamy soil, e., s.e. and n.-cen. Tex., rarely July, usually (Aug.-) Sept.-Oct. (-Nov.) or even Jan.; Kan., Mo., Ark., Okla. and Tex.

Perhaps not separable from *S. ulmifolia* Muhl. of eastern United States.

5. *Solidago Boottii* Hook. Perennial, mostly glabrous (except the margins of the leaves); leaves firm and relatively persistent, the lowest ones though withered often still attached at flowering time, (5-) 7-20 cm. long, distinctly divided into an upper coarsely serrate expanded bladelike portion and a long subpetiolar base; leaves of midstem not triplinerved, the surfaces (not the margins) smooth, about 3 to 4 times as long as broad, marginally serrate in the outer two thirds of the length; upper leaves just below the head-bearing region 2 to 3 times as long as broad; head-bearing region one-sided, very diffuse, with long whiplike distally arcuate branches which bear the crowded heads on strongly secund head-bearing branchlets; involucre 4.5-5.5 (-6) mm. long; disk corolla 3.8-5.2 mm. long; pappus 3.5-5 mm. long. *S. ludoviciana* (Gray) Small. Frequent in usually moist sandy soil, e. and s.e. Tex., Aug.-Oct.; s.e. U.S. n. to N.J., Ky. and Ark.

6. *Solidago sempervirens* L. var. *mexicana* (L.) Fern. SEASIDE GOLDENROD. Rhizomes often extensive; plants altogether glabrous and smooth; aerial stems usually 1-2 m. tall; leaves often somewhat fleshy, perfectly entire, the inconspicuous venation forming merely a fine reticulate pattern rarely with readily discernible secondary nerves; basal leaves ascending, often long, grasslike, terminally rounded and narrowed to the subpetiolar base for most of the length; stem leaves much smaller, grasslike to narrowly elliptic, often ascending or appressed and apically acute or rarely blunt; leaves of the head-bearing portion usually reduced; head-bearing portion often elongate but definitely one-sided and its branches nearly always curly at the tips. *S. stricta* Ait., *S. angustifolia* Ell. Frequent in marshy often slightly brackish swales and ditches, s.e. Tex. (infrequent inland in e. Tex. to Austin and Gonzales cos.), fall; Coastal Plain from Mass. to Ver. (the var. *sempervirens* from Nfld. to Va.)

This is somewhat variable in habit and size of head; plants with highly reduced upper leaves, relatively narrow head-bearing region and small heads have been segregated as *S. stricta*; every conceivable intergradation occurs.

7. *Solidago rugosa* Ait. var. *celtidifolia* (Small) Fern. Rhizomes creeping; aerial stems about 8-15 dm. tall, shortly hispid; basal leaves divided into an expanded bladelike portion and a linear subpetiolar base; leaves of midstem dark-green or sordid, ovate or narrowly ovate, 4-7 (-10) cm. long, 1.3 to 2.5 times as long as broad, apically acute, somewhat wrinkled, essentially penninerved, marginally with 10 to 20 conspicuous serrations on each side spaced out rather evenly from the apex nearly to the base, often stiffly pubescent on the nerves beneath and with very slight scabrosity on the upper surface which has the nerves impressed and the internerve areoles slightly raised, on the lower surface the nerves prominent and the areoles depressed; head-bearing region one-sided, usually very diffuse with several long whiplike branches the outer portions of which bear the markedly secund head-bearing branchlets. *S. aspera* Ait. Referred here are some Texas plants which have been called *S. ulmifolia* (cf. also *S. delicatula*). Frequent in sandy soil, e. and s.e. Tex., Sept.-Oct.; Que., Ont. and e. U.S. w. to Mich., Ind., Mo., Ark. and Tex.

Many, many goldenrods show combinations of characteristics of this species and others, especially *S. altissima*. While genetic mixing is not at all unusual in goldenrods, still the abundance of the plants of hybrid origin is remarkable in this instance. In fact, what has been called *S. rugosa* var. *aspera* (Ait.) Fern. in Texas is probably merely a group of such plants that are primarily *S. rugosa* but contaminated to varying degrees by *S. altissima* genes.

8. *Solidago altissima* L. Rhizomatous perennial, usually with numerous stems (6-) 10-20 dm. tall, the stems and foliage totally more or less densely covered with a fine or microscopic pubescence (thus cinereous or sordid-green) and roughish; leaves of midstem broadest at or below the middle, lanceolate to lance-elliptic, (3 to) 4 to 5 (to 10) times as long as broad, (5-) 10-16 mm. broad, usually triplinerved (i.e., with 2 of the

lower secondary nerves nearly as prominent as the midvein beneath and ascending nearly the full length of the blade), marginally usually with a few close teeth (5 to 10) on each side in the upper half to two thirds of the length; head-bearing portion of stem usually dense, somewhat one-sided, with a number of crowded arcuate branches each for nearly its total length crowded with definitely secund head-bearing branchlets, the total number of heads usually 150 to 500; heads small, the involucre usually only 3-4 mm. high. Open low areas nearly throughout Tex. but most frequent in e., s.e. and n.-cen. Tex., (summer-) fall; Que., Ont. and e. U.S., w. to Wisc., Neb., Okla. and Tex.

The plants of stream margins of the Edwards Plateau (east to Kendall and Uvalde cos.) and of the Trans-Pecos (Brewster, Presidio and Reeves cos.) and even rarely the Plains Country (Oldham Co.) have proportionately narrower leaves and smoother, canescent-pubescent, only obsolete marginal teeth and usually looser head-bearing portions. These are the var. *canescens* (Gray) M. C. Johnst. Plants of Cameron Co. (Brownsville region) have dark-sordid, small, narrow, crowded leaves and extremely crowded heads, up to 1500 heads on some stems; these are the var. *pluricephala* M. C. Johnst.

9. *Solidago gigantea* Ait. Rhizomes extensive; aerial stems 5-25 dm. long, 3-8 mm. thick basally, glabrous or with scattered pubescence in vertical lines on the upper part of the stem; leaf transition from midstem to upper stem very gradual and involving mainly diminution in size; leaves of midstem smooth, thin-membranous, glabrous or with only very slight pubescence on the nervation of the undersurface, bright-green, triplinerved, elliptic or lance-elliptic, 5 to 10 (to 15) times as long as broad, 6-15 cm. long, (8-) 10-19 mm. broad, on each side with 10 to 20 salient teeth which are spaced out evenly from apex nearly to base; upper leaves just beneath the head-bearing region 4 to 8 times as long as broad, smaller and less prominently toothed than the midstem leaves; head-bearing region one-sided, usually fairly dense and compact in relation to the size of the plant, with a number of spreading arcuate branches which nearly to their bases are densely beset with the decidedly secund head-bearing branchlets; involucre about 4 mm. high. Incl. var. *leiophylla* Fern. Frequent in tight moist calcareous soil, Plains Country and n.-cen. Tex. and Edwards Plateau, less frequent s.e. to e. and s.e. Tex. (s. to San Patricio and Karnes cos.), (Aug.-) Sept.-Oct.; s. Can. and most of U.S., s. to Ut., Colo., Tex. and Gulf States.

10. *Solidago missouriensis* Nutt. var. *fasciculata* Holz. Perennial from subrhizomatous bases; stems often obliquely ascending, only 2-6 dm. long, 2-3 mm. thick basally, essentially glabrous; leaves firm, glabrous except for rough margins, (slightly yellowish-) green; leaf transition from bottom to top of plant fairly gradual, mainly involving diminution in size; lowest leaves oblanceolate with a few close teeth in the upper third; midstem leaves narrowly elliptic-oblanceolate, 4-6 cm. long, 4-5 mm. broad, about 10 times as long as broad, triplinerved, on each side with 4 to 6 close teeth on the upper half or these obsolete; upper leaves just below the head-bearing region 4 to 8 times as long as broad, elliptic-linear, entire; head-bearing region variable but one-sided and usually with a number of ascending or spreading arcuate branches which are fairly thickly beset (except at the extreme bases) with the secund head-bearing branchlets. *S. glaberrima* Martens. Rare in calcareous prairies, Plains Country, very rare in n.-cen. Tex., (July-) Aug.-Sept.; the species in plains of N.A. n. to B.C., Ida., Mont., N.D. and Wisc., s. to Ariz., N.M. and Tex., e. to prairies of Ind. and barrens of Tenn.

11. *Solidago odora* Ait. SWEET GOLDENROD. Rhizomatous perennial 5-10 dm. tall; leaves membranous, smooth, essentially glabrous except for the rough margin, pellucid-punctate and usually with a pleasant aroma after bruising, the transition upward on the stem very gradual and involving only diminution in size; midstem leaves narrowly lanceolate, 25-75 (-90) mm. long, 2.5-8 (-10) mm. broad, 7 to 10 (to 15) times as long as broad, essentially entire or with a very few close teeth near the end, with very obscure nervation; head-bearing portion somewhat one-sided, with a number of spreading branches each (to its base) bearing the decidedly secund head-bearing branchlets (3-5 mm.) which are fairly long for this genus; involucre narrowly turbinate, 4-5 mm. high, with only 2 or 3 series of very strongly graduated semirigid erect linear-subulate phyllaries, each phyllary with a very sharply defined darkish midrib. Frequent in open moist sandy places, s.e. Tex. (s. to Aransas Co.), less frequent inland to e. Tex., Sept.-Nov.; s.e. U.S. n. to N.E., O., Mo. and Okla.

When crushed the fresh leaves have a licoricelike odor, when air-dried they are used to make "goldenrod tea."

12. *Solidago tortifolia* Ell. Rhizomatous perennial 5-10 dm. tall; leaves membranous, roughish, minutely pubescent beneath especially near the veins, the transition up the stem very gradual; midstem leaves narrowly lanceolate to linear-lanceolate, 25-55 mm. long, 2.5-5 mm. broad, 7 to 15 times as long as broad, usually with some close teeth on the upper half, with obscure nervation (occasionally very obscurely triplinerved); head-bearing portion somewhat one-sided, with a number of spreading branches each to its base crowded with decidedly secund head-bearing branchlets 1-4 mm. long; involucre narrowly turbinate, about 4 mm. long. Infrequent in s.e. Tex., rare in e. Tex., in sandy land, (Aug.-) Sept.-Oct.; Fla. to Tex. n. to Va.

This has most of the characters of *S. odora* but it has the pubescence and toothing of the leaves, shortness and crowding of the head-bearing branchlets and the characters of the involucre of *S. altissima*. The probable origin is thereby indicated.

13. *Solidago mollis* Bartl. var. *angustata* Shinn. Perennial from a rather tight subrhizomatous base; stems 3-4 dm. long, minutely and a little roughly pubescent; leaves gradually reduced upward; leaves of upper midstem usually narrowly elliptic, 25-35 mm. long, 4-12 mm. broad, about 6 times as long as broad, basally long-cuneate to a subpetiolar base, triplinerved, minutely and densely roughish-pubescent on both surfaces, essentially entire or with a very few nearly obsolete teeth near the acutish apex; head-bearing region one-sided, of several strongly arcuate branches beset with the decidedly secund head-bearing branchlets, the heads numbering 50 to 130. Rare in the Plains Country in dry open or brushy usually sandy prairies, Sept.-Oct.; endemic.

Plants passing under this name are closely related to *S. nemoralis* and probably represent, basically, *S. nemoralis* genetically contaminated by some other species, perhaps *S. petiolaris* (*S. Lindheimeriana*). What has been passing as *S. mollis* var. *mollis* in the Great Plains (s. to Kan. and N.M., not known in Tex.) is a rather different species probably closely related to *S. radula*. The correct application of Bartling's name remains conjectural. Possibly our plants should be called *S. incana* T.&G.

14. *Solidago nemoralis* Ait. Closely clumped perennial from subrhizomatous bases; stems 3-6 dm. long, ascending; stems and leaves minutely and densely cinereous-pubescent, a little rough in some specimens; leaves gradually diminishing upward, firm; leaves of midstem oblanceolate, definitely widest about a third the distance from the apex which is usually slightly acute or less commonly blunt, 3-8 cm. long, 4-10 mm. broad, about 7 to 8 times as long as broad, essentially entire or rarely with the suggestions of 1 or 2 obsolete teeth near the apex, basally long-narrowed to the sessile base, usually triplinerved; head-bearing region one-sided, usually dense, of a number of relatively short strongly arcuate branches bearing the decidedly secund head-bearing branchlets; heads relatively large; involucre 5-6 mm. high, of several series of strongly graduated phyllaries. Incl. var. *Haleana* Fern. and var. *decemflora* (DC.) Fern. Frequent in dry open areas in Edwards Plateau and n.-cen. Tex., less common in Plains Country and rarely to e. Tex., Aug.-Nov.; P.E.I., N.B. to Alta., s. to Ga., the Gulf States, N.M. and Ariz.

Plants of the calcareous soils of north-central Texas and the Edwards Plateau have denser head-bearing regions with more and shorter branches, the head-bearing branchlets several (about 3) mm. long; these plants are the var. *decemflora*. Plants of sandy soils in east Texas have more open inflorescences with head-bearing branchlets only about 1-2 mm. long and represent the var. *Haleana*. The varieties intergrade over a broad zone. Some authors consider *S. decemflora* DC. to be a distinct species.

15. *Solidago sparsiflora* Gray. Perennial from subrhizomatous bases; stems ascending, 4-9 dm. long; stems and leaves closely and densely cinereous-pubescent; leaves diminishing gradually upward; leaves of midstem oblanceolate, 6-10 cm. long, 10-17 mm. broad, about 6 to 7 times as long as broad, triplinerved, mostly entire but with 2 or 3 teeth on each side of some leaves in the apical fifth of their length; head-bearing region one-sided, of 1 or a few ascending very strongly arcuate and curled branches each bearing in its outer two thirds the decidedly secund crowded head-bearing branchlets; involucre about 5 mm. long. *S. trinervata* Greene, a probable synonym, at least as to those Texas plants which have been passing under that name. Frequent above 4,000 ft. elev. in Chisos and Davis mts. in the Trans-Pecos, also at Hueco Tanks, El Paso Co., Aug.-Oct.; S.D. and Wyo. s. to Tex., N.M. and Ariz.

16. *Solidago radula* Nutt. Rhizomatous perennial; rhizomes short in chalky soil, in sandy soil extensive; stems ascending, 3-7 (-10) dm. long; stems and leaves furnished with microscopic translucent pustular-based antrorse barbs (feeling like a reversed cat's tongue); leaves dark-green, often olivaceous when dry, firm, often abruptly diminishing in size at about two thirds the total height; leaves of midstem narrowly obovate to narrowly elliptic-obovate, (3-) 4-5 (-6) cm. long, 10-17 mm. broad, 2.5 to 3.5 times as long as broad, triplinerved, on each side with 3 to 6 salient or obsolescent teeth in the distal half; uppermost leaves often much-reduced, nearly rotund; head-bearing portion one-sided, of several branches rather densely furnished with the decidedly secund head-bearing branchlets. *S. rotundifolia* DC. Frequent in e. Edwards Plateau, n.-cen. Tex. and e. Plains Country on calcareous prairies, less frequent e. to s. part of e. Tex., rare to s.e. Tex., fall, occasionally as late as Jan.; Ill. to La. and Tex.

17. *Solidago speciosa* Nutt. var. *rigidiuscula* T.&G. Clumped perennial or rarely the base subrhizomatous; stems rather rigidly erect, 5-10 dm. tall, glabrous except margins of leaves and uppermost part of stem; leaves firm; leaves of midstem elliptic to usually narrowly so, almost imperceptibly narrowed in the basal third of their length to a cuneate base, essentially entire, apically acute or a little blunt, 35-70 mm. long, 9-15 (-20) mm. broad, 3.5 to 4.5 (to 6) times as long as broad, with a fine reticulate nervation but with 2 lower secondaries very slightly more conspicuous than the rest; upper leaves becoming much smaller and very narrow; head-bearing portion 15-30 cm. long, 25-100 mm. thick, little if at all one-sided, usually cylindroid or narrowly pyramidal, of a number of rather rigidly ascending branches each bearing (in its outer half to two thirds) about 5 to 50 ascending head-bearing branches, these little if at all secund; involucre narrowly turbinate, about 6 mm. long, the longer phyllaries blunt and nearly their entire apical region of the darker color of the expanded midnerve. *S. rigidiuscula* (T.&G.) Porter. Infrequent to rare in sandy openings, e. and s.e. Tex., (June-) Sept.-Oct.; the species as a whole from Mass., N.Y. and s. Minn. s. to the Gulf States; the var. *rigidiuscula* in the s.w. portion of that range n.e. to Mo.

Some of our plants have mistakenly been referred to the var. *angustata* T.&G. which does not occur in Texas.

18. *Solidago petiolaris* Ait. Rhizomatous perennial; stems 5-15 dm. long, rather rigidly erect, often rather densely but minutely cinereous-pubescent at least on the younger parts; leaves numerous, overlapping, marginally raspy and either entire or with a few close teeth, the surfaces rather closely and minutely pubescent with hairs a little stiff and roughish or so soft and small that the leaf is smooth, the venation usually rather obscure except for minute areoles but occasionally decidedly penninerved on the under surface; upward leaf transition often very gradual, in some specimens well-developed leaves found even well up into the head-bearing region; leaves of midstem usually narrowly ovate, varying to elliptic or narrowly elliptic or rarely oblanceolate, 4-7 (-8) cm. long, 10-15 (-20) mm. broad, (2.5 to) 4 to 5 times as long as broad; head-bearing region usually elongate, spicoid to cylindroid or less commonly pyramidal, little if at all one-sided, of several to many ascending branches each crowded nearly to its base with the head-bearing branches which are little if at all secund; heads rather large, 7-11 mm. long (including pappus); involucre of several series of lanceolate phyllaries, the narrow tips of the larger phyllaries being nearly wholly dark and herbaceous (not scarious) in texture and very often spreading or even rarely squarrose; rays often conspicuous, as much as 1.5 mm. broad and slightly surpassing the disk. *S. Wardii* Britt., *S. Lindheimeriana* Scheele (?). Frequent in Plains Country and n.-cen. Tex., less frequent s. to Edwards Plateau and e. to e. Tex., fall; Gulf States, n. to N.C., Mo. and Neb.

The species name is very misleading since the leaves are sessile.

19. *Solidago Wrightii* Gray. Clumped perennial from subrhizomatous bases; stems 3-7 dm. long, ascending or even rather rigidly erect, densely and finely spreading-pubescent, somewhat cinereous, in the head-bearing region the stem pubescence often somewhat glandular (i.e., the hairs capitate); leaves finely and rather densely hispidulous, slightly cinereous, the transition upward very gradual; basal leaves cuneate-oblanceolate, with a very few nearly obsolete teeth near the rounded apex; leaves of midstem narrowly elliptic or usually slightly elliptic-oblanceolate, 3-6 cm. long, (5-) 10-15 (-20) mm. broad, occasionally with a few obsolescent teeth near the blunt or acute apex, nervation

obscure except for minute areoles; head-bearing region only 3-6 (-9) dm. long and about as broad as long, not one-sided, comprising several branches of which the lowest are so long that the whole aggregation [of 5 to 25 (to 50) heads] is almost corymbiform; heads large, 9-12 mm. long and broad; tips of longer phyllaries herbaceous and often slightly spreading, densely pubescent, the hairs often capitate; rays large and showy for this genus, about 4 mm. long and 2 mm. broad. Incl. var. *adenophora* Blake, *S. Bigelovii* Gray var. *Wrightii* (Gray) Gray. Locally frequent at elev. of 4,000-8,000 ft., Glass, Chisos and Davis mts. in the Trans-Pecos, July-Sept.; Tex. to Ariz., presumably also Chih.

20. *Solidago rigida* L. Rhizomatous stout perennial; stems 6-12 dm. long, 3-8 mm. thick basally, rather rigidly erect, usually densely and rather roughly pubescent (or in some plants essentially glabrous and smooth); leaves roughly pubescent or in some plants essentially glabrous and smooth, firm, usually sordid or grayish-green; basal leaves long-oblong and basally very long-petioled, obsolescently serrate; stem leaves usually ovate, sessile, only 2 to 3 (to 3.5) times as long as broad, 3-10 cm. long, marginally obsolescently serrate; head-bearing region (4-) 6-15 (-20) cm. long and about as broad, rarely even broader than long, flat-topped or roughly corymbiform, not one-sided, of 15 to 100 heads which are scarcely secund on the major branches; heads large, about 1 cm. long and broad; phyllaries often somewhat yellowish-stramineous, in about 3 series, oblong, very blunt, the longer ones about 1.5-2 mm. broad near the end, their broad median strips with several distinct vertical nerves seen under a lens, the median strip occupying essentially the full width. Incl. var. *humilis* Porter and var. *laevicaulis* Shinners, *S. parvirigida* Beaudry, *Oligoneuron rigidum* (L.) Small. Infrequent in dry open places, n.-cen. Tex., rare to e. and s.e. Tex. and the Plains Country, Sept.-Oct.; Mass. to Sask. s. to Ga., La., Tex. and Colo.

21. *Solidago nitida* T.&G. Rhizomatous perennial; stems smooth, essentially glabrous, 5-12 dm. long, rather rigidly erect; leaves smooth, glabrous, firm, drying olive-green; basal leaves narrowly oblanceolate, almost grasslike, basally narrowed to a long subpetiolar base; stem leaves linear-lanceolate to linear-oblong, 5 to 10 or more times as long as broad, essentially entire, with obscure nerves or near the base with a few prominent longitudinal secondaries; head-bearing region 2-10 cm. long, 5-10 cm. broad, flat-topped or roughly corymbiform, not one-sided, of 8 to 75 heads which are not secund on the major branches; heads 7-9 mm. long, 4-8 mm. broad; phyllaries in about 3 series, often somewhat yellowish-stramineous, oblong, blunt, about 1.5 mm. broad near the end, their broad median strip (which takes up nearly the whole width) with several distinct vertical nerves as seen under a lens. *Oligoneuron nitidum* (T.&G.) Small. Frequent in open sandy places, e. and s.e. Tex., s. to Aransas Co., July-Sept.; also La. and Okla.

30. ASTER L. ASTER

Annual or usually perennial herbs, when perennial often with caudexes or horizontal rhizomes; leaves when present alternate, not dissected, usually sessile; perennial species usually with basal leaves dissimilar to cauline leaves and the latter usually passing into the much-reduced leaves of the head-bearing branchlets which are usually leafy to the summit; *disk flowers* present and perfect, their corollas yellowish or less commonly tinged with blue, rose or violet; *ray flowers* present, fertile, their corollas white or bluish-white or violet or even rosy at least on the underside but *never* yellow; heads usually numerous and borne at the ends of the usually leafy branches; head-bearing branchlets usually aggregated into paniclelike inflorescences; receptacle of head flat or slightly convex; disk corolla consisting of a basal cylindrical tube plus an expanded usually funnelform limb, the limb consists of a throat plus 5 lobes; phyllaries in several series, imbricate, the outer ones usually green at least near the tip and often on part of the midrib; pappus of numerous capillary bristles in essentially a single series, similar in disk and ray; achenes more or less flattened, with one or more ribs on the faces; style branches usually subulate.

Aster has several hundred species, mostly in temperate regions. It is one of our more difficult genera, both as to its over-all circumscription and the limitation of the species contained. Probably hybridization and back-crossing has occurred frequently, blurring

lines between our species 1 through 15 (especially between species 5 through 9). Only complete specimens, with rhizomes and mature flowers (with anthers exerted), can be determined with any degree of confidence.

1. Head-bearing branchlets relatively few (10 to 30 per plant), remote and ascending, 6-20 cm. long, each terminated by a single hemispheric or campanulate head 12-30 mm. broad; leaves of head-bearing branchlets elliptic, not much diminishing in size upward toward the head, the upper ones crowding around the outer phyllaries of the head, longer and broader than them and partly hiding them or even grading into them and often discolored apically; outer phyllaries white-indurated basally (2)
1. Head-bearing branchlets usually more numerous or if few then their leaves much narrower and pointed; highest leaves of the branchlets not large enough to hide the outer true phyllaries (3)
- 2(1). Outer phyllaries 2-3 mm. broad, on the outer surface glabrous to slightly pubescent, marginally with a distinct fringe of minute porrect rigid cilia; heads hemispheric, the involucre 10-20 mm. broad14. *A. pratensis*.
2. Outer phyllaries 1.3-2 mm. broad, on the outer surface with antrorse-appressed whitish pubescence, not distinctly fringed; heads campanulate, the involucre 7-12 mm. broad15. *A. sericeus*.
- 3(1). Phyllaries with the midrib greenish but this greenish area not expanded toward the apex or at the broadest part not more than twice as wide as at the narrowest part, usually appearing linear, the marginal areas pale and chaffy in texture; leaves when present usually subulate, tapered all the way from base to apex, rarely with a few serrations, mostly entire and glabrous; head-bearing branchlets not very leafy (Sect. *Oxytripolium*) (4)
3. Phyllaries usually with a green splotch toward the apex formed by the lateral expansion of the greenish area near the midrib; leaves variously ovate to lanceolate or linear but usually serrate, rarely subulate; head-bearing branchlets usually leafy (6)
- 4(3). Leaves small or nearly absent, often on some branchlets transformed into green thorns; plants forming colonies from extensively creeping rhizomes18. *A. spinosus*.
4. Leaves well-developed at least in the lower part of the plants; rhizomes if present not extensively creeping (5)
- 5(4). Salt marsh and brackish mud perennial 3-6 dm. tall; heads numbering only 3 to 30 per plant or per shoot, broadly turbinate; involucre 11-17 mm. broad at top16. *A. tenuifolius*.
5. Annual forming colonies in poorly drained areas, (2-) 4-20 dm. tall; heads numbering up to several hundred per plant, turbinate; involucre 7-11 mm. broad at top17. *A. subulatus*.
- 6(3). Tips of phyllaries (as seen under a strong lens) with numerous crowded "glands," i.e., swollen shiny tubercles either sessile or stalked (7)
6. Tips of phyllaries either glabrous or with hairs but these not glandular (*A. praealtus* and *A. hesperius* may have some very minute capitate hairs on the margin of the tip of the phyllaries) (9)
- 7(6). Midstem leaves linear, several cm. long; on breaks of High Plains and Panhandle13. *A. Fendleri*.
7. Midstem leaves oblong to obovate, usually only about 1-2 cm. long (8)
- 8(7). Leaves of the ultimate few cm. of the elongated head-bearing branchlets extremely reduced and sharply contrasted to the midstem leaves, usually only 1-3 mm. long and 0.5-1 mm. broad and tightly appressed11. *A. patens*.
8. Leaves of the ultimate few cm. of the relatively short head-bearing branchlets either not sharply reduced from the other branchlet leaves or else not appressed, usually 3-10 mm. long and 1-2 mm. broad12. *A. oblongifolius*.

- 9(6). Longest phyllaries usually only about 3-4 mm. long, obtuse, marginally with at least a few short rigid cilia forming a fringe quite distinct in appearance from the rest of the pubescence if any 10. *A. ericoides*.
9. Longest phyllaries usually longer than 4 mm., if only that long then lacking a ciliate fringe (10)
- 10(9). Leaves of lower stem and base (at least) with a long narrowly linear subpetiolar base quite distinct from the distal widened portion (11)
10. Leaves of lower stem and base not sharply differentiated into a narrowly linear subpetiolar base and a distal bladelike portion (13)
- 11(10). Bladelike portion of lower leaves abruptly narrowed basally 3. *A. vernalis*.
11. Bladelike portion of lower leaves truncate or even cordate basally (12)
- 12(11). Lower and middle stem leaves usually cordate, less commonly truncate; leaves of upper branches in the head-bearing region mostly obovate-elliptic, not linear 1. *A. texanus*.
12. Lower and middle stem leaves usually truncate; leaves of upper branches linear 2. *A. azureus*.
- 13(10). Leaves of midstem linear, 10-25 (-34) mm. long, 1-2 mm. broad; leaves of the head-bearing branchlets numerous, linear-subulate, ascending 9. *A. dumosus*.
13. Leaves of midstem usually averaging longer than 20 mm. and always broader than 2 mm. (14)
- 14(13). Leaves of midstem with slight basal auricles which make it appear as if the leaves clasp the stem more than half the circumference though the scar involves only about half 4. *A. scabricaulis*.
14. Leaf scar commonly involving as much as half the circumference of the stem but leaf auricles absent (15)
- 15(14). Mature disk corolla (that is, corolla from a floret with anthers exerted or beginning to be exerted) 3-3.5 (-3.9) mm. long, consisting of a tube 1-1.5 mm. long, plus a throat 0.8-1.2 (-1.4) mm. long, plus lobes 0.7-1 (-1.2) mm. long ... 8. *A. lateriflorus*.
15. Mature disk corolla 4-6 mm. long, consisting of a tube 1.3-2.5 mm. long, plus a throat 1.5-3 mm. long, plus lobes 0.5-1.1 mm. long (16)
- 16(15). Phyllaries relatively weakly graduated, the shortest outer ones about half as long as the longest inner ones 5. *A. praealtus*.
16. Phyllaries relatively strongly graduated, the shortest outer ones about a third as long as the longest inner ones (17)
- 17(16). Mature disk corolla 5-5.6 mm. long, with lobes 0.7-1 mm. long, plus throat 2.4-2.7 mm. long, plus tube 2.2-2.5 mm. long; in Trans-Pecos Texas 6. *A. hesperius*.
17. Mature disk corolla (4.1-) 4.5-5 mm. long, with lobes 0.5-0.9 mm. long, plus throat 1.5-2.5 mm. long, plus tube 1.3-2.2 mm. long; in eastern half of Texas 7. *A. Eulae*.

1. *Aster texanus* Burgess. Perennial from short subrhizomatous bases; stem erect, 3-8 dm. tall, freely branched in the upper portion, the branches widely spreading; leaves at first membranous but becoming thickish, brittle and crumbly, those of the lower and middle stem with an ovate basally truncate or usually cordate portion and a linear petiolelike (but broadly winged) basal portion, those of the upper third of the plant (not those of the ultimate head-bearing branchlets) mostly obovate-elliptic; head-bearing branchlets relatively short, usually 1-4 cm. long, with much-reduced leaves; involucre turbinate to hemispheric; rays several mm. long, usually bluish-white but variable. Frequent or local in loamy soils or well-drained clay, open woods and prairies, e., s.e. and n.-cen. Tex. and e. margin of Edwards Plateau, Oct.-Nov., rarely Mar.-Apr.; Ark., La. and Tex.

Not adequately distinct from, and intergrading with, *A. sagittifolius* Willd. var. *Drummondii* (DC.) Shinnars which occurs s.w. to La. and Okla.

Var. *parviceps* Shinners, of Bowie Co., Tex. and Marion Co., Ark. is said to have involucre 3.8-4.2 mm. high and 4-6 mm. broad, whereas the var. *texasus* has involucre 4.2-5.2 mm. high and 6-9 mm. broad; further evaluation is needed.

2. *Aster azureus* Lindl. Perennial from short subrhizomatous bases, the branches stiffly ascending; leaves at first membranous but becoming thickish, brittle and crumbly, those of the lower and middle stem with an enlarged distal basally usually truncate portion and a linear petiolelike (but broadly winged) basal portion, those of the upper third of the plant linear or narrowly lanceolate; head-bearing branchlets with minute subulate leaves; involucre 5-8 mm. high; rays deep-violet-blue, rarely rosy or white. Rare, known only in Grayson Co., n.-cen. Tex., Oct.-Nov.; e. U.S., excluding Fla., w. to Minn. and Tex.

Poorly distinguished from *A. vernalis*, from which it is doubtless only varietally distinct. The leaf character is tenuous, to say the least, and the alleged differences in involucre height are at best merely slight average differences.

3. *Aster vernalis* Burgess. Perennial from short rhizomes; branches stiffly ascending; leaves at first membranous, becoming thickish, brittle and crumbly, the lower and basal ones with fairly well-differentiated basal subpetiolar portion and expanded elliptic distal portion, the higher leaves narrowly lanceolate to linear, those of the head-bearing branchlets minute and subulate; involucre 4-5 (-6) mm. high; rays bluish-white. *A. azureus* var. *poaceus* (Burgess) Fern. Infrequent in openings in woods on sandy soil, e. Tex. and rare in s.e. Tex. (Harris Co.), Oct.-Nov. (rarely Mar.-Apr.); Mo., Ark. and Tex.

See remarks under *A. azureus*.

4. *Aster scabricalis* Shinners. Perennial with rhizomes; stems ascending, weak, 14-18 dm. long, with branches at middle or below to 35 cm. long, scabrous-pubescent throughout, with about 25 to 35 nodes, the middle and upper internodes 1.5-4.5 cm. long; stem leaves withering early, oblong-lanceolate, acute, entire or very shallowly toothed, sessile and clasping (i.e., basally slightly auriculate), scabrous-pubescent on both surfaces or nearly glabrous beneath, about 7 cm. long and 2 cm. broad; leaves of branches similar but much smaller, rather numerous and uniform; heads rather numerous and crowded, the ultimate head-bearing branchlets 3-12 mm. long; involucre 7-8 mm. high; phyllaries in about 5 to 7 rows, subequal, loosely spreading or squarrose. Rare in boggy ground, e. Tex. (Tyler and Van Zandt cos.), Oct.; endemic.

Said to be related to *A. puniceus* L. of northeastern United States.

5. *Aster praealtus* Poir. Rhizomatous perennial with ascending stems and branches; stem leaves sessile, generally lance-linear or very narrowly elliptic, the lower ones 4-10 (-15) cm. long and about 1 cm. broad, those higher up gradually smaller and smaller; leaves of the numerous short rarely somewhat secund head-bearing branchlets very small and subulate or linear-subulate; involucre usually hemispheric, about 6 mm. high, with a few rows of weakly graduated phyllaries, the outer shorter of which are about half as long as the inner longest ones; rays several mm. long, usually bluish-white or less commonly pure-white; mature disk corollas 4.5-6 mm. long, with a tube 1.5-2.5 mm. long, a throat 1.5-3 mm. long and lobes 0.5-1.3 mm. long. Frequent on usually moist banks and in ditches, loamy soil, n.-cen. Tex. and lower Plains Country, less frequent or rarely to e. and s.e. Tex., n. part of Rio Grande Plains and e. part of Edwards Plateau, (Sept.-) Oct.-Nov., less commonly other seasons; Que. and Ont. s. to Md., W.Va. and Ky., s.w. to Ia., Mo., Okla., Tex. and Chih. (?)

The plants of north-central, east and southeast Texas and Rio Grande Plains (most of which are referable to the weak var. *texicola* Wieg.) have disk corolla proportions as follows: tube 1.8-2.5 mm. long, throat 1.5-2 mm. long, lobes 0.8-1.3 mm. long. The stem leaves are narrowly elliptic and often slightly narrowed about a third the length from the base, suggesting a very broad subpetiolar portion. Most plants from the Edwards Plateau and lower Plains Country have disk corolla proportions as follows: tube 1.5-2.2 mm. long, throat 2-3 mm. long, lobes 0.5-1.1 mm. long; the stem leaves generally uniformly lance-linear. These constitute the *Aster coeruleus* DC., which is actually as good a "species" as several other "species" recognized by *Aster* specialists. *A. praealtus* var. *imbricator* Wieg. is a genetically contaminated form with the involucre and inflorescence showing certain characteristics of *A. lateriflorus* and *A. Eulae*.

6. *Aster hesperius* Gray. Erect rhizomatous perennial; stem leaves linear to lance-linear with relatively obscure venation pattern, to 16 cm. long and to 15 mm. broad; leaves of the fairly numerous erect (not secund) head-bearing branchlets much smaller,

oblong to subulate; heads hemispheric; involucre 6-7 mm. high, with several rows of strongly graduated phyllaries; rays several mm. long, bluish; mature disk corolla with tube 2.2-2.5 mm. long, throat 2.4-2.7 mm. long and lobes 0.7-1 mm. long. *A. coerulescens* of many auth., not DC. Rare in the Trans-Pecos (at Muzquiz Swamp, Jeff Davis Co., and Guadalupe Mts., Culberson Co.), Oct.; Alta., N.D. and Wisc. s. to Calif., Ariz., Chih. and Tex.

This is exceedingly close to the *A. praealtus* complex (especially to *A. coerulescens*) and the merit of recognizing it as specifically distinct is doubtful.

7. *Aster Eulae* Shinn. Rhizomatous perennial; stem erect and with many ascending or spreading branches; head-bearing branchlets mostly 1-3 cm. long, usually somewhat secund; leaves membranous; midstem leaves several cm. long (quite variable in size), usually elliptic to oblanceolate but in their basal third broadly cuneate, usually obscurely serrate; leaves in the upper branches similar in shape but smaller, usually 15-30 mm. long, 3-6 mm. broad; leaves of the head-bearing branchlets linear or linear-lanceolate, not crowded, 3-10 mm. long, about 1-2 mm. broad; involucre hemispheric, 4-5 mm. high, of a few series of well-graduated phyllaries, the shortest of which are about a third or even only a fourth as long as the longest; rays 20 to 30, about 4 mm. long, usually white but less commonly bluish-white; mature disk corollas (4.1-) 4.5-5 mm. long, with a tube 1.3-2.2 mm. long, plus a throat 1.3-2.5 mm. long, plus lobes 0.5-0.9 (-1.1) mm. long. Frequent in usually heavy clay or clay-loam soil, ditches, banks and openings in river bottom woods, n.-cen. Tex., infrequent to the s. part of e. and s.e. Tex., perhaps as far s. as Nueces Co., Oct.-Nov.; endemic.

This combines some of the characteristics of *A. praealtus* var. *texicola* and *A. lateriflorus* var. *flagellaris*, and the origin is thereby suggested; but *A. Eulae* seems to be a fairly stable, discrete entity, as *Aster* species go, and regardless of its possible origin should be recognized by a separate name.

8. *Aster lateriflorus* (L.) Britt. Perennial from subrhizomatous bases or slender short rhizomes; stems ascending or usually long-arching, semireclining, usually with several whiplike arching secondary branches, the latter bearing in turn a number of very short secund head-bearing branchlets; leaves of midstem usually membranous, elliptic or lance-elliptic, serrate, to several cm. long and 15 mm. broad but usually smaller, sessile, those of the distal head-bearing region still smaller and those few of the very short head-bearing branchlets minute and subulate; heads not very crowded; involucre turbinate to hemispheric, 4-5.5 mm. high; phyllaries in 3 or 4 rows, strongly graduated, the shorter row only about a fourth as long as the longest, mostly pale-stramineous, the dilated portion of the midrib rather small (so nearly the whole involucre appears stramineous); rays few and only about 3 mm. long, usually white; mature disk corolla 3-3.5 (-3.9) mm. long, with a tube 1-1.5 mm. long, plus a throat 0.8-1.2 (-1.4) mm. long, plus lobes 0.7-1 (-1.2) mm. long. Incl. var. *flagellaris* Shinn. and var. *indutus* Shinn., and Tex. plants which have through error been determined as *A. ontarionis* Wieg. (*A. pantotrichus* Blake). Frequent in sandy usually moist or boggy areas in e. Tex. (s.w. to Gonzales Co.), rare to s.e. Tex. (Harris Co.), Oct.-Nov.; other varieties occur in s.e. Can. s. to Ga., Tenn. and Ark.

Possibly our plants should not be referred to *A. lateriflorus*, which is said to have the lobes of the disk corolla 1-1.6 mm. long.

9. *Aster dumosus* L. Perennial from slender rhizomes; branches (at least the upper ones) usually ascending and much-branched; leaves firm-membranous, those of midstem linear, 10-25 (-34) mm. long and 1-2 mm. broad, usually falling before the end of Sept. and leaving in Oct. only the numerous nearly uniform minute subulate appressed leaves of the upper branches and of the head-bearing branchlets; head-bearing branchlets not markedly secund; involucre 5-7 mm. high; rays a few mm. long, usually bluish-white but variable; mature disk corolla with a tube 1.4-2 mm. long plus a narrowly funnelform throat 1.4-2.3 mm. long, plus usually erect lobes 0.4-1 mm. long, the proportions quite variable. Incl. var. *subulaefolius* T.&G. and var. *coridifolius* (Michx.) T.&G. Infrequent in loamy prairies, s.e. Tex., rare inland in e. Tex., late Sept.-Nov.; s.e. U.S. n. to Me.; other varieties inland as far as Ont., Mich. and Ill.

Some few specimens combine characters of this species and of *A. lateriflorus*.

10. *Aster ericoides* L. Rhizomatous perennial, usually much-branched, the long primary branches either erect or usually arching or reclining and bearing numerous very

short ascending head-bearing branchlets which are usually decidedly secund; leaves mostly linear or oblong, those of the midstem 1-2 cm. long, usually withered by flowering time; leaves of the branchlets very numerous and crowded, about 1 mm. broad and 2-3 mm. long, often appressed; head very crowded; involucre hemispheric, 4-7 mm. broad; phyllaries in few series, the longest ones 3-4 mm. long, obtuse and marginally short-ciliate-fringed; rays several, slightly exceeding the pappus and almost always white. *A. multiflorus* Ait., *A. commutatus* Gray as to specimens but not as to basionym, *A. commutatus* var. *crassulus* (Rydb.) Blake. Frequent in a variety of open situations, n.-cen. and s.e. Tex. and Plains Country, s. and w. parts of e. Tex., n. part of Rio Grande Plains and the Trans-Pecos, late summer or usually fall; s. Can. s. to Gulf States (excl. Fla. and La.), n. Coah., n. Chih. and Ariz.

This species is somewhat variable, especially in degree of pubescence. The heads tend to be of maximum size (*A. commutatus*) toward the western part of Texas, but no subdivision is practicable as every possible intergradation occurs.

11. *Aster patens* Ait. Erect perennial, 40-75 cm. tall from slender rootstocks which in sandy soil are extensive; leaves minutely serrate, those of the lower and middle stem somewhat obovate or spoon-shaped, with a broadly winged subpetiolar clasping base; upper leaves also clasping, becoming ovate to oblong or short-lanceolate and fairly abruptly differentiated from the minute appressed leaves of the elongate stiffly ascending head-bearing branchlets; heads not crowded; involucre turbinate, 7-15 mm. broad; phyllaries in 4 or 5 series, their tips glandular-pubescent; rays several mm. long and usually blue. Incl. var. *gracilis* Hook. Frequent in open dry situations, e. Tex., infrequent w. to n.-cen. Tex., rare in n. part of Rio Grande Plains and in Edwards Plateau and lower Plains Country, late Aug.-middle Nov.; e. temp. N.A. w. to Minn., Kan. and Tex.

Some few specimens seem intermediate between *A. patens* and *A. oblongifolius*.

12. *Aster oblongifolius* Nutt. Rhizomatous perennial, erect, 2-4 dm. tall; leaves minutely serrate, those of the lower and middle stem oblong, with subclasping bases, 1-2 (-3) cm. long, those of the head-bearing branchlets (which are ascending and only 1-4 cm. long) spreading, 3-10 mm. long and 1-2 mm. broad; heads not crowded; involucre usually hemispheric, 8-12 mm. broad; phyllaries in 3 or 4 series, their tips glandular-pubescent; rays several mm. long and usually blue or purple. Incl. var. *rigidulus* Gray and var. *angustatus* Shinners, *A. Kumlienii* Fries. Frequent in calcareous prairies, Edwards Plateau and lower Plains Country, infrequent and local e. to n.-cen. Tex., late Sept.-Nov. (rarely to early Jan.); N.C., Ala., Ark. and Tex. n. to Pa., Wisc., Minn. and N.D.

13. *Aster Fendleri* Gray. Perennial from subrhizomatous ligneous crowns, erect, 2-4 dm. tall; stems leafy nearly to the base even at flowering time; leaves firm, minutely serrate or the lowest leaves spinulose-ciliate, those of the lower and middle stem linear, 20-45 mm. long, 2 mm. broad (often with tufts of smaller leaves in the axils), sessile but not clasping; leaves of the head-bearing branchlets (which are 1-4 cm. long) only 2-4 mm. long, 1-2 mm. broad, ascending; involucre hemispheric, 8-15 mm. broad; phyllaries in a few series, the tips glandular-pubescent; rays several mm. long, bluish. On calcareous prairies, caprocks and stony breaks, High Plains Country, Sept.-Oct.; Kan., Colo., N.M., Okla. and Tex.

14. *Aster pratensis* Raf. Perennial with caudexes and fibrous root systems, (3-) 5-8 dm. tall, (1-) 1.5-3 mm. thick basally; branches few, stiff, ascending; leaves firm, mostly falling before flowering, those of the flowering branchlets persistent, elliptic, the uppermost not reduced, encroaching on the head to form a supplementary involucre; true phyllaries linear to oblong, in few series, each in its lower portion pale, indurate or at least firm-herbaceous to subcoriaceous, the upper portion appressed and hirsute-fringed; rays purple, 10-18 mm. long, 1.5-2 mm. broad; pappus of numerous coarse brownish-white bristles; achenes flattened, glabrous, with several ribs on each face. *A. phyllolepis* T.&G. Prairies and open woods, usually sandy soil, frequent in e., s.e. and n.-cen. Tex. s. to Aransas and DeWitt cos., Sept.-Nov., rarely as late as early Jan.; also La.

15. *Aster sericeus* Vent. Perennial with caudexes and fibrous root systems; branches few, stiff, ascending, 3-5 dm. tall, 1.2-2 mm. thick basally; leaves firm, grayish or sordid, falling before flowering, those of the flowering branchlets persistent, elliptic, the uppermost not much-reduced, encroaching on the head to form a supplementary involucre;

true phyllaries linear, in few series, each in its lower portion pale-indurate and appressed and in the upper portion firm and grayish- or sordid-pubescent, either appressed or rarely spreading; rays purple, 1 cm. long, 1-1.5 mm. broad; pappus of numerous coarse brownish-white bristles; achenes flattened, glabrous, with about 5 ribs on each face. Local in open rocky calcareous soils, s. and e. margin of Edwards Plateau and rare in s. part of e. Tex. (Bastrop, Bexar and Travis cos.), late Oct.-early Dec.; Man. to Mich. s. to Tenn., Mo. and Tex.

Aster sericeus and *A. pratensis* together are as distinct from the genus *Aster*, proper, as are *Ionactis*, *Doellingeria*, and *Leucelene* and perhaps other segregates. *Aster sericeus* in Wisconsin has been known to hybridize with a species of *Aster* but the hybrid was sterile.

16. *Aster tenuifolius* L. Relatively low turgid-succulent perennial; rhizomes apparently creeping in mud; leaves only about 2 mm. broad, to 1 dm. long; heads larger (but fewer) than in *A. subulatus* and *A. spinosus* (see below) but with most of the same characters; each plant or shoot from the rhizome with usually only about 10 to 20 remote heads. Infrequent, salt marshes or brackish mud, s.e. Tex. (Aransas, Brazoria, Calhoun and Galveston cos.), June-Nov.; coastal areas n.e. as far as L.I. and N.H.

17. *Aster subulatus* Michx. HERBA DEL MARRANO. Robust much-branched glabrous annual; leaves linear-subulate, rarely serrate, mostly 1-10 (-20) cm. long, 2-4 (-7) mm. broad, much-reduced toward the top of the plant; involucre turbinate, of a few series of linear phyllaries, each phyllary pale but with a darker linear midrib (if laterally expanded then the widest portion no more than twice as wide as the narrowest).

Most of our plants belong to the var. *ligulatus* Shinnery in which the ligules are several mm. long, surpassing the disk corollas and the pappus; these plants have long passed under the dubious name *A. exilis* Ell. It is an abundant weed in ditches, swales, margins of ponds, lakes and streams and poorly drained places in general, throughout Tex., our most abundant *Aster*, summer-fall; widespread in the warmer parts of Am., n. to S.C., Mo., Kan., N.M., Ariz. and Calif. The var. *euroauster* Fern. & Griseb., characterized by its much-reduced to essentially nonexistent ligules, is extremely rare in s.e. Tex. (Orange Co.) where it grows about and in ponds, Aug.-Sept. It occurs from Conn. to Fla., w. to Tex. One old Galveston collection is referable to the var. *australis* Shinnery, in which the ligules are about equal to the disk corollas and to the pappus in length. It is widespread in C.A. and S.A. The var. *subulatus* is very near the coast from Me. to La.

It has been suggested that *A. spinosus*, *A. subulatus* and *A. tenuifolius* should be segregated as a genus. They do form a coherent natural group somewhat different from our other *Asters*.

18. *Aster spinosus* Benth. MEXICAN DEVIL-WEED. Colonial by rhizomes, essentially leafless or producing a few small leaves when injured near the ground, with minute subulate leaves scattered in some stems; axillary branches often transformed into thorns; heads as in *A. subulatus* (rays short as in var. *euroauster*) but the phyllaries more strongly graduated and the pale narrow margins narrower than the median dark stripe. *Leucosyris spinosa* (Benth.) Greene. Locally very abundant on roadsides and other weedy slopes and banks, s. and w. half of Tex., uncommon n.e. to Brazos, Robertson and McLennan cos., summer-fall; C.R. n. and w. to Calif., Ut., Ariz., N.M. and Tex.

31. HELEASTRUM DC.

A North American genus of 2 or 3 species.

1. *Heleastrum hemisphaericum* (Alex.) Shinnery. Rhizomatous perennial; stems simple (except in the head-bearing region), rising strictly erect, single usually from swollen knots or corms that occur at intervals along the rhizomes, 3-7 dm. tall; leaves firm to subcoriaceous, ascending, linear, the lower ones to 12 cm. long, 5 mm. broad, sessile, marginally essentially entire, often with axillary fascicles of small leaves; the leaves higher on the stem becoming smaller, the upper ones subtending very short [1-10 (-30) mm.] head-bearing branchlets; the whole head-bearing portion of the plant spiciform or subracemiform with few (rarely one, usually 2 to 10) large heads, rarely some of the head-bearing branches becoming much more elongated, equaling or slightly surpassing

the finally determinate main axis; involucre hemispheric, 1-2 cm. broad, about 1 cm. high, with a number of rows of strongly graduated broad squarrose phyllaries; each phyllary with a broad tip which is green to the margin and is not formed by expansion of a midnerve, the green portion giving way abruptly below to the stramineous coriaceous basal portion of the phyllary; rays several cm. long, showy, bluish; disk yellow; pappus alike in ray and disk, of numerous rather coarse bristles, at least some of the bristles expanded in the apical third to as much as twice as thick as the basal portion. *Aster hemisphaericus* Alex., *A. paludosus* subsp. *hemisphaericus* (Alex.) Cronq. Low places, sandy soil, infrequent in e. and s.e. Tex., s. to Victoria and Calhoun cos., late summer to early spring; also La.

32. DOELLINGERIA NEES

A monotypic North American genus.

1. *Doellingeria umbellata* (Mill.) Nees var. *latifolia* (Gray) House. Rhizomatous perennial; aerial stems simple for most of their length, rising at intervals from the rhizome, to 1 m. high; leaves alternate, the lowest leaves (near ground level) actually smaller than those of the midstem, there being an increase in size of the leaves proceeding up the lowest part of the stem; leaves in general ascending or appressed, narrowly ovate-elliptic or broadly lanceolate, several cm. long or reduced in the head-bearing region; upper 3-20 dm. of the plant branched, the branches erect and forming a dense corymbiform grouping of heads, each head on a short erect peduncle 3-10 mm. long; involucre about 4 mm. high, of perhaps 3 series of strongly graduated mostly stramineous phyllaries with unexpanded or only very slightly expanded green midribs; rays 2-3 mm. long, whitish; disk yellow; pappus slightly double, of very unequal capillary bristles, alike in disk and ray. *Aster umbellatus* Mill. var. *latifolius* Gray. Rare in wet usually boggy ground, e. Tex. (Bowie, Freestone and Nacogdoches cos.), Sept.-Oct.; the species as a whole occurs in s.e. Can. and e. U.S. s. to N.C., Ga., Tenn. and w. to Minn., Ia., Ark. and Tex.

33. IONACTIS GREENE

We have a single species; about 3 in North America.

1. *Ionactis linariifolia* (L.) Greene. Tufted perennial; several stems rising stiffly from the ligneous crown, simple except in the upper 3-10 cm. where there are a few erect head-bearing branches; leaves linear or slightly oblanceolate-linear, crowded over most of the stem, about 3 cm. long but in the lowest part of the stem reduced to mere scales, in the branched upper portion reduced to about 3-10 mm. long and about 1 mm. broad; involucre turbinate, 7-15 mm. high; phyllaries in about 5 series, firm, mostly appressed, mostly stramineous, strongly graduated, each with a green midrib very slightly expanded toward the top; rays several mm. long, violet-blue; disk yellow; pappus alike in ray and disk, double, the more copious inner pappus of capillary bristles, the outer pappus short and setulous. *Aster linariifolius* L. Rare in sandy pine-oak woods in e. Tex., fall; s.e. Can. and e. U.S. w. to Minn., Ia., Okla. and Tex.

34. LEUCELENE GREENE¹⁹⁸

There is but a single somewhat variable species.

1. *Leuceleene ericoides* (Torr.) Greene. WHITE ASTER, ROSE HEATH. Perennial, usually about 10-15 cm. high, rarely to 20 cm., from much-branched subrhizomatous bases, with 10 to 100 ascending stems usually branched in the upper two thirds of their lengths; leaves of the stems near or just below ground level reduced to scales, those of the lower half of the plant usually thick, linear to clavate or slightly spatulate, 2-12 (-15) mm. long, 1-2 mm. broad, usually ascending or appressed, densely hirsute and often bristly-ciliate marginally; leaves of the upper half of the plant smaller, often minute and subulate or clavate; heads numerous and borne in a corymbiform group

¹⁹⁸ Adapted from L. H. Shinnars in *Wrightia* 1:82-89. 1946.

because of the nearly uniform height of the upper branches; involucre usually about 5-10 mm. broad, hemispheric to turbinate; phyllaries in a few series, graduated, the shortest phyllaries about a third as long as the longest ones, each phyllary with a broad green median stripe plus very narrow whitish sides, the tip of the green midstripe often discolored purplish; rays about 2-3 mm. long, white; disk yellow; pappus alike in ray and disk, in each flower of 20 to 30 approximately equal capillary bristles. *Aster ericaefolius* Rothr., *A. arenosus* (Heller) Blake, *Leucelene hirtella* (Gray) Rydb. and many other synonyms. Abundant in dry calcareous open places in the Trans-Pecos, Plains Country and Edwards Plateau, e. to Palo Pinto, Concho and Edwards cos., usually with 2 seasons, spring and fall; Kan. to Ut. and Calif., s. to Tex., S.L.P., Dgo. and Son.

35. CHAETOPAPPA DC.¹⁹⁹

Annual or perennial herbs, often much-branched and only 1-3 dm. tall; leaves alternate, simple, entire, essentially sessile; heads usually not crowded, solitary at the ends of branches; involucre hemispheric to subcylindric; phyllaries elliptic to linear-lanceolate, stiff, chartaceous medially, mostly green, scarious-margined, appressed, imbricated in about 2 to 6 series, the outermost not more than half as long as the innermost; receptacle flat or slightly convex, naked, rough; *ray flowers* pistillate, fertile, with oblong white to rosy-white or bluish-white rays; *disk flowers* perfect, fertile (or the innermost ones sometimes not fertile); corolla yellow, with the equally 5-lobed limb being scarcely distinguished from the short basal tube; style branch appendages deltoid; achenes 2-, 3-, 4-, 5- or 10-nerved, compressed to subterete; pappus of scales and sometimes also with awns or in *C. effusa* and *C. bellidifolia* essentially absent.

About 9 species in southwestern United States and Mexico.

1. Involucre campanulate or hemispherical in flower, rather broad and rounded at base, with 12 to 28 rays and 32 to 106 disk flowers; disks 4-12 mm. across 6. *C. bellioides*.
1. Involucres narrowly cylindrical to broadly conical in flowers (broader in fruit), more or less acute basally, with 5 to 18 rays and 6 to 26 disk flowers; disks 1.5-5 mm. across in prepared specimens (2)
- 2(1). Involucres 5-6.5 mm. high or higher (3)
2. Involucres 3-4.9 mm. high (4)
- 3(2). Stem leaves broadest near the base or nearly the same width throughout, the upper more or less clasping 2. *C. effusa*.
3. Stem leaves broadest near the middle or above, not at all clasping 3. *C. Parryi*.
- 4(2). Middle and upper stem leaves broadest near the base or about the same width throughout, the uppermost more or less clasping . . . 2. *C. effusa*.
4. Middle and upper stem leaves broadest above the middle, not at all clasping (5)
- 5(4). Plants low, matted, almost mosslike perennials from rather woody much-divided rootstocks; stem leaves linear-oblongate, coriaceous, persistent, of nearly uniform size 1. *C. Hersheyi*.
5. Plants annual from a slender taproot; stem leaves spatulate to linear, the lower soon withering, the upper much smaller (6)
- 6(5). Inner phyllaries glabrous and entire or with very minutely erose margins, abruptly pointed and often awn-tipped; pappus represented merely by a thickened ring or minute erose crown 4. *C. bellidifolia*.
6. Inner phyllaries with prominently lacerate-ciliate margins especially near the apex, the excurrent midvein made inconspicuous by the ciliation; pappus of well-developed scales in either the ray or disk flowers or both, with or without longer awns in addition 5. *C. asteroides*.

1. *Chaetopappa Hersheyi* Blake. Matted perennial from woody forked rootstocks; stems to 5 cm. high, simple, flexuously ascending; sparsely pubescent with ascending or

¹⁹⁹ Adapted from L. H. Shinnars in *Wrightia* 1:63-81. 1946.

loosely appressed hairs, terminated by a solitary head on a peduncle naked for 1-5 mm. or a few by a tuft of small leaves: basal rosettelike leaf clusters with spatulate or oblanceolate subacute apiculate leaves 1.5-6 mm. long and 0.3-1 mm. broad; stem leaves 4 to 7, linear-oblanceolate or linear, 3-7.5 mm. long, 0.4-1 mm. broad, acute and with a translucent spiny tip, coriaceous, 1-ribbed (rib almost keel-like beneath), sparsely hispid-strigose or glabrous, persistent; lower leaves with narrowed, subpetiolar bases, the upper slightly smaller; involucre 4-4.6 mm. high; phyllaries lanceolate, acute or acuminate and slenderly spine-pointed, sparsely appressed-pubescent on the midrib or glabrous, with white-scarious ciliate margins, imbricated in about 4 series; ray flowers 6 to 10; rays when fresh bluish, fading to white, about 5 mm. long; disk flowers 5 or 6; corollas 3.3-4.3 mm. long, yellow; achenes of ray flowers 2- or 3-nerved, 1.3 mm. long; achenes of disk flowers 5-nerved, 0.8-1 mm. long; pappus similar in disk and ray, of about 5 awns (3.6-4.2 mm. long) and as many very minute ciliate or erose scales about 0.1 mm. long. Local, limestone cliffs and ledges, Guadalupe Mts. in the Trans-Pecos, May; endemic.

2. *Chaetopappa effusa* (Gray) Shinn. Perennial from a somewhat woody irregular crown; stems 1 to several, 2-7 dm. long, loosely pubescent with rather long whitish spreading to appressed hairs, simple up to the diffusely branched head-bearing region (which occupies the terminal one fourth to one half of the plant) with about 15 to 35 leaves below the head-bearing region; leaves firm, dark-olive-green, sparsely strigose on both surfaces and ciliate on the margin with hispid hairs; lowest leaves oblong- to oblong-lanceolate with more or less narrowed bases, 18-55 mm. long, 5-13 mm. broad, the narrowed base making up one sixth to one third the total length; middle and upper leaves gradually and slightly reduced, lanceolate-oblong to deltoid-oblong, the upper broadest at base, sessile and more or less clasping, 1-2 cm. long and 5-10 mm. broad; leaves of the branches abruptly much-reduced to narrowly oblong or (on the branchlets and peduncles) linear-subulate bracts, the larger ones 6-15 mm. long and 3-6 mm. broad, the smaller as little as 0.3 mm. long; involucre 4-5.2 mm. high; phyllaries imbricated in 3 to 5 series; rays 6 to 9, 3-4.5 mm. long, white; disk flowers 4 to 7, the corollas yellow; achenes of ray flowers compressed, 2-ribbed, pubescent, 2-2.2 mm. long; achenes of disk flowers 3-, 4- or 5-ribbed, pubescent on the ribs, 1.6-2 mm. long; pappus a thickened ring or cuplike erose crown, similar in disk and ray. Locally common in calcareous open places, Edwards Plateau, July-Sept.; endemic.

3. *Chaetopappa Parryi* Gray. Perennial forming loose tufts from superficial rhizomes or stolons; rhizomes producing a few leafy rosettes; stems erect, 10-28 cm. tall, normally simple for 4-18 cm. above the base (the terminal one fourth to two thirds of the plant with few elongate spreading-ascending branches), sparsely to rather densely pubescent with appressed to loose or spreading somewhat hispid hairs, with about 8 to 25 leaves below the head-bearing region; basal leaves crowded in a persistent rosettelike cluster, narrowly oblanceolate to broadly spatulate, 1-3 cm. long (the petiolar base 4-16 mm.), 1.5-9 mm. broad, apiculate, sparsely strigose and ciliate, with a single prominent vein beneath; proper stem leaves few, like the basal ones but rather abruptly smaller, the upper gradually reduced, the middle ones about 8-20 mm. long and 1-3.7 mm. broad, those of the branches reduced to narrowly oblanceolate or linear bracts; involucre conical or broadly subcylindric, 5.2-6.5 mm. tall; phyllaries imbricated in about 3 to 5 series; ray flowers 7 to 9, the rays 2.5-3.5 mm. long and pink or white; disk florets 10 to 15, the corollas yellow; achenes 2.2-2.8 mm. long, those of the ray flowers 3-ribbed, those of the disk flowers 3-, 4-, or 5-ribbed; pappus of 5 hyaline fimbriate-ciliate scales united up to halfway into a cuplike crown 0.25-0.85 mm. long, similar in disk and ray florets but that of the latter usually shorter; awns absent or 1 or 5, 0.8-2.5 mm. long. Rare in the Del Norte Mts. in the Trans-Pecos, spring (?); Tam., N.L., Coah. and Tex.

4. *Chaetopappa bellidifolia* (Gray & Engelm.) Shinn. Taprooted annual; stems single or few, 8-40 cm. tall, loosely and rather widely bushy-branched from the base, branches ascending or spreading-ascending; stem and main branches rather coarsely and densely pubescent with widely spreading hairs; pubescence of branchlets and peduncles spreading to loosely appressed; basal leaves (which soon wither) oblanceolate to oblong-spatulate, hispid on both surfaces and ciliate on the margin especially in the narrowed basal portion, subacute or obtuse, 7-35 mm. long, the subpetiolar base about half as long,

3-8.5 mm. wide; stem leaves similar, the upper gradually smaller, the subpetiolar base shorter and less distinct; involucre narrowly to broadly conical, 3.8-4.5 mm. high; phyllaries imbricated in about 3 or 4 series; ray flowers 6 to 15, 2.6-4 mm. long, violet or lavender to violet-blue; disk flowers 8 to 22, yellow; achenes subterete, somewhat clavate, 10-ribbed, glabrous or sparsely pubescent, 1.7-2.2 mm. long; pappus usually none, represented by a thickened ring on the summit of the achene or rarely by a minute erose crown. Abundant in open calcareous places, Edwards Plateau, spring; endemic.

5. *Chaetopappa asteroides* (Nutt.) DC. Taprooted annual; stem single or less often several, 35-300 mm. tall when in flower, simple or usually divaricately branched; branches spreading-ascending to horizontal, rather distant and elongate, each ultimate branchlet or peduncle terminated by a solitary small head; stems and branches with appressed to spreading pubescence; basal rosette leaves (which soon wither) oblanceolate to spatulate-orbicular, obtuse, apiculate, loosely strigose, hispid-ciliate, 4-25 mm. long, with a subpetiolar base one half to two thirds the total length, 1-5 mm. broad; stem leaves similar but narrower, the upper gradually smaller, those of the branches reduced to linear or subulate bracts; involucre 3.5-4.5 mm. high, cylindrical to conical; phyllaries imbricated in 3 or 4 series; ray flowers 5 to 18; rays 2.5-4 mm. long, white, sometimes turning lilac or rosy-violet; disk flowers 6 to 25, the corollas yellow; achenes 1.6-2 mm. long, prismatic, 5-nerved or -ribbed, pubescent; pappus of 5 hyaline scales 0.1-0.8 mm. long alternating with as many awns 1-3 mm. long, or awns less commonly absent; pappus of ray like that of the disk or shorter, rarely the reverse. Incl. var. *imberbis* Gray and var. *grandis* Shinnars. Common in open sandy places, e., s.e. and n.-cen. Tex., Rio Grande Plains and the Llano region of the Edwards Plateau, rarely w. of the e. part of the Plains Country, Mar.-June; Mo., Kan., Ark., La. and Tex.

6. *Chaetopappa bellioides* (Gray) Shinnars. Perennial but flowering the first year and appearing annual, with a taproot or ultimately a forked caudex; stems several to many, 35-280 mm. tall when in flower; basal rosettelike cluster of leaves oblanceolate or spatulate, hispidly strigose and ciliate, 5-47 mm. long, the subpetiolar base being 3-27 mm. of that length, 2-8 mm. broad, soon withering and disappearing; stem leaves narrower, the upper gradually smaller; heads solitary and terminal on the stems, the later ones on peduncles naked for as much as 25 mm. below the head; involucre hemispherical or broadly campanulate, 4-5.1 mm. high; phyllaries imbricated in about 4 or 5 series, broadly lanceolate or oblong, appressed-pubescent on the back, the broad white scarious margin lacerate-ciliate; middle phyllaries 1-1.3 mm. broad; ray flowers 12 to 18, the ray 3.5-5.2 mm. long; disk flowers 33 to 106; achenes about 2 mm. long; pappus of 5 narrowly oblong hyaline erose scales 0.6-1.8 mm. long (often united at base) and as many scabrous setiform awns 2.2-3 mm. long. Frequent in open calcareous uplands, s.w. part of Edwards Plateau, rare in the Trans-Pecos and Rio Grande Plains, Spring-fall; Agh., Chih., Coah., N.L., S.L.P., Zac. and Tex.

Another variety is known from the mountains of west-central Tamaulipas.

36. ERIGERON L. FLEABANE

Herbs, usually pubescent; leaves alternate, essentially sessile (the blades often narrowed to subpetiolar bases); heads solitary, terminating ascending branches which are often somewhat pedunculiform; involucre usually hemispheric, usually 3-8 mm. tall; receptacle flat or often convex, essentially smooth; phyllaries in only about 2 or 3 series, not or only weakly graduated, usually lance-subulate, acute, mostly herbaceous with very narrow scarious margins; ray flowers present, usually in about 2 series, pistillate, fertile; rays linear, white or pale shades of bluish or rose, never yellow; disk flowers perfect and fertile (except sometimes a few central ones abortive); corollas yellow, with a very short basal tube and a slightly broader subcylindric 5-toothed limb; achene laterally flattened, strongly 2-ribbed (or the extreme peripheral ones often 3-ribbed), nearly glabrous; pappus various, either essentially absent or a palaceous crown or of fragile capillary bristles and short scales or usually of unequal capillary bristles, these often in 2 size-classes (the pappus then said to be "double").

With about 200 species, nearly cosmopolitan, *Erigeron* is a difficult group of daisylike plants, often simulating such plants as *Aphanostephus*, *Astranthium*, *Dichaetophora*, etc.

1. Strong perennials from woody caudexes or stout woody roots (2)
1. Weak or short-lived perennials and biennials or annuals, with slender taproots or fibrous root systems (3)
- 2(1). Lower leaves oblanceolate to ovate, 3-15 cm. long including the subpetiolar bases, 10-33 mm. broad; leaves of midstem slightly smaller, lanceolate to ovate or oblong 1. *E. superbus*.
2. Lower leaves oblanceolate; leaves of midstem nearly linear, usually less than 2 cm. long and 2 mm. broad 2. *E. Bigelovii*.
- 3(1). Pappus of both kinds of flowers merely a minute cartilaginous ring or a scaly crown less than 0.2 mm. long (4)
3. Pappus otherwise (5)
- 4(3). Achene about 1.3 mm. long; rays 2.5 mm. long ... 9. *E. mimegletes*.
4. Achene about 0.6 mm. long; rays about 3.6 mm. long ..13. *E. Geiseri* var. *calcicola*.
- 5(3). Pappus of ray and disk unlike, that of the disk flowers composed of bristles and short outer setae, that of the ray flowers lacking the longer bristles (6)
5. Pappus of ray and disk essentially similar, of bristles, sometimes also with outer setae or squamellae (8)
- 6(5). Foliage ample; plants mostly 6-15 dm. tall; stem pubescence long, spreading 5. *E. annuus*.
6. Foliage sparse; plants mostly 3-7 dm. tall; stem pubescence short and appressed at least in the upper part of the stem (7)
- 7(6). Rays 0.8-1.2 mm. broad; basal leaves usually very shallowly few-lobed around the upper margins 7. *E. Traversii*.
7. Rays 0.5-1 mm. broad; basal leaves usually merely weakly toothed or slightly notched or even entire 6. *E. strigosus*.
- 8(5). Pappus simple (9)
8. Pappus double (13)
- 9(8). Annuals, the slender elongate taproot obviously longer than the lateral roots and not at all woody (10)
9. Biennials or perennials (often short-lived) with a fibrous root system or a definitely ligneous taproot (11)
- 10(9). Plants taking on a grayish cast due to relatively dense pubescence; leaves (of the part of the stem which is 5-10 cm. below the heads) 4 to 8 times as long as broad, long-narrowed to the linear base15. *E. Bellidiastrum*.
10. Plants greenish, relatively sparsely pubescent; leaves (of the part of the stem which is 5-10 cm. below the heads) 2 to 4 times as long as broad, often truncate basally and partially clasping14. *E. tenellus*.
- 11(9). Trailing plants of sandy soil near the coast; stems often subrhizomatous12. *E. myrionactis*.
11. Erect plants; rhizomes usually absent (except in *E. pulchellus*) (12)
- 12(11). Plants with superficial rhizomes; disk corollas 4.5-6 mm. long; rays 1 mm. broad or broader 3. *E. pulchellus*.
12. Rhizomes absent; disk-corollas 2.5-3.2 mm. long; rays 0.5 mm. broad or narrower 4. *E. philadelphicus*.
- 13(8). Annual, the slender elongate taproot obviously longer than the lateral roots and not at all woody; pappus of about 10 to 12 fragile capillary bristles alternating with about the same number or fewer extremely minute scales13. *E. Geiseri* var. *Geiseri*.
13. Biennials or perennials (often short-lived) with a fibrous root system or a definitely ligneous taproot; pappus of 10 to 30 capillary bristles and some much shorter microscopic bristles (these rarely united into fimbriate scales) (14)
- 14(13). Essentially all the hairs of the stem appressed or ascending; some branches long-trailing; mountains of the Trans-Pecos11. *E. flagellaris*.
14. At least a few of the hairs (at least on the lower part of the stem) spreading; branches only occasionally trailing (15)

- 15(14). Root system fibrous, the taproot itself stubby and long-surpassed by the adventitious and/or lateral roots; rays 2.5-4.5 mm. long, 0.3-0.5 mm. broad
 8. *E. tenuis*.
15. Roots few, the taproot pronounced, usually ligneous; rays 4-8 mm. long, 0.7-1.2 mm. broad 10. *E. modestus*.

1. *Erigeron superbus* Rydb. Strongly perennial herb 15-60 cm. tall, from woody caudexes; lower leaves oblanceolate to ovate, 3-15 cm. long (including the subpetiolar base), 10-33 mm. broad; heads usually fewer than 8 per plant; involucre 7-9 mm. high; rays 40 to 80, 12-20 mm. long, 1-2 mm. broad, blue or rose-purple, rarely white; pappus double, of bristles. Rare in higher parts of Davis Mts. in the Trans-Pecos, Sept.; Wyo., Colo., Ut., Ariz., N.M. and Tex.

2. *Erigeron Bigelovii* Gray. Strongly perennial herb 1-3 dm. tall, from stout woody roots; stems 1-3 dm. long, ascending, hispid-hirsute with stiff spreading hairs; leaves pubescent like the stems, the lowermost ones oblanceolate and deciduous, the others numerous and linear or nearly so, not more than about 2 cm. long and 2 mm. broad; involucre 4-5 mm. high; rays about 30 to 50, pink, purple or violet, 5-7 mm. long, 0.9-1.2 mm. broad; pappus double, of capillary bristles, alike in ray and disk. Rare in the Franklin Mts. near El Paso in the Trans-Pecos, spring (Apr.-May); endemic.

3. *Erigeron pulchellus* Michx. ROBIN'S-PLANTAIN. Hirsute short-lived erect perennial, 15-60 cm. tall, with fibrous root system and superficial rhizomes; basal leaves oblanceolate to suborbicular, tapering to short subpetiolar bases, 2-13 cm. long, 6-50 mm. broad, shallowly toothed above the middle or subentire; stem leaves lanceolate or oblong to more commonly ovate, obtuse or rounded to slightly acute at apex, entire or nearly so, the middle and lower leaves 2-7 cm. long and 6-20 mm. broad; heads few in a flat-topped arrangement; disk corollas 4.5-6 mm. long or usually longer; rays 1(-2) mm. broad, 6-10 mm. long; pappus simple, of capillary bristles, alike in ray and disk. Rare in open places, deep sandy soil, e. and s.e. Tex., Apr.-May; most of e. U.S.

4. *Erigeron philadelphicus* L. PHILADELPHIA FLEABANE. Short-lived erect perennial 2-7 dm. tall, with fibrous root system; rhizomes absent; stems and leaves usually with spreading hairs; basal leaves narrowly to broadly oblanceolate or even obovate, coarsely crenate-toothed or lobed, rounded at the apex, tapering to the short subpetiolar base, mostly not more than 15 cm. long and 3 cm. broad; stem leaves clasping basally, crenate to dentate or subentire; head region not crowded; involucre 4-6 mm. high; disk corollas 2.5-3.2 mm. long; rays 5-10 mm. long, 0.2-0.5 (-0.6) mm. broad, never bluish; pappus alike in ray and disk, simple, of capillary bristles (often shorter than the corolla in the disk). Frequent, e., s.e. and n.-cen. Tex. and Edwards Plateau, usually in moist loam, spring; most of U.S. and s. Can.

Reports of *E. quercifolius* Lam. in Texas are based partly on specimens of *E. philadelphicus*.

5. *Erigeron annuus* (L.) Pers. DAISY-FLEABANE. Short-lived perennial mostly 6-15 dm. tall, with fibrous root systems; pubescence of stem long, spreading; basal leaves to 1 dm. long (not including the base) and 7 cm. broad, elliptical to broadly ovate or suborbicular, coarsely toothed, contracted into a subpetiolar base to 1 dm. long; stem leaves numerous, most of them toothed, rarely subentire; head-bearing region large and leafy; rays 80 to 125, 0.5-1 mm. broad, to 10 mm. long; disk corolla 2-2.8 mm. long; pappus of rays simple, of a low ring of very short bristles (the longer capillaries absent); pappus of disk double, with capillary bristles plus the very much shorter bristles such as those present in the rays. Rare in open ground, e. and n.-cen. Tex. (Bowie and Grayson cos.), spring; most of U.S. and s. Can.

6. *Erigeron strigosus* Willd. WHITE-TOP. Fibrous-rooted short-lived perennials 3-7 dm. tall; stem pubescence short and appressed at least in the uppermost part of the stem; basal leaves usually merely weakly toothed or slightly notched or even less commonly entire, narrowed to a long subpetiolar base; stem leaves often sparse and reduced, linear to lanceolate, entire on the lower and middle ones or slightly toothed; head arrangement never crowded, often very sparse; involucre 2-5 mm. high; rays 50 to 100, 0.4-1 mm. broad, to 6 mm. long; disk corollas 1.5-2.6 mm. long; pappus of ray and disk unlike, that of the disk flowers composed of bristles and short outer setae, that of the ray flowers lacking the longer bristles. Incl. var. *Beyrichii* (Fisch. & Mey.) Gray. Infrequent, open loamy ground, e. and n.-cen. Tex., Plains Country and extreme n. Rio Grande Plains, Apr.-June (-Sept.); most of U.S. and s. Can.

7. *Erigeron Traversii* Shinn. Short-lived fibrous-rooted perennial, mostly 3-7 dm. tall; stem pubescence short and appressed at least in the uppermost part of the stem; basal leaves usually very shallowly few-lobed around the upper margins; upper foliage very sparse; rays about 70, 0.8-1.2 mm. broad, 5-8 mm. long; pappus of ray and disk unlike, that of the disk flowers composed of bristles and short outer setae, that of the ray flowers lacking the longer bristles. Infrequent in sandy soil, e. Tex., Mar.-Apr.; also La.

Flowering, on the average, earlier in the spring than *E. strigosus*, to which it is exceedingly closely related.

8. *Erigeron tenuis* T.&G. Fibrous-rooted short-lived perennial (the taproot stubby and long-surpassed by the adventitious and/or lateral roots); at least a few of the hairs (at least on the lower part of the stem) spreading; branches only occasionally trailing; basal leaves oblanceolate, 5-10 cm. long including the subpetiolar base, either subentire or usually with a few shallow (rarely deep) pinnately disposed lobes; stem leaves sparse and reduced, often oblong or oblanceolate, infrequently nearly linear, basally subamplexicaul; rays 2.5-4.5 mm. long, 0.3-0.5 mm. broad; pappus of ray and disk essentially similar, double, of about a dozen capillary bristles and some much shorter microscopic bristles. Frequent in open often tight clay soils, e., s.e. and n.-cen. Tex., rare w. to Burnet Co. on the Edwards Plateau, spring; Mo., Ark., La., Okla. and Tex.

The erroneous reports of *E. quercifolius* Lam. from Texas have been based largely on specimens of *E. tenuis*.

9. *Erigeron mimegletes* Shinn. Plant annual from a slender vertical taproot; stems 1 to few, 20-55 cm. tall, sparsely to densely hispid-pubescent; basal and lower stem leaves oblanceolate, with a few coarse teeth, narrowed to the long linear subpetiolar base, in all 3-6 cm. long; stem leaves sparse, narrowly oblong or oblong-lanceolate, about 2-3 cm. long, 3-7 mm. broad; heads not crowded; involucre 3-3.5 mm. high; receptacle conical; rays to 2.5 mm. long and 0.5 mm. broad, numerous; disk corolla about 1.9 mm. long; achene about 1.3 mm. long; pappus of both kinds of flowers represented merely by a blunt whitish cartilaginous ring on the summit of the achene. Infrequent and local, w. part of Edwards Plateau (Crockett, Edwards, Schleicher, Sutton and Val Verde cos.), Apr.-June (-July-Oct.); endemic.

10. *Erigeron modestus* Gray. Perennial, usually about 1-2 (-3) dm. tall and often grayish-pubescent, sometimes short-lived (flowering the first year) with few roots, the taproot pronounced and usually ligneous, often a few other roots present; at least a few of the hairs (at least on the lower part of the stem) spreading; branches only occasionally trailing; basal leaves oblanceolate, several cm. long, usually with a few coarse teeth on pinnate lobes, narrowed to the subpetiolar base; stem leaves mostly narrowly oblong or linear to narrowly oblanceolate, usually 1-2 (-3) cm. long, always extremely narrow at the very base; rays 4-8 mm. long, 0.7-1.2 mm. broad; pappus of ray and disk essentially similar, double, of about a dozen capillary bristles and some much shorter microscopic bristles. *E. divergens* T.&G. var. *cinereus* Gray, *E. nudiflorus* Buckl., *E. commixtus* Greene, *E. Tracyi* Greene, *E. plateauensis* Cronq., *E. lobatus* A. Nels. var. *Warnockii* Shinn. Abundant in open usually dry calcareous uplands, w. half of Tex., e. to Young, Palo Pinto, Somervell and Travis cos., spring, usually; N.M. and Tex., Okla., Ariz., Nev. and n.w. Mex.

11. *Erigeron flagellaris* Gray. RUNNING FLEABANE. Short-lived perennial with few roots, the taproot pronounced and usually ligneous and often a few other roots present; some branches long-trailing; essentially all the hairs of the stem appressed or ascending; otherwise extremely similar to *E. modestus*; pappus of ray and disk essentially similar, double, of about 10 to 15 capillary bristles and some much shorter microscopic bristles. Infrequent in mts. of Trans-Pecos; S.D., Wyo. and Nev. s. to Tex., N.M. and Ariz.

12. *Erigeron myrionactis* Small. Perennial with stems stoloniferous or subrhizomatous in coastal sands, rooting at the nodes, prostrate; stems often to 1 m. long; herbage with spreading hairs; leaves obovate to spatulate or cuneate, 2-8 cm. long, 5-25 mm. broad, coarsely few-toothed near the end; heads solitary, borne about 1 dm. above ground; rays very numerous, white, 5-7 mm. long, about 0.3 mm. broad; disk corollas 3.5-4.5 mm. long; pappus of ray and disk essentially similar, simple, of about 20 to 25 fragile capillary bristles. Frequent in coastal sands, s.e. Tex. and Rio Grande Plains, spring-fall; La., Tex. and Tam.

13. *Erigeron Geiseri* Shinners. Annual, 1-3 dm. tall, the slender elongate taproot obviously longer than the lateral roots and not woody; hair spreading in lower part of stem, ascending or subappressed above; lower leaves spatulate-ob lanceolate to oblanceolate, several cm. long, much-narrowed to the linear subpetiolar base; stem leaves oblong to oblanceolate, ascending, 1-4 cm. long, 2-10 mm. broad; heads solitary at the ends of the branches; involucre 3-3.7 mm. high; receptacle blunt-conical; rays 50 to 70, about 3.6 cm. long and 0.5 mm. broad; disk corolla about 1.6 mm. long; achene about 0.6 mm. long; pappus essentially similar in ray and disk, differing in the varieties below.

Var. *Geiseri*. Pappus represented by 10 or more capillary bristles and about as many minute setuliferous scales. Locally abundant in open usually sandy areas, n. to Young and Hood cos., s. to DeWitt and Nueces cos., e. to Brazoria, Washington and Brazos cos. and w. to Burnet and Young cos., spring; endemic.

Var. *calcicola* Shinners. Pappus represented by a minute denticulate scaly or subcartilaginous crown less than 0.2 mm. long. Known only from near Leakey, Real Co., Edwards Plateau, Apr.; endemic.

14. *Erigeron tenellus* DC. Annual (1-) 2-3 (-4) dm. tall, the slender elongate taproot obviously longer than the lateral roots and not woody; plants greenish, relatively sparsely pubescent; stems often several from the base when plant is not crowded; basal leaves oblanceolate, 3-10 cm. long, with a few pinnate lobes; leaves (of that portion of the stem which is 5-10 cm. below the heads) 2 to 4 times as long as broad, often truncate basally and partially clasping; heads solitary at the ends of the branches; involucre 2-3 mm. high; rays 2-3 mm. long; pappus of ray and disk alike, simple, of about 10 fragile capillary bristles. Infrequent on exposed loamy soil, Rio Grande Delta (Cameron and Hidalgo cos.), rare in Kleberg Co. on Rio Grande Plains, Feb.-May; also Tam.

15. *Erigeron Bellidiastrum* Nutt. WESTERN FLEABANE. Annual, the slender elongate taproot obviously longer than the lateral roots and not woody; plants 1-5 dm. tall, taking on a grayish cast due to relatively dense pubescence; basal leaves (soon withering) oblanceolate, nearly entire; stems usually solitary at the base, often with many ascending branches above; leaves (of that portion of the stem which is 5-10 cm. below the heads) 4 to 8 times as long as broad, long-narrowed to the linear base; heads terminating the numerous branches but not crowded; involucre 3-5 mm. high; rays 30 to 70, 4-6 mm. long, about 1 mm. broad; disk corollas 2.5-3 mm. long; pappus similar in ray and disk, simple, of about 15 very fragile capillary bristles. Incl. var. *robustus* Cronq. Locally abundant in open sandy loam, Plains Country s. to Ward and Winkler cos., May-Aug.; Colo. and S.D., s. to Tex. and N.M.

There is a rare, unnamed race of this species in Trans-Pecos Texas (El Paso, Hudspeth, Presidio and Reeves cos.) marked by the dense, grayish hispid pubescence and small stature (8-11 cm.).

37. CONYZA L.

Annual taprooted herbs, often much-branched, variously pubescent; leaves alternate, entire to dentate or pinnately to bipinnately lobed, usually oblanceolate in general outline; heads variously disposed; receptacle somewhat convex but often with a depressed area in the center, naked; involucre broadly turbinate, 3-8 mm. high; phyllaries in 2 or 3 series, weakly if at all imbricate, mostly thin-herbaceous or with scarious margins, ascending, appressed, usually pubescent on the back; *ray flowers* pistillate, fertile, in 1 to 3 rows on the periphery; corolla cream-colored, with a filiform tube and an extremely minute "ray," this ray much shorter than the tube and often merely represented by an oblique orifice of the tube; *disk flowers* perfect, fertile; corolla cream-colored, with a tube and a 5-toothed limb; achene laterally compressed, 2-ribbed (or the outermost nearly trigonous and 3-ribbed), narrowly obovate in outline, usually pubescent; pappus of both kinds of flowers of bristles which in some species are of 2 size-classes (the outer smaller) and in some species are capillary and fragile, in others stiff and persistent.

More than 50 species, chiefly tropical and subtropical in both hemispheres.

1. Stem leaves slightly narrowed to the clasping base which is about 0.5 to 1 times as broad as the broadest part of the leaf 6. *C. Coulteri*.

1. Stem leaves much-narrowed at base or linear throughout, not clasping (2)

- 2(1). "Ray" flowers in 2 or 3 rows, their corollas usually shorter than the pappus (almost as long in *C. bonariensis*) (3)
- 2. Ray flowers in a single peripheral row, their corollas usually longer than the pappus (5)
- 3(2). Stems and leaves whitish floccose-pubescent5. *C. flaginoides*.
- 3. Stems and leaves variously pubescent but not floccose (4)
- 4(3). Leaves bipinnatifid4. *C. sophiaefolia*.
- 4. Leaves entire to shallowly pinnatifid1. *C. bonariensis*.
- 5(2). Stems glabrous or pubescent with widely spreading hairs; plants normally erect, with stem branching well above the base; larger stem leaves more than 2 mm. broad2. *C. canadensis*.
- 5. Stems with antrorsely appressed hairs; plants usually freely branched at all levels, the branches weak, the entire plant 1-3 dm. tall; larger leaves about 2 mm. broad ...
.....3. *C. ramosissima*.

1. *Conyza bonariensis* (L.) Cronq. Robust annual usually 1 m. tall, somewhat branched near the base, otherwise simple except in the upper 2-5 dm. of the length; stem leaves numerous, ascending or subappressed, usually slightly grayish-green, not clasping, narrowed at the base, in the upper half of the stem 3-6 cm. long and 5-10 mm. broad, saliently toothed (some of those of the lower half of the stem often saliently lobed); head-bearing region of the plant 2-5 dm. long, 5-10 cm. thick, cylindric, rounded apically; heads about 7 mm. high; ray flowers in 2 or 3 rows, their corollas usually shorter than the pappus or almost as long in this species. Rare in e. Tex., collected once near College Station, Brazos Co. and once at Orange, Orange Co., July; widespread in the warmer parts of Am., n. to Fla. and Tex.

2. *Conyza canadensis* (L.) Cronq. HORSE-WEED. Robust annual, virgately erect, 1-2 m. tall; stems nearly simple, glabrous or pubescent with widely spreading hairs; leaves linear-oblancheolate, those of the upper half of the stem 4-10 cm. long and 3-6 mm. broad, often saliently toothed, pubescent, not clasping, narrowed to the base; head-bearing region much as in *C. bonariensis* but perhaps usually more ample; heads 3-5 mm. high; ray flowers in a single peripheral row, their corollas usually longer than the pappus. *Erigeron canadensis* L., *Leptilon canadense* (L.) Britt. Nearly throughout the state, Aug.-Nov.; widespread in temp. N.A.

The species has been separated into 3 weak varieties.

Var. *canadensis* is the abundant and familiar phase of n. and cen. U.S.; in Tex. it is uncommon, restricted to n.-cen Tex. and Plains Country; marked by stems with spreading pubescence.

Var. *glabrata* (Gray) Cronq. replaces var. *canadensis* throughout much of s.w. U.S.; in Tex. it is the most widespread and common of the three varieties; it is marked by nearly glabrous stems and stramineous phyllaries.

Var. *pusilla* (Nutt.) Cronq. is the race of s.e. U.S., marked by nearly glabrous stems and tips of phyllaries stained purplish-red; e. Tex.

3. *Conyza ramosissima* Cronq. Annual herb, much-branched from the base and at all other levels; stems with antrorsely appressed hairs about 1 mm. thick basally, 1-2 (-3) dm. long; leaves ascending, 5-13 mm. long, 0.5-1 (-2) mm. broad, grayish-pubescent, linear; heads not crowded, borne in a zone at the rounded top of the plant, 3-5 mm. high; ray flowers in a single peripheral row, their corollas usually longer than the pappus. *Erigeron divaricatus* Michx., *Leptilon divaricatum* (Michx.) Raf. Locally frequent in waste places and lawns, usually in black calcareous clay soil, n.-cen. Tex., less frequent w. to Plains Country, June-Sept.; Ala., La., Miss. and Tex., n. to Wisc. and N.D.

4. *Conyza sophiaefolia* H.B.K. Annual herb, simple or much-branched from the base, 1-5 dm. tall; leaves rather deeply pinnately or often even bipinnately lobed, with some essentially appressed and rather sparse pubescence; the upper 1-3 dm. of each stem bearing numerous heads in a subracemose arrangement; heads numerous, crowded, 2-3 mm. high; ray flowers in 2 or 3 peripheral rows, the corollas shorter than the pappus. *Eschenbachia tenuisecta* (Gray) Woot. & Standl. Infrequent to rare in igneous rock, Chisos and Davis mts. in the Trans-Pecos, Aug.-Oct.; Tex., N.M., Ariz. and arid-temp. parts of n. and cen. Mex.

5. *Conyza filaginoides* (DC.) Hieron. Annual herb 2-8 dm. tall, with numerous ascending branches in the middle portion, the entire plant linear or somewhat spindle-shaped, rigidly erect, sparsely floccose-tomentose, the main stem 1-3 mm. thick basally; leaves narrowed basally, not clasping, with a few salient teeth marginally or the lower ones very shallowly lobed, in over-all shape linear-oblongate, 1-3 cm. long, 1-3 mm. broad; heads crowded on the lateral as well as the main branch in a spikelike arrangement, each head 5-6 mm. high; ray flowers in 2 peripheral rows. Chisos Mts. in the Trans-Pecos, 6,000-7,500 ft. elev., infrequent, Sept.; also mts. of Mex.

6. *Conyza Coulteri* Gray. Annual herb 2-10 dm. tall, rather rigidly erect, sparingly with ascending branches; leaves narrowly obovate or oblong, with a few salient teeth or shallow lobes, apically rounded, basally rounded or usually with auricles and somewhat clasping; heads numerous and crowded in the upper 1-3 dm. in a subpaniculiform arrangement; heads about 4 mm. high; ray flowers in 2 or 3 peripheral rows. *Eschenbachia Coulteri* (Gray) Rydb. Frequent in the Trans-Pecos, less common in Edwards Plateau and rare in Rio Grande Plains, June-Sept.; s.w. U.S. and Mex.

This plant is known to be toxic to livestock.

38. BOLTONIA L'HÉR.

Perennial herbs 2-10 dm. tall, essentially glabrous, with taproot plus fibrous root systems and very slender creeping rhizomes (these easily broken off); stems slender, branched, wiry, striate-angled, uppermost parts of the branches pedunculiform; leaves linear, those of midstem 1-3 (-12) cm. long, green, alternate, entire, essentially sessile, grading upward into leaves as small as 1-3 mm. long; heads small, solitary at the ends of the branches, 5-10 mm. across (excluding rays); receptacle conic or hemispheric, naked; involucre hemispheric, 2-4 mm. high, of about 3 series of slightly imbricated lanceolate appressed phyllaries with pale scarious margins and darker midribs which are slightly expanded toward the apex; *ray flowers* present, pistillate, fertile; rays white (or pink when dry) or lilac, never yellow; *disk flowers* numerous, perfect, fertile; corollas yellow, the tube not sharply demarcated from the gradually ampliate shallowly 5-lobed limb; achenes laterally compressed, brown, with 2 wings (or in the ray achenes 3-winged); pappus of a number of small pointed scales or broad bristles plus 2 (in ray flowers 3) longer awns over the wings of the achene.

About 7 species occur in North America; one in eastern Asia.

1. Phyllaries 0.5-1 mm. broad; rays 8-15 mm. long, lilac ..1. *B. asteroides*.

1. Phyllaries 0.2-0.5 mm. broad; rays 5-8 mm. long, usually pure-white when fresh ...
.....2. *B. diffusa*.

1. *Boltonia asteroides* (L.) L'Hér. Characters as in the key. *B. latisquama* Gray. Rare in e. and s.e. Tex., summer-fall; most of e. U.S.

2. *Boltonia diffusa* Ell. Characters as in the key. Infrequent in e. and s.e. Tex., summer-fall; Ga. and Gulf States, n. to Ky., Ill. and Mo.

39. TOWNSENDIA Hook.²⁰⁰

Annual, biennial or perennial herbs with taproots, 1-25 cm. tall, sparingly branched, often grayish with appressed pubescence; leaves alternate, oblanceolate, entire, grayish-green, essentially sessile though long-narrowed basally, 1-10 cm. long, not greatly reduced upward, the uppermost usually subtending the head in the manner of an auxiliary bract; heads solitary on the branches; receptacle convex; phyllaries in 3 to 5 series, strongly imbricated, appressed, lanceolate, acute with thin pale lacerate or fimbriate margins but mostly dark (greenish or purplish), thick-herbaceous, especially dark in a large elliptical median zone in the upper half; *ray flowers* rather numerous, pistillate, fertile; corolla white or bluish-white, or purplish-white, never yellow, the pappus similar to that of the disk but shorter or else united into a scaly corona; *disk flowers* perfect, usually fertile; corolla yellow (also frequently tinged with pink or purple), the pappus of

²⁰⁰ Adapted from John H. Beaman in Contr. Gray Herb. n.s. 183:1-151. 1957.

a single series of subulate broad (dorsiventrally flattened) barbellate unequal bristles (some of these divided at top into several bristle-tips); achene oblanceolate, somewhat laterally compressed, 2-ribbed with ascending capitate hairs.

About 20 species in western North America and Mexico.

1. Plant a rosette, rarely to 5 cm. tall; heads appearing at ground level surrounded by a mass of leaves1. *T. exscapa*.
1. Plants caulescent with stems (3-) 10-30 cm. long (2)
- 2(1). Plant annual with several decumbent or ascending stems from the base, each stem about 1 mm. thick2. *T. annua*.
2. Biennial or weak perennial with a single erect stem 3-5 mm. thick at ground level ..
.....3. *T. texensis*.

1. *Townsendia exscapa* (Richards.) Porter. Dwarf perennial from branched woody rootstocks; aerial shoots barely protruding out of the ground, comprising merely a dense rosette of leaves and a solitary central large head 3-4 cm. across. Infrequent in open grama grasslands in the Trans-Pecos, rare in Plains Country and extremely rare e. to n.-cen. Tex., Mar.-May; B.C. to Man. and s. to Chih. and Tex.

2. *Townsendia annua* Beaman. Annual with several decumbent or ascending stems from the base, each stem 3-20 (-25) cm. long and about 1 mm. thick; involucre about 1 cm. high and broad; disk pappus 1.8-3 mm. long, almost always shorter than the corolla. Rare in calcareous deserts in the Trans-Pecos (El Paso and Hudspeth cos.), Mar.-May (also Aug.); Colo., Ut., Ariz., N.M. and Tex.

3. *Townsendia texensis* Larsen. Biennial or weak perennial, at ground level with a single stem 3-5 mm. thick, shortly above branching into a number of ascending stems, the whole plant 1-3 dm. tall; involucre about 1 cm. broad and high; rays about 1 cm. long, disk pappus about 3.5 mm. long. Infrequent in calcareous prairies, higher parts of Plains Country, May-Sept.; also Okla.

40. ASTRANTHIUM Nutt.²⁰¹

Taprooted annuals 5-40 cm. tall, branched; branches ascending, leafy in the lower part; leaves spatulate or obovate-spatulate, a few cm. long, essentially entire, blunt, narrowed to a subpetiolar base, the upper parts of the branches erect, naked and pedunculiform for the last few cm.; heads solitary at the ends of the branches; involucre saucer-shaped, 3-6 mm. high; phyllaries in a single series, green, membranous; receptacle very high-conic, pointed; *ray flowers* present, pistillate, fertile, the rays white or upon drying tinged with blue or red; *disk flowers* numerous, perfect, fertile; corollas yellow, minute, the basal tube sharply distinguished from the abruptly amplified 5-lobed limb; achenes slightly laterally compressed, obovate, glochidiate-pubescent with bifurcate hairs, brown, elliptic in transection, with 2 rounded ribs at the narrower ends of the ellipse; pappus absent or a minute ring or crown.

A North American genus of a few species.

1. Plant 5-30 cm. tall; stems erect or ascending even at the base; leaves not densely crowded, the internodes almost as long as the leaves; involucre 2.5-4.5 mm. high; east of the Trans-Pecos1. *A. integrifolium*.
1. Plant 5-40 cm. tall; stems often decumbent basally but mostly ascending; leaves densely crowded; involucre 4-6.8 mm. high; Trans-Pecos area
.....2. *A. robustum*.

1. *Astranthium integrifolium* (Michx.) Nutt. var. *triflorum* (Raf.) Shinners. WESTERN DAISY. Characters as in the key. Incl. subsp. *ciliatum* (Raf.) DeJong. Abundant in open sandy places, n.-cen., e. and s.e. Tex., infrequent in e. part of Plains Country and in Rio Grande Plains, (Mar.-) Apr.-May (-July); Kan., Ark., Okla., Tex. and N.L.; the species as a whole also in Ky., Tenn., Mo., Ala., Miss. and Ga.

²⁰¹ Adapted from D. C. D. DeJong in Publ. Mich. State Univ. Mus. 2:429-528. 1965.

2. *Astranthium robustum* (Shinners) DeJong. Characters as in the key. Frequent in open sandy places in parts of the Trans-Pecos (Pecos, Brewster, Jeff Davis, Presidio and Reeves cos.), Mar.-June; endemic.

41. *DICHAETOPHORA* GRAY²⁰²

The genus is monotypic.

1. *Dichaetophora campestris* Gray. PLAINS DAISY. Taprooted annual; stems several, erect or decumbent at base, 4-24 cm. tall, simple or sparingly forked, terminating in long naked peduncles 2-9 cm. long below the heads; leaves alternate, oblanceolate, obtuse, entire; heads solitary and terminal on the ends of branches; involucre 3-4.5 mm. high; phyllaries in 2 series, equal, lanceolate, acute, 0.6-1.2 mm. broad, membranaceous, green except for the scarious margin, sparsely and somewhat hispidly appressed-pubescent on the back; receptacle conical to subglobose, naked; ray flowers about 16 to 24, pistillate, fertile; rays white, 5-9 mm. long; disk flowers perfect, fertile; corollas yellow, about 2.5 mm. long, abruptly constricted just above the flared and slightly thickened base to form a very short tube about 0.2 mm. long, the cylindrical-campanulate limb equally 5-lobed at summit; achenes laterally compressed, oval or orbicular in outline, densely pubescent with ascending whitish glandular-tipped hair, surrounded by a broad coriaceous wing margin equal in width to the central portion at either side, densely fringed with glandular-capitate hairs; pappus consisting of 2 antrorsely scabrous erect or diverging equal or slightly unequal awns 0.7-1.1 mm. long, usually with several additional minute awns 0.25 mm. long forming an elliptical ring with long awns on either end over the wing margins. Local in open sandy places of Rio Grande Plains, Feb.-May; Chih., Coah., N.L. and Tex.

Extraordinarily similar in habit and habitat to *Astranthium integrifolium* var. *triflorum* and replacing it geographically. Perhaps the few technical differences in achene and pappus are controlled by a single gene or a few genes and the two taxa could be conspecific. Almost certainly they should be congeneric.

42. *EGLETES* CASS.²⁰³

A tropical American genus of about 10 species.

1. *Egletes viscosa* (L.) Less. Taprooted herb, probably annual; stems subsimple on small plants or bushy branched on larger ones, erect or ascending, 12-60 cm. tall, terete, striate, hispid with widely spreading flat-jointed hairs 1-3 mm. long and pubescent with short widely spreading glandular-capitate hairs 0.1-0.5 mm. long, very densely so in the upper part and on the branches; leaves alternate, simple, the stem leaves usually withering before flowering is over, oblong to obovate, 4-11 cm. long, 2-6 cm. broad, shallowly to deeply pinnatisect or bipinnatisect, the divisions coarsely toothed, the lower ones with narrow clasping subpetiolar bases a third the total length; leaves of upper branches smaller, relatively narrower, less deeply divided, the basal third often entire; upper branchlets or peduncles short, to 2 dm. long, shorter than the small leaves in whose axils they arise; heads rather numerous and crowded toward the tips of the branches; involucre urn-shaped; phyllaries equal or slightly unequal, in 2 or 3 series, 0.8-1.6 mm. broad, lanceolate to ovate-lanceolate, acute, hispid, glandular-pubescent; receptacle conical, naked; ray flowers in one series, 18 to 28, usually shorter or only slightly longer than the phyllaries; rays white, oblong-elliptic, erect, 1.6-2 mm. long, 0.6-0.8 mm. broad; disk flowers perfect; corolla yellow, tubular-funnelform, the limb 4- or 5-lobed; achenes similar in disk and ray, more or less compressed, 2-ribbed, basally constricted, 1.3-1.4 mm. long, glandular-pubescent, with a narrow uneven cartilaginous ring around the summit representing the pappus. Rare in loamy soils at the edges of resacas and lakes on the Rio Grande Delta in Cameron and Hidalgo cos. of extreme s. Tex., summer-fall; Tex., s.e. to C.R.; Cuba.

²⁰² Adapted from L. H. Shinners in *Wrightia* 1:90-94. 1946.

²⁰³ Adapted from L. H. Shinners in *Lloydia* 12:239-250. 1949.

We have the f. *bipinnatifida* Shinnars, characterized by its bipinnatifid leaves having acute dentate lobes. The species is also represented by another variety in Sinaloa.

43. APHANOSTEPHUS DC.²⁰⁴

LAZY DAISY

Annuals or perennials from taproots; leaves alternate, simple, entire to deeply pinnatifid; heads solitary and terminal on the branchlets; peduncles with widely spreading to downwardly appressed hairs; involucre hemispherical; phyllaries narrowly lanceolate to oblong-oblancheolate; receptacle hemispherical to conical, naked, rough; *ray flowers* present, pistillate, fertile; rays white to lavender or rose-purple, never yellow; *disk flowers* numerous, perfect, fertile; corollas yellow, base of tube in some species with thickened or hardened walls, becoming slightly to greatly enlarged in fruit; style branches flattened, tipped with a short broadly triangular acute appendage; achenes of disk and ray similar, columnar or subterete to quadrate, slightly expanded toward the summit, glabrous or sparsely pubescent, with 4 to 12 distinct to very obscure grooves or superficial ridges not differing from the rest of the achene-surface in texture and usually not extending completely from base to summit, true ribs absent; pappus alike in disk and ray, an uneven scaly crown around the periphery of the broad summit of the achene, ciliate or the lobes sharp-pointed or prolonged into narrow awn tips, in all 0.25-1.8 mm. long, or pappus a rather minute crown of equal hairs or cilia 0.1-0.25 mm. long.

A small North American genus.

1. Plant conspicuously hispid with coarse jointed translucent hairs, those of the stem and branches 0.7-2.2 mm. long (easily broken) and spreading at right angles; heads somewhat crowded; peduncles short, naked for 3-12 mm. or (in age) for as much as 22 mm.; rays 12 to 181. *A. pilosus*.
1. Plant soft-pubescent to hispid-pubescent, the hairs widely spreading to deflexed or downwardly subappressed and 0.2-1 mm. long; heads not crowded; peduncles naked for 15-100 mm. or (in age) as much as 150 mm.; rays 16 to 65 or more (2)
- 2(1). Pappus uneven and scaly; scales variously lacerate-ciliate, acute or prolonged into awnlike tips, in all 0.25-1.8 mm. long; corolla bases becoming whitened, hardened and inflated in age to twice or more their original diameter (3)
2. Pappus a ring of very short equal hairs or cilia 0.1-2.5 mm. long; corolla only slightly hardened or thickened at the base or slightly above (4)
- 3(2). Involucres (of well-developed plants) 6-8.2 mm. high; phyllaries in about 4 or 5 series; rays 8-15 mm. long, 1.5-2.3 mm. broad; mature achenes 1.5-2.2 mm. long; pappus an irregular scaly crown or of about 5 unequal acute scales 0.25-0.9 mm. long2. *A. skirrhobasis*.
3. Involucres (4.5-) 5-6.3 mm. high; phyllaries in about 3 series; rays broad for their length, 6-8 mm. long, 1.8-2.4 mm. broad; achenes about 1.5 mm. long; pappus typically of 5 or 10 acute to acuminate or awn-tipped (sometimes also lacerate-ciliate) scales 0.3-1.8 mm. long3. *A. Kidderi*.
- 4(2). Rays 40 to 65 (to 85); achenes 1.5-2 mm. long; hairs of peduncles coarse and hispid, from swollen bases, usually rather sparse, widely spreading, 0.2-0.6 mm. long; lower leaves toothed to deeply pinnatifid, passing rather abruptly into the narrowly oblanceolate or linear entire middle and upper ones, the uppermost 5-30 mm. long and 0.7-2.8 mm. broad; plant clump-forming perennial from obliquely branched or almost creeping woody bases5. *A. Riddellii*.
4. Rays 16 to 42; achenes 1.3-1.5 mm. long; hairs of peduncles rather fine and soft, from slightly swollen bases, sparse to dense, widely spreading to deflexed, 0.3-1 mm. long; lower leaves saliently toothed to deeply pinnatifid, passing gradually into the smaller and less divided middle and upper ones, the uppermost 5-20 mm. long and 0.3-2 mm. broad; plants annual from a taproot, rarely overwintering4. *A. ramosissimus*.

²⁰⁴ Adapted from L. H. Shinnars in *Wrightia* 1:95-121. 1946.

1. *Aphanostephus pilosus* Buckl. Annual 6-33 cm. tall, naked for 3-12 mm. or as much as 25 mm. in age at the top of the stem; whole plant conspicuously hispid-pilose with coarse jointed translucent hairs; involucre 4.5-5.8 mm. long; phyllaries coarsely hispid on the back, in about 3 or 4 series; rays 12 to 18; disk corollas more or less hardened in age but not inflated; pappus a distinct cuplike shallowly lobed lacerate-ciliate scaly crown about 0.3-0.4 mm. long. Locally abundant in prairies, Plains Country, June; also Okla.

2. *Aphanostephus skirrhobasis* (DC.) Trel. Annual to 5 dm. tall, usually much less; ultimate branchlets or peduncles naked for 5-70 mm.; whole plant moderately to very densely gray-pubescent with rather fine and soft hairs; involucre about 6-8.2 mm. high; phyllaries imbricated in about 4 or 5 series; disk flowers more than 250 per head; corollas about 2-2.5 mm. long, the base becoming whitened, hardened and bulbous-enlarged in age, to 1 mm. thick; pappus an irregular lacerate-ciliate scaly crown or of distinct acute scales of unequal length, 0.25-0.9 mm. long.

Two varieties are recognized in Texas.

Var. *skirrhobasis*. Pubescence of the involucre rather coarse and hispid. Abundant in open sandy places, Plains Country and n.-cen. Tex., s. part of e. Tex. and the Llano Region of the Edwards Plateau, infrequent s. to the n. part of the Rio Grande Plains, Mar.-June; also Ark. and Okla.

Var. *thalassius* Shinners. Low spreading habit and soft gray felty pubescence; pubescence of the involucre much finer and softer than in typical variety. Abundant in coastal sands in s.e. Tex. and Rio Grande Plains; also to Fla., La. and Tam.

3. *Aphanostephus Kidderi* Blake. Annual 7-35 cm. tall; involucre 5-6.5 mm. high; phyllaries hispid-pubescent on the back, imbricated in about 3 series; disk corollas with whitish hardened bulbous-enlarged base twice or more the original diameter of the tube; pappus a scaly crown, most typically of 5 or 10 acute to acuminate or awn-tipped often lacerate-fimbriate scales 0.3-1.8 mm. long, conspicuous pointed tips sometimes developed only above the angles of the achene. Abundant in open sandy places, Rio Grande Plains, Apr.-June (-Aug.); Tex., N.L. and Tam.

This species perhaps intergrades to some extent with *A. skirrhobasis*.

4. *Aphanostephus ramosissimus* DC. Annual 5-45 cm. tall; involucre 3.3-7 mm. high; phyllaries hispid-pubescent on the back, imbricated in about 3 series; disk corollas thickened at about 0.5 mm. above the base but only slightly swollen; pappus a minute ciliate crown to 0.25 mm. long. *A. arizonicus* Gray. Exposed calcareous sandy loam, Plains Country, Edwards Plateau, Rio Grande Plains and the Trans-Pecos, rarely e. to n.-cen. Tex., Mar.-June (-Aug.); N.M., Ariz., Tex., Chih., Coah., N.L. and Tam.

5. *Aphanostephus Riddellii* T.&G. Perennial from a woody base; old plants forming dense clumps as much as 35 cm. thick; stems 1-5 dm. tall; long peduncles naked for 2-10 cm. below the heads in flower and 3-15 cm. in fruit; stems, branches and leaves glabrate to moderately densely pubescent with hispid hairs from swollen bases, widely spreading or slightly curled and appearing very slightly deflexed; involucre 4.5-6.2 mm. high; phyllaries hispid on the back, in about 3 or 4 series; corollas only slightly hardened or thickened at base in age, not swollen; pappus a rather minute ciliate crown, rarely as much as 0.2 mm. long. Calcareous open places, abundant on Edwards Plateau, frequent in Plains Country and limestone cuestas on the Rio Grande Plains, Mar.-June (-Oct.); N.M., Coah., N.L., Tam. and Tex.

44. EVAX GAERTN.

RABBIT-TOBACCO. COTTON-ROSE

Low taprooted annuals, gray floccose-woolly all over, usually branching near the base and above; leaves alternate, mostly spatulate, usually 2-15 mm. long; heads smaller in comparison, somewhat urceolate in very dense woolly glomerules terminating stems and branches, the glomerules subtended and often intruded by leaves, branches ultimately emerging from the axils of the subtending leaves; true involucre absent, the apparent phyllaries being pales of the receptacle; receptacle often slightly raised or even conical, chaffy nearly throughout, the pales thin, often woolly, often tardily deciduous; *ray flowers* absent; *disk flowers* of 2 sorts, pistillate, fertile ones in a broad peripheral zone and a few perfect but usually infertile ones at the center; pistillate

flowers with only a vestige of a tubular-filiform corolla; central flowers with a slightly flared 4-toothed corolla and four microscopically caudate anthers; achenes oblong-elliptic in outline, dorsiventrally compressed, elliptic or lenticular in transection, less than 1 mm. long, brownish-translucent, often microscopically papillose; pappus absent.

A temperate region genus of perhaps two dozen species.

1. Glomerules of heads mostly sessile in the axils of leaves and distributed along elongate stems; perfect (central) flowers usually fertile3. *E. candida*.
1. Glomerules of heads nearly all terminal at the ends of branches; perfect (central) flowers usually infertile (2)
- 2(1). Glomerules of heads subtended by leaves 6-12 mm. long and with numerous shorter internal leaves whose tips conspicuously protrude from between the heads; achenes usually sharp-edged, lenticular in transection2. *E. prolifera*.
2. Glomerules of heads subtended by leaves 3-10 mm. long and with very small leaves among and about equaling the heads; achenes blunt-edged, elliptic in transection1. *E. verna*.

1. *Evax verna* Raf. Annual 3-12 (-15) cm. tall; glomerules of heads terminal on usually divergent branches, the internal leaves of the glomerules barely if at all protruding above the rounded woolly surface of the glomerule; leaves subtending the glomerules only 3-10 cm. long; achenes elliptic in transection, the thinner sides blunt or rounded. *E. multicaulis* DC., *Filaginopsis Drummondii* T.&G., *Filago verna* (Raf.) Shinnery, *F. nivea* Small. Often abundant in a variety of soils nearly throughout the state (rare in the higher parts of the Plains Country and Trans-Pecos), spring; Tex., Okla., N.M., N.L. and Coah.

2. *Evax prolifera* DC. Annuals very much like *E. verna* but the glomerules of heads slightly larger, the internal leaves subtending the glomerules of heads 6-12 mm. long; achenes lenticular in transection, the edges sharpish. *Filago Nuttallii* Shinnery, *F. prolifera* (DC.) Britt. Locally abundant on limestone, Edwards Plateau and lower Plains Country, infrequent in n.-cen. Tex. and rare in n. parts of Rio Grande Plains, spring; also Okla.

3. *Evax candida* (T.&G.) Gray. Annual usually 6-12 (-25) cm. tall, from the base with 1 to usually several stems nearly simple and ascending, in the upper axils with sessile glomerules of heads. *Calymandra candida* T.&G., *Filago candida* (T.&G.) Shinnery. Locally abundant on sandy prairies, e. and s.e. Tex., rare w. to n.-cen. Tex. and extremely rare farther w. (Burnet and Llano cos.), spring; endemic.

45. STYLOCLINE NUTT.

A small genus of Eurasia and North America.

1. *Stylocline micropoides* Gray. WOOLLY-HEAD FANBRACT. Taprooted annual (2-) 5-15 cm. tall, whitish-woolly essentially throughout, branched, each branch terminating in a glomerule of heads tightly subtended by a mass of woolly leaves; leaves alternate, nearly linear to linear-spatulate, (5-) 8-20 mm. long, those just below the heads linear-oblanolate to spatulate; heads extremely crowded in the terminal glomerules; a true involucre absent, the apparent phyllaries being outer pales of the receptacle subtending the peripheral flowers; receptacle somewhat mushroom-shaped, flat on top, chaffy only in a peripheral zone below the edge of the flat top; pales cymbiform, with a pronounced dorsal keel in the lower half which reflects the ventral infolding and enclosure of the flower, woolly in lateral-dorsal zones in the lower half, the tip scarious and acutish, the pale and its enclosed fruit eventually falling in late spring as a unit; ray flowers absent; disk flowers of three sorts: (1) peripheral pistillate fertile flowers without corollas, subtended by the pales and lacking pappus; (2) pistillate fertile flowers in an annular intermediate zone, not subtended by any pales, with filiform-tubular corollas and with a pappus of several almost plumose bristles united at the base and caducous as a unit; (3) apparently perfect fertile flowers numbering only 1 to 3 immediately in the

center of the head, not subtended by pales, with 4-toothed corollas somewhat more amply developed and slightly flaring, with anthers caudate basally (i.e., each of the 2 thecae of each of the four anthers with a linear appendage basally), with a pappus as in the last; achenes somewhat dorsiventrally compressed, oblong-elliptic in outline and elliptic in transection, brownish, translucent, less than 1 mm. long, microscopically papillose in vertical lines (less so or almost smooth in the case of the achenes of the peripheral subtended flowers). Rare at El Paso in the Trans-Pecos, spring; reported to occur also in Calif., Nev., Ut., N.M. and Ariz. but there is some doubt that the same species is represented throughout this range. Our species was described on the basis of poor immature material, and has perhaps been misinterpreted.

46. GNAPHALIUM L. CUDWEED. EVERLASTING

Usually floccose-woolly taprooted annual herbs or rarely weak perennials; leaves alternate, sessile, often decurrent; heads cymosely clustered or in dense glomerules at the top; receptacle naked, essentially flat; phyllaries in several series, subequal or more strongly graduated, nearly totally scarious but usually with a green semirigid midnerve; ray flowers absent; disk flowers numerous, all fertile but those toward the center of the head lacking the androecium; corolla linear with 5 minute teeth apically, with two basal tails (one on each theca); style branch appendages absent; achenes terete or flattish, essentially nerveless; pappus of numerous scabrous capillary bristles in one series, minute.

A cosmopolitan genus of perhaps 200 species.

- 1. Pappus bristles united basally, deciduous together as a unit (2)
- 1. Pappus bristles not united basally, if deciduous then severally (4)
- 2(1). Leaves narrowly oblanceolate to nearly linear, 1-6 mm. broad, about equally gray-woolly on both surfaces8. *G. falcatum*.
- 2. Leaves narrowly obovate or broadly oblanceolate, 5-20 mm. broad, not as densely pubescent on upper surface as on lower (3)
- 3(2). Leaves closely whitish-pannose on the lower surface (the hairs subappressed and tightly interwoven, not loosely villous), the upper surface green and sparsely pubescent; involucre with dense wool only at the base, mostly glabrous7. *G. purpureum*.
- 3. Leaves loosely villous-woolly on the lower surface, the upper surface much less densely pubescent and grayish-green; involucre rather densely and abundantly woolly not just at the base6. *G. pensilvanicum*.
- 4(1). Leaves at maturity on the upper surface bright green (often drying brown) and somewhat glandular-pubescent (5)
- 4. Leaves at maturity gray-woolly on both surfaces (7)
- 5(4). Leaves not decurrent5. *G. obtusifolium*.
- 5. Leaves decurrent (6)
- 6(5). Tips of phyllaries pearly white, papery, not shiny; stem densely whitish-woolly even at maturity2. *G. leucocephalum*.
- 6. Tips of phyllaries whitish-stramineous to pale-brownish, thin-scarious, shiny; stems glandular-pilose1. *G. Macounii*.
- 7(4). Leaves mostly strongly decurrent3. *G. chilense*.
- 7. Leaves not at all or only obsoletely decurrent4. *G. Wrightii*.

1. *Gnaphalium Macounii* Greene. CLAMMY CUDWEED. Annual; stems rather stiffly erect, glandular-pilose, usually 3-10 dm. tall, usually simple below, branched only at the very top; leaves bright-green (drying brown) and glandular-pubescent above, whitish-tomentose beneath, all decurrent as thin wings on the stem; heads campanulate-subglobose, 5-6 mm. high, with about 130 to 150 flowers; phyllaries with the shiny thin-scarious tips stramineous to pale-brownish, strongly graduated, conspicuously scarious nearly throughout; pappus bristles not united basally, separately attached.

G. decurrens Ives. Local in Rio Grande Plains and Trans-Pecos, rare in s.e. Tex. and the Llano region of the Edwards Plateau, (Apr.-) July-Oct.; widespread in temp. N.A.

2. *Gnaphalium leucocephalum* Gray. WHITE CUDWEED. Robust annual with a pleasant aroma; stems numerous, densely whitish-tomentose, usually 30 dm. tall or more; leaves bright-green and strongly glandular-pubescent above, whitish-tomentose beneath, all short-decurrent, the cauline ones narrowly linear; heads 4-6 mm. high; phyllaries strongly graduated, conspicuously scarious nearly throughout; tips of phyllaries pearly white, papery, not shiny; pappus bristles not united basally, separately attached. Infrequent, Davis and Glass mts. in the Trans-Pecos, Aug.-Oct.; also Ariz., Son. and Calif.

3. *Gnaphalium chilense* Spreng. COTTON-BATTING. Annual, usually 25 cm. tall or more, often with several simple stems erect or ascending from the base; leaves mostly strongly decurrent, gray-tomentose above as well as beneath; heads in glomerules, 4-6 mm. high, campanulate-subglobose; phyllaries graduated strongly, very obtuse, scarious nearly throughout; tips of phyllaries scarious, yellowish or stramineous; corollas yellowish; achene smooth; pappus bristles not united basally, attached separately. *G. sulphurescens* Rydb. Davis Mts. in the Trans-Pecos, recently reported from Garza and Wheeler cos. in the Plains Country (not seen), May-Oct.; Mont. to Wash. s. to Tex., Ariz. and Calif.

4. *Gnaphalium Wrightii* Gray. Taprooted annual or weak perennial, usually 25 cm. tall or more; pubescence closely woolly but not glandular; leaves not or only obsoletely decurrent, gray-tomentose on both sides; heads 4-6 mm. high; phyllaries strongly graduated, woolly only at the base, scarious nearly throughout; tips of phyllaries white or only slightly stramineous, mostly obtuse; pappus bristles not united basally. *G. texanum* I. M. Johnst. Frequent in mts. of the Trans-Pecos, rare e. to Edwards Plateau, May-Oct.; Tex. to Calif. and n. Mex.

5. *Gnaphalium obtusifolium* L. CAT-FOOT, FRAGRANT CUDWEED. Annual, usually rather strictly erect and usually 25-50 cm. tall, somewhat aromatic; stems at first woolly, later glandular-puberulent or glandular-villous; leaves not decurrent, thinnish, lanceolate to linear, often undulate-margined, basally narrowed, woolly when young but soon bare and green and commonly viscid-puberulent or glandular on the upper surface; heads in glomerules; involucre dull-white, soon with a rusty tinge; phyllaries oblong, obtuse, in 3 to 5 lengths, somewhat graduated; perfect flowers few; achenes sometimes lightly 3- or 4-nerved; pappus bristles not united basally. *G. polycephalum* Michx. Frequent in e., s.e. and n.-cen. Tex., infrequent w. to Edwards Plateau, Sept.-Nov.; Gulf States n. to e. Can.

6. *Gnaphalium pensilvanicum* Willd. Annual or biennial 1-4 dm. tall, resembling *G. purpureum*, usually with several stems from the base; leaves obovate or broadly oblanceolate, 5-20 mm. broad, lower surfaces loosely villous-woolly, grayish, the upper surfaces less densely pubescent and slightly greener; heads in spikelike arrangements, i.e., the few-headed glomerules nearly sessile in the axils of the leaves of the upper dm. of the stem; involucre 3-4 mm. high, brownish to purplish but nearly buried in the wool so that the color is not too apparent; pappus bristles united in a ring basally, all the pappus deciduous as a unit. *G. spathulatum* of many auth., not Lam., *G. peregrinum* Fern. Widespread but scattered in the e. half of Tex., more common in sandy soils of Rio Grande Plains, spring; Gulf States n. to Pa.; also s. Calif.

7. *Gnaphalium purpureum* L. PURPLE CUDWEED. Annual, usually 1-3 dm. tall, often with several ascending stems from the base; leaves oblanceolate, lower surfaces closely white-pannose with the subappressed hairs tightly enmeshed, upper surfaces much less densely pubescent, usually green and sparsely pubescent; the few-headed glomerules of heads nearly sessile in the axils of the upper dm. of the stems, thus in a spikelike arrangement; involucre 4-6 mm. high, densely woolly only at the base; pappus bristles united in a ring basally, deciduous as a unit. E. half of Tex., most common in e. Tex. in sandy soils but as far w. as the Llano region of the Edwards Plateau, spring; widely distributed in warmer parts of Am., n. to N.E., N.Y., O., Ind., Ill., Mo. and Kan.; also Ore.

8. *Gnaphalium falcatum* Lam. Annual, closely resembling *G. purpureum* but the narrower leaves linear or linear-oblanceolate and about equally woolly on both surfaces; involucre 4-6 mm. high, densely woolly only at the base; pappus bristles united in a ring basally, the entire pappus deciduous as a unit. *G. purpureum* var. *falcatum* (Lam.) T.&G. E. half of Tex., local, spring; introd. (?) in the s.e. states and occurring w. to Tex.

47. FACELIS CASS.

A genus of 4 species of South America.

1. *Facelis retusa* (Lam.) Sch. Bip. Annual taprooted herb 6-20 cm. tall, with usually several or numerous branches near the base, these often decumbent for most of their length, usually covered with a close gray wool; leaves alternate, essentially sessile, 15-30 mm. long, 2-4 mm. broad, spatulate, apically usually retuse but with a central mucro; heads in a tight leafy glomerule at the terminal 1-2 cm. of the stem or branch; receptacle naked, essentially flat; phyllaries (at least the inner ones) mostly scarious; *ray flowers* absent; *disk flowers* of 2 sorts, the central ones perfect and usually fertile and with a 5-lobed corolla, the peripheral ones pistillate and with a slender truncate or obscurely lobed corolla; each anther at the base with 2 short tails or long points; achenes whitish-pubescent; pappus of numerous whitish plumose bristles several times longer than the achene. *F. apiculata* Cass. Infrequent roadside weed in sandy soils, e. Tex., Apr.-May; nat. of S.A., now widely distributed in s.e. U.S.

48. ANTENNARIA GAERTN. EVERLASTING. LADIES' TOBACCO.
PUSSY'S TOES

Perennial herbs with dark slender branching rhizomes or stolons; aerial stems arcuate-ascending at intervals, (3-) 6-25 (-35) cm. tall, simple, leafy below, each terminating in a few-headed glomerule; leaves alternate, the blades olive-green and glabrate above but grayish woolly-floccose beneath, usually spatulate to narrowly obovate, often much-reduced or sparse above, the larger ones (to 3-6 cm. long) with narrow subpetiolar bases, crowded near ground level; heads campanulate, about 1 cm. high; phyllaries in 1 or few series, linear or oblong, blunt, the distal part being shiny white-scarious (or silvery in aspect); receptacle convex, naked or papillate; *ray flowers* absent; heads and disk flowers unisexual (pistillate on some plants, staminate on other plants), numerous; flowers of *pistillate plants* with tubular-filiform corollas and a pappus of numerous nearly capillary bristles; achene less than 1 mm. long, brownish, oblong, densely papillate; flowers of *staminate plants* with a flaring 5-toothed corolla, 5 caudate anthers and a pappus of whitish bristlelike members which toward the tips are clavate-expanded and dorsiventrally flattened.

A very widely distributed genus of more than 100 liberally interpreted species. Some "species" reproduce asexually, staminate plants being absent; but populations of our 2 species include plants of both sexes in about equal abundance.

1. Head-bearing stems only 3-10 cm. long and with only 2 or 3 remote appressed leaves; leaves of the other (procumbent) stems only 1-2 cm. long, spatulate 1. *A. marginata*.
1. Head-bearing stems taller and with usually more leaves; leaves of the procumbent stems often 3-4 cm. long, usually with an ovate or obovate bladelike portion and a very narrow subpetiolar base 2. *A. fallax*.

1. *Antennaria marginata* Greene. Characters as in the key. Rare in Davis Mts. in the Trans-Pecos (Mt. Livermore, Madera Canyon), May-June; Colo., Ariz., Ut., N.M. and Tex.

2. *Antennaria fallax* Greene. Characters as in the key. *A. plantaginifolia* (L.) Rich. var. *ambigens* (Greene) Cronq. Frequent in sandy forested areas in e. Tex., infrequent w. to n.-cen. Tex., spring; most of e. U.S.

49. PTEROCAULON ELL. BLACKROOT

A genus of 4 species of warmer parts of the Americas.

1. *Pterocaulon virgatum* (L.) DC. Perennial herb, each woody crown with only 1 (or 2) erect simple virgate stems (5-) 8-15 dm. tall; leaves linear, 5-15 cm. long, green or brown above, densely white-woolly beneath, long-decurrent on the stem as narrow wings; heads densely crowded in an interrupted spikelike aggregation at the top of the stem; involucre campanulate, 4-5 mm. long; phyllaries lanceolate, in about

3 or 4 series, densely white-woolly except the very tip; receptacle less than 1 mm. broad, essentially naked or with a few hairs, flat or slightly concave, blackish; *ray flowers* absent; *disk flowers* of 2 kinds, the more peripheral ones pistillate and fertile with a filiform corolla, the central ones perfect but infertile with the corolla tubular; each of the 2 cells of each of the 5 anthers with a slender tail on the lower end; achenes about 1 mm. long, columnar, several-ribbed, pubescent; pappus of a single series of persistent very fragile white bristles. Infrequent in sandy soils, e. and s.e. Tex. and Rio Grande Plains, late summer-fall; W.I., e. Mex. and Tex.

50. PLUCHEA CASS.²⁰⁵

MARSH-FLEABANE. STINKWEED

Aromatic annual or perennial herbs; leaves alternate; blades simple, unlobed, usually crenate or serrate, ovate to linear-lanceolate, glabrous to glandular-pubescent to floccose; petioles present or absent; heads usually crowded in corymbiform terminal aggregations; involucre campanulate to hemispheric; phyllaries strongly imbricated, herbaceous to chartaceous; receptacle flat, naked; *ray flowers* absent; *disk flowers* very numerous, a few central ones perfect but infertile, the much more numerous outer ones pistillate and fertile; corolla rose to rose-purple or creamy-white, tubular, the corolla of the staminate central flowers 5-lobed, that of the fertile flowers 3-lobed; achenes less than 1 mm. long, cylindrical, dark-brown or reddish-brown, 4- to 6-angled or with prominent ridges, setose to hirtellous or glabrous and with a minute white enlargement basally; pappus a single series of fine barbellate bristles.

A genus of about 9 species of the Americas.

1. Leaves broadly elliptical to lanceolate or ovate to ovate-lanceolate, petiolate or sessile, if sessile the bases of the blades narrowed to the midribs, neither auriculate-clasping nor truncate (2)
1. Leaves oblong to oblong-ovate or oblong-elliptical to oblong-lanceolate, sessile, the bases of the blades auriculate-clasping to truncate, not narrowed to the midribs (3)
- 2(1). Leaves petiolate; phyllaries with resin-globules, only the outermost puberulent and ciliate; the aggregation of heads characteristically elongate and paniculiform, not flat-topped, each branch terminating in a convex aggregation 1. *P. camphorata*.
2. Leaves sessile or petiolate; phyllaries glandular or not, the outermost and median ones copiously puberulent and ciliate, the inner ones sparsely puberulent on their summits; the overall aggregation of heads cymiform, the younger branches elongating and exceeding the more central ones, thus producing a flat-topped or layered inflorescence 2. *P. purpurascens*.
- 3(1). Corollas creamy-white; heads 8-10 mm. high; outer phyllaries obtuse or obtuse-apiculate 3. *P. foetida*.
3. Corollas rose-purplish; heads 4-6 mm. high; outer phyllaries acuminate 4. *P. rosea*.

1. *Pluchea camphorata* (L.) DC. CAMPHOR-WEED. Annual or perennial herb to about 15 dm. tall; stems glabrate below, puberulent on the upper portions and the head-bearing branchlets, leafy to the summit; blades elliptical to oblong-elliptical, 6-15 cm. long, 3-7 cm. broad, marginally dentate-serrate to repand-serrate or essentially entire, upper and lower surfaces with sparsely distributed resin-globules, the lower surfaces puberulent; overall aggregations of heads characteristically elongate-paniculiform, the branches numerous and terminating in smaller convex paniced cymose clusters, the central uppermost "cymes" maturing first but the lateral ones not nearly equaling them in height, occasionally only one terminal "cyme" of heads developing on the entire plant; phyllaries with resin-globules, the outermost sparingly pubescent and ciliate, the

²⁰⁵ Largely adapted from R. K. Godfrey in Jour. Elisha Mitchell Sci. Soc. 68:238-271. 1952.

median and inner not pubescent. Frequent in moist places, e., s.e. and n.-cen. Tex., summer-fall; s.e. U.S.

2. *Pluchea purpurascens* (Sw.) DC. CANELA. Annual herb to about 15 dm. tall; stems glabrate below, copiously puberulent on the upper portions and on the cyme-bearing branches, the latter sometimes cinereous or sordid, leafy to the summit; leaves sessile or petiolate, generally short-ovate to ovate-lanceolate, sometimes lanceolate or elliptical, the apex generally obtuse varying in the more lanceolate or elliptical blades to long-acute, the margins from evenly to unevenly serrate or serrate-dentate or entire; surfaces of the blades varying from essentially glabrous or very sparsely puberulent to copiously puberulent or essentially tomentose; overall placement of heads basically cymiform, the central axis maturing first, the lateral branches equaling or exceeding it in length, thus giving a flat-topped or layered structure; outer and median phyllaries copiously puberulent and ciliate, the inner sparsely puberulent on the summits. Throughout Tex. in muddy places, our most abundant species, summer-fall; s. half of U.S. s. to n. S.A.; W.I.

3. *Pluchea foetida* (L.) DC. STINKING-FLEABANE. Perennial herb 5-8 dm. tall; stems glabrate below, sparingly pubescent in the median portions, densely pubescent and approximately lanate on the head-bearing branchlets; leaves 3-10 (-13) cm. long, 1-3 cm. broad, sessile; lower cauline leaves lanceolate or oblanceolate with cuneate or truncate bases; median and upper leaves oblong to oblong-elliptical or occasionally ovate-oblong, rarely lance-elliptic, typically shallowly auriculate-clasping but occasionally the median and upper leaves as well as the lower with cuneate bases; leaf margins shallowly and unevenly apiculate-serrate; leaf surfaces glandular above, pubescent below; overall arrangement of heads usually loose panicle-cymelike tending to be flat-topped; heads about 8 mm. high; corollas creamy-white. Infrequent in mud, e. and s.e. Tex., s. to Aransas Co., summer-fall; s.e. U.S.; W.I.

4. *Pluchea rosea* Godfrey. Perennial herb 30-55 cm. tall, gray-green; stems glabrate below; surfaces of the stems, leaves and involucre with sessile hemispherical glands and resin-globules, upper stems pubescent, the upper head-bearing branches and involucre tomentose or sometimes rufescent; leaves sessile, the lower oblanceolate with truncate to cuneate-truncate bases, midstem leaves larger and wider, oblong to ovate-oblong or elliptical-oblong with cordate subclasping bases or lanceolate to oblanceolate with cuneate-truncate bases, about 2-7 cm. long, 5-30 mm. broad; upper leaves smaller but similar; margins of the leaves apiculate-serrate; involucre 4-6 mm. high; corollas rose-purple. Infrequent in s.e. Tex. (Hardin and Harris cos.), summer; coastal areas, N.C. to Tex., S.L.P. and Q.Roo; W.I.

51. TESSARIA R. & P.

ARROW-WEED

An American genus of 3 or 4 species, of which we have one.

1. *Tessaria sericea* (Nutt.) Shinn. Shrubs 1 m. tall or more with numerous erect branches, willowlike, gray-green, with a "rank" odor; leaves alternate, simply sericeous, linear-lanceolate, entire, essentially sessile, 1-6 cm. long, (2-) 3-5 (-6) mm. broad; heads crowded into convex subcorymbiform aggregations 2-5 cm. across at the ends of the branches; involucre campanulate, 4-5 mm. high; outer phyllaries ovate, obtuse and tomentose; inner phyllaries linear, deciduous with the flowers; receptacle slightly concave, naked; ray flowers absent; disk flowers very numerous, a few central ones perfect but infertile (their corollas flared, purplish, 5-lobed), the much more numerous outer ones pistillate and fertile (the corollas filiform, 4-lobed terminally); achenes of fertile flowers about 0.5 mm. long, brownish, about 5-ribbed, nearly columnar or slightly flattened; pappus of infertile (staminate, central) flowers persistent, of flattened whitish bristlelike members which near the tips are discolored brownish and about twice as broad as the lower part; pappus of fertile flowers white, bristlelike, persistent, not thickened or discolored. *T. borealis* T.&G. *Pluchea borealis* (T.&G.) Gray, *P. sericea* (Nutt.) Cav., *Polypappus sericeus* Nutt., *Bertholetia sericea* (Nutt.) Rydb. Locally abundant near streams in the Trans-Pecos, summer; Tex., N.M., Chih., Son., Ariz. and Calif.

Reported to be a good honey plant.

52. POLYMNIA L.²⁰⁶

LEAF-CUP

An American genus of 19 species.

1. *Polymnia Uvedalia* (L.) L. BEAR'S-FOOT. Perennial herb occasionally to as much as 3 m. tall; roots fibrous, often partly tuberous; stems few, erect, furrowed, purple-spotted, glabrous to densely pilose, to 3 cm. thick at the very base; leaves (at least the lower ones) opposite, to 68 cm. long and 39 cm. broad, sessile or winged to base, palmately 3- to 5-lobed and veined, ovate to deltoid, scabrous to nearly glabrous above, glabrous or resin-dotted and puberulous below, the hairs larger on the main veins, the base abruptly cuneate to the winged portion; upper leaves sparsely dentate, often not lobed; heads solitary at the ends of the pedunculiform stems; peduncles glabrous, densely pilose, with or without glandular-tipped hairs; phyllaries 4 to 6, in about 2 series, about 20 mm. long and to 12 mm. broad, broadly ovate to ovate-lanceolate, glabrous above, glabrous or with sparse pubescence or greenish-yellow sessile glands below; receptacle flat or convex; *ray flowers* in 1 series, pistillate, fertile, 7 to 13; rays yellow, to 3 cm. long, about 1 cm. broad, the tube 2 mm. long, pilose or glandular-pilose externally; *disk flowers* infertile, staminate, 45 to 80, the corollas yellow, sparsely pilose externally; pales subtending the disk flowers lanceolate, chartaceous; achene 6 mm. long, 4 mm. broad, longitudinally multistriate, ovoid and somewhat laterally compressed, at first white, turning red, purple and finally black; pappus absent. Infrequent or rare in moist crevices of limestone soil near streams, n.-cen. Tex. and e. edge of the Edwards Plateau. Our plants are all of the var. *densipilis* Blake which occurs from Tex. and Okla., s. and cen. Mo. into s.w. Ill., e. to Pa. and Del., and along the Coastal Plain to cen. Fla., also in O., Ind., Tenn., Ky. and W.Va. The species as a whole, including 3 varieties altogether, occurs through much of e. U.S. w. to Okla. and Tex.

Polymnia maculata Cav., of Mexico and Central America, is probably conspecific, too.

53. MELAMPODIUM L.²⁰⁷

BLACK-FOOT

Taprooted annual herbs or caespitose perennials; leaves opposite and decussate, sessile, entire or lobed; heads solitary, arising on peduncles from the middle or upper dichotomies; outer involucre cupulate; outer phyllaries 5, lanceolate-ovate, margin opaque, apex acute, gamophyllous or free; inner phyllaries each enclosing a single ray achene, generally somewhat ribbed and tuberculate, often expanded above the achene into a hood and sometimes bearing an extended awn; *ray flowers* pistillate, the corollas yellow or white, apically bidentate (sometimes obscurely tridentate); *disk flowers* few to many; corollas yellow, regular, 5-lobed, throat salverform-funnelform; ovaries linear and abortive; paleae scarious with a conspicuous midrib, at apex dentate-laciniate.

A genus of 36 species found chiefly in Mexico and Central America.

1. Annual; rays yellow, inconspicuous (0.6-1.5 mm. long); outer phyllaries lanceolate-elliptic; disk flowers 4 to 6 1. *M. hispidum*.
1. Perennials; rays white, conspicuous (2-13 mm. long); outer phyllaries ovate; disk flowers 25 to 50 (2)
- 2(1). Outer phyllaries gamophyllous for more than half their length 2. *M. leucanthum* var. *leucanthum*.
2. Outer phyllaries gamophyllous a third or less their length (3)
- 3(2). Margin of leaf base hispid with hairs 0.6-1.5 mm. long; stems strigose-hispid with hairs 0.2-1.5 mm. long 3. *M. cinereum* var. *hirtellum*.
3. Margin of leaf base strigose with hairs 0.3-0.6 mm. long; stems strigose-hispidulous with hairs 0.1-0.8 mm. long (4)

²⁰⁶ Adapted largely from James R. Wells in *Brittonia* 17:144-159. 1965.

²⁰⁷ Contributed by Tod F. Stuessy.

4(3). Leaves linear, 7-32 mm. long, 2-5 mm. broad; mature heads 3-5 mm. high; diameter of outer involucre 4.5-9 mm.; outer phyllaries 2.7-4 mm. long, 1.3-2.8 mm. wide; hood 0.8-1.5 mm. high 3. *M. cinereum* var.

ramosissimum.

4. Leaves linear-oblong, 12-55 mm. long, 1-14 mm. broad; mature heads 5-8 mm. high; diameter of outer involucre 7-14.3 mm.; outer phyllaries 3.5-7.3 mm. long, 2.3-5 mm. wide; hood 1.3-2.9 mm. high 3. *M. cinereum* var.

cinereum.

1. *Melampodium hispidum* H.B.K. Annual herb; stems moderately hispid-strigillose, 3-25 (usually 15-20) cm. tall; leaves 6-50 mm. long, linear-oblong to oblanceolate, entire to pinnately lobed (lobes 2 to 4), both surfaces strigose; heads 4-8 mm. broad (including awns on hoods, if present), 3-4 mm. high; outer phyllaries lanceolate-elliptic, at margin ciliate, free to very slightly gamophyllous at base, 2.7-6 mm. long; innermost phyllaries completely closed over ray achene apex (rarely with an opening about 0.3 mm. in diameter), sometimes expanded above the achene into a hood usually bearing a cirrhous apical appendage; rays 5 to 8, yellow, 0.6-1.1 mm. long, oblong-ovate; disk flowers 4 to 6; paleae yellow-tipped; chromosome number: $n = 20$. Davis Mts., local in and around Madera Canyon, Trans-Pecos, Aug.-Oct.; Tex. to Ariz. and s. to cen. Mex.

2. *Melampodium leucanthum* T.&G. var. *leucanthum*. Perennial herb or very weak subshrub, strigillose, 15-50 cm. tall; leaves 21-45 mm. long, linear-oblong, entire to pinnately lobed (lobes 0 to 6), both surfaces strigose and with globules of exudate; heads 20-37 mm. broad (including rays), 6-8 mm. high; outer phyllaries ovate, margin entire, gamophyllous for half to three-fifths their length, 5-7 mm. long; apical aperture of innermost phyllaries at point of corolla tube attachment about 0.5 mm. wide; bract expanded above the achene into a hood with a muticous apex (rarely mucronate); rays 8 to 10, cream-white, 7-13 mm. long, oblong-elliptic; disk flowers 25 to 50; chromosome numbers: $n = 10, 20$. Calcareous soil, w. Tex. e. to n.-cen. Tex. and e. margin of Edwards Plateau, Mar.-Nov.; N.M., Ariz., Colo., Kan. and Okla., s. to Chih. and Coah.

3. *Melampodium cinereum* DC. Perennial herb or weak subshrub, strigose-hispid to hispidulous, 14-20 cm. tall; leaves 7-55 mm. long, linear-oblong, both surfaces strigose and with globules of exudate; heads 5-23 mm. broad (including rays), 3-8 mm. high; outer phyllaries ovate, margin entire, gamophyllous for a sixth to a third their length, 2.7-7.3 mm. long; apical aperture of innermost phyllaries at point of corolla tube attachment about 0.5 mm. wide; bract expanded above the achene into a hood with a muticous to cirrhous apex; rays 7 to 13, cream-white, 2-8.2 mm. long, oblong-elliptic; disk flowers 25 to 50; chromosome numbers: $n = 10, 20$. Rio Grande Plains, n. to Val Verde, Uvalde and Bexar cos.; represented by 3 varieties as follows:

Var. *hirtellum* Stuessy. Stems with hairs 0.2-1.5 mm. long; leaves 11-34 mm. long, 2-10 mm. wide, linear-oblong, pinnately 2- to 8-lobed, basal part of margin and midrib beneath with hairs 0.6-1.5 mm. long; heads 9-18 mm. broad (including rays), 4-5.5 mm. high; outer phyllaries 3.3-6 mm. long; hood apex muticous-mucronate; rays 8 to 13, 3-6 mm. long; disk flowers 25 to 50; chromosome number: $n = 10$. Rio Grande Plains n. to Maverick, Uvalde, Kinney and Val Verde cos., Jan.-Nov.; also Coah. and N.L.

Var. *ramosissimum* (DC.) Gray. Stems with hairs 0.1-0.8 mm. long; leaves 7-32 mm. long, 2-5 mm. wide, linear, entire to pinnately cleft (with up to 10 lobes), basal part of margin and midrib beneath with hairs 0.2-1 mm. long; heads 5-14 mm. broad (including rays), 3-5 mm. high; outer phyllaries 2.7-4 mm. long; hood apex mucronate-cirrhous (rarely muticous); rays 7 or 8, 2-3.8 mm. long; disk flowers 25 to 35; chromosome number: $n = 10$. Cameron and Hidalgo cos. in extreme s. Tex., June-Dec.; also Tam.

Var. *cinereum*. Stems with hairs 0.1-0.8 mm. long; leaves 12-55 mm. long, 1-14 mm. wide, linear-oblong, entire or pinnately parted (with up to 10 lobes), basal part of margin and midrib beneath with hairs 0.2-0.6 mm. long; heads 9-23 mm. broad (including rays), 5-8 mm. high; outer phyllaries 3.5-7.3 mm. long; hood apex muticous to cirrhous; rays 7 to 13, 3-8.2 mm. long; disk flowers 30 to 50; chromosome numbers: $n = 10, 20$. Rio Grande Plains s. to Cameron Co., w. to Webb Co., n. to Bexar Co., e. to Jim Wells Co., Jan.-Dec.; also Tam.

The tetraploids, apparently of spontaneous autopolyploid origin, are scattered throughout the range.

54. ACANTHOSPERMUM SCHRANK

A genus of 8 species, primarily tropical American but also reported from Madagascar.

1. *Acanthospermum australe* (Loeff.) O. Ktze. PARAGUAY GREEN-STRIPE. Perennial herb, the lower parts of the stems subrhizomatous, horizontal; leaves mostly 2-3 cm. long including petioles, 1-2 cm. broad, the blades subrhombic, coarsely serrate in upper two-thirds; heads borne in groups of (1 or) 2 or 3, few-flowered, nearly cylindrical, about 7 mm. long; involucre double; phyllaries of 2 sorts, the exterior ones nearly flat and with the texture of leaves, the single series of inner ones folded over and almost completely enclosing the ray achenes and bearing slender projections with hooks or coils at the very end; receptacle paleaceous throughout; *ray flowers* present, pistillate, fertile; *disk flowers* perfect but infertile; achenes with coriaceous or thicker wall, the fertile ones of the rays glabrous, enclosed by and falling with the inner phyllaries; pappus essentially absent. Infrequent or rare in disturbed soils, e. Tex., Mar.-Oct.; widespread in warmer parts of Am., n. to Gulf States, probably adv. with us during the last 50 years.

55. SILPHIUM L. ROSIN-WEED

Perennial herbs from stout rhizomatous bases; stems usually stout and scabrous-hispid at least above, usually sparingly branched; leaves opposite at least below, usually alternate above, usually coarse-textured and scabrous, the lower ones usually narrowed to a subpetiolar base, those in the upper parts usually sessile and sometimes clasping; heads large and showy, variously arranged; involucre usually shallowly campanulate; phyllaries in several series, the outer ones usually broad and foliaceous (very stiff in species No. 1 and 2), coarse, usually scabrous, the outermost shorter than the middle and the innermost smaller, thinner and each subtending a ray flower; receptacle flat or slightly convex, chaffy throughout, the pales firm, usually pubescent apically; *ray flowers* several, in 2 or 3 series, pistillate, fertile, the rays showy, usually 2-4 cm. long, yellow (white in *S. albiflorum*); *disk flowers* numerous, apparently perfect but infertile, the yellow corollas 5-toothed but obscured by the long chaff; ray achenes strongly dorsiventrally flattened, the thin edges broadly firm-winged, the wings often as broad as the body of the achene and often prolonged apically so that the apex of the achene is emarginate, the sides of the notch being defined by the 2 minute awnlike members which represent the pappus (or these absent).

An American genus of perhaps 20 species, the taxonomy of which is rendered difficult by the tendency of a number of the species to hybridize.

1. Leaves pinnatifid (2)

1. Leaves not pinnatifid (3)

2(1). Wings of the achene prolonged beyond the apex of the body of the achene to form a V-shaped notch 3-5 mm. deep 1. *S. albiflorum*.

2. Wings of the achene not so greatly prolonged apically 2. *S. laciniatum*.

3(1). Leaves basal, or mostly confined to the basal few cm. of the stem length, exceedingly reduced and represented only by bracts at midstem, the stem subscapose 5. *S. gracile*.

3. Leaves not so confined, some well-developed ones present even at midstem or above (4)

4(3). Leaves mostly opposite even in the upper half of the stem and entire- or sub-entire-margined (except the lowermost which are usually withered prior to anthesis), long-tapered to an acute apex, gradually reduced upward so that some well-developed leaves are present nearly up to the base of the head or of the tight subcorymbiform aggregation of heads . . . 3. *S. asperimum*.

4. Leaves alternate in the upper third to two-thirds of the stem, usually coarsely toothed (except the uppermost), ovate-elliptic, much-reduced upward so that well-developed leaves are rare in proximity to the solitary more or less irregularly scattered heads 4. *S. Simpsonii* var. *Wrightii*.

1. *Silphium albiflorum* Gray. Perennial herb (2-) 4-10 dm. tall; stems terete (striate when dried), very scabrous; leaves alternate, very rigid, deeply pinnatifid, about as broad as long; heads in a racemelike arrangement at the top, sessile or short-peduncled, large; involucre rigid; phyllaries ovate, thickened and at length coriaceous basally, the middle ones with equally long or longer-spreading foliaceous acumination but this seldom surpassing the disk; rays white, about 25 mm. long, numerous; achenes puberulent, the wings produced and dilated apically into somewhat triangular projections which are adnate to a pair of subulate and more or less projecting awns, the notch narrow, 3-5 mm. deep. Barren limestone knolls and prairies, n.-cen. Tex., Edwards Plateau and Plains Country, summer; endemic.

This might be considered merely a variety of the next.

2. *Silphium laciniatum* L. COMPASS-PLANT. Perennial herb (3-) 5-8 (-12) dm. tall; stems terete (striate when dried), very scabrous; leaves alternate, very rigid, deeply pinnatifid, longer than broad, usually; heads in a racemelike arrangement at the top, sessile or short-peduncled, large; involucre rigid; phyllaries ovate or lance-ovate, thickened and at length coriaceous basally, the middle ones with equally long or longer spreading-foliaceous acumination often surpassing the disk; rays yellow, about 25-40 mm. long, numerous; achenes nearly glabrous, the wings produced and dilated apically into rounded projections, forming a notch 1-3 mm. deep. Rare in prairies, n.-cen., e. and s.e. Tex., summer; Wisc., Ill. and Minn., s. to Tex.

3. *Silphium asperrimum* Hook. Perennial herb (3-) 5-12 dm. tall, with one or few stems from the base, very sparingly branched, usually very scabrous-hispid at least above; leaves opposite nearly throughout, sessile and entire over most of the stems (only the lowermost with subpetiolar bases and obscurely serrate margins), most of them long-tapering to an acute apex, very scabrous, only very gradually reduced upward so that even in the immediate vicinity of the head(s) the leaves are well-developed; heads solitary or in a tight few-headed subcorymbiform aggregation, large; rays yellow. Incl. Texas plants referred to *S. speciosum* Nutt. Frequent in n.-cen. Tex., infrequent or rare in e. Tex., e. part of Edwards Plateau, summer; Mo., Okla. and Tex.

Apparently intergrading with *S. Simpsonii* var. *Wrightii* which in turn intergrades with *S. gracile*.

4. *Silphium Simpsonii* Greene var. *Wrightii* Perry. Perennial herb with one or few stems from the base, each irregularly and sparingly ascending-branched above, usually very scabrous-hispid at least above; leaves opposite usually only in the lower third (to two-thirds in some specimens) of the stem, alternate and much-reduced in size and abundance above (so that no well-developed leaf is in proximity to a head), mostly serrate, ovate-elliptic; heads usually solitary, terminal on the branches which are few and of irregular lengths, thus scattered in no definite arrangement; rays yellow. *S. Reverchonii* Bush. Infrequent in n.-cen. and e. Tex., summer; also La.; the var. *Simpsonii* occurs in Fla.

This can be interpreted as a relatively unstable taxonomic segregate resulting from past introgression of *S. asperrimum* and *S. gracile*, for it is intermediate between them and grades into both.

5. *Silphium gracile* Gray. Perennial subscapose herb (2-) 3-6 dm. tall, usually with a single simple monocephalous stem; leaves few, crowded near the base, scabrous, serrate, only very reduced bracteal (if any) leaves are present at midstem; rays yellow. Infrequent, s.e. Tex., s. to Aransas Co., in sandy soil, late spring-summer; also La.

See remarks under *S. Simpsonii*.

56. BERLANDIERA DC.²⁰⁸

GREEN-EYES

Herbaceous or suffrutescent perennials, arising from fleshy taproots; stems usually branched, decumbent to erect; herbage pubescent with multicellular trichomes, tomentose to scabrous; leaves alternate, simple, sessile to long-petiolate, ovate, obovate, deltoid, lanceolate or spatulate, cuneate to truncate or cordate at base, obtuse to acute at apex, the margins dentate, to crenate or lyrate-pinnatifid; heads multiflowered, paleaceous, usually paniculate-corymbose; receptacle small, somewhat turbinate with flattened or

²⁰⁸ Contributed by Donald J. Pinkava.

slightly depressed summit; *ray flowers* 2 to 13, usually 8, uniseriate, ovulate; rays yellow to orange-yellow with 9 to 12 anastomosing abaxial veins either green or red to maroon; *disk flowers* effectively staminate and (in our species) with red to maroon corollas; pappus absent or an inconspicuous crown of 2 or 3 small teeth; achenes wingless, dorsiventrally compressed, pubescent adaxially; 2 adjacent pales and disk flowers and the subtending phyllary adhering to each ripening achene and abscising with it; stringlike appendages retained about the receptacle.

A genus of four species of southern United States and northern Mexico.

1. Veins on undersurfaces of rays red to maroon; peduncles scabrous to subscabrous *and* leaves velvety with usually at least some lyrate-pinnatifid; stems arising from a persistent basal rosette1. *B. lyrata*.
1. Veins on undersurface of rays green; plant *not* with *both* scabrous to subscabrous peduncles *and* velvety leaves; leaf shapes variable but not pinnatifid; stems not arising from a persistent rosette (2)
- 2(1). Peduncles with long fine matted hairs; blades velvety, usually ovate, petioled2. *B. pumila*.
2. Peduncles with coarser erect to spreading or curling hairs; blades finely hirsute to subscabrous, ovate to deltoid (3)
- 3(2). Midstem leaves hirsute to subscabrous, lanceolate to deltoid, serrate to dentate, about two thirds as broad as long, short-petiolate or sessile; peduncles densely long-hirsute3. *B. texana*.
3. Midstem leaves finely to coarsely hirsute, usually crenate, one half to one and one fourth times as broad as long, petioled; peduncles with spreading to erect hairs; intergrades to 2 and 3 above4. *B. × betonicifolia*.

1. *Berlandiera lyrata* Benth. Herb with erect to decumbent stems to 12 dm. tall, rising from a persistent basal rosette or a cluster of shortened leafy branches; leaves velvety, lower ones long-petiolate; blades except sometimes the uppermost and/or lowermost lyrate-pinnatifid, the terminal lobe crenate to irregularly incised; peduncles long, scabrous to subscabrous; heads 13-17 mm. wide; rays yellow to orange-yellow, 10-14 mm. long, 5-5.8 mm. wide, with red to maroon veins beneath (sometimes entire lower surfaces so colored); achenes small, elongate, 4.5-6 mm. long, 2.7-3.7 mm. wide, quick-maturing. *B. incisa* T.&G. Dry rocky limestone soils, roadsides, Tex. Panhandle and Pecos River westw., most seasons of the year except during coldest weather; Kan., Colo., N.M. and Ariz., s. to S.L.P. and Ags.

On some of the higher mountains (Guadalupe and Glass mts.) are populations with unlobed, merely crenate blades. These have been distinguished as var. *macrophylla* Gray.

2. *Berlandiera pumila* (Michx.) Nutt. Herbaceous to suffrutescent perennial to 7 dm. tall, erect, usually branching; leaves ovate, obtuse, usually cordate, well-distributed along stem, without a persistent basal rosette; midstem leaves usually three fourths to one and one fourth times as broad as long, velvety, with crenate margins; peduncles with dense fine long matted hairs; heads 14-18 mm. wide; rays 12-20 mm. long, 6-9 mm. wide, deep yellow to orange-yellow, with green veins beneath; achenes 4.5-6 mm. long, 3-4 mm. wide. *B. tomentosa* (Pursh) Nutt. (incl. var. *dealbata* T.&G.). Along roadsides and grazed areas, woodland borders and open woodlots, often in deep loose sandy soils, e. Tex., usually spring and summer, less commonly in the fall; S.C., Ga., Fla., Ala., La. and Tex.

3. *Berlandiera texana* DC. Suffrutescent perennial to 12 dm. tall, often much-branched; midstem leaves sessile or short-petioled, about one half to two thirds as broad as long, the wider leaves found on plants toward the eastern portion of range, triangular to ovate with serrate to partially doubly serrate to dentate margins, stiffly hirsute to subscabrous, leaves well-distributed or crowded near summit; peduncles short, densely long-hirsute, bearing heads 18-27 mm. wide; rays 10.5-17 mm. long, 6.5-9 mm. wide, deep yellow to orange-yellow, with green veins beneath; achenes large, obovate, 4.5-6 mm. long, 3-4.8 mm. wide. *B. longifolia* Nutt. Commonly of sandy soils, at woodland margins, on hill-sides or along lightly shaded river banks; cen. and w. Okla. and n.w. Tex. plants have scabrous leaves and hirsute to subscabrous peduncles; also Mo.

Arkansas and south-central Texas plants have wider leaves with more obtuse apices, the pubescence is less erect and is often matted on lower portion of stem.

4. *Berlandiera* × *betonicifolia* (Hook.) Small (pro. sp.) Herbaceous to suffrutescent perennial with well-distributed leaves; stem usually branching; leaves variable, triangular to ovate; blades one half to one and one fourth times as broad as long, with dentate or serrate to coarsely doubly crenate margins, finely hirsute to nearly subscabrous; peduncles with fine curling long somewhat spreading hairs; heads 12-18 mm. wide; rays 9-18 mm. long, 5.4-9 mm. wide, deep yellow to orange-yellow, with green veins beneath; achenes 4-5.5 mm. long, 2.5-4 mm. wide.

This is considered to be a product of crossing of *B. pumila* and *B. texana*. Most characters are intermediate to those of the putative parents in varying degrees and combinations over its range of east-central Texas and western Louisiana.

57. LINDHEIMERA GRAY & ENGELM.

A monotypic genus.

1. *Lindheimera texana* Gray & Engelm. TEXAS YELLOW STAR, LINDHEIMER DAISY. Slenderly taprooted annual, (5-) 8-20 (-30) cm. tall, typically with a single nearly simple stem, usually with slightly harsh spreading pubescence; leaves alternate, crowded over most of the stem, obovate (rarely ovate) to oblanceolate, narrowed to both ends, coarsely toothed in the distal half, essentially sessile, bright-green; heads solitary on peduncles 1-3 (-4) cm. long; involucre 10-15 mm. high, roughly hemispheric; phyllaries in 2 series, (4 or) 5 external and (4 or) 5 internal, the outer 5 longer, narrower, more roughly pubescent and more acute; receptacle in 2 parts, the outer a narrow ring where the ray flowers are attached and a central stele 1-2 mm. high where the disk flowers are attached, chaffy throughout; ray flowers (4 or) 5, pistillate, fertile, the yellow ray about 1 cm. long and 2-toothed apically, showy; disk flowers perfect but infertile, the corolla yellow or red-brownish-yellow, 5-toothed; ray achenes very large, dorsiventrally compressed, flat and appressed to and nearly as large as the (4 or) 5 inner phyllaries, nearly as broad as long, wing-margined; disk pappus of 2 persistent awned scales, one over each shoulder of the achene. Abundant in prairies of n.-cen. and s. part of e. Tex. and Edwards Plateau, less abundant in Plains Country, spring; also Coah.

58. ENGELMANNIA GRAY

A monotypic genus.

1. *Engelmannia pinnatifida* Nutt. ENGELMANN DAISY. Perennial densely hispid herb from stout woody taproot, (1-) 2-5 dm. tall; stems one to several from the crown; basal leaves (1-) 2-3 dm. long, deeply once-pinnatifid; stem leaves 8-30 cm. long, deeply pinnatifid; in the upper dm. of the plant the branches numerous and pedunculiform, each branch capped by a head; involucre 6-10 mm. high, hemispheric; phyllaries in about 3 subequal series, those of outer series linear and green for most of their length (slightly dilated and discolored at the very base), the middle series slightly broader and discolored in the basal half, the inner series very broad and white-indurate most of their length; receptacle essentially flat and chaffy throughout, the pales linear; ray flowers usually 8, pistillate, fertile, each subtended by one of the inner phyllaries, the rays yellow, about 1 cm. long, elliptical, minutely 3-toothed apically; disk flowers perfect but infertile, the corolla yellow and 5-toothed terminally; ray achene dorsiventrally flattened, obovate; ray pappus of a few tardily deciduous scales, 2 slightly larger than the rest (one over each edge of the achene). Frequent in calcareous open uplands over the state (not the forested sandy areas of e. Tex.), commonest in n.-cen. Tex. and Edwards Plateau, spring (-summer); Neb., Colo., Kan., Okla., Tex., N.M., Chih., Coah., N.L. and Tam.

59. PARTHENIUM L.²⁰⁹

Bitter aromatic herbs or shrubs; leaves alternate, entire to highly divided; heads small, many-flowered, inconspicuously radiate, white, borne singly or in terminal corymbose or paniculiform aggregations; involucre usually nearly hemispheric or broader, of several

²⁰⁹ Adapted largely from Reed C. Rollins in Contr. Gray Herb. n.s. 172:1-73. 1950.

broad green phyllaries, the inner ones usually subtending the ray achenes and slightly shorter than the outer ones; receptacle slightly convex or flattish, chaffy throughout; *ray flowers* 5, pistillate, fertile, the white corollas and styles persistent at the apex of the mature achenes; *disk flowers* seeming perfect but infertile, numerous, their corollas whitish; all the disk florets except the peripheral row of 10 disarticulating and falling as a unit with their subtending pales; ray achenes dorsiventrally compressed, very flat, rotund in outline, the margins thickened into riblike structures which are attached to the contiguous pair of infertile disk flowers and the subtending phyllary, the achene, 2 attached flowers and phyllary falling together at maturity; pappus of 2 or 3 awns or 2 scales, or absent.

An American genus of about 16 species.

1. Shrubs; pappus of 2 or 3 awns or absent; heads truncate apically (2)
1. Herbs; pappus scalelike or aristate; heads slightly convex on top (3)
- 2(1). Heads congested on a long (1-2 dm. long) naked peduncle arising from below the branch apex; leaves silvery-canescenscent from a dense covering of appressed trichomes1. *P. argentatum*.
2. Heads not congested, in paniculately corymbose arrangements terminating the branches; peduncles short and bracteate; leaves white-tomentose
.....2. *P. incanum*.
- 3(1). Pappus of 2 weak linear awns; leaves large, variously dentate but not lobed; heads in flat-topped corymbose arrangements3. *P. hispidum*.
3. Pappus of 2 lateral scales; leaves deeply lobed to divided; heads loosely paniculate on numerous fertile branches (4)
- 4(3). Upper leaves and bracts pinnatifid, not markedly reduced upward; peduncles stout, the adjacent bract well-developed and often bilobed; pubescence of stems and leaf veins usually of long white trichomes much longer than those of the leaf blades; biennial or perennial4. *P. confertum*.
4. Upper leaves and bracts entire or bilobed with a linear terminal segment, the leaves markedly reduced upward; head-bearing region widely branching; peduncles slender, the adjacent bracts much-reduced to obsolete; pubescence similar on stems, leaf veins and blades; annual5. *P. Hysterophorus*.

1. *Parthenium argentatum* Gray. GUAYULE. Shrub 3-10 dm. tall, intricately branching just above the base, extremities of branches silvery-canescenscent; leaves long-petioled, silvery-canescenscent with dense covering of peltate trichomes, spatulate to narrowly oblanceolate, acute to acuminate, 2-6 cm. long, 5-20 mm. broad, entire to several-toothed; pedunculi-form, nearly naked axillary branches rising 1-2 dm. and topped by a congested mass of flat-topped heads; pappus 3 erect to slightly spreading awns. Locally abundant in calcareous deserts in the Trans-Pecos, (spring-) fall; Tex., Chih., Coah., N.L., Dgo., Zac. and S.L.P.; with an outlying station in Hgo.

See remarks under the next species.

2. *Parthenium incanum* H.B.K. MARIOLA. Shrub 4-10 dm. tall, intricately branched from the base, the branches cottony-pubescent with long simple trichomes, at length glabrate; leaves mostly lyrate, broadly oblong to obovate, short-petioled, lobed, sometimes deeply so (the lobes rounded), densely cinereous-tomentose beneath, less densely so above, 1-6 cm. long, 5-20 mm. broad; heads in paniculately corymbose groups terminating the main branches, flat-topped; pappus of 2 lateral divergent to erect pubescent awns and a weaker ventral awn (the latter occasionally absent). Very frequent in Trans-Pecos deserts, infrequent e. to Plains Country, Edwards Plateau and along the Rio Grande s.e. to Starr Co. in the Rio Grande Plains, summer-fall; Ariz., N.M., Tex., s. and s.e. to Jal., Michoac. and D.F.

This species and *P. argentatum* have hybridized and occasional hybrid swarms or contaminated individuals are found which cannot be referred with certainty to one or the other species.

3. *Parthenium hispidum* Raf. FEWERFEW. Perennial herb; roots often laterally branched to form underground runners; stems pilose-hispid, unbranched below, striate, 2-4 mm. thick, 2-8 dm. tall; basal leaves long-petioled; blades pilose-hispid, broadly lanceolate to

ovate, crenate to somewhat dentate, 6-20 cm. long, 5-10 cm. broad, with subpetiolar base 6-15 cm. long; lower stem leaves similar to basal, sometimes with a interruptedly winged subpetiolar base; upper stem leaves sessile, auriculate to scarcely so, ovate to ovate-lanceolate, crenate to dentate, pilose-hispid particularly along the veins; heads slightly convex on top, in flat-topped corymbose groups; pappus of 2 rather weak linear awns. *P. integrifolium* of auth. Rare in extreme n.e. Tex. (Bowie Co.), spring?-summer; W.Va., Va., N.C., Mich., Ill., Mo., Kan., Okla., La., Ark. and Tex.

4. *Parthenium confertum* Gray. Biennial or perennial herb; stems 1 to few from the base, branched above, longitudinally striate, 2-7 dm. high, densely hirsute with long simple trichomes; lower leaves pinnatifid to lyrate, with subpetiolar base, densely hirsute; middle and upper leaves sessile, usually crowded, pinnatifid to bipinnatifid, oblong in outline, often crenate, the lobes obtuse; heads slightly convex on top, loosely paniculate on numerous branches; pappus scales 2, broadly oblong to ovate or triangular, petaloid, often erose apically. Incl. var. *divaricatum* Roll. and var. *microcephalum* Roll., *P. lyratum* (Gray) Gray. Frequent in Trans-Pecos deserts and mts., e. to s. Plains Country, Edwards Plateau and Rio Grande Plains, summer-fall; Tex., N.M., Chih., Coah., N.L., S.L.P. and Zac.

Somewhat variable in the presence or absence of minute rays on the ray flowers, the shape of the chaff paleae, etc.

5. *Parthenium Hysterophorus* L. FALSE RAGWEED, SANTA MARIA FEVERFEW, CICUTILLA. Taprooted annual; stems hirsute, single from the base, paniculately branched above, longitudinally striate, 3-10 dm. tall; lower leaves forming a basal rosette, pinnatifid to bipinnatifid, hirsute, with a subpetiolar base; upper leaves entire to slightly lobed, sessile or with a short subpetiolar base, hirsute; heads slightly convex on top, numerous, borne in open paniculiform arrangements 3-4 mm. broad, densely pubescent; pappus of 2 scales, petaloid, closely adjoining corolla on either side, ovate to oblong, entire to faintly notched. Locally very abundant in disturbed ground, Rio Grande Plains and s.e. Tex., less frequent n. into n.-cen. Tex. and infrequent elsewhere in the state, summer-fall; very widespread in the warmer parts of Am., adv. as a weed n. to Mass., Mich. and Okla.; perhaps adv. to Tex.

60. IVA L.²¹⁰

SUMP-WEED. MARSH-ELDER

Annual or perennial herbs, glabrous or pubescent; leaves alternate or opposite, entire, serrate, lobed or pinnately divided; heads in a spiciform, spiciform-racemiform or paniculate arrangement, 2-8 mm. broad, containing both pistillate and staminate flowers, the pistillate flowers peripheral, the staminate flowers representing the disk flowers in the center of the head; receptacle essentially flat, paleaceous throughout; involucre hemispheric or turbinate; phyllaries 3 to 9, sometimes imbricate, free or united; staminate (disk) flowers 3 to 20, their corolla funnelform, 5-lobed, to 6 mm. long; peripheral pistillate flowers 1 to 9, the corolla tubular, truncate, to 6 mm. long or in some species rudimentary; achenes 1-13 mm. long, cuneate to obovate, somewhat compressed, glabrous, resin-dotted, tuberculate or pubescent at maturity.

A North American genus of 19 species.

- 1. Leaves lobed or dissected, or rarely unlobed but serrate; corolla of the peripheral (fertile) flowers absent or rudimentary (2)
- 1. Leaves never lobed or dissected; peripheral (fertile) flowers with developed corolla (4)
- 2(1). Leaves serrate, sometimes 3- to 5-lobed, never pinnatifid 8. *I. xanthifolia*.
- 2. Leaves pinnatifid (3)
- 3(2). Perennial; leaves villous-tomentose 7. *I. dealbata*.
- 3. Annual; leaves not tomentose 6. *I. ambrosiaefolia*.
- 4(1). Phyllaries united (5)
- 4. Phyllaries free (6)

²¹⁰Largely adapted from R. C. Jackson in Univ. Kan. Sci. Bull. 41:793-876. 1960.

- 5(4). Taprooted annual4. *I. angustifolia*.
 5. Perennial with creeping rootstocks5. *I. axillaris*.
 6(4). Annual; phyllaries hispid; mature achenes with few remote resin-dots; leaves of midstem usually ovate3. *I. annua*.
 6. Perennials; phyllaries not hispid; mature achenes with numerous resin-dots; leaves of midstem lanceolate to obovate (7)
 7(6). Leaves of midstem alternate, glabrous and fleshy; phyllaries 6 to 9, imbricate ..
1. *I. imbricata*.
 7. Leaves of midstem opposite, puberulent, not fleshy; phyllaries 4 to 6, not or only slightly imbricated2. *I. frutescens*.

1. *Iva imbricata* Walt. Perennial, woody at the base; stems decumbent, branched above, to 1 m. high, glabrous; leaves 1-5 cm. long, sessile, entire or rarely serrulate, the lowermost opposite, the midstem and upper ones alternate, oblanceolate to oblong, acute, thick, indistinctly 3-nerved; leaves of the head-bearing region reduced to bracts, entire; heads in racemes; involucre hemispheric to campanulate, 5-8 mm. broad, 3.5-5.8 mm. tall; phyllaries 6 to 9, free, imbricate, broadly obovate to orbicular, the margins membranous and erose, the dorsal surfaces glabrous; pales subtending the staminate (disk) flowers spatulate or oblanceolate, erose apically, those subtending the peripheral pistillate flowers oblanceolate to elliptic; staminate flowers numerous, 4-6 mm. long; pistillate flowers 2 to 4, corolla 1-1.5 mm. long; achene 3.5-5 mm. long, brown, resin-dotted at maturity. Rare on sandy beaches in s.e. Tex., known only from Mustang Island, Nueces Co., Aug.; also beaches in Va., Fla., La., Bah. I. and Cuba.

2. *Iva frutescens* L. Bushy perennial; stems 5-35 dm. tall, strigose above, glabrous below; leaves 4-12 cm. long, opposite below, becoming alternate in the head-bearing region, ciliolate with usually 5 to 17 teeth on each side, narrowly lanceolate to lanceolate or elliptic to obovate, often petioled, 3-nerved, strigose above and below, 2.5 to 8 times as long as broad; bracteal leaves of the head-bearing region linear, mostly entire; heads numerous in leafy panicles; involucre hemispheric, 4-6 mm. broad, 2-4.5 mm. high; phyllaries 4 to 6, free, obovate or ovate, sparingly strigulose on the back; palea subtending the staminate flowers linear to narrowly spatulate to oblanceolate; pales subtending the pistillate flowers broadly oblanceolate to oblong or broadly spatulate to elliptic; staminate flowers 6 to 19, with corollas about 2 mm. long; pistillate flowers 4 to 6, corolla about 1 mm. long; mature achenes brown, resin-dotted, 1-3.9 mm. long. Infrequent in mud flats and shallow water in coastal areas, s.e. Tex., s.w. as far as San Patricio Co., June-Oct.; the species as a whole occurs from N.S. to Tex. along the coast.

Essentially all our plants are referable to the var. *frutescens* with their leaves mostly 5 to 8 times as long as broad, the measurements of the flower and head parts approaching the lower limits of those given in the general description and the entire plant usually over 1 m. high. Another variety, the var. *oraria* (Bartlett) Fern. & Griseb., has been collected rarely at Galveston, the specimens perhaps representing casual introductions. It differs from var. *frutescens* mainly in being a smaller plant with typically larger elliptic to broadly lanceolate leaves.

3. *Iva annua* L. MARSH-ELDER, PELOCOTE. Taprooted annual 4-20 dm. tall; leaves opposite, 3-12 cm. long, ovate or becoming lanceolate upward, reduced in the head-bearing region to bracts; petioles present; heads in a terminal spiciform arrangement; involucre turbinate, 4-5 mm. broad; phyllaries 3 or 4, free, cuneate, apically rounded or truncate, dorsally hispid, hispid-ciliate marginally; pales subtending the staminate flowers mostly linear with sessile glands, those subtending the pistillate flowers filiform or with clavate tips, sometimes absent; staminate flowers 9 to 17, corolla about 2.5 mm. long; pistillate flowers 3 to 5, corollas about 1.5 mm. long; mature achenes 2-4.5 mm. long, brown, broadly ovate, lenticular. *I. caudata* Small, *I. ciliata* Willd. E. half of Tex., w. to Wheeler, Taylor, Travis, DeWitt and Hidalgo cos., late summer and fall; most of e. U.S., w. to Neb., Kan., Okla., Tex. and Tam.

4. *Iva angustifolia* DC. Annual, rarely overwintering; stems 5-12 (-14) dm. tall, 1-10 (-25) mm. thick at the base, much-branched above, sparingly to densely strigose; leaves opposite below, becoming alternate above, petiolate, entire or serrate, linear-lanceolate to

lanceolate, conspicuously 3-nerved on the larger leaves, strigose above and below, 2-4 (-5) cm. long, 2-8 (-12) mm. broad, bracts of the head region lanceolate to linear or linear-filiform; heads subsessile in the axils of bracts; involucre turbinate, 2-3 mm. broad, 2-3 (-4) mm. high; phyllaries united into a cup, strigose to hispid on the backs, villous-ciliate at the tips; receptacular scales subtending the staminate flowers filiform to linear, those of the pistillate flowers absent; staminate flowers 1 to 3 (to 5), the corolla about 2 mm. long; pistillate flowers 1 or rarely 2 in each head, the corolla about 1.5 mm. long; mature achenes black, rugose, sometimes pubescent at the apex, 2-2.8 mm. long. E., s.e. and n.-cen. Tex., Edwards Plateau, Trans-Pecos and Rio Grande Plains, locally abundant, late summer-fall; Ark., Okla., Tex. and La.

The plants of the sandy coastal areas of the Rio Grande Plains have a tendency to be robust, the plants and the stems approaching the maximum values given in the general description above, and they may have a tendency to overwinter more often than those farther north. The leaves and especially the bracts in the head region have a tendency to be proportionately broader than those of the plants farther north. These have been called *I. angustifolia* var. *latior* Shinnery and *I. texensis* R. C. Jackson. They can at most be considered varietally distinct.

5. *Iva axillaris* Pursh. Perennial herb from creeping rootstocks; stems herbaceous or ligneous at base, 3-6 dm. tall, strigose to villous; leaves opposite or becoming alternate above, subsessile, unlobed, at margins entire, ovate to elliptic or sometimes spatulate, obtuse, indistinctly 3-nerved; leaves of the capitulescence smaller but similar; heads short-peduncled, solitary in the upper bract axils; involucre hemispheric, 4-5 mm. broad, about 2.5-3 mm. high; phyllaries 4 or 5, united to the middle or above to form a cup (rarely 1 phyllary free), the tips rounded; palea of staminate flowers oblanceolate to spatulate, those of the pistillate flowers oblanceolate or absent; staminate flowers 8 to 20; corolla 2-2.5 mm. long; mature achenes brownish, 2.5-3 mm. long. In the Panhandle (Bailey and Oldham cos.), in and about playa lakes, Apr.-July; Man., Alta. and Wash. s. to Tex., N.M., Ariz. and Calif.

6. *Iva ambrosiaefolia* (Gray) Gray. Much-branched annual; stems 3-8 dm. tall, terete, velutinous and hispid, or with only appressed hairs; leaves alternate, ovate, 5-6 cm. long, bipinnatifid with confluent segments, pubescent on both surfaces, sometimes hispid on the main veins, ultimate segments obtuse or acute and toothed; heads numerous, usually short-peduncled in axillary spikes or panicles and terminal naked panicles; involucre hemispheric, 2-2.5 mm. high, 4-5 mm. thick; phyllaries 5, obovate to oblanceolate, sparingly hispid on the backs; pales subtending the staminate flowers linear-spatulate, those subtending the pistillate flowers cuneate-obovate, obtuse to truncate, the apex entire or slightly erose; staminate flowers numerous, their corolla about 1.5 mm. long; pistillate flowers 6 to 8 in each head, corolla vestigial or absent; achenes corky and ridged when immature, usually smooth and black at maturity, 1.2-1.5 mm. long. Infrequent in the Trans-Pecos deserts, late summer and fall; Ariz., N.M. and Tex., s. to Dgo., Zac. and S.L.P.

7. *Iva dealbata* Gray. WOOLLY SUMP-WEED. Perennial; stems erect, 3-7 dm. tall, striate-angled, tomentose; leaves petioled, alternate, oblanceolate in outline, 5-12 cm. long, pinnately cleft and veined, rugose-tomentose above and below, the terminal divisions ovate or oblanceolate, the basal divisions usually lanceolate; heads numerous in terminal panicles; involucre hemispheric, about 3 mm. thick; phyllaries 5, distinct, slightly imbricate, ovate, the margins membranous and villous-ciliate, usually glabrous on the backs; pales subtending the staminate flowers absent, vestigial or rarely well-developed and oblanceolate, those subtending the pistillate flowers rarely present; staminate flowers 7 to 14, corolla about 1.5 mm. long; pistillate flowers usually 5, corolla 0.3-0.7 mm. long; achenes dark-brown or purplish-brown at maturity, 1.4-2 mm. long. Locally abundant in calcareous deserts in the Trans-Pecos, late summer and fall; N.M. and Tex. s.w. to Dgo., Zac. and S.L.P.

8. *Iva xanthifolia* Nutt. Robust annual; stem 4-20 dm. tall, usually glabrous but sometimes pubescent; leaves of midstem opposite, 7-30 cm. long, 3-nerved, usually scabrous above, strigose or tomentose below, ovate or subcordate, coarsely serrate and sometimes 3- to 5-lobed; heads numerous in axillary spikes or panicles and naked terminal panicles, sessile or pedunculate; involucre turbinate, 4-5 mm. broad; phyllaries 5, obovate,

acuminate, hispid on the backs; pales subtending the staminate flowers subulate or filiform but sometimes absent in the center of the receptacle, those subtending the pistillate flowers obovate, concave, ciliate; staminate flowers 8 to 20, corolla about 2.5 mm. long; pistillate flowers usually 5, corolla 0.5 mm. long or represented only by a small flange at the base of the style; mature achenes obovate, finely muricate, usually dark-brown, about 3 mm. long. Infrequent in sandy stream beds and sandy stream margins, higher parts of the Plains Country, late summer to fall; Que. to Alta. and s. to D.C., O., Mo., Tex., N.M. and Ariz.

61. HYMENOCLEA T. & G.

A western American genus of about 4 species.

1. *Hymenoclea monogyra* T.&G. BURRO-BRUSH. Perennial broomlike subshrub 5-10 (-20) dm. tall, densely branched, the branches ascending; leaves alternate, linear or usually filiform; heads in small roughly globose axillary clusters, about 5 mm. high, of 2 kinds, the more numerous heads of staminate flowers and the less numerous pistillate ones, both kinds present in the same cluster; *staminate heads* with about 5 to 10 flowers, with a few papery obovate phyllaries and the outer flowers subtended by chaff but the inner not; corollas off-white, tubular and 5-toothed apically; *pistillate heads* bizarre, 1-flowered; involucre papery, whitish, with a basal obconical portion about 1 mm. high and 9 to 12 spreading obovate outer phyllaries about 2 mm. long forming a saucer-shaped winglike structure, and in the middle of the "saucer" a few inner phyllaries united to form a tubular-conic corolla-like structure, the solitary pistillate flower comprising merely an ovary and deeply bifurcate style occupies the basal cup and the inner tube cone, the tips of the style protruding from the top of the cone; pappus absent; entire pistillate head becomes airborne as a unit. Locally frequent in sandy desert washes in the Trans-Pecos, rare e. in Edwards Plateau, Sept.-Oct.; Tex., N.M., Ariz., Calif., Baja Calif., Son. and Chih.

62. AMBROSIA L.²¹¹

RAGWEED

Annual or perennial herbs (when perennial usually proliferating from runnerlike roots), 2-30 dm. tall, leafy, resinous and aromatic with glandular trichomes; leaves alternate or opposite at the lower nodes (in some species opposite nearly throughout), entire or palmately lobed or (usually) pinnately lobed or dissected, usually petiolate; ray flowers absent; heads unisexual, both staminate and pistillate borne on the same plant; staminate usually in narrow elongate racemelike or spikelike aggregations; pistillate clustered in axils of leaves and bracts below; *staminate heads* nodding, usually hemispheric; phyllaries few, uniseriate, more or less united; involucre frequently oblique by elongation of the portion away from the stem; receptacle flattish, chaffy throughout (the pales narrow); flowers several to many with rudimentary pistil (pistillodium) and wholly aborted ovaries; anthers usually more or less separated at anthesis; pappus absent; *pistillate heads* with one or few flowers; phyllaries fused about flowers to form a hard indehiscent nutlike receptacle, the phyllary tips more or less evident as spiny processes that project from the surface of the involucre at maturity; flowers lacking pappus, corolla and androecium. *Franseria* Cav.

A predominantly American genus with approximately 43 species, many of these being desert shrubs. They are wind-pollinated, the pollen of all species being highly allergenic.

1. Tubercles or spines of the pistillate head scattered in several series over the body of the fruiting involucre (2)
1. Tubercles or spines of the pistillate head in a single series (or absent) near the apex of the fruiting involucre (4)
- 2(1). Pistillate heads with 2 apical beaks, 2 flowers and 2 cells; foliage silver-canescens
..... 1. *A. Grayi*.
2. Pistillate heads with a single apical beak, flower and cell; foliage green (3)

²¹¹ Contributed by Willard W. Payne.

- 3(2). Pistillate head at fruiting time 2-5 mm. long; involucre spines short and incurved; staminate involucre lacking striations2. *A. confertiflora*.
3. Pistillate head at fruiting time 6-10 mm. long; involucre spines elongate and straight; staminate involucre with three black striations on distal lobes3. *A. acanthicarpa*.
- 4(1). Staminate heads sessile in a spikelike arrangement; staminate involucre very oblique, produced on side away from the stem into a lanceolate-acuminate lobe4. *A. bidentata*.
4. Staminate heads stalked in racemelike arrangements; staminate involucre only slightly if at all oblique (5)
- 5(4). Annual; cauline leaves distinctly petiolate (6)
5. Perennial; cauline leaves sessile (7)
- 6(5). Leaves broadly 3- to 5-lobed or unlobed; staminate head with 3 striations on distal lobes5. *A. trifida*.
6. Leaves pinnately lobed or dissected; staminate head lacking striations on distal lobes6. *A. artemisiifolia*.
- 7(5). Median leaves of flowering stems entire, silky-pubescent7. *A. cheiranthifolia*.
7. Median leaves of flowering stems pinnately lobed and toothed, scabrous-pubescent8. *A. psilostachya*.

1. *Ambrosia Grayi* (A. Nels.) Shinn. Upright perennial herb, proliferating by adventitious shoots from runnerlike underground roots, forming large colonies; leaves alternate; blades narrowed to petiolar bases to 5 cm. long, with several small lobes below the main expanded blade-portion; main bladelike portion obovate-deltoid to lanceolate, to 1 dm. long and 8 cm. broad, irregularly pinnately lobed, major basal lobes and terminal lobe much the largest, large lobes lanceolate-elliptical, serrate, both surfaces (and entire herbage) silvery gray-canescens; staminate heads in racemiform arrangements; pistillate heads in small clusters (2 to 5) or singly in axils of lower leaves and bracts; *staminate involucre*s stalked, to 5 mm. broad, 5- to 9-lobed, the lobes often somewhat irregular, shallow, the upper surface with fine dark striations along the mid-veins obscured by pubescence; *fruiting involucre*s to 7 mm. long and 4 mm. broad, each 2-flowered; spines up to 15, scattered, narrowed to slender uncinat tips. *Franseria tomentosa* Gray. Locally abundant in wet or seasonally moist swales and buffalo wallows, and in moist clay soils under cult., higher parts of the Plains Country, summer-early fall; Kan., Neb., Okla., Colo. and Tex.

2. *Ambrosia confertiflora* DC. Erect perennial forming large colonies by means of proliferations from runnerlike roots, to 18 dm. tall; leaves alternate, narrowed to petiolar bases to 15 cm. long and often with 1 to several pairs of small lobes below the main blade portion; main blade ovate-lanceolate to lanceolate, pinnately to tetrapinnately lobed, the lobes lanceolate to linear, attenuated or abruptly terminated, to 16 cm. long and 15 cm. broad, usually smaller, both surfaces green to somewhat gray-green, glabrous or nearly so to densely strigose, becoming somewhat velutinous; staminate heads in racemiform arrangements, the inflorescence often much-branched; pistillate heads usually abundantly produced in massive glomerules below the staminate "racemes;" *staminate involucre*s stalked, to 1 cm. broad, 5- to 9-lobed, the lobes obscure and poorly defined to well-defined with the sinuses extending nearly halfway to point of stalk attachment; *fruiting involucre*s to 5 mm. long and 4 mm. broad, often much smaller, the base tending to be elongate leaving the spines arranged on the upper two-thirds of the body, 1- (rarely 2-) flowered; spines 10 (or fewer) to 20, short, 1 mm. (or less) to 2 mm. long, slender, uncinat, often appressed, the bases associated with prominent involucre ridges and depressions. *Franseria confertiflora* (DC.) Rydb., *F. tenuifolia* Harv. & Gray and var. *tripinnatifida* Gray, *F. caudata* Rydb., *Ambrosia simulans* Shinn. Abundant in the Trans-Pecos, less frequent in disturbed soil e. to Taylor, Travis, Nueces, Kleberg and Cameron cos., summer-fall; Tex., s.w. Okla. and Colo., w. to Calif. and s.e. to Gro. and Jal.; adv. in H.I. and P.R.

3. *Ambrosia acanthicarpa* Hook. Erect annual herb to 15 dm. tall, becoming much-branched; leaves opposite below, alternate above, narrowed to petiolar base; blade extremely variable, broadly deltoid to narrowly lanceolate, to about 8 cm. long and broad, pinnately to tripinnately lobed, the lobes from narrowly linear to obovate and abruptly acute, both surfaces green or the central portions of the lobes somewhat whitened by pubescence above, sparsely tomentulose to strigose or hispid-scabrous; staminate heads in racemiform arrangements, these often much-branched; pistillate heads in few- to many-headed clusters below; *staminate involucre*s stalked (stalks to 15 mm. long, usually shorter), 3-12 mm. broad, 3- to 9-lobed, the lobes shallow to well-defined with sinuses reaching halfway or more to point of stalk attachment, upper surface of three distal lobes usually marked with heavy black striations along midveins; *fruiting involucre*s to 10 mm. long and 14 mm. broad, 1-flowered; spines to 30, flattened (rarely nearly terete), linear to lanceolate, sharply pointed, to 8 mm. long, scattered, occasionally vestigial or absent. *Franseria montana* Nutt., *F. acanthicarpa* (Hook.) Cov. Locally abundant near El Paso, infrequent e. to Hudspeth Co., late summer-early fall; most of w. U.S., e. to Dak., Neb., Kan. and Tex.

4. *Ambrosia bidentata* Michx. SOUTHERN RAGWEED. Erect annual taprooted herb, 3-10 dm. tall, rough-hirsute, becoming much-branched, the lateral and terminal branches often reaching approximately the same height; leaves mostly alternate, sessile, lanceolate, acuminate, 3-5 cm. long, usually with one broad basal tooth on each side, green, both surfaces hirsute, the hairs commonly with somewhat pustulate bases; staminate heads numerous in dense spicate aggregations; pistillate heads 1 or few per cluster, nearly hidden in axils of leaves subtending the "spikes"; inflorescences usually unbranched; *staminate involucre*s sessile, glandular-granuliferous, very oblique, turbinate, 2 mm. or more broad, the outer margin produced into a lanceolate hispid incurved lobe; *fruiting involucre*s 1-flowered, hirsute, elongate, obovoid, usually 4-angled, each angle terminating in a very sharp subulate spine 1 mm. long or longer and directed forward, the beak subulate and fully 2 mm. long. Rare in prairies in n.-cen. Tex. (Lamar Co.), Aug.-Sept.; Ill., O. and Ky. to La., Tex., Neb. and Okla.

5. *Ambrosia trifida* L. GIANT RAGWEED. Tall erect annual taprooted herb, 1-3 (-5) m. tall; stem angled, striate and scabrous; leaves opposite nearly throughout, scabrous on both sides, with petioles 5-15 cm. long, wingless or very narrowly winged; blades of lower leaves orbicular in outline, 1-2 dm. long, usually deeply 5-cleft, the major divisions often 2- to 3-lobed, the upper commonly 3-cleft or simple, becoming rhombic or ovate-lanceolate in outline, blades sometimes simple throughout, margin serrate; staminate heads in racemiform arrangements, these often much-branched and paniculate; pistillate heads in small to large clusters in axils of bracteal leaves below the "racemes," subtended by (usually) lobed bracts; *staminate involucre*s saucer-shaped, 3 mm. broad, with 6 to 8 rounded lobes, the 3 outer lobes with dark striations on the upper surface, hispidulous between the ribs, pales of the receptacle rudimentary; *fruiting involucre*s obovoid, about 4 mm. long, reticulate and with 4 to 8 obtuse ridges and as many small or obsolete tuberculate spines, the conic beak 1 mm. long or more. Abundant in seasonally moist stream bottoms and overflow areas throughout the e. and n. halves of the state, late summer-fall; throughout the midwest. and cen. U.S. to the Rocky Mts. and from s. Can. to n. Mex., adv. in N.E., Fla. and the far West.

Our plants are all of the form known as var. *texana* Scheele (*A. aptera* DC.), characterized by relatively small fruiting involucre and exceptionally scabrous indument. In the central and southern United States much of the fall hayfever is correctly attributed to this species.

6. *Ambrosia artemisiifolia* L. SHORT RAGWEED, ALTAMISA. Erect annual taprooted herb; stems 3-10 dm. tall, more or less hirsute or hispidulous, branched; leaves opposite below, alternate above, with petioles 1-3 cm. long, often narrowly winged, becoming subsessile or sessile in the inflorescence; blades ovate in outline, to 10 cm. long and 7 cm. broad, usually smaller (sometimes larger), pinnatifid to usually bipinnatifid, the lobes lanceolate, acute, directed forward, the winged rachis to 3 mm. broad, upper leaves often less divided, hirsutulous-puberulent above, strigose beneath and often hirsute on the veins; staminate heads in racemiform aggregations; pistillate heads in few- to several-headed clusters below, the inflorescence often much-branched and paniculate, occasionally nearly all or wholly unisexual; *staminate involucre*s slightly oblique, about 3 mm. broad,

crenate, hirsutulous, hispidulous, or long-hirsute or villous, broadly obconic; pales of the receptacle filiform; *fruiting involucre* obovoid, about 3 mm. long, hispidulous-strigose or glabrate, angled and somewhat reticulate, beak subulate and usually more than 1 mm. long; spines 5 to 7, subulate, short. *A. elatior* L. Infrequent and scattered in local populations through much of Tex. except extreme s. and w., late summer-fall; nearly throughout the U.S. (except the far s.w.) and s. Can., adv. elsewhere.

This is the most widespread and abundant of the ragweed species, and the principal source of allergenic pollen in most of the central United States.

7. *Ambrosia cheiranthifolia* Gray. Erect perennial herb, forming usually restricted often close-spaced colonies from roots; stems 1-3 (-4) dm. tall, grayish strigose; leaves opposite below (or nearly throughout), alternate above, oblanceolate or oblong-lanceolate, 2-4 (-7) cm. long; blade gradually narrowed to the sessile base, unlobed and entire-margined or the lower and larger leaves of juvenile shoots undulate-margined or shallowly pinnate, finely and densely strigose on both sides; inflorescence usually unbranched; staminate heads in racemiform arrangement; pistillate heads in small clusters in axils of leaves below "racemes;" *staminate involucre* saucer-shaped, about 4 mm. broad, canescent, with 4 to 6 triangular-acute lobes; pales of the receptacle linear or oblanceolate, 1-nerved, ciliate toward the apex; *fruiting involucre* puberulent, somewhat angled, obovoid, the body about 3 mm. long; beak stout, conic, 1.5 mm. long; spines 4 or 5, more or less spreading, blunt, about 1 mm. long. Infrequent or rare in the coastal parts of the Rio Grande Plains and s. part of s.e. Tex., in open clay prairies, late summer-fall; also Tam.

8. *Ambrosia psilostachya* DC. WESTERN RAGWEED. Erect perennial herb forming extensive colonies from runnerlike roots; stem 3-6 (-10 or more) dm. tall, often branched above, striate, hirsutulous with short ascending hairs; leaves subsessile, lanceolate to ovate-lanceolate, pinnatifid with the divisions linear-lanceolate, acute or acuminate, entire or the lower few-toothed or weakly lobed, scabrous-hirsutulous and glandular-granuliferous, the hairs with pustulate bases; inflorescence often much-branched; staminate heads in racemiform aggregations; pistillate heads in few- to several-headed clusters below; *staminate involucre* oblique, broadly obconic, about 2.5 mm. broad, crenate at the margins, often with 2 larger teeth at the distal side, hispidulous, the short hairs with conspicuous pustulate bases; body of *fruiting involucre* about 2.5 mm. long, obovoid, rugose, hirsutulous; beak nearly 1 mm. long, stout, tubercles 4 to 6, short, acute or blunt. *A. Lindheimeriana* Scheele. Very abundant on the Coastal Plain and much of the cen. part of Tex., frequent in the Plains Country and becoming less frequent w. until rare in the Trans-Pecos, late summer-fall; throughout most of the U.S. and s. Can. except the Rocky Mts. and e.-cen. states, s. to cen. Mex.

63. XANTHIUM L. COCKLEBUR

Taprooted annuals, 2-20 dm. tall; leaves alternate (those at the very lowest nodes opposite), petiolate, often irregularly toothed or even lobed, several cm. long; heads axillary, nearly sessile, unisexual; *pistillate heads* in the middle axils, burlike, the involucre usually obovoid and completely enclosing the 2 pistillate flowers, forming a conspicuous 2-chambered bur, prickly on the outside; flowers without any corolla or pappus, the achenes solitary in the chambers of the bur; *staminate heads* in the upper axils much smaller; involucre cup-shaped; phyllaries in 1 to 3 series, separate, foliaceous in texture; the receptacle high-conic, chaffy, throughout; ray flowers absent; disk flowers several, with minute tubular corolla and 5 free anthers and vestigial style and ovary.

An American genus (now widely distributed) of two dozen species or possibly as few as 2 species depending on the criteria used. Closely related to some of the franserioid ambrosias, with exaggerated "burs." The fruits are known to cause mechanical damage to animals while the young herbage, when eaten, is known to be poisonous to pigs.

1. Most nodes with a trifold yellow lateral spine attached near the base of the leaf
 1. *X. spinosum*.

1. Herbage not armed, only the heads armed 2. *X. strumarium*.

1. *Xanthium spinosum* L. SPINY COCKLEBUR. As in the key; leaves lanceolate. Infrequent, locally abundant in the Trans-Pecos, Edwards Plateau and Plains Country, sum-

mer-fall; widespread in the warmer drier parts of the world.

2. *Xanthium strumarium* L. ABROJO. As in the key; blades often as broad as long. *X. orientale* L., *X. chinense* Mill., *X. italicum* Moretti, *X. pennsylvanicum* Wallr., *X. saccharatum* Wallr., *X. speciosum* Kearm., *X. cenchroides* Millsp. & Sherff. Frequent throughout Tex., summer-fall; widespread.

It seems useless at this point to try to recognize more than one entity in this complex, for all the proposed segregates intergrade completely.

64. ZINNIA L.²¹² ZINNIA

Low shrubs (usually about 1 dm. tall); taproots woody; stems usually several from near the base; leaves opposite, linear, entire, sessile, the bases connate to some extent; heads terminal on the stems and branches, not much elevated above the herbage; involucre cylindrical to subhemispheric; phyllaries oblong to obovate, imbricate, graduated, the apexes mostly rounded and erose; chaffy throughout, the pales folded around the achenes, erose, membranous, scarious; *ray flowers* present, pistillate, fertile; rays yellow or white, persistent on their achenes, vaguely 3-toothed terminally; *disk flowers* perfect, fertile, the corollas white or yellowish, 5-toothed terminally (but irregular, 1 tooth being longer than the others), the teeth ciliate ventrally; style branches densely velutinous, acute; disk achenes laterally compressed or angular, glabrous or pubescent; pappus of awns. *Diplothrrix* DC.

An American genus of 17 species.

In addition to our native species, the cultivated *Z. peruviana* (L.) L. (*Z. multiflora* L.), a taprooted annual with red flowers, has been reported to be feral in Texas; it probably has escaped from cultivation.

1. Leaves linear to acerose, 1-nerved only at the base; rays white 3. *Z. acerosa*.
1. Leaves linear to very narrowly lanceolate, 3-nerved for at least half their length; rays yellow (2)
- 2(1). Rays to 18 mm. long; heads 5-8 mm. high 1. *Z. grandiflora*.
2. Rays small or wanting; heads 8-10 mm. high 2. *Z. anomala*.

1. *Zinnia grandiflora* Nutt. Shrublet 8-22 cm. tall; leaves linear, 3-nerved for at least half their length, about 25 mm. long, 2.2 mm. broad, strigose-scabrous; peduncles of varying lengths, to 11 mm. long; heads narrow-campanulate to cylindrical, 5-8 mm. high; phyllaries oblong, obtuse, with or without a dark summital band, subsquarrose, their apical margins erose-ciliate, often red-tipped; rays 3 to 6, yellow, ovate or orbicular, to 18 mm. long; ray achenes oblanceolate-linear, 3-angled, the lateral awns generally adnate to the ray or only slightly free at the apex, the awn of the inner angle none or minute; disk flowers usually 18 to 24, red or green in the same population, to 1 cm. long, with lobes 1 mm. long; disk achenes oblanceolate, angular or compressed, 4-5 mm. long; awns absent or 1 to 4, mostly 2 and unequal. Abundant in dry calcareous areas in the Trans-Pecos and Plains Country, summer-fall; Colo., Kan., Ariz., N.M., Chih., Coah., Dgo., Zac. and Tex.

2. *Zinnia anomala* Gray. Very low shrublet about 11 cm. tall, often straggly; leaves linear, to 3 cm. long, 4 mm. broad, marginally scabrous; peduncles less than 19 mm. long, mostly strigose; heads broadly cylindrical, 8-10 mm. high; phyllaries oblong, green with a dark-purplish-brown summital band or discolored zone, the apexes rounded, ciliate; rays absent or when present 5 to 8, yellow, reduced, to 5.7 mm. long but usually much smaller, scarcely tubed; ray achenes oblance-linear, 3-angled, 7-8 mm. long, striate, sparsely strigose, the pappus absent or of 1 or 2 very short awns; disk corollas about 20, brick-red, 5.5-6.2 mm. long; disk achenes oblanceolate, 3.2-5.8 mm. long; pappus of 2 equal or 2 or 3 unequal awns. Infrequent in the Trans-Pecos, rare in Edwards Plateau, summer-fall; Zac., Coah., N.L. and Tex.

3. *Zinnia acerosa* (DC.) Gray. Shrublet to 16 cm. tall; stem greenish, slender, tomentose; leaves acerose to linear, 1-nerved, to 2 cm. long and 2 mm. broad, strigose to

²¹² Adapted from Andrew M. Torres in *Brittonia* 15:1-25. 1963.

essentially glabrous; peduncles to 25 mm. long; heads narrowly campanulate, about 6 mm. high; phyllaries oblong, herbaceous, becoming scarious, their apexes obtuse, ciliate, with a dark summital band or the summit only roughened and discolored; rays 4 to 6, white, oblong to suborbicular, 1 cm. long or shorter, tubeless, green-nerved beneath; ray achenes oblanceolate, 3-angled, truncate apically, 2.6-4 mm. long, the awns striate, ciliate above, fused to and continuous with the main corolla nerves or the 3 awns free, or a single free awn present on the inner angle; disk flowers 8 to 13, yellow (drying reddish), 6 mm. long; disk achenes oblanceolate, 2.4-3.6 mm. long, striate, strigose or only upwardly ciliate, the pappus usually of 2 or 3 unequal awns or these much-reduced. Frequent in Trans-Pecos deserts and desert-grasslands, summer-fall; Ariz., N.M., Tex., Chih., Son., Coah. and N.L.

65. SANVITALIA LAM.²¹³

Taprooted annual herbs; stems pubescent, obscurely striate, terete; leaves opposite, petiolate to sessile, entire, pubescent, at the base connate and sheathing the stem; peduncles terete, pubescent, striate or absent; heads terminal, hemispherical; receptacle low-conical to high-conical; pales of the receptacle conduplicate, hyaline, scarious, usually dark-colored on the upper third, colorless below, at apex acuminate-cuspidate or simply rounded; phyllaries ovate to obovate; ray flowers pistillate, fertile; rays mostly persistent, entire or two-lobed, white or very pale-yellow, shortly tubed to usually tubeless; ray achene mostly 3-angled, mostly with 3 awns at the top representing the pappus; disk flowers perfect, fertile, the corolla tubular with five lobes; disk achenes generally of 2 kinds, those toward the periphery usually 3- or 4-angled, those toward the center of the head compressed and winged, all these disk achenes 0- to 4-awned, at the angles usually of thick cartilage, otherwise smooth to tuberculate.

About 7 species in southwestern United States and Mexico.

1. Leaves more than 7 mm. broad; phyllaries imbricate and graduate; rays membranous; awns of the ray achenes 2.5 mm. long (more or less) 1. *S. ocymoides*.
1. Leaves 4 mm. broad or less; phyllaries valvate, in one series; rays firm; ray achenes with 3 very short stout awns 2. *S. Abertii*.

1. *Sanvitalia ocymoides* DC. Taprooted annual, much-branched from the base, to 2 dm. tall; stems strigose; leaves ovate to obovate, strigose-hispid, darker on the upper surface; petioles to 1 cm. long; blades to 23 mm. long and 18 mm. broad, bases cuneate, apexes rounded; heads sessile, to 8 mm. thick; receptacle conical; pales of the receptacle about equaling the disk flowers, persistent, apexes cuspidate and purple-tipped, the keel lightly pubescent; phyllaries imbricate, graduated, obovate, sometimes foliaceous, pubescent on the upper third, margins ciliated, apexes sometimes mucronate; rays 8 to 11, persistent, reflexed, obovate, about 2 mm. long, glabrous, apex entire to 2-lobed, base adnate to the entire achene apex; ray achene obtriangular, 3-angled, striate, about 3 mm. long, essentially glabrous, becoming tuberculate, the three diverging awns about 2.7 mm. long, slender, expanded basally; disk corollas numerous, with distinct tube and limb, glabrous, about 2 mm. long; peripheral disk achenes 3- or 4-angled, tuberculate, usually awnless or simply with slender hairs; central achenes generally compressed, without a wing or with 1 or 2 wings, ciliate on the inner wing, the inner wing often larger, the achene awnless or with 1 or 2 awns. Infrequent in loamy or clayey soils, Rio Grande Delta, extreme s. Tex., late summer and fall; Coah., N.L. and Tex., s. to Jal. and Gto.

2. *Sanvitalia Abertii* Gray. Annual with taproots, erect, slender, to 26 cm. tall; stems strigose; leaves linear, sessile, entire, scabrous, to 5 cm. long and 4 mm. broad; peduncles 1-30 mm. long; head broadly campanulate, 4-5 mm. high; phyllaries valvate, about 9, linear, uniseriate, essentially glabrous, spreading at maturity, margins narrowly hyaline; receptacle elongate-conical; rays 5 to 9, glabrous, yellow, each usually opposite a phyllary, ovate, weakly reflexed, about 4 mm. high, dorsally with 8 to 10 green nerves, firm, apically 2-lobed; ray achene about 4 mm. long, broadly obtriangular, 3-angled, cartilaginous, truncate basally and apically, the 3 awns very short and very stout; disk

²¹³ Adapted from Andrew M. Torres in *Brittonia* 16:417-433. 1964.

corollas numerous, about 2 mm. high with distinct tube and limb; peripheral disk achenes about 3.5 mm. long, with 3 or 4 angles, tuberculate, essentially glabrous; central achenes compressed, winged; all disk achenes apparently awnless; pales of the receptacle not persistent, linear, glabrous, reddish-brown at the apex, greenish below, acuminate apically. Infrequent in mts. of Trans-Pecos at about 4,000 ft. elev., summer-fall; Ariz., N.M., Tex., Son., Chih. and Coah.

66. HELIOPSIS PERS. OX-EYE

Perennial herbs; leaves opposite, ovate to ovate-lanceolate or deltoid to deltoid-ovate, petiolate; heads terminal on the branches with ray and disk flowers; phyllaries in 2 or 3 series, herbaceous or coriaceous, ovate-lanceolate to ovate, subequal, the outer series often foliaceous and longer than disks; receptacle rather broadly convex, often hollow; pales of the chaff of the receptacle firm, conduplicate, persistent, light-brownish-yellow to red or purple; *disk flowers* perfect, the corollas yellowish to brownish-yellow or purple; *ray flowers* pistillate and fertile; rays yellow or orange-yellow, ovate-lanceolate to oblong-lanceolate, notched apically, persistent; achenes of the disk flowers fertile, quadrangular at the apex, conical at the base, glabrous or minutely pubescent, those of the ray flowers triangular with outer surface convex (otherwise as the disk achenes); pappus absent or represented by 2 or 3 membranous teeth or merely a crenulate ridge or crown.

An American genus of about a dozen species.

1. Rays 6 to 8 1. *H. gracilis*.
1. Rays 10 to 18 (2)
- 2(1). Achenes smooth, brown to dark-brown 2. *H. helianthoides*.
2. Achenes rugose to subtuberculate, tan or black 3. *H. parvifolia*.

1. *Heliopsis gracilis* Nutt. Erect perennial herb 3-4 dm. tall, slender, unbranched to sparingly branched; stems 1-1.5 mm. thick, glabrous, smooth; leaves ovate-lanceolate to lanceolate, 45-55 mm. long; blade 18-20 mm. broad, bright-green below, deep-green above, lower surface glabrous, upper surface sparingly strigose, more dense along margins, somewhat cuneate at base, acuminate at apex, regularly dentate with teeth averaging 1 mm. long; petioles 8-10 mm. long, glabrous to sparingly pubescent, subterete; peduncles 15-22 cm. long, glabrous below, minutely pubescent above; heads 10-12 mm. thick, 7-10 mm. high; phyllaries in 2 series, minutely pubescent on back, becoming more dense along the margins; outer phyllaries slightly foliaceous, spreading, linear-oblong, obtuse apically; inner phyllaries shorter, linear, obtuse; rays 6 to 8, linear, glabrous, 18-22 mm. long, 5-8 mm. broad, 1- to 3-cleft apically, golden-yellow; disk corollas 3.5-4 mm. long, throat pale-brownish-yellow, glabrous, the lobes dull-yellow; pales of the receptacle lanceolate, keeled, 8-10 mm. long, obtuse; achenes glabrous to minutely pubescent on margin, dull-brown; pappus a lacinate crown or 1 to 3 pointed teeth; ray achenes triangular; disk achenes quadrangular. Infrequent in loamy soil in s.e. Tex. (Brazoria and Harris cos.), Nov.; Fla., Ga., Ala., La. and Tex.

This could well be considered a variety of the next species.

2. *Heliopsis helianthoides* (L.) Sweet var. *scabra* (Dun.) Fern. Erect perennial herb 10-15 dm. tall, branched or unbranched; stems terete, sparingly pubescent above, glabrous below, 3.5-5 mm. thick; leaves lanceolate to ovate-lanceolate or deltoid-ovate, 7-12 cm. long, 3-6 cm. broad, glabrous to scabrous; petioles 20-25 mm. long; blade margin coarsely and irregularly dentate; peduncles 11-17 cm. long, scabrous above; heads 12-14 mm. thick; phyllaries in 2 or 3 series, lanceolate to ovate, acute to obtuse, the outer phyllaries usually somewhat like leaves; rays 12 to 14, pale-yellow below, orange-yellow above, 12-14 mm. long, 5-6 mm. broad; pales of the chaff 8-8.5 mm. long, 0.9-2 mm. broad, obtuse, membranaceous to slightly puberulous, brownish-yellow at apex; disk corollas brownish-yellow; ray achenes triangular, outer surface convex, 3-3.5 mm. long; pappus either absent or represented by 2 or 3 membranaceous teeth; disk achenes quadrangular at apex, rounded at base, 2-3.5 mm. long, otherwise as in the ray. Infrequent in open sandy woods, n. part of e. Tex., late summer to fall; Ill., Mo., Ark., Okla., Tex. and La. The species as a whole, including 3 varieties, occurs over much of s. Can. and e. U.S., w. to the Dakotas, Neb., Colo. and N.M.

3. *Heliopsis parvifolia* Gray. Erect perennial herb, 2-4 dm. tall, slender; stems 1.5-4 mm. thick, glabrous or sparingly pubescent below, striate; internodes 15-75 mm. long; leaves deltoid-lanceolate, approaching deltoid-ovate; blade 15-55 mm. long, 8-15 mm. broad, pale-green below to deep-green above, becoming stramineous when dry, both surfaces sparingly pubescent to nearly glabrous, the margin irregularly dentate to nearly entire with the lowermost teeth usually larger and irregular, decurrent or tapering abruptly on the petiole, apex acuminate to obtuse; petioles 8-25 mm. long, slender, puberulous; peduncles 85-200 mm. long, pubescent, apex more or less enlarged and hollow; heads 12-20 mm. broad including the rays; disk 8-10 mm. high; involucre 2-seriate; outer phyllaries exceeding the inner, oblong to oblong-lanceolate, apically acuminate, 4- to 6-nerved, densely pubescent on the margins; rays 9 to 11, 27-29 mm. long, 12-14 mm. broad, oblong-ovate, 7- to 9-nerved, 3-cleft, glabrous, golden-yellow when young, pale-yellow with age; disk corollas yellowish-brown, glabrous, 4-4.5 mm. long, the lobes brighter yellow than tube, obtuse; pales of receptacle lanceolate to oblong, glabrous, keeled, acuminate at apex, 8.5-9 mm. long, brownish-black, triangular, glabrous, rugulose, faintly nerved on each face; disk achenes without pappus, quadrangular, brownish-black when mature, 4-4.5 mm. long. Infrequent in mts. of the Trans-Pecos, June-Nov.; Ariz., N.M. and Tex. s. to Dgo., N.L. and Tam.

67. TETRAGONOTHECA L.

NERVE-RAY

Perennial herbs often from enlarged soft-woody taproots; stems 2-12 dm. tall, ascending; leaves opposite, from deltoid and merely coarsely toothed to pinnatifid, sessile or even connate-perfoliate, some narrowed somewhat basally to subpetiolar bases; heads large (often 2-4 cm. across); involucre shallowly campanulate; phyllaries in roughly two size-classes, those of the outer series always 4 in number, very conspicuous, foliaceous in texture, acute and enfolding the others in bud, those of the inner series 6 to 15, small, each subtending a ray flower; receptacle high-conical, chaffy throughout, the pales folded around the disk achenes; *ray flowers* 6 to 15, pistillate, fertile, the rays conspicuous, yellow (often with some red venation); *disk flowers* numerous, perfect, fertile, the corollas 5-toothed terminally, yellow; achenes 4-angled, truncate; pappus of several short scales or absent.

An American genus of four species, of which we have three.

1. Leaf blades saliently toothed; tall herb of east Texas forested areas 1. *T. ludoviciana*.
1. Leaf blades pinnatifid or repand; herbs 2-5 dm. tall, of drier areas of central and southern Texas (2)
 - 2(1). Plants with the mainly repand leaves crowded at base; corolla tube glabrous; sandy prairies of coastal southern Texas 2. *T. repanda*.
 2. Plants with leafy stems, the mainly pinnatifid leaves not remarkably reduced upward; corolla tube pubescent; calcareous uplands 3. *T. texana*.

1. *Tetragonotheca ludoviciana* (T.&G.) Gray. Stems one or several from the base, (3-) 6-12 dm. tall, leafy; leaves oblong to ovate, 5-17 (-20) cm. long, acutish, closely and saliently toothed, the lower ones with broad bases, the upper ones connate-perfoliate. Infrequent in sandy forested areas, e. Tex., rare w. to n.-cen. Tex., summer-fall; La., Tex. and Okla.

2. *Tetragonotheca repanda* (Buckl.) Small. Stems 2-4 (-5) dm. tall, leaves much-reduced for most of the stem length, the most conspicuous ones being basal, ovate to ovate-lanceolate or rarely narrow toward the top of the stem, or spatulate near the base of the stem, mostly acute, repand, narrowed into slender subpetiolar bases. Frequent in sandy prairies, s.e. Tex. and coastal part of Rio Grande Plains, summer-fall; endemic.

3. *Tetragonotheca texana* (Gray) Engelm. & Gray. Stems (2-) 3-6 (-7) dm. tall, usually solitary or 2 or 3; leaf blades oblong to elliptic or ovate in outline, pinnatifid, incised or repand, 3-10 cm. long, the lower ones basally cuneate, the uppermost expanded and connate-perfoliate at the node. Frequent in calcareous uplands, Edwards Plateau, n.-cen. Tex. and cuestas of the Rio Grande Plains, summer-fall; Tex., Coah., N.L. and Tam.

68. SCLEROCARPUS JACQ.

A genus of perhaps half a dozen species of the American tropics and subtropics.

1. *Sclerocarpus uniserialis* (Hook.) Hemsl. MEXICAN BONE-BRACT. Taprooted annual, rarely overwintering, the stems often 1 m. long but the plants not that tall because the stems often weak and sprawling, rather densely pubescent with antrorse-appressed whitish pustule-based stiff hairs; lower leaves opposite, upper ones alternate; blades (1-) 2-5 (-9) cm. long, usually ovate-rhombic, 3-nerved basally, coarsely toothed distally, acute, basally cuneate to rounded; heads solitary, on naked peduncles (1-) 3-10 cm. long, 1-2 cm. high; involucre of a few spreading linear or oblong-linear phyllaries, so sparse that the individual flowers are readily seen without removal of the involucre; receptacle high-conic, chaffy throughout, the pales narrowly ovate and mostly wrapped around the flowers; *ray flowers* several, pistillate but infertile; rays 5-15 mm. long, rotundly elliptic, yellow; *disk flowers* perfect, fertile, the corollas yellow (usually with reddish veins) and deeply 5-lobed terminally, permanently wrapped up in the investing pales and falling thus enclosed; achenes of the fertile flowers laterally compressed, subrhombic in transection, smooth; pappus essentially absent. *S. major* Small. Frequent in disturbed areas, Coastal Plain of s. Tex. (n. to Jackson, Bastrop, Travis and Comal cos.), late summer-fall; widespread in Mex.

69. ECLIPTA L.

A genus of a few, perhaps only one, species, widespread in the warmer parts of the world.

1. *Eclipta alba* (L.) Hassk. YERBA DE TAGO. Annual with taproots and occasionally also rooting at the nodes, to 1 dm. tall but mostly decumbent stems to 1 m. long, throughout with antrorse-appressed stiff hairs about 0.3-0.5 mm. long; leaves opposite, short-petiole; blades membranous, 2-10 cm. long, linear-oblong to narrowly elliptic, usually remotely and obscurely toothed; heads solitary at the ends of short axillary peduncles, about 1 cm. high; involucre broadly campanulate; phyllaries in roughly 2 series, outer phyllaries about 6, oblong-obovate, apiculate, blunt, inner series fewer, shorter and narrower; receptacle slightly convex, chaffy throughout, the linear pales bristlelike; *ray flowers* numerous, pistillate, fertile, the linear rays minute and white; *disk flowers* numerous, perfect, fertile, the corollas minute and whitish; achenes laterally compressed, rhombic in transection, narrowed to the base, each side with an elongate medial patch of verrucose projections; pappus absent or represented merely by slight points above the corners of the achene. In mud at the edges of fresh water bodies, nearly throughout, though rare in the Trans-Pecos and the higher parts of the Plains Country, summer-fall; warmer parts of the world.

Some authors claim that the species is indigenous to the Old World and introduced in the New World.

70. VARILLA GRAY

A genus of 2 species, one found only in Coahuila.

1. *Varilla texana* Gray. SALADILLO. Subshrub 2-3 dm. tall, much-spreading and forming hummocks, many branching stems rising from the subrhizomatous bases; leaves fleshy, alternate, terete, 1-2 (-3) cm. long, dark-green, confined to the lower part of the stems; ultimate branches simply erect, nearly naked, 1-2 dm. tall, each bearing a single head; involucre 5-10 mm. high; phyllaries numerous, lanceolate, acute, pale-green drying blackish, fleshy, the median vein firmer and thicker than the lateral portion, in 4 or 5 series, strongly graduated, appressed; receptacle high-conic, chaffy, the concave pales merely subtending the flowers; *ray flowers* absent; *disk flowers* perfect, fertile, the corolla yellow, 5-toothed; anthers purplish; achenes columnar or falcate-columnar, black, with 6 or 7 ribs and an equal number of less prominent intervening ones; pappus absent. Locally abundant in gypseous soil, Rio Grande Plains, Apr.-July, often again in Sept.-Oct.; also N.L. and Tam.

This species is a primary host plant for the root parasite, *Orobanche multiflora*.

71. ISOCARPHA R. BR.

A genus of a few species in the warmer parts of the Americas.

1. *Isocarpus oppositifolia* (L.) R. Br. Annual herb (2-) 3-6 (-10) dm. tall; branches opposite, widely spreading; leaves opposite, narrowly rhombic-ovate, 3-9 cm. long, narrowed to the base but lacking a clearly defined petiole, essentially entire, not at all crowded, smaller and narrower in the upper part near the heads; heads ovoid, solitary on the branches or sometimes in clusters of 3 when the uppermost branches are short; involucre obconic; phyllaries in about 2 series, lanceolate, 2-3 mm. long, acute, 3-nerved; receptacle high-conic, chaffy throughout, the pales much like the phyllaries; *ray flowers* absent; *disk flowers* perfect, fertile, shorter than and hidden by the chaff, the corollas whitish and 5-toothed; achenes about 1.5 mm. long, dorsiventrally flattened, minute, stramineous, slightly tapered toward the base, 5-ribbed (2 ribs on the abaxial side, 2 at the sharp edges and one on the ventral side); pappus absent. Exceedingly rare in the Brownsville region in extreme s. Tex., fall; W.I., Mex. and Tex.

Probably not a member of our flora except through occasional waiving, but a very common weed not far south in Tamaulipas.

72. SPILANTHES JACQ.

A world-wide genus of about 60 species.

1. *Spilanthes americana* (Mutis) Hieron. var. *repens* (Walt.) A. H. Moore. CREEPING SPOT-FLOWER. Perennial herb extensively creeping and rooting at many nodes, also rhizomatous, only the flowering branches ascending; leaves opposite; blades narrowly rhombic-ovate or deltoid-ovate, 2-4 cm. long serrate; petiole 1-2 cm. long; heads solitary, about 1 cm. high, on naked axillary peduncles 5-15 cm. long; involucre about 5 mm. high, of 2 series of subequal linear phyllaries; receptacle very high-conic, chaffy throughout, the pales enfolding the flowers and about equaling them; *ray flowers* few, pistillate but infertile; rays only a few mm. long, yellow, irregularly 3-toothed terminally; *disk flowers* numerous, perfect, fertile, the corolla yellow and 5-toothed; achenes somewhat laterally compressed but not flat (elliptic in transection and with 2 rounded edges), blackish; pappus absent or rarely of one or two awns. *S. repens* (Walt.) Michx. Local in mud along streams, bayous, lakes, ditches, etc., s.e., e. and n.-cen. Tex., late summer-fall. The var. *repens* occurs in s.e. U.S., other varieties occur in North America and South America.

73. ECHINACEA MOENCH²¹⁴

PURPLE CONE-FLOWER

Perennial herbs; rootstalks vertical or horizontal; stems erect, simple or branched, hirsute, hispid, strigose or smooth, rarely glaucous; leaves petiolate below, sessile and reduced above, alternate, ovate to ovate-lanceolate or lanceolate to elliptical, obtuse or acute, entire or coarsely toothed, pubescent or smooth, 3- to 5-veined; heads singly terminating pedunculiform stems or branches, the involucre conical or hemispherical; phyllaries in 3 or 4 series, imbricated, foliaceous, lanceolate to linear-lanceolate, attenuate or acute, ciliate, smooth or pubescent, showing transition into pales; pales conduplicate, terminated into sharp or blunt spines, exceeding disk flowers; *ray flowers* sterile, in 1 series; rays strap-shaped, bifid or trifid, rose-colored, purple, white or yellow (*E. paradoxa* var. *paradoxa*); *disk flowers* fertile; corolla expanded below into a fleshy bulblike base and sessile on achene, the tube cylindrical, with 5-lobed erect limb, smooth or minutely pubescent, yellowish or purplish; stamens 5, the anthers sagittate at base and terminating in an ovate appendage; pollen yellow or white (*E. pallida*); styles usually enlarged at base, equaling or slightly shorter than corolla, branches acuminate, hairy; achenes 4-angled, 3-5.5 mm. long, terminated by a smooth or toothed crown; chromosome numbers $n=11$, $n=22$.

²¹⁴ Contributed by Ronald L. McGregor.

A North American genus of 9 species. The systematics of the genus is complicated due to frequent hybridization wherever 2 species are in proximity.

1. Leaves broadly to narrowly ovate, frequently coarsely toothed, rounded at base; pales of receptacle 9-13 mm. long, the awns 4-6 mm. long 1. *E. purpurea*.

1. Leaves lanceolate to lance-linear or narrowly elliptical, attenuate to base; pales with awns less than 3.5 mm. long (2)

2(1). Stems and leaves strigose or strigose-hirsute (3)

2. Stems and leaves hirsute or hispid (5)

3(2). Ligules definitely longer than width of head 2. *E. paradoxa* var. *neglecta*.

3. Ligules shorter to barely longer than width of head (4)

4(3). Plant 5-10 dm. tall 3. *E. atrorubens*.

4. Plant 2-5 dm. tall 4b. *E. angustifolia* var. *strigosa*.

5(2). Achenes 3 mm. long; heads nearly hemispherical .. 5. *E. sanguinea*.

5. Achenes 3.5-5 mm. long; heads conical (6)

6(5). Ligules 4-9 cm. long, drooping; pollen white 6. *E. pallida*.

6. Ligules 2-4 cm. long, spreading; pollen yellow 4a. *E. angustifolia* var. *angustifolia*.

1. *Echinacea purpurea* (L.) Moench. Stems erect, mostly branched, glabrous to hirsute, often glaucous, 6-18 dm. high; basal leaves with petioles to 25 cm. long, ovate to ovate-lanceolate, acute, coarsely or sharply serrate, rarely entire, to 20 cm. long and 15 cm. wide, cordate or abruptly narrowing to base; cauline leaves petiolate to sessile above, 7-20 cm. long, 1.5-8 cm. wide, coarsely serrate to entire, rough to the touch; heads 15-30 mm. high, 1-4 cm. wide (exclusive of rays); phyllaries linear-lanceolate, attenuate, entire, ciliate, hirsute; rays 3.2-6 cm. long, 5-10 mm. broad, purplish to rarely white; pales 9-13 mm. long, body 5-8 mm. long, awn 4-6 mm. long; achenes 4-4.5 mm. long; pappus a low crown of equal teeth; pollen yellow; chromosome number: $n = 11$. Rocky open woods and thickets in extreme n.e. Tex., May-Sept.; Ga. to La., e. Okla., Mo., n. to Ia., Ill., Mich., O. and Va.

Our plants would be included in the var. *arkansana* Steyerem. which is an early season ecological form associated with an open habitat.

2. *Echinacea paradoxa* (Nort.) Britt. var. *neglecta* R. L. McGreg. Stems simple, sparsely to densely strigose, sometimes hirsute just below the head, stramineous or yellowish-green; basal leaves with petioles 2-13 cm. long, oblong-lanceolate to long-elliptical, 4-25 mm. wide; upper leaves linear to lanceolate, strigose on both surfaces, the margins scabrous-ciliate; heads 20-35 mm. high, 3-4 cm. wide (exclusive of rays); phyllaries 7-12 mm. long, 1-3 mm. wide, lanceolate to ovate-lanceolate, strigose or glabrous, ciliate; rays 3-7 cm. long, 5-8 mm. wide, narrowly oblanceolate to lanceolate, rose-colored or whitish; pales 11-14 mm. long, body 9-11 mm. long, awn 2-3 mm. long, achenes 4.5-5.5 mm. long, glabrous; pappus a crown of equal teeth; pollen yellow; chromosome number: $n = 11$. Rocky prairies and open wooded hillsides, n. Tex. (?), May-June; Arbuckle Mt. area of Okla.

Included here on the basis of a specimen collected by Lindheimer in 1843 without stated locality. This variety and the following species have long been confused with var. *paradoxa*. The latter is a yellow-rayed plant endemic to the Ozarks of Mo. and n. Ark.

3. *Echinacea atrorubens* Nutt. Stems simple to rarely branched, 3-9 dm. high, glabrous below to strigose above, hirsute just below head; basal leaves with petiole 1-15 cm. long, the blade 4-15 cm. wide; upper leaves progressively smaller, becoming sessile, strigose and ciliate; heads 15-40 mm. high, 20-36 mm. wide (exclusive of rays); phyllaries in 3 or 4 series, narrowly lanceolate, strigose, ciliate, abruptly reflexed; body of pales 7-9 mm. long, awn 2-3 mm. long; ligules dark-purple, rarely pink or white, 19-33 mm. long, shorter than to as long as head, strongly reflexed; achenes 4-5 mm. long, glabrous, teeth of pappus crown unequal; chromosome number: $n = 11$. Sandy prairies and open woods, e., s.e. and n.-cen. Tex., May-June; a narrow band from s.e. Tex. to Ardmore, Okla. and Topeka, Kans.

4a. *Echinacea angustifolia* DC. var. *angustifolia*. Stems simple, rarely branched, 1-5 dm. high, hirsute below, tuberculate-hirsute to tuberculate-hispid; basal leaves short to long-petiolate, 5-27 cm. long, 1-4 cm. wide, becoming sessile above; heads 15-30 mm. high, 15-25 mm. wide (exclusive of rays); phyllaries in 3 or 4 series, lanceolate, entire, hirsute or hispid; rays spreading, 2-3 cm. long, white, pinkish or purplish; achenes 4-5 mm. long; pappus a toothed crown; pollen yellow; chromosome number: $n = 11$. Dry rocky prairies and hillsides, n.-cen. Tex., Edwards Plateau and Plains Country, rarely to the s.w. part of e. Tex., May-June; Minn. to Sask., s. to Okla. and Tex.

4b. *Echinacea angustifolia* var. *strigosa* R. L. McGreg. Similar to var. *angustifolia* except stem and leaves strigose-hirsute, stem often branched, rays usually reflexed, and stem somewhat flexuous. Dry rocky prairies, n.-cen. Tex. Most Texas colonies of this variety have a chromosome number of $n=22$, but to the north in Okla. plants have $n=11$. It appears that this variety represents a stabilized hybrid population derived from the hybridization of *E. atrorubens* and *E. angustifolia* var. *angustifolia* and in which both diploid and tetraploid colonies are found.

5. *Echinacea sanguinea* Nutt. Stems simple to frequently branched, 4-9 dm. high, glabrous to sparsely hirsute; basal leaves petiolate, entire, 10-24 cm. long, lanceolate to elliptical, upper leaves becoming sessile, hirsute; heads nearly hemispheric, becoming slightly conic in fruit, 1-2 cm. high, 17-25 mm. wide (exclusive of rays); peduncle half or more the height of plant; phyllaries lanceolate, 7-10 mm. long, hirsute, ciliate; rays rose-colored to dark-red, rarely white, 4-7 cm. long; pales 8.5-10 mm. long, awn 1.5-2 mm. long; achenes 3 mm. long; pappus a low crown; pollen yellow; chromosome number: $n=11$. Sandy open prairies and pine barrens, e. and s.e. Tex., May-June; s.w. Ark., s.e. Okla., w. La. and Tex.

6. *Echinacea pallida* Nutt. Stems simple, rarely branched, 4-9 dm. high, sparsely hirsute below to densely so above; basal leaves 10-35 cm. long, 1-4 cm. wide, oblong-lanceolate to long-elliptical, hirsute, triple-veined; cauline leaves 10-25 cm. long, petiolate below to sessile above; heads 20-35 mm. high, 15-30 mm. wide (exclusive of rays); phyllaries lanceolate to narrowly oblong, ciliate, hirsute; rays drooping, 4-9 cm. long, white, pink or purplish; pales 10-13 mm. long, awn 2.5-3.5 mm. long; achenes 3.7-5 mm. long, glabrous; pappus a toothed crown; pollen white; chromosome number: $n=22$. Prairies and open wooded hillsides, e. and n.-cen. Tex., May-June; n. Ind. and Ill., Ia., e. Neb., s. to Tex.

This is the only species in the genus with white pollen.

74. RUDBECKIA L.

BROWN-EYED SUSAN. CONE-FLOWER

Perennial or annual herbs; leaves alternate (the extreme basal ones sometimes opposite); involucre hemispheric; phyllaries imbricated in 2 or more series; receptacle conical, chaffy throughout, the pales acute; *ray flowers* present, infertile (styles absent); rays yellow or with a brown spot basally, rarely slightly reddish all over, never white, vaguely 3-toothed apically; *disk flowers* numerous, perfect, fertile, the corolla tubular, equally 5-toothed terminally and brown (at least terminally), the style branches with blunt or subulate pubescent tips; achenes truncate apically, 4-angled; pappus when present merely a toothed crown of 2 to 4 short teeth.

An American genus of perhaps 30 species.

1. Achenes with 4 nearly equal facets which are flat or convex, commonly expanded by the mature ovules, typically truncate basally and basally attached to the receptacle; pales of the receptacle characteristically 1.5 to 2 times as long as the achenes (2)
1. Not as above (5)
- 2(1). Style branches apically elongate, slenderly subulate 1. *R. hirta*.
2. Style branches short and blunt (3)
- 3(2). Pales of the receptacle canescent near the tip with short viscidulous hairs; leaves dotted with microscopic resin-globules 2. *R. grandiflora*.
3. Pales glabrous or ciliate; leaves not resin-atomiferous (4)

- 4(3). Plants never stoloniferous, the leafy tufts arising only at the base of the stem; basal leaves broadly linear to lance-spatulate; stems and leaves densely villous-hirsute; branches sharply ascending 3. *R. missouriensis*.
4. Plants commonly stoloniferous, most of the leafy tufts arising at the ends of the stolons; basal leaves lanceolate or broader; stems and leaves nearly glabrous to hirsute or strigose; branches distinctly spreading . . . 4. *R. fulgida*.
- 5(1). Leaf blades (at least those of the lower leaves) deeply lobed or divided 5. *R. laciniata*.
5. Leaf blades entire or merely toothed (6)
- 6(5). Leaves glaucous, the blades ovate to broadly ovate or oblong; plants 1-3 m. tall 6. *R. maxima*.
6. Leaves lustrous, the blades narrower; plants usually less than 1 m. tall 7. *R. nitida*.

1. *Rudbeckia hirta* L. Annual or short-lived perennial herb, with roughly pubescent herbage; leaves narrowed to a subpetiolar base or nearly sessile, unlobed but often obscurely toothed, variable in shape but nearly always longer than broad; rays yellow with red-brown spots basally or in the lower half; style branches (of the disk-flowers) apically elongate, slenderly subulate (absent in ray flowers); achenes equally quadrangular in transection, the sides flat or slightly bulging.

We have two varieties of this species:

Var. *pulcherrima* Farw. Annuals usually branching above the middle (if simple, the peduncle not more than a third as long as the height of the plant). *R. serotina* Nutt., *R. flexuosa* T. V. Moore. Frequent in a variety of situations in the e. two thirds of the state, spring-summer; Nfld. to B.C. and s. to n. Mex.

Var. *angustifolia* (T. V. Moore) Perdue. Short-lived perennial, branching at or near the middle (if simple, the peduncle at least half as long as the height of the plant); leaves relatively narrow. *R. divergens* T. V. Moore. Frequent in sandy wooded areas, e. and s.e. Tex., spring-summer; Ga. and Fla. to Tex.

Some plants in east and southeast Texas are intermediate between the two varieties.

2. *Rudbeckia grandiflora* (Sweet) DC. Herbage lacking resin-globules, the stem somewhat scabrous-pubescent below, the hairs short; leaves mainly on the lower part of the stem, very rough on both surfaces, with an ovate-elliptic to lanceolate unlobed bladlike portion 6-15 cm. long, apically acute or acuminate; pales canescent near the apex with short viscidulous hairs; style branches short and blunt; achene quadrangular in transection (the sides of the quadrangle subequal); pappus a conspicuous but low crown. *R. alismaefolia* T.&G. Local in e. and s.e. Tex., summer; Ark., Okla., La. and Tex.; Ga.

3. *Rudbeckia missouriensis* Boynt. & Beadle. Perennial, the leafy tufts arising from a crown; basal leaves broadly linear to lance-spatulate; stems and leaves densely villous-hirsute, the branches sharply ascending; phyllaries 8-10 mm. long, linear to linear-oblong; rays usually 12 to 14, 15-25 mm. long; style branches short and blunt; pappus very short-coroniform; achene with 4 nearly equal facets. *R. fulgida* var. *missouriensis* (Boynt. & Beadle) Cronq. Rare in e. Tex., late summer-fall; Mo., Ark., Okla. and Tex.

Closely related to *R. fulgida*.

4. *Rudbeckia fulgida* Ait. var. *palustris* (Eggert) Perdue. Stoloniferous perennial, most of the leafy tufts arising at the ends of the stolons; herbage nearly glabrous to hirsute or strigose; basal leaves elliptical to ovate or orbicular; stem leaves lanceolate to ovate-lanceolate, gradually reduced upward, the uppermost bracteiform; pales apically ciliate; rays mostly 15-30 mm. long; style branches short and blunt; achenes equally 4-faceted, facets flat or bulging. *R. Coryi* Shinn. Infrequent in e. and n.-cen. Tex., rare in moist places w. to Edwards Plateau, summer; Mo., Ark., Okla. and Tex.; the entire species widely distributed in e. U.S.

5. *Rudbeckia laciniata* L. Plants 6-15 dm. tall, cinereous-pubescent, branched above; leaves petioled, some or all of the lower ones 3-lobed or 3-parted, the terminal lobe elliptic to lanceolate, acuminate, serrate, the lateral lobes smaller and narrower, the upper stem leaves mostly undivided; heads numerous; phyllaries linear or nearly so, acuminate; pales apically canescent; rays several, yellow, 2-3 cm. long. Infrequent in e. Tex., summer-fall; e. U.S.

6. *Rudbeckia maxima* Nutt. Plants 1-3 m. tall, smooth, glaucous; leaf blades unlobed, ovate to broadly ovate or oblong, 6-20 cm. long, mostly obtuse, undulate to repand-denticulate or entire, the upper sessile and partly clasping; heads large; phyllaries linear or linear-lanceolate, acute, short; rays several, 15-40 mm. long; disks 25-60 mm. long, oblong usually; pales abruptly short-pointed, apically pubescent; achenes 6-8 mm. long; pappus of small teeth. Moist open places, e. Tex., spring-summer; Ark., Okla., La. and Tex.

7. *Rudbeckia nitida* Nutt. var. *texana* Perdue. Plants 6-12 dm. tall, simple or branched, glabrous; leaves unlobed, entire-margined or crenate, dentate or serrate, the teeth when present abundant; basal leaves narrowly to broadly elliptic or spatulate, the blades lustrous, 10-15 cm. long, 3-6 cm. broad, sharply or broadly acute, attenuate basally to a long slender subpetiolar base; rays several, yellow; disk conical to conical-cylindric, 20-45 mm. long; achenes 5-7.5 mm. long. Infrequent in s.e. Tex., rare in e. Tex., spring-fall; also La. (the var. *nitida* in Ga. and Fla.)

75. DRACOPIS CASS.

A monotypic genus, closely related to the *Ratibida-Rudbeckia* alliance.

1. *Dracopis amplexicaulis* (Vahl) Cass. Annual herb 3-7 dm. tall (rarely to 1.2 m.), usually branched above; leaves alternate, simple, spatulate to oblong-lanceolate or ovate, sessile, clasping, 4-10 cm. long, often obscurely serrate; phyllaries biseriate, the inner ones half as long as the outer, the outer ones few and somewhat foliaceous, 6-10 mm. long, lanceolate to linear-lanceolate; receptacle columnar, slender; *ray flowers* present, 5 to 9, styleless, infertile; rays yellow or often red-brown or brown-purple basally, 10-25 cm. long; disk oblong-cylindric at maturity; *disk flowers* numerous, perfect, fertile, the corollas brownish and 5-toothed terminally; style branches with small pubescent appendage; mature achenes terete, minutely transversely wrinkled, about 2 mm. long; pappus absent. *Rudbeckia amplexicaulis* Vahl. Moist places in the e. two thirds of the state, rare in Plains Country and Rio Grande Plains, spring-summer; Coastal States, Ga. to Tex.

76. RATIBIDA RAF.

MEXICAN HAT

Biennial or perennial herbs with taproots or rhizomes; stems usually branched, at least above, erect; leaves alternate, pinnatifid or bipinnatifid, the basal ones sometimes lanceolate, serrate or entire, acute, strigose-hirsute; heads borne singly at the tops of the ultimate branches which are often leafless; involucre very short-obconic; phyllaries biseriate, herbaceous in texture, linear to linear-lanceolate, the outer ones twice or more than twice as long as the inner; receptacle columnar, chaffy throughout, the pales folded around the achenes and deciduous with them; *ray flowers* always present but quite infertile, completely lacking any styles or stamens, the rays yellow or yellow with a red-brown spot basally, obscurely 3-toothed apically; *disk flowers* very numerous, perfect, fertile, the corolla 5-lobed terminally, usually brown or red-brown at least in the distal part; achenes laterally strongly compressed, narrowly rhombic in transection, sometimes fimbriate along the sharper of the two winglike edges, otherwise glabrous; pappus a microscopic corona or prolonged upward on each edge forming two awnlike teeth. *Lepachys* Raf.

An American genus of about 5 species.

1. Heads globular or oblong; achenial crown yellowish, thickened, bordered by minute lacerate setae 3. *R. Tagetes*.
1. Heads cylindrical or columnar; pappus consisting of 2 persistent toothlike projections (2)
- 2(1). Leaves not much reduced in the middle of the stem and upward 1. *R. columnaris*.
2. Leaves crowded near the base, the upper part of the plant comprising long essentially naked peduncles(s) 2. *R. peduncularis*.

1. *Ratibida columnaris* (Sims) D. Don. Stems 2-12 dm. tall, branched, closely strigose-hirsute throughout with occasional resin-dots, the lateral branches spreading; leaves including petioles 3-15 cm. long, closely strigose-hirsute on both surfaces, pinnately cleft to the midrib into 5 to 13 linear, narrowly lanceolate, oblong or oblong-lanceolate divisions, these entire or sometimes trifid, acute, 5-30 mm. long, 1-10 mm. broad; heads cylindrical, 10-55 mm. long, 7-10 mm. thick; outer phyllaries linear, 4-12 mm. long, acuminate, inner ones about 3 mm. long; rays 3 to 7, yellow throughout or with a red-brown spot at the base or in many plants almost the entire ray red-brown with only a narrow yellow margin, broadly oblong-elliptical, 1-2 cm. long, 6-10 mm. broad, trifid; mature achenes compressed, 2 mm. long, glabrous except the ventral edge which is fimbriate; pappus of 2 toothlike projections on each edge of the crown. Incl. var. *pulcherrima* (DC.) D. Don. Abundant in open usually calcareous soils over much of the w. two thirds of the state (absent only from extreme e. Tex.), (spring-) summer-fall; N.D., S.D., Ill., Mo., Ark., Minn., Neb., Kan., Okla., Tex., Mont., Colo., Wyo., N.M., Coah., Chih., N.L. and Tam.

Some authors use the illegitimate name *R. columnifera* for these plants.

2. *Ratibida peduncularis* (T.&G.) Barnh. Plants leafy below, terminating in slender naked peduncles 2-5 dm. long, spreading-hirsute below; leaves often crowded near the base, pinnatifid or more or less bipinnatifid, including the subpetiolar base 25-150 mm. long, strigose-hirsute on both surfaces often with microscopic resin-globules interspersed; heads solitary, columnar, 15-40 mm. long, 8-11 mm. thick; outer phyllaries linear, 6-10 mm. long, acute; inner phyllaries about 2 mm. long; rays 5-25 mm. long, yellow or yellow with a red-brown spot basally or even almost entirely red-brown with a narrow yellow margin; achenes flat, 4 mm. long including the toothlike projections, the edges winglike, conspicuously pectinate-fimbriate at least on the ventral edge and sometimes on both. Incl. var. *picta* (Gray) Sharp. Sandy (usually loose) soils, s.e., and e. Tex. and the extreme coastal part of the Rio Grande Plains, (spring-) summer-fall; also La.

Perhaps intergrading with *R. columnaris*. Some of the plants very near the coast have definite rosettes of leaves and the stem is subscapose, but away from the coast some of the populations have stems leafy nearly to the middle.

3. *Ratibida Tagetes* (James) Barnh. PRAIRIE CONE-FLOWER. Plants often bushy-branched, 15-40 cm. tall, leafy; basal and lower cauline leaves lanceolate, entire or more often pinnatifid or bipinnatifid, 5-13 cm. long including the subpetiolar base; upper cauline leaves usually 3- to 5-cleft into linear or linear-lanceolate segments 5-30 mm. long; heads on peduncles only 2-7 cm. long, numerous, often forming close clusters, globular to oblong, 8-15 mm. long, 8-10 mm. thick; rays 5 to 7, rotund-ovate to oblong-ovate, 4-6 mm. long, yellowish with red-brown bases or nearly all red-brown, varying; achenes winged on the ventral edge, the wing fimbriate-ciliate. Frequent in dry plains, Trans-Pecos and Plains Country, summer-fall; Kan., Okla., Colo., Tex., N.M. and Chih.

77. BORRICHIA ADANS.

A tropical genus of perhaps 5 species.

1. *Borrichia frutescens* (L.) DC. SEA OX-EYE DAISY. Rhizomatous subshrub (2-) 4-8 (-12) dm. tall, much-branched but the branches all rather stiffly ascending; leaves opposite, variable in size and shape, obovate to oblanceolate to spatulate, 2-6 cm. long, sessile or narrowed to a subpetiolar base, acutish or obtuse, entire or spinulose-dentate or even with small lobelike teeth on the sides near the base, thick and somewhat fleshy, gray-green, densely but minutely pubescent; heads terminating the branches on upwardly slightly expanded peduncles 1-3 cm. long; involucre hemispheric, about 5 mm. high; phyllaries rather indurate, in roughly 2 series; outer phyllaries about half to two thirds as long as the inner, acute, in texture and pubescence and color much like the leaves; inner phyllaries spinose-squarrose, nervate, less pubescent than the outer; receptacle flat or very slightly convex, chaffy throughout; pales firm or indurate, nearly linear but with a stout noxious spine-tip; ray flowers 15 to 30, pistillate, fertile; rays 5-10 mm. long, yellow or orangish, 3-toothed apically; disk flowers numerous, perfect, fertile, the corolla yellow and 5-toothed terminally; achenes prismatic, those of the ray flowers trigonous,

of the disk flowers tetragonous; pappus a low crown of persistent brown scales, one over each angle of the achene. Extremely abundant in coastal areas of Tex. and inland in local areas of poor drainage and salt accumulation to Gonzales and Webb cos., nearly all year; coastal areas, D.C. to Ver.; also S.L.P.; much of W.I.

78. VIGUIERA H.B.K. GOLDEN-EYE

Herbs or shrubs; leaves usually opposite at least in the lower part of the plant, in some species throughout the plant, sessile or with subpetiolar bases; heads singly terminating the stems or branches; involucre campanulate to hemispheric; phyllaries in 2 to 5 series, graduated or subequal, lanceolate or linear-lanceolate to ovate or oblong, with usually indurated (and ribbed) bases and narrowly abruptly herbaceous apices or in some species herbaceous throughout; receptacle flat to low-conic, paleaceous throughout; pales firm, scarious or apically subherbaceous, carinate, embracing the achenes and persistent after the achenes fall; *ray flowers* pistillate but infertile, the showy rays yellow; *disk flowers* numerous, perfect, fertile; corolla yellow, with tube, throat and 5-toothed limb; style branches recurved, hispid above, with acutish to acuminate appendages; disk achenes laterally compressed but not flat, usually narrowly rhombic in transection, usually appressed-pubescent, unmarginated, essentially unribbed, apically truncate or rounded; pappus present or absent, when present of 2 awns (one over each of the sharpest angles of the achene) and several free or united nearly always much shorter scarious scales, or of several subequal muticous-fimbriate scales. *Heliomeris* Nutt.; *Hymenostephium* Benth.

A genus of almost 200 species of North America and South America.

1. Pappus present (2)
1. Pappus absent (4)
- 2(1). Pappus of 6 to 8 muticous-fimbriate scales 3. *V. ludens*.
2. Pappus of awns over the angles of the achenes and of scales between (3)
- 3(2). Phyllaries with indurated ovate bases and abruptly narrowed linear herbaceous apices 1. *V. dentata*.
3. Phyllaries otherwise, the herbaceous apices not distinctly different in texture from the subherbaceous bases 2. *V. cordifolia*.
- 4(1). Shrub with deeply pinnatifid leaves 6. *V. stenoloba*.
4. Herbs; leaves not deeply pinnatifid (5)
- 5(4). Leaves 4-14 mm. broad 4. *V. longifolia*.
5. Leaves 1.5-3 mm. broad 5. *V. annua*.

1. *Viguiera dentata* (Cav.) Spreng. Perennial herb, paniculately branched, 1-2 m. tall; stems slender, usually sparsely strigillose or glabrate; leaves opposite below, alternate above, ovate to rhombic-ovate, basally cuneate to truncate, tapering into the subpetiolar base, serrulate or serrate, the teeth usually appressed, green and sparsely pubescent on both surfaces, 35-125 mm. long plus a subpetiolar base 6-55 mm. long, 9-80 mm. broad; heads usually numerous, 22-37 mm. broad, on naked or minutely bracteolate often sharply angled penduculiform branch-ends 3-14 cm. long; disk 7-10 mm. high, 10-14 mm. thick; involucre 3-seriate, 5-10 mm. high; phyllaries graduated or subequal, with ovate to ovate-oblong indurated costate and vittate body and shorter or often much-elongated linear or linear-oblong herbaceous apices, loose or appressed; rays 10 to 12, rarely styliiferous but sterile, ovate to oblong-ovate, 7-15 mm. long, 3-7.5 mm. broad; disk corollas hirtellous, 3-4 mm. long; pales scarious-margined, hispidulous dorsally, with ovate-oblong body abruptly narrowed into an acuminate stiff pungent tip, 6.5 mm. long; achenes obovate-oblong, black or mottled, appressed-pubescent, 3.5-3.8 mm. long, 2 mm. broad; awns of pappus slender, 2.2-2.8 mm. long; squamellae 4, quadrate, free, fimbriate, 0.7 mm. long. Extremely abundant in Edwards Plateau, less common on cuestas of chalky limestone in n.-cen. Tex. and the Trans-Pecos, Oct. (-Nov.); Ariz., N.M. and Tex. s.e. to Guat.

2. *Viguiera cordifolia* Gray. Perennial herb; main taproot napiform, as much as 3 dm. long and 3 cm. thick; stems several, hispid, about 1 m. high; leaves mostly opposite or sometimes mostly alternate, ovate to deltoid-ovate or the upper lanceolate, acute to acuminate, mucronate, basally rounded to cuneate-rounded or shallowly cordate, obscurely or rather sharply serrate or the upper ones entire, green and very rough on both sides, above tuberculate-hispidulous with incurved hairs and glandular-granular, beneath more or less hispid or hispidulous and glandular-granular, 3-nerved, rather veiny, 2-10 cm. long, 13-68 mm. broad, on petioles 1-8 mm. long; heads usually numerous, 25-45 mm. broad, on peduncles 13-143 mm. long; disk 11-15 mm. high, 11-18 mm. thick; involucre 3- or 4-seriate, graduated, 7.5-15 mm. high; phyllaries varying from lance-subulate and attenuate, usually mucronate, herbaceous or subherbaceous or usually strongly indurated and costate-vittate except at the herbaceous apex, tuberculate-hispid on margin and midline, sometimes also on dorsum and densely tuberculate-granulose; rays 6 to 8, oblong to ovate, 9-19 mm. long, 3.5-9 mm. broad; pales acuminate, cuspidate, 8-11 mm. long; achenes appressed-pilose, 6.5 mm. long; pappus awns 5.5 mm. long; squamellae 4 to 6, united below or free, 0.8-2 mm. long. Infrequent in limestone areas, near the Guadalupe Mts. in the Trans-Pecos, Oct.; Ariz., N.M., Tex., Son., Chih. and S.L.P.

3. *Viguiera ludens* (Shinners) M. C. Johnst. Taprooted annual 30-45 cm. tall, much-branched; branches ascending, all with stiff antrorse appressed white hairs; leaves opposite only in the lowest 4 cm. of the stem, alternate above, ascending; blades linear-lanceolate, (3-) 4-9 cm. long not including the petiole, (5-) 8-11 mm. broad, obscurely sinuate-dentate, 3-nerved, membranous, on both surfaces cinereous with stiff antrorsely appressed white hairs; the very narrowly winged petiole about 1 cm. long, sparsely ciliate with stiff spreading translucent pustule-based setae about 2 mm. long; peduncles few, terminal, (3-) 5-10 cm. long, slightly enlarged and fistulose just beneath the solitary head; involucre hemispheric or slightly shallower, 7-10 mm. high; phyllaries linear-lanceolate, 1-1.5 (-2) mm. broad, blunt or acutish, gray-green, appressed or slightly spreading near the tips, biseriate, subequal or the inner ones usually slightly shorter, dorsally in the lower half discolored, firm to indurate, with 2 or 3 pale ribs and sparse spreading pustule-based setae, marginally ciliate with such setae, dorsally on the distal half with the texture and pubescence of the leaf blades; receptacle slightly convex, chaffy throughout; pales folded over the disk achenes, erect, translucent except at the 2 firm strong ribs which converge to form the firm very acute glabrous larger central tooth of the 3-cuspidate apex; rays 11 to 14, about 5-11 mm. long, 2-4 mm. broad, yellow; disk about 12-14 mm. across, yellow except for the darker anthers; achenes about 3 mm. long, 1.5 mm. broad, grayish-mottled, antrorsely appressed-pubescent all over; pappus persistent, of about 6 to 8 low fimbriate scales, the 1 scale on the achene angle toward the center of the head longer (0.8-1 mm. long) and slightly acute, the remainder about 0.5 mm. long and muticous. *Helianthus ludens* Shinners. In the Trans-Pecos, Culberson Co., Lobo Flat, 19 mi. e. of Van Horn, ditch beside cotton field, 28 Aug., 1953; known only from the one locality.

4. *Viguiera longifolia* (Robins. & Greenm.) Blake. Annual with taproots, erect, subsimple or branched, about 8 dm. tall; stem strigillose with appressed or incurved hairs, sometimes subglabrate; leaves opposite below or nearly throughout, narrowly lanceolate to linear-lanceolate, acuminate to attenuate at each end, 1-nerved and feather-veined, glandular-tuberculate-strigillose above, tuberculate-strigillose and scarcely paler beneath, entire or obscurely repand-toothed, only slightly revolute, 45-110 mm. long, 4-11 (-14) mm. broad; petioles 5 mm. long or less; involucre 2-seriate, 4-7 mm. high; phyllaries lanceolate or linear-lanceolate, acuminate, herbaceous, strigose-hispid below, strigillose above; rays about 12, ovate to oblong, 7-17 mm. long; disk corollas puberulous below, 2.5-3 mm. long; pales firmly short-pointed, hispid-pilose above, 4 mm. long; achenes lucid, blackish, glabrous, 1.8 mm. long; pappus absent. *Heliomeris longifolia* (Robins. & Greenm.) Cockl. Rare, Trans-Pecos deserts, late summer-fall; Ariz., N.M. and Tex. s. to Dgo., S.L.P. and Zac.

5. *Viguiera annua* (M. E. Jones) Blake. Taprooted annual, erect, paniculate branched to subsimple, slender, about 7 dm. tall, the stem subtuberculate-strigillose or strigose; leaves opposite below, alternate above, linear or very narrowly linear-lanceolate, attenuate at each end, tuberculate-strigillose on both sides and gland-dotted beneath, equally green

on both sides, 1-nerved and feather-veined, very strongly revolute, 3-7 cm. long, 1.5-3 mm. broad, the upper smaller; petioles 4 mm. long or less; disk of heads 5-7 mm. high, 6-8 mm. thick; involucre 3-4 (-5) mm. high, 2-seriate; phyllaries lanceolate, acuminate, bluntish-tipped, callous-mucronulate, herbaceous, below strigose, above strigillose or subglabrous, appressed or loose; rays about 12, ovate, 5-12 (-15) mm. long; disk corollas with a few glandular hairs below, 2.5-2.8 mm. long; pales and achenes as in *V. longifolia*; pappus absent. *Helimeris annua* (M. E. Jones) Cockll. Rare, Trans-Pecos deserts, late summer-fall; Ariz., N.M., Tex., Son. and Chih.

Extremely closely related to *V. longifolia* and perhaps conspecific with it.

6. *Viguiera stenoloba* Blake. RESIN-BUSH. Much-branched shrub about 1 m. high; stem slender, glabrous or strigillose, sometimes subcanescent; leaves alternate or rarely opposite, ovate in outline or linear, divided nearly to midrib into 3 to 7 linear or linear-lanceolate entire or few-lobed or few-toothed lobes, or the upper leaves linear and entire or subentire (the lobes attenuate), 1-5 mm. broad, equaling the central part of the leaf in width, above dull-green and tuberculate-strigose, beneath canescently strigillose, 25-60 mm. long, 4 cm. or less broad across the basal pair of lobes; peduncular branch-ends 2 dm. long or less; disk 6-8 mm. high, 8-12 mm. thick; phyllaries in 3 series, with ovate-lanceolate pale strongly indurated and ribbed base, abruptly narrowed into a linear loose or spreading herbaceous tip, more or less strigose and strigillose or the hairs somewhat looser; rays about 12, 7-14 mm. long, 2-4 mm. broad; disk corollas puberulous, the recurved teeth 3.8 mm. long; pales abruptly acute, 5 mm. long; achenes glabrous, substriate, rather strongly compressed but subquadrangular in transection, 3.5 mm. long; pappus absent. Locally abundant in dry desertic or subdesertic areas in the Trans-Pecos and Rio Grande Plains, infrequent in w. part of Edwards Plateau, summer; N.M. and Tex., s.w. and s. to Dgo., Coah., N.L. and Tam.

79. HELIANTHUS L.²¹⁵

SUNFLOWER

Annual or perennial herbs; stems simple or branched; leaves always opposite at least at the base of the stems and usually alternate above (usually alternate for most of the length of the plant, but opposite nearly throughout in some species), usually coarse-textured, 3-nerved (this obscure in some species), at least the lower ones usually narrowed to a petiole or a subpetiolar base; heads usually borne singly at the ends of nearly naked terminal peduncles; involucre usually saucer-shaped to hemispheric; phyllaries in 2 to 4 series, either subequal or strongly graduated, often ciliate-margined; receptacle plane to convex, chaffy throughout; pales folded around the disk achenes; *ray flowers* uniseriate, usually pistillate but always infertile, the yellow rays 3-toothed apically; *disk flowers* very numerous, perfect, fertile; corolla tubular, mostly yellowish but with 5 equal teeth terminally which are yellow to brownish to reddish to purplish; disk achenes laterally compressed but not thin-edged, often subrhombic in transection, often emarginate apically as seen from the side; pappus usually of two elongated awns over the thinner shoulders of the achene and often with a smaller accessory palea on each side of each awn, sometimes with small intermediate scales between the 2 principal awns, all of these pappus members readily caducous.

An American genus of about 67 species, made difficult taxonomically by the tendency toward hybridization between many of its constituents or at least by the evidence of past genetic intercontamination. *Helianthus* is closely related to *Viguiera* and *Helimeris* and perhaps should be merged with them.

1. Glauous blue-green rhizomatous perennial with leaves nearly all opposite; stems rarely more than 7 dm. tall; phyllaries obtuse to acute, glabrous dorsally, white-ciliate, ovate to oblong, closely imbricated, shorter than the disk 10. *H. ciliaris*.
1. Plants not strongly glauous or blue-green and not with the combination of other characters given (2)

²¹⁵ Much of this treatment is adapted from various papers by Charles B. Heiser; the characterization of *H. Maximiliani* is by Robert Long and that of *H. ciliaris* by R. C. Jackson.

- 2(1). Perennial herbs usually with rhizomes or rhizomelike organs (doubtful cases should be keyed under both alternatives) (3)
2. Taprooted annuals (11)
- 3(2). Disk corollas with red-brown to purple-brown lobes (4)
3. Disk corollas with yellow lobes (6)
- 4(3). Principal leaves oblong-lanceolate to lance-ovate, serrate, mostly more than 10-15 mm. broad 3. *H. laetiflorus*.
4. Principal leaves linear to linear-oblong or elongate-lanceolate with entire or barely undulate mostly revolute margins, the broadest 10-15 mm. broad (5)
- 5(4). Leaves and stems smooth and glabrous or nearly so; leaves crowded, without axillary fascicles, all but the basal narrowly linear to nearly filiform, sub-membranaceous, 1-3 mm. broad, with scarcely narrowed sessile base; involucre smooth; achenes with rounded summit; rhizome elongate 9. *H. salicifolius*.
5. Leaves and at least the base of the stem scabrous; leaves numerous but not crowded, often with axillary fascicles, firm, mostly 3-15 mm. broad, commonly narrowed above the base; involucre scabrous; achenes truncate; rhizome a short erect crown 8. *H. angustifolius*.
- 6(3). Phyllaries firm, very unequal, tightly appressed, neither long-attenuate nor with foliaceous spreading or recurving tips; chief heads long-peduncled 7. *H. occidentalis*.
6. Phyllaries looser, the outer ones (at least) spreading and with long-attenuate or more or less foliaceous tips (7)
- 7(6). Principal leaves rounded to sessile or with very short-petioled bases, mostly opposite, their petioles when developed rarely 5 mm. long (8)
7. Principal leaves tapering to base, if strongly rounded then with petioles more than 5 mm. long (9)
- 8(7). Stem, lower leaf surfaces and backs of phyllaries densely whitish-villous; leaves mostly cordate-clasping 6. *H. mollis*.
8. Stems, lower leaf surfaces and backs of phyllaries greener, variously pubescent but not whitish-villous; leaves not cordate-clasping 5. *H. hirsutus*.
- 9(7). Main stem glabrous 1. *H. grosse-serratus*.
9. Main stem scabrous-hispidulous or at least hirtellous (10)
- 10(9). Leaves nearly all alternate, lanceolate; rhizomes stout but lacking tuberos thickening 4. *H. Maximiliani*.
10. Leaves on the lower quarter of the stem opposite, the rest usually alternate, mostly ovate 2. *H. tuberosus*.
- 11(2). Stems, leaves and involucre densely covered with whitish silky wool 11. *H. argophyllus*.
11. Stems, leaves and involucre pubescent but not densely white-woolly (12)
- 12(11). Phyllaries at least in the lower part conspicuously long-ciliate and 4-7 mm. broad, usually rather abruptly contracted proximal to the apex 12. *H. annuus*.
12. Phyllaries narrower and usually not conspicuously ciliate in the lower part, usually rather gently long-tapered to the apex (13)
- 13(12). Leaves lanceolate, much more than twice as long as broad; Trans-Pecos Texas 15. *H. paradoxus*.
13. Leaves proportionately shorter and broader (except in aberrant individuals of *H. debilis*) (14)
- 14(13). Leaves for the most part cordate; isolated populations in Trans-Pecos Texas .. 16. *H. neglectus*.
14. Leaves rarely cordate (15)

- 15(14). Leaf blades usually entire, generally twice as long as broad, bluish-green to canescent bluish-green; tips of pales in center of disk densely villous
13. *H. petiolaris*.
15. Leaf blades entire or more often serrate, generally less than twice as long as broad, not bluish-green; tips of pales villous to merely hispid
14. *H. debilis*.

1. *Helianthus grosse-serratus* Martens. Perennial herb; rhizomes often branched and elongate; stems stout, erect, 1-4 (-5) m. tall, normally simple for most of the length, glabrous, glaucous, very smooth; leaves alternate; blades lanceolate to oblong-ovate, acuminate very near the apex, grossly and saliently serrate, very near the base cuneate, shiny-dark-green, densely hispidulous beneath, at midstem about 20-25 cm. long, (2-) 5-6 (-9) cm. broad, the upper leaves reduced and less deeply serrate; petiole about 8 cm. long at midstem; upper branching paniculiform; involucre hemispheric; phyllaries narrowly lanceolate or linear-subulate, acuminate, attenuate to long subulate tips, very dark-green, mostly glabrous toward the base, finely appressed-pubescent toward the apex, softly appressed-ciliate marginally, very loose but not recurring, longer than the disk; pales linear, mostly entire or rarely 3-cuspidate; rays 25-40 mm. long, obovate; disk 1-2 cm. across, the corollas totally yellow; achenes slender, glabrous, pale brown, sometimes mottled, about 5 mm. long; pappus of 2 slender narrowly lanceolate awns without other scales. Rare and local, n.-cen. Tex. and near Gonzales, Gonzales Co. in s.-cen. Tex., summer-fall; O. to N.D. and s. to Tex.; sometimes cult.

2. *Helianthus tuberosus* L. JERUSALEM ARTICHOKE. Perennial herb with abundant coarse fibrous roots; rhizomes slender and distally with tuberous thickenings; stems stout, 15-25 dm. tall, branched, sulcate, scabrous-hispid, rarely subglabrous, sometimes glabrescent toward the base; leaves normally opposite at least on the lower fourth to third the total height, usually alternate above; blades ovate or broadly ovate-lanceolate, sometimes broadly oblong-lanceolate, always acuminate, dentate or serrate-dentate, usually large (about 1-2 dm. long by 7-15 cm. broad); petioles winged, 4-9 cm. long; involucre hemispheric to broadly campanulate; phyllaries linear-lanceolate, often attenuate, usually more or less short-appressed-pubescent, ciliate, variable in length but usually slightly to greatly longer than the disk, usually loose, the tips somewhat reflexed when they are only a little longer than the disk but loosely erect when much longer; pales 3-cuspidate; rays 25-40 mm. long; disk usually 10-15 mm. across, the corollas totally yellow; achenes turgid, usually dark; pappus of 2 narrowly lanceolate awns without other scales. Rare in n.-cen. Tex., Aug.-Oct.; Ont. and Sask. s. to Ga., Tenn. and Tex.; perhaps adv. with us.

The species elsewhere intergrades with *H. laetiflorus* var. *rigidus*, apparently because of past introgression. In Texas the two taxa do not overlap in distribution. The tubers of this plant are eaten, cooked, pickled and raw.

3. *Helianthus laetiflorus* Pers. Perennial herb with fibrous roots on stout rhizomes; stems stout, erect, 5-20 dm. tall, mostly simple below; leaves nearly all opposite, reduced and sparser upward, ovate to broadly lanceolate or less commonly linear, mostly broadly rhombic-lanceolate, acute, obscurely to conspicuously serrate, sessile (to a broad subpetiolar base), 5-28 cm. long, 4-7 cm. broad, very firm-textured, rough on both sides; peduncles few, long, stout, nearly naked; involucre short-cylindric-campanulate; phyllaries in 3 or 4 series, elliptic to oblong-ovate, obtuse or broadly acute, the outermost shorter, glabrous, conspicuously short-ciliate marginally the full length, deep-green, glabrous, usually shiny, shorter than the disk, erect and closely appressed; pales entire or obscurely 3-cuspidate, the middle cusp larger and dark; rays ovate, about 2-3 cm. long, often emarginate; disk 15-20 mm. across, the corollas with red-brown or reddish lobes; achenes turgid, dark, more or less pubescent apically; pappus of 2 broadly lanceolate, pubescent awns with accessory awns at each side of the principal awns.

We have two varieties in Texas.

Var. *rigidus* (Cass.) Fern. Stems harshly scabrous, 8-20 dm. tall, with 7 to 15 nodes; leaves oblong-lanceolate to lance-ovate, tapering to long acuminate tips, 8-27 cm. long; phyllaries narrowly ovate or lanceolate. *H. rigidus* (Cass.) Pers. Infrequent or rare in e. Tex., Aug.-Oct.; midwest. U.S. s. to Tex.

Var. *subrhomboideus* (Rydb.) Fern. Stems less harsh above, 5-10 dm. tall, with 6 to 9 nodes; leaves subrhombic-ovate to subrhombic-lanceolate, subacute, 5-12 cm. long; phyllaries nearly oblong-ovate. Rare in Trans-Pecos mts., late summer; s. Can. and n. U.S., s. in the mts. to Tex.

The var. *laetiflorus* occurs in n.e. U.S., s.w. to Mo. and Kan. Elsewhere these varieties intergrade, and the var. *laetiflorus* intergrades with *H. tuberosus*, making the taxonomy most perplexing.

4. *Helianthus Maximiliani* Schrad. MAXIMILIAN SUNFLOWER. Stout perennial, with usually several mostly simple stems 3-30 dm. tall from the woody crowns or short root-stocks, rarely with lateral branches near the top, scabrous or with abundant short white hairs; leaves alternate, lanceolate, gradually acuminate to both ends, mostly 14-30 cm. long, 20-55 mm. broad, marginally entire, sometimes obscurely serrate, surficially with many short hairs imparting a grayish-green color, sessile; phyllaries 10-15 mm. long, densely pubescent, marginally strongly ciliate, spreading; heads in a simple terminal racemose arrangement, less commonly in a paniculiform grouping, 50-75 mm. across; disk florets 10-12 mm. long, the base of the corolla puberulent; rays bright-yellow, 25-35 mm. long, concave; pales linear-acuminate, obscurely 3-cuspidate, apically pubescent. Frequent in seasonally moist ditches, depressions or prairies, n.-cen. and s.e. Tex. and Edwards Plateau, infrequent in Plains Country and rare in the Trans-Pecos, (late summer)-fall; most of s. Can., s. in cen. U.S. to Tex. and in Coastal States to N.C.

5. *Helianthus hirsutus* Raf. Perennial with coarse roots; rhizomes very stout, much-branched, 1-3 dm. long; stems erect, 5-17 dm. tall, usually simple most of the length, densely scabrous-hispid or scabrous-hirsute, often glabrescent below, rough; leaves opposite; blades ovate or ovate-lanceolate to narrowly lanceolate, often acuminate, marginally serrate to obscurely so and often revolute, rarely entire, rounded or abruptly contracted at the broad base, sometimes subcordate, densely hispid above, scabrous-hispid beneath, 6-15 cm. long, 7-70 mm. broad; petiole (sometimes winged) 5-20 mm. long; involucre hemispheric; phyllaries broadly linear-lanceolate, slightly to greatly longer than the disk, ciliate, hispid, very loose, recurved; pales 3-cuspidate, carinate; rays 15-25 mm. long, oval; disk 1-2 cm. across, the corollas totally yellow; achene broadly obovate, turgid, dark, glabrous; pappus of 2 broadly lanceolate rather short pubescent awns, without other scales. *H. leptocaulis* (Wats.) Blake var. *trachyphyllus* T.&G. and var. *stenophyllus* T.&G. Frequent in e., s.e. and n.-cen. Tex., infrequent to e. part of Edwards Plateau, summer-fall; most of e. U.S.

Reports of *H. leptocaulis* from Texas are based on specimens of *H. hirsutus*.

6. *Helianthus mollis* Lam. Perennial herb with many fine fibrous roots, the creeping rhizomes very stout and rarely more than 15 cm. long; stems often tufted, erect, 5-10 dm. tall, scabrous-hirsute, simple in medium or small plants, often branched above in large ones, the branches rather rigidly ascending; leaves mostly opposite, narrowly ovate to ovate-lanceolate, entire or serrulate, sessile, clasping, sometimes cordate-clasping, mostly about 9 cm. long, 2-6 (-9) cm. broad, variable in size, densely scabrous-hispid above, densely cinereous-pubescent beneath; involucre hemispheric; phyllaries broadly linear-lanceolate, acute, often abruptly acuminate, not much longer than the disk, erect, densely hispid or scabrous-tomentose; disk 2-3 cm. across, the corollas totally yellow; achenes slightly villous at the apex; pappus of 2 broadly lanceolate awns, without other scales. Frequent in sandy soil, e., s.e. and n.-cen. Tex., late summer-fall; most of e. U.S.

7. *Helianthus occidentalis* Ridd. Perennial herb with abundant fine fibrous roots, the rhizomes very slender; stems several, slender, erect, 8-15 dm. tall, finely appressed-pubescent; leaves strictly opposite (except the few and much-reduced bracteals above), crowded at or very near the base and persistent even at flowering time; bladelike portion ovate, obtuse, crenate-dentate, subcoriaceous, about 10 cm. long and 5 cm. broad, remotely appressed-pubescent with very short hairs; narrow petiolelike base about as long as the blade; heads in a small paniculiform group at the top of the nearly naked stem; involucre subcampanulate; phyllaries narrowly lanceolate, subulate-attenuate, very loose but not reflexed, longer than the disk, obscurely and very finely appressed-pubescent; pales lanceolate, subglabrous; disk about 1 cm. across, the corollas all yellow; achenes villous at the apex and on the angles; pappus of 2 broadly lanceolate awns. Incl. var. *plantagineus* T.&G. Infrequent in e. Tex., late summer-fall; most of e. U.S.

8. *Helianthus angustifolius* L. Perennial herb; roots fibrous; rhizomes few, very slender, 5-15 cm. long; stems 10-17 dm. tall, leafy, mostly simple, usually scabrous,

hispid; leaves mostly alternate, variable but mostly linear or narrowly lanceolate, 1-2 dm. long, 3-15 (-20) mm. broad, obtuse, sessile, very firm, very scabrous above, pubescent beneath, often with resin-dots; upper branching open-paniculiform; phyllaries narrowly lanceolate, slightly acuminate, usually shorter than the disk, very loose, setose or scabrous, scarcely ciliate; pales 3-cuspidate; disk about 1 cm. across; lobes of disk corolla purple, puberulent; achene slender, glabrous, about 4 mm. long; pappus of 2 lanceolate awns, without intermediate scales. Moist places, e. and s.e. Tex., late summer-fall; N.J. s. to Fla., w. to Ia. and Tex.

A very closely related form, but with an entirely yellow disk and reputed to be more robust with woodier rootstocks, is *H. simulans* E.E.Wats. It is rare in boggy areas in east Texas (Robertson Co. and probably elsewhere), and Louisiana. Its degree of distinctness needs further investigation.

9. *Helianthus salicifolius* Otto & Dietr. Perennial from stout rhizomes 2-3 dm. long with coarse roots; stems 4-8 dm. tall or occasionally to 2 m., erect, mostly glabrous, simple below the head-bearing region; leaves mostly alternate, crowded, narrowly linear-lanceolate to linear, marginally often revolute, 5-15 cm. long, 1-3 (-5) mm. broad; upper branching paniculiform; peduncles 5-6 cm. long; involucre campanulate; phyllaries narrowly lanceolate to linear-lanceolate (outermost shorter), acuminate, attenuate into subulate tips often longer than the disk, very loose but not reflexed, glabrous or nearly so, scarcely ciliate or ciliate toward the base; rays numerous, 1-2 cm. long; disk about 10-11 mm. across, the corollas with red-purple lobes; achenes slender, glabrous, dark-brown, apically rounded; pappus of 2 lanceolate short awns, without other members. *H. filiformis* Small. Rare in calcareous prairies, n.-cen. Tex., e. part of Plains Country and Edwards Plateau, late summer-fall; from cen. Plains States s. into Tex.

10. *Helianthus ciliaris* DC. BLUE-WEED. Perennial from slender rhizomes; stems 1 to several, 5-7 dm. tall, glabrous, glaucous; midstem leaves opposite, sessile or very short-petiolate, linear to broadly lanceolate, entire to somewhat pinnately lobed, glabrous and glaucous, conspicuously 3-nerved when lanceolate; heads 12-25 mm. across; phyllaries obtuse, ovate to broadly lanceolate, ciliate, glabrous or slightly puberulent dorsally, about 5-7 mm. long, about 3.5 mm. broad; rays 12 to 18, about 1 cm. long; disk corolla 5-6 mm. long, basally puberulent and yellow, the lobes reddish or sometimes the entire corolla red; pales entire to 3-cuspidate, the tips obtuse to acute and puberulent; achenes about 3 mm. long, black or grayish at maturity; pappus of the disk of 2 broadly ovate-acuminate scales; ray pappus absent or of 1 to 3 linear to lanceolate scales. Locally abundant near streams or canals, often in subalkaline desert soil in the Trans-Pecos and Plains Country, infrequent in Rio Grande Plains, summer-fall; Kan., Okla., Tex., N.M., Ariz., Chih., Coah., N.L., Tam. and S.L.P.

11. *Helianthus argophyllus* T.&G. SILVERLEAF SUNFLOWER. Taprooted short annual 1-2 m. tall, densely white-tomentose (especially the younger parts), profusely branched in the upper half; leaves mostly alternate, ovate, obtuse, entire or rarely serrate, more or less subcordate, petiolate (petiole about as long as blade in larger midstem leaves); blade normally almost 2 dm. long and broad, densely tomentose on both surfaces; peduncles 5-15 cm. long; involucre flattish; phyllaries broadly ovate-acuminate with subulate tips, about equaling the disk, loose but not reflexed, densely tomentose, more or less ciliate, the cilia usually obscured by the tomentum; pales 3-cuspidate, often red-purple; disk 2-3 cm. across, deep-purple; achene more or less pubescent toward the apex; pappus of 2 lanceolate ample awns, without any other scales. Locally abundant in deep loose sandy soils, s.e. Tex. and Rio Grande Plains, scattered and perhaps introd. in e. Tex., late summer-fall; perhaps endemic but now introd. widely as an ornamental and escaping in the Gulf States.

Hybridizes occasionally with *H. annuus* (and perhaps also with *H. debilis*), producing local hybrid swarms.

12. *Helianthus annuus* L. COMMON SUNFLOWER, MIRASOL. Taprooted annual; stems 5-25 dm. tall, less commonly taller, simple or branched, hispid, very rough, green, often mottled; leaves nearly all alternate; blades ovate (rarely ovate-lanceolate), obtuse or less commonly acute, basally truncate to cordate, dentate (rarely subentire), scabrous-setose above, hispid beneath, (5-) 10-30 cm. long and nearly as broad as long; petioles often as long as or longer than the blades; peduncles very variable; heads often numerous; involucre shallow; phyllaries broad, 4-10 mm. broad, in the proximal part marginally conspicuously ciliate and oblong in shape, rather abruptly contracted toward the tip

(thus acuminate), often attenuate, sparingly to densely hispid, about equaling the disk; pales ample, 3-cuspidate; disk 20-35 (-45) mm. across, the corolla lobes red or purple; achenes 3.3-5.5 (-7) mm. long, obovate, glabrous or obscurely pubescent apically, light gray, often mottled; pappus of 2 broadly lanceolate awns, without intermediate scales.

We have 3 intergrading races as follows:

Subsp. *annuus*. Plants usually very tall and branched; leaf blades ovate, cordate basally; phyllaries 7-10 mm. broad, sparingly to densely pubescent; disk 3-5 cm. across; rays 21 to 35, 3-5 cm. long, 10-15 mm. broad; disk corollas red or purple; achenes 4-7 mm. long. Rare in n.e. Tex., late summer-fall; e. and cen. U.S. and s. Can.

Subsp. *texanus* Heiser. Plants 15-25 dm. tall, usually much-branched; stem frequently conspicuously purple and green-mottled; lower leaves ovate, cordate at base, occasionally somewhat jaggedly serrate; phyllaries 4-6 mm. broad, generally sparingly pubescent; disk generally 21-30 mm. across; rays light yellow, 19 to 25, 24-32 mm. long, 8-12 mm. broad; disk corollas and anthers purplish; achenes 3.3-5 mm. long. *H. annuus* var. *texanus* (Heiser) Shinn. Widespread in e. and s. halves of Tex., late summer-fall; also in n.e. Mex.

Subsp. *lenticularis* (Dougl.) Cockl. Plants generally 5-25 dm. tall, branched; lower leaves lanceolate to ovate, truncate to cordate basally; phyllaries 4-7 mm. broad, sparingly to densely pubescent; disk generally 20-35 mm. across; rays 12 to 26, 25-39 mm. long, 9-13 mm. broad; disk corollas generally red or purple; anthers reddish or purplish, rarely yellow; achenes 4-5.5 mm. long. Infrequent in w. Tex., late summer-fall; most of w. N.A.

In Texas the common sunflower has apparently introgressed with *H. debilis*; the racial characters of the subsp. *texanus* can be explained as the result of introgressive genetic influence of *H. debilis* populations on *H. annuus* populations. The cultivated giant sunflower is a member of *H. annuus*, derived through artificial selection.

13. *Helianthus petiolaris* Nutt. PLAINS SUNFLOWER. Taprooted annual; stems erect, usually 5-20 dm. tall, often much-branched, variously pubescent (see remarks below); leaves alternate; blades narrowly lanceolate to deltoid or ovate, obtuse to acute, marginally entire to deeply serrate-dentate or dentate, at the extreme base cuneate, rarely cuneate-subcordate, 4-15 cm. long, 1-10 cm. broad (mostly about 8 × 3-4 cm.), variously pubescent; petiole slender, 1-15 cm. long, longest on the lowest leaves, about as long as the blade; branching above paniculiform, the heads solitary at the tips, the peduncles mostly about 1 dm. long; involucre hemispheric; phyllaries broadly lanceolate, about as long as the disk, erect, somewhat appressed, ciliate or not, densely short-hispidulous; pales 3-cuspidate; rays oval, about 2 cm. long; disk 10-25 mm. across, the corollas with red-purple lobes; achene turgid, oblong, apically rounded, evenly and conspicuously villous; pappus of 2 broadly lanceolate awns about half as long as the corolla. Local in usually sandy plains and prairies, w. half of Tex., sporadically waifed farther e., summer-fall; much of the Great Plains and s. to Chih.; waifed in a few areas of n.e. U.S.

The Trans-Pecos representatives of this species have gray-pubescent herbage; since they show some degree of reproductive isolation from the greener plains plants, they are considered by some authors to be a separate species, *H. canus* (Britt.) Woot. & Standl., or a separate variety, *H. petiolaris* var. *canescens* Gray; but there is complete intergradation of this sort with the true *H. petiolaris* of the plains. The var. *canescens* is distributed in Tex., N.M., Ariz., Calif., Baja Calif., Son. and Chih. It is one of the *Helianthus* taxa most similar to *Viguiera*, to which the entire genus *Helianthus* is most closely related.

14. *Helianthus debilis* Nutt. Taprooted annual 4-20 dm. tall, rather much-branched, subglabrous to canescent-pubescent, usually scabrous above, the upper stem and branches usually conspicuously mottled; leaves nearly all alternate; blades deltoid-ovate to deltoid-lanceolate, acute, more or less cordate basally, 3-8 cm. long, 2-5 cm. broad, irregularly serrate (rarely subentire), green (or rarely canescent-pubescent); petiole nearly as long as the blade; heads few, terminating the upper branches; involucre hemispheric; phyllaries narrowly lanceolate, attenuate to subulate apically, exceeding the disk, loose but not reflexed, not very ciliate; pales 3-cuspidate; rays 11 to 16 (rarely to 20), 15-27 mm. long; disk 14-17 mm. across; corolla lobes deep-red-purple; achene slender and pubescent at the summit; pappus of 2 short slender awns.

We have several races of this species all found in sandy soil and nearly all on the Coastal Plains, as follows:

Subsp. *silvestris* Heiser. Stems erect, dark-reddish-mottled, frequently glabrate branched above, the branches somewhat drooping; lower leaves deltoid-ovate, cordate, for the most part regularly serrate; blades 6-14 cm. long, 4-13 cm. broad; peduncles slender, 16-30 (-40) cm. long; disk for the most part 15 mm. across; phyllaries about 2 mm. broad; rays 12 to 14 (rarely to 20), 15-23 mm. long, 7-12 mm. broad; pales for the most part hispid. Sandy soils, e. Tex., late summer-fall; endemic.

Subsp. *cucumerifolius* (T.&G.) Heiser. Erect, much-branched, the branches ascending, hispid below, usually conspicuously purple-mottled, 55-65 dm. tall; lower leaves deltoid-ovate to deltoid or lanceolate, cuneate to truncate or cordate basally, fairly regularly serrate, slightly wavy-margined; blade 4-9 cm. long, 3-8 cm. broad; peduncles not conspicuously slender, 25-50 cm. long; disk 16-18 (-20) mm. across at anthesis; phyllaries 2-2.5 mm. broad; rays 12 to 18, about 2 cm. long, 7-12 mm. broad; central pales with hispid or slightly villous tips. *H. debilis* var. *cucumerifolius* (T.&G.) Gray, *H. cucumerifolius* T.&G. Sandy soils, Travis Co. s. to Victoria Co., w. to Bandera, Medina and Frio cos., late summer-fall; endemic.

Subsp. *praecox* (Engelm. & Gray) Heiser. Usually somewhat prostrate or erect with branches horizontal; stems greenish, not conspicuously mottled, hispid to hirsute, 4-5 dm. tall; lower leaves deltoid-ovate, usually cuneate to truncate basally, finely and fairly regularly serrate, 3-8 cm. long, 2-7 cm. broad; peduncles 15-30 cm. long; disk about 14 mm. across; phyllaries 3-4 mm. broad, short-attenuate; rays generally 14 to 15, 17-27 mm. long, 7-12 mm. broad; central pales hispid or occasionally slightly villous. *H. debilis* var. *praecox* (T.&G.) Gray, *H. praecox* T.&G. Coastal sands, Galveston and Chambers cos., late summer-fall; endemic.

Subsp. *Runyonii* Heiser. Erect, generally reddish, hispid to hirsute, 5-6 dm. tall; lower leaves deltoid-ovate, basally cuneate to truncate, generally with small acute teeth and regularly serrate; blades 30-75 mm. long, 2-6 cm. broad; peduncles 2-3 dm. long; disk about 14 mm. across; phyllaries 3-4 mm. broad, abruptly attenuate; rays generally 11 to 13, 22-24 mm. long, 10-11 mm. broad; central pales villous. Coastal areas, Aransas Co. to Cameron Co. and inland to Bee and Brooks cos., late summer-fall; endemic.

Subsp. *hirtus* Heiser. Similar to subsp. *Runyonii* but more hirsute; blades 3-9 cm. long, 2-7 cm. broad; peduncles 3-4 cm. long; disk 15-17 mm. across; rays 14 to 16, 21-27 mm. long, 7-13 mm. broad. Known only from sands in Dimmit Co., Rio Grande Plains; endemic.

H. debilis, especially as it is represented by its subspecies *praecox*, *Runyonii* and *hirtus*, is exceedingly closely related to *H. petiolaris*.

15. *Helianthus paradoxus* Heiser. Taprooted annual 15 dm. tall, the stem sparsely scabrous; leaves opposite below, alternate above; lower blades lanceolate, 10 cm. long, 25 mm. broad, 3-nerved, entire, rough; petioles 2 cm. long; peduncles 3 to 5, 12-18 cm. long; phyllaries 16 to 20, ovate-lanceolate or ovate, sparsely hispid, 10 mm. long, 3 mm. broad; disk about 18 mm. across; rays about 15, 17 mm. long, 7 mm. broad; disk corolla purple; pales apically glabrous. Rare, known from one population, 7 miles w. of Ft. Stockton, Pecos Co. in the Trans-Pecos (11 Sept., 1947). Also known from an old collection from Valencia Co., N.M. Very likely extinct in Texas.

Probably has hybridized to some extent with *H. annuus* subsp. *lenticularis*.

16. *Helianthus neglectus* Heiser. Taprooted annual, 8-15 dm. tall, densely hispid below, branched above; lower leaves ovate, for the most part cordate basally, subentire to remotely serrulate, sparsely hispid, the hairs somewhat appressed; blades 7-14 cm. long, 75-123 mm. broad; petioles 9-11 mm. long; peduncles 1-4 dm. long; phyllaries 25 to 35, lanceolate, attenuate, 15-24 mm. long, 25-40 mm. broad; rays 21 to 31, 30-39 mm. long, 10-14 mm. broad; disk about 23-28 mm. across; scales apically white-hirsute. Rare, known from scattered populations along U.S. highway 80, from 2 to 10 miles e. of Monahans, in the sandy "South Plains" (22 July 1955). Also known from Eddy Co., N.M. Closely related to *H. petiolaris*. Probably has hybridized to some extent with *H. annuus*.

80. FLOURENSIA DC.

A genus of about 2 dozen species of North America and South America.

1. *Flourensia cernua* DC. TARBUSS, HOJASÉ. Shrub 1-2 m. tall, densely leafy, glabrous, glutinous, aromatic with an odor of tar; leaves alternate, elliptic or nearly so, 17-25 mm.

long, 6.5-11.5 mm. broad, acute at both ends, deep-green; petioles 1-2.5 mm. long; heads nearly sessile in leafy clusters on the branchlets, nodding, about 1 cm. long and thick; involucre campanulate; phyllaries in roughly 3 series, strongly graduated, linear, firmly herbaceous, glutinous, the tips often spreading; involucre slightly convex, chaffy throughout, the pales nearly as long as the flowers and partially enfolding them; *ray flowers* absent; *disk flowers* perfect, fertile, the corollas dull-yellow and 5-toothed terminally; achenes laterally compressed and 2-edged but not winged nor very flat, silky-villous, narrowly cuneate, about 6 mm. long, 2 mm. wide; pappus of 2 ciliate awns, unequal, 2.5-3.2 mm. long; intermediate squamellae absent. Very abundant in Trans-Pecos deserts, rare e. to w. part of Plains Country, Sept.-Dec.; Tex., N.M., Ariz., Son., Chih., Coah., N.L., Dgo. and Zac.

81. ENCELIA ADANS.

An American genus of about 15 species, of which we have one.

1. *Encelia scaposa* (Gray) Gray. Strongly perennial herb from woody rootstocks 1-2 cm. thick; leaves mostly alternate but so densely crowded at the base that the phyllotaxy is obscure, narrowly oblanceolate to sublinear, 3-10 cm. long, 1-8 mm. broad; stems few, naked, scapelike, erect, 3-5 dm. tall, monocephalous; involucre about 1 cm. high, hemispheric or even broader; phyllaries linear, in about 2 or 3 series, the inner shorter than the outer; receptacle slightly convex, chaffy throughout, the pales folded and enveloping the flowers; *ray flowers* about 20 to 40, pistillate but infertile; rays about 15 mm. long, oblong, yellow, showy, 2-toothed terminally; *disk flowers* perfect, fertile, the yellow corolla 5-toothed terminally; achenes strongly laterally compressed, very pubescent especially on and near the 2 sharp edges; pappus of 2 hairs or awns, one over each shoulder of the achene, easily dislodged and often absent from the mature achenes. Incl. var. *stenophylla* Shinnery. Rare in deserts of the Trans-Pecos (Hudspeth and Terrell cos.), Mar.-Apr.; also N.M.

82. SIMSIA PERS.

BUSH SUNFLOWER

Annual or perennial herbs, usually harshly doubly pubescent with some longer bristly hairs intermixed with fine shorter ones; nearly all the leaves opposite, only a very few uppermost ones alternate, the petiole well-marked, the blade often deltoid or shallowly hastately lobed and marginally serrate; peduncles several cm. long, monocephalous; involucre 7-12 mm. high; phyllaries in about 3 unequal or subequal series, firm and finely bristly, basally often somewhat indurated and discolored and about 3-nerved; receptacle slightly convex, chaffy throughout; pales often discolored or stramineous, elliptic, acute, folded over and mostly enveloping the flower; *ray flowers* 8 to 30, pistillate but infertile; the yellow rays often also suffused or spotted (especially underneath) with purple, linear, terminally rounded; *disk flowers* numerous, perfect, fertile, the corollas mostly yellowish (often with purplish lines) and 5-toothed terminally; disk achenes laterally strongly compressed, nearly completely flat, obovate in outline, usually emarginate apically (the margins winglike but quite firm), blackish or mottled; pappus absent or of 2 awns, 1 over each shoulder of the developing achene and caducous, usually absent on the mature achene.

A genus of two dozen species of the warm-temperate and tropical parts of the Americas. It has been included in *Encelia* by some authors but it is as well-marked as various other genera closely related (*Verbesina*, *Helianthus*, *Viguiera*, *Flourensia*).

1. Phyllaries subequal; rays 15 to 30; perennial from thick fusiform or woody underground parts; petioles of some leaves auricled at the attachment to the stem and auricles of opposing leaves usually united at the side of the stem; corolla of disk flowers gibbous near the base on the side toward the periphery of the head 1. *S. calva*.
1. Phyllaries markedly graduated; rays about 8 to 10; annual from slender taproots; petioles not auricled; corolla not gibbous 2. *S. exaristata*.

1. *Simsia calva* (Engelm. & Gray) Gray. Perennial herb from woody or slightly fleshy fusiform underground organs often 1-2 cm. thick (these organs rarely extricated from crevices in Trans-Pecos and Edwards Plateau habitats), harshly pubescent, several-stemmed from the base and with the characters given in the key. *Encelia calva* (Engelm. & Gray) Gray, *Simsia subaristata* Gray. Abundant in Rio Grande Plains, frequent in the Trans-Pecos, n.-cen. and s.e. Tex., Edwards Plateau and Plains Country, spring-fall; Tex., Tam., N.L. and Coah.

The degree of development of the pappus awns and their degree of persistence is highly variable. Plants of the Trans-Pecos mts. are racially distinct in several subtle ways and probably deserve recognition as a variety.

2. *Simsia exaristata* Gray. Annual herb, erect, much-branched above and with the characters given in the key. Incl. var. *perplexa* Blake, *Encelia exaristata* (Gray) Gray. Very rare in deserts, w. part of the Trans-Pecos, late summer-fall; Tex., N.M., Ariz., Son., Chih. and southw.

Apparently intergrading with the central and southern Mexican *S. lagascaeformis* DC., and probably should be referred to by the latter name.

83. ZEXMENIA LA LLAVE & LEX.

Small shrubs; leaves mostly opposite, short-petiolate or nearly sessile, often rough-pubescent, the blades usually unlobed; peduncles remote, 1-2 cm. long, naked; heads solitary on the peduncles; involucre usually hemispheric or deep-campanulate; phyllaries in 2 or 3 series, graduated, usually ovate or oblong and with herbaceous tips; *ray flowers* usually 8, fertile; rays yellow or orange; *disk corollas* yellow or orange; disk achenes more or less compressed, mostly oblong or obovate, acute- or sharp-edged or sometimes winged; achene more or less markedly constricted near its summit, forming a sort of neck which separates the insertion of the pappus from the body of the achene; pappus of 2 or 3 awns and several usually more or less connate squamellae.

An American genus of several dozen species.

1. Stem leaves 5 cm. or more in length (sometimes shorter) 1. *Z. hispida*.
 1. Stem leaves 2-3 (rarely -4) cm. long; outer phyllaries squarrose, loose and enlarged or the heads subtended by 2 or 3 bractlike leaves 2. *Z. brevifolia*.

1. *Zexmenia hispida* (H.B.K.) Gray. Shrub 5-10 dm. tall, strigose-hispid; leaves rhombic-lanceolate or ovate-lanceolate, acute at the base, sessile or nearly so, sparingly dentate or subhastately lobed, generally strigose on both sides; peduncles terminal, solitary or occasionally in a cyme of 3, very long; heads about 1 cm. high; involucre 2-seriate, cylindraceous-campanulate, generally less than 1 cm. broad; outer phyllaries (or bractlike leaves) lanceolate, subfoliaceous; rays broad, conspicuous, yellowish-orange; achenes variable as to wing and size; achenes of the ray flowers commonly 3-angled, with 2 or occasionally 3 wings; achenes of the disk flowers broadly 2-winged or with the wings reduced to 2 upwardly directed auricles; pappus separated from the body of the achene by a strong constriction or neck bearing a somewhat expanded row of very short squamellae and 2 or 3 short awns. Abundant on Edwards Plateau (n.w. to Kent Co.), Rio Grande Plains and less frequent in the Trans-Pecos and s. part of s.e. and n.-cen. Tex., summer-fall; Tex. and much of upland and n.e. Mex. s.e. to Ver. and Hgo.

2. *Zexmenia brevifolia* Gray. Rounded shrub usually 5-10 dm. tall, rather harshly pubescent; leaves ovate to broadly elliptic-ovate, 2-3 (rarely -4) cm. long, entire, obtuse at apex; peduncles long, slender, terminal, solitary, densely strigose; heads 10-15 mm. high; involucre lax, roughly 3-seriate; outermost phyllaries ovate, foliaceous at apex, squarrose, loose and enlarged; rays 5 to 8, small, the achenes broadly winged; disk achenes 4-6 mm. long, slightly rugose, narrowly winged; pappus scales well-developed, usually united at base to form a short cup at achene summit, the neck evident in disk achenes; awns shorter than the body, rather rigid. Frequent in low scrubby vegetation on limestone, Rio Grande Plains and s. Trans-Pecos, summer-fall; Tex., Chih., Coah., N.L., Tam. and S.L.P.

84. VERBESINA L. CROWN-BEARD

Pubescent annual or perennial herbs; leaves opposite or alternate, mostly roughly ovate or deltoid in shape (less commonly elliptic) and basally narrowed either to a subpetiolar winged base or rarely a true petiole, marginally usually coarsely serrate, in some species basally decurrent as wings on the stem; heads solitary or clustered; receptacle low to high-conical to nearly globose; involucre usually hemispheric or campanulate; phyllaries imbricated in 2 to several series, ascending or spreading at maturity, usually not markedly unequal; each pale folded at one edge of the achene; *ray flowers* present, pistillate, fertile or infertile, yellow or white, 3-toothed or shortly 3-lobed terminally; *disk flowers* numerous, perfect, fertile, the corollas yellow or white and 5-toothed; style tips acute or attenuate; achenes strongly laterally compressed, with 2 thin edges each usually with a well-developed wing, the body glabrous or pubescent; pappus of 2 deciduous or persistent usually straight awns or in some species essentially absent. *Ximenesia* Cav.; *Actinomeris* Nutt.; *Ridan* Britt.; *Pterophyton* Cass.

A rather diverse genus, marked by the very thin and thin-margined or wing-margined achenes. *Zexmenia* has somewhat similar achenes but it comprises shrubs or subshrubs and its achenes tend to be slightly thicker, and the outer phyllaries are broad, almost foliaceous. About 150 species, native to America.

- 1. Rays deeply 3-toothed or shallowly 3-lobed terminally, the teeth or lobes 1.5-3 (-4) mm. long (2)
- 1. Rays more shallowly 3-toothed or with 3 scallops terminally (3)
- 2(1). Annual, usually bushy-branched; rays yellow2. *V. encelioides*.
- 2. Perennial, subrhizomatous, not bushy-branched; rays orange3. *V. nana*.
- 3(1). Rays white (4)
- 3. Rays yellow (5)
- 4(3). Wings of the stems commonly 6, usually present also in the upper head-bearing region; leaves mostly sinuate-dentate or deeply crenate; pubescence very short7. *V. microptera*.
- 4. Wings of the stem 4 or 5, narrow, seldom proceeding upward into the head-bearing region; leaves soft-pubescent8. *V. virginica*.
- 5(3). Phyllaries few, soon deflexed; achenes at maturity squarrosely spreading1. *V. alternifolia*.
- 5. Phyllaries numerous, imbricated; achenes at maturity ascending (6)
- 6(5). Leaves opposite, for the most part harshly scabrous-pubescent; Edwards Plateau4. *V. Lindheimeri*.
- 6. Leaves alternate for the most part; pubescence not harshly scabrous; not on Edwards Plateau (7)
- 7(6). Stems winged by the decurrent leaf bases; eastern half of state5. *V. helianthoides*.
- 7. Stems not winged; Trans-Pecos mountains6. *V. oreophila*.

1. *Verbesina alternifolia* (L.) Britt. WINGSTEM. Perennial herb usually 1-2 m. tall, erect, not much-branched except in the upper 1-4 dm.; leaves alternate (rarely opposite), elliptic, basally cuneate, apically acute, coarsely serrate, decurrent as narrow wings on the stem; *ray flowers* few, neutral, sterile; rays yellow, about 1 cm. long; disk only about 1 cm. thick, soon nearly globose on account of the high-conic receptacle and spreading phyllaries, pales and flowers; achenes with prominent wings; pappus of 2 persistent awns. *Actinomeris alternifolia* (L.) DC. Rare in n.-cen. Tex. (Dallas Co.), presumably adv.; Gulf States n. to Ont. and Ia.

2. *Verbesina encelioides* (Cav.) Gray. COWPEN DAISY. Much-branched grayish-green or canescent-pubescent taprooted annual 1-9 dm. tall; leaves chiefly opposite, with a roughly deltoid lamina portion (coarsely dentate) and narrowed below to a

broad subpetiolar base which usually clasps the stem, rarely the leaves with true, unwinged petioles (var. *exauriculata* Robins. & Greenm.); heads solitary on the pedunculiform ends of the branches or rarely 2 or 3 fairly closely aggregated, each 2-3 cm. across (incl. the expanded rays); outer phyllaries long, green, much-surpassing the disk or else subequal; rays about 1 cm. long; ray flowers fertile, yellow, showy, deeply 3-toothed terminally; wings of the achene rarely narrow or nearly vestigial, usually broad and acutish summitally. *Ximenesia encelioides* Cav. and var. *cana* DC., *X. australis* H. & A., *X. exauriculata* (Robins. & Greenm.) Rydb. Very frequent in disturbed soils essentially throughout although rare in extreme e. Tex., summer; Fla., Tex., s.e. through most of the warmer parts of Am., adv. in Old World.

3. *Verbesina nana* (Gray) Robins. & Greenm. Rhizomatous perennial, the aerial shoots only 1-2 (-3) dm. tall; leaves chiefly opposite, often canescent-pubescent, oval, obtusish, irregularly dentate (the teeth often blunt), often only 3-5 cm. long, nearly half as broad, narrowed basally to a linear subpetiolar base which is entire and bears 2 to 4 teeth near the stem; heads solitary at the pedunculiform ends of the branches, about 2 cm. across; phyllaries oblong to lance-linear, about 8 mm. long, subequal; ray flowers fertile; rays orangish, usually less than 1 cm. long, 3-toothed apically; pales narrow, nearly filiform; achenes suborbicular in outline, broadly winged, villous, the wings obtuse at the summit; pappus absent. *Ximenesia nana* (Gray) Shinn. Local in deserts in the Trans-Pecos, rare in Rio Grande Plains, summer; also Coah.

4. *Verbesina Lindheimeri* Robins. & Greenm. LINDHEIMER CROWN-BEARD. Perennial herb (2-) 4-6 (-10) dm. tall; stems not winged; herbage harshly scabrous; leaves opposite for the most part but alternate in the head-bearing region, with an ovate-deltoid lamina-portion but basally narrowly long-tapered to a cuneate base (not clasping); heads few; peduncles essentially naked; phyllaries broadly oblong; rays showy, yellow; pappus awns short. Locally abundant in limestone hills in e. part of Edwards Plateau, late summer-fall; endemic.

5. *Verbesina helianthoides* Michx. Perennial about 1 m. tall; most of the leaves alternate, all basally decurrent on the stem as wings, elliptic, basally cuneate, apically acute, marginally serrate; heads 3-5 cm. across when the rays are expanded and spreading; phyllaries lanceolate to linear-oblong; ray flowers usually infertile; rays long (18-30 mm.), yellow, showy; wings of the achene broad. Local in open areas of n.-cen. Tex., rare in e. Tex., May-Oct.; s.e. U.S. n. to O. and Ia. and w. to Okla. and Tex.

6. *Verbesina oreophila* Woot. & Standl. Perennial herb about 1 m. tall; stems erect, stout, not winged, minutely puberulent; leaves alternate; blades triangular-lanceolate to deltoid-ovate, 8-11 cm. long, 7 cm. broad or less, acute, narrowed basally to a very short linear subpetiolar base, marginally coarsely serrate, scaberulous on the upper surface, soft-pubescent on the lower; heads numerous, each on a slender naked peduncle in a loose cymelike arrangement, about 12 mm. across; phyllaries oblanceolate to linear-oblong or lanceolate, acute, 5 mm. long or less, appressed-pubescent; rays bright-yellow, conspicuous, obovate-spatulate; achenes 5 mm. long, cuneate-obovate, brown, glabrous, closely invested by the receptacular pales. Mts. of the Trans-Pecos, above 7,000 ft., (Aug.-) Sept.-Nov.; also N.M.

7. *Verbesina microptera* DC. CAPITANA. Perennial herb from knotty crowns and fibrous roots, 5-20 dm. tall; stems prominently winged with usually 6 wings, the wings progressing up well into the highly branched head-bearing region; leaves alternate with an elongate-deltoid or rarely elliptic lamina portion which is coarsely toothed or crenate and narrowed basally to a broadly winged subpetiolar base; rays and disk whitish. *V. texana* Buckl. Abundant in loamy soil, Rio Grande Plains, s. part of Edwards Plateau and s. part of s.e. and e. Tex., summer-fall; also n.e. Mex.

Intergrading on a broad scale with the next and probably conspecific with it.

8. *Verbesina virginica* L. FROSTWEED. Perennial herb usually 1-2 dm. tall, much resembling the last but the stem with only 4 or 5 wings and these usually absent from the highly branched head-bearing region; pubescence averaging softer and less harsh than in *V. microptera*; rays and disk whitish. Abundant in loamy soil, e., s.e., and n.-cen. Tex., late summer-fall; Gulf States n. to Pa., Ky., Mo. and Kan.

Probably to be enlarged to include *V. microptera*, with which it intergrades.

85. CALYPTOCARPUS LESS.

A monotypic genus.

1. *Calyptocarpus vialis* Less. HIERBA DEL CABALLO. Perennial herbs, with weak often sprawling stems (1-) 2-6 dm. long but only 2-9 cm. tall; leaves opposite, with deltoid marginally serrate strigose blades 1-3 (-4) cm. long and petioles (or subpetiolar winged bases) about a third as long; peduncles naked, axillary, 3-50 mm. long, topped by a solitary head; head less than 1 cm. long; involucre obconical; phyllaries about 5, slightly unequal (the inner ones shorter and narrower), leaflike in texture, obtuse and broadly overlapping; receptacle chaffy throughout, the scarious pales lance-subulate; ray flowers pistillate, fertile, the yellow rays spatulate; disk flowers perfect, fertile, the yellow corollas equally 5-toothed; achenes strongly dorsiventrally compressed, subulate; pappus of 2 awns, one over each corner of the achene. *Zexmenia hispidula* Buckl. Frequent in s.e. Tex. and Rio Grande Plains, infrequent n. to e. and n.-cen. Tex. and Edwards Plateau, nearly all year; Pan., C.R., Guat. and Mex., n. to Coah., Tex., La., Ala. and Fla.; Cuba.

A troublesome lawn weed.

86. COREOPSIS L.²¹⁶

COREOPSIS. TICK-SEED

Annual or perennial herbs, glabrous or pubescent; leaves opposite or more rarely (in the upper part of the plant) alternate, undivided and entire or dentate, or 1 to 3 times ternately or pinnately dissected; heads peduncled; phyllaries commonly in 2 or rarely in 3 or 4 series, more or less connate at the very base (but not high up); outer phyllaries commonly herbaceous or submembranous and appressed or often spreading; inner bracts commonly larger, brown or yellow, membranous; receptacle flat or slightly convex, chaffy throughout; pales flat or somewhat concave, membranous, striate; ray flowers present, neuter or pistillate, usually infertile; rays spreading, yellow (in some species with two shades of yellow, in others with a red-brown spot basally), 3-toothed terminally; disk florets numerous, perfect and fertile, the corolla yellowish (often with reddish veins) and equally 5-toothed terminally; achenes dorsiventrally flattened, orbiculate to oblong or more or less oblong-linear, often 2-winged (the wings membranous or indurate-thickened, entire or not, flat or incurved), glabrous or especially at the margin villous; pappus usually present, usually of 2 awns over the two shoulders of the achene and with or without intermediate scales, persistent.

A genus of probably 100 species widely distributed.

- 1. Style branches terminally cuspidate or acute-conic (2)
- 1. Style branches terminally truncate or obtuse-conic (6)
- 2(1). Style branches acute-conic terminally1. *C. tripteris*.
- 2. Style branches cuspidate (3)
- 3(2). Annual herb; 2 shades of yellow on each ray2. *C. nuecensis*.
- 3. Perennial herbs; rays unicolor (4)
- 4(3). Plants subcaulescent, the leaves crowded near the base, the branches subscapose3. *C. lanceolata*.
- 4. Plants leafy nearly to the top (5)
- 5(4). Blades pinnately parted into narrow segments ...4. *C. grandiflora*.
- 5. Blades broad, simple5. *C. intermedia*.
- 6(1). Achenes wingless (7)
- 6. Achenes winged (8)
- 7(6). Outer phyllaries not commonly shorter than the inner; achenes obovate6. *C. basalis*.
- 7. Outer phyllaries much shorter than the inner; achenes narrowly oblong, slender, flattish7. *C. tinctoria*.

²¹⁶ Adapted from E. E. Sherff in N. Am. Fl. II, 2:1-190. 1955.

- 8(6). Achenial wings entire 8. *C. cardaminaefolia*.
 8. Achenial wings dissectedly fimbriate-pectinate 9. *C. linifolia*.

1. *Coreopsis tripteris* L. Perennial herb, erect from a horizontal base, commonly glabrous, more rarely pubescent, more or less pallid, 1-3 m. tall, the stems branched toward the top; leaves opposite, the principal ones petiolate, 6-8 mm. long including petioles, 3-parted, the middle leaflet rhomboid-lanceolate, 17-23 mm. broad and often in turn 3-parted, the segments lanceolate, at the apex acute or subobtusely, marginally revolute, superficially glabrous, the uppermost leaves smaller, often simple and subsessile; heads smelling of anise when bruised, in subcorymbiform aggregations, on peduncles 3-8 cm. long, at anthesis about 3 cm. broad and 8 mm. high; style branches acute-conic terminally; achenes brownish-black, glabrous, cuneate-oblong or cuneate-obovate, 4-4.5 mm. long and including the wings about 3 mm. broad. Incl. var. *subrhomboidea* Sherff. Rare in extreme n.e. Tex. (Bowie Co.), summer; most of e. U.S.

2. *Coreopsis nucensis* Heller. Annual herb, sparsely hirsute or almost glabrous, 2-6 dm. tall; stems erect but weak, branched toward the base, the uppermost nude; leaves opposite in often remote pairs, the uppermost subsessile, the others petiolate (with wide or very narrow petioles hispid-ciliate with pluriloculate hairs and up to 5 or even 12 cm. long), including the petiole 4-10 (-20) cm. long, the blades now entire and widely ovate or oblong-spatulate, now pinnately cut with up to 5 segments (the terminal one much the largest, the lateral more often alternate segments rarely lobate and the lowermost often petiolulate); heads terminating the stem and often 2-3 dm. long branches, radiate, at anthesis about 35-48 mm. broad, about 1 cm. tall; outer phyllaries about 8, oblong-lanceolate to narrowly deltoid-ovate or subulate, dorsally glabrate, at the apex narrow and more often rounded, at the sides often scarios, at the edges ciliate with pluriloculate bristles, 5-8 mm. long; each ray yellow, toward the base with large dark brownish-red or brownish-yellow spots, apically 3-lobate with the median lobe much larger and commonly divided into 2 smaller often emarginate lobes; style branches cuspidate; achenes about 4 mm. long and broad, winged. Abundant in sandy soils, s.e. Tex. and coastal parts of Rio Grande Plains, less frequent in e. and n.-cen. Tex., spring; endemic.

3. *Coreopsis lanceolata* L. Perennial herb 2-6 dm. tall; stems erect or ascending, glabrous, branched, foliose toward the base, subscarescent and very greatly elongated above where they pass into peduncles; leaves opposite, glabrous or pubescent, commonly 5-15 cm. long, the upper ones sessile, the lower ones more often elongately and slenderly petiolate with petioles sometimes surpassing the blades in length, spatulate to linear or linear-lanceolate to linear-oblancheolate, commonly simple, rarely divided, with mostly 1 or 2 small lateral lobes; heads 3-6 cm. broad, 10-14 mm. high; outer phyllaries 8 to 10, lanceolate or oblong, ovate; rays 13-30 mm. long; style branches caudate-appendaged, cuspidate; achenes 2.3-3 mm. long, the body black, winged. Incl. var. *villosa* Michx. Infrequent to rare in e. and s.e. Tex., spring; most of cen., midwest. and s.e. U.S.; n. N.M.

4. *Coreopsis grandiflora* Sweet. Perennial or rarely annual herb, erect or ascending commonly not pubescent except at the ciliate petioles, 3-6 dm. tall, often branched, commonly foliose at least near the base; leaves opposite, more or less petiolate with petioles more often 5-40 mm. long, the lower ones simple or irregularly parted or pinnate, with the petiole included usually 5-10 cm. long, the other leaves (often reduced) commonly 3- to 5-parted or less commonly simple, the segments at times again 3- to 5-parted, the ultimate segments filiform to linear or lance-linear; heads often solitary, 3-6 cm. broad, 8-12 mm. high, moderately pedunculate with peduncles often 10-15 cm. long; outer phyllaries 7 to 10, often in 2 series, lance-subulate, near the base often subdilated; rays 13-25 mm. long, cuneate-obovate, 3-lobate apically; style branches cuspidate; achenes winged, about 2.5 mm. long, the body black. *C. longipes* Hook., *C. Harveyana* Gray. Sandy wooded areas, e. Tex., frequent, less frequent w. to n.-cen. Tex., spring; s.e. U.S. and inland to Ark., Mo., Okla., Kan. and N.M.

5. *Coreopsis intermedia* Sherff. Erect herb, more or less glabrous, probably perennial, scarcely branched above, about 6 dm. tall; leaves opposite, simple, the basal ones with elongate and very slender petioles to 45 mm. long; blade oblong-oblancheolate or narrowly and obtusely obovate, the principal cauline ones sessile, widely oblong-lanceolate, ciliate, thickish, apically subacute, 50-70 (-95) mm. long and 12-20 (-32) mm. broad; heads pedunculate (peduncles 15-25 cm. long), 35-40 mm. broad and about 12

mm. high; outer phyllaries 8 to 10, lanceolate to linear-lanceolate, apically acute and cartilaginous; rays about 8, about 15 mm. long, obovate or oblanceolate, apically 3-lobed and with the median lobe strongly emarginate; style branches caudate, cuspidate; achenes winged, the body 2-3 mm. long. Exceedingly rare in sandy woods, e. Tex. (near Mineola, Wood Co.), spring; endemic.

Probably only a geographic race of *C. pubescens* Ell., which is widespread in e. U.S. w. to La. and Okla.

6. *Coreopsis basalis* (Otto & Dietr.) Blake. Annual, erect, branched, variously pubescent, 2-4 dm. tall, the stems and branches angulate and sulcate; leaves opposite, with petioles 1-5 cm. long, up to 12 cm. long (with petioles included), the principal ones 1- to 3-pinnate, the segments linear (rarely almost filiform) or linear-lanceolate to elliptic-oblong or even orbiculate, membranous, undulate, entire, obtuse apically or rarely acute; peduncular branches nude, 5-15 cm. long; heads 30-45 mm. or less broad, about 8 mm. high, or less; outer phyllaries 8 to 10, often spreading, subulate or linear-lanceolate, apically commonly acute, at the margins more or less hispid-ciliate, usually as long as the inner phyllaries, 5-9 mm. long; rays 13-23 mm. long, cuneately and broadly obovate, 3-lobed apically, medial lobe in turn 2- (rarely 3-) lobate; style branches obtusely conic apically; achenes wingless, obovate, on the dorsal surface black and very papillate, 1.4-1.8 (-2) mm. long. *C. Drummondii* (D. Don) T. & G. Abundant over much of the e. half of the state and w. on to the Edwards Plateau and the lower parts of the Plains Country; showing 2 rather distinct races:

Var. *basalis* with ultimate leaf segments averaging toward the broader limits given in the description. Common on sandy soils.

Var. *Wrightii* (Gray) Blake. Leaf segments filiform or linear or rarely lance-linear. Common on limestone soils, especially in the Edwards Plateau area, spring; endemic, or perhaps venturing as far w. as N.M. infrequently.

7. *Coreopsis tinctoria* Nutt. Annual herb, erect, glabrous, 6-12 dm. tall; stems foliose, much-branched; leaves opposite, subsessile or short-petiolate, usually 5-10 cm. long, 1- or 2-pinnate or the uppermost ones undivided; segments (or blades) narrowly linear or linear-lanceolate; heads numerous, 2-3 cm. broad, 4-6 mm. high; outer phyllaries about 8, more or less biseriolate and imbricate, linear-oblong or more often triangulate, about 2 mm. long; rays about 7 or 8, 7-15 mm. long, obovate, commonly 3-lobate apically, often with a red-brown spot near the base; style branches apically obtuse; achenes wingless, black, 1.2-4 mm. long. Abundant in seasonally moist soils, e. half of Tex. and less frequent nearly throughout, spring-early summer; Minn., Sask. and Wash. s. to La., Tex., N.M. and Calif.

8. *Coreopsis cardaminaefolia* (DC.) Nutt. MANZANILLA SILVESTRE. Annual herb, glabrous, erect, slender, suberectly branched, 2-5 dm. tall; stems subterete, foliose; leaves opposite, remote, shorter than the internodes, all but the sessile topmost ones with petioles commonly 1-4 cm. long, the lower and midstem leaves 1- or 2-pinnate with elliptic-oblong or widely or narrowly linear segments, the upper ones sometimes pinnately few-lobed or sometimes simple; peduncles glabrous, 1-5 cm. long; heads often numerous, 16-24 mm. broad, 6-8 mm. high; outer phyllaries 6 to 9, more or less lanceolate and irregularly placed, often subacute, 1-2 mm. long; rays about 7 or 8, about 1 cm. long, with a red-brown spot near the base (or this absent and the rays all yellow in a rare form known as *C. stenophylla* Boynt.); style branches obtusely conic; achenes strongly winged, 2-3 mm. long or occasionally less, the body black; awns of the pappus (one over each of the two shoulders, between the wing and the body) minute or in a coastal race (*C. similis* Boynt.) to 0.5 mm. long. *C. stenophylla* and *C. similis* Boynt. Abundant in seasonally moist soil, essentially throughout, spring-early summer, occasionally again in fall; La., Neb., N.M. and Ariz., s. to Tam., Coah. and Chih.

9. *Coreopsis linifolia* Nutt. Perennial herb, glabrous, pale, erect, 5-7 dm. tall; stems slender, corymbosely branched above; leaves opposite or the lower alternate, marginally entire but indurate or calloused, the lower ones spatulate or oblanceolate, shorter than the internodes (or the basal ones at times twice as long), 4-10 (-14) mm. broad, apically rounded, basally petiolate (petioles usually 1-4 cm. long) or the other ones sessile, linear, often truncate or exceedingly obtuse at the apex, much smaller; peduncles usually 3-7 cm. long; heads few, 2-3 cm. broad, about 6-7 mm. high; outer phyllaries about 6 to 11, glabrate, often irregularly placed, ovate to lanceolate-deltoid, lengthwise pluristriate, coriaceous, scarious at the margins, subacute or rounded apically, 1-3 mm. long; rays

7 or 8, 10-15 mm. long, obovate, apically 3-lobed with the median lobe emarginate; style branches obtusely conic; achenes winged, the wings lacerate or dissected-fimbriate-pectinate. Rare in wet soil, e. Tex., spring-early summer; Va. to Fla. and w. to Tex.

87. BIDENS L. BEGGAR-TICKS. BUR-MARIGOLD

Annual taprooted herbs or less commonly perennial herbs with taproots or fibrous roots; leaves opposite, entire or dentate or incised, or 1-, 2- or 3-ternately or -pinnately dissected; upper leaves sometimes alternate; involucre usually campanulate or subhemispheric; phyllaries commonly biseriata, at the base often very shortly connate; outer phyllaries usually herbaceous in texture, sometimes short, sometimes expanded into leaf-like members; inner phyllaries usually membranous, usually hyaline- or yellow-margined; receptacle flat or convex, chaffy throughout, the pales narrow and flattish; ray flowers present or absent, when present neuter or less commonly pistillate but infertile; rays when present whitish or yellow or less commonly rosy or a shade of red, usually shallowly 3-lobed apically; disk flowers numerous or less commonly few, perfect, fertile; corolla equally 5-toothed, usually yellow; style branches bearded above, tipped with short and acute or longer and subulate appendages; achenes dorsiventrally compressed or less commonly triangular or rhombic in transection; pappus awns absent or 1 to 8 in number and commonly persistent, usually more or less antrorsely or retrorsely barbed.

A genus of possibly 150 species in the warmer parts of the world, often separated on the most technical sort of characters, thus difficult to key out unless with patience and a good lens; heads both in anthesis and in fruit. The kinds with retrorsely barbed pappus awns are efficiently dispersed, becoming attached easily in fur and clothing.

- 1. Rays yellow (2)
- 1. Rays white or rosaceous to red or absent (5)
- 2(1). Pappus of 2 to 4 retrorsely barbed awns 6. *B. laevis*.
- 2. Pappus awns smooth, antrorsely setose, or absent (3)
- 3(2). Achenes black, the body 2.5-4.5 mm. long; outer phyllaries 7 to 10 3. *B. mitis*.
- 3. Achenes brown or blackish, the body 5-7.5 mm. long (4)
- 4(3). Outer phyllaries mostly 8 to 12, glabrous or moderately ciliate, usually shorter than the inner ones 1. *B. aristosa*.
- 4. Outer phyllaries 12 to 20, very ciliate or coarsely hispid, commonly longer than the inner ones 2. *B. polylepis*.
- 5(1). Achenes broadly or narrowly cuneate, not narrowed below the apex (6)
- 5. Achenes linear or clavate but never manifestly cuneate, often attenuate above (8)
- 6(5). Achene bodies striate; leaves simple or deeply incised (cf. remarks under *B. frondosa*) 6. *B. laevis*.
- 6. Achene bodies not striate; leaves at least 1- or 2-pinnate, the terminal leaflet commonly petiolulate (7)
- 7(6). Outer phyllaries 3 to 5 (commonly 4), not manifestly ciliate; pappus awns erect-hispid or smooth 4. *B. discoidea*.
- 7. Outer phyllaries 5 to 8, regularly and copiously ciliate; pappus awns retrorsely barbed 5. *B. frondosa*.
- 8(5). Achenes 5 to 9 (rarely 13) 8. *B. leptcephala*.
- 8. Achenes 14 to 50 (9)
- 9(8). Leaves simply pinnate 10. *B. pilosa*.
- 9. Leaves (at least the lower ones) 1- or 2-pinnate (10)
- 10(9). Achenes dimorphic, a few peripheral ones clavate with a body only 4-7 mm. long; body of the inner achenes 8-13 mm. long after anthesis 7. *B. Bigelovii*.
- 10. Achenes nearly all alike, the body often longer than 12 mm. 9. *B. bipinnata*.

1. *Bidens aristosa* (Michx.) Britt. TICKSEED SUNFLOWER. Annual or biennial herb, glabrate or scarcely pubescent, 3-10 (-15) dm. tall; leaves petiolate [petioles 10-15 (-30) mm. long], including the petiole 5-15 cm. long, pinnate or bipinnate; blade segments lanceolate or linear-lanceolate, acuminate, incised-serrate or pinnatifid, membranous, ciliate, scarcely pubescent on the lower surface; heads 2-5 cm. broad, 7-9 mm. high; involucre often hispid; phyllaries subequal, the outer ones 8 to 10, linear, sometimes scarcely ciliate, sometimes very ciliate, 5-12 mm. long; rays 6 to 10, golden, 10-25 mm. long, oblong-ob lanceolate, apically obtuse and entire or subdenticulate; achenes to 6.5 mm. long, flat or flattish, blackish or yellowish-black; pappus awns rarely absent (var. *mutica* Gray), usually present and smooth or antrorsely ciliate. In moist or seasonally moist soil, e. and s.e. Tex., infrequent, spring-early summer; most of the e. U.S.

2. *Bidens polylepis* Blake. Annual or biennial herb, glabrous, 3-10 dm. tall; leaves petiolate (petioles to 25 mm. long), including the petiole 8-15 cm. long, commonly bipinnate; leaflets lanceolate or linear-lanceolate, acuminate, sharply serrate, membranous, ciliate; heads 2-5 cm. broad, 7-9 mm. high; outer phyllaries numerous, commonly 15 to 20, usually spreading or reflexed, linear-elongate, conspicuously hispid-ciliate, dorsally hispid or glabrate, 10-27 mm. long; inner phyllaries lanceolate, shorter; rays about 8, golden-yellow, 10-25 mm. long, oblong-ob lanceolate, apically entire or obscurely denticulate; achenes flat, brown or blackish-brown, 5.5-7.5 mm. long; pappus awns nearly obsolete or slightly developed and with erect-hispid teeth. Frequent in e. and s.e. Tex., spring-early summer; Midwest U.S. and s. to Tex.

3. *Bidens mitis* (Michx.) Sherff. Annual herb, more or less glabrous, 3-10 dm. tall; leaves petiolate (petioles 3-30 mm. long), including the petioles 4-12 cm. long, membranous, variable, lanceolate or ovate, serrate, acute or acuminate, sometimes entire or more often pinnately 3- to 7-parted, the terminal leaflet commonly very elongate, the blade or segments linear and commonly entire or broader and incised-serrate, very rarely decomposed; peduncles 2-12 cm. long; heads 2-5 cm. broad; involucre glabrous or sparsely hispid at the base; outer phyllaries 7 to 10, linear or linear-spatulate, usually ciliate, acute or obtuse, 5-10 mm. long, the inner phyllaries often shorter; rays about 8, golden-yellow, 12-27 mm. long, ob lanceolate or elliptic-obovate, entire or very minutely denticulate; achenes flattish or scarcely trigonal in transection, broadly cuneate, black, the body 2.5-4.5 mm. long; pappus awns 0.6-1 mm. long, antrorsely setose. Rare in s.e. Tex., in moist soil, spring-early summer; s.e. U.S.

4. *Bidens discoidea* (T.&G.) Britt. Annual herb, 3-18 dm. tall; leaves petiolate (petioles 1-4 cm. long), including the petiole 5-12 cm. long, membranous, tripartite; leaflets lanceolate or ovate-lanceolate, acuminate, serrate, all commonly petiolulate, sometimes obscurely ciliate; heads numerous, the disk finally 7-9 mm. broad and 6-7 mm. high; involucre glabrous; outer phyllaries 3 to 5 (usually 4), foliaceous, linear-spatulate, membranous, not distinctly ciliate, commonly surpassing the disk, 7-25 mm. long; inner phyllaries oblong-lanceolate, membranous, subequal to the disk; ray flowers absent; achenes blackish, flattish, linear-cuneate, often tuberculate, pilose-hispid, the body 3-6.2 mm. long; pappus awns 0.2-2.2 mm. long, erect, hispid. Frequent in e. and s.e. Tex., spring and early summer; s.e. Can. and e. U.S.

5. *Bidens frondosa* L. BEGGAR-TICKS, STICK-TIGHTS. Annual herb, more or less glabrous, paniculate-branched, 5-12 dm. tall; leaves petiolate (petioles 1-6 cm. long), including the petiole 5-15 (-20) cm. long, pinnately 3- or 5-divided, membranous, ciliate, on the upper surface commonly glabrate, on the lower surface glabrate or obscurely and sparsely or even rather densely clothed with minute setae; leaflets lanceolate, acuminate, serrate, the terminal one slenderly petiolulate; heads about 1 cm. broad, 6 mm. high; involucre basally hispid; outer phyllaries 5 to 8 or occasionally as many as 10, conspicuously ciliate, often very long (even 3-5 cm. long) and foliaceous, linear-spatulate; inner phyllaries ovate or ovate-lanceolate, shorter (finally 5-7 mm. long); ray flowers absent or if present minute, the golden-yellow rays 2-3.5 mm. long, cuneate-obovate, commonly 2- or 3-denticulate; achenes flat, narrowly cuneate, blackish, subglabrous or pilose-hispid, on each face strongly 1-nerved, the body 6-10 mm. long; pappus awns 2, retrorsely barbed, 3-4.5 mm. long. Frequent near moist places, e. half of Tex., recently reported from Hemphill Co. in the Panhandle, spring-early summer; e. Can., most of the U.S.

Bidens tripartita L. has recently been reported to occur in Hemphill Co. in the Panhandle of Tex. (we have not seen specimens). It has heads and achenes rather similar to

those of *B. frondosa*, but the primary leaves are simple, incised-serrate, or 3- to 5-lobed; it is otherwise known from Eur. and adv. in Que. and N.H.

6. *Bidens laevis* (L.) B.S.P. Annual or perennial herb, erect or procumbent at base, 3-10 dm. tall; leaves sessile, undivided, linear-lanceolate to lanceolate or rarely ovate-lanceolate, narrowed at each end or at the base sometimes broad and connate, apically often acuminate, regularly serrate with the teeth often slender and almost subulate, glabrate or on the margin often sparsely ciliate, 5-15 cm. long; heads commonly few, 3-7 cm. broad, 8-11 mm. high; involucre commonly hispid at base; outer phyllaries 6 to 8, scarcely foliaceous, linear-lanceolate, apically obtuse or acute, marginally subsparingly aciculate-ciliate, very rarely longer than the head; ray flowers rarely absent, usually 7 or 8; rays golden-yellow, 15-30 mm. long, obovate-lanceolate, apically rounded and often minutely 2- or 3-denticulate; achenes narrowly cuneate, flat or 3- or 4-angulate, on the angles retrorsely barbed, the body 6-9 mm. long; pappus awns 2 to 4, 3-5 mm. long, retrorsely barbed. *B. Nashii* Small. Scattered near water in e., s.e., n.-cen. Tex. and Edwards Plateau, rare in the Trans-Pecos, summer; most of U.S. except higher mt. areas.

7. *Bidens Bigelovii* Gray. Annual herb, erect, almost glabrous, 4-10 dm. tall; leaves petiolate (petioles 10-25 mm. long), including the petiole to 8 cm. long, tripartite, the segments 3- to 5-partite, their lobes oblong or cuneate and pinnatifidly incised (with the rather few teeth mucronate), membranous, more or less ciliate; peduncles to 15 cm. long; heads subsolitary, at anthesis about 6-9 mm. broad and equally tall; involucre basally hispid; outer phyllaries 6 to 9, linear, dorsally glabrous, marginally ciliate, terminally sharp-apiculate, 5-7.5 mm. long; inner phyllaries lanceolate, often shorter; rays absent or 3 to 5 in number, whitish, 5-7 mm. long, oblong-obovate; achenes subquadrangulate, dimorphic, the 1 to 4 exterior ones linear-cuneate, truncate, papillose-hispidulous and very scabrous, often castaneous, the body 5-7 mm. long, the apex either essentially awnless or with 2 or 3 short retrorsely barbed pappus awns; inner achenes narrowly linear, black, glabrate below but commonly erect-hispid above, the body 8-12 mm. long; pappus awns 2 or 3, retrorsely barbed, 1.5-3 mm. long. Rather frequent in moist canyons, Trans-Pecos mts., summer; Colo. N.M., Tex., Ariz. and Son.

8. *Bidens leptcephala* Sherff. Annual herb, 1-5 dm. tall, branched; leaves petiolate (petioles 3-40 mm. long), including the petioles 2-10 cm. long, 15-55 mm. broad, bipinnate, minutely ciliate, hispid or glabrate, the segments sometimes linear or sometimes ovate; peduncles 2-8 cm. long; heads 4-8 mm. broad, 3-5 mm. high (in fruit to 15 mm. high); involucre subglabrous at the base; outer phyllaries 4 to 6, linear, ciliate, 10-25 mm. long, inner ones half again as long, lanceolate, glabrous or at the apex pubescent; rays occasionally absent, usually 3, only 2.5 mm. long and 1.2 mm. broad, whitish, entire or bidentate; achenes 5 to 9, rarely to 13, subquadrangulate, linear, the inner ones blackish, 9-14 mm. long, some of the outer ones sometimes shorter and browner; pappus awns 1-3 mm. long, retrorsely barbed. Frequent in moist canyons, Trans-Pecos mts., summer; Chih., Tex., N.M., Ariz. and Baja Calif.

9. *Bidens bipinnata* L. SPANISH-NEEDLES. Annual herb, erect, commonly glabrous but rarely minutely setose-hispid, branched, 3-12 (-17) dm. tall; leaves petiolate (petioles 2-5 cm. long), including the petioles 4-20 cm. long, normally 2- or 3-pinnate, membranous, ciliate, the ultimate segments often deltoid- (or rhombic-) lanceolate, toward the base cuneate; peduncles to 1 dm. long; heads 5-7 mm. high, 4-6 mm. broad; involucre pubescent at base; outer phyllaries 7 to 10, linear, apically acute (var. *bipinnata*) or distally dilate (var. *biternatoides* Sherff), 3-5 mm. long; inner phyllaries linear-lanceolate, half again as long; rays inconspicuous, yellowish-white, not exceeding the disk florets, lanceolate or obovate-lanceolate, apically entire or 2- or 3-lobulate; achenes linear, tetragonal, the body commonly black, distally attenuated and often sparsely setulose, glabrate below, 10-18 mm. long (the outer shorter and often castaneous); pappus awns usually 3 or 4, yellowish, retrorsely barbed, 2-4 mm. long. Infrequent in moist places, e. Tex., rare (var. *biternatoides*) in moist canyons of Trans-Pecos mts., summer; most of e. U.S.; Mex.; Braz., Arg., Chile, etc.; widely adv. in Old World.

10. *Bidens pilosa* L. Annual herb, erect, branched, 3-18 dm. tall; petioles 10-65 mm. long; leaves including petioles 5-20 cm. long, membranous, on the margins ciliate and serrate, on each surface subglabrous or scatteringly pilose with unequal and appressed hairs or sometimes densely tomentose-pilose, the lowermost often simple, ovate, apically acute, the midstem leaves 3- to 5- (or even 7-) partite, the uppermost leaves simple and

lanceolate; heads 7-8 mm. broad, 5-7 mm. high (at anthesis); peduncles 1-9 cm. long; involucre basally hispid; outer phyllaries 7 to 9, linear or linear-spatulate, indurate-apiculate, ciliate, 4-5 mm. long, shorter than the lanceolate inner phyllaries; rays commonly absent or when present minute (2-3 mm. long) or well-developed (to 15 mm. long), white or pale-yellowish-white; achenes linear, straight or the marginal ones incurved, obcompressed-quadrangulate or flattish, glabrous below, tuberculate-strigose above, 4-16 mm. long, the inner ones longer than the outer; pappus awns 2 or 3 (rarely to 5), yellowish, retrorsely barbed. Infrequently (probably repeatedly) waived in extreme s.e. and Trans-Pecos Tex., summer-fall; an exceedingly common weed of disturbed moist soil in all the warmer parts of the world, not hardy in the temp. parts but repeatedly introd.

88. COSMOS CAV. COSMOS

Annual herbs, taprooted; leaves opposite, undivided to lobed or 1- to 3-pinnatisect; peduncles long; heads usually solitary; involucre subhemispheric; phyllaries biseriata, connate basally, membranous, striate, scarcely unequal or less commonly the outer shorter; receptacle flat or flattish, chaffy throughout, the pales flat or somewhat concave; *ray flowers* in one series, infertile; rays spreading, entire or subdentate, rosy-white or orange; *disk flowers* numerous, perfect, fertile, the corolla equally 5-toothed terminally; style branches slender, thickened above, hirtellous, tipped with short and acute appendages; achenes linear, more or less fusiform, more or less tetragonal or more rarely obcompressed or even alate, toward the apex usually attenuate into a beak, attenuate toward the base, at the base itself more or less enlarged; pappus awns 2 to 8, usually persistent, commonly retrorsely (rarely antrorsely) barbellate or hispid.

A genus of perhaps 50 species of the warmer parts of America.

1. Rays rosy-white or whitish 1. *C. parviflorus*.
 1. Rays orange 2. *C. sulphureus*.

1. *Cosmos parviflorus* (Jacq.) Pers. Annual herb, erect, slender, often branched above, 3-9 dm. tall; leaves scarcely petioled or with petioles wing-margined and to about 5 mm. long, with total length of about 3-7 cm., bipinnate; segments very narrowly linear, only 0.1-0.6 mm. broad, glabrous above and below, often strongly spinulose-ciliate, apically acute or subobtuse, the rachis and its branches somewhat winged; heads singly terminating peduncles 1-3 dm. long, 15-25 mm. broad, 6-9 mm. high; outer phyllaries commonly 8, lance-acuminate or linear-elongate, often spreading or even reflexed, on the outer surface green and marked with 3 to 5 black nerves, 6-9 mm. long; inner phyllaries oblong, acute, a little shorter than the outer; rays about 8, whitish to roseate, 5-9 mm. long, cuneate-obovate, apically 2- or 3-dentate; disk corollas yellow; achenes subfusiform, linear, 9-16 mm. long; pappus awns 2 to 4, erect, retrorsely barbed, about 2 mm. long. Infrequent in moist meadows, Trans-Pecos mts., summer-early fall; Tex., Colo., N.M., Ariz., s. and s.e. to Pue. and Michoac.

2. *Cosmos sulphureus* Cav. Annual herb 6-21 dm. tall; leaves 1-20 cm. long including the petiole, bi- or tripinnatisect; heads 35-55 mm. broad, 12-18 mm. high; outer phyllaries commonly 8; rays about 8, intensely orange or yellowish-red, 18-28 mm. long, 10-17 mm. broad, obovate, often 1- to 5-denticulate apically; achene linear-fusiform, black, 16-28 mm. long including the setulose-coronate rostrum; pappus awns very slender, here and there weakly retrorsely barbed, 4.5-7 mm. long. Rare and local, escaped from cult., s. Tex., especially near Laredo, summer-fall; widespread at moderate elev. in the Am. trop., adv. elsewhere; probably originally nat. of Mex.

This is the commonly cultivated *Cosmos*; it occasionally escapes, but probably persists nowhere in Texas.

89. HETEROSPERMA CAV.

A genus of about 10 species from the United States to Argentina.

1. *Heterosperma pinnatum* Cav. Taprooted annual, nearly glabrous, 1-8 dm. tall, usually with a single stem 1-2 (-7) mm. thick basally, much-branched, stem and branches rather rigidly ascending and leafy throughout; leaves opposite, the upper ones with a

linear subpetiolar portion 8-20 mm. long and subamplexicaul basally and 3 longer linear palmate lobes, or some of the larger leaves in some plants pinnatifid with a terminal linear portion and on each side 2 linear lobes; peduncles absent; heads solitary, terminating the erect branches, closely subtended by the uppermost pair of leaves whose lobes are closely appressed to the involucre (almost like accessory bracts) and fimbriate-ciliate marginally; involucre 4-5 mm. high, slightly urceolate, of about 4 equal separate erect obovate broadly overlapping membranous colorless phyllaries each with 8 or 10 dark-brown broad nerves; *ray flowers* about 4, fertile, with no pappus, the minute ray yellow; *disk flowers* few, fertile, perfect; corolla minute, 5-toothed, regular, yellow, the pappus of the peripheral ones absent, of the central ones 2 minute spreading awns; pales of the disk similar to the phyllaries subtending the ray flowers but progressively slightly longer and narrower toward the center; achenes of the ray and outer disk flowers dorsiventrally flattened, narrowly wing-margined, apically blunt; achenes of the central disk flowers not winged but subulate-beaked, much-surpassing the involucre and surmounted by the spreading pappus awns. Local in moist canyons, Davis Mts. in the Trans-Pecos, 4,500-8,000 ft. elev., Sept.-Oct.; Mex. highlands n. to Ariz. and Tex.

90. DICRANOCARPUS GRAY

A monotypic genus.

1. *Dicranocarpus parviflorus* Gray. PITCHFORK. Taprooted annual, 1-5(-7) dm. tall, with a single stem basally but divaricately bushy-branched above, essentially all glabrous and very brittle; leaves all opposite, once or twice ternately divided into filiform lobes or the uppermost nearly simple; heads on short branches, only 3 mm. high in flower; involucre obconic; phyllaries 3 or 4, linear, membranous, at length loose, deciduous in age (occasionally 1 or 2 short calyculate outer phyllaries also present); receptacle slightly convex, chaffy throughout, the pales membranous and subulate; *ray flowers* 3 or 4, pistillate, fertile; ray corolla only 1 mm. long, yellowish, obscurely 3-toothed apically, deciduous; *disk flowers* 3 or 4, seemingly perfect but infertile; corolla 1.5 mm. long, abruptly flaring, equally 5-toothed, yellow; ray achenes markedly unequal, flattened, linear, the longer ones to 1 cm. long, warty-roughened on the flat sides; ray pappus of 2 widely divergent persistent stout awns. Infrequent in gypseous soil in the Trans-Pecos, Sept.-Oct.; Tex., N.L., Coah. and S.L.P.

91. THELESERMA CHAM. & SCHLECHT.²¹⁷

GREEN-THREAD

Erect annual or perennial herbs, sometimes suffrutescent below, 1-18 dm. tall, glabrous except for the ciliate leaf bases; stems 1 to several near the base, usually rebranching above; leaves all opposite, evenly distributed throughout or crowded toward the base, ternately or 1- to 3-pinnatisect, trifold or simple, the ultimate segments narrowly oblanceolate or linear to filiform; heads on short to elongate naked peduncles; phyllaries of 2 distinct size-classes; outer phyllaries herbaceous, short and obtuse to long and lance-linear, spreading to appressed, often with narrow scarious margins; inner longer phyllaries membranous with broad transparent scarious margins, basally connate for a fifth to a half or more their length, the free portion lanceolate to ovate, often subapiculate and pubescent at the tip; receptacle flat, chaffy; *ray florets* present or absent, when present neutral, sterile; ligule yellow or yellow with a red-brown base to purple-brown spot at base or rarely red-brown to purple-brown nearly throughout; *disk flowers* perfect, fertile, the corollas yellow with red-brown veins or red-brown tube, the limbs narrowly campanulate to cylindrical, equally or unequally lobed for a fifth to nine-tenths the length, when unevenly lobed one lobe longer than the other 4; pales scarious with 2 red-brown medial nerves, oblong to ovate-lanceolate, smooth or dentately erose, in fruit usually tightly enclosing and falling with the achene; achenes linear to linear-oblong, erect to slightly curved or cucullate, 2-7 mm. long, terete, dorsally or dorsiventrally flattened, verrucose to smooth, subtruncate; pappus of 2 rarely 3 ciliate awns or teeth, or essentially absent.

About a dozen species in warm regions in America.

²¹⁷ Many of the characters are adapted from a dissertation by Thomas E. Melchert.

1. Limb of the disk corolla usually shallowly lobed for a third its length or less, rarely up to half its length; pappus of small toothlike awns or essentially absent (2)
1. Limb of the disk corolla unequally lobed, the deepest lobe half as long as the limb or longer; pappus of well-developed awns (3)
- 2(1). Leaves crowded near the base of the plant; most of the stems essentially naked2. *T. longipes*.
2. Leaves sparse and evenly distributed on the stems1. *T. simplicifolium*.
- 3(1). Plants perennial; rays present or absent (4)
3. Plants annual; rays present (6)
- 4(3). Outer phyllaries lance-linear, usually at least half as long as the inner phyllaries; rays present; involucre suburceolate7. *T. filifolium*.
4. Outer phyllaries minute, mostly 1-2 mm. long, obtuse to rounded at the apex; rays present or absent; involucre hemispheric to campanulate (5)
- 5(4). Rays present or rarely absent; disk corollas red-brown4. *T. ambiguum*.
5. Rays absent or rarely present; disk corollas yellow3. *T. megapotamicum*.
- 6(3). Disk corollas red-brown (7)
6. Disk corollas yellow (9)
- 7(6). Outer phyllaries with hispid-ciliate margins; at least some of the achenes cream-colored with scalloped wings; rays purple-brown, only a very narrow zone at the apex yellow-orange5. *T. Burridgeanum*.
7. Outer phyllaries completely smooth; achenes wingless or essentially so; rays either completely yellow, yellow with a small red-brown basal spot or with diffuse red-brown color throughout most of the area (8)
- 8(7). Each ray with a small well-defined red-brown spot at the base or with diffuse red-brown pigmentation over half or nearly all the length; outer phyllaries appressed to the inner series; basal leaves when present with linear ultimate segments6. *T. nuecense*.
8. Rays either all golden-yellow or with a small amount of diffuse red-brown pigment at the base but this pigment never forming a well-defined basal spot; outer phyllaries spreading; plants usually densely and evenly leafy for three-fourths the height; leaves often with narrowly oblanceolate ultimate segments7. *T. filifolium*.
- 9(6). Peripheral achenes cucullate, winged, 2.5-3 mm. broad; pappus of 2 minute teeth; involucre usually glandular-punctate.8. *T. curvicaipum*.
9. Achenes erect to somewhat curved, terete to dorsally flattened, wingless, 1.5 mm. broad or less; pappus of well-developed awns; involucre never glandular-punctate (10)
- 10(9). Plants 2-3 (-4) dm. tall, the internodes relatively short, the stems densely leafy7. *T. filifolium* var. *intermedium*.
10. Plants 7-18 dm. tall, the internodes elongate, the stems remotely leafy9. *T. flavodiscum*.

1. *Thelesperma simplicifolium* Gray. Slender perennial from vertical or horizontal rhizomes; stems 1 to several, simple or branching above, 3-7 dm. tall; leaves few, 35-80 mm. long, much shorter than the internodes giving the plant a somewhat naked appearance; lowermost stem leaves pinnatifid to trifid or simple, mid- and upper-stem leaves trifid or simple; heads 1 to many on relatively short peduncles, the peduncles 3-17 cm. long; involucre hemispheric, 6-13 mm. thick; outer phyllaries 8 to 10, sublinear, obtuse to subulate, herbaceous, 1.5-4 mm. long, mostly less than half as long as the inner phyllaries; inner phyllaries 8, brownish to greenish-black, ovate, scarious-margined, mostly 4.5-8.5 mm. long, basally connate for two-fifths to three-fifths their length, often subapiculate with a pubescent tip; ray flowers 8; rays yellow, cuneate, usually 10-22 mm. long, 6-10 mm. broad; disk corolla yellow with reddish-brown veins, 3-5.5 mm. long, the red-brown tube 1-2 mm. long, the cylindrical limb 2-3 mm. long, shallowly and evenly lobed to a fifth the length; pales curved, 3-5 mm. long; outer achenes incurved, robust,

3-5 mm. long, 1-2.2 mm. broad, completely smooth or dorsally wrinkled, occasionally also ventrally wrinkled; pappus of 2 minute smooth or slightly ciliate cusplike awns, or obsolete. Often abundant on open and well-drained limestone uplands, Edwards Plateau, less common on calcareous cuestas e. to n.-cen. Tex. and w. into the Trans-Pecos, summer and fall; N.L., Coah. and Tex.

2. *Thelesperma longipes* Gray. Suffrutescent perennial herb from thick woody rootstocks, these forming dense multiscaped globular clumps or irregular mats; stems many, irregularly branched, 20-38 cm. tall; leaves filiform, crowded toward the base, pinnatifid to trifid or simple, mostly 3-5 cm. long; heads numerous, solitary on elongate peduncles 12-32 cm. long; involucre 5-8 mm. thick; outer phyllaries 5, minute, obtuse, 1-2.5 mm. long; inner phyllaries 8, striate, reddish-brown, scarious, 4-5.5 mm. long, basally connate for half their length, often reflexed; ray flowers absent; disk corolla yellow, cylindrical, 3-4.2 mm. long, the limb equally or subequally lobed for a fifth to two-fifths its length; pales narrowly oblong, often curved and enclosing the achenes, 3-4 mm. long; achenes curved, 2-2.5 mm. long, smooth or slightly dorsally verrucose, usually with a small apical disk; pappus absent or of 2 minute toothlike awns. Abundant, often on calcareous soil or almost naked limestone ledges in the Trans-Pecos and w. part of the Edwards Plateau, n. into the n. part of the Plains Country, summer to fall; Ariz., N.M. and Tex., s. and s.e. to S.L.P.

3. *Thelesperma megapotamicum* (Spreng.) O. Ktze. Perennial herb from horizontal rhizomes, mostly 30-75 cm. tall; stems erect, one or several from the base, each usually branching once or twice toward the midstem; leaves either evenly and distantly distributed throughout the stem by elongate internodes or crowded toward the lower half of the stem; basal and cauline leaves usually once-, rarely twice-pinnate, often trifid or simple, rarely ternately pinnatisect, 40-95 mm. long, their ultimate segments elongate and linear-lanceolate to subfiliform; involucre campanulate to subhemispheric, smooth, 7-14 mm. thick; outer phyllaries 4 to 6, minute, oblong to oblong-ovate, obtuse or rounded, 1-2 (-3) mm. long, narrowly white-margined, usually appressed to the inner ones; inner phyllaries 8, ovate-lanceolate, red-brown to green-black, scarious-margined, mostly 6-8 mm. long, basally connate two-fifths to two-thirds their length; ray flowers rarely present; disk corolla yellow with red-brown veins, 5-7.4 mm. long, the limb deeply and irregularly lobed for half to five-sixths its length; pales oblong to ovate-lanceolate, 7-11 mm. long, often erose; achenes erect to slightly incurved, subterete, with the dorsal side somewhat flattened or both dorsally and ventrally flattened, black to brownish, with conspicuous tubercles or more or less smooth; pappus of 2 triangular retrorsely barbed awns 1.5-3 mm. long. Widespread and usually common in calcareous or alkaline uplands and lowlands in the Trans-Pecos and Plains Country, rare e. to n.-cen. Tex. and on much of the Edwards Plateau, summer and fall; Neb., Wyo., Ut., Ariz., s. and e. to Zac.; also Braz., Urug., Parag. and Arg.

4. *Thelesperma ambiguum* Gray. Perennial from slender horizontal rhizomes, 22-50 cm. tall; stems 1 to many from the base, erect, simple or branched above; leaves extremely variable as to shape and arrangement, usually with a basal rosette and stem leaves distributed over a half to a third the length of the stem; rosette leaves 6-16 cm. long, compactly twice- or thrice-pinnatisect to loosely once- or twice-pinnatisect, occasionally trifid or sometimes simple, their petioles 3-8 cm. long; mid- and upper cauline leaves when present once pinnate to trifid or simple, their ultimate segments revolute; heads 10 to 50, on short or elongate peduncles 8-22 cm. long; involucre 7-15 mm. thick; outer phyllaries 4 to 6, minute, oblong to oblong-ovate, obtuse, 1-2 (-3.5) mm. long, smooth; inner phyllaries 8, ovate-lanceolate, scarious-margined 6.5-10 mm. long, basally connate for two-fifths to two-thirds their length, often with a pubescent tip; rays usually present, rarely absent, yellow; disk corolla irregularly lobed for a half to five-sixths its length; pales oblong to ovate-lanceolate, 6-9 mm. long, erose, usually clasping the dorsal half of the achene; achenes erect or slightly incurved, 4-6.5 (-7) mm. long, subterete, with the dorsal side somewhat flattened or both dorsally and ventrally flattened; pappus of 2 deltoid retrorsely barbed awns 1-2 (-2.7) mm. long. *T. fraternum* Shinn. Locally abundant on calcareous cuestas and well-drained open areas, Rio Grande Plains and the s.w. extreme of the Edwards Plateau, rare w. into the Trans-Pecos and n. to the s. part of the Plains Country, summer and fall; Tex., Tam. and N.L.

5. *Thelesperma Burridgeanum* (Regel) Blake. Annual herb 3-7 dm. tall; stems 1 to several from the base, branching above; leaves crowded on the basal half of the plant, deeply pinnately dissected, the ultimate segments linear to linear-lanceolate; basal leaves numerous, simply or ternately twice- or thrice-pinnatisect, 5-15 cm. long, never forming a definite basal rosette; midstem leaves once- or twice-pinnatisect; upper leaves once-pinnatisect, trifid or simple; heads usually many or few on elongate peduncles 8-24 cm. long; involucre urceolate, 9-13 mm. thick; outer phyllaries 8, subulate, herbaceous, 3-4.5 mm. long, sparsely to densely hispid-ciliate, the extreme basal portion often with larger tuberculate projections and/or purple punctate glands; inner phyllaries usually 8, red-brown to green-black, ovate-oblong to ovate-lanceolate, scarious-margined, 6-8 mm. long, basally connate a third to two-fifths the length, usually reflexed at anthesis and with a subapiculate pubescent tip; ray corollas purple-brown with a narrow yellow-orange apical margin, 10-15 mm. long, 6-12 mm. broad; disk corollas purple-brown, the limb subequally or strongly unequally lobed three-fifths to three-fourths its length; pales narrowly oblong, not erose; achenes somewhat dorsally compressed with 3 conspicuous scalloped wings at the lateral or ventral edges, these especially noticeable near the base; inner achenes elongate and narrow, covered with tubercles; peripheral achenes shorter and stouter, 4-4.5 mm. long, to 2.5 mm. broad, smooth except for the dorsal verrucose surface; pappus of 2 awnlike retrorsely barbed awns 0.5-1 mm. long, divergent from the main axis of the achene. Local in sandy soil, n. part of the Rio Grande Plains (Atascosa, Bexar, Dimmit, Frio, Karnes, LaSalle and Wilson cos.), Apr.-May, rarely to June; endemic.

These are attractive plants and have been taken into cultivation.

6. *Thelesperma nuecense* B. L. Turner. Annual 45-100 cm. tall; stems one to several from the base, weakly rebranching above, unequally leafy for about half the length; lower stem leaves ternately or merely once- or twice-pinnatisect, 75-190 mm. long, often but not always forming a basal rosette, the ultimate segments narrowly linear; leaves of midstem mostly once-pinnatifid, 7-13 cm. long; uppermost leaves trifid or simple; peduncles 135-400 mm. long; involucre suburceolate, 1-2 cm. thick; outer phyllaries 8, subulate, herbaceous, 2-6.5 mm. long, usually half or less as long as the inner phyllaries, completely smooth, the extreme basal portion sometimes roughened but never tuberculate; inner phyllaries 8, oblong or ovate to ovate-lanceolate, 6-9 mm. long, basally connate for a third to two-fifths their length, red-brown above, often reflexed at anthesis, subapiculate with pubescent tips; rays 8, broadly cuneate, 15-25 mm. long, 8-18 mm. broad, gold-yellow with a small well-defined red-brown spot at the base or with diffuse or conspicuous red-brown coloring for approximately half the length or completely red-brown except for a yellow terminal margin; disk corolla 4-6.5 mm. long, the limb subequally or decidedly unequally lobed for three-fifths to three-fourths the length; pales narrowly oblong, 5-8 mm. long, mostly smooth; achenes erect or slightly incurved, terete to somewhat dorsally flattened, 4.5-7 mm. long, completely smooth or with evenly distributed roughening, wings obsolete or merely minute, entire, lateral flanges toward the base of the achene; pappus of 2 erect triangular retrorsely barbed awns 0.5-1 mm. long. Deep sandy soil, s. part of s.e. Tex. and n.e. part of Rio Grande Plains (Aransas, Brooks, Duval, Hidalgo, Jim Hogg, Kenedy, Kleberg, Live Oak, Nueces and Willacy cos.), spring-fall; endemic.

7. *Thelesperma filifolium* (Hook.) Gray. Taprooted annual or weak perennial, leafy, 2-7 dm. tall; stems simple to multibranching at the base, usually rebranching above to form dense sub-bushy clumps; leaves regularly distributed throughout; basal and lower cauline leaves mostly 5-12 cm. long, ternate or occasionally simple or thrice-pinnatisect; ultimate segments usually flattened, 1 mm. broad, narrowly oblanceolate to linear; upper cauline leaves becoming less segmented and the segments narrower, mostly simply pinnatisect and filiform, the uppermost occasionally trifid or simple; heads several to many on peduncles 6-25 cm. long, drooping in bud but totally erect at anthesis; involucre urceolate, 8-14 mm. thick; outer phyllaries 7 to 12, narrowly linear-lanceolate, herbaceous, 3-12 mm. long, spreading, variable in length; inner phyllaries 8, lanceolate to ovate-lanceolate, scarious-margined, 7.5-10 mm. long, basally connate for a fourth to two-fifths the length, greenish and glaucous at the base, reddish-brown above; rays 8, yellow or golden-yellow throughout or with a small amount of diffuse red-brown coloring at the base but this never in a definite spot, broadly cuneate, 3-lobed, 9-22 mm. long, 9-17 mm. broad; disk corolla yellow or red-brown, 4-7 mm. long, the limb variously lobed; pales narrowly oblong to ovate-lanceolate, 5-7.5 mm. long, clasping the achene; achenes polymorphic, 3.5-6.5 mm.

long, green to brownish or black, smooth to dorsally or completely verrucose, the outer ones curved, mostly short and thick, the inner ones elongate and slender, subterete to dorsiventrally flattened; pappus of 2 erect retrorsely barbed yellow awns 0.5-2 mm. long.

Our plants fall into two varieties of this species.

Var. *filifolium*. Robust habit, usually 25-70 cm. tall; limb of the disk corollas deeply and unequally lobed, the shorter lobes half or slightly less than half the length of the limb, the longer ones two-thirds to four-fifths or more the length of the limb; outer phyllaries normally more than half as long as the inner phyllaries; rays of golden-yellow. *T. intermedium* var. *rubrodiscum* Shinners. Widespread and abundant in n.-cen. Tex., e. part of the Plains Country, the extreme s. portion of e. and s.e. Tex. and infrequent in Rio Grande Plains and the Trans-Pecos, mostly late spring and early summer; Ark., Okla., La. and Tex.

Var. *intermedium* (Rydb.) Shinners. Smaller size, usually 2-3, rarely to 4 dm. tall; disk corolla yellow, the limb of which is subequally lobed for half or slightly less than half the length of the limb or decidedly irregularly lobed, the shorter lobes being half or less than half the length of the limb, the longer lobes two-thirds to three-fourths the length of the limb; outer phyllaries usually half or less than half as long as the inner phyllaries; rays yellow instead of golden-yellow. Abundant in the Plains Country, rare in the Trans-Pecos, spring-summer; Mo., Neb., Colo., Kan., Okla., N.M., Tex. and N.L.

8. *Thelesperma curvicaupum* T. E. Melchert. Taprooted annual 25-50 cm. tall, glabrous except for the ciliate leaf bases; stems single or multibranched from the base, rebranching above to form a paniculate head-bearing region; internodes more or less equidistant throughout, giving a kind of loose open aspect; basal leaves ternately twice- or thrice-pinnatisect, 3-12 cm. long, their ultimate segments to 2 mm. broad, narrowly oblanceolate to sublinear; lower and middle cauline leaves once- or twice-pinnatisect, usually as long as or only slightly shorter than the basal leaves, their linear segments 1 mm. wide, the uppermost leaves becoming palmately three-divided or simple; heads 2 to many; peduncles 4-15 cm. long; involucre 8-14 mm. thick, often dotted with black glands; outer phyllaries usually 8, linear-lanceolate, herbaceous, half to three fourths as long as the inner phyllaries; inner phyllaries 8, oblong, apiculate, scarious-margined, 6.5-8.5 mm. long, 2.5-4 mm. broad, basally palmate for a fifth to three-tenths the length; ray flowers 8, sterile; rays pale yellow, mostly 10-17 mm. long, 7-10 mm. broad, slightly 3-notched; disk flowers yellow with red-brown veins, 5-6 mm. long; limb 2.5-3.5 mm. long, irregularly lobed to three-fifths its length; pales scarious, with 2 medial nerves; peripheral achenes conspicuously cucullate, 3 mm. long, 2.5-3 mm. thick, purple-brown at maturity with conspicuous warts and corky flanges, these often tightly clasped by the pale; central achenes longer, narrower and decidedly less curved than the peripheral series; pappus of 2 minute teeth-like awns often protruding from a small crown formed by the corky wings, the awns retrorsely ciliate, the crown antrorsely ciliate. Locally abundant in open areas of the Edwards Plateau and in calcareous cuestas of the s. part of the Plains Country (Crockett, Taylor, Coleman, San Saba and Burnet cos.), spring to early summer; endemic.

9. *Thelesperma flavodiscum* (Shinners) B. L. Turner. Taprooted annual; stems slender with elongate internodes, erect, 1 to 3 (to 5) from the base, 7-8 dm. tall, usually branching toward the summit; leaves ternately or once- or twice- (rarely thrice-) pinnatisect, to 95 mm. long, of more or less equal length throughout, only the uppermost trifid, their ultimate segments filiform, elongate and to 8 cm. long, usually in a loose arrangement; peduncles 1-2 dm. long; involucre suburceolate, 8-13 mm. thick; outer phyllaries 7 to 9, filiform to subulate, herbaceous, 3-6 (-10) mm. long; inner phyllaries 8, lanceolate, red-brown, scarious, 6-9 mm. long, basally connate for two-fifths to three-fifths the length, often reflexed at the tip; rays 8, yellow, cuneate, 3-notched, 12-15 mm. long, to 8 mm. broad; disk corolla yellow with red-brown vein; tube 2-3 mm. long; limb 2.5-3 mm. long, deeply and unequally lobed, the shorter lobes half the length of the limb, the longer lobe four-fifths to nine-tenths the length of the limb; pales clasping the achene, 5-8 mm. long; achenes polymorphic, 4-6.2 mm. long, terete to somewhat dorsally flattened, smooth to dorsally or completely verrucose, usually with scattered antrorse hispid hairs toward the apex; outer achenes incurved; inner achenes erect; pappus of 2 short retrorsely hispid awns 0.8-1 mm. long. Deep fine sandy soils in oak woods, s. and s.e. portion of e. Tex., late spring-summer; endemic.

92. MARSHALLIA SCHREB.²¹⁸

BARBARA'S-BUTTONS

Perennial erect herbs from caudexes or rhizomes with fibrous roots; leaves alternate, simple, entire, 1- to 3-nerved, glabrous, sessile or contracted into subpetiolar bases, the stem leaves somewhat clasping when present; heads solitary at the end of the stems or branches; involucre hemispherical or campanulate; phyllaries herbaceous, often with hyaline margins, subequal, in 1 or 2 series, imbricated or merely approximate and not at all imbricate; receptacle convex or conical, chaffy throughout; pales herbaceous, often hyaline-margined below, narrowly linear in outline, longer than the achenes, semirigid; *ray flowers* absent; *disk flowers* perfect, fertile; corollas white, cream-colored, pale-lavender or purplish, never yellow, longer than the pales, externally pubescent, the tubes slender, the 5 equal lobes of the limb long and linear-obtuse; achenes turbinate or clavate, truncate, somewhat 5-angled, 10-ribbed, the achene-surface between the ribs concave and usually beset with minute resin-dots, these rarely absent; pappus scales 5 (sometimes 6), erect or spreading, forming a crown at the summit of the achene, membranous-scarious, white-hyaline or ferruginous, ovate to ovate-lanceolate or triangular-lanceolate, sessile, the apex acuminate or acute, the margins regularly or irregularly serrulate or lacerate.

About 10 species, in southern United States.

1. Phyllaries and pales merely acute or obtuse, not subulate-tipped, glabrous; phyllaries not winged; flowering in the spring and early summer 1. *M. caespitosa*.
1. Phyllaries and pales strongly acuminate or subulate-tipped, pubescent; phyllaries usually winged below the middle; flowering late summer and early fall 2. *M. tenuifolia*.

1. *Marshallia caespitosa* DC. Perennial herb (1-) 2-4 (-6) dm. tall with a short rhizome; leaves entire, gradually tapering below the middle into a winged subpetiolar base; lowermost leaves when present 2-8 (-18) cm. long and (3-) 5-10 (-20) mm. broad, with obovate to spatulate or oblanceolate obtuse blades; leaves of midstem when present (4-) 5-15 (-16) cm. long and 2-10 (-12) mm. broad, linear or linear-lanceolate with obtuse rarely acutish apices; heads solitary on the stems; involucre (5-) 6-12 (-15) mm. high; phyllaries herbaceous, green except for the white-hyaline margins below, glabrous, entire, subequal in 1 or 2 series, the outer usually but scarcely imbricate, 5-12 (-15) mm. long, 1-2 (-3) mm. broad, linear-oblong or linear-lanceolate with obtuse or merely acutish apices; pales 5-8 mm. long, linear with merely acute apices, slightly dilated at the summit; corollas usually white or cream-colored, only occasionally pale-lavender; pappus scales (1.5-) 2-3 (-4) mm. long; achene (2-) 3-4 (-4.5) mm. long. E. half of Tex. w. to Taylor, Val Verde and DeWitt cos., Apr.-May (-June); Miss., Ark., Okla., Tex. and La.

We have two varieties.

Var. *caespitosa*. Leaves all crowded near the base of the plant. E., s.e. and n.-cen. Tex., s. to Refugio and w. to Navarro and Bastrop cos.; Miss., Ark., Okla. and Tex.

Var. *signata* Beadle & Boynt. Stems leafy nearly throughout except for the uppermost peduncular flowering portion. Abundant on the Edwards Plateau and in limy cuestas of n.-cen. Tex., the Rio Grande Plains and the e. part of the Plains Country, s. to DeWitt Co. and w. to Val Verde and Taylor cos.; endemic.

2. *Marshallia tenuifolia* Raf. Leafy-stemmed perennial (2-) 4-10 (-12) dm. tall from a caudex; stem usually branched near the middle, the branches strictly erect; radical leaves spreading, thin-textured, obovate or spatulate, obtuse; stem leaves numerous, gradually reduced upward, glabrous, entire, the lowermost ones (2-) 3-4 cm. long and (4-) 5-10 (-13) mm. broad, mostly 3-nerved, spatulate to obovate or oblong-obovate in outline, with obtuse sometimes emarginate bladlike portion gradually narrowed basally into broad-winged subpetiolar bases shorter than the blades; lower stem leaves elongate, linear to linear-oblong or linear-lanceolate, attenuate, (2-) 4-20 (-22) cm. long, (1-) 2-13 (-14) mm. wide, broadest near the middle, gradually tapering to obtuse or acutish apices and more or less sessile somewhat clasping bases, prominently 1- to 3-nerved; upper stem leaves narrowly linear, attenuate, acute, gradually reduced in size upwards to the linear-subulate bracts of the peduncles; heads singly terminating the pedunculiform upper portion of the branches; involucre (5-) 10-15 (-20) mm. high; phyllaries herbaceous, sub-

²¹⁸ Adapted from R. B. Channell in Contr. Gray Herb. n. s. 181:41-132. 1957.

equal in about 2 series, linear-lanceolate to lanceolate or somewhat rhomboidal in outline, with strongly subulate apices, (2-)4-5(-6) mm. long; pales linear-attenuate, strongly subulate-tipped, 4-7 mm. long, longer than the phyllaries; corolla purple or pale-lavender, 6-14 mm. long; pappus scales (0.7-)1-2(-2.5) mm. long, achenes 1.5-3 mm. long. Infrequent in sandy usually moist soil, forests of e. and s.e. Tex., late summer-Oct.; Coastal States, Ga. to Tex.

93. GALINSOGA R. & P.

QUICK-WEED

Annual herbs, rather freely branched, about 1-4 dm. tall; leaves opposite, petiolate, ovate to narrowly ovate, entire or usually finely serrate; blades 1-3 cm. long; heads small, compressed-hemispherical, very short-pedunculate, borne solitary at the ends of branches; bracts imbricated in 2 series, thin, the inner sometimes longer than the outer; receptacle conic or sometimes elongate; chaff present; *ray flowers* present, inconspicuous, few, pistillate, fertile; rays white, about 1 mm. long; *disk flowers* several, perfect, fertile, the corolla yellow; achenes 4- or 5-angled or the outer ones slightly flattened; pappus of ray either absent or of several bristles, that of the disk of 15 to 20 minutely fimbriate scales.

A very small tropical American group.

1. Pappus of disk flowers linear-lanceolate, conspicuously fimbriate, equaling or even exceeding the corollas, that of the ray flowers absent; achenes glabrous or somewhat pilose; plants freely branched; leaves slender-petioled, ovate-lanceolate, coarsely or bluntly serrate; peduncles and stems near the nodes clothed with a fine rarely glandular pilosity1. *G. parviflora*.
1. Pappus of disk flowers linear, fimbriate, two-thirds the length of the corolla tube; pappus of ray flowers of a few short white bristles or absent; achenes minutely hispidulous at the summit or glabrate; plants rather strictly ascending, rarely branched from the base; internodes elongate; leaves short, petioled, linear-lanceolate or narrowly deltoid-lanceolate, bluntly serrate to subentire; pedicels and nodes of the stem with a coarse partly appressed puberulence2. *G. semicalva*.

1. *Galinsoga parviflora* Cav. Characters as in the key. Infrequent or rare in Davis Mts. in the Trans-Pecos at elev. of 5,000-7,500 ft., fall; nat. of S.A., now widely distributed in N. A.

2. *Galinsoga semicalva* (Gray) St. John & White. Infrequent or rare at elev. of 6,000-8,000 ft., Davis and Chisos mts. in the Trans-Pecos, Aug.-Oct.; Ariz., N.M., Tex., Chih., Dgo. and S.L.P.

94. BEBBIA GREENE

A genus of 2 species in southwestern United States.

1. *Bebbia juncea* (Benth.) Greene. Perennial, much-branched at base and in the head-bearing region; stems to 10 dm. high, with long internodes, often canescent-pubescent; leaves mostly opposite, few, linear or uncommonly with a few linear lobes, to 5 cm. long and 7 mm. wide, canescent; heads about 1 cm. long and thick; receptacle chaffy throughout, the pales longer than the achenes; phyllaries about 20, in about 3 series, canescent-green and with the texture of leaves except for the narrow hyaline margins; *ray flowers* absent; *disk flowers* about 20 to 30, perfect, fertile; corolla pale-yellow, 5-lobed terminally; achenes compressed, with 2 sharp angles and one blunt one; pappus a single series of about 15 or 20 plumose bristles. Rare in crevices, Franklin Mts., near El Paso, El Paso Co. in the Trans-Pecos, spring; Tex. to Nev. and Calif. s. to n. Mex.

95. GAILLARDIA Foug.²¹⁹

INDIAN BLANKET. BLANKET FLOWER

Annual or perennial herbs, rarely suffruticose basally, either scapose or caulescent; leaves alternate or basal, entire, toothed or pinnatifid, with long petioles or somewhat clasping; heads solitary, terminating the peduncles; involucre rotate; phyllaries herbaceous in texture (or indurated and discolored basally), ovate or lanceolate, 2- or 3-seriate,

²¹⁹ Adapted from Susan Fry Biddulph in Res. Stud. St. Coll. Wash. 12:195-256. 1944.

strongly reflexed in fruit; receptacle convex, alveolate with long setiform or in some species small dentiform fimbriae; *ray flowers* present, pistillate or not, infertile, rarely absent; rays usually yellow or yellow with red or red-purple spots basally, trifold apically; *disk flowers* perfect, fertile; corollas yellow to red or red-purple at least on the teeth, with 5 equal teeth terminally covered with moniliform hairs; style branch appendages usually long and hispidulous but sometimes short and glabrous; achenes broadly obpyramidal, wholly or partly covered with long hairs; pappus of several separate members, each thin and bractlike, lanceolate to ovate with an awn almost as long as the body.

An American genus of perhaps 15 or 20 species.

1. Receptacle with small dentiform setae (representing pales); lobes of the disk corollas caudate-acuminate (2)
 1. Receptacle with long stiff setae; lobes of the disk corollas triangular (4)
 - 2(1). Disk yellow7. *G. aestivalis*.
 2. Disk brown or red-brown (3)
 - 3(2). Heads long-pedunculate; branches slender; rays often absent
.....7. *G. aestivalis*.
 3. Heads short-pedunculate; branches stout and somewhat stiff; rays present
.....8. *G. fastigiata*.
 - 4(1). Style branches short and glabrous6. *G. suavis*.
 4. Style branches long and hispidulous (5)
 - 5(4). Annuals (doubtful cases should be keyed under both alternatives) (6)
 5. Perennials (7)
 - 6(5). Phyllaries only shortly chartaceous basally; rays red, tipped with yellow
.....1. *G. pulchella*.
 6. Phyllaries chartaceous with herbaceous tips; rays totally dark-reddish
.....2. *G. Amblyodon*.
 - 7(5). Achenes glabrate above3. *G. mexicana*.
 7. Achenes hairy all over (8)
 - 8(7). Plants densely villous; woody caudex absent4. *G. pinnatifida*.
 8. Plants minutely puberulent; caudex thick and woody ..5. *G. multiceps*.

1. *Gaillardia pulchella* Foug. INDIAN BLANKET, FIREWHEEL. Taprooted annual; stems becoming ligneous basally toward the end of the growth season, 3-6 dm. tall, usually branched, striate with short moniliform hairs; leaves 2-8 cm. long, oblong to oblanceolate, coarsely toothed to lobed or entire, acute or rounded apically, sessile and somewhat clasping or tapering into a short petiole, both surfaces with some moniliform hairs, the margins somewhat ciliate; peduncles 5-15 cm. long; phyllaries lanceolate, acute, chartaceous basally, herbaceous distally, ciliate marginally with moniliform hairs, reflexed at anthesis; receptacular setae subulate, twice as long as the achene; rays 6 to 10, 12-20 mm. long, red tipped with yellow; disk 15-20 mm. across; corollas 6-7 mm. long, yellow below and purple-red above by reason of the long moniliform hairs or occasionally with yellow hairs, the lobes triangular-acuminate; pappus scales 5-6 mm. long, lanceolate and gradually attenuate into an awn; achenes about 2 mm. long, hirsute from the base only, the hairs scarcely equaling the body. Incl. var. *picta* (Sweet) Gray, *G. Drummondii* (Hook.) DC., *G. villosa* Rydb., *G. neomexicana* A. Nels. Prairies, often sandy areas, common throughout the state but rare in the densely forested e. areas, late spring-early summer; Neb., Colo. and Ariz., s. to Tam., N.L., Coah. and Chih., rare e. to Ark. and along the coastal sandy areas to Va.; exceedingly close to *G. Amblyodon* below.

One of our most characteristic and plentiful spring flowers.

2. *Gaillardia Amblyodon* Gay. Taprooted annual; stems 3-5 dm. tall, simple or branched above, with crisp moniliform hairs; leaves 3-7 cm. long, long-lanceolate, sessile and slightly auricled basally, with short moniliform hairs; peduncles 3-10 cm. long; phyllaries 10-15 mm. long, lanceolate, the base chartaceous and appressed, only the tip herbaceous; setae of the receptacle subulate, 5-6 mm. long; rays 15-20 mm. long, dark-red to brownish-purple, the tip *not* yellow; disk 10-15 mm. across, lobes of disk corollas triangular, ciliate with moniliform hairs; style with long hispidulous appendages; achenes

about 3 mm. long, densely villous basally; pappus scales lanceolate, produced into an awn about half as long as the body. Sandy prairies and open woods in s.e. Tex. but most common in the s.w. extreme of e. Tex. and n. Rio Grande Plains, late spring-early summer; endemic.

Exceedingly closely related to *G. pulchella* above and probably not deserving separate recognition.

3. *Gaillardia mexicana* Gray. Perennial herb; stems 3-5 dm. tall, branched from the base, often with a reddish-tinge and pubescent with short moniliform hairs; rosette leaves 6-7 cm. long, oblanceolate with long subpetiolar bases, the margins coarsely lobed or entire; cauline leaves 25-35 mm. long, oblong or ovate-lanceolate, sessile, marginally entire or toothed; peduncle 15-20 cm. long; phyllaries 7-10 mm. long, lance-acuminate, herbaceous in texture, pubescent with short moniliform hairs; setae of the receptacle subulate, 3-4 mm. long; rays yellowish-red or purple, 7-9 mm. long; disk 12-15 mm. across, the triangular corolla lobes pubescent with brownish-purple moniliform hairs; pappus scales ovate-lanceolate, about 5 mm. long including the awn; achenes 2.5 mm. long, hairy from the base only, the hairs about as long as the body of the achene. Infrequent to rare in the vic. of Del Rio, Val Verde Co., spring; Tex., Chih., Coah., N.L. and S.L.P.

4. *Gaillardia pinnatifida* Torr. Perennial herb; stems 3-4 dm. tall, striate; leaves confined to lower half, lower leaves long-petioled, upper ones sessile or short-petioled; blades pinnatifid, oblanceolate in outline, covered with moniliform hairs; peduncles 8-18 cm. long; setae of the receptacle stiff, almost equaling the body of the achenes; rays yellow (the base sometimes pale-reddish), strongly purple-veined beneath; disk 2 cm. across; lobes of disk corollas triangular, covered with purple moniliform hairs; achenes 3 mm. long, covered with silky hairs; pappus scales lanceolate, each with an awn a third to half as long as the body. Abundant in grasslands of the Trans-Pecos and Plains Country, infrequent s.e. to n.e. part of Rio Grande Plains, late spring-fall; Okla., Colo. and Ut., s. to N.L., Coah. and Dgo.

5. *Gaillardia multiceps* Greene. Suffruticose perennial growing in bunches; stems 15-30 cm. tall, leafy in the lower half to two-thirds; leaves obtuse to acute, linear-oblanceolate, sessile, 2-8 cm. long, punctate and covered with moniliform hairs on both sides; peduncles 3-10 cm. long; phyllaries linear-lanceolate, acute, woolly with moniliform hairs; setae of the receptacle shorter than the body of the achene; disk 15-25 mm. across; lobes of disk corollas triangular, covered with purple-brown moniliform hairs; rays yellow with brown silky hairs; pappus scales 4-5 mm. long, lanceolate and often notched at the apex, the midrib extending into an awn a third the length of the body. Infrequent or rare in gypseous sands of Hudspeth Co. in the Trans-Pecos, summer; Ariz., N.M., Tex. and Coah.

6. *Gaillardia suavis* (Gray & Engelm.) Britt. & Rusby. Perennial herb; stems scapiform, 3-8 dm. tall; leaves basal, 5-15 cm. long, variable in shape from spatulate or oblanceolate-entire to only slightly toothed or lyrate pinnatifid, if entire strongly 3-nerved; leaf surfaces with a few scattered moniliform hairs; heads single; peduncles 3-8 dm. high; phyllaries ovate-lanceolate, acute, herbaceous in texture, with a few long moniliform hairs; setae of the receptacle subulate; rays often absent, if present short and usually orange-brown, inconspicuous; disk 15-20 (-30) mm. across, nearly spherical; corollas about 6 mm. long, exceeded by the awns of the pappus, reddish-brown; style branches with short glabrous appendages; achenes about 2.5 mm. long, the body covered with long white hairs; pappus scales including the awn 7-9 mm. long, ovate-lanceolate. *G. trinervata* Small. Widespread in calcareous and sandy-calcareous prairies in the w. two-thirds of the state, spring-early summer; Kan., Okla., Tex., Coah. and N. L.

7. *Gaillardia aestivalis* (Walt.) Rock. Perennial herb; branches slender and spreading, 3-7 dm. long or tall, the stems reddish-striate; upper leaves 2-8 cm. long, sessile, linear or oblanceolate; lower leaves 5-10 cm. long, oblanceolate, petioled; leaves glandular-punctate with short moniliform hairs on both surfaces and short cilia on the margins; peduncles 4-20 cm. long; phyllaries 8-10 mm. long, lanceolate, acute, covered with very short moniliform hairs but not ciliate; setae of the receptacle short and weak; rays 12 to 18, red or yellow; disk about 2 cm. broad; lobes of the disk corollas caudate-acuminate with long purple moniliform hairs; achenes 2 mm. long, the hairs covering the body; pappus scales lanceolate, tapering into an awn twice the length of the body. *G. lanceolata* Michx., *G. chrysantha* Small, *G. lutea* Greene, *G. serotina* (Walt.) Rock. Widespread in sandy soils, open woodlands and prairies, e. part of Tex. s. to Willacy Co. and w. to Medina Co., spring-summer, less commonly in fall; Coastal States, S. C. to Tex., inland to Ill., Mo., Ark. and Okla.

8. *Gaillardia fastigiata* Greene. Perennial herb; stems usually rigid, branching toward the top with the branches erect, 3-6 dm. tall; leaves sessile, linear-oblong or oblanceolate, acute, entire or coarsely dentate, glandular-punctate and covered with short moniliform hairs; peduncles 4-8 cm. long; phyllaries acute or acuminate, 8-12 mm. long, covered with short moniliform hairs; setae of the receptacle short, weak, flattened; rays yellow or occasionally reddish basally, 10-15 mm. long; disk 18-25 mm. broad; lobes of the disk corollas caudate-acuminate, covered with moniliform hairs, brown or dark-purple; achenes 2 mm. long, hairy from the base only but the hairs almost covering the body; pappus scales lanceolate, tapering into an awn longer than the body, body plus awn 5-6 mm. long. *G. rigida* Small. Open woods and prairies, sandy soil, e. half of Tex., spring-summer (less commonly in fall); Kan., Okla., Ark. and Tex.

Exceedingly closely related to *G. aestivalis* and probably not really separable therefrom except as an inland race.

96. AMBLYOLEPIS DC.

There is only one species; referred by some authors to *Helenium*.

1. *Amblyolepis setigera* DC. HUISACHE-DAISY. Slenderly taprooted annual with a pleasant odor like new-mown (*Medicago* or *Melilotus*) hay, sparingly branched, 1-5 dm. tall, glabrous or sparingly long-pilose; leaves alternate, sessile, thin-membranous, entire, the lower ones 2-5 (-8) cm. long, oblanceolate and narrowed to the base, the ones of midstem ovate, usually acutish and often somewhat clasping; upper 3-15 cm. of branches essentially naked, pedunculiform, each with a single head; involucre hemispheric, 7-11 mm. high; phyllaries in 2 series, the outer ones 8, longer, green, narrowly elliptic, the inner ones shorter, very inconspicuous, hyaline, mucicous, much-resembling pappus scales; receptacle strongly convex, naked except for persistent projections about 0.5 mm. long subtending the central flowers; ray flowers about 8 or 10, pistillate, fertile; rays yellow, 1-2 cm. long, deeply 3-(4-) toothed terminally; disk flowers numerous, perfect, fertile, the yellow corollas equally 5-toothed; achenes narrowly obconic, almost equally 10-ribbed, about 4 mm. long, densely covered with antrorse silky brownish hair; pappus of about 5 scarious scales 2.5-3 mm. long. *Helenium setigerum* (DC.) Britt. & Rusby. Abundant in Rio Grande Plains and the Edwards Plateau, infrequent in n.-cen. and s.e. Tex. and Plains Country, rare in the Trans-Pecos, spring; also Coah.

97. HELENIUM L.

SNEEZEWEED

Annual or perennial caulescent herbs usually with taproots; stems 1-20 dm. tall, usually simple below, ascendingly branched above; leaves alternate, usually ascending, in some species decurrent, essentially sessile, the lowest ones often pinnately lobed, the upper usually not, all beset with microscopic droplets of resinlike exudate; peduncles moncephalous, terminal; receptacle usually globose or prolate (or globose but basally truncate), naked or rarely with a few short bristles in the peripheral zone; involucre usually flat or even inverted-saucer-shaped; phyllaries about 16, in 2 series of about 8, lanceolate to subulate, herbaceous in texture, usually pubescent and resin-atomiferous, the outer somewhat longer than the inner, usually reflexed at maturity; ray flowers absent or present, about 8, pistillate or not, fertile or infertile; rays yellow (or red-brown with a yellow tip), apically 3-lobed, often reflexed, dorsally often hairy and resin-atomiferous; disk usually globose or prolate; disk flowers numerous, perfect, fertile; corollas yellow mostly, with 5 moniliform-pubescent triangular lobes which are either yellow or red-brown; style branches unappendaged, truncate, penicillate; achenes obpyramidal, 4- or 5-angled, short and squatty, usually antrorsely hairy at least in the basal part; pappus of 5 translucent scales each of which usually is prolonged into an awnlike tip, occasionally the whole scale narrow and awnlike.

About 40 species, mostly in western America.

1. Cauline leaf bases not decurrent along the stem, the stem thus not winged (2).

1. Cauline leaf bases (at least those of the midstem leaves) decurrent along the stem to form wings on the stem (3)

- 2(1). Lobes of disk corollas yellow5. *H. amarum*.
 2. Lobes of disk corollas red-brown6. *H. badium*.
- 3(1). Rays absent (4)
 3. Rays present (5)
- 4(3). Perennial with short fibrous-rooted caudex; perennation by leafy offsets; disk red-brown7. *H. flexuosum*.
 4. Annual or biennial with a coarse taproot; leafy offsets usually absent; disk reddish to yellowish (8)
- 5(3). Ray flowers neutral, sterile (6)
 5. Ray flowers styliiferous, fertile (tardily so in some) (7)
- 6(5). Disk yellow; stem nearly simple8. *H. Drummondii*.
 6. Disk red-brown; stem branched7. *H. flexuosum*.
- 7(5). Perennial1. *H. autumnale*.
 7. Annual or biennial with a coarse taproot, usually with numerous heads on shortish peduncles and the heads relatively small (8)
- 8(4,7). Pappus scales ovate, with a long awn tip, altogether fully three fourths as long as the disk corolla4. *H. linifolium*.
 8. Pappus scales obtuse, pointless, without conspicuous midrib (9)
- 9(8). Leaves narrowly elliptic and often undulate-dentate; plants usually leafy even up to the top among the heads; achenes mostly 0.8-1 mm. long and pappus 0.2-0.4 (0.5) mm. long; "disk" usually slightly higher than thick; rays (1-) 2-3 (-5) mm. long2. *H. microcephalum*.
 9. Leaves lanceolate to linear, rarely undulate, much-reduced upward so the heads are definitely peduncled and emergent above the foliage; achenes 0.5-0.7 (-0.8) mm. long and pappus 0.1-0.2 (rarely to 0.3) mm. long; disk usually slightly thicker than high; rays 3-15 mm. long3. *H. quadridentatum*.

1. *Helenium autumnale* L. Perennial herb from a fibrous-rooted subrhizomatous base; stems erect, 3-10 dm. tall, branched above, winged; leaves mostly linear-elliptic, usually serrate, 3-15 cm. long, 3-18 mm. broad, acute, decurrent; peduncles 3-6 cm. long; receptacle roughly globose; ray flowers pistillate, tardily fertile, the rays yellow; disk globose, 8-13 (-20) mm. thick, yellow, the corollas 5-merous; achenes about 1.5 mm. long, hairy on the ribs; pappus scales lanceolate, erose-fimbriate, acuminate, about a fourth as long as the tube. *H. canaliculatum* Lam., *H. edwardsianum* Cory. Infrequent in moist usually calcareous places, n.-cen. and e. Tex., Edwards Plateau and Plains Country, (Aug.-) Sept.-Oct.; widespread in temp. N. A.

2. *Helenium microcephalum* DC. SNEEZEWEED. Taprooted annual (2-) 3-6 (-8) dm. tall, usually simple-stemmed basally, bushy-branched above, the stems winged; leaves narrowly elliptic or narrowly oblong-elliptic, usually serrate or undulate-serrate-margined, blunt, ascending, decurrent; peduncles short so that the heads usually just barely emerge above the foliage mass; receptacle usually short conic-globular; rays entirely yellow, (1-) 2-3 (-5) mm. long; disk pale-red-brown, usually slightly higher than thick; achenes mostly 0.8-1 mm. long; pappus scales 0.2-0.4 (-0.5) mm. long, ascending. *H. ooclinium* Gray. Abundant in overgrazed areas, especially in low seasonally moist areas of clay soil, w. half of Tex., infrequently e. to Brazos and San Patricio cos., summer- (fall); Tex., Tamp., N.L. and Coah.

3. *Helenium quadridentatum* Labill. ROSILLA. Taprooted annual (2-) 3-6 (-8) dm. tall, usually single-stemmed basally, bushy-branched above, the stems winged; leaves lanceolate to linear, those of midstem and above entire-margined, acute, ascending, decurrent; peduncles long enough to elevate the heads distinctly above the foliage; receptacle usually globose; rays yellow or often partly red-brown basally, 3-15 mm. long; disk red-brown, usually slightly thicker than high; achenes mostly 0.5-0.7 mm. long; pappus scales 0.1-0.2 (rarely 0.3) mm. long, usually slightly spreading. *H. elegans* DC., *H. amphibolum* Gray. Frequent or local in the Trans-Pecos and n.-cen. Tex., Edwards Plateau and Rio Grande Plains, (May-) summer; Tex., La., Miss., Okla., Tam., N.L., Coah., s.e. to Hgo., perhaps even to C. A.

The allegations that this species has 4-merous disk corollas seem unfounded, at least in Texas material. The species may have introgressed to a small extent with *H. microcephalum*.

4. *Helenium linifolium* Rydb. Taprooted annual (2-) 3-6 (-8) dm. tall, simple basally, with few ascending branches, the stems and branches narrowly winged; lowermost leaves (often withered before flowering) oblanceolate, pinnatifid; stem leaves linear, narrowly decurrent, (2-) 3-5 cm. long, ascending; peduncles (3-) 4-6 cm. long; receptacle conic-globose; ray flowers about 8, pistillate, tardily fertile; rays about 1 cm. long, 3-fid, yellow or yellow with red-brown spot basally or nearly all red-brown with yellow lobes; disk 5-10 mm. thick, globose; corollas 5-lobed, the lobes yellow to red-brown; achene about 1 mm. long, hispid on the angles; pappus scales ovate, each with a long awn-tip, altogether fully three fourths as long as the corolla. Infrequent in Rio Grande Plains in sandy loam soil, spring; endemic.

Closely related to the *H. amarum*-*H. badium* alliance, but with stems very narrowly winged.

5. *Helenium amarum* (Raf.) Rock. BITTERWEED. Taprooted annual (5-) 10-50 (-80) cm. tall, bushy-branched above or rarely subsimple; leaves not decurrent on the stem, mostly linear but the lowermost (usually withered prior to anthesis) pinnately lobed, oblanceolate in outline and long-tapered to the base; heads numerous; rays about 8; disk corollas 5-lobed, entirely yellow. *H. tenuifolium* Nutt. Very widespread in (usually disturbed) sandy or loamy soil in the e. two thirds of the state, spring-summer (rarely again in the fall); s.e. U.S.

The stems are striate or ribbed, each rib leading downward from the side of a leaf base, but the stem is definitely not winged. The whole plant is odoriferous and bitter; the milk of cows which have eaten even a small quantity of this plant is distasteful. The plant is very weedy and increases enormously under the usual regime of abusive overgrazing.

6. *Helenium badium* (Gray) Greene. Identical to the last but the lobes of the disk corolla red-brown so that the disk appears dark. *H. amarum* var. *badium* (Gray) Waterfall. This can easily be considered merely a variety of *H. amarum* but it is more restricted geographically to calcareous disturbed soils of the Edwards Plateau, Plains Country and Trans-Pecos, infrequently farther e., spring-summer (rarely again in fall); also Okla.

7. *Helenium flexuosum* Raf. Perennial herb perennating by rosetted offshoots at the crown; stems 3-10 dm. tall, simple basally, profusely branched, winged below; radical leaves usually withered by flowering time, linear-lanceolate to elliptic-lanceolate or oblanceolate to spatulate, entire to pinnatifid-incised, 3-21 cm. long, 4-30 mm. broad; stem leaves mostly entire, linear-lanceolate, decurrent, much-reduced upward; heads usually many, globose; receptacle subglobose to conical-subglobose; ray flowers when present infertile (style usually absent); rays yellow, umber or suffused with red or purple, 10-21 mm. long; disk red-brown to red-purple, 7-20 mm. thick, 5-15 mm. high, the corollas predominantly 4-merous; achenes 1-1.5 mm. long, columnar to truncate-turbinate; pappus scales usually 5, lanceolate, acute and awned apically. *H. nudiflorum* Nutt. Infrequent in moist sandy places, s.e. Tex. (s. to Calhoun Co.), rare in e. Tex., spring (to first week in June); e. U. S., w to Mo., Okla. and Tex.

8. *Helenium Drummondii* Rock. Perennial herb perennating from rosette-leaved offshoots of the crown; stems (19-) 47-54 (-60) cm. tall, solitary, simple, subscapose, monocephalous, winged below; radical leaves usually present at flowering time, linear-lanceolate to elliptic-lanceolate or less commonly spatulate or oblanceolate, marginally entire to repand, dentate to pinnatifid; stem leaves narrower, nearly linear, very strongly reduced upward, the uppermost (near the middle of the stems) being mere bracts; receptacle convex to hemispherical; ray flowers astylous, infertile, the yellow rays 12-22 mm. long; disk yellow, 9-14 (-18) mm. high, 12-22 mm. thick, the corollas 5-lobed; achenes columnar to truncate-turbinate, 1-1.5 mm. long, hairy on the ribs; pappus scales 5 to 10, 2-3.5 mm. long, deeply divided into capillary segments. Infrequent in poorly drained areas, s.e. Tex., rare in e. Tex., spring; Tex., La. and Fla.

98. HYMENOXYSS CASS.²²⁰

BITTERWEED

Annual or perennial herbs from a taproot, sometimes also with a caudex (persistent old exposed stem bases); herbage granulate, dotted with microscopic globules of resinlike

²²⁰ Contributed by Kittie F. Parker.

exudate, pilose to glabrate; stems sulcate; leaves alternate, both rosulate and cauline or all basal, simple, entire, few-toothed or lobed to pinnatisect, impressed-glandular-punctate on both surfaces; heads solitary on each peduncle, cymosely or corymbosely arranged; involucre hemispherical to nearly cylindrical; outer phyllaries rigid, united from near base to half their length and strongly thickened below or distinct to base and not strongly thickened; inner phyllaries distinct to base, either in 1 definite series and coriaceous throughout or in 2 indefinite series and more or less herbaceous and membranous-margined; receptacle high-conical, naked, pitted; ray flowers pistillate, fertile; rays yellow, sharply reflexed at maturity, persistent, becoming almost whitish; disk flowers numerous, perfect, fertile; disk corollas yellow; style branches dilated-truncate, at tip penicillate; anther appendages broadly triangular to ovate; achenes of ray and disk similar, obturbinate, indistinctly 4-angled, coarsely sericeous, 1.5-3.5 mm. long; pappus of 5 to 8 hyaline scales. *Tetraneris* Greene.

An American genus of about 27 species, confined to limestone soil or derivatives of limestone or of basic igneous rocks (basalt, andesite, etc.). Some species are poisonous to sheep.

1. Phyllaries dissimilar, rigid; outer phyllaries keeled or strongly thickened below, herbaceous above, united from near base to half their length; inner phyllaries separate, coriaceous throughout, in 1 series, slightly longer than outer and convergent in fruit (2)
1. Phyllaries similar, separate, erect but not rigid nor strongly thickened, subequal; inner phyllaries more or less herbaceous and membranous-margined, in 2 indistinct series, not convergent (4)
- 2(1). Perennial with a branched woody caudex, the base conspicuously long-villous-woolly among the persistent petiole bases; Culberson Co1. *H. Richardsonii*
var. *floribunda*.
2. Annual from a slender taproot, the base not conspicuously long-villous or woolly, lacking persistent petiole bases (3)
- 3(2). Leaves all pinnately divided into 3 to 13 linear-filiform segments; ray flowers obvious, longer than phyllaries; common in Texas ...2. *H. odorata*.
3. Leaves of rosette spatulate with short lobelike teeth; cauline leaves few, becoming linear, entire; ray flowers not obvious, shorter than phyllaries; Harris Co.3. *H. texana*.
- 4(1). Annual with basal rosette and cauline leaves; stems simple to few- or many-branched from base to near top, sometimes flowering before branching; phyllaries 2.5-4.5 mm. high; disk flowers 1.5-2.5 mm. long ...4. *H. linearifolia*.
4. Perennial with or without a caudex; plants acaulescent or flowering stems sparingly branched near base; leaves all basal or ascending the stem a third or more its length; phyllaries 4.5-8.5 mm. high; disk flowers 2.5-4.5 mm. long (5)
- 5(4). Leaves densely sericeous, all entire, clearly basal, not imbricated along basal part of stem nor ascending stem; plants strictly acaulescent, the scapes arising from a short thick woody multicapital caudex5. *H. acaulis* var. *acaulis*.
5. Leaves not sericeous, densely to thinly pilose-villous to glabrate, entire or some with 1 to 5 short toothlike lobes, closely imbricated along basal part of stem or ascending a third or more the length of the stem; plants rarely strictly acaulescent, the stems often branched below; caudex lacking to well-developed (6)
- 6(5). Petioles 2-6 mm. broad, the clasping base scarcely broader than rest of petiole, not coriaceous, sometimes membranous; leaves 6-15 mm. broad, not linear, lanceolate to spatulate; phyllaries 5.5-8.5 mm. high6. *H. Turneri*.
6. Petioles 0.5-1.5 mm. broad, the clasping base expanded and much broader than rest of petiole, pale to whitish, coriaceous, often pearly, shiny; leaves (1-) 14 mm. broad, linear to oblanceolate; phyllaries 4.5-6 mm. high (7)
- 7(6). New leaves closely imbricated around base of stem, not ascending stem; stem not visible between leaf bases (8)
7. New leaves ascending stem a third or more its length; stem clearly visible between leaf bases, sparingly branched below (10)

- 8(7). Caudex forming a woody fastigiately branched mound to 1 dm. or more high; leaves mostly entire, 1.5-4 mm. broad, thinly pilose to glabrate 7. *H. scaposa* var. *glabra*.
8. Caudex none to short, the new growth often arising by scapelike branches or well-developed, few-branched and spreading; commonly some leaves short-lobed, 1.5-14 mm. broad (9)
- 9(8). Leaves moderately pilose to glabrate, 1.5-9 mm. broad; widespread 7. *H. scaposa* var. *scaposa*.
9. Leaves densely long-villous-pilose, 4-14 mm. broad; southeast Trans-Pecos Texas and western Edwards Plateau 7. *H. scaposa* var. *villosa*.
- 10(7). Leafy part of flowering stem conspicuously and densely whitish-villous-woolly-tomentose; leaves 1-3 (-4) mm. broad 7. *H. scaposa* var. *argyrocaulon*.
10. Leafy part of flowering stem appressed-puberulent, not densely villous-woolly; leaves 1.5-9 (-11) mm. broad 7. *H. scaposa* var. *scaposa*.

1. *Hymenoxys Richardsonii* (Hook.) Cockll. var. *floribunda* (Gray) Parker. PINGUE. Cespitose perennial 15-45 cm. high, from a well-developed multicapital woody caudex, the base conspicuously long-villous-woolly in axils of persistent petiole bases; stems many, well-branched; leaves entire to mostly pinnatisect into 2 to 15 long narrow segments, densely cauline and forming a tuft at base of each stem; heads many per stem, in flat-topped corymbs, the peduncles 2-6 cm. long; phyllaries 4-5.5 mm. high; outer phyllaries united about half their length, thickened, dorsally keeled, gland-dotted; inner phyllaries slightly longer, mucronate; rays 6 to 9, 8-11 mm. long; disk flowers 3-4 mm. long; pappus scales 1.5-3 mm. long. Locally abundant in overgrazed limestone or dolomite mt. meadows, Guadalupe Mts., Culberson Co., 5,700 to 8,751 ft. elev., July-Aug. (-Sept.); Colo., Ut., Ariz. and Tex.

The species as a whole is more widely distributed in the Rocky Mts. Poisonous to sheep.

2. *Hymenoxys odorata* DC. BITTERWEED. Bushy annual, much-branched, 7-45 (-60) cm. high, aromatic when crushed, sparingly canescent to glabrate; leaves pinnatisect into 3 to 15 very narrow to filiform divisions; heads many, small, solitary on terminal or axillary peduncles 3-7 (-14) cm. long; phyllaries 4-6.5 mm. high; outer phyllaries united near (noticeably thickened) base; inner phyllaries 1-3 mm. longer, strongly convergent in fruit; rays 6 to 13, 5-11 mm. long; disk flowers 2.5-4.2 mm. high; pappus scales acuminate or awn-tipped, 1-1.8 (-2.3) mm. long. A weed of overgrazed plains, roadsides and wasteplaces in limestone soils, abundant in Edwards Plateau and the Trans-Pecos, frequent in n.w. Tex., e. and s. to Wilbarger, Robertson and Starr cos., Feb.-June (-Nov); Kan., Colo., N.M., Ariz., Calif., Tex., Okla., Son., Chih., Coah., N.L. and Tam.

Poisonous to sheep.

3. *Hymenoxys texana* (Coul. & Rose) Cockll. Delicate annual 5-15 cm. high, with several divergent branches from base, sparingly short-villous to glabrate; rosette leaves spatulate with short marginal teeth or lobes, 4-5 mm. broad; cauline leaves few, becoming narrowly linear and entire; heads few, small, on peduncles 4-15 mm. long; phyllaries 5 mm. long; outer phyllaries strongly thickened and united near base; inner phyllaries longer, convergent in fruit; rays only 2-3 mm. long, shorter than and hidden by phyllaries; disk flowers 2 mm. long; pappus scales 5, acuminate to short-awned, 1.5-2.4 mm. long. Rare in sandy soils near Hockley and Houston, Harris Co., probably extinct (no known collections after 1900), Mar.-Sept.; endemic.

4. *Hymenoxys linearifolia* Hook. Annual; first stem from basal rosette commonly flowering before it branches or other stems are fully developed, the branches often greatly rebranched in age and the plant bushy, or stem rarely solitary, simple below, sparingly branched above, 3-40 (-60) cm. high, densely to sparingly long-pilose below; rosette leaves caducous, oblanceolate, entire or with 1 to 5 short lobes, glabrate to densely pilose, 4-8 (-13) mm. broad; cauline leaves becoming narrowly linear; heads solitary on naked peduncles 3-20 cm. long, disk of first flowering to 14 mm. across, later heads smaller, as narrow as 3.5 mm.; phyllaries 2.5-4 (-4.5) mm. long; rays 6 to 22; disk flowers 1.5-2.5 (-2.8) mm. long. *Tetranneuris linearifolia* (Hook.) Greene. Locally abundant in prairies,

floodplains, weedy places and mts. to 7,000 ft. elev., in limestone soil throughout except rare in Plains Country and forested parts of e. Tex., Mar.-May (-July); reflowering to July (-Nov.), heads progressively smaller; Okla., N.M., Tex., Coah., N.L. and Tam.

5. *Hymenoxys acaulis* (Pursh) Parker var. *acaulis*. Cespitose scapose perennial from a short thick woody multicapital caudex, covered by persistent leaf bases with woolly axils, strictly acaulescent; scapes 6-35 cm. high; leaves strictly basal, entire, linear-oblongate, 2-6 mm. broad, densely sericeous; heads solitary on each scape; phyllaries 4.5-6 mm. high, densely silky-villous; rays 8 to 16, 6-14 mm. long; disk corollas 2.5-3.5 mm. long; pappus scales 5 to 6 (or 7), 2-2.8 mm. long. *Tetaneuris acaulis* (Pursh) Greene var. *acaulis*. Frequent on limestone bluffs, slopes and roadsides, Plains Country s. to Randall and Donley cos., May-June, spasmodically to Aug.-Sept.; Alta. and Sask. s. to N.M. and Tex.

6. *Hymenoxys Turneri* Parker. Perennial with a branched decumbent caudex, weak and spreading, not cespitose; leafy part of flowering stems densely long-pilose-woolly, the hairs often whitish; stems unbranched to sparingly branched near base; leaves basal and often ascending a third or more the stem length, 6-15 mm. broad when mature, entire to trifid or with 4 or 5 short lobes, mostly densely long-pilose, lanceolate or oblanceolate to spatulate; petioles 2.5-6 mm. broad, the clasping bases inconspicuous, scarcely broader than petioles, not coriaceous, sometimes membranous; heads large, the disks 14-22 mm. across; phyllaries 5.5-8.5 mm. long; rays 14 to 27; disk flowers 3-4.5 mm. long; pappus scales 2.6-4.1 mm. long; chromosome number: $n = 45$. Frequent locally in dry limestone plains and roadsides in the s. tip of the Blackland Prairies and s.-cen. Rio Grande Plains from Karnes and Goliad cos. s. through Live Oak and s. San Patricio to Jim Wells Co., Feb.-Apr.; endemic.

7. *Hymenoxys scaposa* (DC.) Parker. Perennial from a slender taproot to cespitose with a well-developed caudex; leaves closely imbricated along basal part of stem to ascending a third or more of the stem length, entire or with 1 to 5 short lobes, linear or linear-lanceolate or oblanceolate to rarely spatulate, densely pilose-villous to glabrate, attenuate below into a petiole 0.5-1.5 mm. broad, the clasping bases expanded, whitish, coriaceous, often pearly, shiny, the axils densely long-pilose-villous; heads solitary on long naked peduncles; phyllaries 4.5-6 mm. high; rays variable in number and length; disk corollas 3-3.6 mm. long; pappus of 5 to 8 scales 1.5-3.3 mm. long; achenes 2.2-3.3 mm. long. *Tetaneuris scaposa* (DC.) Greene. Late Mar.-June (-Aug.), often reflowering Sept.-Oct.; widespread over Tex. except extreme e. part, with several intergrading forms or races, 4 of which are recognized here as varieties:

Var. *scaposa*. Caudex lacking to sparse, often with scapelike branches to well-developed and few-branched, spreading; leaves 1.5-9 (-11) mm. broad, entire to few-lobed; scapes 7-36 cm. high, sometimes sparingly branched among the leaves; rays 12 to 31; corollas 8-22 mm. long, the veins sometimes purplish-brown beneath. *Tetaneuris scaposa* var. *scaposa*, *H. scaposa* var. *linearis* (Nutt.) Parker. Locally abundant in limestone soil in the Plains Country, Blackland Prairies to Dallas Co., Edwards Plateau, n. Rio Grande Plains and Trans-Pecos to Hueco Mts., El Paso Co., up to 6,500 ft. elev.; Kan., Okla., N.M., Tex., Chih., Coah., Dgo., N.L., Tam. and S.L.P.

Var. *glabra* (Nutt.) Parker. Caudex forming a fastigiately branched woody mound to 1 dm. or more high; leaves 1.5-4 mm. broad, usually entire, occasionally short-lobed, thinly pilose to glabrate, in closely imbricated tufts at stem base, rarely ascending above base; scapes 5-20 (-25) cm. high; rays 8 to 13, 6-13 mm. long. *H. glabra* (Nutt.) Shinners, *Tetaneuris glabra* (Nutt.) Greene. Locally common in dry rocky limestone soil in the Plains Country to Tom Green Co., infrequent in the Trans-Pecos from Guadalupe Mts. to Glass Mts.; Neb., Kan., Okla., Colo., Ut., N.M., Tex., Coah., N.L. and S.L.P.

Var. *villosa* Shinners. Leaves densely long-villous-pilose, 4-14 mm. broad, often some only sparingly punctate; rays as in var. *scaposa*, the veins usually purplish-brown beneath; caudex none to sparse. *Tetaneuris scaposa* var. *villosa* (Shinners) Shinners. Frequent on rocky limestone mesas and disturbed areas in s.e. Trans-Pecos and w. Edwards Plateau; Tex., N.M. and Coah.

Var. *argyrocaulon* Parker. Mostly with a many-branched spreading caudex; lower part of new stems clearly visible between leaf bases, frequently branched, densely pilose-woolly, the hairs conspicuously whitish (ferruginous in old specimens); leaves ascending a third or more up the stem, linear to linear-lanceolate, 1-3 (-4) mm. broad, entire to trifid, moderately to thinly silky-pilose, often silvery. Fairly common in sandy calcareous

soil in s.w. Rio Grande Plains in Webb, Duval, Jim Hogg and Zapata cos., rare in Edwards Plateau (Edwards Co.), Feb.-Apr.; Tex., Coah., N.L. and Tam.

99. DYSSODIA CAV.²²¹

DOGWEED. FETID MARIGOLD

Strongly scented annual or perennial herbs, or shrubs, glabrous to densely tomentose; foliage and phyllaries dotted with translucent usually orange or dark-brown oil glands; capitula usually pedunculate, sometimes sessile or subsessile, in cymose clusters in *D. tagetoides*; calyculum (short bracts subtending the phyllaries proper) usually present; involucre hemispheric to narrowly turbinate or cylindric, 4-12 mm. high; phyllaries in 2 series, free or variously connate from the base, the upper portions gland-dotted; receptacle flat to convex, minutely fimbriate, puberulent or naked; ray florets usually present (mostly 8 to 13), pistillate; corollas light-yellow to orange; pappus and achene similar to those of the disk; disk florets 12 to 100 per head, perfect; corollas usually dull-yellow, the tube and throat about equal, the short lobes deltoid; style branches in the disk florets long, slender, abruptly tipped with a short papillate cone; pappus of 5 to 22 squamellae, muticous, awned or dissected into several bristles; frequently both muticous and awned scales on the same achene; achenes stout, obpyramidal and sericeous to slender, cylindric and glabrous.

An American genus of about 32 species; most common in the more arid regions of southwestern United States and northern Mexico.

- 1. Phyllaries free nearly to the base of the involucre; rays inconspicuous, barely exerted beyond the phyllaries 1. *D. papposa*.
- 1. Phyllaries connate half their length or more; rays (when present) conspicuous (2)
- 2(1). Ephemeral annual; leaves alternate, pinnatisect; calyculum absent; plants of Trans-Pecos Texas 9. *D. aurea*.
- 2. Perennials (sometimes flowering the first year and behaving as annuals), usually with calyculate heads; leaves opposite or alternate, simple to pinnatisect (3)
- 3(2). Leaves simple, entire or toothed but not pinnatisect into linear lobes; calyculum more than half as long as the involucre (4)
- 3. Leaves pinnately parted into 3 to 15 linear lobes (entire in *D. tenuiloba* var. *Wrightii*); calyculum less than half as long as the involucre (7)
- 4(3). Plants woolly-tomentose, ashy-white; leaves mostly alternate (5)
- 4. Plants glabrescent, green; leaves opposite or alternate (6)
- 5(4). Plants depressed, spreading, less than 1 dm. high; leaves spatulate 2. *D. micropoides*.
- 5. Plants erect, mostly 1-3 dm. high; leaves linear-filiform .. 3. *D. tephroleuca*.
- 6(4). Plants mostly less than 3 dm. high; leaves opposite, acerose, 1-2 cm. long 4. *D. acerosa*.
- 6. Plants 3-9 dm. high; leaves becoming alternate, toothed, 4-9 cm. long 5. *D. tagetoides*.
- 7(3). Leaves opposite, the divisions rather stiff to the touch; margins of the outer phyllaries usually free for half or more of their length (8)
- 7. Leaves alternate, rather soft to the touch; margins of the outer phyllaries united up to the short deltoid tips 8. *D. tenuiloba*.
- 8(7). Plants ashy-white, tomentose; tips of the phyllaries attenuate 6. *D. setifolia* var. *radiata*.
- 8. Plants green, glabrous to puberulent but not tomentose; tips of the phyllaries short, deltoid 7. *D. pentachaeta*.

1. *Dyssodia papposa* (Vent.) Hitchc. Erect to spreading annual, 1-7 dm. high; leaves mostly opposite, becoming alternate, 15-50 mm. long, pinnately parted into 11 to 15 narrow lobes (sometimes secondarily divided), glabrous to sparsely pubescent, irregularly

²²¹ Contributed by John L. Strother.

dotted with numerous small ovate glands; heads subsessile or on short peduncles; calyculum of 4 to 9 linear bracts, usually bearing 1 to 3 elongate glands; involucre turbinate to campanulate, 6-10 mm. high; phyllaries 6 to 12, free, oval-oblongate, tips acute to rounded-obtuse, scarious, fimbriate, bearing 1 to 7 elongate to ovate glands inset slightly from the upper margin; *ray florets* 8 or fewer, inconspicuous, yellow-orange; tube 3-3.5 mm. long, sparsely puberulent, constricted just below the lamina, the latter 1.5-2 mm. long and about 1 mm. wide, 2- or 3-denticulate at the apex; *disk florets* 12 to 50; corollas dull-yellow, about 3 mm. long; pappus of about 20 squamellae, each dissected into 5 to 10 fine bristles with the longest about equaling the disk corollas; achenes stout, 3-3.5 mm. long, subsericeous. Trans-Pecos and High Plains (Panhandle), Aug.-Oct.; Me. to Mont. s. through Mex. Highlands to Chis.

2. *Dyssodia micropoides* (DC.) Loes. Depressed spreading short-lived perennial, 5-10 cm. high, with a slender taproot or woody caudex, densely arachnose-floccose throughout; leaves alternate, spatulate, 10-25 mm. long, 3-5 mm. wide, mostly entire, sometimes with a few subtle teeth toward the apex, lower surface dotted with tiny glands hidden in the dense wool; heads sessile or terminating short branches; calyculum of 3 to 5 linear bracts hidden in the wool; involucre a turbinate cup, 6-7 mm. high, 5-6 mm. wide; phyllaries 12 to 14, united to the short scarious triangular tips, dotted in the upper fourth with tiny glands hidden in the wool; *ray florets* 10 to 15; corollas bright-yellow, turning greenish, the tube about 3 mm. long, the obovate lamina about 5 mm. long and 3 mm. wide; *disk florets* about 60; corollas yellow, about 3 mm. long; pappus of 5 mucicous scales less than 1 mm. long alternating with 5 lanceolate aristate ones, about equaling the disk corollas; achenes clavate or nearly cylindrical, 2.3-3 mm. long, sparsely pubescent. Trans-Pecos, throughout the year with favorable conditions; Tex., Coah. and N.L.

3. *Dyssodia tephroleuca* Blake. ASHY DOGWEEED. Erect perennial to 3 dm. high, lanate-tomentose, the upper stems white with dense wool; leaves alternate, linear, entire or weakly trifid at the tip, 10-15 mm. long, 0.3-0.8 mm. wide; peduncles also white-tomentose, 1-3 cm. long, bearing 0 to 3 foliaceous bracts; calyculum of 3 to 4 linear bracts about half as long as the phyllaries; involucre a campanulate cup, 5-7 mm. high, lanate; phyllaries 12 to 13, connate about three-fourths their length, the tips acutely triangular, 1.5-2 mm. long, each bract glandular in the upper half or third; *ray florets* 12 to 13; corollas golden-yellow; tube about 2 mm. long; lamina oblong-oval, 6-8 mm. long, 3-4 mm. wide, 2- or 3-denticulate at the tip; *disk florets* about 30; corollas yellow, 4.5-5 mm. long; pappus of 10 to 11 subequal squamellae about equaling the disk corollas, each scale bearing a central awn and 2 to 4 shorter lateral ones; achenes 3-4 mm. long. Very rare in grassland-brush in Starr and Zapata cos. in Rio Grande Plains, Feb.-Mar., Aug.; endemic.

4. *Dyssodia acerosa* DC. Compact much-branched erect or spreading suffruticose perennial, 10-25 cm. high; stems and leaves glabrous or minutely pubescent; leaves acerose, mostly opposite but sometimes becoming alternate, 10-18 mm. long, 0.5-2 mm. wide, bearing numerous small swollen glands; heads sessile or borne on very short peduncles; calyculum of about 5 linear-lanceolate bracts; involucre turbinate-cylindric, 5-7 mm. high, 3-4 mm. wide; phyllaries about 13, connate nearly to the tips, conspicuously dotted with glands in the upper half or third; *ray florets* 7 to 8; corollas bright lemon-yellow; tube about 2.5 mm. long; lamina elliptic, 5-6 mm. long, 2-3 mm. wide, retuse or entire; *disk florets* 18 to 25, the light-yellow corollas 3-4 mm. long; pappus of about 20 squamellae, each dissected into 3 to 5 bristles, about equaling the disk corollas; achene 3-3.5 mm. long. Arid calcareous soils w.-cen. and Trans-Pecos Tex., mostly July-Nov.; Tex., Ut. and Nev. to Hgo. and Zac.

5. *Dyssodia tagetoides* T.&G. Annual or short-lived perennial 4-9 dm. high, becoming corymbosely branched above, glabrous; leaves mostly alternate, linear, 4-9 cm. long, 2-6 mm. wide, the margins with coarse subopposite teeth, conspicuously dotted with orange glands; peduncles about 5 cm. long, bearing 4 to 6 linear more or less foliaceous bracts; calyculum conspicuous, of 5 to 8 pinnatisect bracts; involucre turbinate-cylindric, 9-12 cm. high, 5-8 mm. wide; phyllaries 10 to 12, united nearly to the apex but the margins of the outer ones free quite to the base, each with several laterally disposed glands (occasionally the inner ones glandless); *ray florets* 7 to 12; corollas bright-yellow, the tube about 3 mm. long, the linear-elliptic lamina about 13 mm. long and 5 mm. wide; *disk florets* 20 to 40; corollas brownish-yellow and about 4 mm. long; pappus of 10 to 12 unequal lanceolate

scales, 1-2.5 mm. long, each scale with 1 to 3 awns; achenes 3-3.5 mm. long. N.-cen. Tex. s. to Bexar and Fayette cos., June-Aug.; cen. Okla. s. to s.-cen. Tex.

6. *Dyssodia setifolia* (Lag.) Robins. var. *radiata* (Gray) Strother. Diffusely branched white-tomentose perennial, forming dense caespitose clumps 10-15 cm. high; leaves opposite, 6-12 mm. long, stiff, the lower ones 3 to 5 parted near the base, the upper entire, acerose, dotted with glands hidden in the dense indumentum; peduncles very slender, 3-4 cm. long, glabrous or nearly so, bearing 3 to 8 subulate bracts; calyculum of 1 to 3 short subulate bracts; involucre turbinate to narrowly campanulate, 3.5-4 mm. high, nearly glabrous; phyllaries 9 to 15, united about three-fourths their length, each with 2 or 3 swollen glands at the apex; *ray florets* 7 to 10; corollas bright-yellow, the tube about 1 mm. long, the elliptic lamina 2-3 mm. long and 0.8-1.2 mm. wide; *disk florets* 20 to 40; corollas dull-yellow and 2-2.5 mm. long; pappus a mere crown 0.3-0.5 mm. high, the squamellae united into a cup; achenes 1.5-2.2 mm. long. Rocky calcareous soils, w. Tex., mostly July-Sept.; Guadalupe Mts. in N. M. s. into Coah. and N.L.

7. *Dyssodia pentachaeta* (DC.) Robins. PARRALENA. Short-lived perennial 1-2 dm. high, glabrescent to puberulous or villous; leaves opposite, pinnately parted into 5 to 11 linear lobes, rather stiff to the touch; peduncles slender, bracteate, 2-10 cm. long; calyculum (when present) usually of 3 to 6 triangular to subulate bracts; involucre 4-6 mm. high, narrowly turbinate to broadly campanulate; phyllaries 12 to 17, united high up but the margins of the outer ones more or less free, glandular; *ray florets* mostly 8 to 13; corollas yellow to yellow-orange, the tube 1.5-2 mm. long, the lamina 2-8 mm. long and 1-3 mm. wide; *disk florets* 16 to 70; corollas dull-yellow and 2-4 mm. long; pappus of about 10 awned scales or 5 awned scales alternating with 5 muticous ones; achenes slender, 2-3 mm. long, glabrous.

Four varieties are distinguished as follows:

Var. *pentachaeta*. Leaves mostly 9- to 11-parted, all lobes about equal; peduncles 5-10 cm. long; calyculum of 3 to 5 triangular bracts; involucre turbinate, usually glabrous; phyllaries with the outer margins free half their length or less. N.-cen. Tex. w. to the Pecos River, and e. to the Rio Grande Valley and Gulf Coast, Apr.-May and Sept.-Nov.; Tex. s. to Coah., N.L., Tam. and S.L.P.

Var. *Belenidium* (DC.) Strother. Leaves with the distal lobe somewhat longer than the lateral ones; peduncles 2-5 cm. long; heads calyculate; margins of the outer phyllaries free nearly to the base, bearing 3 to 6 pairs of marginal glands; *disk florets* usually more than 50. Trans-Pecos, mostly Apr.-Aug., throughout the year with favorable conditions; Tex., s. Ut., Nev. and Calif. s. to Zac. and S.L.P.

Var. *puberula* (Rydb.) Strother. Leaves mostly 5- to 7-parted; peduncles 5-10 cm. long; calyculum absent or represented by 1 to 3 slender usually glandless bracts; involucre campanulate, puberulous; margins of the outer phyllaries free only a third their length. Cen. and Trans-Pecos Tex., summer-fall; Tex. to S.L.P. and Hgo.

Var. *Hartwegii* (Gray) Strother. Leaves with the distal lobes longer than the lateral ones; involucre nearly cylindrical, usually less than 3.5 mm. wide, glabrescent to puberulous; margins of the outer phyllaries connate almost to the tips; *disk florets* 40 or fewer. Rare in the Trans-Pecos, May and Aug.; Ariz. and N.M. s. to Ags., Zac. and S.L.P.

8. *Dyssodia tenuiloba* (DC.) Robins. Annual or short-lived perennial, erect or spreading, sometimes forming dense clumps 15-50 cm. across, 1-3 dm. high, glabrous to sparsely hirtellous; leaves mostly alternate, 1-3 cm. long, dissected into 7 to 15 linear-filiform lobes or entire (var. *Wrightii*); peduncles slender, 3-8 cm. long, bracteate; calyculum of 3 to 8 subulate-triangular glandular bracts; involucre turbinate-campanulate, 5-7 mm. high, glabrous; phyllaries 12 to 22, completely united up to the short triangular tips, scarious and glandular in the upper half or third; *ray florets* mostly 13 (10 to 21); corollas golden-yellow to yellow-orange, the tube 2-3 mm. long, the lamina 4-10 mm. long and 1.3-3 mm. wide; *disk florets* 50 to 100; corollas yellow-orange, usually darker than the rays, 2.8-4.5 mm. long, sometimes tending to zygomorphy; pappus of 5 to 12 squamellae, variously awned or erose; achene slender, 2-3.2 mm. long, glabrous.

Four varieties are distinguished as follows:

Var. *tenuiloba*. Leaves dissected into 7 to 15 linear lobes; pappus of 10 to 12 similar squamellae 2-3.4 mm. long, each bearing 3 to 5 awns. Cen. Tex. s. to the Rio Grande and e. to the Gulf Coast, Mar.-June, Sept.-Nov.; Tex. and adj. Mex.; adv. in s. Fla., Cuba and Bah. I.; Afr. and Asia.

Var. *Treculii* (Gray) Strother. Leaves as in var. *tenuiloba*; pappus of 5 oblanceolate

or truncate scales alternating with 5 longer squamellae awned from a bifid apex. *D. Treculii* (Gray) Robins. S. Tex. near the Rio Grande, Feb.-Apr. and Nov.-Dec.; Tex., Coah., N.L. and Tam.

Var. *texana* (Cory) Strother. Foliage as in var. *tenuiloba*; pappus of 5 to 10 lanceolate or truncate scales 0.7-1.2 mm. long, either all erose or 1 to 3 with a single delicate awn about equaling the squamellae proper. *D. texana* Cory. W. Tex. (Tom Green Co., etc.), Mar.-June and Oct.; additional populations in e.-cen. Coah. and adj. N.L.

Var. *Wrightii* (Gray) Strother. Leaves mostly spatulate, entire, sometimes with a few lateral lobes; pappus of 10 to 12 squamellae, about 3 mm. long including the 3 to 5 awns, *D. Wrightii* (Gray) Robins. Confined to sandy soils of the Coastal Plain, mostly Feb.-June; endemic.

9. *Dyssodia aurea* (Gray) A. Nels. Erect or spreading annual 1-2 dm. high, diffusely branched from the base; leaves alternate, 15-40 mm. long, pinnately parted into 5 to 13 linear lobes 5-12 mm. long, glabrous, conspicuously gland-dotted; peduncles 1-3 cm. long, 1- to 5-bracteate; calyculum absent or represented by but 1 or 2 short subulate bracts; involucre turbinate to campanulate, 5-6 mm. high; phyllaries 12 to 15, connate about two-thirds to three-fourths their length, margins of the outer ones free nearly to the base, the scarious tips in both series deltoid to attenuate, glandular; ray florets 8 to 12; corollas bright-yellow, the tube about 1.5 mm. long, the ovate lamina 4-6 mm. long and 2-3 mm. wide; disk florets 30 to 45; corollas yellow and about 3 mm. long; pappus of 8 to 10 muticous scales 0.3-0.6 mm. long (var. *aurea*) or of about 20 squamellae each dissected into 3 to 5 awns or bristles [var. *polychaeta* (Gray) M. C. Johnst.]. The two varieties are both found in the Trans-Pecos, frequently in the same populations; var. *aurea* flowers in July-Aug. and extends n. through N.M. into Colo. and Kan.; var. *polychaeta* flowers Aug.-Oct. and extends s. through Chih. into Dgo.

100. CHRYSACTINIA GRAY

A genus of about 4 species, mostly Mexican.

1. *Chrysactinia mexicana* Gray. DAMIANITA. Low spreading taprooted shrub (1-) 2-3 (-4) dm. tall, aromatic, nearly glabrous or minutely hispidulous, densely leafy except for the nearly naked ascending peduncles 3-8 cm. long; first pair of leaves of each branchlet of the season opposite, all the rest alternate, somewhat fleshy, linear, about 1 cm. long, very crowded and dark-green, with oil glands visible under a lens; heads solitary on the peduncles, usually numerous on the shrub, showy; involucre hemispheric, about 4-5 mm. high; phyllaries about 12 in a single series, linear, round-keeled dorsally, green, with oil glands; receptacle convex, naked, pitted; ray flowers usually 12, pistillate, fertile; rays oblong or linear, bright-yellow, 3-toothed terminally; disk flowers about 20 to 25, perfect, fertile, the yellow corollas 5-toothed; achenes narrowly columnar or very slightly fusiform-columnar, 3-4 mm. long, blackish, striate, hispidulous; pappus persistent, of a number of stiffish unequal buffy-white bristles. Local on limestone, Edwards Plateau and Trans-Pecos, Apr.-Sept.; N.M., Tex., Coah., N.L., Tam., Chih. and reputedly also s. to Ver. and Mex. State.

101. NICOLLETIA GRAY

A genus of 3 species of desert herbs; 2 in the California-Baja California area.

1. *Nicolletia Edwardsii* Gray. Annual from slender taproots, 1-3 dm. tall, rather freely bushy-branched, essentially glabrous, strongly aromatic; lowermost leaves opposite but most of them alternate, mostly 2-6 cm. long, deeply pinnately dissected into linear-filiform axis and lobes, beset with reddish oil glands; peduncles 1-3 cm. long; heads numerous; involucre occasionally calyculate with deltoid bracts about 1 mm. long at the extreme base equal, erect, 8 in a double row (4 in, 4 out), green, thin, with a few elongate oil glands; involucre slenderly conical, 11-14 mm. high, 5-9 mm. thick, occasionally calyculate with deltoid bracts about 1 mm. long at the extreme base outside; phyllaries free, oblanceolate, equal, erect, 8 in a double row of 4 each, green, thin, with a few elongate oil glands; receptacle slightly convex, naked; ray flowers about 8, pistillate, fertile; ray pink or lavender-pink or nearly white with red-purple nerves, 8-16 mm. long, 3-toothed terminally; disk flowers about 25 or 30, perfect, fertile, the yellowish corolla 5-toothed; achenes

gently tapered to the base, 5-7 mm. long, antrorsely hispidulous, blackish; pappus double, the internal pappus of 5 lanceolate awn-tipped scales, the external pappus of 5 groups of numerous bristles (these 5 groups alternate with the inner scales and interpretable as 5 deeply dissected units). Rare in Trans-Pecos deserts, late summer-fall; Tex., Coah., Chih., Dgo. and Zac.

The odor, often described by collectors as unpleasant, is like that of *Porophyllum scoparium*.

102. PECTIS L.

Herbs usually not more than 2 dm. tall, branching at least in the upper part and sometimes from the base, with strong-scented (occasionally disagreeable) essential oils mostly residing in reddish oil glands; leaves opposite (at least most of them), gland-dotted, mostly entire, usually with several pairs of marginal bristles near the base or in the lower half; heads usually solitary on nearly naked peduncles but these sometimes so numerous the heads seem crowded, occasionally the heads in rounded subcorymbose aggregations; involucre cylindric to turbinata; phyllaries 3 to 12, free from each other, uniseriate, subequal or equal (calyculate outer phyllaries absent), usually gland-dotted, rounded-carinate at least near the base; receptacle essentially flat, naked; ray flowers few, pistillate, fertile, the yellow rays usually of the same number as the phyllaries; disk flowers few, perfect, fertile, the corollas yellow; style hispidulous, the short branches obtuse, exappendiculate; achenes linear, terete or somewhat angled, pubescent or glabrate; pappus various, of few or many scales, awns or bristles or a mere scaly crown with or without bristles.

An American genus of perhaps 100 species, much in need of a comprehensive revision.

1. Pappus of well-developed scales (2)
 1. Pappus (at least in the ray flowers) at least in part of bristles or slender awns or rarely a mere scaly crown (3)
 - 2(1). Phyllaries 5 1. *P. prostrata*.
 2. Phyllaries 3 2. *P. cylindrica*.
 - 3(1). Pappus bristles at least in the disk flowers 10 or more (4)
 3. Pappus bristles 0 to 6 usually (5)
 - 4(3). Perennial with a caudex or rootstock 3. *P. longipes*.
 4. Taprooted annual 4. *P. papposa*.
 - 5(3). Phyllaries 3 to 5 7. *P. filipes*.
 5. Phyllaries about 8 (6)
 - 6(5). Pappus merely of 2 to 6 bristles without a scaly crown 6. *P. tenella*.
 6. Pappus of a shallow scaly crown with or without 1 or 2 bristles (7)
 - 7(6). Leaves not dilated, merely ciliate basally 4. *P. papposa*.
 7. Leaves dilated and lobed basally 5. *P. angustifolia*.

1. *Pectis prostrata* Cav. Depressed taprooted annual, branched from the base and the branches spreading, 4-20 cm. long; leaves oblance-linear, entire, 1-3 cm. long, 2-4.5 mm. broad, acute, often mucronate, ciliate with 5 to 9 pairs of bristles below; peduncles 0-5 mm. long; involucre oblong, 5-6 mm. high, 2.5-3 mm. thick; phyllaries 5, oblong or linear-oblong, rounded or truncate apically; rays 5; achenes 3-4 mm. long; pappus of the ray flowers of 2 narrowly lanceolate scales and 1 to 3 bristles. Frequent in Trans-Pecos deserts, usually in arroyos and washes, summer-fall; widespread in warmer drier parts of Am. n. to N.M. and Ariz.

2. *Pectis cylindrica* (Fern.) Rydb. Very similar to *P. prostrata* but phyllaries only 3 in number. *P. prostrata* var. *cylindrica* Fern. Known from one station in Starr Co., in extreme s. Tex., probably not a persistent member of our flora, fall; also N.M., Ariz. and Son.

3. *Pectis longipes* Gray. Perennial with cespitose slender caudexes; stems densely leafy below, 1-2 dm. tall, glabrous, ascending; leaves linear, mucronate, thickish, 2-4 cm. long, 1.5-3 mm. broad, with 2 or 3 pairs of bristles near the base; heads solitary at the ends of

the branches or in the upper axils; peduncles 6-14 cm. long, slender; involucre 6-8 mm. high, 8-10 mm. broad; phyllaries 12 to 15, linear, flat above, keeled below, acute, each with a large apical oil gland; rays 12 to 15; disk flowers 40 to 75; achenes 4-5 mm. long; pappus bristles of the disk flowers 20 to 40, very unequal, capillary, the longest 4-6 mm. long; pappus bristles of the ray flowers 2, slender, 3-5 mm. long, rarely with a few additional shorter ones. Infrequent in the Trans-Pecos, summer-fall; Tex., N.M. and Ariz., s. to Son., Dgo. and Chih.

4. *Pectis papposa* Gray. Slender taprooted annual; stems pseudodichotomous with spreading branches, 1-3 dm. tall; leaves slightly fleshy, filiform, 1-6 cm. long, 1-2 mm. broad, with 2 to 5 pairs of bristles near the base; heads in leafy cymose aggregations; peduncles 1-3 cm. long; involucre turbinate, 4-6 mm. high, 3-5 mm. thick; phyllaries 7 to 9, narrowly linear, strongly involute, strongly round-keeled and basally gibbous, obtuse, with 3 to 7 conspicuous glands; rays 7 to 9; disk flowers 10 to 15; achenes 4-5 mm. long; pappus of the disk flowers of 12 to 20 short-plumose bristles about 4 mm. long or rarely reduced to a crown; pappus of the ray flowers a short oblique crown of united scales, 1 or 2 of which are rarely produced into awns. Infrequent in Trans-Pecos desert washes, summer-fall; Tex., N.M., w. to Calif., Baja Calif. and Son.

5. *Pectis angustifolia* Torr. Annual, diffusely and pseudodichotomously branched, 1-2 dm. tall, essentially glabrous; leaves 1-4 cm. long, 1-2 mm. broad, slightly fleshy, with more or less dilated scarious-margined bases which are lobed into 3 to 5 pairs of lanceolate or subulate bristle-tipped lobes; heads in bundles at the ends of the branches; involucre turbinate, 4-5 mm. high, almost as broad; phyllaries 8 to 10, narrowly linear, strongly involute and round-ribbed, gibbous basally, each with a conspicuous apical gland; rays 8 to 10; disk flowers 10 to 15; achenes 4 mm. long; pappus of a crown of 4 or 5 short scales or rarely with 1 or 2 additional short awns in the ray flowers. *P. texana* Cory. Locally abundant in calcareous dry uplands, Edwards Plateau, s. part of Plains Country and Trans-Pecos, summer-fall; Neb., Colo. and Ariz. s. and s.e. to S.L.P.

6. *Pectis tenella* DC. LIMONCILLO. Low annual; stem usually less than 1 dm. tall, pseudodichotomously branched near the base, with ascending or spreading branches; leaves 1-4 cm. long, 1-2 mm. broad, linear, broadened at the base, pectinately divided (especially the lower) into 1 to 4 narrow lobes ending in bristles; heads in bundles, sessile or short-pedunculate; peduncles rarely as much as 5 mm. long; involucre turbinate, 4-5 mm. high, 3-4 mm. thick; phyllaries 7 to 9, linear, prominently round-keeled, strongly involute, basally gibbous, each with a single conspicuous apical gland and sometimes 1 or 2 below; rays 7 to 9; disk flowers 10 to 15; achenes about 3 mm. long; pappus of 2 to 6 unequal minutely scabrous awns. Locally abundant in Rio Grande Plains, spring-fall; Tex., Chih., Coah., N.L. and Tam.

7. *Pectis filipes* Gray. Slender taprooted annual; stems 1-5 dm. tall, diffusely branched, glabrous or scabrous; leaves glabrous or slightly scabrous, 3-6 cm. long, 1-3 mm. broad, with 1 to 5 pairs of basal bristles; heads in leafy cymose arrangements; peduncles 2-8 cm. long; involucre turbinate, 4-6 mm. high, 3-5 mm. broad; phyllaries oblanceolate, obtuse, slightly keeled below, often glandless; rays 5 or 6; disk flowers about 5; achenes 4-5 mm. long; pappus of 1 to 4 awns 2.5-4 mm. long with sometimes a few blunt squamellae at their base. Local in the Trans-Pecos, summer-fall; Tex., N.M., Ariz., Son. and Chih.

103. POROPHYLLUM GUETT.²²²

Aromatic annual or perennial herbs, subshrubs or shrubs, glabrous, often glaucous; leaves alternate, opposite or both, simple; blades from broad and sinuate with slender petioles to filiform, entire and sessile, with translucent oil glands along the margins or sometimes also scattered on the surfaces, occasionally absent; heads discoid, solitary or 2 to several at the ends of branches; involucre cylindrical or campanulate, uniseriate; phyllaries 5 to 9, linear or oblong to ovate or obovate, free or connate only at the base with linear to oblong dorsal translucent oil glands in 2 rows; receptacle small, naked; flowers perfect, fertile; corollas whitish, purplish or yellow, actinomorphic to slightly bilabiate, throat funnelliform and several times shorter than the slender tube to cylindrical and longer than the tube;

²²² Contributed by R. Roy Johnson.

anthers rounded to obscurely sagittate at the base, acute at the apex; style branches elongated, subulate, hirtellous; pappus of numerous free bristles, hispidulous or scabrescent; achenes slender, linear to long-triangular, striate, often tapering at the apex, puberulent, usually hispidulous.

An American genus of approximately 30 species occurring from southern Nevada to central South America; of little economic value but some eaten green in Mexico, used for medicinal purposes by natives of several countries and others (such as *P. gracile* and *P. Greggii*) browsed by cattle and wildlife.

1. Annual; leaves petiolate, thin, elliptical or oblong to ovate or obovate, occasionally widely lanceolate or oblanceolate 4. *P. ruderale* subsp.
macrocephalum.
1. Perennials; leaves sessile or subsessile, filiform to lanceolate; shrubs or subshrubs (2)
- 2(1). Phyllaries 7 to 9; erect shrub or subshrub; corolla yellow
..... 1. *P. scoparium*.
2. Phyllaries 5; plant or corolla otherwise (3)
- 3(2). Plant flexuous, weak; corolla yellow 2. *P. Greggii*.
3. Shrub or subshrub; corolla white to purplish 3. *P. gracile*.

1. *Porophyllum scoparium* Gray. Perennial, suffruticose, odoriferous, glabrous; stems much-branched, 2-6 dm. high or more, erect, green, becoming brownish with age, terete, scarcely striate; leaves sessile, opposite in seedlings, mostly alternate in mature plants, sessile, filiform, somewhat fleshy, to 4 cm. long, with numerous small dark glands, apex acute to acuminate; heads solitary at the ends of branches; peduncles 1-2 cm. long or shorter, greatly enlarged at base of involucre; phyllaries 7 to 9, green to yellowish, 6-9.3 mm. long, 1.5-2.3 mm. wide, linear to oblanceolate, usually with 2 rows of long linear glands on the rounded back, apices acute; flowers more than 45; corolla 5.3-8 mm. long, yellow, the tube shorter than the cylindrical throat; pappus 5.4-7.5 mm. long, yellowish, bristles hispidulous; achenes 3.7-5.5 mm. long, hispidulous. Locally abundant in desert arroyos and on limestone slopes, often forming almost pure stands, in the Trans-Pecos from El Paso and Culberson cos., s. through Brewster and Val Verde cos., throughout year, depending on rain and temperature; Tex., N.M., Chih., Coah. and N.L.

2. *Porophyllum Greggii* Gray. Perennial glabrous herb; stems green, 15-30 cm. high, flexuous, weak, semi-erect, terete, striate; leaves alternate, sessile, to 6 cm. long, filiform with many small glands; heads solitary at the ends of branches; peduncles 2-4 cm. long; phyllaries 5, pale-green, scarious-margined, 8.9-12 mm. long, 3.4-5.5 mm. wide, elliptical to obovate-oblong, with 2 rows of linear or oblong yellowish glands, apex rounded; flowers more than 50; corolla yellow, 7.6-9.8 mm. long, the tube slightly shorter than the cylindrical throat; pappus 8-9 mm. long, straw-colored, bristles hispidulous; achenes 6.8-8 mm. long, densely puberulous with tawny hairs. Rare in mts. and desert grasslands in (?) Trans-Pecos, May-Oct.; endemic.

3. *Porophyllum gracile* Benth. Perennial, suffruticose, glabrous, often glaucous; stems little- to much-branched, 2-6 dm. high, suberect to erect, green to purplish, becoming brownish to purplish with age, terete, striate; leaves opposite in seedlings, mostly alternate in mature plants, sessile, filiform to linear, to 5 mm. wide, apex acute to obtuse; heads solitary at the ends of branches; peduncles 4-25 mm. long, moderately enlarged at base of involucre; phyllaries 5, green to purple, 9.3-14.6 mm. long, 1.4-3.5 mm. wide, linear to oblong, apex obtuse or seldom acute, rounded on the back with round to linear glands in 2 rows or rarely scattered; flowers 12 to 30, rarely as few as 5; corolla 6-9.1 mm. long, white to pale-purple with dark-purple streaks, the tube shorter to longer than the funnel-form throat; pappus 5.3-8.6 mm. long, white to purplish, bristles hispidulous; achenes 5.7-10.3 mm. long, hispidulous. Rare in desert grassland, Franklin Mts., El Paso Co. in the Trans-Pecos, throughout year, depending on rain and temperature; s. Nev. and s. Calif., s. through Baja Calif., Son. and Tex.

4. *Porophyllum ruderale* (Jacq.) Cass. subsp. *macrocephalum* (DC.) R. R. Johnson. Annual, erect, glabrous, somewhat glaucous; stems branching above, 1.5-10 dm. high, green to purplish, terete, striate; leaves opposite or alternate; blades 1-3.5 cm. long, to 25 mm. wide, thin, broadly ovate to obovate, rarely widely lanceolate or oblanceolate,

sinuate with one gland in each sinus and one at the apex, surfaces of the blades with or without glands, apex rounded, base usually rounded or sometimes attenuate; petioles 0.5-2 cm. long; heads solitary at the ends of branches; peduncles erect, clavate, 15-64 mm. long; phyllaries 5, green, purple-tinged, 17-23 mm. long, 2.5-3.7 mm. wide, linear with 2 rows of linear glands, apex obtuse or acute to rarely acuminate; flowers 30 or more; corolla 9.2-12.4 mm. long, puberulent, purple to olive-green, the slender tube several times longer than the funnellform throat; pappus 6.7-9.7 mm. long, straw-colored to brown, bristles scabrescent; achenes 9.5-12.4 mm. long, hispidulous. Rare in higher parts of Chisos Mts. in the Trans-Pecos, Aug.-Oct.; s. Ariz., N.M. and Tex. s. to cen. S. A.

104. TAGETES L. MARIGOLD

A large genus of the Mexican and Central American highlands, with a few species in the Andes.

1. *Tagetes micrantha* Cav. LICORICE-MARIGOLD. Delicate taprooted aromatic annual, usually only 1-2 dm. tall; leaves opposite, mostly linear to linear-filiform and 1-3 cm. long, beset with numerous microscopic oil glands; heads terminal on the leafy branches, not peduncled; involucre fluted, cylindric, 9-11 mm. long, about 1.5 mm. broad, of 5 linear phyllaries united marginally for essentially their full length and beset with microscopic oil glands; receptacle essentially flat, quite naked; flowers usually 7; *ray flowers* solitary, pistillate, fertile; ray barely protruding from the involucre, yellowish-white, oblong, 2- or 3-toothed apically; *disk flowers* usually 6, perfect, fertile, with included yellowish-white 5-toothed corolla; achene elongate-linear, about 7 mm. long, black, fine-striate or costellate, slightly flattened; pappus of 2 awns over the shoulders of the achene and on each broader side between the awns a scale, one shorter than the other, all persistent. Local in high moist canyons, Davis and Chisos mts. in the Trans-Pecos, late summer; Ariz., N.M. and Tex., s. to Qro.

105. CLAPPIA GRAY

A monotypic genus.

1. *Clappia suaedaefolia* Gray. Subshrub from taproots, only slightly woody below, much-branched, the upper third or fourth of the height being nearly naked fistulose peduncles; leaves opposite on the lowest part of the stem but mostly alternate, crowded, confined to the lower two-thirds or three-fourths of the plant, fleshy and almost terete, linear, rarely with a lateral lobe or trifid in the distal half, often having lines of black (glandular?) dots visible under a lens, grayish-green when fresh; heads solitary, on the ends of the enlarged peduncles; involucre hemispheric, about 8-10 mm. high; phyllaries in about 4 or 5 series, strongly graduated, linear-oblong, definitely rounded apically, rather firm-membranous with an exceedingly narrow scarious margin, often with parallel dark or subglandular longitudinal striae; receptacle convex, decidedly fimbriate-setose around the sockets but not chaffy; *ray flowers* about 12, pistillate, fertile; rays yellow, linear, terminally 2- or 3-toothed; *disk flowers* numerous, perfect, fertile, the corolla yellow and 5-toothed; style-branches hispidulous, with ovate tips; achenes about 3.5 mm. long, columnar or slightly tapered to the base, black, about 10-ribbed, the ribs hispidulous; pappus of 15 to 25 unequal coarse stiff slightly tawny dorsiventrally flattened persistent bristles about as long as the achene. Locally abundant in subsaline poorly drained clay flats, Rio Grande Plains, spring-fall, less commonly summer and winter; also N. L. and Tam.

106. PSEUDOCLAPPIA RYDB.

The genus, closely related to and probably congeneric with *Clappia*, is monotypic.

1. *Pseudoclappia arenaria* Rydb. Weak shrub or strong subshrub from woody taproots, the branches very numerous, the whole plant usually 2-4 dm. tall; leaves opposite at the very lowest nodes of the branches but mostly alternate, crowded, fleshy, nearly

terete, 1-2 cm. long, essentially glabrous; leaves on the upper 2-3 cm. reduced to setaceous bracts on the slightly swollen pedunculiform branch endings; heads solitary on the erect peduncles; involucre broadly obconic, 8-10 mm. high; phyllaries linear or slightly oblanceolate, slightly fleshy, appressed, in about 3 crude series of diverse lengths but not well-organized, glabrous; receptacle convex, not chaffy but bristly around the sockets; *ray flowers* few, 2 to 4 per head, pistillate, fertile; rays linear, 5-9 mm. long, dirty-yellow, terminally 2- or 3-toothed; *disk flowers* 20 to 30, perfect, fertile, the corollas dirty-yellow and 5-toothed; achenes about 3 mm. long, slightly tapering to the base, dark-brown to black, irregularly 10-ribbed with less prominent intermediate ribs, some of the larger ribs antrorsely hispid; pappus persistent, of numerous unequal dorsiventrally flattened stramineous bristles mostly much longer than the achene. Restricted to gypseous deserts near Pecos, Reeves Co. in the Trans-Pecos, summer-fall, following rains; also N.M.

107. SARTWELLIA GRAY

A genus of 2 species of Mexico, Texas and New Mexico; one occurs in the United States.

1. *Sartwellia Flaveriae* Gray. Taprooted herb, apparently perennial but flowering first year, essentially glabrous or slightly puberulent, 1-3 dm. tall, with several ascending stems from the base and these subsimple except in the uppermost parts; leaves opposite, essentially sessile, linear to linear-filiform, (1-) 2-6 cm. long, 1-2 mm. broad; heads in dense subcorymbiform aggregations at the top, about 3 mm. high; involucre campanulate-cylindric, about 2 mm. high and wide; phyllaries about 5, subequal, oval or elliptic, often yellowish; receptacle flat, naked; *ray flowers* 3 to 5, pistillate, fertile; rays ovate, about 1.5 mm. long, yellow; *disk flowers* 6 to 15, perfect, fertile; corollas 2-2.5 mm. long, yellow, 5-toothed terminally; achenes columnar, black, 10-ribbed, about 2 mm. long; pappus stramineous, of 5 erose broad scales and 5 narrow bristlelike ones about as long as the broad ones or a little longer, all 10 united for a third to five-sixths the length (when united high up, appearing as a mere cup). *S. puberula* Rydb. Infrequent in gypseous-saline deserts in the Trans-Pecos and w. extreme of Edwards Plateau, late summer-fall; Coah., Tex. and N.M.

108. FLAVERIA Juss.

Glabrous or puberulent herbs, usually annual; leaves opposite, narrow, entire to dentate, sessile, often more or less connate; heads numerous, sessile or short-pedunculate, in dense glomerules or cymelike clusters; involucre usually narrowly campanulate to nearly cylindric; phyllaries 1 to 8 subequal and often 1 or 2 smaller outer ones; receptacle small, naked or setose; *ray flowers* solitary, pistillate and fertile or absent; rays entire, emarginate or 3-dentate terminally, yellow, inconspicuous; *disk flowers* 1 to 15, perfect, fertile; corolla yellow, 5-toothed terminally; style 2-parted, reflexed, obtuse; achenes oblong, somewhat compressed, 10-ribbed; pappus absent or in *F. chloraefolia* present and of 2 to 4 distinct irregular scales.

A genus of about 20 species in the warmer parts of America, with no known economic importance.

- 1. Pappus of 2 to 4 scales; leaves connate-perfoliate, broad; throat of the disk corollas elongate, funnellform4. *F. chloraefolia*.
- 1. Pappus absent; leaves barely connate (2)
- 2(1). Receptacle setose; phyllaries 1 or 2; heads 1-flowered; throat of the disk corollas campanulate1. *F. trinervia*.
- 2. Receptacle naked; phyllaries more than 2; flowers 2 to 20 per head; throat of disk corollas funnellform (3)
- 3(2). Phyllaries 3, rarely 42. *F. campestris*.
- 3. Phyllaries 5 to 73. *F. oppositifolia*.

1. *Flaveria trinervia* (Spreng.) Mohr. Taprooted annual 1-5 (-12) dm. tall, glabrate, widely branched; leaves slightly connate, lanceolate, 3-nerved, serrate, 3-9 cm. long, the

lower short-petioled; heads so closely crowded that each aggregation of them appears like a single head 20-25 mm. broad and each such aggregation closely subtended by 3 pairs of leaves simulating phyllaries; heads small, usually 1-flowered; flowers either subligulate and pistillate or regular and perfect; phyllaries concave, 1 or 2 (if 2, the outer shorter); receptacle setose; achene about 2 mm. long; pappus absent. Infrequent in low waste places in the Trans-Pecos, late summer-fall; S.A. n. to s. U.S.

2. *Flaveria campestris* J. R. Johnst. Taprooted annual, the erect stems glabrous or pubescent only at the nodes; leaves linear or linear-lanceolate, serrulate, 3-ribbed, narrowed basally, slightly connate, 25-70 mm. long, 10-25 mm. broad; heads 4- or 5-flowered; phyllaries 3, nearly equal, 5 mm. long, the outer shorter ones 2 and unequal, 1-3 mm. long, linear-lanceolate; receptacle naked; ray oval, reflexed, 2.5 mm. long; disk flowers 3 or 4; corollas 3 mm. long; achene 2.5-3 mm. long, that of the ray slightly larger than the rest; pappus absent. Frequent in low waste ground or disturbed ground, Plains Country, late summer-fall; Mo. to Colo., N.M. and Tex.

3. *Flaveria oppositifolia* (DC.) Rydb. Taprooted annual 3-10 dm. tall, simple below; leaves glabrous, broadest at the sessile base, nearly linear, entire or rarely spinulose-denticulate; heads of 10 to 15 flowers in ample rather open cymose clusters; phyllaries 5 to 7, oblong, 4 mm. long; receptacle naked; ray flower absent; disk corolla 3 mm. long, glabrous; achenes 1.5 mm. long; pappus absent. Locally abundant in poorly drained coastal areas, Rio Grande Plains and s. part of s.e. Tex., late summer-fall; Tex., Tam., N.L., Coah., Ver. and perhaps elsewhere in Mex.

4. *Flaveria chloraefolia* Gray. Herb to 2 m. tall, the herbage glaucous; leaves ovate-oblong to lanceolate, 25-100 mm. long, 10-35 mm. broad, glabrous, connate-perfoliate; heads in open cymose clusters, 11- to 13-flowered; phyllaries 5, oblong, 6-7 mm. long, the outer calyculate ones 2, lanceolate; receptacle naked; ray flower absent; disk corolla 6 mm. long, glabrous; achenes 3 mm. long; pappus of 2 to 4 hyaline unequal incurved scales, the larger about 0.5 mm. long. Infrequent to rare in mud along creeks in calcareous areas in the Trans-Pecos, rare to w. part of Edwards Plateau, late summer-fall; Tex. to Dgo. and N.L.

109. PERICOME GRAY

A monotypic genus.

1. *Pericome caudata* Gray. Rather tall widely branching perennial herb, strong-scented, minutely puberulent; leaves opposite, long-petioled, green, membranous, minutely somewhat resin-dotted; blades triangular-hastate, 5-15 cm. long, marginally sparingly crenate-dentate or entire, caudately long-acuminate as also to a lesser degree are the basal angles; heads numerous in roughly corymbiform aggregations, each about 1 cm. high; involucre hemispheric, about 5-6 mm. high; phyllaries in a single series, linear, 16 to 20 in number, each with a rounded keel (which is actually composed of 3 very close nerves) and scarious margins; receptacle flat, naked; *ray flowers* absent; *disk flowers* numerous, perfect, fertile; corolla yellow, the 5-lobed limb abruptly much wider than the short glandular tube; achenes flattened, black, about 5 mm. long, shiny, nearly linear or gradually tapered below, the 2 sharp thin edges with a conspicuous antrorse whitish ciliate fringe; pappus of a few fimbriate scales. Infrequent in moist canyons of the higher Trans-Pecos mts., late Aug.-Oct.; Colo., N.M., Ariz., Tex., Nev. and Chih.

110. PERITYLE BENTH.²²³

ROCK DAISY

Annuals or herbaceous to suffruticose perennials from fleshy or woody bases, most species growing from crevices in bare rock exposures; leaves opposite or alternate, glabrous to tomentose-canescens, notably viscid and bitter-tasting, widely variable in shape and size, from finely dissected to merely lobed, serrate or entire; heads solitary to densely aggregated and cymose; peduncles short so that heads are partially obscured by leaves or long and heads borne well-above leaves; involucre subcylindric, narrowly to broadly campanulate or hemispheric; phyllaries of 2 equal or subequal series, the inner ones

²²³ Contributed by A. Michael Powell.

somewhat membranous or with broader scarious margins than the outer; receptacles slightly convex but typically flattened and alveolate; *rays* when present white or yellow, pistillate and fertile; *disk flowers* 4-lobed, white or yellow, infrequently purple-tinged; achenes black, the peripheral ones typically partially clasped by the phyllaries and incurved, oblong to narrowly obconical, typically distinctly laterally flattened with conspicuous or inconspicuous callous margins, the margins glabrous, minutely pubescent or densely ciliate, in some species rounded or angled on one or both surfaces, the surfaces glabrous to minutely pubescent; pappus absent or of 1, 2 or numerous bristles, or of a conspicuous to inconspicuous crown of laciniate hyaline squamellae with (rarely zero or) 1 to 2 naked or short-ciliate bristles. *Closia* Remy; *Laphamia* Gray; *Monothrix* Torr.; *Galinsogeopsis* Sch. Bip.; *Nesothamnus* Rydb.; *Leptopharynx* Rydb.; *Pappothrix* Rydb.

At least 25 species, native to southwestern United States and Mexico.

1. Pappus of a crown of laciniate hyaline squamellae and 1 or 2 (rarely no) bristles; achene margins densely ciliate (2)
1. Pappus absent, a callous crown or 1, 2 or numerous (10 to 30) bristles; achene margins glabrous or merely short-pubescent (6)
- 2(1). Rays yellow (3)
2. Rays white or absent (4)
- 3(2). Leaves palmately divided into 3 lobes or subcruciform 1. *P. Vaseyi*.
3. Leaves not deeply 3-lobed, cordate to subreniform 2. *P. Parryi*.
- 4(2). Rays white; disks yellow; pappus of 2 delicate bristles 0.7-1 mm. long; achenes 1.5-2 mm. long 5. *P. microglossa*.
4. Rays absent or both rays and disks white; pappus of 1 to 12 bristles 3.5-5.5 mm. long; achenes 2.5-3.2 mm. long (5)
- 5(4). Rays absent; disks yellow; pappus bristles 1 (rarely 2) 4. *P. aglossa*.
5. Rays and disks white; pappus bristles (1 to) 8 to 12 ... 3. *P. Parryi* (hybrid)
- 6(1). Pappus bristles 1 or 2 or none (7)
6. Pappus bristles 10 to 30 (14)
- 7(6). Leaves extremely dissected 6. *P. dissecta*.
7. Leaves otherwise (8)
- 8(7). Inflorescence of loose or dense corymbs; plants (8-) 15-45 (-60) cm. high (9)
8. Inflorescence of solitary heads or small clusters; plants 2 10 (-12) cm. high (11)
- 9(8). Heads radiate; rays and disks yellow (10)
9. Heads discoid; disks yellow 8. *P. angustifolia*.
- 10(9). Pappus of a single bristle 7a. *P. Lindheimeri* var. *Lindheimeri*.
10. Pappus absent 7b. *P. Lindheimeri* var. *halimifolia*.
- 11(8). Pappus absent 9. *P. Warnockii*.
11. Pappus of 2 bristles (12)
- 12(11). Plants 2-7 cm. high; leaves opposite below, rarely alternate above, essentially glabrous, the margins entire, subsessile to short-petiolate (1-2 mm. long) 10a. *P. bisetosa* var. *bisetosa*.
12. Plants 4-12 cm. high; leaves opposite below, alternate above or distinctly alternate, scabrous-hispidulous or glabrous, the margins serrate or serrate-sinuate; petioles 20-70 mm. long (13)
- 13(12). Leaves opposite below, alternate above, ovate to suborbicular, serrate, scabrous-hispidulous; petioles 2-4 mm. long 10b. *P. bisetosa* var. *scalaris*.
13. Leaves distinctly alternate, ovate, serrate or serrate-sinuate, glabrous; petioles 3-7 mm. long 10c. *P. bisetosa* var. *appressa*.

- 14(6). Disk florets 5 (rarely 6 or 7); disk corollas yellow . . 11. *P. quinqueflora*.
 14. Disk florets more than 5 (8 to 16); disk corollas white or yellow (15)
 15(14). Pubescence tomentose-canescens; disk corollas white12. *P. cinerea*.
 15. Pubescence otherwise; disk corollas yellow or white (16)
 16(15). Pappus reduced to 2 to 6 main bristles, rarely with 10 to 12 vestigial ones;
 leaves strongly veined; plants 3-10 cm. high; disk corollas white13. *P. vitreomontana*.
 16. Pappus always of 25 to 30 unequal bristles; leaves not so strongly veined; plants
 6-20 cm. high; disk corollas yellow or white (17)
 17(16). Disk corollas yellow14a. *P. rupestris* var.
rupestris.
 17. Disk corollas white14b. *P. rupestris* var.
albiflora.

1. Perityle Vaseyi Coult. Large herbaceous to suffruticose perennial with fleshy tap-roots; stems erect to somewhat spreading; leaves opposite or alternate, 25-65 mm. long, 2-5 cm. wide, typically palmately divided into 3 lobes or subcruciform, with the lobes further dissected, cleft or parted, less often the leaves are strongly 3-lobed, cleft or parted; petioles 14-35 mm. long; inflorescence of solitary heads or small subcymose clusters; heads borne on long peduncles 1-7 (-13) cm. long, radiate, campanulate (broadly so) or hemispheric, 8-15 mm. high; phyllaries numerous, oblanceolate to linear-lanceolate, typically acute at the apex, rarely somewhat attenuated; ray flowers numerous (about 20), the rays yellow; disk flowers numerous (about 200); disk corollas yellow, 3.2-5 (-6) mm. long; achenes 3.2-3.7 (-4.3) mm. long, 0.5-1 mm. wide, linear-elliptic to obconical-elliptic, tapering to the base, rounded at the apex, with thin to conspicuous callous margins, the margins short-pubescent to dense-pilose, 0.1-0.9 mm. long; pappus of a crown of squamellae 0.2-0.9 mm. long and 1 (rarely 0 or 2) bristle, (1.2-1.8) 2.8-3 (-5) mm. long, the cilia flaring toward the tip or becoming lateral or retrorse in some. *Leptopharynx trisecta* Rydb. Common in soil, s. Brewster, Presidio and Terrell cos., spring-fall; also Chih. and Coah.

Notable for tremendous variation in leaf shape and pappus bristle structure throughout its range. Possibly intergrades or hybridizes with *P. Parryi*.

2. Perityle Parryi Gray. Low suffruticose perennial from a woody base in crevices of rocks or tall spreading semiherbaceous to suffruticose perennial in soil; leaves opposite or alternate, 30-95 mm. long, 2-6 cm. wide, cordate to subreniform, the margins irregularly lobed, dentate or lacinate but typically shallowly to deeply 3-lobed; petioles 18-40 mm. long; heads same as or slightly smaller than in *P. Vaseyi*; other floral features about the same as *P. Vaseyi* except achenes are slightly smaller (2.5-3.8 mm. long). *Laphamia Parryi* (Gray) Hemsl., *Leptopharynx Parryi* (Gray) Rydb. Common in crevices of limestone and igneous bluffs and rocks, or soil, Brewster Co. and s.w. Presidio Co., spring-fall; also Chih. and Coah.

Notable for variation in leaf shape, approaching the degree of lobing characteristic of *P. Vaseyi*, and possibly intergrading or hybridizing with the latter taxon.

3. Perityle Parryi (hybrid). Low perennial from a woody base; leaves opposite or alternate, ovate-deltoid, shallowly 3-lobed or lacinate-dentate; heads radiate, campanulate, 7-10 mm. high, 4-8 mm. wide, on short peduncles; ligules white; disk corollas cream-white, 4.5-5.5 mm. long; achenes 3-3.2 (-3.8) mm. long, about 0.7 mm. wide, narrowly obconical with thin callous margins, the margins not strongly ciliate but merely short-pubescent to sparsely short-pilose; pappus of 1 or numerous (8 to 12) bristles of unequal length, 3.5-4 mm. long, if one main bristle then numerous vestigial bristles resembling hyaline squamellae or actual squamellae present, or squamellae may be absent and pappus only of numerous bristles from 1-3.5 mm. long, the shortest very delicate. Extremely rare in crevices of igneous rock bluffs, lower Window Trail, Chisos Mts. Basin, Brewster Co.; endemic.

Derived from hybridization between *P. Parryi* and *P. rupestris* var. *albiflora*.

4. Perityle aglossa Gray. Suffruticose perennial 15-40 cm. high; leaves opposite or alternate, 22-34 mm. long, 6-22 mm. wide, ovate to subcordate or subdeltoid, irregularly

lobed to lacinate or serrate-dentate, often shallowly 3-lobed; petioles 8-23 mm. long; inflorescence same as *P. Vaseyi* and *P. Parryi* but peduncles typically shorter (10-25 mm. long); heads discoid, campanulate, 4-7 mm. wide, 8-11 mm. high; phyllaries linear-lanceolate, attenuated at the apex; disk corollas yellow, typically pinkish- or purplish-tinged, 4.2-6 mm. long; achenes (2-) 2.5-3.2 mm. long, oblong-obconical and truncate at the base, the margins distinctly calloused and ciliate; pappus a crown of squamellae and a single bristle (rarely 2), 4.5-5.5 mm. long. *Laphamia aglossa* (Gray) Hemsl., *Leptopharynx aglossa* (Gray) Rydb. Infrequent in crevices of limestone bluffs, s. Brewster Co., late summer-fall; also Chih.

5. *Perityle microglossa* Benth. MAZANILLA BRONCA. Herbaceous annual, 10-55 cm. high; leaves opposite below, alternate above, 22-56 mm. long, 12-31 mm. wide, 3-lobed or -cleft to subhastate, infrequently pinnately lobed; petioles 5-16 mm. long; heads radiate, 4-7 mm. wide, 4-5 mm. high; rays white; disk corollas yellow, 1.6-2 (-2.2) mm. long; achenes 1.5-2 mm. long, obconical, with conspicuous whitish callous margins, the margins hirsute-ciliate; pappus of a short crown of squamellae and 2 (rarely 1) delicate unequal bristles, 0.7-1 mm. long. Incl. var. *effusa* Gray, *Perityle acmella* Harv. & Gray, *P. effusa* (Gray) Rose, *P. urticifolia* Rydb. Uncommon in Cameron and Willacy cos. in extreme s. Tex., in sandy loam soil, perhaps introd., spring-fall; typical of s. Ariz., w. coast of Mex. to Nic. and s. tip of Baja Calif.

6. *Perityle dissecta* (Torr.) Gray. Perennial from a woody base, 7-18 cm. high; leaves opposite or alternate, usually alternate above, 9-20 mm. long, 5-10 mm. wide, hirsute-pilose, irregularly dissected, once- to twice- or thrice-pinnately divided, less often pinnately parted or cleft, the lobes irregular and rounded; petioles 4-8 mm. long; inflorescence of solitary heads or small clusters, borne on rather stout peduncles 2-8 (-17) mm. long; heads discoid, campanulate, 8-10 mm. high, 4-5 mm. wide, typically partly obscured by leaves; phyllaries 11-13 mm. long, 0.7-0.9 mm. wide, linear-lanceolate, attenuate at the apex; disk corollas yellow, (4.5-) 5-5.5 mm. long; achenes (2.8-) 3-3.8 mm. long, slender-oblong to narrowly obconical, with rather conspicuous callous margins, short-pubescent on the margins and both surfaces; pappus 1 (rarely 0 or 2) rather stout bristle(s) 2.2-2.5 mm. long and a vestigial crown of squamellae. *Laphamia dissecta* Torr., *Leptopharynx dissecta* (Torr.) Rydb. Rare in crevices of limestone bluffs near Shafter in Presidio Co., and Santa Elena Canyon, Brewster Co., spring-fall; also Chih.

Has been confused with *P. Lemmonii* (Gray) Macbr. of Ariz. because of similarities in habit, but both are distinct species. Related to *P. Castillonii* I. M. Johnst. of Coah. and Chih.

7a. *Perityle Lindheimeri* (Gray) Shinnery var. *Lindheimeri*. Perennial from a woody base, (10-) 18-45 (-60) cm. high; leaves opposite below, alternate above, 2-5 cm. long, 10-35 mm. wide, punctate, essentially glabrous, broadly ovate-lanceolate, with 3 to 5 serrate lobes on anterior margins; petioles 4-10 mm. long; inflorescence cymose with numerous heads loosely to densely aggregated at the tips of slender often dichotomously branched peduncles; heads radiate, narrowly campanulate, 6-7 mm. high, 4-5 mm. wide; ray flowers 3 to 5; rays yellow, 2.5-3 mm. long, 1.5-2 mm. wide, oblong to suborbicular; disk corollas yellow, 3-3.5 mm. long; achenes 2-2.8 mm. long, linear-oblong to narrowly obconical, with thin callous-margins, minutely pubescent on margins and surfaces; pappus of a single bristle, 0.5-1.5 mm. long, arising at the apex of one margin, often with a vestigial nub at the other, and a callous crown with minute squamellae. *Laphamia Lindheimeri* Gray, *L. rotundata* Rydb., *Perityle rotundata* (Rydb.) Shinnery. Common in crevices of limestone rock exposures, Edwards Plateau, spring-fall; endemic.

7b. *Perityle Lindheimeri* var. *halimifolia* (Gray) Powell. Pappus bristle absent except in a few individuals. Restricted and isolated in distribution, rare on Cretaceous limestone exposures s. of Loma Alta in s.w. Val Verde Co., Apr.-May and early June; endemic.

After further study it may prove necessary to submerge var. *halimifolia* completely with *P. Lindheimeri*. As it stands now this essentially nonpappous population serves to link the related species, *P. angustifolia*.

8. *Perityle angustifolia* (Gray) Shinnery. Perennial from a woody base, 8-25 cm. high; leaves opposite below, alternate above, 15-30 mm. long, (1.5-) 3-10 mm. wide, punctate, essentially glabrous, often coriaceous, linear to oblanceolate or lanceolate to broadly so, typically 3- to 5-lobed or -cleft, less often subentire or lacinate, the lobes acute to attenuate, subsessile to short-petiolate; petioles when present 4-10 mm. long;

inflorescence subcymose, typically with several heads loosely aggregated at tips of dichotomously branched peduncles; heads discoid, campanulate to narrowly so, 5.5-7 mm. high, 3.5-5 (-6) mm. wide; disk corollas yellow, 2.2-2.8 (-4.5) mm. long; achenes 2-2.5 (-2.8) mm. long, narrowly obconical, with thin callous-margins, minutely pubescent on margins and surfaces; pappus absent. *Laphamia angustifolia* Gray, *L. angustifolia* var. *laciniata* Torr., *L. laciniata* (Torr.) Rydb. Common in crevices of Cretaceous limestone exposures, w. Val Verde, Crockett, Terrell and Pecos cos., spring-fall; endemic.

Easily distinguished from *P. Lindheimeri* by narrower leaves, discoid heads and non-pappous achenes.

9. *Perityle Warnockii* Powell. Small perennial, 2-10 cm. high; leaves opposite below, alternate above, 8-15 mm. long, 4-8 (-10) mm. wide, scabrous-pubescent, suborbicular to ovate-lanceolate, the margins conspicuously serrate; petioles 2-5 (-8) mm. long; inflorescence of solitary heads on short peduncles; heads discoid, campanulate, 0.7-1 cm. high, 4-7 mm. wide, sometimes partly obscured by subtending leaves; disk corollas bright-white, 5-6 (-6.5) mm. long, the tube glandular-pilose, the throat subfunneliform, sparsely glandular-pilose, the lobes attenuate-acute, (1-) 1.2-1.6 mm. long; achenes 2.2-2.5 (-2.8) mm. long, oblong to oblong-obconical, truncate at the base and apex, with conspicuous callous-margins, the margins glabrous, minutely pubescent on the surfaces; pappus absent. Known only from a single population, about 1 mile e. of the Pecos River in n.w. corner of Val Verde Co., fall; endemic.

Related to *P. bisetosa* but differs in several important characters.

10a. *Perityle bisetosa* (Gray) Shinnars var. *bisetosa*. Small perennial 2-7 cm. high; leaves opposite or alternate, 5-10 mm. long, 2-6 mm. wide, essentially glabrous, glandular-punctate, coriaceous, ovate to ovate-lanceolate or lanceolate, the margins entire to subserrate, subsessile or short-petiolate; petioles when present 1-2 mm. long; heads discoid, solitary, narrowly campanulate, 7-8 (-10) mm. high, 3.5-7 mm. wide, subtended and mostly obscured by leaves; disk corollas white, (4-) 4.2-5.5 mm. long, the throat tubular to subfunneliform; achenes 1.8-2.2 (-3) mm. long, narrowly obconical, with conspicuous callous-margins, the margins glabrous, minutely pubescent on the surfaces; pappus of 2 bristles 1.5-2.3 mm. long, the bristles rather flattened, linear; chromosome number: $n = 17$. *Laphamia bisetosa* Gray. Rare, growing in pockets and crevices of limestone rock, s.e. Brewster Co., July-Oct.; endemic.

10b. *Perityle bisetosa* var. *scalaris* Powell. Perennial, in small erect or pendulous clumps, 6-12 cm. high; leaves opposite below, alternate above, 8-12 mm. long, 5-8 mm. wide, scabrous-hispidulous, ovate or broadly so to suborbicular, with one or two shallow lobes per margin or serrate, lobes and serrations acute; petioles 2-4 mm. long; floral features mostly slightly larger than in var. *bisetosa* but otherwise similar except pappus in some heads composed of 3(4) bristles equal in length or the 3rd and 4th shorter; chromosome number of several individuals determined to be $n =$ about 102. Single population growing on lower limestone cliffs of Stairstep Mt. in Black Gap Game Refuge, Brewster Co., Aug.-Oct.; endemic.

10c. *Perityle bisetosa* var. *appressa* Powell. Perennial growing in dense leafy clumps closely appressed to rocks, 4-8 cm. high, 12-20 cm. broad; leaves distinctly alternate (rarely opposite below), 10-15 mm. long, 4-8 mm. wide, glabrous, ovate, serrate or serrate-sinuate to shallow-lobed, typically with 2 or 3 serrations or lobes per margin (less often 4), the serrations obtuse to subacute; petioles 3-7 mm. long; chromosome number: $n = 17$. Single population growing on the e. face of the limestone caprock of a small mt. peak on the n. rim of San Francisco Creek Canyon, Brewster Co., May-June (Aug.-Sept.); endemic.

11. *Perityle quinqueflora* (Steyerm.) Shinnars. Perennial from a woody base, 7-30 cm. high; leaves opposite, often becoming alternate above, 15-25 (-38) mm. long, 8-20 (-35) mm. wide, glabrous to puberulent, fleshy-succulent or coriaceous, typically reniform to subreniform, sometimes short-cordate, the margins obtuse-dentate or shallow-lobed; petioles 5-8 (-12) mm. long; inflorescence typically of several to many heads in a cluster, borne on rather slender peduncles 2-10 (-15) mm. long; heads discoid or cylindrical to very narrowly campanulate, 7-8 (9) mm. high, 2-3 mm. wide, often partially obscured by leaves; phyllaries 5 or 6, essentially 1-seriate, 5-6 mm. long, (1-) 1.3-1.7 mm. wide; disk flowers typically 5, rarely 6 or 7 per head; disk corollas yellow, 3.8-4.3 (-5) mm. long; achenes 1.9-2 (rarely 2.5-2.9) mm. long, oblong-obconical with rather in-

conspicuous callous-margins, the margins, angles and surfaces short-pubescent; pappus of 25 to 30 slender unequal bristles. *Laphamia quinqueflora* Steyerem., *Pappothrix quinqueflora* (Steyerem.) Everly. Crevices of limestone bluffs, Guadalupe and Diablo mts. of Culberson Co. and Quitman and perhaps Eagle mts. of Hudspeth Co., perhaps Vieja Mts. of Presidio Co., spring-fall; also Guadalupe Mts. in N.M.

12. *Perityle cinerea* (Gray) Powell. Suffrutescent to suffruticose perennial 8-25 (-45) cm. high, cinereous; leaves opposite below, alternate above, 12-25 mm. long, 10-18 mm. wide, tomentose-canescens, broadly ovate to subdeltoid, rarely subreniform, the margins deeply serrate with lobelets obtuse to acute; petioles 6-10 mm. long; inflorescence of solitary heads or clusters of heads borne on rather stout peduncles 3-10 mm. long; heads discoid, campanulate, 8-10 mm. high, 4-7 mm. wide, sometimes partially obscured by subtending leaves; phyllaries 8 to 10, 2-seriate, subequal, 5-7 mm. long, 1.1-2 mm. wide, tomentose; disk flowers 10 to 15; disk corollas white, 5.3-6 mm. long; achenes 2.6-3 (-3.5) mm. long, oblong to narrowly obconical, with rather inconspicuous callous-margins, the margins, angles and surfaces short-pubescent; pappus of 14 to 20 slender unequal to subequal bristles. *Laphamia cinerea* Gray, *Pappothrix cinerea* (Gray) Rydb. Rare in crevices of limestone caprock, mesas in Pecos and Upton cos., spring-fall; endemic.

13. *Perityle vitreomontana* Warnock. Small perennial from a woody base, 3-10 cm. high; leaves opposite, becoming alternate above, 7-10 (-13) mm. long, 5-8 (-12) mm. wide, pilose, ovate to ovate-deltoid, the margins obtuse-serrate to incised-lobed, rarely lacinate, strongly veined; petioles 2-4 mm. long; inflorescence typically of loosely clustered heads, rarely solitary, borne on short rather stout peduncles (1-) 2-3 (-8) mm. long; heads discoid, subcampanulate, 6-7 mm. high, 3-4 mm. wide, often mostly obscured by leaves; phyllaries (9 or) 10 to 12, 2-seriate, equal, 4-5 mm. long, 0.8-1 mm. wide; disk flowers 11 to 16; disk corollas white, 4.2-4.5 mm. long; achenes 1.9-2 mm. long, narrowly obconical, typically truncate at the base and apex, with rather inconspicuous callous-margins, angles and surfaces short-pubescent, margins essentially glabrous; pappus typically of 2(3) very slender bristles 1.2-2 mm. long, often with 3 to 6 bristles shorter than the main 2, rarely with 10 to 20 short to vestigial bristles and nubs. Known only from a single population, growing in crevices of limestone exposures, n. side of Glass Mts., Brewster Co., June-Oct.; endemic.

14a. *Perityle rupestris* (Gray) Shinnars var. *rupestris*. Suffrutescent perennial 6-20 (-35) cm. high; leaves opposite or alternate, usually alternate, 10-32 mm. long, 8-35 mm. wide, sparsely to densely pilose to short-pilose or pilose-hirsute, ovate to broadly so to cordate or subdeltoid, less often subreniform, margins irregularly serrate to serrate-lobed, the serrations or lobes acute; petioles 4-13 mm. long; inflorescence of solitary heads or small clusters; heads discoid, often partially obscured by leaves, subcampanulate or subfunnel-form to subcylindric, 2.5-8 mm. high, 3-4 mm. wide; phyllaries 8 to 10, 2-seriate, equal, 4.5-5.5 (-6) mm. long, 1-2 mm. wide; disk flowers 8 to 12; disk corollas yellow, 4-4.5 mm. long; achenes 1.8-2.5 mm. long, oblong-obconical, subtruncate or rounded at the base, with rather conspicuous to inconspicuous callous-margins; angles, surfaces and margins short-pubescent; pappus of 25 to 30 unequal bristles, 2-3 mm. long; chromosome numbers: $n = 17$, $n = 34$, $n = 68$. *Laphamia rupestris* Gray, *Pappothrix rupestris* (Gray) Rydb. Common in crevices of igneous bluffs and boulders from about 10 miles n. of Alpine throughout Jeff Davis Co. and probably n. Presidio Co., spring-fall; endemic.

14b. *Perityle rupestris* var. *albiflora* Powell. Disk corollas white; leaves of some populations smaller; tendency for more florets per head; pappus bristles tend to be shorter than achenes in most populations; chromosome numbers: $n = 17$, $n = 34$, $n = 85$. Common in crevices of igneous-rock bluffs and limestone bluffs and boulders, from about 10 miles n. of Alpine, s. throughout Brewster Co., extreme s. Jeff Davis Co., and e. Presidio Co.

Both varieties of *P. rupestris* include isolated populations of diploid and polyploid individuals which increase the range of variability in each taxon. No infravarietal population seems to exhibit characteristics of sufficient distinction to warrant its recognition as a separate taxon. Included in the variety *albiflora* are isolated and rather distinct populations growing on Caballos novaculite limestone exposed in the Marathon Basin, and on igneous bluffs below San Estaban Dam south of Marfa. Plants growing on the novaculite limestone have mostly opposite leaves, but these rarely tend to be alternate above. While plants of this type are recognizable in the field, there seems to be no consistent feature which allows formal, separate recognition of the population. Below San Estaban Dam is

a tetraploid population with large leaves and heads. Future study may provide additional characters which can be used for another disposition of these populations.

111. PALAFOXIA LAG.²²⁴

Taprooted annuals, rarely overwintering in the southern areas; stems ascending, often nearly simple for most of the length; leaves alternate (except in seedlings the lowermost pairs above the cotyledons may be opposite), firm-membranous, petiolate; blades usually lanceolate or broadly so, entire; heads borne in irregularly corymbiform masses at the top of the plant, 5-20 mm. high; involucre turbinate to hemispheric or cylindrical; receptacle essentially flat, naked; phyllaries 2- or 3-seriate, subequal, thickish, green, often with a slightly discolored (reddish) tip; *ray flowers* present or absent, when present pistillate, fertile; rays pink to mauve or roseate, conspicuously 3-toothed terminally; *disk flowers* perfect, fertile; corollas equally (in one species unequally) 5-lobed or 5-toothed terminally; style branches linear, spreading or revolute, hispidulous; achenes 4-angled, obpyramidal; pappus of 7 to 10 scales, varying from a minute callosity to a long acuminate hyaline-margined callose midrib. *Othake* Raf.; *Polypteris* Nutt.

About 10 species, in southwestern United States and northern Mexico.

1. Heads with conspicuous rays (2)
1. Heads without rays (peripheral flowers inconspicuously zygomorphic in *P. riograndensis*) (4)
- 2(1). Leaves linear-lanceolate, 2-4 mm. broad; stems not glandular except in the upper branched head-bearing region; achenes 5-6 mm. long; phyllaries 6-7 mm. long 1. *P. Reverchonii*.
2. Leaves lanceolate to ovate-lanceolate, 3-20 mm. broad; stems usually glandular for some distance below the head-bearing region, often conspicuously so; achenes 6-9 mm. long; phyllaries 7-20 (-25) mm. long (3)
- 3(2). Species of western Texas; heads narrowly turbinate to cylindrical; phyllaries 2-2.5 (-3) mm. broad; rays mostly 10 mm. long or shorter; stems not robust, branching at or below the middle (except in immature or depauperate plants) 2. *P. sphaelata*.
3. Species of eastern Texas; heads broadly turbinate to campanulate; phyllaries 2-5 mm. broad; rays mostly 10 mm. long or longer; stems robust, branched at or below the middle (except in mowed or injured plants) 3. *P. Hookeriana*.
- 4(1). Involucre cylindrical; corolla of outermost flowers zygomorphic; achenes (7-) 8-11 mm. long 4. *P. riograndensis*.
4. Involucre turbinate; corollas regular; achenes 4-7 mm. long (5)
- 5(4). Leaves mostly broadly lanceolate, 6-15 mm. broad; chromosome number $n = 11$; plants of south-central Texas and southward 7. *P. texana*.
5. Leaves mostly narrowly lanceolate, 2-6 mm. broad; chromosome number $n = 10$; plants of south-central to western Texas and northward (6)
- 6(5). Phyllaries narrowly linear, 0.6-1.3 mm. broad; pappus 0.5-2 mm. long; plants predominantly found on limestone areas 5. *P. callosa*.
6. Phyllaries linear to obovate, mostly 1.2-2.5 mm. broad; pappus 2-8 mm. long; plants predominantly found on sandy soils 6. *P. rosea*.

1. *Palafoxia Reverchonii* (Bush) Cory. Annual herb 3-5 (-8) dm. tall; stems not glandular except in the upper branches of the head cluster; leaves linear-lanceolate, 4-6 cm. long, 2-4 mm. broad (rarely broader); phyllaries 7 to 9, about 6-7 mm. long; ray flowers 4 to 6, the rays deeply 3-lobed; achenes 5-6 mm. long. Infrequent in sandy forested areas, e. Tex., summer-fall; endemic.

2. *Palafoxia sphaelata* (Torr.) Cory. Stems 3-6 dm. tall, branching at or below the middle (except in immature or depauperate plants), usually glandular for some distance below the peduncles; leaves lanceolate to ovate-lanceolate, 4-7 cm. long, 3-20 mm. broad; phyllaries 7-20 (-25) mm. long, 2-2.5 (-3) mm. broad, glandular; ray flowers

²²⁴ Many of the characters were supplied by B. L. Turner from his unpublished manuscript on this genus.

present, the rays mostly 10 mm. long or shorter but still conspicuous; achenes 6-9 mm. long. Frequent in sandy plains and dune areas, Plains Country and Trans-Pecos, May-Oct.; Kan., Okla., Tex., Colo., N.M. and Chih.

3. *Palafoxia Hookeriana* T.&G. Stems branched at or below the middle, usually glandular for some distance below the head-bearing region, often conspicuously viscid-glandular; heads broadly turbinate to usually campanulate or hemispheric; phyllaries (7-) 10-15 mm. long, 2-5 mm. broad, with glandular as well as nonglandular pubescence; ray flowers present, mostly 10 mm. long or longer; achenes 6-9 mm. long. Incl. var. *minor* Shinnars. Frequent in sandy soil, s.e. Tex., s.w. part of e. Tex., and coastal parts of Rio Grande Plains, Sept.-Oct.; endemic.

The plants in full flower are quite showy; well worthy of cultivation.

4. *Palafoxia riograndensis* Cory. Stems 4-7 dm. long, only the uppermost peduncles with glandular hairs; involucre cylindrical; phyllaries 1.3-1.7 mm. broad, 1.3 to 1.7 times as long as broad, rather densely hispid with appressed or spreading trichomes, mostly with prominent swollen bases; ray flowers absent; outermost disk corollas slightly zygomorphic; achenes (7-) 8-11 mm. long. Rare in sandy vegas of the Rio Grande in the Trans-Pecos, Aug.-Nov.; also Chih.

5. *Palafoxia callosa* (Nutt.) T.&G. Annual; peduncles 5-33 mm. long; leaves mostly narrowly lanceolate, 2-6 mm. broad; involucre turbinate; phyllaries narrowly linear, 0.6-1.3 mm. broad; ray flowers absent; all corollas regular; achenes 4-7 mm. long; pappus 0.5-2 mm. long; chromosome number: $n = 10$. *P. bella* Cory. Abundant on limestone areas, Edwards Plateau and n.-cen. Tex., rare w. to Terrell Co., (later summer-) fall; Mo., Ark., Okla. and Tex.

6. *Palafoxia rosea* (Bush) Cory. Annual; leaves mostly narrowly lanceolate, 2-6 mm. broad; involucre turbinate; phyllaries linear to obovate, mostly 1.2-2.5 mm. broad; ray flowers absent; achenes 4-7 mm. long; pappus 2-8 mm. long; chromosome number: $n = 10$. In sandy soil.

We have 2 varieties:

Var. *rosea*. Pappus 2-5 mm. long. E. and s.e. Tex., rare w. to n.cen. Tex., June-Nov.; endemic.

Var. *macrolepis* Rydb. Pappus 6-8 mm. long. Plains Country, rarely s.e. as far as the Llano-Burnet cos. region or even the Bexar-Wilson cos. area, May-Sept.; Tex. and N.M. n.w. to Wyo.

7. *Palafoxia texana* DC. Annual; leaves mostly broadly lanceolate, 6-15 mm. broad; involucre turbinate; phyllaries narrowly linear, 0.6-1.3 mm. broad; ray flowers absent; corollas all equally 5-toothed; achenes 4-7 mm. long; pappus very variable in length (see below); chromosome number: $n = 11$.

We have 2 varieties as follows:

Var. *texana*. Pappus 3-5 mm. long. *P. rosea* var. *papposa* Shinnars, *Othake canescens* Rydb. W. part of Rio Grande Plains, spring-fall; Tex., Coah., N.L. and Tam.

Var. *ambigua* (Shinnars) B. L. Turner. Pappus usually 2-3 mm. long. *P. rosea* var. *ambigua* Shinnars. In the sandy and more coastward parts of the Rio Grande Plains and the s.w. portion of s.e. Tex., May-Nov.; also Tam.

112. HYMENOTHRIX GRAY²²⁵

Erect annual (or perhaps longer enduring) herbs, 3-7 dm. tall; stems usually single from a taproot; leaves alternate, biternately or triternately divided into linear divisions; heads in some species crowded near the top in a roughly corymbiform arrangement; involucre turbinate to hemispheric; phyllaries scarious, 1- or 2-seriate; receptacle nearly flat, naked; ray flowers present or absent, when present pistillate, fertile; rays 3-4 mm. long, creamy; disk flowers numerous, perfect, fertile; corollas white to lavender-pink or pale-yellow, 5-lobed terminally, the lobes either subequal or in some species distinctly unequal and the corollas zygomorphic; style branches flattened to nearly terete, with distinct marginal stigmatic lines, apically with rather small conic or swollen obtuse appendages; achenes obpyramidal, 4-sided, the faces conspicuously nerved to smooth; pappus of 12 to 18 scales, the midnerves of the scales conspicuous and extending to the apex and often beyond.

²²⁵ Adapted from B. L. Turner in *Brittonia* 14:101-120. 1962.

A genus of about 5 species of Mexico and southwestern United States. Only one has been definitely found in Texas.

1. Ray flowers present 1. *H. Wislizenii*.
 1. Ray flowers absent 2. *H. Wrightii*.

1. *Hymenothrix Wislizenii* Gray. Plant annual or biennial, 3-7 dm. tall; lower leaves pinnately 1- or 2-dissected, the upper less so, the earliest ones forming a rosette but subsequent ones conspicuously alternate; midstem leaves glabrous (rarely minutely puberulent), dissected, the ultimate divisions linear or spatulate-linear, 5-40 mm. long, 1.5-4 mm. broad; petioles 15-50 mm. long; disk corollas creamy-white or pale-yellow; ray flowers small, creamy-white to yellowish, 4-5 mm. long, 1.5-2 mm. broad. Not definitely known to occur in Texas, but occurring very close in Chih. and N.M. and to be expected in the El Paso area, late summer-fall; Ariz.; N.M., Son. and Chih.

2. *Hymenothrix Wrightii* Gray. Plant 3-6 dm. tall; stems erect, 1 to several from the crown of a taproot, the lower portion pubescent with long spreading hairs, the upper portions glabrous or nearly so (rarely pubescent throughout); leaves alternate, the lower ones pinnately twice or thrice ternately dissected, the upper ones less dissected, the lowermost forming a rosette but the later ones conspicuously alternate; midstem leaves glabrous (rarely pubescent), with petioles 0.6-2 mm. long, dissected, the ultimate divisions 5-40 mm. long and 0.5-1.5 mm. broad; heads turbinate, 9-12 mm. high, 7-10 mm. broad, with 15 to 30 white to lavender-pink or purplish disk flowers (ray flowers absent!). Exceedingly rare in the Trans-Pecos, collected once in 1889 in the "Chenates region," late summer-early fall; otherwise known in Calif., Baja Calif., Ariz., Son., Chih. and N.M.

113. FLORESTINA CASS.²²⁶

A Mexican and Central American genus of 8 species.

1. *Florestina tripteris* DC. Erect taprooted annual herb 1-6 dm. tall; stems single, not developing a rosette; first leaves opposite, the later ones alternate, simple to 3-parted; head-bearing region open, a dichotomously branched or subcorymbose cyme of 5 to numerous heads; involucre broadly to narrowly turbinate; phyllaries mostly in a single series, usually with scarios margins and often suffused with purple; rays absent; corollas hermaphroditic with well-defined tubes and throats, distinctly irregular, white; style branches flattened, with well-developed marginal stigmatic lines, abruptly terminated by a penicillate cuspidate appendage, otherwise glabrous; achenes obpyramidal, 4-sided, the faces smooth or distinctly 3-ribbed; pappus of 8 to 10 ovate to obovate or truncate scales, the midnerve only rarely extending to the apex or beyond. *Palafoxia tripteris* (DC.) Shinnery and var. *brevis* Shinnery. Frequent in Rio Grande Plains and s. and w. parts of Edwards Plateau (Crockett, Sutton and Terrell cos.), summer-fall; Tex., Chih., Coah., Dgo., N.L. and Tam.

114. SCHKUHRIA ROTH²²⁷

THREAD-LEAF

Taprooted annuals, ascending, 5-50 cm. tall; stems short-glandular-hairy to glabrate; leaves mostly opposite, those on the upper part alternate, pinnately or bipinnately divided into linear-filiform lobes, rarely simple, often impressed-punctate; involucre obconic to turbinate; phyllaries 4 to 9, obovate to oblanceolate, rather narrow, scarios and frequently colored at the margins, occasionally 1 or more smaller phyllaries present; ray flowers absent or solitary, minute, when present pistillate and fertile, the ray pale yellow; disk flowers few to several (up to 30); corolla yellow, equally 5-toothed terminally, the tube glandular; achenes elongate, obpyramidal, generally 4-sided, villous or hispid on the angles (particularly near the base); pappus of 8 (rarely more) scarios squamellae, callused at the base or with prominent midrib becoming an awn in some of the species.

An American genus of 6 or 8 species, of which we have two. The genus is exceedingly closely related to *Bahia*, with which it should probably be united.

²²⁶ Adapted from B. L. Turner in *Brittonia* 15:27-46. 1963.

²²⁷ Adapted from C. B. Heiser, Jr. in *Ann. Missouri Bot. Gard.* 32:265-278. 1945.

1. Ray flowers absent; disk flowers 15 to 30 1. *S. multiflora*.
 1. Solitary ray flower present; disk flowers 5 or fewer 2. *S. anthemoidea*.

1. *Schkuhria multiflora* H. & A. Branching annual, the branches widely spreading and then ascending, 5-25 cm. tall; stems short-glandular-hairy to glabrate; leaves pinnately dissected into lobes 0.5-1 mm. broad, to 3 cm. long; petioles 2-10 mm. long; peduncles glandular-pubescent, 5-30 mm. long; involucre turbinate to obconic, 5-6 mm. high, 5-10 mm. broad; phyllaries 7 to 9, scarious-tipped, frequently reddish or yellowish on the margins, 1-2 mm. broad and narrowing gradually; ray flowers absent; disk corollas 15 to 30; achenes 3-4 mm. long; scales of the pappus 1-2 mm. long, obtuse to acutish, rarely several or all of them awned, usually strongly calloused at the base. Higher parts of the Trans-Pecos mts. in grasslands on igneous rocks, summer-early fall; Ariz., Colo., N.M., Tex., Chih.; Bol., Peru, Arg. and Chile.

2. *Schkuhria anthemoidea* (DC.) Coult. Erect annual 2-5 dm. tall; leaves glabrate, pinnately or bipinnately dissected into linear-filiform segments 1-4 cm. long and 0.5-2 mm. broad or the upper and lower entire, conspicuously glandular-punctate; involucre 5-7 mm. high, narrower than high; phyllaries 4 or 5, obovate, obtuse, glabrous, punctate, green with scarious colored margins, deep-purple to red; ray flower solitary, the ray about 1 mm. long; disk flowers 5 or fewer; achenes 3-4 mm. long, about twice as long as thick, striate, densely villous on the 4 angles, the hairs 0.4 mm. long or longer; pappus scales subequal, obovate, rounded apically, denticulate. *S. Hopkirkia* Gray. Our plants are of the var. *Wrightii* (Gray) Heiser. Infrequent in the higher parts of the Davis and Vieja mts. in the Trans-Pecos, fall; the species occurs from Ariz. and N.M., s.e. to Guat. and Salv.

115. BAHIA LAG.²²⁸

Annual, biennial and perennial herbs, when perennial with rootstocks; leaves alternate at least over a portion of the stem, the lower leaves opposite, mostly ternately dissected into linear or ovate segments (often simple or merely lobed in *B. absinthifolia*), impressed-punctate or punctulate in each pit with a minute resin-globule; heads few to many, in a cymose paniculiform aggregation; involucre hemispheric-campanulate; phyllaries 8 to 24, subequal in 1 to 3 series, membranous marginally, usually reflexed with age; receptacle slightly convex or flat, naked; ray flowers 5 to 20, pistillate and fertile, the rays yellow; disk flowers 25 to 140, the yellow corollas 5-toothed terminally; achenes 4-sided, narrowly obpyramidal, hispid to essentially glabrous; pappus absent or of 8 to 15 scarious obovate or oblanceolate scales, the midrib percurrent, excurrent or absent.

A genus of about 11 species of Mexico and southwestern United States (one in Chile). Rather closely related to *Schkuhria*, differing in the extent to which the phyllotaxy is opposite and in the tendency toward coloring of the external bracts. *Schkuhria multiflora* is by some authors included in *Bahia*, and in some ways it connects the two genera. Another closely related taxon is *Picradeniopsis*, which is often included in *Bahia*.

1. Leaves opposite over at least half the length of the plant, only those on the upper branches alternate (2)
 1. Leaves opposite only very near the base, alternate over more than half the total length (3)
 2(1). Taprooted annual; leaves sparingly pubescent 4. *B. Bigelovii*.
 2. Subrhizomatous perennial; leaves white-pubescent 3. *B. absinthifolia*.
 3(1). Pappus absent; achenes essentially glabrous 2. *B. dissecta*.
 3. Pappus of scales present; achenes hispid 1. *B. pedata*.

1. *Bahia pedata* Gray. Taprooted annual 3-10 (-12) dm. tall; stems single (rarely 2 following injury) and erect, paniculately branched above, each terminal branch culminating in 1 to 4 1-headed peduncles, variously pubescent and glandular with resin-globules and/or numerous stipitate glands; leaves alternate, often crowded near the base, pedately divided into 3 segments, each lateral segment 2-parted, the middle segment of

²²⁸ Adapted from William L. Ellison in *Rhodora* 66:67-86, 177-215, 281-311. 1964.

3 to 7 lobes, the ultimate lobes obovate or broadly oblong and 2-5 mm. broad; uppermost leaves simple and entire or ternately divided into entire linear segments 4-11 cm. long, pubescent; heads 5-8 mm. high, 15-20 mm. broad; involucre broadly campanulate; phyllaries short stipitate-glandular, 13 to 17 in 2 series with 1 or more outer bractlets, scattered-pubescent, 4-6 mm. long, 1.5-2.5 mm. broad, oblong-oblancheolate; ray flowers 10 to 15, the rays 5-6 (-7) mm. long and 2.5-5 mm. broad; achenes 2.4-4 (-4.5) mm. long; pappus of 10 to 15 scarious oblancheolate or spatulate scales. Frequent in Trans-Pecos desert grasslands, recently reported from Dallam Co. in the Tex. Panhandle, late summer-fall; Tex., N.M., Coah. and Chih.

The closely related *B. biternata* Gray with leaf segments averaging narrower and the pappus scales (of inner achenes) with a prominent excurrent midrib, has been collected close to the Texas border north of El Paso and may eventually be found in the state.

2. *Bahia dissecta* (Gray) Britt. Taprooted annual 2-8 (-12) dm. tall; stems single (rarely 2 or 3 following injury) and erect, paniculate-branched above, each terminal branch culminating in numerous 1-headed peduncles, more or less pubescent with numerous stipitate glands on the upper stems and branches; leaves alternate, often crowded near the base, ternately divided, each segment compoundly subdivided into linear or oblong-ovate segments 1-3 mm. broad; upper leaves reduced and ternately divided into entire linear-lanceolate segments, 2-13 cm. long, more or less pubescent; heads 5-10 mm. high, 1-2 cm. broad; involucre hemispheric or broadly campanulate; phyllaries 12 to 24 in 2 or 3 series, 4.5-6 mm. long, 1-3 mm. broad, oblancheolate to lanceolate; ray flowers 10 to 20, the rays 5-7.5 mm. long and 2-3.5 mm. broad; achenes 3-4.5 (-5) mm. long; pappus absent. Infrequent in the higher parts of the Chisos and Davis mts. in the Trans-Pecos, late summer-fall; Tex., N.M., Ariz., Calif., Nev., Wyo., Colo., Baja Calif., Son., Chih. and Coah.

3. *Bahia absinthifolia* Benth. Subrhizomatous perennial 1-4 dm. tall, branching from the base, each terminal branch culminating in 1 to 5 1-headed peduncles, canescent or only partially clothed with short appressed hairs; leaves opposite (becoming alternate only on the upper stems), highly variable in form, some being narrowly to broadly lanceolate and entire or toothed with others ternately divided into narrow-to-broad linear segments which may themselves be divided, 1-5 cm. long, (1-) 2-15 mm. broad at the point of maximum breadth, tomentulose-canescent; heads 5-15 mm. high, 10-25 mm. broad; involucre hemispheric or broadly campanulate; phyllaries tomentose and farinose with few resin-globules beneath the tomentum, 12 to 16 in 2 series with 1 or more outer phyllaries, 5-9 mm. long, 1-4 mm. broad, lanceolate with acute to ovate or frequently acuminate apices; ray flowers 10 to 13, the rays 5-12 mm. long and 2-3.5 mm. broad; achenes 2.5-5.5 mm. long; pappus of 6 to 9 scarious obovate scales. *B. dealbata* Gray. Abundant in the Trans-Pecos and s.w. parts of Rio Grande Plains, infrequent in extreme s.w. part of Edwards Plateau, spring-fall; Ariz., N.M., Tex., s.e. to Jal. and Gto.

4. *Bahia Bigelovii* Gray. Taprooted annual 15-35 cm. tall; stem erect, branched, each terminal branch culminating in 1 to 4 1-headed peduncles; leaves opposite (becoming alternate only on the uppermost branches), 3-parted into linear entire segments or secondarily divided, the segments 15-50 mm. long and 1 (-2) mm. broad, sparingly pubescent, impressed-punctate (each depression with a resin-globule); heads 4-7 mm. high, 8-16 mm. broad; involucre broadly campanulate; phyllaries more or less pubescent and resin-globule-dotted, 10 to 14 (to 18) in 2 series, 3.5-4.5 mm. long, 1-1.6 mm. broad, obovate, the apex acute to acuminate or obtuse and the midrib weakly discernible or absent; ray flowers 5 to 9, the rays 3.5-4.5 mm. long and 1.5-3 mm. broad; achenes 2-2.5 (-4.3) mm. long; pappus of 8 (or 9) broadly ovate scarious scales. Moist canyons, higher parts of Trans-Pecos mts., late summer-fall; endemic.

116. PICRADENIOPSIS Rydb.

A genus closely related to *Bahia* and containing 2 species, of which we have one.

1. *Picradeniopsis Woodhousii* (Gray) Rydb. Rhizomatous perennial forming extensive colonies, 5-15 cm. tall, oppositely branched, ultimate branching terminating in 1 to 6 1-headed peduncles, cinereous, sparingly pubescent and farinose with few to numerous resin-globules; peduncles 1-2 cm. long; leaves opposite, ternately divided into linear segments 1-2 mm. broad, the latter entire or again divided, 1-3 cm. long, sparingly pubescent,

cinereous, impressed-punctate (each depression with a resin-globule); heads 4-8 mm. high, 8-12 mm. broad; involucre campanulate, puberulent and somewhat farinose with numerous resin-globules; phyllaries 8 to 10 in 1 or 2 series, 2.5-7 mm. long, 1.5-3 mm. broad, oblong or obovate with the apex obtuse, more or less keeled with the midrib prominent, marginally membranous; receptacle flat or slightly convex, naked, about 2 mm. broad; *ray flowers* 5 to 9, pistillate, fertile; rays yellow, 2.2-4 mm. long, 1-1.4 mm. broad, oblong or somewhat spatulate with a notched or 2- or 3-lobed apex; *disk flowers* 25 to 40, perfect, fertile; corolla yellow to orange-yellow, 2.5-5 mm. long, equally 5-toothed terminally; achenes 3-4 mm. long, narrowly obpyramidal, 4-sided, brown to black, hispid on the angles at the base, otherwise hispidulous; pappus of 8 or 9 scarious lanceolate scales 0.6-2 mm. long (subequal or conspicuously unequal), 0.2-0.5 mm. broad, basally thickened, the midrib prominent and extending to the apex (occasionally slightly excurrent). *Bahia Woodhousii* (Gray) Gray. Abundant in disturbed soil, especially road shoulders, higher parts of Plains Country and rare in the Trans-Pecos (Culberson Co.), spring-fall; Colo., Kan., Okla., N.M., Ariz. and Tex.

The other species, *P. oppositifolia* (Nutt.) Rydb., with glandular achenes and broader pappus-scales, has been found within a few miles of the Texas border in N.M. and Okla.

117. PSILOSTROPHE DC.²²⁹

PAPER-FLOWER

Taprooted herb, reputed to be "biennial" or less commonly perennial, growing in clumps, 5-60 cm. tall; branching, pannose, densely villous or glabrate; lower leaves petioled, obovate to oblanceolate, entire or occasionally lobed, villous to glabrate; upper leaves alternate, smaller and sessile, spatulate to linear, rarely lobed; involucre campanulate-cylindric; phyllaries roughly of 3 sorts, the principal ones 4 to 12, linear-oblong to lanceolate, villous, connivent; inner phyllaries 1 to 7, smaller, scarious; solitary outer phyllary a much smaller bract or this commonly absent; receptacle nearly flat, naked; heads crowded usually in subcorymbiform masses; peduncles present or absent; *ray flowers* present, pistillate, fertile, in a single series, 3 to 7; rays yellow, persistent, papery, 3-16 mm. long, roughly 3-toothed apically; *disk flowers* perfect, fertile; corolla equally 5-toothed or -lobed, glandular; achenes small, linear, striate, obtusely angled or terete, glabrous or long-villous; pappus of 4 to 6 nerveless hyaline scales which are lanceolate to ovate, acute to obtuse, equal or unequal. *Riddellia* Nutt.

An American genus of about 6 species, rather closely related to *Baileya*.

1. Achenes and pappus long-villous; heads subsessile or with peduncles mostly less than 5 mm. long; rays about 6 mm. long 1. *P. gnaphalodes*.
1. Achenes and pappus glabrous or essentially so; heads long-peduncled (or subsessile in *P. villosa*) (2)
- 2(1). Heads densely clustered, on peduncles mostly less than 5 mm. long; rays 3-5 mm. long, deeply lobed 2. *P. villosa*.
2. Heads loosely clustered, on peduncles mostly longer than 5 mm.; rays 5 mm. or more long, shallowly lobed 3. *P. tagetina*.

1. *Psilostrophe gnaphalodes* DC. Herb 1-5 dm. tall; basal leaves spatulate to oblanceolate, occasionally lobed, loosely long-villous to pannose, to 8 cm. long and 2 cm. broad, upper leaves smaller and oblanceolate to linear; heads several in a congested corymbiform cluster, on peduncles less than 5 mm. long or subsessile; involucre densely woolly, 5-6 mm. high, 3 mm. broad; rays 3 or 4, 5-7 mm. long, slightly 3-lobed; disk flowers 8 to 12; achenes and pappus scales densely long-villous; pappus scales subulate to lanceolate, acute, about half as long as the corolla. Frequent, Trans-Pecos, Rio Grande Plains and extreme w. end of Edwards Plateau, waifed farther e., spring-fall; Tex., Chih., Coah., Dgo., N.L., S.L.P., Son., Tam. and Zac.

Reputed to be poisonous to livestock.

2. *Psilostrophe villosa* Rydb. Herb loosely to densely long-villous, 1-6 dm. tall; basal leaves spatulate to oblanceolate, entire or some 3- to 5-lobed, short-petioled, 5-10 cm. long; upper leaves smaller and sessile, rarely lobed; heads several in small congested cor-

²²⁹ Adapted from C. B. Heiser, Jr. in Ann. Missouri Bot. Gard. 31:279-301. 1944.

ymbiform clusters, on peduncles less than 5 mm. long or sessile; involucre densely woolly, 5 mm. long, 3 mm. broad; rays 3 or 4, 3-5 mm. long, 3-lobed about half their length or rarely 4-lobed; disk flowers 5 to 12, usually 6 to 8; achenes glabrous or essentially so; pappus scales linear-lanceolate, acute, half as long as the disk corolla or more. Frequent in Plains Country, infrequent in the Trans-Pecos and Rio Grande Plains, waived farther e., spring-fall; Kan., Okla., Tex. and N.M.

Closely related to *P. gnaphalodes* and replacing it to the north.

3. *Psilostrophe tagetina* (Nutt.) Greene. Perennial herb; stems densely to slightly villos, occasionally glabrate, 1-5 dm. tall; basal leaves ovate to oblanceolate or usually spatulate, entire or pinnately lobed, densely to slightly villous, 2-10 (-15) cm. long, less than half as broad; upper leaves linear to oblanceolate or spatulate, occasionally lobed, smaller and greener than the basal leaves, 1-7 cm. long; heads generally numerous in dense to loose corymbiform clusters; peduncles usually 5-20 (-30) mm. long; involucre usually densely woolly, 5-7 mm. long, 3-4 mm. broad; rays 3 to 5, 5-12 mm. long, shallowly 3-lobed; disk flowers 6 to 12; achenes glabrous or with a few short and scattered hairs; pappus scales various, lanceolate or lance-elliptic to oblong, obtuse to acute, entire to erose, from half to two-thirds the length of the disk corolla. Incl. var. *lanata* A. Nels. Frequent in the Trans-Pecos, infrequent in s. part of Plains Country and rare in w. part of Edwards Plateau, spring-fall; Ariz., N.M., Tex., Chih., Coah. and Ut.

118. BAILEYA HARV. & GRAY

A North American desert genus of about 3 species.

1. *Baileya multiradiata* Harv. & Gray. Annual or weak perennial herb, flowering the first year, (1-) 2-3 dm. tall, with 1 to several stems from the base; stems ascending for most of the length, sparingly branched, leafy except in the upper 5-15 cm. of the length which is naked and pedunculiform, whitish or grayish floccose-woolly throughout; heads solitary on the peduncles; involucre of 2 or 3 subequal series of woolly phyllaries 5-6 mm. long; receptacle flat or slightly convex, naked; *ray flowers* about 30 or 40, pistillate, fertile; rays about 1 cm. long, broadly linear, bright-yellow, distinctly 3-toothed terminally, persistent and becoming papery in texture; *disk flowers* numerous, perfect, fertile; corolla yellow, 5-toothed; achenes somewhat dorsiventrally flattened or somewhat prismatic, pale, many-striate, truncate; pappus absent. *B. pleniradiata* Harv. & Gray and var. *perennis* A. Nels., *B. Thurberi* Rydb. Very abundant in Trans-Pecos deserts, rare in Edwards Plateau, almost any month; Calif., Ut., Nev., N.M., Ariz., Tex., Chih. and Coah.

Reputed to be highly toxic to livestock.

119. HYMENOPAPPUS L'HÉR.²³⁰

WOOLLY-WHITE

Biennial and perennial subscapose to leafy-stemmed herbs from a single unbranched obconical taproot (in biennial species) or from a woody much-branched taproot bearing several crowns (in perennials); stems erect; leaves alternate, forming a basal rosette, mostly bipinnately dissected to rarely simple or merely lobed, reduced up the stem, minutely impressed-punctate, with usually inrolled margins; heads in a few- to many-headed cymose aggregation, on slender peduncles; involucre subturbinate to broadly campanulate, of 6 to 14 subequal phyllaries in 2 or 3 series (these membranous at the apex or rarely throughout); receptacle dome-shaped to nearly flat, naked; *ray florets* when present (in *H. biennis* only) pistillate and fertile, with conspicuous white ligules; *disk florets* with regular corollas (at least the throat), yellow to white or less often reddish-purple, narrowed below into a slender mostly glandular tube and above this (after anthesis) an abruptly flaring campanulate to funnelform throat, the equal lobes ovate and reflexed after anthesis; achenes with 4 faces, obpyramidal to rarely incurved and diagonally compressed, the narrow base often shortly stipitate (in biennial species), faces 0- to 3-nerved, glabrous to densely pubescent with ascending or spreading hairs; pappus when present of 12 to 22 linear-oblong or broadly ovate obtuse hyaline scales, usually with an included medial nerve.

About 10 species, in the United States and Mexico.

²³⁰ Adapted from B. L. Turner in *Rhodora* 58:163-186, 208-242, 251-269, 295-308. 1956.

1. Perennial with roots bearing several to many crowns; stem leaves few to none or 1 to 4 per stem; heads 1 to 6 per stem; corolla throat 2.5 to 4 times as long as the lobes 1. *H. filifolius* var. *cinereus*.
1. Biennials or less commonly robust winter annuals with roots usually bearing a single crown; stem leaves usually more than 10; corolla throat 1 or 2 (to 3) times as long as the lobes (2)
 - 2(1). Heads with white rays 2. *H. biennis*.
 2. Ray flowers absent (3)
 - 3(2). Corolla tube 1.5-2 (-2.2) mm. long; basal rosette leaves bipinnately dissected, the ultimate segments mostly linear and 0.5-6 mm. broad; flowers yellow or white; corolla throat campanulate (very rarely funnelform) (4)
 3. Corolla tube 2-3 mm. long; basal rosette leaves simple to bipinnate with ultimate segments 5-20 mm. broad; flowers white or vinaceous, never yellow; corolla throat funnelform (rarely campanulate) (5)
 - 4(3). Flowers white; ultimate leaf segments narrowly linear, 0.5-1.5 mm. broad 3. *H. tenuifolius*.
 4. Flowers yellow; ultimate leaf segments short, 1-6 mm. broad 4. *H. flavescens*.
 - 5(3). Basal rosette leaves pinnately to bipinnately parted; flowers white; pappus 0.2-0.8 (-1) mm. long; plants of clayey soils 5. *H. scabiosaeus* var. *corymbosus*.
 5. Basal rosette leaves simple to pinnately parted; flowers vinaceous or reddish-tinged (rarely completely white); pappus 0.5-2 mm. long; plants of sandy soils 6. *H. artemisiaefolius*.

1. *Hymenopappus filifolius* Hook. var. *cinereus* (Rydb.) I. M. Johnst. Perennial 15-40 cm. high, sparsely grayish-green tomentose; principal rosette leaves 5-14 cm. long, bipinnately dissected with linear filiform divisions 0.5-1 mm. wide, conspicuously impressed-punctate; stem leaves none or usually 2 to 4, much-reduced upwards; heads 1 to 6 per stem, subturbinate to campanulate, 25- to 40-flowered, on ultimate peduncles 1-6 cm. long; principal phyllaries 6-9 mm. long, 2-4 mm. wide, glabrous to densely tomentose, yellow or rarely white-membranous for 1-2 (-3) mm. from the acute to obtuse tip; corolla yellow or rarely white (ochroleucous), 3-4.5 mm. long, the tube moderately glandular and 1.5-2.5 mm. long, the throat campanulate and 1.5-2.5 mm. long with lobes reflexed, 2.5 to 4 times longer than the lobes; achenes 4-6 mm. long, evenly pubescent with conspicuous hairs 1-3 mm. long; pappus of 14 to 18 linear-oblong scales 1.5-2 mm. long. Frequent in higher parts of Plains Country, May-Sept.; Ut., Ariz., Colo., N. M. and Tex.; with 13 varieties, this species as a whole is distributed from Alta., Sask. and Wash., s. to Baja Calif., Ariz., N.M. and Tex.

2. *Hymenopappus biennis* B. L. Turner. Biennial 6-10 dm. tall; stems single from each taproot, much-branched and leafy, tomentose to nearly glabrate; basal rosette leaves 6-16 cm. long, 3-6 cm. broad, bipinnately dissected into linear mostly flattened ultimate segments 6-20 mm. long and 1-3 mm. wide, sparsely tomentose to nearly glabrate, conspicuously impressed-punctate; stem leaves 10 to 40, gradually reduced upward; heads in a large much-branched cymose aggregation, 20 to 40 per stem, 40- to 60-flowered, on ultimate peduncles 1-6 cm. long; principal phyllaries 5-8 mm. long, 3-5 mm. wide, sparsely tomentose to nearly glabrate, yellow-membranous for 1-2 mm. from the acute to obtuse tip; *ray flowers* 8, pistillate and fertile, tubular at the base for about 2 mm., extending into a conspicuous white ray 14-16 mm. long and 6-8 mm. wide, not cleft at the apex or obscurely so; *disk flowers* yellow, 3-3.5 mm. long, the tube densely glandular and 1.5 mm. long, the throat campanulate and 1.5-2 mm. long with lobes reflexed, 2 to 3 times as long as the acute lobes; achenes black, glabrous (or with a few sessile glands near the apex), 4 mm. long, obpyramidal, 4-sided, becoming incurved near the periphery of the head; pappus obsolete or nearly so (0-0.2 mm. long). Calcareous soils at elev. above 6,000 ft., Guadalupe Mts. in the Trans-Pecos, July-Oct.; also N.M.

3. *Hymenopappus tenuifolius* Pursh. Biennial 4-15 dm. tall; stems from a single taproot (rarely 2 crowns forming on a root, especially on injured plants), erect, much-branched, sparsely white-tomentose to more frequently nearly glabrous; leaves alternate,

forming the first year a basal rosette, the larger basal leaves 8-15 cm. long and 4-5 cm. wide, bipinnately dissected with linear or filiform ultimate segments 0.5-1.5 mm. wide, conspicuously impressed-punctate; stem leaves 8 to 30, becoming reduced upwards; heads numerous (20 to 200), 25- to 50-flowered, on pubescent to glabrate ultimate peduncles 1-5 cm. long, in a flat-topped cymose aggregation; involucre campanulate; principal phyllaries mostly glabrate (rarely tomentose) or densely glandular, 5-8 mm. long, 2-4 mm. wide, yellowish-membranous for 1-2 mm. from the acute to obtuse tip; ray flowers absent; disk corollas white, 2.5-3 mm. long, the glandular tube 1.5-2.2 mm. long, the campanulate throat 0.8-1.5 mm. long with lobes reflexed, 1.5 to 2 times longer than the lobes; achenes 3.5-4.5 mm. long, 4-sided, the faces 2- or 3-nerved, pubescent principally on the corners with hairs 0.5-1 mm. long; pappus of 16 to 18 linear oblong scales 1-1.5 (-2) mm. long. Calcareous loamy soils, Plains Country and n.-cen. Tex., s. to the n. edge of the Rio Grande Plains, May-Aug.; S.D. and Colo., s. to Tex. and N.M.

4. *Hymenopappus flavescens* Gray var. *flavescens*. Biennial 45-90 cm. high, the stems single from each taproot; larger rosette leaves 6-14 cm. long, sparsely canescent to glabrate above, densely tomentose below (rarely tomentose on both surfaces), bipinnately parted (except for the first 1 to 4 leaves) with broad ultimate segments mostly 2-6 mm. wide; stem leaves 15 to 40, becoming reduced upward; heads 30 to 100 per stem, campanulate, 30- to 70-flowered, on short ultimate peduncles 0.5-3 cm. long, in a many-headed mostly congested cymose arrangement; principal phyllaries pubescent to glabrate, 4-5 (-6) mm. long, 2-4 mm. wide, yellow-membranous for about 1 mm. from the acute or narrowly obtuse tip; ray flowers absent; disk corollas bright-yellow, 2.5-3.5 mm. long, the tube densely to sparsely glandular and 1.5-2 mm. long, the throat abruptly campanulate to campanulate-funnelform and 0.8-1.5 mm. long with lobes reflexed, as long as the lobes (rarely shorter); achenes obpyramidal, 4-sided, 3.5-4 mm. long, pubescent principally on the corners with hairs 0.3-1 mm. long; pappus of 18 to 20 linear oblong scales 0.5-1 (-1.2) mm. long. Distinguished from the other variety below by the following combination of characteristics: leaf segments 2-6 mm. broad; leaves generally glabrous or less pubescent above, pappus 0.5-1 (-1.2) mm. long. Plains Country, May-Sept.; Kan. and Colo., s. to Tex. and N.M.

Var. *cano-tomentosus* Gray. Biennial 3-9 dm. tall, the stems typically densely tomentose and single from each taproot (rarely 2 crowns forming on injury); larger rosette leaves 6-15 cm. long, 2-4 cm. wide, evenly pubescent on both surfaces, usually densely tomentose but often merely canescent, bipinnately dissected with the small narrow ultimate segments 1-2 mm. wide; stem leaves 10 to 50, becoming reduced upwards; heads 15 to 100 per stem, campanulate, 30- to 90-flowered, on ultimate peduncles 1-6 cm. long; principal phyllaries (4-) 5-8 mm. long, 2-4 mm. wide, densely tomentose to nearly glabrate, yellow-membranous for about 1 mm. from the acute to rarely obtuse tip; ray flowers absent; corollas yellow, 2.5-3.5 mm. long, the tube glandular and 1.5-2 mm. long, the throat abruptly campanulate and 1-1.5 mm. long with lobes reflexed, 1 to 1.5 times longer than the lobes; achenes obpyramidal, 4-sided, 3-4.5 mm. long, evenly pubescent with hairs 0.5-1.5 mm. long; pappus of 16 to 22 linear oblong scales, 1-1.5 mm. long (very rarely less). Distinguished from the var. *flavescens* by the following characters: leaf segments 1-2 mm. broad; leaves usually evenly pubescent on both surfaces; pappus 1-1.5 mm. long, rarely less. Locally abundant in sandy soils in the Trans-Pecos, Apr.-Aug.; N.M., Ariz., Tex. and Chih.

5. *Hymenopappus scabiosaeus* L'Hér. var. *corymbosus* (T.&G.) B. L. Turner. OLD PLAINSMAN. Biennial 4-10 dm. tall; stems single from each taproot (rarely two crowns forming, especially on injured plants), erect, usually much-branched, tomentose to nearly glabrate; leaves forming the first year a basal rosette, the primary leaves entire to variously lobed, the later-formed rosette leaves becoming pinnately dissected, 5-15 cm. long, 5-7 cm. wide, mostly glabrate or sparsely canescent above, more tomentose below, the ultimate divisions linear, acute and 2-8 mm. wide; stem leaves (on well-developed plants) 15 to 30, becoming reduced upward; heads campanulate, numerous (40 to 100), 20- to 60-flowered, on densely strigose ultimate peduncles 5-30 mm. long, these without conspicuous petaloid bracts at their bases; involucre campanulate; principal phyllaries 5-9 mm. long, 2-4 mm. wide, glabrate above, pubescent below, yellowish-white or white membranous for 2-4 mm. from the acute to narrowly obtuse tip; ray flowers absent; disk corollas white or creamy white, 3-4 mm. long, sweet-scented, the tube sparsely glandular

and 2-3 mm. long, the funnellform throat 1-1.5 mm. long, with lobes reflexed, the lobes equal to or nearly as long as the throat; achenes obpyramidal, 4-sided, 3-4 mm. long, short-pubescent (especially on the corners) with hairs 0.1-0.5 mm. long, the faces 2- or 3-nerved; pappus of 14 to 18 obtuse or spatulate scales, 0.2-0.8 (-1) mm. long. Frequent in calcareous often tight clay prairie soils, lower parts of Plains Country, n.-cen. Tex., s.w. part of e. Tex., s.e. Tex., Rio Grande Plains, Edwards Plateau and s.e. part of the Trans-Pecos, Mar.-July; Neb., s. to Coah. and Tex. The var. *scabiosaeus* occurs in Fla., Ga., S.C., Miss., Ind., Ill. Mo, Ark. and Okla.

6. *Hymenopappus artemisiaefolius* DC. var. *artemisiaefolius*. Biennial 4-9 dm. tall, tomentose to nearly glabrate; larger rosette leaves 8-18 cm. long, simple to once-pinnate with broad primary divisions, 6-30 mm. wide, mostly densely tomentose on the lower surface, becoming glabrate above; stem leaves (6 to) 8 to 16, not much-reduced upward; heads 30 to 60 per stem, campanulate, on ultimate peduncles 1-4 (-6) cm. long; principal phyllaries broadly elliptic to ovate, 6-12 mm. long, 3-7 mm. wide, snowy-white-membranous for about half their length or more (often tinged with red); corollas rosy-vinaceous to rarely completely white, 3.5-5 mm. long, the tube moderately glandular and 2.5-3 mm. long, the funnellform throat 1-1.5 mm. long, with lobes reflexed, 1.5 times as long as the lobes; achenes obpyramidal, 4-sided, 3.5-4 mm. long, principally pubescent on the corners with short white hairs 0.3-0.6 mm. long, the faces 2- or 3-nerved; pappus of 16 to 18 oblong scales 0.5-1 (-1.5) mm. long. Frequent in sandy soils, e., s.e. and n.-cen. Tex., Mar.-May; also La.

Var. *riograndensis* B. L. Turner. Biennial 45-100 cm. high; principal rosette leaves 1-2 dm. long, 2-5 cm. wide, tomentose on both surfaces, simple to once-pinnate with broad coarsely toothed divisions; stem leaves 2 to 8, much-reduced upward; heads 20 to 60 per stem, campanulate, 40- to 60-flowered, on slender bractless ultimate peduncles 2-5 cm. long, in a large open cymose-paniculate aggregation often comprising two thirds of the plant height; principal phyllaries 5-7 mm. long, 2-4 mm. wide, the apex narrowly obtuse or acute with an inconspicuous yellow-membranous tip 1-(2) mm. long or less; corollas "yellow-reddish," 3-3.5 mm. long, the tube sparsely glandular and 2 mm. long, the campanulate-funnelform throat 1.5 mm. long with lobes reflexed, 1 to 1.2 times longer than the acute lobes; achenes 4-5 mm. long, pubescent principally on the corners with white hairs (0.8-) 1-1.2 mm. long; pappus of 16 to 18 linear oblong scales 1.5-2 mm. long. Frequent in deep loose pure sandy soil, Rio Grande Plains (specimens intermediate between the 2 varieties are found as far north as Refugio Co.), Mar.-May; endemic.

120. ANTHEMIS L. CAMOMILE

A genus of several species, mostly European; one is adventive with us. *A. nobilis* L. is the usual source of "camomile," a useful stomach drug. *Maruta* Cass.

1. *Anthemis Cotula* L. MAYWEED, DOG-FENNEL. Ill-scented taprooted annual 2-5 dm. tall, usually with several stems from the base; leaves alternate, bipinnatifid, the divisions linear; heads terminal and solitary on the branches which are naked for the upper 1-3 cm.; involucre saucer-shaped, about 3 mm. high, 6-8 mm. broad; phyllaries in 2 series, subequal, mostly scarious, elliptic, obtuse or acutish, pubescent; receptacle high-conic, chaffy toward the apex, the subulate pales stiff; ray flowers 10 to 15, infertile; rays white, 6-8 mm. long, about 2 mm. broad; disk flowers numerous, perfect, fertile; corolla greenish-yellow, glandular-granuliferous, 2 mm. long, with 5 teeth; achenes cylindric, 1-1.5 mm. long, nearly ribless or very weakly 10-ribbed; pappus absent. Scattered in waste places in the e. two thirds of Tex., escaped from cult., Mar.-June; a Eur. herb now widely adv. in the world.

121. ACHILLEA L.

A large genus of north-temperate areas.

1. *Achillea millefolium* L. COMMON YARROW, MILFOIL. Perennial herb with 1 to several stems from the base, 2-10 dm. tall; leaves alternate, bi- or tripinnatifid, variably pubescent, rather fernlike; heads with about 10 to 20 flowers, in terminal corymbose rather dense clusters; involucre turbo-cylindric, 4-5 mm. high, 2.5-4 mm. thick; phyllaries in about 4 series, graduated, mostly scarious; receptacle chaffy, the stiffish pales oblong; ray flowers

present, 5 to 12; rays white; tube of disk corolla more or less flattened; corolla whitish or yellowish-white, 5-toothed; achenes more or less obcompressed, subrhombic to obliquely triquetrous in transection, oblong or obovate in outline, callous-margined, glabrous; pappus absent. Frequent in disturbed soil, n. half of Tex., spring-summer; nat. of Eur. and Asia, with varieties nat. to nearly all of N. A.

Ours are mostly of the var. *occidentalis* DC. with rays about 2 mm. long, but the Trans-Pecos plants tend toward the var. *lanulosa* (Nutt.) Piper with rays 2.5 mm. long or longer.

122. ARTEMISIA L.* WORMWOOD. SAGEBRUSH

Perennial herbs or less commonly subshrubs or rarely shrubs, with several virgate stems from the base that are somewhat branched upward, the entire plant often (2-) 5-10 dm. tall, glabrous to tomentose, usually aromatic; leaves alternate; heads small, urceolate at anthesis (except in *A. frigida*), narrowly campanulate in fruit, usually nodding and aggregated in rather many-headed sometimes leafy panicles, often with hundreds of heads per stem; involucre only 3-6 mm. high; phyllaries with very broad scarious margins (the scarious texture sometimes obscured by the dense pubescence), in 2 distinct size-classes and three rather definite series; outer phyllaries about a fourth to a half as long as those of the inner 2 series, usually lanceolate and acute, forming a calyculum; middle and inner phyllaries nearly equal in length but the middle ones very broad, nearly as broad as long and blunt, the inner ones elliptic and blunt to acutish; receptacle convex or often conical, naked or rarely hairy; flowers few; ray flowers present, 1 to few, pistillate, fertile or infertile; corolla 1 mm. long or less, yellowish-white, mostly in the form of a cylinder with a V-shaped gap down most of the side toward the disk; disk flowers 3 to 20, about equaling the longer phyllaries, perfect, infertile or fertile, with minute yellowish-white equally 5-toothed corollas; achenes about 1 mm. long or less, usually plump-elliptic in transection, rarely nearly cylindrical, in outline obovate-oblong or oblong, very faintly or weakly 10-costellate, translucent-brown; pappus absent.

A genus of a few hundred species in the cooler, drier parts of the world. The plants are wind-pollinated and have toxic, allergenic pollen. The beverage absinthe is made by steeping the leaves of *A. absinthium* L. in alcohol. Tarragon, an herb used in cooking, is the herbage of *A. Dracuncululus* L., a species fairly closely related to our species *A. glauca*. The over-abundant "sagebrush" of the western plains is *A. tridentata* Nutt. Most of our species afford some low-quality forage for livestock.

- 1. Receptacle hairy; rare in Trans-Pecos mts. 1. *A. frigida*.
- 1. Receptacle naked (2)
- 2(1). Shrubs; leaves sordidly-tomentose, 15-25 mm. long and 2-4 mm. broad, at the extreme tip cuneate-dilated and 3-toothed with each tooth 1-2 mm. long; rare in west Texas 2. *A. Bigelovii*.
- 2. Herbs or subshrubs, if approaching a shrubby habit (in *A. filifolia*) the foliage quite different from that above (3)
- 3(2). Leaves linear-filiform or very deeply dissected into linear-filiform segments, only 1 or 2 (or 3) times as broad as thick or if several times as broad as thick then of the same color and pubescence on both sides; disk flowers infertile; ray flowers fertile but maturation long-delayed (4)
- 3. Leaves either broader or with broader segments or if these fairly narrow then often somewhat revolute with slightly to much-contrasting color and vesture on the 2 surfaces; disk flowers fertile; ray flowers rarely fertile (6)
- 4(3). Definitely subshrubby; leaves canescent-pubescent, usually densely so 5. *A. filifolia*.
- 4. Usually mostly herbaceous; leaves not canescent (5)
- 5(4). Leaves of the upper stems and head-bearing region dissected to the base, usually with a main axis and near the base on each side with 1 or 2 segments 6. *A. caudata*.
- 5. Leaves of the upper stems and head-bearing region entire or rarely a few of them with a few lobes 7. *A. glauca*.

* See also *Cotula* in Appendix.

- 6(3). Leaves 5-20 mm. long, either entire and linear or pinnately dissected into few linear lobes 1 mm. broad or narrower4. *A. Carruthii*.
 6. Leaves usually 10-60 mm. long, if dissected the lobes broader than 1 mm.
3. *A. ludoviciana*.

1. *Artemisia frigida* Willd. PRAIRIE-SAGEWORT. Woody at the extreme base; leaves only about 1 cm. long and much-dissected into narrow segments, canescent-pubescent; heads in a loosely spikelike arrangement on the upper 5-10 cm. of the stems, many-flowered; receptacle hairy. Very rare in Trans-Pecos mts. if still extant, collected once near the Eagle Mts. in 1881, late summer; Sask. to Minn., s. to Tex., Ariz.; also Sib.

2. *Artemisia Bigelovii* Gray. Shrub 2-4 dm. tall; stems many from the base, spreading; twigs densely sordid- or canescent-pubescent; leaves 15-25 mm. long, 2-4 mm. broad, tip cuneate-dilated and 3-toothed with each tooth 1-2 mm. long; ray flowers 1 (or 2) per head; disk flowers 3 to 5, fertile. Rare in the Trans-Pecos and Plains Country, (Sept.-) Oct.; Colo., Ut., Tex., N.M. and Ariz.

Exceedingly similar to and closely related to the true sagebrush, *A. tridentata*, differing only in the technical detail of presence of a ray flower in each head. Probably *A. Bigelovii* should be considered merely a race of *A. tridentata*.

3. *Artemisia ludoviciana* Nutt. WESTERN MUGWORT, WHITE SAGE. Perennial herb, rarely slightly subshrubby below, often subrhizomatous, several- to many-stemmed from the base, (2-) 3-9 (-15) dm. tall, all the herbage grayish- or whitish-pubescent except in some plants the upper surface of the leaves nearly glabrous; leaves entire or dissected, the main axis and lobes usually 3-10 mm. broad, exceedingly variable in shape; involucre usually closely grayish- or whitish-woolly; ray flowers present, occasionally fertile, usually infertile. *A. mexicana* Willd., *A. gnaphalodes* Nutt., *A. vulgaris* var. *americana* Bess., *A. Lindheimeriana* Scheele, *A. redolens* Gray, *A. rhizomata* A. Nels., *A. texana* Rydb., *A. albula* Woot. & Standl. Frequent to infrequent over much of Tex. except the extreme s., summer-fall; widespread in temp. N. A.

The exceedingly variable habit and herbage have led to attempts to recognize numerous variations but these show so little geographic or morphic discreteness that nothing is gained by these attempts. The species has been considered, perhaps correctly, to be conspecific with the Eurasian *A. vulgaris* L.

4. *Artemisia Carruthii* Carruth. Rhizomatous perennial herb 1-3 (-5) dm. tall; stems several from the base, about 1 mm. thick; herbage closely canescent-woolly; leaves slightly darker on the upper surface than the lower, 5-20 mm. long, entire and linear or pinnately dissected into few linear lobes 1 mm. broad or narrower and often slightly revolute-margined; disk flowers fertile; ray flowers rarely fertile; involucre closely canescent-woolly. *A. Wrightii* Gray, *A. kansana* Britt. Locally abundant in Davis Mts. of the Trans-Pecos, rare in higher parts of Plains Country, July-Sept.; Kan. to Chih., Ariz., Ut. and Colo.

Perhaps intergrading to a limited extent with *A. ludoviciana*.

5. *Artemisia filifolia* Torr. SAND SAGE. Suffrutex; leaves or their lobes decidedly filiform, as thick as broad and grayish or canescent all over; heads only about 2 mm. long and exceedingly numerous in leafy panicles; ray flowers belatedly maturing achenes (long after the infertile disk flowers, which have nearly entire styles, have shed their pollen). Very abundant locally in areas of dunes or other deep loose sand, in the Trans-Pecos and higher parts of the Plains Country, Apr.-May; Sept.-Oct.; Wyo. and Neb. to Chih., Ariz. and Nev.

6. *Artemisia caudata* Michx. Biennial or weakly perennial herb with taproots and 1 to few stems from the base, 3 to 9 dm. tall; leaves 2-5 cm. long, very deeply (most of them) pinnately or pedately dissected, the divisions linear-filiform, nearly glabrous, drying dark-olive-green; heads about 3 mm. long, very numerous in elongate leafy paniculiform aggregations, not woolly, essentially glabrous; ray flowers belatedly maturing achenes; disk flowers infertile. *A. campestris* L. subsp. *caudata* (Michx.) Hall & Clem. Local in the Trans-Pecos and Plains Country, Sept.-Oct.; scattered over much of the U.S.

Intergrading with *A. glauca* and differing from it in the denser aggregations of heads, the tendency toward dissection of the foliage and the darkness of the color upon drying, all differences of degree. The superficially slightly similar *A. annua* L. has been found in sandy soil very near our limits north of Perryton, and no doubt will eventually be found in Texas; it has fertile disk flowers and a definitely annual taproot.

7. *Artemisia glauca* Pall. Perennial herb with woody crown; stems several, nearly simple, slender, usually purplish, nearly glabrous, to 13 dm. tall; leaves (at least those of the upper 1 to 4 dm.) linear, entire, 1-5 cm. long, rarely with 1 or 2 lateral lobes; heads about 3 mm. long, usually not crowded, not woolly, essentially glabrous; ray flowers belatedly maturing fruit; disk flowers infertile. *A. dracunculoides* Pursh, *A. dracunculina* Wats. Frequent in Plains Country and Trans-Pecos, infrequent to rare in Edwards Plateau, Aug.-Oct.; widespread in w. N. A.; also widespread in dry-temp. parts of Sib. and other areas of the Old World. (See remarks under *A. caudata*.)

123. SOLIVA R. & P. BURWEED

Low-growing taprooted annuals, usually only 2-10 cm. high, rosettelike and essentially acaulescent or else slightly proliferous with numerous short spreading stems; leaves alternate but the phyllotaxy often very obscure because of approximation of nodes just below the heads, the petioles slender; blades usually deeply tripinnately dissected or in some merely bipinnatifid, the divisions lance-linear or linear-deltoid; heads terminal but sessile in clusters of leaves (in the proliferous species the branches several, emerging from the axils just below the heads); involucre hemispheric, 3-5 mm. high; phyllaries numerous, lanceolate, in 2 subequal series, with broad scarious margins; receptacle low-conical, hairy around the sockets; flowers numerous; peripheral flowers corresponding to ray flowers, pistillate and fertile, the corollas absent; central flowers seemingly perfect but infertile, with a minute whitish 4-toothed corolla; achene dorsiventrally flattened, with lateral wings or somewhat winglike appendages, crowned by the persistent noxious spinelike erect style about as long as the achene; pappus absent. *Gymnostyles* Juss.

A genus of about 9 species centered in South America, with weedy tendencies and now widely distributed by man. These are noxious weeds because of the persistent styles, which are more injurious even than *Cenchrus* burs when the unwary hand or bared foot comes in sudden contact with the mature fruit head.

- 1. Achenes with broad lateral wings which are indented toward the lower half with a lobe below, glabrous apically3. *S. pterosperma*.
- 1. Achenes with thick lateral appendages that are only vaguely winglike and not lobed, hairy apically (2)
- 2(1). Lateral appendages of the achenes with divergent acute projections or shoulders at the top, one on each side of the achene at the level of the base of the style ..
.....2. *S. stolonifera*.
- 2. Lateral appendages of the achenes not having any acute projections
.....1. *S. Mutistii*.

1. *Soliva Mutisii* H.B.K. BUTTON BURWEED. Annual herb essentially acaulescent, with a number of heads clustered in the basal rosette; leaves several cm. long, much-dissected and sordid-villous all over, especially at the base; achenes with thick lateral appendages, the width about constant or very slightly wider toward the hairy apex, often with irregular transverse corrugations. Locally abundant in disturbed ground, s.e. and e. Tex. and Rio Grande Plains, (Feb.-) Mar.-Apr.; Col., Ecu.; adv. in Tex.

Our plants have been mistaken for the closely related and perhaps conspecific *S. anthemifolia* (Juss.) R. Br. of Brazil, Paraguay and Argentina; plants of the latter species are nearly glabrous.

2. *Soliva stolonifera* (Brot.) Loud. Annual, much-proliferous and rooting under the scattered head-bearing rosettes; leaves usually merely pinnatifid to bipinnatifid; achenes with thick lateral appendages (with prominent transverse rugae) becoming noticeably wider upward and (at the level of the juncture of achene and style) with a pointed lateral projection; achene hairy terminally. Rare and local in e. and s.e. Tex. (Bastrop, Hardin, Leon and Nueces cos.), Mar.-Apr.; Urug. and Arg.; now widely adv.

3. *Soliva pterosperma* (Juss.) Less. Annual herb, proliferous, rooting at the lower nodes, the heads scattered and never clustered near the base; leaves tripinnatifid, small, the bases of the petioles much-dilated beneath the heads; achenes with broad very firm wings which on each side are divided by an indentation into a smaller lower lobe and a larger upper lobe, the upper lobe on each side in some plants with an erect spinose

projection very near the side of the style, apex of achene glabrous. Local in e. and s.e. Tex., Apr.-May; Braz., Parag., Urug., Arg., Chile; widely adv. elsewhere.

124. BARTLETTIA GRAY

There is but a single species.

1. *Bartlettia scaposa* Gray. Taprooted annual herb 1-3 dm. tall, sparsely hirsute to nearly glabrous; leaves alternate, 1-2 cm. long, 7-17 mm. broad, clustered at the base or cauline, ovate with deeply and widely serrate margins or those at midstem pinnately lobed, the basal lobes usually large with acute apices; petioles usually about 25 mm. long but often to 35 mm.; heads solitary on peduncles 9-15 cm. long, naked except sometimes for 1 or 2 minute bracts; phyllaries linear-lanceolate, about 18 to 20 in 2 series, sparsely hirsute to hirsute dorsally, thin, indistinctly 2- or 3-nerved; inner (principal) phyllaries 7-10 mm. long, 2-4 mm. broad, with scarious margins; outer phyllaries successively shorter and narrower, 5-7 mm. long, 1.5-2 mm. broad; receptacle convex-conical, tuberculate-alveolate; pales linear-lanceolate, membranous, ciliate, about as long as the achenes, deciduous with and adnate to at least the inner achenes; *ray flowers* 10 to 12, pistillate, fertile, the corollas tubular for 3.5-4 mm. from the top of the achene; rays 4-7 mm. long, oblong, 3-toothed terminally, yellow; *disk corolla* 5-7 mm. long, with a cylindrical tube 2.5-4.5 mm. long gradually merging into the funnellform throat 2-2.8 mm. long, the 5 erect lobes 1 mm. long and acute; achenes compressed, about 3 mm. long and 1 mm. broad, ciliate on the margins, 1- or 2-nerved on each face; pappus bristles 18 to 20, 4.5-6 mm. long, in a single series, slightly unequal, fuscous. Very rare in Trans-Pecos deserts (10 miles s.e. of McNary, Hudspeth Co.), Oct.; Dgo., Chih., Tex. and N.M.

125. PSATHYROTES GRAY

BRITTLE-STEM

A western American genus of about 4 species.

1. *Psathyrotes scaposa* Gray. Taprooted annual or weak perennial, 1- to several-stemmed from the base, ascendingly rebranched above, 1-2 (-3) dm. tall; leaves crowded at or near the base, with subrhomboid blades (1-) 2-4 cm. long, scurfy-pubescent to tomentose, serrate or irregularly undulate on the distal margin; petioles about as long as the blades; stems often essentially naked and subscapose but somewhat branched, heads (1 or) 2 to 10 per main stem; involucre hemispheric (rarely obconic); principal phyllaries about 21, 5-7 mm. long, equal, in a double row, dorsally glandular- or scurfy-pubescent, thin-marginal; receptacle naked, essentially flat or with a minute umbo centrally; *ray flowers* absent; flowers all alike, perfect, fertile, the corollas yellowish-white to creamy-white and equally 5-toothed; achenes narrowly obpyramidal, 3- or 4-faceted, pubescent; pappus of many coarse tawny or buffy bristles, these united below into 5 scales. *Pseudobartlettia scaposa* (Gray) Rydb. Frequent in Trans-Pecos deserts, Feb.-May (June) and Sept.-Nov.; Tex., N.M. and Chih.

126. SENECIO L.

GROUNDSEL. RAGWORT. SQUAW-WEED

Herbs or subshrubs; leaves alternate, often pinnatifid; involucre usually campanulate or obconic-campanulate (or urceolate at anthesis); phyllaries usually in 2 size-classes; longer (inner) phyllaries 12 to 25, equal in length, in a double row, linear, often acute, with a herbaceous median area and usually thin margins; outer phyllaries much shorter, subulate-setaceous, forming a calyculum or in many species entirely absent; receptacle slightly convex, essentially naked; *ray flowers* present, pistillate, fertile; rays linear or elliptic-linear, yellow, terminally 3-toothed; *disk flowers* numerous, perfect, fertile; corolla equally 5-toothed, yellow; achenes columnar, nearly terete, several-nerved, alike in ray and disk; pappus of numerous capillary bristles.

An enormous world-wide genus of between 2,000 and 3,000 species, reputed to be among the several largest seed-plant genera.

1. Subshrubby perennials of southern and western Texas with leafy ligneous stems; leaves linear or usually with linear axis plus linear lobes (2)
1. Annual or perennial herbs; leaves not linear and the lobes very rarely so (4)

- 2(1). Involucres campanulate or broadly obconic, with about 19 to 23 principal phyllaries14. *S. longilobus*.
2. Involucres narrowly obconic-campanulate, with about 12 to 14 principal phyllaries (3)
- 3(2). Leaves linear, rarely lobed13. *S. Warnockii*.
3. Leaves regularly pinnately lobed12. *S. spartioides*.
- 4(1). Leaves merely serrate, not lobed, usually only gradually reduced upward along the stem, in the lower half of the stem longer than the internodes (5)
4. Leaves usually lobed or if some of them unlobed then most of them crowded near the base and the stem leaves much reduced and remote (6)
- 5(4). With a floccose tomentum or nearly glabrous but not glandular-pubescent; east of Trans-Pecos Texas 2. *S. ampullaceus*.
5. Glandular- and usually somewhat viscid-pubescent; Trans-Pecos Texas 1. *S. Parryi*.
- 6(4). Annuals, usually with slender taproots; leaves well-distributed along the stem and only gradually reduced upward and very deeply pinnately lobed (7)
6. Perennials, usually rhizomatous or subrhizomatous; often with most of the leaves crowded near the base, usually becoming much-reduced and remote toward the middle of the stem (9)
- 7(6). Terminal lobe subreniform and incised-dentate; lateral lobes of the upper leaves usually cuneate, strongly contracted toward the axis into a linear basal portion 9. *S. imparipinnatus*.
7. Terminal lobe and lateral lobes irregularly shaped, often not dentate; lateral lobes only slightly if at all narrowed, the basal portions about half as wide as the terminal portions (8)
- 8(7). East Texas10. *S. glabellus*.
8. Trans-Pecos Texas and perhaps rarely Rio Grande Plains . 11. *S. Greggii*.
- 9(6). Leaves unlobed, all crowded at the base (except for 1 or 2 minute triangular bracts high on the scape), serrate, lance-obovate; plants glaucous and essentially glabrous 3. *S. Wootonii*.
9. At least some leaves of the plant pinnately lobed or if approaching unlobed then the plant not all glabrous (10)
- 10(9). Even the basal leaves pinnately lobed, those of midstem 3-10 cm. long, glabrous and with about 10 cuneate linear-based lobes on each side; Trans-Pecos mountains 8. *S. millelobatus*.
10. Basal leaves usually unlobed or if slightly lobed then those of midstem with fewer than 10 lobes on each side and the lobes oblong (11)
- 11(10). Plants persistently floccose-woolly at least in patches near the nodes (12)
11. Plants glabrous at maturity or with very small spots of wool near the base of each leaf (13)
- 12(11). Leaves of midstem usually deeply pinnately lobed; involucre glabrate 5. *S. plattensis*.
12. Leaves of midstem shallowly pinnately lobed or unlobed; involucre persistently pubescent 4. *S. tomentosus*.
- 13(11). Basal leaves thickish, firm, usually with a weakly lobed oblong portion distally and proximally narrowed to a petiole about the same length 6. *S. tridenticulatus*.
13. Basal leaves thin, weak, membranous, usually with an unlobed blade about as broad as long and a very thin petiole longer than the blade .. 7. *S. obovatus*.

1. *Senecio Parryi* Gray. MOUNTAIN GROUNDSEL. Annual (?) herb to 4 dm. tall; stems striate, densely glutinous-pubescent with crisped subglandular hairs; leaves pubescent like the stems, sharply and unequally dentate; stem leaves 5-10 cm. long, obovate, basally attenuate, at the very base dilated and auriculate-clasping; uppermost stem and branch leaves deltoid-lanceolate, also truncate-clasping; heads few, short-pedunculate; involucre 10-13 mm. high, at the base with a few acuminate calyculate bractlets; principal phyllaries

about 21; rays 12 to 15, oblong, yellow, 10-13 mm. long; achenes silky-gray. Rare in wooded canyons in the Trans-Pecos (Chisos Mts. at about 4-5,000 ft. elev.), Sept.-Nov.; Tex., Coah. and the Mogollon Mts. of N.M.

2. *Senecio ampullaceus* Hook. TEXAS GROUNDSEL. Taprooted annual 3-8 dm. tall; herbage either persistently whitish floccose-tomentose or nearly glabrate; leaves gradually reduced upward, well-distributed over at least three-fourths the length, dentate, unlobed; lowermost leaves lanceolate or lance-obovate, narrowed to a linear subpetiolar base and at the extreme base auriculate-clasping, those higher lance-deltoid and often truncate-clasping, mostly longer than the internodes which they subtend; involucre 7-11 mm. high, often urceolate at early anthesis but soon campanulate; principal phyllaries about 21. Abundant in sandy soils, Rio Grande Plains, n.-cen., e. and s.e. Tex., infrequent w. to Llano Region and the e. part of the Plains Country, spring; endemic.

3. *Senecio Wootonii* Greene. Perennial from a stubby crown about 1 cm. thick; stems nearly naked, glaucous, glabrous, 25-50 cm. tall, nearly simple except at the very top; leaves crowded at the base, glaucous, unlobed, serrate, oblanceolate or lance-obovate, 8-30 cm. long, acutish, basally narrowed to a long linear subpetiolar base; branches few, stiffly spreading or ascending 5-12 cm. long, naked-pedunculiform, each terminated by a head; principal phyllaries about 21, 8-13 mm. long. Rare in high moist canyons, Mt. Livermore, Davis Mts. in the Trans-Pecos, late spring-early summer; also s. N.M.

This is possibly a form of the New Mexican *S. microdontus* (Gray) Heller.

4. *Senecio tomentosus* Michx. Weakly perennial herb; stems 25-50 cm. long, mostly erect, floccose-woolly or less commonly mostly glabrate; leaves mostly crowded near the base, serrate; basal leaves with an oblong to lance-ovate blade (3-) 5-10 cm. long and a linear petiole (4-) 6-16 cm. long (upper portion of petiole sometimes with a few lobes), floccose or often glabrate; leaves of lower stem much-reduced as compared to the basal ones, lanceolate, incised-serrate, petiolate or sessile; the few remote bracts higher on the stem lance-deltoid to subulate, 1-3 cm. long, truncate-clasping; involucre 6-7 mm. high, campanulate; phyllaries about 21, usually persistently pubescent. Rare in sandy soil, e. Tex., Apr.; s.e. U.S., n. to N.J. and w. to Okla. and Tex.

Intergrading with *S. plattensis* in Ark., La. and Tex. (See remarks under *S. tridenticulatus*.)

5. *Senecio plattensis* Nutt. PRAIRIE GROUNDSEL. Perennial rhizomatous herb (1-) 2-5 (-7) dm. tall, persistently floccose-woolly at least over boundaries of the herbage near the nodes; many leaves crowded near the base, with oblong to elliptic or ovate-elliptic and serrate blades (1-) 2-6 (-10) cm. long and (5-) 10-30 (-40) mm. broad, 1 to 3 times as long as broad, usually unlobed but less commonly pinnately lobed and petioles usually longer than the blades; stem leaves rather reduced and remote upward, usually rather deeply pinnatifid with 3 to 8 (to 10) lobes on each side and basally truncate-clasping; involucre campanulate; principal phyllaries usually 21, 5-7 mm. long, dorsally quickly glabrate. Frequent in Plains Country and n.-cen. Tex., rare in e. Tex., spring; Va. and Tenn. w. to Mont., Wyo. and Colo., n. to cen. Can. and s. to Tex.

Intergrading to a degree with *S. obovatus* and with *S. tomentosus*.

6. *Senecio tridenticulatus* Rydb. Perennial from woody vertical sparingly-branched caudexes 4-10 mm. thick; stems 1-3 dm. tall, glabrous to lightly floccose in a few small spots near the nodes; leaves crowded near the base, firm and almost 0.5 mm. thick in life, petiolate; blades rarely unlobed, usually with 2 to 8 lobes on each side (and these again incised-dentate near their apices), oblanceolate or oblong in outline, 2-5 cm. long, 5-15 mm. broad, usually about 3 times as long as broad; stem leaves few, remote and much-reduced (or absent), linear-oblong in outline, usually pinnatifid, clasping; involucre campanulate; phyllaries usually 21, 5-9 mm. long. Infrequent or rare in Davis Mts. in the Trans-Pecos, in the Llano Region and the Plains Country, spring; cen. Can. and Plains States s. to N.M. and Tex.

Probably has introgressed with *S. plattensis*. The closely related *S. neomexicanus* Gray has been reported to occur in the Guadalupe Mts.; it would key to the east Texas *S. tomentosus* in this treatment.

7. *Senecio obovatus* Muhl. GOLDEN GROUNDSEL. Perennial herb from slender branching rhizomes 2-3 mm. thick; stems 2-5 (-7) dm. tall, essentially glabrous except in genetically contaminated plants; basal leaves crowded; blades thin-membranous, unlobed, serrate, 2-8 cm. long, usually about as broad as long, truncate or slightly angled at the base;

petioles (1.5) 2 to 4 times as long as the blade; *stem leaves* few, remote and much-reduced (occasionally nearly absent), clasping, usually pinnately lobed; involucre campanulate; phyllaries about 20, 3-7 mm. long. Incl. var. *rotundus* Britt., *S. aureus* of Tex. reports. Frequent in Edwards Plateau and n.-cen. Tex., usually in calcareous soil, less common in e. Tex., spring; most of e. and s.e. U.S., w. to Ill., Kan., Okla. and Tex.

Shows evidence of introgression with *S. plattensis*.

8. *Senecio millelobatus* Rydb. Rhizomatous perennial herb; aerial shoots 10-25 (-40) cm. tall, rather leafy throughout; lowest (basal) leaves few and occasionally only weakly lobed but in most plants the leaves rather similar all up and down the stem except for slightly reduced size and reduction of petiole upward, all linear or linear-oblongate and very deeply pinnatifid (or even nearly pinnately compound), the lobes much-constricted basally and upwards of 10 in number on each side; principal phyllaries usually about 21, 5-6 mm. long. Locally frequent in Trans-Pecos mts. (Chisos and Davis), Apr.-Sept.; Ariz., Chih. and Tex.

9. *Senecio imparipinnatus* Klatt. Slenderly taprooted annual; stems solitary or few, sparingly branched, erect, (1-) 2-4 (-6) dm. tall; leaves usually well-distributed over the stem, only very gradually reduced upward, 2-10 cm. long, very deeply pinnatifid, the terminal lobe subreniform and incised-dentate, the lateral lobes of the upper leaves usually cuneate and strongly contracted toward the axis into a linear basal portion (the cuneate portion of the lobe itself often incised); involucre campanulate; principal phyllaries 3-6 mm. long, usually about 21 in number. Abundant over e. half of the state, infrequent w. in the Plains Country and Edwards Plateau, spring; Tam., Tex., Okla. and La.

Intergrades with *S. glabellus* and *S. Greggii*, these three species being poorly defined from each other. In Dallas and Grayson counties occurs a form in which the lateral lobes are again deeply incised-lobed, the ultimate divisions being short-linear. This race has not been given a separate botanical name.

10. *Senecio glabellus* Poir. BUTTERWEED. Annual 1-4 (-10) dm. tall; leaves pinnately lobed, lateral lobes oblong, undulate-margined, basally (toward the axis) not or only slightly constricted, the terminal lobe irregularly undulate. Rare in sandy soil, e. Tex. (Gregg and San Augustine cos.), spring; s.e. U.S., n. to N.C., Ill. and Mo., w. to Kan., Okla. and Tex.

11. *Senecio Greggii* Rydb. Annual 1-3 dm. tall, 1 to several-stemmed from the base; stems rather stiffly erect, about 2-3 mm. thick; leaves pinnately lobed, the terminal lobe irregularly incised-serrate or again lobed, the lateral lobes only slightly narrowed basally (toward the axis), the base about half as broad as the distal portion. Rare in sandy soil along the Rio Grande in the Trans-Pecos (rare farther down the river), Apr.-May; also Chih.

12. *Senecio spartioides* T.&G.* Subshrubby perennial (3-) 5-10 (-13) dm. tall, freely branched from the base and again near the upper end, essentially glabrous; leaves numerous, well-distributed over the stem, not reduced upward, often slightly succulent or fleshy, (2-) 3-6 cm. long, pinnatifid with linear lobes, the lateral lobes 2 to 5 on each side and rather well-distributed along the axis, the terminal lobe less than a third the total length of the leaf; involucre usually obconic; principal phyllaries about 12 to 14, about 1 cm. long. Locally abundant, usually in rather loose sandy soil, w. half of state and also in coastal part of Rio Grande Plains, July-Oct.

We have two varieties:

Var. *Fremontii* (T.&G.) Greenm. Rather close-branching above so that the entire plant is densely subcorymbose; leaves not succulent but merely a little fleshy. *S. Riddellii* T. & G. Western half of state; widespread in w. U. S. and n. Mex.

Var. *Parksii* (Cory) Shinnars. With widely spreading branches above, the whole plant loosely corymbose; leaves rather succulent. Locally abundant in loose sandy soils of Brooks, Jim Hogg, Kenedy, Kleberg, and Nueces cos., s. Tex.; endemic.

Both varieties comprise very showy plants that are reputed to be toxic to livestock. A few specimens in western Texas seem to show intermediacy in character between *S. spartioides* and *S. longilobus*.

13. *Senecio Warnockii* Shinnars. Subshrubby perennial; stems several from the base and with ascending branches above, 2-4 dm. tall, essentially glabrous or minutely whitish-

* Recent studies by Robert I. Ediger indicate that this should be *S. Riddellii* T.&G.

floccose and then glabrate; leaves very numerous, crowded, linear-filiform, rarely lobed, (2-) 3-6 cm. long, somewhat fleshy; heads not crowded; involucre obconic; principal phyllaries about 13 or 14, 8-9 mm. long. Restricted to gypseous sands of the Culberson-Hudspeth county area where locally abundant, Sept.-Oct.; also N.M.

14. *Senecio longilobus* Benth.* Subshrubby perennial; stems several from the base and freely ascending-branched above, closely whitish-floccose on all herbage or eventually glabrate; leaves numerous, crowded-ascending, 3-10 (-12) cm. long, usually pinnately lobed at least in the lower half, the lateral and terminal lobes filiform-linear, the terminal lobe often comprising as much as half the total length or more; involucre campanulate; principal phyllaries usually 21. *S. filifolius* Nutt. Abundant in w. half of Tex., e. rarely to Rio Grande Plains, spring-fall; widespread in driest parts of w. U. S. and n. Mex.

These are very showy plants increasing enormously in abundance under the prevalent abusive overstocking of ranges; reputed to be toxic to livestock. Some plants seem to combine characters of this species and of *S. spartioides*.

127. CACALIA L. INDIAN PLANTAIN

Strongly perennial essentially glabrous herbs; stems stout, 5-20 dm. tall, mostly simple and erect except at the extreme top; leaves alternate, the blades lanceolate or elliptic to rhombic-ovate or rhombic-oblongate, the lower ones usually long-petioled, the distal margin often undulate or remotely dentate; unlobed heads in a close corymbose arrangement at the tip of the plant; involucre short-urceolate, 5-10 mm. long; phyllaries about 5, broad, yellow-green; receptacle slightly convex, naked; *ray flowers* absent; *disk flowers* few, perfect, fertile, the corolla pale-yellowish or nearly white with its limb equally 5-toothed; achene columnar, smoothish; pappus persistent, of numerous very slender white bristles.

About 50 species, mostly in eastern Asia.

1. Phyllaries wing-keeled; basal and lower stem leaves ovate or rhombic-ovate, usually broadly so; plant usually flowering April-June1. *C. plantaginea*.
1. Phyllaries not wing-keeled; basal and lower stem leaves lanceolate; plant flowering July-October2. *C. lanceolata*.

1. *Cacalia plantaginea* (Raf.) Shinn. Lower stem leaves ovate to rhombic, usually broadly so; each phyllary at least by anthesis with a narrow median dorsal keel. *C. tuberosa* of auth. Frequent in open areas, e., s.e. and n.-cen. Tex., Apr.-June and less commonly again in late Sept.-Nov.; widespread in e. U. S.

2. *Cacalia lanceolata* Nutt. Lower stem leaves narrower than in *C. plantaginea*, usually lanceolate; phyllaries not wing-keeled even after anthesis. Infrequent in e. and s.e. Tex., July-Oct.; coastal s.e. states. *C. plantaginea* and *C. lanceolata* intergrade to some extent.

128. ERECHTITES RAF. FIREWEED. BURNWEED

A genus of about 15 species in America, Australia and New Zealand.

1. *Erechtites hieracifolia* (L.) Raf. var. *intermedia* Fern. Annual herb with stubby taproots and numerous adventitious roots, the lower parts of the stem occasionally propped in the mud by adventitious roots at the lower nodes, leafy, usually with one stem and few branches, to 1 m. tall; leaves alternate, irregularly and often doubly serrate, the lower ones narrowed to a subpetiolar base and broadly oblanceolate, the higher ones semiamplexicaul and the teeth tending to be incised very deeply almost forming shallow lobes; heads on slender peduncles 2-18 cm. long; receptacle essentially flat, naked; involucre cylindrical or slightly urceolate at anthesis, becoming narrowly campanulate in fruit; principal phyllaries equal, linear, about 13 or 14 in number, in a double row, 9-13 mm. long; outer phyllaries few, setaceous, 1-3 mm. long, forming a weak calyculum; flowers of 2 kinds; *peripheral flowers* pistillate, fertile, with a yellowish-white filiform-tubular corolla which at the tip is microscopically unequally toothed with 3 of the teeth much longer than the other 2 (the 3 longer teeth corresponding to the 3 teeth at the end of a

* Recent studies by Robert I. Ediger indicate that this should be *S. Douglasii* DC. var. *Jamesii* (T.&G.) Ediger.

ray and oriented to the outside of the head); *central flowers* numerous, perfect, fertile, the corollas with basal tube and a flaring equally 5-toothed limb; achenes all alike, columnar; pappus of copious soft white capillary bristles. Infrequent in muddy places, s.e. Tex. and s. part of e. Tex., Aug.-Nov.; e. U.S.

129. HAPLOESTHES GRAY

A genus of 2 species of which one is represented with us; the other species occurs in Coahuila.

1. *Haploesthes Greggii* Gray var. *texana* (Coulst.) I. M. Johnst. FALSE BROOMWEED. Subshrub from very tough woody taproots; stems several to numerous from the base, (2-) 3-5 (-8) dm. tall, much-fastigiately-branched, nearly glabrous; leaves numerous, opposite, linear-filiform, never lobed, 2-5 cm. long; heads numerous, in dense corymbose terminal clusters; involucre campanulate or somewhat urceolate; phyllaries constantly 5 in number, 3-4 mm. long, plumbeous to blue or green when dry, 1 to 1.5 times as long as broad, in one series, subequal, free, broadly overlapping; receptacle slightly convex, naked; *ray flowers* 3 to 5, pistillate, fertile; rays 1-2 mm. long, yellow to yellowish-white; *disk flowers* perfect, fertile, the corollas yellow to yellowish-white and equally 5-toothed; achenes irregularly columnar to falcate-columnar, about 1.5 mm. long, usually 10-ribbed, ripening blackish; pappus persistent, of a number of tawny or buffy unequal stiff bristles. Local apparently in gypseous areas, Plains Country, Edwards Plateau, Trans-Pecos and Rio Grande Plains, known to flower in all months except Nov. and Dec.; Coah., Chih. and Tex.

130. CENTAUREA L. STAR-THISTLE

Herbs; leaves alternate; heads solitary, terminal or axillary; phyllaries in several to many series, strongly imbricated; receptacle flat, covered with whitish bristles; ray flowers absent; marginal or peripheral disk flowers usually larger than the central ones especially as to corolla-size; corollas very deeply 4- or 5-lobed with the lobes linear; anthers with an elongate appendage apically; style thickened below the fork, the 2 branches papillate to the obtuse tips; achenes usually attached at an obliquely beveled surface just above the base or at a lateral notch slightly removed from the base.

A large and relatively diverse genus related to the thistles but not really thistlelike except for the spinose involucre of some species; most of our representatives are introduced.

- 1. Heads including corollas (3-) 4-8 (-10) cm. across; corollas pink (rarely white in albinos)1. *C. americana*.
- 1. Heads smaller or if nearly 3 cm. across then corolla not pink (2)
- 2(1). Phyllaries not spinose, at most with denticulate margins; corolla blue, pink or white (3)
- 2. Phyllaries with spines; corollas yellowish (4)
- 3(2). Plants thinly arachnose; leaves decurrent on the stem as narrow wings; annual ..
.....2. *C. Cyanus*.
- 3. Plants nearly glabrous; leaves not decurrent; rhizomatous perennial
.....3. *C. repens*.
- 4(2). Spinose tip of phyllary darker than the body of the phyllary, 3-9 mm. long
.....4. *C. melitensis*.
- 4. Spinose tip stramineous, those of the upper-middle phyllaries 10-17 mm. long
.....5. *C. solstitialis*.

1. *Centaurea americana* Nutt. BASKET-FLOWER, THORNLESS THISTLE, CARDO DEL VALLE. Erect annual (3-) 10-15 (-20) dm. tall; stems (1-) 2-4 (-6) mm. thick, leafy, simple below, branched above; leaves sessile and essentially entire; lowermost leaves sessile, narrowly obovate, scabrous; middle and upper leaves lanceolate, 2-6 cm. long, nearly glabrous; heads solitary at the ends of the upper branches, (3-) 4-8 (-10) cm. across (including the corollas); involucre broadly and shallowly campanulate; phyllaries appressed, in many series, strongly imbricate, each firm and stramineous and articulated into 2

portions, the lower portion linear and entire, the upper portion shorter and lance-deltoid with a flat subulate tip and on each side with 4 or 5 toothlike cusps or lobes; corollas pink or white in albinos, the peripheral ones much larger than the central ones; achenes fuscous, attached at an obliquely beveled surface just above the base; pappus of long barbellate bristles in 1 or 2 series, attached separately or only very weakly coalescent basally. Locally abundant over much of the state except the sandy forested areas of e. Tex., late spring-summer; Mo. to Ariz. and s. to La., N. L. and Coah.

Very showy and sometimes cultivated.

2. *Centaurea Cyanus* L. BACHELOR'S BUTTON, CORNFLOWER. Annual 3-6 dm. tall; stems usually 1-2 (-3) mm. thick and solitary from the base, branched above, the branches ascending, the herbage thinly tomentose; basal and lower stem leaves oblanceolate, shallowly pinnately lobed or merely toothed; upper stem leaves 1-5 cm. long, narrowly oblanceolate, sometimes toothed but not spiny, decurrent as extremely narrow stem wings; heads solitary, terminating the short leafy branchlets (the whole plant subcorymbiform); involucre campanulate, 15-25 mm. broad, of about 5 series of strongly imbricated phyllaries; outer phyllaries appressed, thinly arachnose and narrowly deltoid, with a well-defined thinner white margin that is either lacerate-fimbriate or usually divided into a number of short toothlike lobes, grading to the upper middle phyllaries that are more pointed and in which the denticulate margins are dark-purplish or brownish-purple to form a dark margin; longest innermost series of phyllaries strongly spreading, lanceolate, purple-tipped, not denticulate marginally but each with a blunt cusplike top which has a few toothlike laciniae; corollas purplish-blue to pink or white, the peripheral ones larger than the central ones; achenes attached at a notch on one side just above the base; pappus of a number of series of strongly unequal nonbarbellate bristles, shiny-white, 0.2-3.5 mm. long. Locally escaped along roadsides, widely cult. as an ornamental, Apr.-June; nat. of Eur., widely cult. and escaped.

3. *Centaurea repens* L. RUSSIAN KNAWEED. Perennial with slender rhizomes; stems 3-6 (-10) dm. tall, only 1-3 mm. thick, much-branched above, the branches spreading and then terminally ascending; leaves entire, not spiny, mostly oblanceolate, narrowed basally but not petiolate, the lowermost ones 4-10 cm. long, those of midstem (15-) 20-30 mm. long, reduced on the head-bearing branchlets to minute bracts; heads solitary on the branches, about 1 cm. thick; involucre stramineous or whitish; phyllaries not at all spinose, in about 4 series, most of the outer ones as broad as long, very blunt, mostly firm but with a narrow margin which is thin and minutely lacerate-fimbriate terminally, grading to the innermost phyllaries that are not firm but are lanceolate and toward the acute weak tip are densely pilosulous or hirsutulous; corollas blue, pink or white, the peripheral ones larger than the central ones; achenes not oblique basally; pappus of a number of separate barbellate units about 5-7 mm. long. *C. Picris* Pall. Rare and local in the Trans-Pecos (near Balmorra), perhaps not a persistent member of our flora, summer; nat. of Eur., now widely adv.

4. *Centaurea melitensis* L. TICALOTE, MALTA STAR-THISTLE. Winter annual or rarely biennial; stems several from the base, usually ascending, 1-5 (-8) dm. long, branched above; basal leaves and lower stem leaves oblanceolate in outline, 5-10 cm. long, pinnately lobed, the lobes rounded, not at all spinose; upper leaves nearly linear, 1-3 cm. long, not much-reduced upwards on the stem, decurrent, forming narrow wings on the stem; heads in the axils of the upper leaves; peduncles absent or 1-3 mm. long; involucre nearly globose, about 1 cm. thick (not including the spines), burlike; phyllaries in about 5 series, very firm, often thinly arachnose near the tip when young, the body stramineous, nearly as broad as long and strongly tapered or rounded upward, abruptly giving way apically to the even more indurate and noxiously spreading spinose-tip which is subulate (3-9 mm. long), darker than the body and often near its base on each side bears a couple of very short spine-lobes; corolla yellow; achenes attached at a lateral notch slightly removed from the base on one edge; pappus bristles shining, white, 2-6 mm. long, in several series, separate, not barbellate. Abundant in disturbed calcareous soil especially along roads over much of Edwards Plateau, n.-cen. Tex., s. part of e. Tex. and n. part of Rio Grande Plains, spring; nat. of Eur., now widely adv.

5. *Centaurea solstitialis* L. BARNABY STAR-THISTLE. Annual 3-7 dm. tall, usually with a single stem from the base, thinly arachnose over most of the herbage, widely branched above; basal leaves 5-8 cm. long, deeply pinnatifid, usually withered before anthesis; stem leaves 1-3 cm. long, essentially linear, long-decurrent as pronounced stem wings;

heads terminating the branchlets, erect; involucre globose, about 1 cm. thick (not including spines), burlike; phyllaries in about 4 to 5 series, very firm, often thinly arachnose near the tip when young, the body greenish-stramineous and about as broad as long, rounded upward abruptly giving way to the even more indurate and noxiously spreading spinose tip which is subulate and stramineous (those of the upper-middle phyllaries 10-17 mm. long) and often near its base bears on each side a couple of very short spine lobes; corolla yellow; achenes attached at a lateral notch slightly removed from the base on one edge; pappus bristles shining-white, 2-4 mm. long, in several series, separate, not barbellate, present only on the central (abortive?) achenes, the peripheral plump white achenes being epappose. Rare in disturbed soil especially along roadsides, n.-cen. Tex., spring-early summer; nat. of Eur., now widely adv.

131. CARDUUS L. PLUMELESS THISTLE

Annual or biennial herb 5-20 dm. tall, with few stems from the base; leaves alternate, decurrent, pinnatifid, with spiny-serrate margins; heads solitary or clustered at the ends of branches; involucre nearly cylindrical to campanulate, 5 to 7 series of lanceolate acute spine-tipped phyllaries, strongly imbricate; receptacle covered with soft hairlike bristles; ray flowers absent; disk flowers numerous, perfect, fertile; corolla pink, deep-pink or rarely purple, deeply subequally 5-lobed; filaments separate; achenes attached basally to the receptacle; pappus bristles not plumose, sometimes barbellate in the lower part but the lateral projections only about as long as the breadth of the central axis or shorter; pappus deciduous as a unit because of the joining of the bristles into a ring basally.

An Old World Temperate Zone genus of almost 100 species. The genus probably should be re-enlarged to include *Cirsium* which was originally excluded on the basis of the single technicality of pappus plumosity.

1. Heads 30-50 (-60) mm. thick, usually essentially solitary at the ends of branches; some of the outer phyllaries spreading or even sharply reflexed 1. *C. nutans*.
1. Heads 10-15 (-20) mm. thick, usually in close clusters of 5 to 10 heads at the ends of branches; phyllaries mostly ascending 2. *C. tenuiflorus*.

1. *Carduus nutans* L. MUSK-THISTLE. Considered to be biennial, 4-20 dm. tall; leaves pinnatifid, the lobes coarsely spiny-toothed; heads solitary at the ends of ascending branches that are usually naked and pedunculiform several cm. below the heads; involucre campanulate, usually 25-50 mm. thick, squarrose. Local on Edwards Plateau and to be expected elsewhere, May-July; nat. of Eur., now widely adv. in temp. areas.

2. *Carduus tenuiflorus* Curt. Considered to be annual, 3-10 dm. tall; leaves pinnatifid, the lobes coarsely spiny-toothed; heads in close clusters of 5 to 10 heads at the ends of ascending leafy branches; involucre 10-15 (-20) mm. thick, the phyllaries ascending. Local on Edwards Plateau, Apr.-May; nat. of s. Eur., now widely adv. in dry temp. areas.

132. CIRSIUM MILL. THISTLE. PLUMED THISTLE

Winter annual, biennial or perennial herbs; leaves alternate, entire or often lobed, usually also irregularly serrate, the whole blade plus each lobe plus each tooth usually ending in a spine-tip, sessile, often narrowed to a subpetiolar base, often slightly decurrent on the stem, often with a thin floccose wool beneath or on both surfaces; heads singly terminating the pedunculiform upper parts of the branches; involucre ovoid or subcylindrical to urceolate or nearly globose, usually much broader and more saucer-shaped after anthesis and when the achenes are mature; receptacle covered with soft hairlike bristles; phyllaries in many series, strongly imbricated, mostly lanceolate and nearly always each one ending in a spine-tip (not in *C. muticum*); ray flowers absent; disk flowers numerous, perfect, fertile; corolla usually mauve, reddish-purple, purple or pink, rarely white or yellowish (in *C. horridulum*), deeply and subequally 5-lobed; filaments separate; achenes mostly oblong or elliptic-oblong, flattish, unribbed, attached basally to the receptacle; pappus of numerous bristles united in a ring at the base, the lower part of each bristle plumose, the entire pappus deciduous as a unit.

A north-temperate genus of about 150 species. Differing from *Carduus* only in that

each unit of the pappus is decidedly plumose in the lower part; probably should be sub-merged in *Carduus*.

1. Flowers pinkish or yellowish; phyllaries of the true involucre all with weak flat tips but the large heads (4-8 cm. broad) subtended and often equalled or surpassed by a false involucre of large very spinescent appressed bracteal leaves 2. *C. horridulum*.
1. Flowers pinkish or purplish, rarely white and *never yellow*; at least the outer phyllaries prickly-tipped or with firm points; heads either naked at base or with only a few narrow or linear bracteal leaves at the base shorter than the involucre (2)
- 2(1). Outer phyllaries barely pointed, scarcely prickly-tipped; tips of inner phyllaries broadly lanceolate 7. *C. muticum*.
2. Outer phyllaries prickly-tipped (3)
- 3(2). Involucre 10-22 mm. high, nearly as broad as high or broader in flower, much broader in age (4)
3. Involucre 25-50 mm. high, higher than broad in flower, broader in age (5)
- 4(3). Taproot well-developed, much-surpassing the ring of secondary roots near the base of the stem 8. *C. texanum*.
4. Taproot poorly developed, stubby, shorter than the other roots so that the root system is fibrous 9. *C. carolinianum*.
- 5(3). Rare in crevices of cliffs in mts. in the Trans-Pecos; phyllary tips straight in line with the body of the rigid phyllary and not differing much from it in texture; most of the phyllaries largely reddish-purple or purple-tinged 1. *C. Turneri*.
5. Collectively widespread in sandy or rocky soils; phyllary tips (prickles) at least those of the middle phyllaries of a different (paler, more indurated) texture than the body of the phyllary and often slightly more spreading than the body, or even reflexed; most of the phyllaries largely stramineous or blackish, only the innermost (if any) purple-tinged (6)
- 6(5). Upper stem leaves with broad bases, subamplexicaul; plants strongly perennial, sometimes with creeping rhizomes, forming loose clumps or colonies; heads usually quite naked basally, about 1 cm. remote from the nearest bracteal leaf or if leaves closely subtending the head then these not differing substantially from those slightly farther down the peduncle (7)
6. Upper stem leaves basally narrowed to a subpetiolar base; biennials or weak perennials; heads often with a few small narrow bracteal leaves at the base differing in their narrowness and crowded condition from the bracteal leaves slightly farther down the peduncle (8)
- 7(6). Leaves shallowly pinnatifid (lobes usually less than a third the total breadth) or rarely unlobed, upper and lower surfaces almost the same shade of gray, not decurrent or only decurrent as much as 5 mm. below the departure of the midrib from the stem 4. *C. undulatum*.
7. Leaves pinnatifid with lobes often more than a third the total breadth, upper surfaces often strikingly darker (less canescent) than the lower, decurrent at the base often as much as 10 mm. below the point of divergence of the midrib from the stem ... 3. *C. ochrocentrum*.
- 8(6). Stem leaves entire to shallowly pinnatifid (the lobes up to a third the total breadth); roots coarsely fibrous, not tuberous-thickened; flowering mainly from mid-June to September 5. *C. iowense*.
8. Stem leaves (except the uppermost) more deeply pinnatifid on the average; usually some roots with tuberous enlargements; flowering mainly late May to July 6. *C. terraenigrae*.

1. *Cirsium Turneri* Warnock. CLIFF THISTLE. Roots perennial, rupicolous, not dislodged from their crevices; crowns fibrous, woody, 8-30 mm. thick; stems annual, herbaceous, 5 to 30 from each crown, 15-45 cm. long, simple except just beneath the head clusters, usually horizontal or drooping from cliff overhangs, 3 mm. thick, greenish-brown with

paler striae (excurrent midveins of leaves), thinly arachnose with flat jointed translucent hairs; internodes much shorter than the leaves; leaves pale-green, crowded, oblanceolate, pinnately lobed, 10-15 cm. long at midstem or much longer at base of stem and reduced beneath the heads, glabrous except thinly arachnose along the midveins, superficially microscopically pustular, basally narrowly clasping, apically and marginally spinose with principal slender spines stramineous and 4-7 mm. long; heads essentially sessile, not calyculately bracteate, 60- to 80-flowered, disposed in subcorymbose terminal clusters of (1 to) 3 to 5 per stem; involucre campanulate, 2-3 cm. broad; phyllaries strongly graduated in 3 or 4 series, linear-lanceolate, rose-purple to royal-purple or magenta, the outermost only a fourth as long as the innermost, marginally thinly arachnose, spine-tipped and with distinct midribs, the innermost round-keeled and long-acuminate into flattened stramineous tips; receptacles flat, 5-7 mm. wide, alveolate, thickly beset around the alveolae with white hairs about 1 cm. long; corollas slightly exceeding pappus, rose-purple to magenta, very slender, divided more than halfway into 5 very narrow lobes; achenes linear-oblong, about 5 mm. long. Rare in crevices of limestone or basalt bluffs and cliffs in the Trans-Pecos at elev. of 3,000-5,000 ft., July-Dec.; endemic.

2. *Cirsium horridulum* Michx. BULL THISTLE, YELLOW THISTLE. Winter annual or biennial, 1-10 dm. tall, rarely taller; stems commonly 5-10 mm. thick basally; flowering stem commonly solitary at the base, rarely much-branched above, usually with a solitary terminal head; leaves in over-all outline often broadly linear to lanceolate or oblanceolate, pinnatifid with shallow, spiny lobes; heads subtended closely by a false involucre or calyculum of large very spiny appressed bracteal leaves as long as or longer than the true involucre; involucre 4-8 cm. broad; phyllaries of the true involucre all with weak flat tips; corolla pinkish or yellowish. *Carduus spinosissimus* Walt. Common in open sandy places, e. and s.e. Tex. and coastal part of Rio Grande Plains, Mar.-May; mostly on the Coastal Plain, Me. to Tex.

Some of the populations of rather small plants near the Texas coast seem to show some similarities to the Floridan taxon called *C. vittatum* Small, but it is extremely doubtful that they are specifically distinct from *C. horridulum*.

3. *Cirsium ochrocentrum* Gray. YELLOW-SPINE THISTLE. Subrhizomatous perennials (2-) 3-8 (-12) dm. tall; leaves often with upper surfaces much less canescent than the lower, in over-all outline mostly lanceolate or oblanceolate but pinnatifid with extremely spiny lobes often more than a third the total breadth of the leaves, those of midstem narrowly decurrent basally often as much as 1 cm. below the point of departure of the midvein from the stem; upper stem leaves with broad bases, subamplexicaul, long-tapered to the apex; uppermost parts of the stems naked or if some of the smallest upper leaves closely subtend the head they are not differentiated into linear calyculate bracts but resemble the other bracteal leaves just below; heads at flowering time longer than thick, broader in age; involucre 25-50 mm. high; phyllaries often with a medial glandular black or vernicose strip, often (at least when young) tomentose thinly at the base and also along the margins, the lower middle phyllaries (2.2-) 2.5-3 mm. broad and long-tapered to the very acute apexes, each phyllary provided with a straight spreading spine-tip differing in texture from the body of the phyllary; flowers purplish, rosy-lavender or rarely whitish. Frequent or local in open areas, often disturbed soil, Trans-Pecos and Plains Country, infrequent or rare e. to n.-cen. Tex. and Edwards Plateau, summer; Neb. s. to Tex. and w. to Ariz.

Apparently some populations show genetic contamination of *C. ochrocentrum* by *C. undulatum* and vice versa.

4. *Cirsium undulatum* (Nutt.) Spreng. Subrhizomatous perennial (2-) 3-10 (-20) dm. tall; leaves often with the upper surfaces nearly or quite as canescent as the lower, in over-all outline mostly broadly linear to lanceolate or oblanceolate but pinnatifid with somewhat or weakly spiny lobes usually less than a third the total breadth; leaves of midstem not at all decurrent or else decurrent for less than 5 mm. below the point of departure of the midvein from the stem; upper stem leaves with broad bases, subamplexicaul, long-tapered to the apex; uppermost parts of the stems naked or if some of the smallest upper leaves closely subtend the head they are not differentiated into linear calyculate bracts but resemble the other bracteal leaves just below; heads at flowering time longer than thick, broader in age; involucre 25-50 mm. high; phyllaries often with a

medial glandular black and/or vernicose strip, often (at least when young) tomentose thinly at the base and also along the margins, the lower-middle phyllaries 2.5-3.5 (-4) mm. broad and long-tapered to the very acute apexes, each phyllary provided with a straight spreading spine tip differing in texture from the body of the phyllary; flowers lavender, purplish or white. *C. megacephalum* (Gray) Cockll. Frequent locally in Plains Country and n.-cen. Tex., infrequent s. to Edwards Plateau and the Trans-Pecos, May-June (-July); B.C. and most of w. U.S. e. to Man., Mich., Mo., Okla. and Tex.

Some Trans-Pecos plants which have been called *C. perennans* (Greene) Woot. & Standl. by some authors are referred here. Notes under *C. ochrocentrum* and *C. undulatum* indicate the probability of past hybridization with those taxa.

5. *Cirsium iowense* (Pammel) Fern. Winter annual or biennial (or rarely perennial by slender rhizomes?), usually with slender fibrous roots crowded at the crown, no definite taproot in evidence; stems few, 5-15 dm. tall; leaves mostly oblanceolate, with a number of short spines along the margin, either nearly entire or with a few shallow lobes up to a third the total breadth; upper stem leaves narrowed to a linear subpetiolar base; heads in flower usually distinctly longer than thick, immediately subtended by a few linear calyculate bracteal leaves much shorter than the involucre; involucre urceolate or usually short-cylindric to cylindric-campanulate, 3-5 cm. high; phyllaries mostly stramineous marginally, usually with a darker subglandular subrhombic medial patch, usually nearly glabrous except on the margins, each with a spine-tip of a slightly different texture and slightly more spreading than the body of the phyllary, the lower-middle phyllaries 2.2-2.5 (-2.9) mm. broad; flowers lavender. Locally abundant in disturbed usually calcareous open soil, n.-cen. Tex., rare in e. and s.e. Tex., June-Sept.; Plains States, Minn. and Ia. s. to Tex.

Reports of *C. altissimum* (L.) Spreng. in Texas are based on incorrectly determined specimens of this species.

6. *Cirsium terraenigrae* Shinn. Biennial or weak perennial with crowded slender fibrous roots near ground level, some of these often tuberous-thickened well below ground (rarely preserved in prepared specimens); stems few, mostly 5-15 dm. tall; leaves mostly broadly linear or oblanceolate in over-all outline but deeply pinnately lobed, the lobes usually a third to nearly half the total breadth and rather spiny, often the upper surface distinctly less canescent-tomentose than the lower and nearly dark green; upper stem leaves narrowed to a linear subpetiolar base; heads in flower usually distinctly longer than thick, immediately subtended by a few linear calyculate bracteal leaves much shorter than the involucre; involucre urceolate to usually short-cylindric or cylindric-campanulate, 25-50 mm. high; phyllaries mostly stramineous marginally, with a darker subglandular subrhombic medial patch, nearly glabrous, each (except sometimes the outermost) with a spine tip of a slightly different texture and slightly more spreading than the body of the phyllary, the lower-middle phyllaries (1.9-) 2.1-2.8 mm. broad; flowers deep-rosy-lavender. Locally abundant in open calcareous prairies, n.-cen. Tex., rare and local in restricted areas of calcareous soils in e. Tex., May-July; endemic or perhaps also in Okla.

Reports of *C. discolor* (Muhl.) Spreng. in Texas are based on incorrectly determined specimens of this species. According to some researchers the name *C. Engelmannii* Rybd. may apply to this species.

7. *Cirsium muticum* Michx. SWAMP-THISTLE. Biennial supposedly; stems thick and hollow, 4-30 dm. tall; leaves thinnish, very deeply pinnatifid, the lobes almost half the total breadth; involucre ovoid-cylindric, 20-35 mm. high; outer phyllaries blunt and merely subulate-mucronate, not spiny-tipped; flowers purple or rarely whitish. Very rare in moist sand, usually acid areas, e. Tex., July-Aug.; s.w. Can. and n.e. U.S. s. to N.C., Tenn., La. and Tex.

8. *Cirsium texanum* Buckl. Biennial (?) or weak perennial from a slender napiform or irregularly tuberous-enlarged deep taproot, often with a ring of fibrous secondary roots near the top of the taproot; stems usually solitary at the base, (2-) 10-15 (-20) dm. tall, often much-branched, the long branches erect or ascending; leaves slightly auriculate-clasping, those of midstem in outline usually narrowly obovate to lance-obovate, long-tapered basally, on each side with 3 to 9 triangular or rounded lobes which are in turn irregularly spiny-denticulate, above dark-green and glabrous or less commonly deciduous-floccose, beneath thinly grayish or whitish floccose-woolly; upper leaves reduced, broadest at the clasping base and tapering to the acute apex; upper (1-) 2-25 cm. of the flowering

branch essentially naked; involucre 14-22 mm. high, as broad as high or broader in flower, much broader in age, not subtended by any narrow bracteal leaves immediately at the base of the involucre; phyllaries often very thinly floccose in early head-condition, the innermost long-subulate and often purplish-tinged, the middle and outer ones not purplish-tinged, each with a prickle-tip usually spreading more than the body of the phyllary, the lower middle phyllaries at the base about 1 mm. broad (0.8-1.3, rarely to 1.5); disk pink, pink-purple, lavender-purple or rose-purple. Incl. var. *stenolepis* Shinnars, *Carduus austrinus* Small. Locally extremely abundant especially in disturbed soils, along roadsides and in fields, nearly throughout except in extreme e. Tex., extreme w. part of the Trans-Pecos and the higher parts of the Plains Country, late spring-summer, rarely again in fall; Okla. to Tam., N.L. and Coah.

In parts of the Edwards Plateau and the eastern part of the Trans-Pecos occur populations showing some of the characters of *C. undulatum* and probably representing the result of genetic contamination of *C. texanum* by *C. undulatum*. Such plants served as the basis of *Carduus Helleri* Small and *Cirsium Wrightii* Gray. Possibly the present species should be called *C. Wrightii* Gray even though the original collections of it were of genetically mixed plants.

9. *Cirsium carolinianum* (Walt.) Fern. & Schub. Biennial (?) or weak perennial, with fibrous root-systems on a stubby taproot about 1 cm. long and only a little less thick; stems usually solitary at the base, moderately branched above, in all usually about 1 m. tall (3-15 dm); leaves relatively thin and pliable, above green and nearly glabrous or promptly glabrate or merely hirtellous, beneath with a dense white tomentum of close felt, not decurrent or decurrent for not more than 5 mm. below the point of departure of the midvein from the stem; peduncles naked or with only 1 or 2 remote bracteform leaves, at the summit not bearing any calyculum of spinescent bracts below the heads; involucre 15-20 mm. high, usually as broad as high or broader even as early in development as anthesis; phyllaries spine-tipped (except the innermost), not purplish (except the innermost in some populations), the spine-tips spreading more than the body of the phyllary, basal portions of the lower-middle phyllaries about 1 mm. broad, the inner phyllaries very long-subulate; disk purple, pink-purple or lavender-purple, only 2-3 (-4) cm. across. *C. flaccidum* Small. Locally abundant in openings in sandy, forested areas, e. Tex., late spring-summer; Ga. to Tex., n. to N.C., O., Ind., Ill. and Mo.

133. SILYBUM ADANS. MILK THISTLE

There are 2 species, both native to the Mediterranean region.

1. *Silybum Marianum* (L.) Gaertn. Annual or biennial 1-2 m. tall; leaves alternate, to 8 dm. long and 3 dm. broad, mottled white especially in the vicinity of the veins, with clasping bases and wavy or lobed margins with many yellow spines; heads 25-50 mm. thick, solitary at the ends of ascending branches, often nodding; involucre oblate; phyllaries in many series, leathery, each with a spine-tip 1-2 cm. long or the outer ones merely mucronate; receptacle fleshy and covered with hairlike bristles; ray flowers absent; disk corolla purple; filaments united into a short tube slightly above the level of their insertion on the corolla tube, free only just below the attachment to the anthers; achenes glabrous, about 6 mm. long, basifixed; pappus shining white, in several series, the bristles not plumose. Rare and local, Edwards Plateau, perhaps not a persistent member of our flora, late spring-summer; nat. of Medit. region, widely adv.

134. CARTHAMUS L.

An Old World genus of 13 species; we have a single species. Another species, *C. tinctorius* L. (Safflower) is cultivated for oil (from the achenes) and orange dye (from the corollas).

1. *Carthamus lanatus* L. DISTAFF-THISTLE. Annual (allegedly), 4-12 dm. tall; leaves alternate, firm, pinnatifid, the lobes coarsely spiny-toothed, basally subamplexicaul; heads solitary, terminal on the branches, broadly ovoid; outer phyllaries ending in leaflike appendages, the inner rigid ones appressed and spine-tipped; receptacle with scaly chaff; ray flowers absent; disk corollas yellow with red veins; achenes obpyramidal, 5-6 mm.

long, stramineous; pappus of several short scales in several series (or in some species absent), the outer shorter, the inner to 1 cm. long and rigid. Rare in disturbed roadsides, n. part of Edwards Plateau (McCulloch Co.), June; nat. of Medit. region, now widely adv.

135. ONOPORDUM L. COTTON THISTLE

An Old World genus of about 40 species.

1. *Onopordum Acanthium* L. Biennial (allegedly), usually (1-) 2-3 m. tall, with a canescent cottony pubescence all over the aerial parts except the flowers; leaves alternate, mostly elliptic to elliptic-oblong in over-all outline, coarsely doubly spiny-serrate or shallowly spiny-lobed; heads often in a roughly corymbiform aggregation at the top of the plant, on short leafy-winged ascending branches, several cm. thick; phyllaries ascending to spreading, each nearly subulate, tapering only very slightly from near the base all the way to the spine-tip; receptacle neither setose nor scaly but deeply alveolate, fleshy or spongy in texture; ray flowers absent; disk corollas purple; filaments separate; achenes basifixed; pappus of slender barbellate bristles. Rare and local in n.-cen. Tex. (Tarrant Co.) near stockyards, May-July; nat. of Eur., adv. in N.A.

136. GOCHNATIA H.B.K.

With about 40 species in the warmer parts of the Americas; we have a single species.

1. *Gochnatia hypoleuca* DC. Much-branched shrub 1-2 (-3) m. tall; leaves alternate, sessile, elliptic to lance-elliptic, 2-5 cm. long, unlobed, marginally entire and often slightly revolute, strikingly bicolored, the dark upper surface almost blackish-green, the lower surface grayish or whitish with a very close fine dense tomentum; heads about 1 cm. high, 7- to 12-flowered, in terminal subcorymbose clusters on the branches; involucre cylindrical-obconic; phyllaries firm; in 3 or 4 series, strongly imbricated, narrowly obovate, acute, green, turning brownish; receptacle essentially flat and naked; flowers all perfect and fertile; corollas apparently pinkish, bilabiate, the upper lip long-linear and ascending with 2 minute teeth apically, the lower lip deeply cut into 3 linear lobes; each of the 5 whitish anthers with 2 subulate appendages basally; achenes narrowly obpyramidal, with about 3 or 4 angles, yellow-brown, shiny, antrorsely puberulent; pappus of a number of rather stiff dirty-white bristles. Infrequent on gravel and caliche cuestas in extreme s. Tex. (Duval, Hidalgo, Jim Hogg, Starr and Zapata cos.), late Oct.-Feb.; Tex., N.L. and Coah. s. to Qro. and Hgo.

137. TRIXIS P. BR.

Weak shrubs to 1 or 2 m. tall, often semiscandent; leaves alternate, lanceolate or lance-elliptic, entire or marginally serrate, sessile, disposed under the heads almost in the manner of calyculate outer phyllaries; heads in irregular clusters toward the ends of the branches, 1-2 cm. high and wide, with about 12 to 14 flowers; involucre campanulate or obconic; phyllaries firm, 8, linear, terminally rounded, dorsally round-keeled in age; receptacle flat, alveolate, densely short-bristly around the sockets but not paleaceous; flowers perfect, fertile; corolla yellow, bilaterally symmetrical, the longer raylike portion with 3 teeth terminally, the other 2 shorter portions lance-subulate; each of the 2 cells of each anther each with a long subulate white appendage proximally; achenes linear-columnar, minutely glandular-pubescent, 4-7 mm. long, flared apically to a pappus pedestal; pappus of very numerous buffy or ochraceous-white rather stiff bristles, persistent.

About three dozen species of warmer parts of the New World.

- 1. Leaves thin-membranous, the fine nerve reticulum conspicuous under a lens, drying dark-green or blackish, beneath nearly glabrous and not punctate or if so the dots sparse 1. *T. radialis*.
- 1. Leaves firm-membranous, the nerve reticulum obscure, drying ochraceous or olivaceous-green, beneath puberulent and microscopically densely gland- or resin-dotted 2. *T. californica*.

1. *Trixis radialis* (L.) O. Ktze. Shrub 1-2 m. tall; leaves thin and with a fine nerve-net conspicuous under a lens, nearly glabrous beneath and rarely with a few sparse resin-dots, the whole drying dark-green; flowers bright-yellow. Frequent in extreme s. Tex. (Cameron, Hidalgo, Jim Hogg, Kenedy, Starr and Willacy cos.) in brush on well-drained clay loam, July-Mar.; Tex. and N.L. s.e. to Pan.; W.I.

2. *Trixis californica* Kell. Shrub about 1 m. tall; leaves thin but firm, the fine nerve-net obscure, drying buffy or olivaceous-green, beneath with pubescence and densely beset with resin-dots; flowers bright-yellow. frequent in canyons, parts of the Trans-Pecos, May-Oct. (following rains); Calif., Ariz., N.M., Tex., Baja Calif., Son., Chih., Coah. and S. L. P.

138. PEREZIA LAG.

Perennial often somewhat rhizomatous herbs from strongly ligneous underground crowns, often rusty-floccose at the upper nodes of the crowns and lowest node(s) of the aerial stem; leaves alternate, the phyllotaxy obscure in one acaulescent species, essentially sessile and marginally usually spinose-dentate; heads mostly 1-3 cm. high; involucre broadly obconical; phyllaries in 3 to 5 series, strongly imbricated, linear-subulate or lanceolate and acute or acuminate; receptacle essentially flat, not paleaceous but often areolate and slightly short-hairy around the sockets; flowers all perfect and fertile; corollas bilabiate, the lower lip raylike and 3-toothed terminally, the upper lip more or less deeply cleft into 2 teeth or lobes, purple, pink, rose-red or lavender, or so pale as to be nearly white; each of the 5 anthers with 2 subulate appendages basally; achenes linear-columnar, sometimes with a few obscure ribs, sometimes more or less attenuate upwards, often glandular-pubescent, at the summit flared into a pappus pedestal; pappus persistent, of many separate bristles.

About 75 species in the warmer parts of the Americas.

1. Essentially acaulescent herbs; leaves basal, pinnatifid; heads (usually solitary) on elongate scapose peduncles1. *P. runcinata*.

1. Stems leafy; leaves not pinnatifid; peduncles not scapose (2)

2(1). Plants usually taller; most leaves appreciably longer than broad
.....2. *P. Wrightii*.

2. Plants 1-2 dm. tall; leaves about as broad as long
.....3. *P. nana*.

1. *Perezia runcinata* (D. Don) Gray. PEONÍA. Leaves pinnatifid, crowded in a basal rosette; scapes 8-33 cm. long, with 1 or 2 heads terminally; heads 2-3 cm. high, with about 40 or 50 flowers. *Clarionea runcinata* D. Don. Frequent in brush on calcareous soil, Rio Grande Plains, less frequent in e. parts of the Trans-Pecos and Edwards Plateau, Mar.-Nov.; Tex., N.L. and Coah., s. to Hgo.

2. *Perezia Wrightii* Gray. BROWNFOOT. Erect leafy herb 6-13 dm. tall; leaves obovate-elliptic to oblong-elliptic, 2-7 cm. long, not lobed; heads crowded in small subcorymbose terminal groups, about 10-15 mm. high, with 8 to 11 usually pinkish flowers. Frequent or local in the Trans-Pecos, less frequent in Edwards Plateau and with an outpost in Cameron Co. in extreme s. Tex., June-Nov.; Ut., Ariz., N.M., Tex., Son., Chih., Coah., Dgo., N.L., S.L.P. and Zac.

3. *Perezia nana* Gray. DESERT HOLLY. Colonial herb often forming extensive patches in calcareous deserts by means of rhizomes; aerial shoots only 3-20 cm. tall, erect, sparingly branched, often somewhat zigzag; leaves firm, markedly spinose-dentate, rotund, appressed to the internodes or ascending, usually 2-4 cm. long and broad; heads solitary at the stem tips, 19-28 mm. high, with 15 to 24 lavender-pink flowers. Frequent in the Trans-Pecos, infrequent in w. part of Edwards Plateau (Sterling and Tom Green cos.), Apr.-Dec. (rarely in summer); Ariz., N.M., Tex., Son., Chih., Coah. and S.L.P.

Not often collected because rarely found in flower in spite of its abundance.

139. CHAPTALIA VENT.

Acaulescent perennial herbs, subrhizomatous with abundant fibrous roots; leaves rosetted, narrowly obovate or oblanceolate, narrowed to a subpetiolar base, the under-

surface whitish-tomentose, marginally entire or usually shallowly lyrate-pinnatifid; heads solitary at the ends of scapose peduncles; phyllaries well-imbricated in 4 or 5 series, acute, often tomentose dorsally; receptacle flat, with a depression at the point of attachment of each flower, the depression-margin often with short hairs but otherwise nude; flowers dimorphic or trimorphic, the more peripheral ones lacking anthers and lacking the upper corolla lip, the more central ones with 2-lipped corollas, the most central flowers either perfect and fertile or merely staminate and infertile; each of the 10 anther thecae with subulate tail at the lower end; achene fusiform, 5- to 7-ribbed, often glandular-pubescent; pappus of numerous rather rigid buffy-white bristles.

About 25 species in warmer parts of America.

1. Central flowers merely staminate, with abortive ovaries; east Texas 1. *C. tomentosa*.
1. Central flowers perfect; not in east Texas 2. *C. nutans* var. *texana*.

1. *Chaptalia tomentosa* Vent. Leaves oblong-elliptic, obtuse or mucronate, entire or toothed, 8-10 cm. long, 12-30 mm. broad, the upper surfaces of the young ones with thin tomentum which becomes lost, the lower surfaces densely white-tomentose; scape bractless, tomentose, to 35 cm. long and 1.5 mm. thick; heads erect at anthesis (nodding when young and nodding also after anthesis); receptacle much broader than the peduncle, with about 60 trimorphic flowers; external pistillate flowers (about 20) in one cycle, their corollas raylike (lacking an upper lip), white, surpassing the involucre by 3-6 mm., 4-nerved; internal pistillate flowers few (5 to 11), the corolla variable, from 2-lipped and somewhat larger than the style to tubular and only half as large as the style; central flowers staminate, about 25, yellow, with abortive ovaries, corolla 2-lipped, the lower lip of 3 toothlike lobes, the upper lip with 2 lobes; achene glabrous, 5- to 7-ribbed, beaked, the beak shorter than the body. Infrequent to rare in sandy forested areas, e. Tex., Mar.-Apr.; Coastal States, N.C. to Tex.

2. *Chaptalia nutans* (L.) Polák var. *texana* (Greene) Burk. SILVER-PUFF. Leaves broad, membranous, at times very thin, ascending or prostrate, 6-15 cm. long, 24-40 mm. broad, lyrate, narrowed to a subpetiolar base, tomentose on the underside, tomentum thick or thin; peduncles 1-6 dm. long, scapelike, ebracteate or rarely with 1 or 2 minute bracts; head nodding, 12-25 mm. high, with about 150 flowers; receptacle broad, flat, naked; pistillate flowers peripheral, raylike (upper lip absent), generally rose-colored, the more internal pistillate flowers very numerous with their corollas filiform; perfect central flowers 2-lipped; achene 5- or 6-ribbed, red-violet, 9-16 mm. long, 0.7 mm. thick, fusiform, with a filiform beak comprising two-thirds the total length. Infrequent or rare in calcareous areas, Edwards Plateau, n.-cen., s.e. and Trans-Pecos Tex., and Rio Grande Plains, Mar.-Apr., again Sept.-Nov.; warmer parts of Am. from Arg. n. to Tex.

140. PINAROPAPPUS LESS.

Perennial herbs; leaves alternate, essentially glabrous, lobed or entire; heads solitary, terminating often somewhat scapelike branches; involucre obconical; phyllaries in several series, well-imbricated, texturally leaflike, linear or lanceolate; receptacle very slightly convex, with a chaffy scale subtending each flower; flowers (type "d") perfect, fertile; corollas rosy-white or lavender-white or nearly pure-white, bilaterally symmetrical, the raylike portion 5-toothed terminally; achene obscurely and rounded 5-ribbed, slender, strongly attenuate upward but the beaklike portion ribbed and of the same texture as the bodylike portion (thus a "true beak" not present); pappus persistent, of a number of microscopically barbed buffy white bristles.

About seven species, all North American.

1. Plants with short rhizomes, forming tight clumps; rhizomes about 2-3 mm. thick but not or rarely ligneous; phyllaries usually with a dead brownish or fuscous tip area 1. *P. roseus*.
1. Plants forming mats over dolomitic limestone cliffs, with much-branched highly ligneous crownlike stems mostly 3-4 mm. thick; phyllaries lacking an obvious sphacelate tip area 2. *P. parvus*.

1. *Pinaropappus roseus* (Less.) Less. ROCK-LETTUCE. Leaves often but not always crowded near the base of the stem which is usually 1-3 dm. tall; heads about 15-25 mm. high including the flowers. Frequent in open limestone areas, Edwards Plateau, Plains Country and n.-cen. Tex., less frequent in Rio Grande Plains and rare in s.e. Tex. (usually brought in with gravel for railroads, roads, etc.), spring; Tex. s.e. to Chis.; another var. in Ariz. and Chis.

2. *Pinaropappus parvus* Blake. A distinctive mat-forming woody-based perennial; scapes scarcely 3 cm. tall, unmistakable. Locally abundant on dolomitic limestone cliffs of Guadalupe and Diablo mts. in the Trans-Pecos, June-July; also N.M.

141. KRIGIA SCHREB.²³¹

DWARF DANDELION

Small herbs; leaves alternate or the uppermost opposite, often crowded near the base, sessile, basally narrowed; heads solitary on the branches; involucre of a single or double row of nearly equal phyllaries; calyculum usually absent; receptacle flat or slightly concave becoming slightly convex in fruit, naked; flowers perfect, fertile, the corolla (of type "d") yellow; achenes ovoid-columnar to prismatic, slightly attenuate upward but not beaked; pappus absent or single or double, when present of a few hyaline scales or an inner ring of scabrous unequal bristles (normally 5 or multiple of 5) and an outer ring of very short scales (usually about 5 or 10). *Cynthia* D. Don; *Cymbia* (T.&G.) Standl.

About 8 species in North America.

1. Phyllaries 4 to 8 times as long as broad, linear-lanceolate to oblong-lanceolate, relatively numerous (8 to 16), becoming shrivelled and reflexed in age, never keeled, scarcely even with a definite midvein; inner pappus of bristles 4.5-8 mm. long, outer pappus of as many or fewer short scales less than a fourth as long (2).
1. Phyllaries 1.5 to 3 times as long as broad, lanceolate to ovate, remaining erect and expanded in age, relatively few (4 to 10), with midvein which in age becomes prominent and keel-like; pappus absent or of short scales or of short bristles to 2 mm. long and an equal number of hyaline scales a third or more as long (3)
- 2(1). Involucre 7-15 mm. high, scarcely enlarged in fruit; perennial from a short caudex1. *K. Dandelion*.
2. Involucres 4-6.5 mm. high (to 9 mm. in fruit); annual or persisting for one winter only2. *K. virginica*.
- 3(1). Stems leafless and unbranched (but robust or partly buried plants may develop short basal internodes); well-developed pappus present or short scales or both scales and bristles3. *K. occidentalis*.
3. Stems leafy, branched (but leaves may be crowded near the base in stunted plants); pappus absent or merely a minute scaly crown (4).
- 4(3). Involucres 3-4.3 mm. high in flower, 3.3-5.3 mm. high in fruit; rays 2-4 mm. long4. *K. oppositifolia*.
4. Involucres 5.3-8.5 mm. high in flower, 6.2-8.5 mm. high in fruit; rays 5-10 mm. long5. *K. gracilis*.

1. *Krigia Dandelion* (L.) Nutt. POTATO-DANDELION. Perennial 10-45 cm. tall, from a crown with fibrous root system and slender rhizome bearing tuberlike enlargements; leaves crowded at the base of the aerial shoot, numerous, with a narrow subpetiolar base, elliptic to oblanceolate or lanceolate or linear-lanceolate, entire to pinnatifid, nearly glabrous; flowering stems scapelike, each terminating in a solitary head; involucre 10-15 mm. high; phyllaries 15, erect, in 2 series, free from each other, oblong-linear to lance-linear, acute, green, scarious-margined; receptacle flat or low-convex, naked; rays 12-17 mm. long; achenes columnar, 10- to 15-ribbed, appressed-pubescent, about 2.5 mm. long and 1 mm. thick, reddish-brown; inner pappus of 25 to 45 unequal scabrous bristles 5-8 mm. long; outer pappus of 10 oblong-lanceolate acute or acuminate hyaline scales 0.6-1 mm. long. Frequent in sandy soils, e. and s.e. Tex., infrequent w. to n.-cen. Tex., spring (-early summer); Gulf States, n. to N.J., Ind., Ill., Mo. and Kan.

²³¹ Adapted from L. H. Shinnars in *Wrightia* 1:187-206. 1947.

2. *Krigia virginica* (L.) Willd. Annual with short taproots, rarely overwintering, 4-35 cm. tall; leaves crowded at the base, narrowed to a subpetiolar base, cuneate-oblong to spatulate-oblong or oblanceolate, sharply and remotely denticulate to pinnatifid, often with glandular-capitate hairs; head-bearing stems scapelike, 1 to many, each with a solitary terminal head; involucre turbinate or broadly campanulate, 4.8-6.5 mm. high in flower, 5.2-9 mm. high in fruit; phyllaries 10, erect or suberect, in 2 equal series, glabrous, long-acute, becoming widely spreading and ultimately reflexed, with hyaline margins; rays linear-oblong, 4-7 mm. long; achenes narrowly conical-columnar, 1.8-2 mm. long, 15-ribbed, more or less angular in transection, scabrous-pubescent, reddish-brown; pappus of 5 scabrous bristles 4.5-5.5 mm. long and 5 rounded-truncate hyaline scales 0.6-1 mm. long. Frequent in sandy soils, e. Tex., infrequent w. to n.-cen. Tex., rare in Llano region, spring (-Nov.); e. U.S.

3. *Krigia occidentalis* Nutt. Annual 4-16 cm. tall, from inconspicuous taproots plus fibrous root systems; leaves crowded at the base, linear-lanceolate to oblong-lanceolate or elliptic to spatulate, narrowed to a subpetiolar base, entire to pinnatifid; stems several, scapelike, each terminating in a solitary head; involucre turbinate or campanulate, 2.5-5.5 mm. high in flower, 4.3-6.5 mm. high in fruit; phyllaries (4 or) 5 (to 7), united in the basal fourth to third their length, more or less overlapping, remaining erect in fruit, the involucre becoming closed by shrivelling after the achenes are shed; phyllaries lanceolate to lance-ovate, with scarious margins; rays 3.5-3.8 mm. long; achenes conical-columnar, 1.3-1.7 mm. long, slightly flared at summit, 10- or 15-ribbed and more or less angular, cinnamon or red-brown at maturity; pappus of 5 scabrous bristles 1.2-2 mm. long (rarely shorter, often unequal) plus 5 transparent flabelliform scales 0.4-0.6 mm. long. Frequent, n.-cen. and e. Tex., infrequent to s.e. Tex. and w. to Llano region, spring; Mo., Okla., Ark. and Tex.

4. *Krigia oppositifolia* Raf. Annual from a predominately fibrous root system; stems erect to half decumbent, usually 35-40 cm. tall, freely branching, glabrous or sparingly pubescent with capitate hairs, the ultimate branchlets pedunculiform and naked for 2-15 mm. below the heads; lower leaves alternate or subopposite, sessile, basally narrowed and subpetiolar, clasping, to 55 mm. long, the distal portion linear-lanceolate to elliptic; upper leaves smaller, the uppermost usually subopposite and unequal in size, elliptic or narrowly oblong to lance-linear; involucre urceolate, 3-4.3 mm. high in flower, 3.4-5.3 mm. high in fruit; phyllaries 5 to 8, in 1 or 2 series, equal, remaining erect; rays 2-4 mm. long; achenes ovoid-columnar, 1.4-1.6 mm. long, strongly 10- or 15-ribbed, cinnamon-red to dark-red-brown at maturity; pappus absent or a minute scaly crown as much as 0.2 mm. long. Common in e., s.e. and n.-cen. Tex., infrequent w. to Llano region, spring (-Nov.); Gulf States, n. to N.C., Tenn., Ark. and Kan.

5. *Krigia gracilis* (DC.) Shinn. Annual from a predominately fibrous root system, erect or ascending, 8-40 cm. tall, freely branching, glabrous or sparingly pubescent with capitate hairs, the ultimate branchlets pedunculiform, naked for 25-160 mm. below the heads; lower leaves alternate or subopposite, sessile, basally narrowed and subpetiolar, clasping, the distal portion lance-linear to narrowly oblong-lanceolate; upper leaves subopposite or opposite, clasping; involucre broadly urceolate, 5.3-8.3 mm. high in flower, 6.3-8.5 mm. in high in fruit; phyllaries 8 to 10, in one series but with overlapping scarious margins, ovate or ovate-lanceolate; rays 5-10 mm. long; achenes ovoid-columnar, 1.4-1.7 mm. long, strongly 15-ribbed; pappus absent or an obscure scaly crown. Local in seasonally moist clay loam, n.-cen. Tex., infrequent w. to the Llano region, e. to the s. part e. Tex., spring (-Nov.); endemic.

142. CICHORIUM L.

About 9 species in temperate parts of the Old World.

1. *Cichorium Intybus* L. CHICORY. Rhizomatous perennial 2-10 dm. tall; rhizomes somewhat fleshy, branching, deep; stems few, simple below, rigidly and divaricately branched above; leaves alternate, sessile, the basal ones lyrate- or runcinate-pinnatifid, those of lower stem merely serrate or dentate and oblanceolate, those of the upper stems reduced to mere rigid bracts, to about 35 cm. long and 2-7 cm. wide; many of the heads borne sessile at the nodes, others solitary at the ends of spreading rigid naked pedunculiform

branches; involucre roughly cylindroid, about 1 cm. high, in an inner double series of erect membranous phyllaries (the distal margins of which are glandular-ciliate) and some much shorter (outer squarrose or reflexed ones), also glandular-ciliate-fringed, the whole involucre basally eventually becoming white-indurate; receptacle convex, furnished with a few chaffy scales; flowers few (about 15); corollas (type "d") blue, terminally 5-toothed; achenes obscurely striate, plump, not regularly compressed, not ribbed, glabrous; pappus a low crown of minute scales. Infrequent, along roads, n. half of Tex., spring-fall; nat. of Eur., now widely adv., sometimes cult.

The ground and roasted roots of this species are commonly mixed with coffee. Another species, *C. Endivia* L. (endive), is a popular green and potherb.

143. NOTHOCALAIS GREENE

About 4 species in North America.

1. *Nothocalais cuspidata* (Pursh) Greene. Acaulescent perennial herb from thick somewhat fleshy scaly vertical rhizomes (or corms?); leaves all crowded at ground level, linear-lanceolate, somewhat fleshy and glaucous, 10-17 cm. long, 5-19 mm. broad, upon drying becoming very undulate along the margins and minutely fringed with crisped white hairs; scapes 13-30 cm. long, erect; heads solitary on the scape; involucre obconical; phyllaries in 2 (or 3) series, subequal or weakly imbricate, the inner lanceolate, 19-27 mm. high, broadly hyaline-margined and acuminate-tipped, the outer ones only slightly shorter; calyculum absent; receptacle slightly convex, naked; flowers numerous, perfect, fertile, all bilaterally symmetrical; corolla raylike, yellow, terminally 5-toothed; achene columnar, very gently tapered apically but truncate and not beaked, brownish, about 1 cm. long, with about 10 prominent smooth ribs; pappus of about 70 shiny white non-plumose persistent bristles, dorsiventrally flattened basally, as long as the achenes, toward the bases united to various lengths into scalelike members. *Agoseris cuspidata* (Pursh) Raf. Rare in prairies, n.e. part of Panhandle (Lipscomb, Ochiltree and Roberts cos.) in Plains Country, May.; Wisc. to Mont., s. to Mo., Tex. and N.M.

144. MICROSERIS D. DON

About 14 species in western North America, plus 1 in Chile, 1 in Australia and 1 in New Zealand.

1. *Microseris linearifolia* (DC.) Sch. Bip. Annual 1-3 dm. tall; taproot whitish, 2-3 cm. thick; stems several from the base, erect, subscapose; leaves alternate, crowded near or at the base, 3-20 cm. long, with minute white crisped hairs near the margins, nearly linear but pinnatifid with short linear lobes; heads solitary, terminating the nearly naked stems; receptacle naked, slightly convex; involucre of roughly 2 series of slightly unequal phyllaries, about 2 cm. high; phyllaries lanceolate, acute or even subulate, very thin-membranous or even scarious with hyaline margins, erect at anthesis, eventually deflexed; flowers 70 to 100, perfect, fertile, bilaterally symmetrical with a long yellow 5-toothed ray; achenes about 8-10 mm. long, essentially linear-cylindric or slightly swollen in the lower half, black at maturity, 10-ribbed; pappus of 5 nearly linear scales a little longer than the achene, basally overlapping, near the apex bifurcate and with a subulate awn in the fork. Rare in moist meadows near springs in the Trans-Pecos (Hueco Tanks, El Paso Co.), May; Wash., Ore., Ida., Calif., Nev., Ut., Ariz., Baja Calif., Son., N.M. and Tex.

145. PYRRHOPAPPUS DC.

FALSE DANDELION

Herbs; leaves alternate (often crowded at the base where the phyllotaxy is obscure), thin, often with a minute fringe of crisped white hairs; stems few, the branches few or none (stems in a few species scapelike); heads solitary at the ends of branches or stems; involucre in flower about 15-23 mm. high, roughly cylindrical but slightly flared upward; phyllaries numerous, lance-subulate, acute, thin, mostly green but with thin hyaline margins, in 2 definite size-classes; inner (longer) phyllaries in 2 subequal series, at

anthesis appearing slightly coalescent but afterwards pulling apart into discrete units and gradually becoming spread and ultimately reflexed at maturity of achenes, each near the tip on the dorsal side with a glandular area which at anthesis projects dorsally as a crest about 1 mm. high making the end of the phyllary appear 2-pointed; outer phyllaries much shorter, calyculate, subulate, 2-4 mm. long; receptacle very slightly convex, naked; flowers all perfect, fertile; corolla sulphur-yellow, bilaterally symmetrical, the ray 5-toothed terminally; achene brown basally with a plump fusiform body portion, with 5 broadly rounded ribs, the upper portion of the body antrorsely scabrous with scale-like projections, the body abruptly giving way upward to the very long filiform beak longer than the body (this beak at the very top slightly flared to form a pedestal for the pappus); pappus pedestal with a villous ring of reflexed microscopic hairs; pappus of a large number of capillary bristles (not plumose), tawny-white or buffy-white, persistent on the pedestal (although the beak itself is easily broken, sometimes making it appear as if the pappus is deciduous as a unit). *Sitilias* Raf.

A genus of about 8 species in North America. The genus is superficially similar to *Taraxacum*, and the plants are often mistaken for the latter (and vice versa). In *Taraxacum* the pappus is always white or yellowish-white, never with a tawny tinge, and the basal leaves are always definitely runcinate; furthermore, the true dandelions are all introduced in Texas, and nearly always found in disturbed areas in towns and other areas of human habitation.

1. Perennial, the slender vertical root terminating 3-10 cm. below ground level in a tuberous thickening about 1 cm. thick 1. *P. grandiflorus*.
1. Annual from slenderly napiform taproots (2)
- 2(1). Leaves of upper half of (sometimes scapelike) stems lanceolate, unlobed or with a small lobe on each side near the base; lower stem and basal leaves lanceolate or oblanceolate, rarely lobed, usually merely toothed 3. *P. carolinianus*.
2. Leaves of upper half of (often scapelike) stems pinnatifid with usually 2 or 3 linear lobes on each side; lower stem and basal leaves usually pinnatifid, sometimes merely toothed when produced very early or very late in the season (February or late May) 2. *P. multicaulis*.

1. *Pyrrhopappus grandiflorus* (Nutt.) Nutt. Perennial herb with vertical roots terminating several cm. below ground level in a globose or prolate tuberous thickening 5-12 mm. thick; leaves pinnatifid, crowded at ground level in a rosette; stems solitary or 2 or 3 scapelike, (1-) 2-3 dm. tall, naked or with a few scattered subulate bracts; heads solitary, terminating the scapes. Frequent in open calcareous areas, Plains Country, rare in n.-cen. and s.e. Tex., and the s. part of e. Tex., Mar.-May(-June); Kan., Colo., Okla., N.M. and Tex.

Exceedingly similar to some forms of *P. multicaulis*. The vast majority of prepared botanical specimens, lacking the complete root system, are not definitely assignable to species. The perennial *P. Rothrockii* Gray, with juncaceous habit, narrow leaves and small heads (only about 14 mm. long, even in fruit) has been reported to occur in Texas, but no specimens have been seen.

2. *Pyrrhopappus multicaulis* DC. Annual herb from slenderly napiform taproots, (1-) 2-5 (-8) dm. tall; stems few, mostly simple except in unusually robust plants; leaves usually crowded toward the base, with only 1 or 2 (or 3) nodes above; basal leaves usually pinnatifid, less commonly merely toothed; leaves of the upper nodes (if any) reduced, pinnatifid, with 2 or 3 linear lobes on each side; heads few to many. *P. Geiseri* Shinn. Abundant in n.-cen. and s.e. Tex. and Rio Grande Plains, less common in Edwards Plateau and s. and w. parts of e. Tex. and Plains Country, spring; Coah., N.L., Tam., Tex. and Okla.

A rather variable species with apparently some of the variability owing to widespread genetic intercontamination with *P. carolinianus*. The proposed segregate *P. Geiseri* consists of a suite of such introgressants. In the Brownsville region occur some plants with shallowly lobed elongate leaves and attenuate habit of *P. Sessaeanus* (D. Don) DC., a Mexican species which probably grades into *P. multicaulis*. Near El Paso occurs a variant in which, as in *P. carolinianus*, the lower lobes of the upper leaves are nearly suppressed.

3. *Pyrrhopappus carolinianus* (Walt.) DC. Annual herb from slenderly napiform

taproots, (2-) 3-7 (-10) dm. tall; some leaves crowded near the base, mostly oblanceolate, dentate or uncommonly shallowly lobed, some well-developed leaves (but smaller than the basal ones) scattered along the stem which is rarely scapiform and sparingly branched; leaves of upper half of plant lanceolate, unlobed or only with a single lobe on each side very near the base. Frequent in sandy soils, e. and s.e. Tex., rare in Plains Country (Hemphill Co.) and n.-cen. Tex., spring-early summer; s.e. U.S., n. to Del., Ind., Mo. and Kan., w. to Okla. and Tex.

146. *LYGODESMIA* D. DON*

SKELETON-PLANT

Annuals or perennials from branched slender subrhizomatous bases; stems green, striate, tough, wiry, usually intricately branched; leaves alternate, the basal ones sometimes much-lobed but most of the leaves reduced to small or minute linear or subulate bracts; heads solitary, terminating the ultimate branches; involucre nearly cylindroid, at least at anthesis; phyllaries definitely of 2 size-classes, few, the inner ones subequal and the outer ones much shorter and forming a calyculum, all grayish-green and with very narrow scarious margins; receptacle slightly convex, naked; flowers relatively few, the rays rosy, pink, lavender, blue or purple, *never yellow*, 5-toothed terminally; achenes narrowly columnar, few-ribbed or few-angled, truncate apically, not narrowed to a beak nor regularly compressed in any direction; pappus of a number of bristles that are weakly dorsiventrally flattened basally and in some species plumose, in some species persistent and in others deciduous in groups. *Stephanomeria* Nutt.

A genus of about 30 species, all North American.

1. Pappus bristles not plumose; involucre 10-21 mm. high (2)
1. Pappus bristles plumose; involucre 8-11 mm. high (3)
- 2(1). Involucre 16-21 mm. high1. *L. texana*.
2. Involucre 10-15 mm. high2. *L. juncea*.
- 3(1). The lateral projections of the pappus very short (about 0.2-0.5 mm. long) and present only in the upper half to two-thirds the length5. *L. Bigelovii*.
3. Lateral projections of bristles longer or if nearly as short as those above then present nearly to the base (4)
- 4(3). Pappus bristles plumose to near the base but not to the base (the basal 0.5-1 mm. of bristles not plumose), the lateral hairs 1-1.4 (-2) mm. long3. *L. pauciflora*.
4. Pappus bristles plumose essentially to the base (plumose to within 0.2 mm. of the base), the lateral hairs averaging only 0.6 mm. long ..4. *L. tenuifolia*.

1. *Lygodesmia texana* (T.&G.) Greene. Loosely clumped perennial from slender branched rhizomes; aerial shoots subsimple to freely branched, (2-) 4-6 dm. tall; basal and lowermost stem leaves pinnatifid, the medial portion and the lobes linear; leaves of midstem somewhat reduced, linear-subulate, the upper half of the plant essentially leafless; involucre 10-21 mm. high; rays usually lavender, varying to bluish or rosy; pappus of a number of nonplumose bristles. *L. ramosissima* Greenm. Frequent in open usually calcareous places in the Trans-Pecos and n.-cen. Tex., Edwards Plateau, Rio Grande Plains and Plains Country, and s. parts of e. and s.e. Tex., spring-fall; Chih., Coah., Tex. and Okla.

The plants of Mexico and Trans-Pecos Texas are more freely branched, on the average, than those east of Trans-Pecos Texas and of Oklahoma, and perhaps deserve separate recognition; they have been called *L. ramosissima* Greenm.

2. *Lygodesmia juncea* (Pursh) D. Don. Clump-forming perennial from deep branched rhizomes; aerial shoots intricately branched, 2-5 dm. tall; essentially all leaves reduced, linear or subulate, bractlike; involucre 10-15 mm. high; rays pink to pale-violet; pappus of a number of bristles, not plumose. Infrequent in prairies, higher parts of the Plains Country, June-Aug. (-Oct.); Wisc. to Alta., s. to Mo., Okla., Tex., N.M. and Ariz.

* See Appendix.

3. *Lygodesmia pauciflora* (Torr.) Shinners. Clump-forming perennial from branched rhizomes; aerial shoots (1-) 2-3 (-5) dm. tall, much-branched, usually grayish and glaucous; basal leaves (usually withered in prepared botanical specimens) and lower stem leaves linear with small linear lateral lobes or teeth; involucre about 9-10 mm. high; rays pink or pale-pinkish-lavender (rarely white?); pappus of a number of bristles, each plumose for most of the length but not in the basal 0.5-1 mm. of the length where merely microscopically scabrous, the axis at the base dorsiventrally flattened, the longest diameter being 1.5 to 2 times as great as the smallest diameter, the lateral hairs of the upper part 1-1.4 (-2) mm. long; achene 1.5-2 mm. long; *Ptiloria scabrella* Greene, *P. neomexicana* Greene. Frequent in crevices and exposed rocky prairies, Plains Country and Trans-Pecos mts., infrequent in w. part of Edwards Plateau, spring-summer; Kan., Colo., Okla., N.M. and Tex. (closely related, perhaps conspecific, taxa w. to Calif.).

The plants of the Plains Country are, on the average, lower in stature, more spreading and more intricately branched than the Trans-Pecos plants which have been given the name *Stephanomeria neomexicana* (Greene) Cory.

4. *Lygodesmia tenuifolia* (Torr.) Shinners. Perennial forming clumps from branched rhizomes; aerial shoots (2-) 3-5 (-7) dm. tall, branched at least in the upper part, often subsimple below; basal and lower stem leaves linear, sometimes with small linear lateral lobes but these often absent; leaves of midstem usually 1-3 cm. long, linear; involucre 8-11 mm. high; rays pink or lavender-pink; pappus of a number of bristles, each plumose for nearly the entire length (at least to within 0.2 mm. of the base), the axis basally dorsiventrally flattened, the longest diameter being 1.5 to 2 times as great as the smallest diameter, the lateral hairs averaging only 0.6 mm. long. *Stephanomeria tenuifolia* (Torr.) Hall, *S. Wrightii* Gray. Infrequent in Trans-Pecos mts., rare in w. part of Edwards Plateau, June-Aug. (-Sept.); N.M., Tex., Coah., Chih. and possibly farther n. and w.

5. *Lygodesmia Bigelovii* (Gray) Shinners. Annual with slenderly napiform taproots; stems simple below, much-branched above, 2-5 dm. tall; basal and lower stem leaves pinnatifid, semiamplexicaul, grading upward to nearly linear leaves and eventually to minute bracteal leaves; heads numerous; involucre about 8 mm. high; rays pink; pappus of a number of bristles, each plumose in the upper half to two-thirds the length (not in the basal portion), the axis basally dorsiventrally flattened (twice as broad as thick), the lateral hairs of the upper portion 0.2-0.5 mm. long. Very rare if still extant (reported to occur at Fronteras, El Paso, but not collected in Texas since 1852), May-June; Ariz., Ut., Calif. and Nev.

147. RAFINESQUIA NUTT.

PLUME-SEED

A genus of 2 species of southwestern United States.

1. *Rafinesquia neomexicana* Gray. Probably winter annual with taproots; stems essentially glabrous, much-branched at and near the base, ascending 2-5 dm. tall, often 3-5 mm. thick near the base, each ultimate branch terminating in a head; lower leaves pinnatifid, upper ones reduced and only about 5-10 mm. long, clasping the stem and with a few lateral lobes near the base; heads (15-) 20-25 mm. high including the rays and the pappus; involucre narrowly campanulate or in flower nearly top-shaped, with a double inner series of long lance-subulate membranous phyllaries with scarious margins and some extremely short outer calyculate ones; receptacle slightly convex, sometimes with a few hairlike bristles; corolla (type "d") purplish-white to usually pale-pink, 5-toothed terminally; achenes about 11 mm. long, with a fusiform body but in the upper third slightly attenuate to a stout beak, brownish, scabrous, basally excavated so that the point of vascular attachment is in the middle of a minute concavity; pappus of about 10 units which are dorsiventrally flattened but very narrow, filiform-subulate and long-plumose for most of the length (but not at the extreme tip!). Infrequent in deserts in the Trans-Pecos (El Paso), Apr.; Calif., Ut., Nev., Ariz., N.M., Tex. and Chih.

148. MALACOTHRIX DC.

A genus of 20 species of western North America.

1. *Malacothrix Fendleri* Gray. Nearly glabrous taprooted annual, many-stemmed from the base, 1-2 dm. tall, with many nearly linear basal and lower stem leaves (the latter

with some teeth or weak lateral lobes); stems sparingly branched, each ultimate branch terminating in a head; heads about 1 cm. high; involucre hemispheric, of a double series of equal inner phyllaries and 2 or 3 outer much shorter somewhat imbricated subcalyculate ones, all thin-membranous and with narrow scarious margins; receptacle slightly convex, quite naked; corolla (type "d") yellow, 5-toothed terminally; achenes columnar, about 2 mm. long, not attenuate toward the apex, dark-brown, with 15 close flutings or ribs, at the very summit with a thin-edged cup fitting around the base of the pappus; pappus of a number of ascending soft nonplumose bristles that are attached to each other, all deciduous as a unit except for 1 persistent pappus bristle. Rare in the Trans-Pecos (El Paso Co.), Apr.; Ariz., N.M., Chih. and Tex.

149. CALYCOSERIS GRAY

A genus of 2 species in North America.

1. *Calycoseris Wrightii* Gray. WHITE CUP-FRUIT. Taprooted annual, several-stemmed from the base, 5-20 cm. tall; leaves crowded near the base, pinnately lobed, the median portion and the lobes nearly linear; upper leaves greatly reduced, to mere bracts on the subscapose stems; stem often sparingly branched near the top and each fork bearing numerous stipitate tack-shaped glands, terminated by a head; heads 11-15 mm. high; involucre roughly hemispheric, with a long double series of equal inner phyllaries that are thin, membranous and broadly scarious-margined, plus 2 or 3 series of much shorter unequal imbricated subequal phyllaries at the base; receptacle essentially naked or with some scattered hairlike projections; corolla (type "d") long, whitish or with a rosy- or purplish-tinge (especially on the dorsal side) and terminally 5-toothed; achenes with a fusiform body basally, contracted into a slender beak in the upper third or fourth the length, with about 6 flutes or ribs, at the very apex with a minute thin-walled cup surrounding the base of the pappus; pappus of a number of whitish slender bristles lightly coalescent at their bases, the whole pappus tending to dehisce as a unit though easily broken into 2 or more units. Rare in the Trans-Pecos (El Paso Co.), Mar.-Apr.; Ut., Calif., Ariz., N.M. and Tex.

150. TRAGOPON L.

Biennials with deep napiform taproots; stems 1 or few, (2-) 3-8 dm. tall, basally (3-) 5-9 mm. thick, sparingly and ascendingly branched above, coarse and very tough (difficult to break); leaves alternate, lance-linear, long-tapered to a fine point; upper (5-) 10-15 cm. of ultimate branches essentially naked, pedunculiform, 5-10 mm. thick, each capped by a head 8-12 cm. in diameter; involucre roughly obconical, 3-4 cm. high at anthesis, to 7 cm. after anthesis; phyllaries in 2 series, subequal, lance-linear or subulate, attenuate to a fine point, the longer ones always surpassing the rays; calyculum absent; receptacle flat, rough, not chaffy; flowers perfect, fertile, numerous; corollas bilaterally symmetrical, yellow or purple, the ray 5-toothed terminally; achenes 25-36 mm. long including the beak, with a narrowly fusiform 5-ribbed basal body with much antrorse subspinose roughening, the slender beak about as long as the body; pappus persistent, of a number of plumose bristles which are dorsiventrally flattened.

A genus of about 50 species of temperate Eurasia (1 reported native to South Africa), several of them now widely adventive in temperate areas.

1. Corolla lemon-yellow 1. *T. dubius*.
 1. Corolla dark-violet 2. *T. porrifolius*.

1. *Tragopogon dubius* Scop. GOAT'S-BEARD. Low and bushy, the branches originating from near stem base; flowers 100 to 200 per head; bracts usually 13 per head, long, narrow; rays lemon-yellow; achene body gradually narrowed to and not strongly differentiated from the beak; outer achenes pale-brown, the inner ones stramineous; pappus white. *T. major* Jacq. Infrequent weed of Plains Country, rare in the Trans-Pecos and n.-cen. Tex., May-June (-July); nat. of Eur., now widely adv.

2. *Tragopogon porrifolius* L. SALSIFY, OYSTER PLANT. Stout but strict, the branches fewer and usually originating higher on the stem than in *T. dubius*; flowers 84 to 117 per head; bracts usually 8 per head, relatively broader and shorter than in *T. dubius*; rays

dark-violet; achene body abruptly narrowed to and clearly differentiated from the somewhat longer beak; outer achenes dark-brown, the inner ones paler; pappus brownish. Infrequent or rare weed in the Trans-Pecos, n.-cen. Tex. and Plains Country, May-June; nat. of Eur., now widely adv.

The somewhat oyster-flavored napiform taproot of this plant is cooked, often as a stew, or is used as a relish.

151. HYPOCHOERIS L.

A cosmopolitan genus of nearly 100 species, many occurring in South America.

1. *Hypochoeris microcephala* (Sch. Bip.) Cabrera var. *albiflora* (O. Ktze.) Cabrera. Perennial from stout underground parts, 3-7 dm. tall; stems 1 to 3, simple below, with many ascending branches above; basal leaves deeply pinnatifid, the medial portion and the lobes nearly linear; stem leaves few, the lower ones pinnately lobed, the upper ones reduced to subulate bracts; heads solitary on the ultimate branches; involucre very narrowly campanulate, 10-17 mm. high, of a number of erect lance-subulate green phyllaries which are well-graduated and not clearly of two size-classes, the midribs whitish; receptacle convex, with long membranous lance-subulate chaffy scales subtending the flowers; corolla (type "d") white, 5-toothed terminally; achene about 1 cm. long, in 2 rather distinct portions, the lower part fusiform, brown, with about 10 ribs and numerous trabecular cross-septa between the ribs, the upper part a slender beak; pappus of about 20 ascending apparently persistent plumose bristles. Rare and local in s.e. Tex. (6 miles n. of Orange) in disturbed ground near a road, spring; nat. of s. S.A., adv. in Tex.

152. HEDYPNOIS SCHREB.

A genus of three species in the Canary Islands, Madeira and Mediterranean region.

1. *Hedypnois cretica* (L.) Willd. Annual from slender taproots; stems usually several from near the base, spreading and distally ascending, 1-3 dm. long, sparingly branched, the branches naked and pedunculiform, smaller upward to the solitary terminal heads; leaves alternate, the basal ones shallowly pinnately lobed and sparsely scabrous-hispid; stem leaves few and much-reduced; involucre roughly campanulate, about 1 cm. long; phyllaries in 2 definite size-classes; inner (longer) phyllaries in a double series, scabrous-hispid, linear, after anthesis becoming curved and boat-shaped (round-keeled dorsally) and somewhat indurated, usually each enclosing one of the peripheral achenes; outer phyllaries less than half as long as the inner, appressed; receptacle nearly flat, naked; flowers perfect, fertile (or some of the central ones infertile); corolla (type "d") yellow, with 5 purple teeth; achenes columnar or curved-columnar, about 5-6 mm. long, with about 15 close ribs, not attenuate, beakless, dimorphic: pappus of outer (peripheral) achenes a scaly fringed crown about 1 mm. high, that of the central achenes (mostly infertile) of several elongate scales about 5 mm. long. *H. rhagadioloides* (L.) Willd. var. *gracilior* (Boiss.) Hegi. Local on coquina beds at shoreline near Corpus Christi, Mar.-Apr.; nat. of Medit. region, Madeira, Canary Is.; adv. in Calif. and Tex.

153. SONCHUS L. SOW THISTLE

Slenderly taprooted annuals, nearly glabrous or some with capitate glands at various places on the stem; leaves alternate with spinose-dentate margins, the lowest ones usually runcinately pinnatifid, those of midstem with a few lateral lobes or nearly lobeless and clasping, the upper ones reduced in size somewhat and usually lance-deltoid, clasping and acute; branches usually few below, but several near the top of the plant, each ultimate one terminating in a head; involucre roughly obconic at anthesis, about 1 cm. high; phyllaries in roughly 2 size-classes, all (especially the longer ones) often with 1 to 3 glandular places near the midnerve which proliferate into capitate glands or minute dorsal crests, or these absent; the longest phyllaries in a double series, subequal, lance-subulate, thin-membranous, green, scarious-margined; the outer shorter phyllaries not at all equal but somewhat imbricated, forming an indistinct calyculum, the bases and broad midnerves

after anthesis becoming whitish-indurate and callous-thickened; receptacle flat or slightly convex, naked; flowers numerous, perfect, fertile; corolla yellow, bilaterally symmetrical, the raylike portion about as long as the very slender tube; achenes dimorphic, the peripheral ones of a paler color (grayish or stramineous), the much more numerous central ones becoming darker and brown to reddish-brown, strongly flattened, elliptic to narrowly obovate in outline, unbeaked, about 3 mm. long, with about 3 to 5 longitudinal slightly curved ribs on each of the 2 faces, roughened by numerous parallel retrorse microscopically spinose transverse ridgelets; pappus dimorphic, of 50 to 100 extremely fine white persistent capillaries plus 6 to 10 white dorsiventrally flattened caducous bristles, the latter being attached nearer the center of the achene apex than the more peripheral capillaries.

Native of Eurasia and Africa with a few dozen species. Ours are troublesome weeds especially in lawns and gardens. The bristly fruits of some species are known to cause skin infections.

1. Achenes 3.5 to 4 times as long as broad, broadest above the middle, the wall rather firm and distinctly transversely roughened (even those of the central achenes); leaves of upper and midstem with acute auricles1. *S. oleraceus*.

1. Achenes about 2 to 2.5 times as long as broad, broadest near the middle, the wall thinner, less firm and less distinctly roughened (the paler peripheral achenes somewhat roughened but the central ones nearly smooth on the faces); leaves of upper and midstem with rounded auricles2. *S. asper*.

1. *Sonchus oleraceus* L. Characters as in the key; in addition the foliage is softer and less distinctly spinose-margined than the other species but the foliage characters are not as reliable as the achene characters in determination of individual plants. Disturbed ground throughout the state, usually spring but most any time of the year; nat. of Eur., now widely adv.

2. *Sonchus asper* (L.) Hill. *ACHICORIA DULCE*. Characters as in the key; foliage rather roughly and harshly spinose-margined but see comments above. Disturbed ground throughout Tex., usually spring; nat. of Eur., now very widely adv.

154. LACTUCA L. LETTUCE

Mostly biennial or winter annual herbs; leaves alternate, lobed or not, marginally serrate and often with each tooth slightly spinose, the upper ones (at least) often clasping; stems tall, erect, mostly simple except in the upper (head-bearing) region; involucre narrowly urceolate just before anthesis, usually after anthesis becoming more or less campanulate; phyllaries well-imbricated, mostly erect (tips sometimes spreading), ovate-lanceolate to lanceolate or lance-linear, green with narrow white margin; receptacle flat-tish, naked; flowers 5 to 35 per head, perfect, fertile; corollas yellow, blue, white, rosy-white or lavender, bilaterally symmetrical, the raylike portion terminally 5-toothed; achenes definitely flattened, some extremely flat and even slightly winged, with a definite body portion below which is usually obovate or elliptic in outline and abruptly narrowed to a long or short thick or thin (or even filiform) beak, the microscopic apex flared as a pappus pedestal; pappus of numerous white or whitish capillary bristles, persistent or tardily deciduous as individual bristles (not as a unit).

An Old World genus of perhaps 100 species. *Lactuca sativa* L., the cultivated lettuce, a native of Europe, is probably the best-known species of the genus, but most of our species are native. Some of our species hybridize, thus making determinations troublesome. The young leaves of all species are used for salads and greens.

1. Acheneal beak absent or stout, only 0.5-1 mm. long (2)

1. Acheneal beak filiform, 2-4 mm. long (3)

2(1). Rhizomatous perennial; involucre at anthesis 12-15 mm. high6. *L. pulchella*.

2. Annual; involucre at anthesis 9-10 mm. high7. *L. floridana*.

3(1). Achene about a third as thick as broad, on each face with about 7 distinct longitudinal nerves, the short wings of the upper sides being pubescent1. *L. Serriola*.

3. Achenes very flat, each face with 1, 2 or 3 longitudinal nerves, the wings (if present) not pubescent (4)

- 4(3). Lower leaves mostly linear, 10-33 cm. long, 5-12 mm. broad; mountains of Trans-Pecos Texas 5. *L. graminifolia*.
4. Lower leaves not linear or (if so) proportionately broader; generally distributed (5)
- 5(4). Achenial body 2 to 2.5 times as long as broad; lower leaves usually pinnatifid and those of upper midstem narrowed basally to a nonclasping base 4. *L. hirsuta* var. *albiflora*.
5. Achenial body 1.5 to 2 times as long as broad; lower leaves either pinnatifid or unlobed, when lobed then usually the leaves of upper midstem clasping (6)
- 6(5). Achenial body 3.5-4.5 mm. long, the beak 2.2-2.5 mm. long; leaves usually unlobed, marginally toothed or entire but not spiny-toothed 2. *L. canadensis*.
6. Achenial body 4.5-5 mm. long, the beak (2-) 2.5-3 mm. long; leaves usually weakly spiny-dentate 3. *L. ludoviciana*.

1. *Lactuca Serriola* L. PRICKLY LETTUCE. Taprooted annual or winter annual; stems (3-) 5-20 dm. tall, erect, simple except in the uppermost reaches; leaves usually pinnatifid (except the uppermost) and usually clasping, the margins usually finely spinose-dentate; involucre 8-11 mm. long at anthesis, 9-13 mm. long in fruit, the inner (longer) phyllaries after anthesis becoming filiform-involute for most of their length; corollas yellow (often the extreme tip discolored bluish or purplish); achene body 2.5-3 mm. long, somewhat compressed but still lenticular in transection and about a third as thick as broad, brownish, oblanceolate or linear-obovate, on each face with about 7 distinct longitudinal nerves, not winged or only very shortly winged on the upper shoulders near the junction with the beak and these thin shoulders microscopically ciliate, the beak filiform and 3-4 mm. long. Frequent in disturbed soil, n.-cen. Tex. and Edwards Plateau, infrequent in e. and Trans-Pecos Tex. and Plains Country, June-July; nat. of Eur., now widely adv. The name is sometimes misspelled "scariola."

2. *Lactuca canadensis* L. Biennial (?) with crowns 1-3 cm. thick; stems 5-25 dm. tall, mostly simple except in the upper fifth of the height where branched, most of the stem leafy; lowermost leaves (in the lower fifth of the height) usually pinnately lobed (rarely even up to half the leaves lobed) but usually most leaves nearly lobeless; upper leaves usually narrowly obovate, acute and basally narrowed to a nonclasping base; leaf margins not spiny-dentate, some with weak teeth; involucre about 1 cm. long at anthesis, later 13-15 mm. long in fruit, the larger outer phyllaries about 1.8-2 mm. broad; corollas yellow; achene body obovate, 3.5-4.5 mm. long, about 1.5 to 2 times as long as broad, very flat and somewhat winged, dark-brown or usually black, each face with 2 or 3 longitudinal nerves and numerous weak transverse ridges, the filiform beak 2.2-2.5 mm. long. Infrequent in sandy soil, e. Tex., rare in n.-cen. and s.e. Tex., June-July (-Aug.); s.e. Can. and e. U.S.

In Texas *L. canadensis* and *L. ludoviciana* intergrade or perhaps simply have contaminated each other genetically through introgression. It would appear that *L. canadensis* has been more contaminated by *L. ludoviciana* than vice versa.

3. *Lactuca ludoviciana* (Nutt.) Ridd. Biennial (?) with crowns 1-2 cm. thick; stems erect, (3-) 5-15 dm. tall, mostly simple except in the upper 1-3 dm. (head-bearing region) where branched, most of the stem very leafy; leaves mostly pinnately lobed except the uppermost which become merely deltoid and clasping; leaf margins slightly spiny-dentate; involucre 1 cm. long at anthesis, (13-) 14-17 mm. long in fruit; larger outer phyllaries 2-3 mm. broad; flowers yellow or at least ochraceous; achene body 4.5-5 mm. long, about 1.5 to 2 times as long as broad, very flat and somewhat winged, dark-brown or black, each face with 1 or 2 (or 3) longitudinal nerves and numerous weak transverse ridges, the beak filiform and (2-) 2.5-3 mm. long. Frequent (in usually calcareous soil), n.-cen. Tex. and Edwards Plateau, less frequent to Plains Country and the Trans-Pecos, rare in the Brownsville region of extreme s. Tex. and in e. Tex. (Jasper Co.), May-June (or Mar.-Apr. in extreme s., July in extreme w.); Ont., Minn., Ia. and Neb. s. to Tex.

4. *Lactuca hirsuta* Muhl. var. *albiflora* (T.&G.) Shinn. Biennial (?) with crowns 7-10 mm. thick; stems erect, 5-16 dm. tall, mostly simple except in the upper 2-5 dm. (head-bearing portion) where are a number of spreading-ascending branches, most of

stem leafy; most of the leaves deeply pinnatifid, the upper ones never clasping but usually also pinnatifid and narrowed to the subpetiolar base, the midrib beneath often hispid; involucre 10-13 mm. long at anthesis, 13-18 mm. long in fruit; larger outer phyllaries 1.5-2.2 mm. broad; flowers very pale-yellow (creamy) or more commonly pink or pale-lavender, never strong yellow; achene body very flat, 4-4.5 mm. long, narrowly obovate in outline, 2 to 2.5 times as long as broad, dark-brown or black, with about 3 longitudinal nerves on each face and numerous weak transverse ridges, the filiform beak 2-2.5 mm. long. Infrequent in sandy woods, e. Tex., May-July; also La.

The var. *hirsuta* and var. *sanguinea* (Bigel.) Fern. occur extensively in e. U.S.

5. *Lactuca graminifolia* Michx. Biennial or weak perennial with taproots; stems erect, (3-) 5-9 dm. tall; basal outer leaves sometimes runcinately pinnatifid but most of the lowest stem leaves unlobed and linear, 10-25 (-33) cm. long, 5-12 mm. broad, remotely toothed or entire marginally; leaves of midstem much-reduced upward, lance-linear or linear, entire, tapered to a fine point; upper 1-2 dm. of plant essentially leafless, sparingly branched; involucre 10-12 mm. long at anthesis, 15-16 cm. long in fruit; corollas lavender or yellow; achene body very flat, about 5 mm. long, oblong or oblong-elliptic in outline, 2 to 2.5 times as long as broad, black, with 2 or 3 longitudinal nerves on each face plus numerous weak transverse ridges, the slender beak 2-4 mm. long, often drying flat. Rare in moist canyons, higher parts of Davis and Guadalupe mts. in the Trans-Pecos, June-Sept.; s. U.S. from N.C. to Fla. and w. to Ariz., s. to n. Mex.

Not clearly separated from *L. pulchella* and probably grading into it; possibly *L. graminifolia* comprises individuals representing ancient genetic mixing of *L. pulchella* with *L. canadensis* or *L. ludoviciana*.

6. *Lactuca pulchella* (Pursh) DC. BLUE LETTUCE. Perennial; rhizomes scaly, extensive, 3-5 mm. thick; aerial shoots erect, 3-8 dm. tall, simple and leafy for nearly the entire length; leaves not greatly reduced upward (those at midstem more than half as long as those at base), mostly linear and unlobed (in some specimens with very remote teeth marginally) or uncommonly nearly all the leaves runcinately pinnatifid; involucre 12-15 mm. long at anthesis, 15-20 mm. long in fruit; corollas blue or lavender-blue; achene compressed, the body oblanceolate, about 4 mm. long, about 1 mm. broad, fuscous-black, with about 5 longitudinal nerves and very weak internerve-roughening, near the top tapering shortly into the stout beak which is 1 mm. long and about 0.4 mm. thick. Very rare in the Davis Mts. in the Trans-Pecos at about 5,000 ft. elev. (Muzquiz Creek) (collected once in Tex., Aug. 12, 1934); widespread in Rocky Mts. and s. to Mex. and Guat.; also Mich., Wisc., Ia., Mo. and Que. to Alas.

7. *Lactuca floridana* (L.) Gaertn. Robust annual (5-) 10-25 (-33) dm. tall, the stem simple for nearly the entire height or branched only very near the top; leaves nearly all deeply runcinate-pinnatifid but with an extremely ample triangular terminal portion and only 1 (or 2) large lateral lobes on each side, marginally toothed; involucre 9-10 mm. long at anthesis, to 10-12 mm. long in fruit; corollas bluish or white; achene body oblanceolate, 4-4.5 mm. long, flattened but not at all winged, about 3 times as long as broad, with 2 or 3 longitudinal nerves on each face and many weak transverse internerve ridges, mottled black and brownish-gray, shortly tapered apically to a stout somewhat beaklike cylindrical apex (0-) 0.5-1 mm. long and 0.5 mm. thick. *L. villosa* Jacq. Frequent in n.-cen. and e. Tex., rare to s.e. Tex., Aug.-Oct.; e. U.S.

155. *HIERACIUM* L. HAWKWEED

Perennial herbs from subrhizomatous bases with fibrous root systems; stems 3-15 dm. tall, erect, sparingly or not branched except in the upper reaches, bearing long spreading tawny hairs in the lower part but glabrous above, upper parts of stems essentially leafless; leaves alternate, sessile but narrowed to a subpetiolar base or rarely with true short petioles, bearing long spreading tawny hairs; heads 5-15 mm. high, often somewhat nodding, solitary on the ultimate branches, 3 to 50 per plant; involucre obconical at anthesis, 5-13 mm. high; phyllaries in 2 fairly well-marked size-classes, the longer ones lance-subulate, in a double row, free, green, pubescent, the outer ones subulate, calyculate; receptacle very slightly convex, naked; flowers perfect, fertile; corollas bilaterally symmetrical, yellow to orange-yellow or dirty-yellowish-white, the raylike portion terminally

5-toothed; achene columnar, in some species gently tapered but never beaked, nearly black at maturity, 10-ribbed, 2-5.5 mm. long; pappus a number of tawny-white bristles, persistent, often somewhat unequal.

A cosmopolitan Temperate Zone genus of about 100 species; several thousands of species have been proposed chiefly on the basis of local apomictic strains.

1. Achenes about 5.5 mm. long3. *H. Fendleri*.

1. Achenes 2-3 mm. long (2)

2(1). Leaves to about a third (of the total height) above the base of the plant, narrowly obovate; east and north-central Texas1. *H. Gronovii*.

2. Leaves to a third the total height from the base of the plant, oblong-linear; Trans-Pecos mountains2. *H. Wrightii*.

1. *Hieracium Gronovii* L. Perennial herb, the stems 4-15 dm. tall; leaves 3 to 12 per stem, borne below the middle of the stem, obovate to narrowly so, blunt; involucre at anthesis about 7-8 mm. high, afterwards to 10 mm. high; achenes 2-3 mm. long. *H. longipilum* Torr. Frequent in sandy rather open-forested areas, e. Tex., infrequent or rare w. to n.-cen. Tex., commonly spring, less commonly again in fall; e. U.S. and s.e. Can.

2. *Hieracium Wrightii* (Gray) Robins. & Greenm. Caudex stout, comose; stems stout, fistulose, 4-9 dm. tall, very hirsute to the summit; leaves 5 to 9, the basal ones oblanceolate, narrowed to a subpetiolar base, glaucescent, obsolete glandular-denticulate, villous-hirsute above and below; stem leaves lance-oblong, attenuate; involucre campanulate, in fruit nearly 1 cm. thick; phyllaries tomentulose and covered with long spreading tawny or darker colored glandular setae; achenes 2-3 mm. long; pappus bright-white or slightly tawny. Frequent in the higher parts of the Trans-Pecos mts., Aug.; Tex., Coah., Chih., Baja Calif., S.L.P. and Dgo.

3. *Hieracium Fendleri* Sch. Bip. Stems 1 to 3, erect, 26-52 cm. tall, hirsute with long fine widely spreading or slightly reflexed bristles, or glabrate; basal leaves 3 to 14, oblanceolate to obovate, acute to rounded and apiculate, cuspidate-serrate, attenuate basally, 5-12 cm. long, 17-60 mm. broad, on both surfaces and marginally covered with long sparse hairs; stem leaves 1 or 2, much smaller, lance-oblong, acute; heads 3 to 40 per plant; inner phyllaries 10-12 mm. long; achene about 5.5 mm. long, tapered almost from the base to the summit; pappus sordid-white. Rare in Davis Mts. in the Trans-Pecos at elev. of 6,000-8,000 ft., June; N.M., Colo., Ariz., Tex. and Chih.

156. PRENANTHES L.

RATTLESNAKE ROOT

Perennial herbs 5-15 dm. tall from thick perennial taproots or corms sometimes connected by slender rhizomes; stems nearly simple, erect and leafy except in the immediate vicinity of the heads; leaves alternate, the lower ones usually withered before anthesis, some of them usually deeply lobed; upper 1-2 dm. of the stem repeatedly branched, each ultimate branchlet drooping and bearing a pendulous head; involucre at anthesis nearly cylindrical, 1-2 cm. long; phyllaries in 2 definite size-classes; inner (longer) phyllaries 5 to 8, linear and in a double row, free but the margins overlapping; outer (smaller) phyllaries lanceolate, much shorter than the inner ones, calyculate; receptacle very slightly convex, naked; flowers 5 to 12, perfect; corollas white or with a roseate or creamy tinge, bilaterally symmetrical, the ray portion 5-toothed terminally; achenes slenderly columnar, 5-10 mm. long, smooth but 5-ribbed, unbeaked; pappus of a number of microscopically barbellate buffy-white bristles, persistent.

A genus of perhaps 40 species in North America, Africa and Asia.

1. Principal phyllaries 6 to 8; heads with 10 to 12 flowers .1. *P. barbata*.

1. Principal phyllaries 5; heads with 5 or 6 flowers2. *P. altissima*.

1. *Prenanthes barbata* (T.&G.) Milstead. Tall virgate perennial; some of the midstem leaves pinnately lobed; principal phyllaries 6 to 8; phyllaries of the calyculum lance-subulate, each usually with a row of coarse short bristles; heads with about 10 to 12 flowers; achenes 8-10 mm. long. *P. Serpentaria* Pursh var. *barbata* (T.&G.) Gray. Rare in sandy forested areas, e. Tex. (Jasper Co.), Oct.; s. e. U. S.

2. *Prenanthes altissima* L. Tall virgate perennial; some of the midstem leaves pal-

mately 3- (or 5-) lobed; principal phyllaries 5; phyllaries of the calyculum bluntly lanceolate, essentially smooth or microscopically puberulent; heads with about 5 or 6 flowers; achenes about 5 mm. long. Very rare in moist rich beech woodland, e. Tex. (Newton Co.), Oct.; Que. to Man. s. to Ga., Tenn. and Tex.

157. YOUNGLIA CASS.

A genus of 35 or 40 species of temperate and tropical Asia.

1. *Youngia japonica* (L.) DC. Annual from short taproots, essentially glabrous; stems sparingly branched except in the upper 2-5 cm. where the branches are numerous with each ultimate one terminated in a head; leaves crowded at the base, lyrate-pinnatifid or runcinate; stem leaves few and reduced; heads about 6-7 mm. high including the pappus and rays; involucre 4-5.7 mm. high, nearly short-cylindrical except abruptly narrowed basally to the peduncle, of an inner double series of equal thin-membranous scarious-margined phyllaries and a few outer much shorter phyllaries near the base; receptacle slightly convex, naked; rays yellow or orange-yellow, 5-toothed terminally; achenes about 2 mm. long, fusiform in outline (occasionally falcate-fusiform), in transection 3- or 4-angular, on each of the 3 or 4 facets with 1 or 2 subordinate ribs, black; pappus of a number of soft white capillary bristles which tend to persist. Rare and local in cult. soil of flower beds and gardens, perhaps not a persistent member of our flora, Oct.-Nov.; nat. of Asia, now widely adv. in s.e. U. S.

This is exceedingly similar to *Crepis capillaris*. The technical details for distinguishing the genera *Crepis* and *Youngia* are tenuous.

158. CREPIS L. HAWK'S-BEARD

Herbs; leaves alternate; phyllaries of two size-classes, the longer ones subequal, in a double inner series, thin-membranous and scarious-margined, the outer calyculate ones deltoid and much shorter; receptacle convex, either naked or sparingly hairy; corollas (type "d") yellow, 5-toothed terminally; achenes terete or subterete in transection, not beaked though upwardly gradually attenuate in some species, with about 10 fine ribs; pappus copious, of numerous fine soft white capillary bristles, not plumose.

A genus of perhaps 200 species of the Northern Hemisphere and Asia.

- 1. Perennial 1. *C. runcinata*.
- 1. Annuals (2)

- 2(1). Achenes 4-6 mm. long, more or less attenuate upward; pappus rather persistent 2. *C. pulchra*.
- 2. Achenes 1.5-2.5 mm. long, terete or subterete, fusiform or oblong and abruptly narrowed at both ends; pappus caducous 3. *C. capillaris*.

1. *Crepis runcinata* (James) T.&G. Essentially glabrous perennial from woody or slightly fleshy rootstocks to 5-10 mm. thick, these apparently branched well-underground; leaves all crowded at the base, 5-12 cm. long, 15-30 mm. broad, oblanceolate, nearly entire or rarely with a few teeth or shallow lobes, rather fleshy and glaucous, essentially sessile; cauline leaves only 1 or 2 per stem and much-reduced to mere bracts, entire and oblanceolate, appressed; scapelike stems sparingly branched, the branches ascending with each terminating in a head; heads few; involucre narrowly campanulate, 12-20 mm. long, an inner double series of subequal linear-subulate thin-membranous scarious-margined phyllaries and 8 to 10 much shorter calyculate ones at the base; receptacle convex, naked or with a few minute hairs; rays yellow, 5-toothed terminally; achenes 4-5.5 mm. long, slightly attenuate apically but not beaked, nearly columnar or the outer ones somewhat compressed, with 10 to 13 ribs; pappus rather persistent, of a number of white fine capillary bristles which are lightly coherent basally. Rare in open seasonally moist prairies, higher parts of Plains Country (Dallam Co.), summer; very widespread in Great Plains and trans-Montane basins.

2. *Crepis pulchra* L. Glandular-pubescent taprooted annual 3-7 dm. tall, with a single stem basally which is simple for most of the height of the plant; lower stem leaves oblan-

ceolate, often shallowly runcinate or merely toothed, apically blunt, basally cuneate, sessile; leaves of midstem smaller, often oblong and clasping, those a little higher up much-reduced and narrowly deltoid-clasping and apically subulate; heads 5 to 50 per plant, not crowded, each terminating an ascending naked pedunculiform branch; involucre nearly cylindrical or narrowly obconical, 8-11 mm. long, of an inner double series of linear-subulate thin-membranous scarious-margined phyllaries and a very few minute calyculate ones basally; receptacle convex, few-flowered, naked; rays orangish-yellow, 5-toothed terminally; achenes 4-6 mm. long, slenderly columnar, more or less attenuate upward, several-ribbed; pappus copious, persistent, of numerous fine white capillary bristles. Rare adv. in sandy soils, e. Tex. (Upshur and Wood cos.), Apr.-May; nat. of Medit. region, middle Eur. and e. to Himalayas and Tien Shan Mts., now sparingly adv. in s.e. U.S.

3. *Crepis capillaris* (L.) Wallr. Annual or biennial, 2-90 cm. tall; stem erect, branched above or profusely branched from base upward; involucre cylindrical (eventually turbinate in fruit); inner phyllaries 8 to 16, thin, scarious-margined, pubescent on the median dorsum; outer phyllaries much shorter, calyculate; receptacle naked; rays yellow; achenes brownish, 1.5-2.5 mm. long, terete or subterete, fusiform or oblong and slightly narrowed at both ends, with 10 ribs; pappus of numerous soft white capillary bristles, caducous. Rare lawn weed at Alpine (in 1928) in the Trans-Pecos, probably not a persistent member of our flora, spring; nat. of Eur., now widely adv.

159. TARAXACUM ZINN DANDELION

A Temperate Zone genus of perhaps 50 species. Hundreds of species have been proposed, based largely on apomictic populations.

1. *Taraxacum officinale* Wiggers. COMMON DANDELION. Winter annual or perennial herb from deep taproots to 1 cm. thick; leaves all crowded in a basal rosette, 5-15 cm. long, runcinately pinnatifid; stems scapose, 3-20 cm. tall, solitary or few, each topped by a solitary head; involucre broadly obconic, about 1-2 cm. broad and high; phyllaries in 2 definite size-classes; inner (longer) phyllaries in 2 equal series, linear-subulate, thin-membranous with hyaline margins, at anthesis appearing very slightly coherent at the overlapping margins but with age pulling apart and eventually spreading at maturity of fruit, each near the apex dorsally with a minute glandular spot which usually during maturation of the fruit proliferates into a low crest or minute horn, making the phyllary appear double-tipped or -appendaged; outer (shorter) phyllaries about half or less as long as the inner, of the same texture and shape, spreading during anthesis, calyculate; receptacle very slightly convex, naked; flowers all perfect, fertile, in some races parthenogenetic and lacking functional stamens; corolla yellow, bilaterally symmetrical, the ray-like portion 5-toothed terminally; achene very slightly flattened (the exterior ones sometimes roughly trigonous but plump and rounded), the basal fusiform body with about 5 major rounded ribs and some lesser intermediate ones, the one in the anterior portion often with a row of antrorse spinose projections, the body giving way abruptly to the filiform beak as long as or longer than the body and slightly flared apically; pappus of a large number of whitish or yellowish-white fine capillary bristles which are either persistent or break off separately but not falling together. *T. erythrospermum* Besser, plus a number of other synonyms. Locally abundant in lawns, roadsides and other disturbed favorable places, throughout the state except the extreme s., spring-summer; nat. of Eur., now widely adv.

A troublesome lawn weed whose leaves are used as a pot herb when young. The color of the achene varies from grayish or buffy to rich-chestnut, but no other characters are correlated with this color and there seems to be no justification for recognition of *T. erythrospermum* as a separate entity.

APPENDIX

POLYPODIACEAE

Cf. *Asplenium* on page 63. A plant of this species was recently found by Jim Blassin-game, of South Plains College, Levelland, Texas, at Boot Springs in the Chisos Mts. of Big Bend National Park.

Asplenium septentrionale (L.) Hoffm. Plant tufted, grasslike in appearance; fronds 5-15 cm. long; blade with 2 to 5 linear to oblong-lanceolate segments tapered at both ends, the margins entire or remotely slender-toothed. Usually in crevices of ledges and rocks. Widely distributed in w. U.S., Eur. and Asia.

The plant differs markedly from all other species of *Asplenium* found in Texas.

HYDROCHARITACEAE

Cf. PAGE 100.

Ottelia alismoides (L.) Pers. Vegetatively resembling a large, coarse *Plantago*; leaves thin, submerged or partly emerged, broadly ovate to suborbicular or cordate-reniform, to 21 cm. in diameter, with 7 to 11 prominent parallel curved veins; peduncle several-angular, to 3 dm. tall; spathe elliptic to ovate, with 2 acute tips, 1-flowered; flowers sessile, fragrant; sepals linear to oblong, obtuse, 1-nerved, to 16 mm. long and 4 mm. wide; petals obovate, 2-3 cm. long, white to very pale pink, slightly darker distally, yellow-based; anthers bright yellow; fruit oblong, rostrate, 2-4 cm. long, crowned by the sepals, bursting irregularly.

This Afro-Asian plant has recently been found in Cameron Parish, Louisiana, in shallow, clear water in McCain's Fishing Lake, about 3 miles southwest of Sweet Lake (15 miles south of Lake Charles), about 30 miles east of the Texas state line. It will probably be only a matter of time before it is found in similar locations in Texas.

LILIACEAE

Cf. *Nothoscordum* ON PAGE 391.

A second species described from Arizona, *N. texanum* M. E. Jones, has been reported (but not seen by us) from west Texas. It has somewhat fragrant, yellowish-white flowers externally tinged with purple. If in Texas, the species should be in mountains of the Trans-Pecos.

CARYOPHYLLACEAE

Cf. PAGE 612.

Cardionema ramosissima (Weinm.) A. Nels. & Macbr. A fragmentary specimen of this littoral species in the U. S. National Herbarium bears the information "Texas, Oct. 1850" on an "Ex Coll. Geo. Thurber" label. The occurrence of this coastal western North American and Latin American species in Texas needs verification. It should be looked for among dunes and along beaches of our coast. It is a tufted perennial with numerous stems forming a mat, and resembles somewhat a congested plant of *Paronychia*. Its subulate, spine-tipped leaves subtended by prominent silvery stipules and its very unequal sepals with the outer, larger ones tipped with stout, divergent spines, are characteristic.

LEGUMINOSAE

Cf. *Acacia* ON PAGE 770.

1. *Acacia tortuosa* (L.) Willd. (cf. page 771). Duane Isely has very recently concluded that this species, in the strictest sense, is confined to the West Indies and Florida.

Texas plants treated by us under this name are referred to *A. Schaffneri* (Wats.) Herm. var. *bravoensis* Isely. The var. *Schaffneri*, in Isely's opinion, is limited to the highlands of Mexico.

2. *Acacia Farnesiana* (L.) Willd. (cf. page 772). Isely has concluded that this species, in the strict sense, occurs in southern Florida, West Indies, Central America and northern South America. Texas huisache is called *A. Smallii* Isely (new name for *Vachellia densiflora* Small) and is said to occur as far east as the Panhandle of Florida and to have disjunct populations in Arizona and California.

7. *Acacia Greggii* Gray. (cf. page 773). Plants treated here by us have recently been treated by Isely under two weak varieties: var. *Greggii* with glabrous to slightly puberulent leaflets and occurring over most of the range west to the Trans-Pecos; var. *arizonica* Isely with pubescent leaflets and occurring from the Trans-Pecos west to California.

12. *Acacia texensis* T. & G. (cf. page 774). Most of the Trans-Pecos plants treated by us under this name are referred by Isely to *A. angustissima* (Mill.) O. Ktze. var. *chisosiana* Isely, described as a low shrub with sparsely puberulent leaves, petiole and rachis together 8-20 (-30) mm. long, pinnae (1 or) 2 to 4 pairs, leaflets 6 to 10 pairs, and 4- to 8- (to 10-) flowered glomerules, and said to occur in the Trans-Pecos and also in Chihuahua and Coahuila. The "true" *A. texensis* is treated as *A. angustissima* var. *texensis* (T. & G.) Isely, described as an herb or suffrutex with small leaves, petioles and rachises together mostly 25-40 mm. long, pinnae (3 or) 4 to 6 pairs, leaflets 9 to 15 pairs per pinna, largely intercalary inflorescences, and 4- to 6-flowered glomerules, and said to occur in "southern and western Texas and southwestern New Mexico."

CF. *Hoffmanseggia* ON PAGE 797.

The transfer of *Caesalpinia oxycarpa* (from page 796) to *Hoffmanseggia* necessitates the following revision of the key to species in that genus.

- 1. Peduncle and calyx with stalked glands (2)
- 1. Peduncle and calyx without stalked glands (3)
- 2(1). Petals conspicuously clawed 1. *H. glauca*.
- 2. Petals not clawed 4. *H. oxycarpa* Gray.
- 3(1). Pinnae 7 to 11; inflorescence 5- to 10-flowered; pod 25-40 mm. long, strongly falcate 2. *H. drepanocarpa*.
- 3. Pinnae 3 to 7; inflorescence 3- or 4-flowered; pod 12-15 mm. long, straight 3. *H. tenella*.

CELASTRACEAE

CF. PAGE 998.

Pachistima myrsinites (Pursh) Raf. BOX-LEAF, MOUNTAIN-LOVER. Densely branched glabrous leafy evergreen shrub to 1 m. tall, sometimes essentially prostrate; branchlets quadrangular; stipules minute, deciduous; leaves decussately opposite, coriaceous, subsessile to shortly petiolate, oblong-elliptic to ovate-elliptic or oblanceolate, obtuse to rounded at apex, serrulate above, 10-15 mm. long, 2-6 mm. wide; flowers perfect, regular, 4-merous, about 4 mm. in diameter, in 1- to 3-flowered short-pedunculate axillary cymes; capsule coriaceous, 4 mm. long, 2-valved, tardily dehiscent. Represented only by a single collection on the Edwards Plateau, should occur in the mts. of the Trans-Pecos, May-Aug.; from B.C. to Calif., s. in the Rocky Mts. to Ariz., N.M., Tex. and Mex. (N.L. and Coah.)

This is a typically prostrate plant with opposite leaves.

LYTHRACEAE

CF. *Cuphea* ON PAGE 1117.

- 1. Perennial; stems thin and wiry, spreading-assurgent; stem leaves sessile or essentially so, about 1.5 cm. long 3. *C. glutinosa*.
- 1. Annuals; stems stoutish and erect; stem leaves distinctly petiolate, usually 2 cm. long or more (cf. key on page 1118).

3. *Cuphea glutinosa* Cham. & Schlecht. Perennial with slender rootstocks, the roots fibrous, the herbage more or less glandular-viscid throughout; stems thin and wiry, spreading-assurgent, 1-3 dm. long, simple or usually sparingly branched; leaves sessile or nearly so, ovate to oblong-lanceolate, acute, about 1.5 cm. long or less; pedicel about 1.5 mm. long; hypanthium 7-8 mm. long, curved, gibbous; calyx limb with 5 minute equal deltoid lobes; petals deep violet-color, elliptic-oblong, obtuse, 5-6.5 mm. long; seeds discoid, about 2 mm. long. Wet meadow about small woodland lake in s.e. Tex. (Tyler Co.), Sept.-Nov.; also La.; nat. of S.A.

MELASTOMATACEAE

Cf. *Rhexia* ON PAGE 1118.

Rhexia alifanus Walt. Erect glabrous perennial with simple or basally branched wand-like stems to about 1 m. high, from an enlarged spongy rootstock; leaves ovate-lanceolate or narrowly elliptic, glabrous, 3-nerved, entire, to 75 cm. long and 1 cm. wide, acute to acuminate at apex, cuneate to the sessile base; flowers few in a paniculate cyme; sepals deltoid, 1-1.5 mm. long; petals rose-color or purplish, somewhat glandular-pubescent on outer surface, 2-2.5 cm. long; anthers yellow, linear-lanceolate, curved, 7-8 mm. long, short-appendaged, with filaments 6-8 mm. long; mature hypanthium 7-10 mm. long, glandular-setose, with a short neck; seeds lustrous, brown, angled, 1-2 mm. long. A plant of savannahs, bogs and peaty pinelands, recently reported from Hardin Co., s.e. Tex., Apr.-Aug.; from e. N.C., s. to Fla. and w. to Tex.

This is one of the most distinctive of all species in this genus. It is an erect, smooth plant with large, rose-color flowers.

GENTIANACEAE

Cf. *Centaurium texense* ON PAGE 1207.

"Lady Bird's centaury." Named for Mrs. Lyndon B. Johnson who, because of her interest in this attractive little plant, made a special effort to collect seeds in 1966 from limestone hills south of Johnson City, and planted them in gravelly-rocky soil along the ranch airfield runway where they grew and bloomed in 1967.

Cf. *Bartonia* ON PAGE 1209.

Bartonia verna (Michx.) Muhl. Stems erect, purplish to rarely yellowish, 5-20 cm. high; leaves opposite or subopposite, reduced to scales 1-3 mm. long; flowers solitary, racemose or sometimes paniculate on robust plants; pedicels 5-20 mm. long, rarely more; sepals triangular-acute, 2-3 mm. long; corolla white, rotate; petals oblanceolate to obovate, obtuse, entire, 5-10 mm. long, 1.5-4 mm. wide; stamens about half as long as corolla, ascending; pistil two thirds as long as corolla; capsule 3-7 mm. long. In pitcher plant bogs and low savannahs in s.e. Tex. (Tyler Co.), Feb.-Mar.; from N.C. s. to Fla. and w. to Tex.

Only recently discovered in Texas by Geraldine Watson of Silsbee. Its habit of early spring flowering and petals 5-10 mm. long distinguish this species from others in this genus.

BORAGINACEAE

Cf. page 1280. In March 1970, Dr. Richard Spellenberg, of New Mexico State University, Las Cruces, discovered this genus and its two species for the first time in Texas.

PECTOCARYA MEISN.

Slender annual herbs with linear leaves and inconspicuous white flowers; pedicels recurving at maturity; mericarps in divergent pairs.

About 10 species in western North America.

1. Mericarps conspicuously heteromorphous, 2 of them more or less ascending and with distinct upturned sparsely toothed or entire margins, the other 2 somewhat recurved and inconspicuously margined 1. *P. heterocarpa*.

1. Mericarps homomorphous or essentially so, all of the mericarps with pectinately lacerate or dentate margins, the body straight or only moderately curved
 2. *P. platycarpa*.

1. *Pectocarya heterocarpa* I. M. Johnst. Plant branched from base; stems prostrate or spreading-ascending; calyx strongly asymmetric; mericarp with linear or oblong body; fruit about base of plant apparently from cleistogamic flowers, its mericarps reflexed and not margined. Rather frequent on east slope of Franklin Mts., El Paso Co., Mar.-Apr.; Calif., Ariz. and s.w. Ut., s. to Son. and w. Tex.

2. *Pectocarya platycarpa* Munz & I. M. Johnst. Plant branched from base; stems prostrate or spreading-ascending; calyx nearly regular; mericarp with linear or oblong straight or moderately curved body, with a conspicuous broad toothed cartilaginous margin, the triangular or cuneate teeth evidently united at base; fruit about base of plant apparently from normal flowers, not noticeably modified. Rather common on east slope of Franklin Mts., El Paso Co., Mar.-Apr.; s. e. Calif., Ariz. and s.w. Ut., s. to n. Son. and w. Tex.

LABIATAE

Cf. *Physostegia* ON PAGE 1359.

Physostegia virginiana (L.) Benth. Stoloniferous herb; stems erect, to 1.5 m. high, simple or paniculately branched at summit; leaves submembranous to firm, linear-oblong to oblong-lanceolate near apex of stem, 4-12 cm. long, 1-3 cm. wide, acute to acuminate, serrate or incised-serrate (at least above middle), narrowed to the sessile base; racemes spikelike, simple or paniced, rather closely flowered, in fruit with overlapping calyces, the longer spikes to 2 dm. long; pedicels much shorter than the calyx; bracts ovate-lanceolate to lanceolate; calyx glandular-viscid and usually hirtellous-puberulent, 6-8 mm. long, the tube cylindric-campanulate, the teeth triangular-lanceolate to lanceolate, acute to somewhat acuminate, more or less spreading, one third as long as the tube; corolla usually purple or roseate, 2.5-3 cm. long, the lower lip irregularly denticulate, the upper lip with 3 lobes notched and apiculate in each notch; cocci 3 mm. long, sharply angled. *Dracocephalum virginianum* L. River banks, swamps and low grounds, introd. and naturalized in n.-cen. Tex., not yet known as an escape, Aug.-Nov.; Que. to n.w. Can., s. to N.C., Tenn., Mo. and Tex. (introd.)

This is our only other *Physostegia* besides *P. praemorsa* that flowers from August to November. It may be distinguished from that species by its slender, elongate rhizomes and large, not bractlike, stem leaves below the inflorescence.

Cf. *Hedeoma* ON PAGE 1379.

Hedeoma pilosum Irving. Small perennial cespitose herb about 4 cm. high, forming mats; stems herbaceous, extremely short, unbranched above, profusely branched below, pubescent with short spreading hairs; leaf pairs crowded, the internodes about 1.5 mm. long; leaves coriaceous and sharply ascending, appressed to the stems, ovate, entire, sessile, tapered to a narrowly obtuse or acutish apex, 5 mm. long, 2-3 mm. wide, the margins pilose-ciliate, upper and lower leaf surfaces glabrous; flowers solitary in the uppermost leaf axils; primary peduncles short; pedicels 1-2 mm. long, canescent; bracteoles short, oblong, ciliate; calyx 7.5 mm. long, somewhat coriaceous, the tube tubular-funnelform, not at all gibbous below, dilated upward, about 5 mm. long, pilose, the hairs long and spreading; upper calyx teeth connate for about one-half their length to form a broad upper lip about 2.5 mm. long, the triangular lobes about 1.2 mm. long and 0.5 mm. wide at the base, slightly laterally spreading and reflexed, pilose-ciliate; lower calyx teeth narrowly triangular-lanceolate, ascending, about 2.5 mm. long, pilose-ciliate; annulus dense, included, about 1 mm. wide and seated deep within the tube, about 2 mm. below the juncture of the upper and lower lips; corolla and cocci not observed. Restricted to summit of "Old Blue Mt." (Brewster Co.), June-July; endemic.

Within our Texas species *H. pilosum* is quite distinct and related only to *H. apiculatum*. Features common to these 2 endemics are plants cespitose, forming mats; leaves coriaceous; flowers solitary or in 3-flowered axillary cymules; very restricted in distribution. They may be distinguished as follows:

1. Plants about 4 cm. high; leaves ovate, pilose-ciliate, about 5 mm. long, apex obtuse or acute; calyces pilose, with hairs long and spreading *H. pilosum*.
1. Plants 10-15 cm. high; leaves lanceolate-elliptic, about 10 mm. long, apex apiculate, the margins tuberculate; calyces hispidulose *H. apiculatum*.

SOLANACEAE

CF. *Chamaesaracha* ON PAGE 1392.

Recent work by John E. Averett on the genus *Chamaesaracha* indicates the need for considerable revision of our treatment. He has kindly contributed the following synopsis of the Texas species of the genus.

1. Leaves ovate to broadly ovate-lanceolate, entire to crenate, 15-35 mm. wide; flowering calyces usually more than 5 mm. long (2)
1. Leaves rhombic to lanceolate, subentire to lobed, less than 20 mm. wide; flowering calyces usually shorter than 4 mm. (3)
- 2(1). Herbage villous with long forked and simple trichomes; leaf blades about half as wide as long, subsessile 4. *C. villosa*.
2. Herbage basically glandular but with some longer simple trichomes; leaf blades about as wide as long, petiolate 5. *C. crenata*.
- 3(1). Herbage glabrous to sparsely or densely pubescent with stellate hairs; leaves linear to linear-lanceolate or rhombic, entire to undulate or deeply undulate or few-lobed; stems often cinereous or purplish at base (4).
3. Herbage pubescent with glandular hairs and/or simple trichomes, or if hairs stellate then leaves not as described above; stems green (6)
- 4(3). Leaves linear to linear-lanceolate, usually few-lobed, sparsely pubescent with scurfy white stellate or branched hairs 1. *C. Coronopus*.
4. Leaves broadly lanceolate to rhombic, entire to undulate or deeply undulate, the pubescence stellate, lacking or otherwise (5)
- 5(4). Leaves densely pubescent with stellate hairs; stems also with stellate hairs 3. *C. pallida*.
5. Leaves essentially glabrous; stems usually with glandular hairs 2. *C. edwardsiana*.
- 6(3). Leaves rhombic to broadly lanceolate or ovate, entire to undulate; pubescence primarily of short glandular hairs 6. *C. sordida*.
6. Leaves with numerous pinnate or irregular lobes; pubescence of longer trichomes (simple or stellate), occasionally mixed with glandular hairs 7. *C. coniodes*.

1. *Chamaesaracha Coronopus* (Dun.) Gray. Erect to diffuse with age; roots slender and subligneous, 1.5-3.5 mm. thick; stem 1-5 dm. long, about 1.5 mm. thick, herbaceous, much-branched primarily from the base, slightly angular or striate, often purplish or cinereous at base, glabrous to sparsely pubescent with scurfy, short, white, stellate or branched hairs; leaves linear to linear-lanceolate, usually pinnately lobed, 2-6.5 cm. long, 1-10 (-15) mm. wide, gradually narrowing to an attenuate subsessile base, with variable lobes to 4 mm. long and about 1.5 mm. wide, at apex acute to rounded or obtuse, with a prominent midnerve but no other conspicuous venation, usually with some stellate hairs, leathery or thick; flowers solitary or in pairs in the axils; pedicels 1-2 cm. long, elongating in fruit; calyx 2.5-4 mm. long, rather densely pubescent, with acute teeth about 2 mm. long or about half the total calyx length and pubescent with stellate or branched hairs or occasionally with mixed trichomes; corolla 6-10 (-15) mm. wide, with prominent contiguous white-tomentose appendages filling the throat, pubescent on the lobes dorsally and especially on the margins; fruit 4-8 mm. thick; chromosome numbers: $n = 24, 36$. N.-cen. Tex., Rio Grande Plains, Trans-Pecos and Plains Country, spring-fall; Tex. to Ariz. and s.e. to S.L.P.

2. *Chamaesaracha edwardsiana* Averett. Roots slender and subligneous, 1.5-3.5 (-7) mm. thick; stems 7-30 cm. long, about 1.5 mm. thick, herbaceous, branching from the

base, terete or only slightly angular to striate, often purplish or cinereous at the base, glabrous to pubescent with stellate hairs or occasionally with simple and branched trichomes (especially in the upper portions); leaves linear-lanceolate to narrowly rhombic, typically undulate but occasionally few-lobed, 2.5-7 cm. long, 7-15 mm. wide, at base attenuate, subsessile to slightly petiolate, with a prominent midrib and inconspicuous secondary venation, essentially glabrous; flowers solitary or less commonly in pairs in the axils; pedicels 2-2.5 cm. long, elongating in fruit, pubescent with trichomes and glandular hairs; calyx 4-5 mm. long, with acute teeth about half the total length and pubescent with stellate, branched and simple trichomes; corolla 10-15 mm. wide, the lobes pubescent dorsally especially near the margins; fruit 5-8 mm. thick; chromosome number; $n = 24$. Primarily on limestone outcrops, Edwards Plateau, summer; also rare in N. L.

3. *Chamaesaracha pallida* Averett. Erect to somewhat diffuse with age; roots usually slender and subligneous but occasionally woody; stems 7-15 (-20) cm. long, herbaceous, much-branched primarily from the base, striate or only slightly angular, often purplish or cinereous at base, usually densely pubescent with stellate or branched hairs; leaves narrowly rhombic to ovate-lanceolate or ovate to oblanceolate, 2-3.5 (-4) cm. long, 1-1.5 cm. wide, about half as long as wide, subentire to deeply undulate, at apex acute to obtuse or rounded, at base attenuate to subsessile or short-petiolate, densely pubescent with stellate or branched hairs; flowers solitary in axils; pedicels slender, 1-2 cm. long, elongating in fruit; calyx 3-4 mm. long, with triangular to acute or slightly rounded teeth 1-1.5 mm. long, hispid with rather stiff branched and/or unbranched trichomes; corolla 10-15 mm. wide but occasionally smaller, the tomentose appendages not filling the throat; fruit about 5-7 mm. thick, mostly enclosed in the calyx; chromosome number: $n = 36$. Scattered in s. part of the Trans-Pecos, rare e. to Uvalde Co., May-Oct.; also N.M., Coah., Chih. and Dgo.

4. *Chamaesaracha villosa* Rydb. Strongly perennial, with woody roots; stems erect to diffuse with age, 15-50 cm. long, 1.5-3.5 mm. thick, herbaceous to basally somewhat woody, much-branched primarily from the base, striate or angular, densely pubescent with long villous forked trichomes and occasionally with some glandular hairs; leaves ovate to ovate-lanceolate, 4-7 cm. long, 15-30 mm. wide, entire to undulate-crenate, at apex acute to obtuse, at base attenuate; petioles about 1 cm. long; flowers solitary or in pairs in the axils; pedicels slender, striate, villous, 1-2 (-4) cm. long, elongating in fruit; calyx about 5 mm. high, pubescent, with ovate obtuse or acute teeth about half the total length; corolla 5-30 mm. wide, with the white-tomentose appendages not filling the throat; fruit 5-8 mm. thick; chromosome number: $n = 12$. Deserts, s. part of the Trans-Pecos, summer-fall; also Dgo., Chih. and Coah.

5. *Chamaesaracha crenata* Rydb. Strongly perennial, with woody roots; stems erect to diffuse with age, 15-40 cm. long or longer, 1.5-3.5 mm. thick, herbaceous or at base somewhat woody, much-branched primarily from the base, striate or angular, densely pubescent with glandular hairs and with some longer usually simple trichomes; leaves ovate to broadly rhombic, 4-6 cm. long, 15-35 mm. wide, entire-undulate to crenate, at apex obtuse, at base cuneate or somewhat attenuate; petioles 2-3 cm. long; flowers solitary or in groups of 2 to 5 in axils; pedicels slender, somewhat striate, 1-2 (-4) cm. long, elongating in fruit; calyx (3-) 5-7 mm. long, densely pubescent primarily with long trichomes and usually with prominent glandular hairs, with ovate acute to obtuse teeth about 3 mm. long; corolla 1-2 cm. wide, the tomentose appendages not filling the throat; fruit 8-10 mm. thick; chromosome number: $n = 12$. Trans-Pecos, summer-fall; also Coah.

This species and *C. villosa* appear to have hybridized in the Big Bend National Park and near Lajitas, Presidio Co. A few plants in that region are difficult to assign definitely to one or the other species.

6. *Chamaesaracha sordida* (Dun.) Gray. Roots subligneous to woody, 2-8 (-10) mm. thick; stems branching primarily from the base, 9-30 cm. long, 1.5-2 mm. thick, occasionally somewhat striate but not conspicuously so, pubescent to the base; herbage densely pubescent with glandular hairs but occasionally also with mixtures of simple and branched trichomes; leaves rhombic, 1.5-4 cm. long, 4-8 (-10) mm. wide, entire to undulate or somewhat lobed, at apex acute to somewhat rounded, at base gradually narrowing and subsessile; flowers solitary or in pairs in the axils; pedicels slender, 1-3 cm. long, elongating in fruit; calyx about 3 mm. long, with acute teeth a third to half the total length, rather densely pubescent; corolla typically 1 cm. wide or less, the tomentose appendages not

filling the throat; fruit 4-8 mm. thick; chromosome number: $n = 12$. Rio Grande Plains, Plains Country and the Trans-Pecos, spring-fall; Tex. to s. Ariz., s. to Chih. and Coah.

7. *Chamaesaracha coniodes* (Dun.) Britt. Roots subligneous to woody, 2-8 (-10) mm. thick; stems erect to diffuse with age, 9-30 cm. long, 2-3 mm. thick, branching primarily from the base, striate or slightly angular; herbage pubescent predominantly with simple trichomes but these often mixed with glandular hairs, usually somewhat villous, the indument of the leaves more glandular and hispid than that of the stems; leaves broadly lanceolate, 2.5-5.5 cm. long, 1-2 cm. wide, crenate to deeply pinnately lobed (the lobes 3-6 mm. long), at apex acute to rounded, at base attenuate and sessile; flowers solitary or in pairs in the axils; pedicels 2-3 cm. long, elongating in fruit; calyx about 4 mm. high, villous and with acute teeth about 1.5 mm. long; corolla 1-1.5 cm. wide; fruit about 7 mm. thick; chromosome numbers: $n = 24, 36$. Plains Country and n.-cen. Tex. s. to the Trans-Pecos and Rio Grande Plains, spring-fall; Colo. and Kans. s. to Chih., Coah. and Tex.

COMPOSITAE

CF. PAGES 1533 AND 1705.

1. *Cotula australis* (Sieb.) Hook. f. Weak slender-stemmed annual herb, branched and spreading from base, to about 15 cm. high, sparsely pubescent with spreading hairs; leaves 1-3 cm. long, finely pinnate with linear lobes; heads 2-5 mm. broad; phyllaries broadly elliptic, with scarious margins; receptacle flattish, not chaffy but beset with minute fuzzy achene pedestals; disk yellow, the corollas 4-toothed; marginal achenes laterally compressed, white-ribbed on the 2 sharp edges, about 1 mm. long, stipitate, minutely glandular on both faces, smooth on margins. A troublesome Australian weed recently discovered on the Texas A&M University campus (Brazos Co.) by Prof. John J. Sperry, Mar.-Apr.; also adv. in S.A., Calif., etc.

Superficially similar to *Soliva* but differs in its stipitate achenes and 4-toothed disk corollas.

CF. *Lygodesmia* ON PAGE 1727.

Recent work by A. S. Tomb on the plants included in our treatment in *Lygodesmia* has shown the need for considerable revision. He has kindly submitted the following short synopsis for Texas plants of this affinity.

1. Pappus plumose (in our species) 146b. *Stephanomeria*.
1. Pappus capillary (2)
- 2(1). Pappus about 4 mm. long 146c. *Prenantheella*.
2. Pappus about 8 mm. long or longer 146a. *Lygodesmia*.

146a. LYGODESMIA D. DON

Pappus not plumose; pollen echinolophate, i.e., patterned with very thick ridges; $x = 6$ or 9 pairs of chromosomes. An American genus of 9 species.

1. Plants annual; lower leaves opposite 2. *L. rostrata*.
1. Plants perennial; lower leaves not opposite (2)
- 2(1). Basal leaves not forming a rosette 1. *L. juncea*.
2. Basal leaves forming a rosette (3)
- 3(2). Involucre of 8 to 10 principal phyllaries; flowers 9 to 12 per head; roots fleshy 3. *L. texana*.
3. Involucre of 5 to 7 principal phyllaries; flowers 5 to 7 per head; roots woody 4. *L. ramosissima*.

1. *Lygodesmia juncea* (Pursh) D. Don. Perennial; basal leaves not opposite and not forming a rosette. Higher parts of the Plains Country, June-Sept.; Alta., Sask., Man. and Br. Col. s. to Tex., Nev. and Ut.

Rarely or perhaps never setting fertile seeds in Texas.

2. *Lygodesmia rostrata* (Gray) Gray. Annual herb with opposite leaves. Loose sandy soils, often blowing dunes, Plains Country, June-Oct.; Alta. and Sask. s. to Tex. (very rare, last collected in Texas about 1850).

3. *Lygodesmia texana* (T. & G.) Greene. Perennial herb; leaves forming a basal rosette; principal phyllaries 8 to 10; flowers 9 to 12 per head; roots fleshy. N.-cen. Tex. (e. to Washington and Austin cos.), Edwards Plateau, Rio Grande Plains, Plains Country and Trans-Pecos, Apr.-Oct.; Okla., N.M., Tex. and Coah.

4. *Lygodesmia ramosissima* Greenm. Perennial herb; leaves forming a basal rosette; principal phyllaries 5 to 7; flowers 5 to 7 per head; roots woody. In the Trans-Pecos at elev. above 4,500 ft., May-Oct.; N.M., Tex., N.L., Chih. and Dgo.

Hybridizing with *L. texana* in the Davis Mts. of the Trans-Pecos.

146b. STEPHANOMERIA NUTT.

Pappus plumose; pollen merely echinate; $x = 8$ pairs of chromosomes.

An American genus of about 16 species.

1. Annual herbs 1. *S. exigua*.

1. Perennial herbs (2)

2(1). Pappus pure white; pappus bristles plumose to the base; plants slender, virgate, usually with a single main stem 2. *S. Wrightii*.

2. Pappus sordid- or tawny-white, not plumose all the way to the base; plants intricately bushy-branched 3. *S. pauciflora*.

1. *Stephanomeria exigua* Nutt. Annual herb. *Lygodesmia Bigelovii* (Gray) Shinners. Rare in the Trans-Pecos (near El Paso), summer; N.M. to Calif., s. to Chih. and Son.

2. *Stephanomeria Wrightii* Gray. Perennial herb; plants slender, virgate, usually with a single main stem; pappus bristles plumose to the base, nearly pure white. *Lygodesmia tenuifolia* (Torr.) Shinners. Infrequent to rare in the Trans-Pecos, summer-fall; also N. M.

3. *Stephanomeria pauciflora* (Torr.) A. Nels. Perennial herb, intricately bushy-branched; pappus bristles not plumose near the base but plumose above, sordid-or tawny-white. *Lygodesmia pauciflora* (Torr.) Shinners. Higher parts of the Plains Country and Trans-Pecos, summer-fall; Tex. to Calif., s. to Chih. and Coah.

146c. PRENANTHELLA RYDB.

A monotypic American genus.

1. *Prenanthes exigua* (Gray) Rydb. Involucre much-reduced, with only 3 or 4 principal phyllaries plus a calyculum of 1 or 2 minute outer phyllaries; flowers 3 or 4 per head; pappus capillary but less than half as long as that of any species of *Lygodesmia*; pollen merely echinate; $x = 7$ pairs of chromosomes. *Lygodesmia exigua* Gray. Type from stony hills above El Paso in the Trans-Pecos but not taken in Texas in the last 115 years, Apr.-July; otherwise Sonoran Desert n. to Ut. and Calif.

GLOSSARY

(Based primarily on the compilation by David D. Keck in Munz' and Keck's "A California Flora" (1959); with permission.)

- A-**. A prefix denoting without, such as *asexual*.
- Abaxial**. Located on the side away from the axis; dorsal.
- Abbreviated**. Shortened, as when one part is shorter than another.
- Aberrant**. Differing from the type of a species, genus or higher taxon in one or more characters but not readily assignable to another taxon.
- Abortive**. Imperfect or barren.
- Abrade**. To rub or scrape off.
- Abrupt**. Terminating suddenly; not tapering.
- Absciss-layer**. A zone of tissue forming a layer of separation, especially with reference to the phenomena of defoliation.
- Abscission**. Act or process of cutting off. *Abscising*: to cut off.
- Acaulescent**. Stemless or essentially so, or with stem subterranean. (Cf. *Caullescent*.)
- Accessory**. Additional to the usual number of organs.
- Accrescent**. Increasing in size with age, as often with the calyx after flowering.
- Accumbent**. Lying against something, as cotyledons against the radicle.
- Aceriform**. Like a maple leaf.
- Acerose**. Needle-shaped, as the leaves of pines.
- Achene (akne)**. A small, dry, indehiscent, one-seeded, usually hard fruit in which the ovary wall is free from the seed. *Achenial*: relating to or like an achene. *Achenelet*: the diminutive.
- Achlorophyllus**. Devoid of chlorophyll, or apparently so.
- Acicular, aciculate**. Needlelike.
- Acidulous**. Slightly sour.
- Acotyledonous**. Destitute of cotyledons.
- Acrid**. Sharp and harsh or bitterly pungent to the taste.
- Acrodome**. Having the principal nerves or veins terminating at the leaf tip.
- Acropctal**. Produced in a succession toward the apex, as applied to the development of organs.
- Acroscopic**. Looking towards the summit (reverse of basiscopic).
- Actinomorphic**. Exhibiting radial symmetry, as a regular flower.
- Aculeate**. Prickly; beset with prickles or sharp points.
- Acumen**. A tapering point. A point the margins of which are not exactly straight but bow inward.
- Acuminate**. Gradually tapering to a diminishing point and with the margin bowing inward; long-pointed. (Cf. *Acute*, *Attenuate*.)
- Acute**. Sharp-pointed, but less tapering than acuminate.
- Adaxial**. Located on the side nearest the axis.
- Adhere**. To stick fast or cleave. *Adherent*: attached or joined, though naturally or normally separate.
- Adnate**. Grown together entirely or partially with an unlike part, as the calyx tube with an inferior ovary, or an anther by its whole length with the filament.
- Adpressed, appressed**. Pressed flat against another organ.
- Adventitious**. Out of the usual place, as a bud produced from the stem instead of in the axils of leaves.
- Adventive**. Applied to an introduced plant, not definitely established or naturalized.
- Aerial**. Epiphytic plants; plants or parts of plants living above the surface of the ground or water.
- Aestival**. Belonging or peculiar to summer.
- Aestivation**. The arrangement of the parts in a flower bud.
- Aggregate**. Collected into dense clusters or tufts. *Aggregate fruit*; one formed by the clustering together of pistils that were distinct in the flower, as blackberry.
- Alate**. Winged.
- Albidus**. Whitish.
- Albumen**. Any deposit of nutritive material within the seed coat and not in the embryo.
- Alkaline**. Of, pertaining to, or having the properties of an alkali (a soluble mineral salt present in some soils of arid regions).
- Alliaceous**. Onionlike, usually in respect to odor.
- Allergenic**. Having the substance to cause allergy or to cause it to become manifest.
- Alluvial**. Soils deposited by running water.
- Alpine**. Strictly applicable to plants growing above timber line.
- Alternate**. Any arrangement of parts along the axis other than opposite or whorled; situated regularly between other organs, as stamens alternate with petals.
- Alveolate**. Honeycombed; with deep angular cavities (alveoli) separated by thin partitions; faveolate.
- Ament**. Catkin; a spike of flowers usually bracteate and frequently deciduous, as the male flowers of willow, beech, oak, etc.
- Amethystine**. Violet-colored.
- Amorphous**. Shapeless, the form not regular or definite.
- Amphibious**. Capable of living on land or in water.
- Amphitropous**. Turned both ways; applied to an ovule with hilum intermediate between the micropyle and chalaza.
- Amplexicaul**. Claspings the stem, as the base of certain leaves.
- Ampliate**. Enlarged; dilated.
- Ampule**. Flasklike traps and floats as in the Utricularias. *Ampulliform*: swollen out in a flask shape.
- Anastomosing (-ed)**. Netted; particularly applied to veins so connected by cross veins as to form a network.
- Anatropous**. An inverted and straight ovule, with the micropyle next to the hilum.
- Ancipital, ancipitous**. Two edged, as certain flattened stems.
- Androecium**. The whole set of stamens.
- Androgynous**. Having staminate and pistillate flowers in the same inflorescence, or in *Carex* in the same spikelet, the former above the latter.

- Androphore.** A support or column on which the stamens are borne.
- Anemophilous.** Wind-pollinated.
- Angiosperms.** Plants having their seeds enclosed in an ovary.
- Angular, angulate.** Angled. Used when an organ shows a determinate number of angles.
- Angustiseptal.** Having a narrow-partitioned fruit, as the silicle of *Thlaspi*.
- Anisolateral.** Laterally unequal.
- Annual.** Of one year's or season's duration from seed to maturity and death. *Winter annual:* a plant from autumn-germinating seeds that fruits in the following spring.
- Annular.** Circular; in the form of a ring, or marked transversely by rings. *Annulate:* ring-shaped.
- Annulus.** A ring-shaped part or organ, such as surrounds the sporangium in some ferns.
- Antepetalous.** Opposite the petals.
- Antero-lateral.** In front and on the sides.
- Anterior.** On the front side; in the flower the side away from the axis and toward the subtending bract.
- Antesepalous.** Opposite the sepals.
- Anther.** The pollen-bearing part of the stamen.
- Antheridium.** The male sexual organ of ferns; analogous to the anther.
- Antheriferous.** Anther-bearing.
- Anthesis.** Strictly, the time of expansion of the flower, but also used for the period during which the flower is open and functional.
- Anthocarp.** A structure in which the fruit proper is united with the perianth or receptacle.
- Anthocyanin.** The blue and sometimes red coloring of most flowers. *Anthocyanous:* showing anthocyanin in the herbage, a class of soluble glucoside pigments producing reddish or purplish coloring. Cf. *betacyanins*.
- Antrorse (-ly).** Directed upward or forward.
- Aperture.** An opening, gap, cleft.
- Apetalous.** Without petals.
- Apex (pl. apices).** The tip of an organ.
- Aphyllodidic.** Without leaves at the base.
- Aphyllous.** Leafless.
- Apical.** Situated at the tip.
- Apicule, apiculus.** A short pointed tip at the apex of a leaf or floral segment. *Apiculate:* terminated abruptly in a little point.
- Apocarpous.** With carpels separate, not united.
- Apomictic.** Producing seed without any form of fertilization or sexual union.
- Apopetalous.** Having free petals; polypetalous.
- Apophysis.** An enlargement or swelling of the surface of an organ; the part of a cone scale that is exposed when the cone is closed.
- Appendage.** Any attached supplementary or secondary part. *Appendiculate:* furnished with an appendage.
- Appressed.** Cf. *adpressed*.
- Approximate.** Near together.
- Aquatic.** Living in water.
- Arachnoid (-ose).** Cobwebby; of soft and slender entangled hairs.
- Arborescent.** Tree-like in tendency.
- Archegonium.** The female sexual organ of ferns; analogous to the pistil.
- Arcuate.** Moderately curved, as if bent like a bow.
- Areola (-ae).** A little area defined on a surface, as the angular space between vein reticulations; in Compositae the circle at the summit of the achene where sat the corolla. *Areolate:* with areolae; reticulate.
- Argillaceous.** Clayey, growing in clay or clay-colored.
- Aril.** A process of the placenta adhering about the hilum of a seed. *Arillate:* with an aril. *Arilliform:* bag-shaped.
- Arista (-ae).** An awn. *Aristate:* awn- or bristle-tipped, as the floral bracts of barley. *Aristulate:* bearing a short awn.
- Armature.** Any kind of defense, as prickles or thorns. *Armed:* bearing thorns or similar defenses.
- Aromatic.** Fragrant, pungent, spicy to smell or taste.
- Arroyo.** A water course, or channel or gully, often dry, carved by water.
- Article.** A joint such as that in the loment of *Desmodium*.
- Articulate.** Jointed; having a place for natural separation with a clean-cut scar.
- Ascending, ascending.** Rising obliquely or curving upward.
- Asepalous.** Without sepals.
- Asexual.** Sexless; without sex; arising without the phenomenon of sex.
- Asperous.** Rough to the touch; scabrid.
- Assimilate.** To absorb or appropriate.
- Assurgent.** Ascending, rising.
- Asterean.** Similar to or belonging to the genus *Aster* or the tribe Astereae.
- Astylous.** Without a style.
- Atrocastaneous.** Very dark chestnut-colored.
- Atropurpureus.** Black-purple.
- Attenuate.** Slenderly tapering or prolonged; more gradual than acuminate.
- Atypical.** Not typical; departing from the norm.
- Auricle.** An ear-shaped appendage. *Auricular, auriculate:* auricled. *Auriform:* ear-shaped.
- Autophyte, autophytic.** A plant or said of a plant able to produce its own food through the presence of chlorophyll.
- Autopolyploid.** A polyploid originating by the multiplication of the chromosome set of an individual.
- Autumnal.** Belonging to autumn; flowering at, or developing vegetative growth peculiar to, that season.
- Auxo-.** Greek combining form to denote concern with or due to growth, as in auxoclone.
- Auxoclone.** An annular clone in which the older, central parts have died, the peripheral ones continuing to spread, as in *Spartina*.
- Awl-shaped.** Tapering from the base to a slender or stiff point.
- Awn.** A terminal slender bristle on an organ.
- Axial.** Relating to the morphological axis, as distinct from its appendages.
- Axil.** Upper angle formed by a leaf or branch with the stem. *Axillary:* situated in the axil.
- Axile.** Belonging to, or situated in, the axil.
- Axis (pl. axes).** The central stem along which parts or organs are arranged; the central line of any organ or structure.
- Baccate.** Berrylike and pulpy.
- Ballistic.** Those fruits that discharge their seeds elastically; catapult-fruits.
- Banner.** Upper petal of a papilionaceous flower.
- Barbate.** Bearded with long stiff hairs.
- Barbed.** Bearing sharp rigid reflexed points like barbs of a fish-hook. *Barbellate:* finely barbed, usually with short stiff hairs. *Barbule:* a small barb.
- Basal.** Relating to, or situated at, the base.
- Basifixed.** Attached by the base.
- Basiscopic.** Looking towards the base (reverse of acroscopic).
- Bayou.** A creek, often slow-moving.
- Beak.** A prolonged firm tip, particularly of a seed or fruit. *Beaked:* ending in a beak.

- Bearded.** Bearing long stiff hairs.
- Berry.** A pulpy indehiscent fruit with no true stone, as the tomato.
- Betacyanins.** The nitrogenous pigments of beet juice and other Chenopodiaceae, and of the flowers of Cactaceae, Nyctaginaceae, Portulacaceae, Aizoaceae, etc.; cf. *anthocyanins*.
- Bi- or Bis-.** Latin prefix signifying two, twice, or doubly.
- Bibracteate.** Having two bracts. *Bibracteolate*: the diminutive.
- Bicolored.** Two-colored or particolored.
- Biconvex.** Convex on both sides.
- Bidentate.** Having two teeth.
- Biennial.** Of two years' duration from seed to maturity and death.
- Bifarious.** Distichous.
- Bifid.** Two-cleft to about the middle.
- Bifoliolate.** A leaf composed of two leaflets.
- Bifurcate.** Two-forked or -pronged.
- Bilabiate.** Two-lipped (calyx or corolla).
- Bilamellate.** Consisting of two plates or lamellae.
- Bilateral (-ly).** Arranged on opposite sides.
- Bilobed.** Divided into two lobes. *Bilobulate*: the diminutive.
- Bilocular.** Two-celled.
- Binate.** In pairs.
- Binomial.** The combination of a generic and specific name to denote a given organism, as *Ulmus americana*.
- Biotype.** One of the local more or less uniform character-combinations found in a polytypic species.
- Bipartite.** Divided into two parts almost to the base; two-parted.
- Bipinnate.** Doubly or twice pinnate; when both primary and secondary divisions of a leaf are pinnate. *Bipinnatifid*: twice pinnately cleft; with the divisions extending deeply but not to the rachis or midvein. *Bipinnatisect*: bipinnate.
- Bisected.** Completely divided into two parts.
- Bisexual.** Having both sexes on the same individual; a hermaphrodite.
- Bivalvate.** With two valves.
- Bladdery.** Thin and inflated.
- Blade.** The expanded part of a leaf or petal.
- Bloom.** (Cf. *blossom*, *glaucous*). The waxy or pruinose covering of many fruits and leaves.
- Blossom.** The flower, more often applied to those of fruit trees.
- Bole.** The trunk or stem of a tree.
- Brackish.** Somewhat salty, as water in saline soils.
- Bract.** A reduced leaf subtending a flower, usually associated with an inflorescence. *Bracteal*: of or pertaining to bracts. *Bracteate*: provided with bracts. *Bracteose*: having conspicuous or numerous bracts. *Bractiform*: bract-shaped.
- Bractlet.** A secondary bract borne on a pedicel instead of subtending it; sepaloid organs subtending the sepals in many Rosaceae. *Bracteole*: a bractlet or small bract. *Bracteolate*: with bractlets.
- Bristle.** A stiff hair. *Bristly*: bearing stiff strong hairs or bristles.
- Bud.** An undeveloped stem, leaf or flower. Buds are often enclosed by reduced or specialized leaves termed bud scales.
- Bulb.** An underground leaf bud with thickened scales or coats like the onion.
- Bulbil.** Daughter bulbs arising around the mother bulb; a diminutive bulb.
- Bulblet.** A small bulb, especially one borne aerially as in a leaf axil or in the inflorescence.
- Bulbose, bulbous.** Having bulbs or the character of a bulb.
- Bullate.** Blistered or puckered.
- Bundles.** A strand of specialized tissue, variously modified.
- Bur.** Any rough or prickly envelope, as of a pericarp, a persistent calyx, or an involucre, like in *Castanea*.
- Bush.** (Cf. *shrub*).
- Caducous.** Falling off very early or prematurely.
- Calcarate.** Spurred.
- Calcareous.** Containing an excess of available calcium, usually in the form of the compound calcium carbonate. "Limy."
- Calcifuge.** Shunning limy situations. *Calciphile*: a plant that is addicted to calcareous soils.
- Caliche.** A crust of calcium carbonate formed on stony soils in arid regions.
- Callosity.** A hardened thickening. *Callus*: a callosity; the thickened extension at the base of the lemma in some grasses. *Callose, callous*: bearing callosities.
- Calycine.** Belonging to, or of the nature of, a calyx.
- Calyculate.** Bearing bracts around the calyx imitating an outer involucre in some Compositae. *Calyculum, calicle*: the involucre simulating an additional calyx; a whorl of bracts outside the true calyx.
- Calyptra.** A lid or hood.
- Calyx** (pl. *Calyxes* or *Calyces*). The external, usually green, whorl of a flower, contrasted with the inner showy corolla.
- Calyx lobe.** In a gamosepalous calyx, the free projecting parts.
- Cambium.** The layer of delicate, rapidly dividing cells that form wood internally and bark externally.
- Campanulate, campanuloid.** Bell-shaped.
- Campylotropous.** (ovule or seed). So curved as to bring apex and base nearly together.
- Canaliculate.** Longitudinally channeled or grooved.
- Cancellate.** Latticed; resembling lattice-work.
- Canescent.** Covered with grayish-white or hoary fine hairs.
- Capillary.** Hairlike; exceedingly slender.
- Capitate.** Head-shaped; aggregated into very dense clusters or heads. *Capitellate*: the diminutive. *Capitulum (-a), capitule*: (cf. *Head*).
- Capsule.** A dry dehiscent fruit composed of more than one carpel. *Capsular*: pertaining to a capsule; formed like a capsule. *Capsuliferous*: bearing capsules.
- Carinate.** Keeled; with a sharp longitudinal ridge.
- Carinal**: relating to the keel in aestivation when the carina includes the other parts of the flower.
- Carnivorous.** Flesh-eating; applied to those plants that digest insects.
- Carpel.** A simple pistil, or one of the modified leaves forming a compound pistil. *Carpellary*: relating to a carpel. *Carpellate*: possessing carpels. *Carpid*: one of the monocarpellary segments resulting from schizocarpous dehiscence.
- Carpophore.** A prolongation of the floral axis between the carpels, as that which supports the pendulous fruit of the Umbelliferae.
- Cartilage.** A tough almost bony tissue. *Cartilaginous*: like cartilage in texture; tough.
- Caruncle.** An excrescence or outgrowth at or near the hilum of certain seeds. *Carunculate*: possessing a caruncle.
- Caryopsis.** The grain or fruit of grasses.
- Castaneous.** Chestnut-colored; dark-brown.
- Catkin.** A scaly deciduous spike; ament.
- Caudate.** Bearing a tail or slender tail-like appendage.

- Caudex** (pl. *caudices*). The woody base of an otherwise herbaceous perennial.
- Caullescent**. With an obvious leafy stem; plants with radical leaves and flowers on a scape are called *acaulescent*.
- Cauline**. Belonging to the stem.
- Cell**. A cavity of an anther containing the pollen, or of an ovary containing the ovules. *Cellulous*, *cellular*, *cellulose*: made up of cells or marked off so as to resemble cells.
- Ccnospecies**. All the ecospecies so related that they may exchange genes among themselves to a limited extent through hybridization.
- Centrifugal**. In inflorescences, blooming from the inside outward, or from top to base.
- Centripetal**. Growing from without toward the center; an indeterminate inflorescence.
- Ccraceous**. Waxy in appearance or color.
- Ceriferous**. Wax-producing; waxy.
- Cernuous**. Nodding; drooping.
- Cespitose**, *caespitose*. In little tufts or dense clumps; said of low plants of turfy habit.
- Chaff**. Thin dry scales. *Chaffy*: paleaceous.
- Chalaza**. That part of the ovule or seed in which the nucellus joins the integuments; the base of the nucellus always opposite the upper end of the cotyledon. *Chalazal*: pertaining to the chalaza.
- Channeled**. Deeply grooved longitudinally, like a gutter.
- Chaparral**. A xerophytic formation of dense, impenetrable thickets composed of stiff or thorny, mostly small-leaved, evergreen shrubs.
- Chartaceous**. With the texture of stiffish writing paper.
- Chasmogamous**. With pollination taking place while the flower is open (the opposite of *cleistogamous*).
- Chiasma**. A crosswise fusion, as of chromosomes.
- Chlorophyll**. The green coloring matter in the cells of autophytic plants. *Chlorophyllous*: containing chlorophyll.
- Chromosome**. One of the small bodies into which the chromatin of the cell nucleus resolves itself previous to the mitotic division of the cell.
- Cilium** (pl. *cilia*). Used generally in the plural to denote marginal hairs. *Ciliate*: fringed with hairs on the margin. *Ciliation*: with a fringe of hairs on the margin. *Ciliate*: the diminutive.
- Cincinnus** (pl. *cincinnati*). A curl; used in the plural here for the branches of a unilateral scorpioid cyme.
- Cinereous**. Ash-colored; light-gray. *Cinerascent*: becoming ashy gray. *Cinereo-*: used in combination to denote gray—.
- Cinnamomeous**. Cinnamon-colored, a light yellowish-brown.
- Circinate**. Coiled from the top downward with the apex as a center.
- Circumpolar**. Occurring around the pole, as of arctic plants mostly confined to far northern latitudes.
- Circumscissile**. Dehiscing by a transverse line around the fruit or anther, the top falling as a lid.
- Cirrhose**. Tendrilled; with a wavy hair-point.
- Cladode**. A branch of a single internode simulating a leaf; a cladophyll. *Cladophyll*: a branch assuming the form and function of a leaf; a cladode.
- Clasping**. Leaf partly or wholly surrounding the stem; amplexicaul.
- Clathrate**. Latticed or pierced with apertures.
- Clavate**. Club-shaped; gradually thickened toward the apex from a slender base. *Clavellate*: the diminutive. *Claviform*: club-shaped.
- Claw**. The narrow petiolelike base of some petals and sepals. *Clawed*: with a claw.
- Cleft**. Cut about halfway to the midrib.
- Cleistogamous**, *cleistogamic*. Small flowers self-fertilizing without opening; usually additional to the ordinary flower and inconspicuous, as in some violets. *Cleistogamy*: the condition described.
- Cleistogene**. A plant that bears cleistogamous flowers; cleistogamous flower.
- Clinandrium**. The anther bed in orchids, that part of the column in which the anther is concealed.
- Cline**. A series of form changes; a gradient of biotypes along an environmental or geographic transition. *Clinal*, *clinally*: pertaining to, and of, a cline.
- Clonc**. The vegetatively produced progeny of a single individual.
- Coalescent**. Said of organs of one kind that have grown together. *Coalesce*: to form union by growth.
- Coarctate**. Crowded together.
- Cob**. Rachis of the pistillate corn (maize) spike.
- Coccus** (pl. *cocci*). A berry; in particular one of the parts of a lobed fruit with one-seeded cells; part of a schizocarp or lobed fruit.
- Cochleate**. Coiled like a snail shell. *Cochleiform*: shaped like a snail shell.
- Coetaneous**. Of the same age; existing at the same time.
- Coherent**. Congenitally united with another organ of the same kind (*coalescent*), or of another kind (*adnate*). *Cohere*: to become coherent.
- Collateral**. Descriptive of accessory buds arranged on either side of a lateral bud.
- Collar**. Outer side of the grass leaf at the junction of sheath and blade.
- Colonial**. Forming colonies by means of underground rhizomes, stolons, etc.; used commonly for plants with asexual reproduction.
- Colporate**. Applied to pollen grains with slits (*colpi*) that have germ pores (*ora*).
- Columella**. The persistent axis of certain capsules.
- Column**. Body formed by union of stamens and pistil in orchids, or of stamens in mallows and milkweeds. *Columnar*: having the form of a column.
- Coma**. A tuft of hairs, particularly at the end of some seeds; the tuft at the summit of the inflorescence, as in the Umbelliferae. *Comose*: furnished with a coma.
- Commissure**. The face by which two carpels cohere, as in Umbelliferae. *Commissural* (adj.).
- Complanate**. Flattened.
- Complete**. Having all the parts belonging to it, as a flower with sepals, petals, stamens and pistils.
- Complicate**. Folded together.
- Compound**. Having two or more similar parts in one organ. *Compound leaf*: one with two or more separate leaflets. *Compound pistil*: having two or more carpels united or at least coalescent.
- Compressed**. Flattened laterally.
- Concave**. Hollow, as the bowl of a spoon. *Concavity*: an existing hollow.
- Concavo-convex**. Concave on one side and convex on the other, as an eggshell or a lens.
- Concentric**. Having a common center.
- Concolor**, *concolorous*. Of uniform color.
- Concrescent**. Growing together.
- Conduplicate**. Folded together lengthwise, as the leaves of many grasses.
- Cone**. The fruit of some fern allies, or a pine or fir-tree with scales forming a strobile; an inflorescence or fruit with overlapping scales. *Conelet*: a small cone. *Conoid*: conelike.
- Confervoid**. Composed of threads.

- Confluent.** Blending of one part into another.
- Congested.** Crowded together.
- Conglomerate.** Densely clustered.
- Conic, conical.** Cone-shaped, with the point of attachment at the broad base.
- Coniferous.** Producing or bearing cones, cf. *Gymnosperms*.
- Conjugate.** Joined in pairs.
- Connate.** Congenitally united, as similar organs joined as one. *Connate-perfoliate:* united at base in pairs around the supporting axis.
- Connective.** Portion of the filament connecting the two cells of an anther.
- Connoent.** Converging or coming together, but not organically united.
- Consimilar.** When both sides are alike, like a bivalve.
- Conspecific.** Of the same species.
- Constricted.** Tightened or drawn together.
- Contiguous.** When neighboring parts are in contact, as most cotyledons.
- Continuous.** Not articulated (grass rachis) or interrupted.
- Contorted.** Twisted, bent, or distorted.
- Contracted.** Narrowed in a particular place, or shortened; the opposite of open or spreading (inflorescence).
- Convergent.** Applied to veins that run from the base to the apex of a leaf in a curved manner. *Converge:* to become convergent.
- Convex.** Rounded on the surface.
- Convolute.** Rolled up longitudinally. Said of blades or floral envelopes in the bud when one edge is outside and the other inside.
- Coralloid.** Coral-like.
- Cordate.** Heart-shaped with the notch at the base and ovate in general outline. *Cordiform:* shaped like a heart.
- Coriaceous.** Leathery in texture; tough.
- Corm.** A short, bulblike, underground stem, as the "bulb" of a gladiolus.
- Corneous.** Of the texture of horn.
- Corniculate.** Bearing little horns or hornlike processes.
- Cornucopiate.** Shaped like a horn of cornucopia.
- Cornute.** Horned or spurred.
- Corolla.** The inner perianth of a flower, composed of colored petals, which may be almost wholly united. *Corolline, corolloid:* belonging to a corolla, corollalike, or seated on a corolla.
- Corona.** A crown; the crownlike cup found at the orifice of the corolla tube in *Narcissus*. *Coroniform:* crown-shaped. *Coronate:* crowned; having a crown.
- Corrugated.** wrinkled; folded.
- Cortex.** Rind or bark.
- Corymb.** A flat-topped or convex racemose flower cluster, the lower or outer pedicels longer, their flowers opening first. *Corymbiform:* shaped like a corymb. *Corymbose:* arranged in corymbs.
- Costa (pl. costae).** A rib; the midrib of a leaf. *Costate:* ribbed; having longitudinal elevations.
- Costapalmate.** Palmately ribbed or veined.
- Cotyledon.** The primary leaf or leaves of the embryo; seed leaf.
- Cotype.** An additional or associate type specimen from which a species is described.
- Crateriform.** Shallowly cup-shaped.
- Creeping.** Spreading over or beneath the ground and rooting at the nodes.
- Crenate.** Having the margin cut with rounded teeth; scalloped. *Crenulate:* the diminutive. *Crenation:* with rounded teeth.
- Crescentic.** Shaped like the moon in its first quarter. *Crescentiform:* crescent-shaped.
- Crest.** An elevation or ridge upon the summit of an organ. *Crested:* having a crest, elevated appendage, or ridge on the summit of an organ.
- Crinite.** Bearded with long and weak hairs.
- Crisped, crispate.** Irregularly curled (said of hairs or leaf margins).
- Cristate.** Crested or tufted.
- Cross.** Hybrid of any description.
- Cross-fertilization.** Fertilization secured by pollen from the flower of another plant.
- Cross-pollination.** Transfer of the pollen of one flower to the pistil of another.
- Crown.** The persistent base of an herbaceous perennial; the top of a tree; a circle of appendages on the throat of a corolla, etc.
- Crozier.** The young coiled leaves of some ferns.
- Cruciate.** Cross-shaped, used especially for the flowers of *Cruciferae*. *Cruciferous:* cross-bearing; a flower with four petals placed opposite each other at right angles. *Cruciform:* cross-shaped.
- Crustaceous. Crustose.** Of brittle or hard texture.
- Crystalline.** Resembling crystals or of the nature of crystals.
- Cube.** The regular solid of six equal square sides. *Cubical:* of cubic form.
- Cucullate.** Hooded, or hood-shaped.
- Cucullus.** A hoodlike process on some seeds; cf. *caruncle*.
- Cucurbitaceous.** Of the nature of plants in the family *Cucurbitaceae*.
- Cuesta.** A topographic ridge; usually a ridge which has a long, gentle slope on one side (usually toward the coast) and a short, steep slope on the other side.
- Culm.** The type of hollow or pithy slender stem found in grasses and sedges.
- Cultigen.** Plant or group known only in cultivation, presumably originating under domestication; contrast with *indigene*.
- Cultivar.** A variety or race that has originated and persisted under cultivation, but not necessarily referable to a botanical species.
- Cuneate, cuneiform.** Wedge-shaped; triangular, with the narrow part at point of attachment.
- Cupule.** The cup of such fruits as the acorn; an involucre composed of bracts adherent by their base at least. *Cupulate, cupular:* cup-shaped, as the cup (involucre) of the acorn. *Cupuliform:* cup- or cupule-shaped.
- Curvate.** Continued flexure or bending from a straight line.
- Curvi-.** A combination form to denote curved or bent.
- Cusp.** A sharp, rigid point. *Cuspidate:* tipped with a cusp, or short, rigid point.
- Cutin.** A substance present as a thin continuous external layer on the outer wall of the epidermis of a leaf or stem. *Cutinized:* covered with cutin.
- Cyathium (pl. cyathia).** The ultimate inflorescence of *Euphorbia*, consisting of a cuplike involucre bearing the flowers from its base. *Cyathiform:* shaped like a drinking cup. *Cyathophorous:* like or of a cup.
- Cyclic.** Said of foliar structures arranged in whorls; coiled into a cycle or related to a cycle.
- Cylindraccous, cylindrical.** Somewhat or nearly cylindrical. *Cylindroid:* of a cylindrical shape. *Cylindro-.* Used in various combinations to denote cylindrical.
- Cymba, cymbiform.** A boat or boat-shaped.
- Cyme.** A determinate flower cluster in which the first flower is terminal on the main axis, the next flower(s) terminal on axes arising from the axils of bracts subtending the first flower, and so on; often cymes are flat-topped or convex (cf. *determinate*).

- Cymose:** arranged in cymes. **Cymiform:** cyme-shaped. **Cymule:** a small or few-flowered cyme. **Cystolith.** Mineral concretions, usually a calcium carbonate on a cellulose stalk, occurring in special cells in the Urticaceae, etc.
- Cytoplasm.** The general protoplasm of the cell.
- Deciduous.** Falling off, as petals fall after flowering, or leaves of nonevergreen trees in autumn or said of plants whose leaves fall, as in "deciduous tree."
- Declinate.** Bent or curved downward or forward. **Declined:** directed obliquely.
- Decompound.** More than once divided or compounded.
- Decorticate.** To deprive of bark.
- Decumbent.** Lying down, but with the tip ascending.
- Decurrent.** Extending down the stem below the insertion; said of leaves or ligules.
- Decussate.** Opposite pairs (usually leaves) alternating at right angles with those above or below.
- Deflexed.** Turned abruptly downward.
- Defoliate.** The act of shedding leaves.
- Dehiscent, dehisce, dehiscence.** Opening spontaneously when ripe to discharge the contents, as an anther or seed vessel.
- Deliquescent.** Dissolving or melting away.
- Deltoid, deltate.** Equilaterally triangular.
- Dendritic, dendroid.** Treelike, as the branching hairs of some Cruciferae.
- Dentate.** Having the margin cut with sharp salient teeth not directed forward. **Denticle:** a small tooth. **Denticulate:** slightly and finely toothed. **Dentiform:** tooth-shaped.
- Depauperate.** Dwarf, starved.
- Depressed.** Low, as if flattened from above.
- Descending.** Tending gradually downward as the branches of some trees.
- Determinate.** Said of an inflorescence (as a cyme) in which the terminal flower blooms slightly in advance of its nearest associates; limited in number and extent.
- Dextrorse.** Turned to the right.
- Di-, dis-** Greek prefix meaning two or double.
- Diadelphous.** Stamens united by their filaments into two sets.
- Diagonal.** A mean between two forces, a compromise of position.
- Diandrous.** Having two stamens.
- Diaphanous.** Transparent.
- Diaphragm.** A dividing membrane or partition as that in the pith of grape vines and the pith in *Juglans*.
- Dibrachiate.** When branches spread and are doubly and widely divergent.
- Dicarpellary.** Having two carpels.
- Dichasium** (pl. *dichasia*). A cyme with two lateral axes. **Dichasial:** provided with *dichasia*.
- Dichotomous.** Repeatedly forking in pairs. **Dichotomy:** a condition of being dichotomous.
- Dicotyledons** (abbr. *dicots*). A class of angiosperms differentiated by possession of two cotyledons.
- Didymous.** Twin; found in pairs.
- Didynamous.** With four stamens in two pairs of unequal length as in most Labiatae.
- Diffuse.** Scattered; widely spread.
- Digitate.** Fingered; shaped as an open hand; compound with the members arising from one point.
- Dilated.** Flattened and broadened, as an expanded filament.
- Dimidiolate.** Halved, as a condition in which half an organ is so much smaller than the other as to seem wanting.
- Dimorphic, dimorphous.** Having two forms, as flowers with short stamens and long styles or long stamens and short styles.
- Diocious.** Having staminate and pistillate flowers in different plants.
- Diploid.** Having two basic chromosome sets (twice the number in normal, haploid gametes).
- Disarticulating.** Separating joint from joint at maturity.
- Discoid.** Disklike, in the Compositae, a head without ray florets. **Disciform:** flat and circular like a disk.
- Discolorous.** Used when the two surfaces of a leaf are unlike in color.
- Discrete.** Separate; not coalescent.
- Disjunct.** Characterized by having separate groups; disconnected.
- Disk, Disc.** A fleshy development of the receptacle about the base of the ovary; in Compositae, the tubular flowers (disk florets) of the head as distinct from the ray.
- Disparate.** Unequal; dissimilar.
- Dissected.** Deeply divided into numerous usually fine segments.
- Dissepiment.** A partition in an ovary or pericarp caused by the adhesion of the sides of the carpellary leaves.
- Distal.** Opposite the point of attachment; apical; away from the axis.
- Distant.** Said of similar parts not closely aggregated; opposed to approximate; remote.
- Distichous.** In two vertical rows or ranks.
- Distinct.** Separate; not united with parts in the same cycle. Cf. *Free*.
- Dithecal.** Having two thecae or cells.
- Diurnal.** Occurring in the daytime; sometimes used meaning ephemeral.
- Divaricate, divaricately.** Widely divergent.
- Divergent.** Extending away from each other by degrees.
- Divided.** Separated to the base.
- Dolabriform.** Axe-shaped or hatchet-shaped.
- Dormant.** Said of plants that are not in active life.
- Dorsal, dorsally.** Pertaining to the back; the surface turned away from the axis. **Dorso-:** used in combination to denote the back of. **Dorsum:** the back or parts of the flower that face the outside.
- Dorsifixed.** Attached by or to the back.
- Dorsiventral.** Having distinct dorsal and ventral surfaces.
- Double.** Used of flowers when the petals are increased in number at the expense of other organs, especially the stamens; twice.
- Down.** Soft pubescence; the pappus of such plants as thistles. **Downy:** closely covered with very short and weak soft hairs.
- Drizzling.** Erectish at base but bending downward above, as the branches of a grass panicle.
- Drupe.** A fleshy one-seeded indehiscent fruit containing a stone with a kernel; a stone-fruit such as a plum. **Drupelet:** a diminutive drupe.
- Drupaceous:** resembling a drupe, possessing its character, or producing similar fruit.
- Duff.** The partly decayed vegetable matter on the forest floor.
- E-, Ex-** Latin prefix meaning without, out of, from, as "ebracteate."
- Ebeneous.** Black as ebony.
- Ebracteate.** Without bracts.
- Echinate.** Prickly, a hedgehog.
- Ecology.** The study of organisms in relation to their environment.
- Ecorollate.** Without a corolla.
- Ecospecies.** All individuals so related that they

- are able to exchange genes freely without loss of fertility or vigor in the offspring.
- Ecotype.** Those individuals that are fitted to only one kind of environment occupied by the species.
- Edaphic.** Pertaining to, or influenced by, soil conditions.
- Edentate.** Without teeth.
- Elaiosome.** Characteristic oily appendages and seeds of some plants, such as arils, crests, glands offering food-bodies to ants.
- Elater.** In *Equisetum*, 4 club-shaped hygroscopic bands attached to the spores, which serve for dispersal.
- Elliptic.** In the form of a flattened circle usually more than twice as long as broad. **Ellipsoid:** an elliptic solid.
- Elongate.** Drawn out in length.
- Emarginate.** With a small notch at the apex.
- Embryo.** The incipient plantlet in the seed.
- Emergence.** Outgrowths from superficial cells on the surface of an organ such as prickles, warts, glands, etc.
- Emersed, emergent.** Raised above and out of the water.
- Enantiostylous.** Flowers whose styles are protruded right or left of the axis, with the stamens opposite.
- Enation.** An outgrowth on the surface of an organ.
- Endemic.** Confined to a given region, as a country or island. **Endemism:** the condition of endemic plants.
- Endocarp.** The inner layer of the pericarp.
- Endodermis.** The layer of ground tissue that abuts on the stele, being differentiated as a sheath around it.
- Endogenous.** Forming new tissue within.
- Endoglossum.** A transverse projection from the dorsal wall of the carpel to make it almost completely septate.
- Endosperm.** The nutritive tissue surrounding the embryo of a seed and formed within the embryo sac.
- Ensiform.** Sword-shaped, as the leaves of *Iris*.
- Entire.** Undivided; the margin continuous, not incised or toothed.
- Entomophilous.** Insect-pollinated.
- Envelope.** The surrounding part. **Enveloping:** involucrate; to enclose.
- Epappose.** Without pappus.
- Epetiolate.** Without petals.
- Ephemeral.** Lasting for a day or less.
- Epi-.** Prefix meaning upon, such as "epiphyte."
- Epicarp.** The outer layer of the pericarp.
- Epidermis.** The true cellular skin or covering of a plant below the cuticle. **Epidermal:** relating to the epidermis.
- Epigynous.** Borne on the ovary; said of floral parts when the ovary is wholly inferior. **Epigyny:** the state of having epigynous flowers.
- Epipetalous.** Borne upon the petals.
- Epiphyte, epiphytic.** Characterized by growing on other plants or objects but not parasitically, such as orchids, bromeliads and ferns.
- Equidistant.** Of equal distance.
- Equitant.** Astride, as if riding, such as the leaves of an *Iris*; folded lengthwise and distichous.
- Erect.** Upright in relation to the ground, or sometimes perpendicular to the surface of attachment; a lip of a corolla is erect when in line with the tube.
- Ericoid.** Said of leaves that are like those of heaths.
- Erose.** Irregularly toothed as if gnawed.
- Escape.** A cultivated plant found growing as though wild, dispersed by some agency.
- Escarpment.** A steep slope, especially if wide.
- Estipulate.** Without stipules. (cf. *exstipulate*).
- Etiolation.** The condition of being lengthened (as a stem) or deprived of color by absence of light.
- Evanescence.** Quickly disappearing.
- Evergreen.** Remaining green through the winter.
- Exalate.** Without wings.
- Exalbuminous.** Without endosperm, referring to seeds.
- Exappendiculate.** Without appendages.
- Excentric (eccentric).** One-sided, off-center, abaxial.
- Excrescence.** Small warty outgrowth.
- Excurrent.** Projecting beyond the edge, as the midrib of a mucronate leaf or nerve of a floral segment.
- Excurved.** Curved outward or away from a central part. **Excurvature:** an excurved part.
- Exfoliate (-ing).** To come off in scales or flakes, as the bark of the sycamore (*Platanus*).
- Exiguous.** Small and narrow.
- Exocarp.** The outer layer of the pericarp.
- Exogenous.** Forming new tissue outside the old.
- Exotic.** Foreign, not native; from another region.
- Explanate.** Spread out flat.
- Exserted.** Protruding, as stamens projecting beyond the corolla; not included.
- Exsiccatae.** Dried plants specimens, usually in sets for sale or for subscribers, or for exchange.
- Exstipulate.** Without stipules.
- Extant.** Still existing.
- Extensile.** Capable of being extended or enlarged.
- Extratropical.** Beyond or outside of the tropics.
- Extrorse.** Facing outward from the axis, as the dehiscence of an anther.
- Exudate, exudation.** The transpiration of liquids from hydathodes, etc., as seen on the leaf tips of Monocotyledons.
- Exvaginate.** Outside of the sheath.
- Eye.** The marked center of a flower, such as in some species of *Physalis* and *Hibiscus*.
- Face.** That surface of an organ that is opposed to the back, usually the upper or inner side.
- Facet.** One of a set of small plane surfaces; a little face.
- Facial.** Applied to a hilum that is on the side and not on the margin of a seed.
- Falcate.** Sickle-shaped. **Falciform:** sicklelike.
- Fan.** The soil and debris outwash formed from a mesa or other elevation.
- Farina.** Starch or starchy matter. **Farinaceous:** containing starch; mealy in texture. **Farinose:** covered with a mealiness. **Farinule:** minutely mealy.
- Fasciated.** An abnormal widening and flattening of the stem as though several stems had coalesced in one plane.
- Fascicle.** A close cluster or bundle of flowers, leaves, stems or roots. **Fasciculate:** in a fascicle.
- Fastigate.** Clustered, parallel, erect branches.
- Faucal.** Pertaining to the throat of a gamopetalous corolla.
- Faveolate, favose.** Honeycombed, as the receptacle in many Compositae; alveolate.
- Fenestrate.** With transparent areas or windowlike openings.
- Feral.** Wild or indigenous; not cultivated.
- Ferruginous.** Rust-colored.
- Fertile.** Said of pollen-bearing stamens and seed-bearing fruits.
- Fertilization.** Effect of pollen deposited on a stigmatic surface resulting in conversion of flower into fruit and of ovule into seed; the union of egg and sperm.
- Fetid.** Disagreeably odorous.

- Fibrillose.** Furnished with little fibers.
- Fibrous.** Having numerous woody fibers, as the scales of some bulbous plants.
- fid.** A suffix meaning deeply cut.
- Filament.** A thread, especially the stalk of an anther. **Filamentous, filamentose:** formed of filaments or fibers.
- Filiferous.** With filaments or threads.
- Filiform.** Threadlike.
- Fimbriate.** Fringed (with longer or coarser hairs as compared with ciliate). **Fimbrillate:** the diminutive.
- Fissured.** To be cracked or fractured, as the bark of a tree.
- Fistular, fistulous, fistulose.** Hollow throughout, as the leaf of an onion.
- Flabellate, flabelliform.** Fan-shaped; broadly wedge-shaped.
- Flaccid.** Weak, limp, soft or flabby.
- Flagellate.** With very slender whiplike runners.
- Flagelliform:** whip-shaped.
- Flange.** A part that spreads out like a rim.
- Flavescent:** Yellowish, becoming yellow. **Flavo-:** used in combinations to denote yellowish.
- Fleshy.** Thick and juicy; succulent.
- Flexuous, flexuose.** Zigzag, bending alternately in opposite directions. (cf. *fractiflex*). **Flexed:** to be alternately bent.
- Floccose.** With flocs or tufts of soft woolly hair.
- Flocculent:** the diminutive. **Floccosity:** state of being floccose.
- Flora.** The aggregate of plants of a country or district, or a work which contains the enumeration of them.
- Floral.** Of or pertaining to flowers. **Floral tube** (or *cup*): a more or less elongate tube consisting of perianth or other floral parts.
- Floret.** The individual flower of the Compositae and Gramineae; a small flower of a dense cluster.
- Florican.** The flowering cane, usually the second year's development of the primocane, in *Rubus*, etc.
- Floriferous.** Bearing or producing flowers.
- Fluted.** Regularly marked by alternating ridges and groove-like depressions.
- Foliaceous.** Leaflike; said especially of sepals or bracts that in texture or appearance resemble leaves. **Foliar:** leafy or leaflike. **Foliose:** having numerous leaves.
- Foliage.** The leafy covering, especially of trees.
- Foliate.** Having leaves. **Foliolate:** having leaflets.
- Follicetum.** A whorl or glomerule of follicles sometimes more or less coalescent at base.
- Follicle.** A dry monocarpellary fruit, opening only on the ventral suture, as in the larkspur. **Follicular:** shaped like a follicle.
- Form.** Subdivision of a variety of species usually differing in one character and usually but not necessarily perpetuated vegetatively, such as differences in flower color and style lengths.
- Fornicate.** Provided with arched scalelike appendages in the corolla tube, as in *Myosotis*.
- Fovea** (pl. *Foveae*). A depression or pit, as in the upper surface of the leaf base in *Isoetes*, that contains the sporangium; the seat of the pollinium in orchids. **Foveate:** pitted. **Foveolate:** the diminutive.
- Fractiflex.** Bending alternately and sharply in opposite directions; zigzag.
- Franserloid.** Of or pertaining to the genus *Franseria* (*Ambrosia*).
- Free.** Not joined to other organs; the reverse of adnate.
- Fronde.** Leaf of a fern, including the stipe and blade.
- Fructiferous.** Producing or bearing fruit.
- Fruit.** The ripened pistil with all its accessory parts.
- Frutescent, fruticose.** Shrubby or bushy in the sense of being woody. **Fruticulose:** applied to a little shrub.
- Fugacious.** Perishing very early.
- Fulvous.** Tawny; dull-yellow.
- Fungoid.** Pertaining to or resembling a fungus.
- Funicle, funiculus.** The cord or thread that sometimes connects the ovule or seed to the placenta.
- Funnelform.** Gradually widening upwards, like a funnel.
- Furcate.** Forked, with terminal lobes that are like prongs.
- Furfuraceous.** Covered with branlike scales; scurfy.
- Furrowed.** With longitudinal channels or grooves; striate on a large scale; sulcate.
- Fuscous.** Grayish-brown.
- Fusiform.** Spindle-shaped; thickest near the middle and tapering toward each end.
- Galea.** The helmetlike upper lip in certain bilabiate corollas. **Galeate:** having a galea. **Galeiform:** helmet-shaped.
- Gametophyte.** The gamete-producing form of the plant (as in ferns) contrasted with the spore-producing form or "sporophyte."
- Gamopetalous.** Corolla with petals united. Same as sympetalous and monopetalous.
- Gamophyllous.** Composed of coalescent leaves or leaflike organs.
- Gamosepalous.** Calyx with sepals united.
- Geminate.** In pairs, binate, twin.
- Gemma** (pl. *gemmae*). A bud or a body analogous to a bud capable of producing a new plant. **Gemmiferous:** bearing buds.
- Gene.** The unit of inheritance, which occupies a fixed chromosomal locus, is transmitted in the germ cells, and which governs, affects or controls the transmission and development of a hereditary character. **Genetic:** that which is inherited.
- Geniculate.** Bent abruptly, as a knee.
- Genitalia.** The stamens and pistils; reproductive organs.
- Genome.** A chromosome set; the chromosome complement of a gamete or other cell or organism.
- Genuflexed.** Bent.
- Genus.** (pl. *genera*). The natural group containing distinct species; a group of one or more related species.
- Germinal.** Relating to a bud.
- Germinate.** To sprout; to begin to grow and develop.
- Gibbous.** Swollen on one side; ventricose. **Gibbosity:** a swelling at the base of an organ.
- Gigantism.** Of unusually large size.
- Glabrous.** Without hairs; incorrectly used in the sense of smooth, the antonym of rough. **Glabrate:** almost glabrous; tending to be glabrous. **Glabrescent:** becoming glabrous.
- Gladiate.** Flat, straight or slightly curved, with acute apex and approximately parallel edges, ensiform, swordlike.
- Gland.** A depression, protuberance, or appendage on the surface of an organ, which secretes a usually sticky fluid. **Glandular:** bearing glands or glandlike. **Glanduliferous:** bearing glands. **Glanduliform:** gland-shaped.
- Glaucous.** Covered or whitened with a bloom, as a cabbage leaf; bluish-white or bluish-gray. **Glaucouscent:** becoming glaucous.
- Globe.** The flower cluster in some species of *Acacia*, etc.

- Globose.** Spherical or rounded. **Globular:** somewhat or nearly globose. **Globule:** a little globe; a small spherical particle.
- Glochid.** A barbed hair or bristle. **Glochidiate:** barbed at the tip, as a bristle.
- Glomerate.** Densely compacted in clusters or heads. **Glomerule:** a compact capitate cyme. **Glomerulate:** arranged in small clusters. **Glomeriform:** head-shaped.
- Glumes.** The pair of bracts at the base of a grass spikelet. **Glumaceous:** resembling glumes.
- Glutinous.** With a gluey exudation.
- Gneiss.** A laminated or foliated metamorphic rock.
- Gourd.** A fleshy one-celled many-seeded fruit, like a melon.
- Graduate.** Marked with small regular distances.
- Gramineous.** Related to grass or grain-bearing plants. **Graminiform:** grass-shaped.
- Granular, granulose.** Covered with very small grains or granules; minutely mealy. **Granuliferous:** granule-bearing.
- Gregarious.** Growing in groups or colonies.
- Grenadine.** A brilliant color of reddish red-yellow hue.
- Grisous.** Of a light color or white, mottled with black or brown.
- Grit cells.** A sclerotic cell, as in the flesh of pears.
- Gymnosperms.** Plants with naked (uncovered) ovules, as the conifers.
- Gynandrous.** Stamens adnate to the pistil.
- Gynecandrous.** Having staminate and pistillate flowers in the same spikelet, the latter above the former.
- Gynobase.** An elongation or dilation of the receptacle to support the carpels or nutlets, as in many borages.
- Gynobasic.** Applied to a style which adheres by its base to a prolongation upwards of the torus between carpels.
- Gynoecium** (pl. **Gynoecia**). The pistils collectively of a flower.
- Gynophore.** The prolonged stipe of a pistil, as in *Cleome*.
- Gynostegium.** A sheath or covering of the gynoecium of whatever nature.
- Gypsaceous, gypsiferous.** Containing calcium sulfate (gypsum). **Gypsophile, gypsophilous:** dwelling on gypsaceous soils, a few plants confined to such places.
- Gyrate.** Curved into a circle or circular; circinate.
- Habit.** General appearance of a plant.
- Habitat.** The normal situation in which a plant lives.
- Halberd-shaped.** Hastate; arrow-shaped with the lobes turned out.
- Halophyte.** A plant of salty or alkaline soils. **Halophytic** (adj.).
- Haploid.** Single; having the reduced number of chromosomes typical of gametes, as opposed to the somatic number.
- Hastate.** Halberd-shaped; of the shape of an arrowhead but with the basal lobes turned outward.
- Haustoria.** The suckerlike attachment organs of parasites like *Cuscuta*.
- Head.** A dense globular cluster of sessile or subsessile flowers arising essentially from the same point on the peduncle; capitulum.
- Heartwood.** The innermost and oldest wood next to the pith.
- Helicoid, helical.** Curved or spiraled like a snail shell.
- Helix.** Having a spiral form.
- Hemi-.** In composition means half.
- Hemicordate.** Half-hearted.
- Hemispheric, hemispheroidal.** Shaped like half a sphere.
- Hemitropous.** Amphitropous, the axis of the ovule being more curved than the anatropous condition.
- Herb.** A plant without persistent woody stem, at least above ground.
- Herbaceous.** Pertaining to a herb; opposed to woody; having the texture or color of a foliage leaf; dying to the ground each year.
- Herbage.** Collectively, the green parts of a plant.
- Herbarium.** A collection of dried and pressed plants, usually mounted on strong sheets of rag paper or otherwise prepared for permanent preservation, and usually systematically arranged.
- Hermaphrodite.** With stamens and pistil in the same flower.
- Hesperidium.** A superior, polycarpellary, syncarpous berry, pulpy within, and externally covered with a tough rind, as an orange.
- Heterochlamydeous.** With the perianth clearly divided into a calyx and a corolla.
- Heterogamous.** Producing two or more kinds of flowers.
- Heterogeneous.** Not uniform in kind.
- Heteromorphic.** Of more than one kind of form.
- Heterophyllous:** Having leaves of different forms.
- Heterophylly:** Two different forms of leaves marked by difference in organization.
- Heterosporous.** Having spores of two sizes or shapes.
- Heterostylous, heterostylic, heterostyled.** The state of having unlike or different length styles.
- Heterozygous.** Having genes for both members of at least one pair of allelomorphous Mendelian characters.
- Hexagonal.** Six angled.
- Hexamerous.** Having the floral whorls composed of six members.
- Hexaploid.** Having six basic chromosome sets (six times the gametic number).
- Hibernacle, hibernaculum.** A winter bud.
- Hilum.** The scar at the point of attachment of an ovule or seed. **Hilar:** relating to the hilum.
- Hip.** The fruit of the rose; technically a cynarrhodium.
- Hippocrepiform.** Horseshoe-shaped.
- Hirsute, hirtus.** Rough with coarse or shaggy hairs. **Hirsutulous (-ose):** the diminutive. **Hirtellous:** minutely hirsute.
- Hispid.** Rough with stiff or bristly hairs. **Hispidulous (-ose):** the diminutive. **Hispidulo-:** used in combination to denote stiff or bristly hairs.
- Hoary.** Covered with white down.
- Holosericeous.** Covered with fine and silky hairs.
- Holotype.** The one specimen on which a species or other taxon is based.
- Homo-.** A Greek prefix denoting all alike or of one sort.
- Homochromous.** Uniform in color.
- Homogamous.** A head or cluster with flowers alike throughout.
- Homogeneous.** Of the same kind or nature, uniform, opposed to heterogeneous.
- Homorphic.** Uniform in shape.
- Homonym.** In nomenclature, a name rejected because it duplicates a name previously and validly published for a group of the same rank based on a different type.
- Homosporous.** With spores all alike in size and shape.
- Homostylous.** The relation of length between all styles and anthers of the same species; the state of having similar or equally long styles.
- Homozygous.** Having genes for only one member of at least one pair of allelomorphous Mendelian characters.

- Hood.** Cf. *cucullate*.
- Horny.** Hard or dense in texture.
- Host.** A plant that nourishes a parasite.
- Humistrate.** Spread over the surface of the ground.
- Humus.** Decomposing organic matter in the soil.
- Husk.** The outer covering of certain fruits or seeds, as in the Juglandaceae.
- Hyaline.** Colorless or translucent, rarely transparent.
- Hybrid.** A cross between two species.
- Hydathode.** An organ that extrudes water or other liquid.
- Hydrophyte.** Partially or wholly immersed water plant. *Hydrophilic, hydrophilous:* dwelling in wet places or water; pollinated by water.
- Hygroscopic.** Susceptible of extending or shrinking on the application or absence of water or vapor.
- Hypanthium.** A cup-shaped enlargement of the receptacle on which the calyx, corolla, and often the stamens are inserted; in perigyny the "calyx tube."
- Hypocotyl.** The axis of an embryo below the cotyledons but not passing beyond them.
- Hypocrateriform.** Salver-shaped, with a salver-shaped corolla.
- Hypodermal.** Beneath the epidermis.
- Hypogynium.** The perianthlike structure subtending the ovary in some genera of the Cyperaceae.
- Hypogynous.** Borne on the receptacle below or free from the pistil; said of petals or stamens.
- Igneous.** Resulting from the action of intense heat, as igneous rock.
- Imbibe.** To saturate, imbue, soak, steep.
- Imbricate.** Overlapping as shingles on a roof.
- Immaculate.** Unspotted.
- Immersed.** Growing under water.
- Imparipinnate.** Odd-pinnate, having a terminal leaflet.
- Imperfect flower.** Having either stamens or pistils, but not both.
- Inarticulation.** With no joints, continuous.
- Incanous.** Quite gray, hoary.
- Incipient.** Beginning to be or to show itself; initial.
- Inclined.** Cut rather deeply and sharply.
- Inclined.** Falling away from the horizontal direction.
- Included.** Not protruding beyond the surrounding organ or envelope.
- Incrasate.** Made thick or stout, as the leaves of some species of *Sedum*.
- Incumbent.** Lying upon anything; said of cotyledons when the back of one rests against the stalk of the embryo.
- Incurved.** Bending inwards.
- Indefinite.** Relating to number, inconstant or very numerous.
- Indehiscent.** Not splitting open, as an achene.
- Indeterminate.** Not terminated absolutely, as a raceme.
- Indigene, indigenous.** Native to the country; not introduced.
- Indument, indumentum.** Any hairy covering or pubescence.
- Induplicate.** Valvate aestivation in which the margins of the leaves are bent or folded inward.
- Indurate.** Hard, hardened.
- Indusium (pl. *indusia*).** In ferns, the epidermal outgrowth that covers or invests the sorus; in Goodeniaceae the 2-lobed or 2-lipped flange or cup surrounding the style near its apex. *Industate:* possessing an indusium.
- Inequilateral.** Unequal-sided.
- Inferior.** Lower or beneath. *Inferior ovary:* one that is adnate to the hypanthium and situated below the calyx lobes.
- Inflated.** Blown up; bladdery.
- Inflexed.** Turned abruptly inward. *Inflexure:* a sudden turn inward.
- Inflorescence.** The flower cluster of a plant, or, more correctly, the disposition of the flowers on an axis.
- Inframedial.** Below the middle.
- Infraspecific.** Within the species.
- Infrastamineal.** Below the stamens.
- Infrastipular.** Below the stipules.
- Infructescence.** The inflorescence in a fruiting stage; collective fruits.
- Infundibular, infundibuliform.** Funnelform.
- Innate.** Borne on the apex of the support; in an anther the antithesis of adnate.
- Innocuous.** Harmless, hence unarmed or spineless, or nontoxic.
- Innovation.** In Gramineae a new sterile basal shoot; an offshoot from a stem, as in *Polygonum*.
- Inrolled.** Rolled inward.
- Insectivorous.** Consuming insects, i.e., by digesting out the organic parts.
- Inserted.** Attached to or growing upon.
- Insertion.** The place or mode of attachment of an organ to its support.
- Integument.** The covering of an organ or body; the envelope of an ovule.
- Inter-.** Used in combinations meaning between.
- Intercostal.** Situated between ribs or costae.
- Interlacunar.** Between air spaces.
- Internerves.** Spaces between the nerves.
- Internode.** The portion of stem between two nodes. *Internodal* (adj.).
- Interpetiolar.** Between the petioles; enclosed by the expanded base of a petiole; also applied to connate stipules that have coalesced from two opposite leaves.
- Interrupted.** Not continuous or regular.
- Interspecific.** Between different species.
- Interstices.** Small air spaces, the larger are termed lacunae, and still larger air passages.
- Interstitial.** Pertaining to the space which intervenes between one thing and another.
- Interstylar.** Between styles.
- Interval.** Space between ridges.
- Interverticillar.** Between verticils.
- Intine.** The innermost coat of a pollen grain.
- Intra-.** A prefix used to denote within.
- Intrafoliar.** Within the leaves.
- Intramarginal.** Placed within the margin near the edge.
- Intrastaminal.** Within the stamens, as the disk of Anacardiaceae.
- Introduced.** Brought from another region.
- Introggression.** Entrance; going in; used for hybridization and repeated back-crossing which can result in genetic contamination of one taxon by another. *Introgressant:* that which goes in; used for the organisms which show the results of introggression.
- Introrse.** Turned inward, towards the axis.
- Intruded.** Projecting inward or forward.
- Intrusive.** To enter though unwelcome; to be unexpected.
- Invaginate.** To enclose in a sheath. *Invagination:* enclosing in a sheath.
- Inverted.** Upside down; turned over.
- Involucel.** A secondary involucre, as the bracts subtending the secondary umbels in the Umbelliferae. *Involucellate:* with a secondary involucre.
- Involucre.** A whorl of bracts (phyllaries) subtending a flower cluster, as in the beads of Compositae. *Involucral:* pertaining to an invo-

- lucre. Involucrate:** having an involucre. *Involucriform:* of the form of an involucre.
- Involute.** With the edges rolled inward, i.e., toward the upper side.
- Iridescent.** Showing several colors as in a rainbow.
- Irregular.** Showing a lack of uniformity; asymmetric, as a zygomorphic flower.
- Isodiametric.** Of equal dimensions.
- Isolateral.** Equal sided.
- Isomorphic.** Of equal form.
- Isotype.** A specimen of the type collection other than the holotype.
- Isthmus (pl. Isthmi).** A narrow, constricted, necklike section of an organ.
- Joint.** The internode of a grass culm; an articulation, as in fruits of *Desmodium*.
- Junceous.** Rushlike.
- Juxtaposed.** The relative position in which organs are placed.
- Keel.** A prominent longitudinal ridge, analogous to the keel of a boat; the two lower and united petals of a papilionaceous corolla.
- Kernei.** The nucellus of an ovule or of a seed; that is, the whole body within the coats.
- Key or Key Fruit.** A winged fruit, like the maples; samara.
- Labellum.** A lip; the odd petal of an orchid.
- Labia, labiate.** Lipped; a member of the Labiales.
- Lacerate.** Appearing irregularly torn or cleft.
- Lacinia.** A slash or slender lobe. *Laciniate:* cut into narrow lobes or segments. *Lacinations:* fission.
- Lactescent.** Producing milky sap, as the milkweeds. *Latex:* the milky sap of some plants.
- Lacuna (-ae).** An air space in the midst of tissue; said of the vallecular canals of *Equisetum*; a hole or cavity.
- Laevigate.** Smooth, as if polished.
- Lamella (-æ).** A thin plate. *Lamellate, lamellar:* made up of thin plates. *Lamelliform:* platelike.
- Lamina (-ae).** The blade or expanded part of a leaf, petal, etc. *Laminar:* of the blade.
- Laminate.** In plates or layers.
- Lanate, lanose.** Woolly; densely clothed with long entangled hairs. *Lanulose:* short-woolly.
- Lanceolate, lance.** Lance-shaped; much longer than broad, tapering from below the middle to the apex and (more abruptly) to the base.
- Lanuginous.** Cottony or woolly; lanate.
- Latent.** Dormant.
- Lateral.** At or on the side.
- Laticiferous.** Latex-bearing.
- Latifoliate, latifolious.** Broad-leaved.
- Latisept.** With broad partitions in their fruits as in the Cruciferae.
- Lax.** Loose, distant.
- Leaf.** The principal appendage or lateral organ borne by the stem or axis.
- Leaflet.** A segment of a compound leaf.
- Leaf scar.** The mark or cicatrice left by the articulation and fall of a leaf.
- Leaf stalk.** The stem of a leaf; petiole.
- Lectotype.** A specimen or other element selected from the original material to serve as the nomenclatural type, when the holotype was not designated at the time of publication, or when the holotype is missing.
- Legume.** The seed vessel of Leguminosae, one-celled and two-valved, but various in form; a superior 1-celled fruit of a simple pistil usually dehiscent into two valves, having the seeds attached along the ventral suture; a leguminous plant.
- Leguminous:** pertaining to a legume or the family Leguminosae.
- Lemma.** In grasses, the lower of the two bracts immediately enclosing the floret.
- Lenticels.** Corky spots on young bark, arising in relation to epidermal stomates. *Lenticellate:* having lenticels.
- Lenticular.** Lens-shaped. *Lenticulate (adj.):*
- Lentiginous.** Minutely dotted as though freckled.
- Lepidote.** Covered with small scurfy scales; scurfy; furfuraceous.
- Liane.** Luxuriant woody climbers in the tropics and subtropics, with anomalous structure.
- Ligament.** Anything that ties or unites one thing or part to another.
- Lignous.** Woody. *Lignescence:* somewhat woody or becoming woody.
- Ligule.** The strap-shaped part of a ray corolla in Compositae; the thin, collarlike appendage on the inside of the blade at the junction with the sheath in grasses. *Ligulate:* provided with a ligule. *Liguliform:* strap-shaped.
- Limb.** A border; in particular, the expanded portion of a gamopetalous corolla or a gamosepalous calyx.
- Limen.** Basal corona in Passifloraceae.
- Linear.** Resembling a line; long and narrow, of uniform width, as the leaf blade of grasses.
- Lineate.** Marked with parallel lines.
- Lineolate.** Marked with fine or obscure lines.
- Lingulate, linguiform.** Tongue-shaped.
- Lip.** One of the two divisions of a bilabiate corolla or calyx, hence an upper lip and a lower lip, although one lip may be wanting; the upper lip of orchids, by a twist of the ovary, usually appears to be the lower.
- Lithophyte.** A plant that grows on rocks but derives its carbon dioxide, water and minerals from the atmosphere and from accumulated humus and weathered materials.
- Littoral.** Of a shore, particularly of the seashore.
- Llano.** A flat plain, usually grassy and treeless.
- Lobe.** A division or segment of an organ, usually rounded or obtuse; cut less than halfway to the midrib (of a leaf). *Lobed:* bearing lobes.
- Lobule.** A small lobe. *Lobulate:* having a small lobe.
- Locular.** Having cells or loculi, as a bilocular pistil or two-celled anther.
- Locule.** *Loculus.* Compartment or cell of pistil or anther.
- Loculicidal.** Dehiscent longitudinally through the middle of the back of a pericarp, between the partitions into the cavity.
- Lodicules.** The 2 or 3 minute hyaline scales at the base of the stamens in grasses, representing the perianth.
- Loess.** Drifting dust held by vegetation.
- Loment.** A flat legume that is constricted between the seeds, falling apart at the constrictions when mature into one-seeded joints.
- Lorate.** Strap-shaped, ligulate. *Loriform:* of the form of a strap.
- Lozenge.** Diamond-shape; rhomb.
- Lunate.** Crescent-shaped.
- Lustrous.** Shining, having a sheen.
- Lutescent.** Becoming yellow.
- Lyrate.** Lyre-shaped; pinnatifid, with the terminal lobe considerably larger than the others.
- Macro-.** Greek prefix meaning large or more properly, long.
- Macrosporangium.** The organ in which macrospores are produced.

- Macrospore.** The larger of the two kinds of spores in Selaginellaceae, etc.
- Macrosporophyll.** The modified leaf that bears the macrosporangium.
- Maculate.** Spotted or blotched. *Maculation:* a spot.
- Male** (plant or flowers). Having stamens but no pistils.
- Malodorous.** Ill-smelling.
- Malpighiaceous hairs.** Straight appressed hairs attached by the middle and tapering to the free tips.
- Mammiform.** Breast-shaped, conical with rounded apex.
- Mamillate.** Having nipples.
- Marbled.** Stained with irregular streaks or blotches of color.
- Marcascent.** When withered, not falling off, especially leaves and corollas.
- Marginal.** Of, pertaining to, or attached to the edge.
- Marginate, margined.** Distinctly margined; the margin distinctly different.
- Marine.** Growing within the influence of the sea or immersed in its water.
- Maritime.** Of the seacoast, pertaining to the sea.
- Marsh.** A tract of wet or periodically inundated treeless land, usually characterized by grasses, cattails or other monocots.
- Massula (-ae).** A group of cohering pollen grains produced by one primary mother cell, as in the orchids; pollen mass.
- Matorral.** Field full of brambles and briars, a brushy place; a thicket, copse.
- Medial. Median.** Of the middle.
- Medifixed.** Fixed or attached by the middle.
- Medullary.** Pertaining to the pith. *Medullose:* the texture of pith.
- Megasporangium.** The sporangium in which megaspores are developed or contained.
- Megaspore.** A synonym of macrospore.
- Membrane, membranaceous, membranous.** Of the nature of a membrane; thin, soft and pliable.
- Meniscoid.** Thin and concavo-convex, like a watch glass.
- Mentum.** An extension of the foot of the column in some orchids, in the shape of a projection in front of the flowers.
- Meristem.** Embryonic or undifferentiated tissue, the cells of which are capable of active division. *Meristematic:* pertaining to the meristem.
- Mericaarp.** One of the two seedlike carpels of an umbelliferous fruit.
- merous.** Greek suffix, having parts, as pentamerous or 5-merous, having 5 parts.
- Mesa.** A flat-topped hill with abrupt or steeply sloping side or sides.
- Mescal.** A drink distilled from the juice of the maguey; a small cactus (*Lophophora*).
- Mesic.** Characterized by or pertaining to conditions of medium moisture supply.
- Mesocarp.** The middle layer or coat of a fruit.
- Mesophyte.** A plant that grows under medium moisture conditions.
- Micro-** Greek prefix meaning small.
- Micron.** A measure of length used for microscopical measurements, equal to 1/1000 of a millimeter or 1/25,000 of an inch.
- Microphyllous.** Small leaved.
- Micropyle.** The minute orifice in the integuments of an ovule through which the pollen tube enters the seed cavity. *Micropylar:* relating to the micropyle.
- Microsporangium.** The organ in which microspores are produced.
- Microsporoc.** The smaller of the two kinds of spores in Selaginellaceae, etc.
- Microsporophyll.** The modified leaf that bears the microsporangium.
- Microtuberculate.** Minutely tuberculate.
- Midrib.** The central rib of a leaf or other organ.
- Mitriiform.** Shaped like a mitre or cap.
- Monadelphous.** Stamens united by their filaments into a tube surrounding the gynoecium, as in malvaceous flowers.
- Monandrous.** With one stamen.
- Moniliform.** Resembling a string of beads.
- Mono-** In Greek compounds meaning one.
- Monocarpic.** An annual or other plant that flowers but once; composed of one carpel only.
- Monocephalous.** Bearing only one head.
- Monochasium (-a).** A one-branched cyme, either pure or resulting from the reduction of cymes.
- Monochlamydeous.** Having only one set of floral envelopes.
- Monocotyledon (-ous, -oid).** (Abbr., *Monocot*). A plant having but one cotyledon or seed leaf.
- Monoccius.** Having staminate and pistillate flowers on the same plant but not perfect ones.
- Monomorphic.** Of one form, only, not polymorphic.
- Monopodium.** A stem of a single and continuous axis. *Monopodial* (adj.).
- Monothecal.** Having a single locus or cell.
- Monotypic.** Having a single type or representative, as a genus with only one species.
- Monstrosity.** Some conformation deviating from the usual and natural structure.
- Montane.** Pertaining to or living in mountains.
- Mucilaginous.** Slimy, composed of mucilage.
- Mucro, mucronation.** A small and short abrupt tip of an organ, as the projection of the midrib of a leaf. *Mucronate:* with a mucro. *Mucronulate:* minutely mucronate.
- Multi-** Latin prefix for many.
- Multicipital.** Descriptive of a crown of roots or a caudex from which several stems arise.
- Multifid.** Cleft into many narrow lobes or segments.
- Multiflorous (-ate).** Many flowered.
- Muricate, murication.** Rough with short and firm sharp excrescences. *Muriculate:* the diminutive.
- Mutation.** A sudden variation, the offspring differing from its parents in some well-marked character or characters.
- Muticous.** Pointless, blunt, awnless.
- Naked.** With a usual covering wanting, as a flower destitute of a perianth.
- Napiform.** Turnip-shaped.
- Nascent.** In the act of being formed.
- Naturalized.** Of foreign origin, but established and reproducing itself as though a native.
- Navicular.** Cymbiform; boat-shaped; shaped like the bow of a canoe.
- Necrotic.** Affected with, characterized by, or producing, necrosis.
- Nectary.** The organ in which nectar is secreted, formerly applied to any anomalous part of a flower, as its spurred petal. *Nectariferous:* nectar-bearing; having a nectary, or an organ which secretes nectar.
- Needle(s).** Stiff, linear leaves as in Pinaceae.
- Neotentially.** A prolongation in reaching maturity.
- Nerve.** A simple vein or slender rib of a leaf or bract. *Nerved, nervature:* with nerves. *Nervelet:* an ultimate branch of a nerve. *Nervation:* the manner in which the foliar nerves or veins are arranged.
- Neuter.** Sexless, as a flower that has neither stamens nor gynoecium. *Neutral:* devoid of functional stamens or gynoecium.
- Nigrescent.** Turning black.
- Nitid.** Smooth and clear, lustrous, glittering.

- Nocturnal.** Occurring at night or lasting for one night only, as night-blooming.
- Node.** The joint of a stem; the point of insertion of a leaf or leaves.
- Nodding.** Hanging down. Cf. *Pendent*.
- Nodifrond.** Bearing fronds or foliage at the node.
- Nodose.** Furnished with knots or knobby nodes. *Nodulose*: the diminutive.
- Novaculite.** A very hard, fine-grained siliceous rock of possible sedimentary origin.
- Nut.** A hard-shelled and one-seeded indehiscent fruit derived from a simple or compound ovary.
- Nutant.** Nodding.
- Nutlet.** Diminutive of nut; applied to any small and dry nutlike fruit or seed. Thicker-walled than an achene.
- Ob-** Latin prefix signifying the reverse or contrariwise.
- Obcompressed.** Flattened the other way, anteroposteriorly instead of laterally, opposite of the usual way.
- Obconic.** Inversely conical, with the point of attachment at the small end.
- Obcordate.** Inversely cordate, the notch at the apex.
- Obdeltoid.** Inversely deltoid.
- Obdiplostemonous.** Where the stamens are double the number of the petals to which the outer series are opposite.
- Oblanceolate.** Inversely lanceolate.
- Oblate.** Flattened at the poles.
- Obligate.** Necessary, essential; the reverse of facultative.
- Oblique.** Of unequal sides (as in leaves), slanting.
- Oblong.** Much longer than broad with nearly parallel sides.
- Obovate.** Inversely ovate.
- Obovoid.** Inversely ovoid.
- Obreniform.** Inversely reniform.
- Obsolete.** Rudimentary or not evident; applied to an organ that is almost entirely suppressed; vestigial. *Obsolescent*: becoming rudimentary or extinct.
- Obtuse.** Blunt or rounded at the end.
- Ocellate.** With a circular patch of color.
- Ochraceous.** Ochre-colored, yellow with a tinge of red.
- Ocrea (-ae).** A sheath around the stem derived from the leaf stipules; used chiefly in the Polygonaceae.
- Ocreola (-ae).** The smaller or secondary sheaths, as in the inflorescences of *Polygonum*.
- Ochroleucous.** Yellowish-white, buff.
- Odd-pinnate.** With a terminal leaflet; imparipinnate.
- Odd-pinnatifid.** Pinnately cleft, with an unpaired terminal leaflet and the lateral leaflets without a distinct petiolule and the rachis winged between them.
- Offsets.** Short basal lateral shoots from which new plants can develop.
- Olivaceous.** Olive green, olive-colored.
- Opaque.** Dull; neither shining nor translucent.
- Operculum.** A lid. *Operculate*: furnished with a lid.
- Opposite.** Set against, as leaves when two at a node; one part before another, as a stamen in front of a petal.
- Oppositifolious.** With opposite leaves.
- Orbicular, orbiculate.** Approximately circular in outline.
- Orifice.** The mouthlike opening of a tubular corolla at the junction of limb and throat or tube.
- Orthotropous** (ovule or seed). Erect, straight, with the micropyle at the apex and the hilum at the base.
- Oval.** Broadly elliptic.
- Ovary.** The part of the pistil that contains the ovules.
- Ovate.** With the outline of an hen's egg in longitudinal section, the broader end downward.
- Ovoid.** Solid ovate or solid oval.
- Ovule.** The megasporangium of a seed plant; the body in the ovary which becomes a seed. *Ovulate, ovuliferous*: bearing ovules.
- Palate.** In personate corollas, the projecting part of the lower lip, which closes the throat, as in the snapdragon.
- Palea (-æ), pale.** One of the chafflike scales on the receptacle of many Compositae; the inner bract of a grass floret, often partly invested by the lemma. *Paleaceous*: chaffy; composed of small membranaceous scales. *Paleiform*: resembling or of the shape of palea.
- Pallid.** Pale.
- Palmate.** Hand-shaped with the fingers spread; in a leaf, having the lobes or divisions radiating from a common point.
- Palmatifid.** Cleft so as to resemble the outstretched fingers of the hand. *Palmatisect*: palmately divided.
- Paludal.** Pertaining to marshes, wet all through the year.
- Palustrine.** Of or pertaining to marshes.
- Pandurate, panduriform.** Fiddle-shaped; obovate and with a contraction on each side.
- Panicle.** A compound racemose inflorescence. *Paniculate*: borne in a panicle. *Paniculiform*: panicle-shaped.
- Pannose.** Feltlike in texture or appearance.
- Papilionaceous.** Applied to the butterflylike corolla of the pea, with banner, wings, and keel.
- Papilla (-ae).** A minute nipple-shaped projection. *Papillate, papillose*: bearing minute conical processes, or papillae. *Papillary*: resembling papilla. *Pappilliform*: shaped like a papilla.
- Pappose.** Pappus-bearing.
- Pappus.** The modified calyx limb in Compositae, consisting of a crown of bristles or scales on the summit of the achene.
- Papule.** A pimple or small pustule.
- Papyraceous.** Papery, white as paper.
- Parabolic.** Ovate-oblong or ovate, obtuse and contracted below the apex (used in reference to a leaf).
- Parallelogramiform.** In the shape of a parallelogram.
- Parasite.** An organism subsisting on another, the host. *Parasitic*: deriving nourishment from another organism.
- Paratype.** A specimen belonging to the original series, but not the type selected by the author.
- Parenchyma.** Soft tissue of cells with unthickened walls, as pith cells.
- Parietal.** Attached to the wall of the ovary, instead of to the axis; said of ovules or a placenta.
- Paripinnate.** See Pinnate.
- Parted, partite.** Deeply cleft nearly to the base.
- Parthenogenetic.** Developing without fertilization.
- Particolored.** Colored with different tints, variegated.
- Patelliform.** Disk-shaped.
- Patent.** Spreading. *Patulous*: standing open, spreading.
- Pauci-** A prefix used in combination to denote few.
- Pectinate.** With narrow closely set divisions like the teeth of a comb.
- Pedate.** Palmate, with the lateral lobes 2-cleft; said of leaves.
- Pedicel.** The stalk of a single flower in a flower cluster or of a spikelet in grasses. *Pedicelled,*

- pedicellary, pedicellate*: having a pedicel, as opposed to sessile.
- Peduncle*. The general term for the stalk of a flower or a cluster of flowers. *Pedunculata, peduncular*: having a peduncle. *Pedunculiform*: in the form of a peduncle.
- Pellicle*. A thin skin or filmy covering.
- Pellucid*. Transparent, clear.
- Peltate*. Shield-shaped; a flat body having the stalk attached to the lower surface instead of at the base or margin, as the petiole attachment to the blade of some species of *Hydrocotyle*.
- Pendent, pendulous*. Suspended or hanging, as an ovule that hangs from the side of the locule; nodding.
- Penicillate*. Ending in a tuft of fine hairs.
- Penninerved*. Pinnately veined or nerved.
- Pentagonal*. Having 5 angles or sides.
- Pentamerous*. With parts of fives, as a corolla of five petals.
- Penultimate*. The last but one of a series.
- Pepo*. A gourd fruit, with hard rind, one-loculed, many-seeded, derived from an inferior ovary.
- Percurrent*. Extending throughout the entire length.
- Perdurant*. Very long lasting.
- Perennate*. Lasting the whole year through.
- Perennial*. Lasting from year to year.
- Perfect*. A flower having both stamens and pistils.
- Perfoliate*. With the leaf entirely surrounding the stem, or with 2 leaves basally united around the stem.
- Perianth*. The floral envelopes collectively; usually used when calyx and corolla are not clearly differentiated.
- Pericarp*. The ripened walls of the ovary, referring to a fruit. *Pericarpial*: in reference to, or like, a pericarp.
- Perigonium*. A perianth.
- Perigyntum (-a)*. The inflated saclike organ surrounding the pistil in *Carex*.
- Perigynous*. Borne around the ovary in contrast to beneath it, as the stamens and corolla are inserted on the floral tube.
- Periphery, Peripheral*. On or near the margin.
- Perisperm*. The nutritive tissue surrounding the embryo of the seed and formed outside the embryo sac.
- Persistent*. Remaining attached, as a calyx on the fruit.
- Personate*. A bilabiate corolla having the throat nearly closed by a prominent palate.
- Petal*. One of the leaves of a corolla, usually colored. *Petaline*: pertaining to a petal; attached to, or resembling a petal. *Petaloid*: having the aspect of or colored as petals. *Petalifcrous*: bearing petals.
- Petiole*. A leaf stalk. *Petiolate*: having a petiole. *Petiolar*: borne on or pertaining to a petiole. *Petioliform*: resembling a petiole in shape.
- Petiolule*. The stalk of a leaflet. *Petiolulate*: having a small petiole; having petiolules of leaflets.
- Phalange*. A bundle of stamens in diadelphous and polyadelphous flowers.
- Phenotype*. A group of individuals of similar appearance but not necessarily of similar genetic constitution.
- Phloem*. The tissue that conducts food in a plant.
- Photosynthesis*. The manufacture of carbohydrates within green leaves by energy derived from light, from simple organic materials such as carbon dioxide and water.
- Phyllary*. An individual bract of the involucre of a member of the Compositae.
- Phyllode, phyllodia*. A dilated petiole serving as a leaf blade.
- Phyllopodic*. With a leafy base.
- Phyllotaxy*. Leaf arrangement.
- Phylogeny*. The race history of a plant or natural group; relationship by descent; ancestral history deduced from development.
- Phylum*. A primary division of the plant kingdom.
- Pilose*. Bearing soft and straight spreading hairs.
- Pilosulous (-ose)*: the diminutive. *Pilosity*: hairiness.
- Pinna (-ae)*. A leaflet or primary division of a pinnate leaf.
- Pinnate*. A compound leaf, having the leaflets arranged on each side of a common petiole; featherlike. *Odd-pinnate*: pinnate with a single terminal leaflet (imparipinnate). *Abruptly pinnate*: pinnate without an odd terminal leaflet (paripinnate).
- Pinnatifid*. Pinnately cleft into narrow lobes not reaching to the midrib.
- Pinnatisect, pinnatipartite*. Pinnately divided to the midrib.
- Pinnule*. A division of a pinna.
- Pistil*. The ovule-bearing organ of a flower, consisting of stigma and ovary, usually with a style between.
- Pistillate*. Provided with pistils and without stamens; female.
- Pistillode, pistillodium*. A rudimentary pistil.
- Pith*. The spongy center of an exogenous stem.
- Pitted*. Having little depressions of pits; foveate.
- Placenta (-ae)*. The ovule-bearing surface in the ovary. *Placental*: a placenta that is long and narrow and bears many ovules. *Placentation*: the arrangement or orientation of the placentas.
- Plait*. A fold, like those of a fan. *Plaited*: pliated, folded.
- Plane*. Surface flat and even, not curved.
- Plano-*. A combining form to denote plane or flat.
- Plano-convex*. Flat on one side and convex on the other.
- Plate (-d)*. A flattened structure.
- Pleat*. A fold. *Pleated*: folded.
- Pleiochastum*. Each relative main axis of a cyme producing more than two branches. *Pleiochasial* (adj.)
- Plexus*. A network.
- Plicate*. Plaited; folded as a fan. *Plicatulate*: the diminutive of plicate.
- Plumbeous*. Lead-colored.
- Plumose*. Feathery; having fine hairs on each side as a plume.
- Plumule*. The primary leaf bud of an embryo.
- Pluriloculate*. Many-celled.
- Pod*. Any dry dehiscent fruit; specifically a legume.
- Podium*. A foot stalk or similar support.
- Pollen*. The male fecundating spores found in the anther.
- Pollen tube*. The tube emitted by a pollen grain passing down from the stigma to the ovary and ovules.
- Pollination*. The placing of the pollen on the stigma or stigmatic surface.
- Pollinia*. The pollen masses of the orchids and milkweeds.
- Polliniferous*: Pollen-bearing.
- Polygamo-dioecious*. Polygamous but chiefly dioecious.
- Polygamo-monoecious*. Polygamous but chiefly monoecious.
- Polygamous*. Bearing unisexual and bisexual flowers on the same plant.
- Polymorphous, polymorphic*. Of various forms.
- Polypetalous*. With many distinct petals.
- PolypHYllous*. Having many leaves.
- Polyploid*. Having a chromosome number that is a multiple of a basic number for a group of forms. *Polyploid series*: examples— $2n = 8$ (diploid), 16 (tetraploid), 24 (hexaploid), 32

- (octoploid), etc. *Polyplloid complex*: intimately related members of a polyplloid series.
- Polystichous*. In several vertical rows or ranks.
- Polytypic*. Having several or many types or representatives.
- Pome*. An applelike fruit.
- Porcelaneous*. With the appearance of, or resembling, porcelain.
- Pore*. A small aperture, as in some anthers for the emission of pollen. *Porose*: with small holes or pores. *Porulus* (-ose): somewhat porous.
- Porticidal*. Opening by pores.
- Porrect*. Directed outward and forward; vertical to the substratum.
- Posterior*. On the side toward the axis; the upper side of the flower.
- Postero-lateral*. Situated back and at the side.
- Praemorse*. As it were, bitten off; said of roots.
- Precocious*. Flowering before the appearance of the leaves.
- Prefloration*. Cf. *Aestivation*.
- Prehensile*. Clasping or grasping, as in tendrils.
- Prickle*. Sharp outgrowth of the bark or epidermis. *Prickly*: armed with prickles, as the rose.
- Primary*. First in order of time or development.
- Primocane*. The first year's cane (usually without flowers) of *Rubus* and similar genera.
- Primordia*. A member or organ in its earliest condition. *Primordial*: first in order of appearance.
- Prismatic*. Of the shape of a prism.
- Process*. Any projecting appendage.
- Procumbent*. Trailing on the ground, but not rooting.
- Prolate*. Drawn out towards the poles.
- Proliferous*. Bearing offsets, bulbils, or other vegetative progeny; abnormal or redundant development, as when a leafy shoot develops from a flower part. *Proliferate*: to develop prolificously.
- Prolification*. The production of terminal or lateral leaf buds in a flower.
- Prominent*. Standing out beyond some other part.
- Prophyllum* (-a). The bracteole at the base of an individual flower, as in *Juncus*; a membranous structure between a branch and the main stem in Gramineae.
- Prostrate*. Lying flat upon the ground.
- Protandrous*. With anthers maturing before the pistils in the same flower.
- Proterandrous*. Shedding the pollen before the stigma of the flower is receptive. *Proterogynous*: having the stigma receptive before the stamens of the flower mature.
- Prothallium* (-a). A cellular, usually flat and thalluslike growth, resulting from the germination of a spore, upon which are developed sexual organs or new plants.
- Prototype*. The assumed ancestral form from which the descendants have become modified.
- Protracted*. Long drawn out.
- Protuberance*. A protrusion or bulge such as a bump or swelling.
- Proximal*. Nearest the axis or base, as contrasted with distal.
- Pruinose*. Covered with a coarse waxy powder, more pronounced than when glaucous.
- Pseudo-*. A Greek combining form to denote false.
- Pseudobulb*. The thickened or bulb-formed stem of certain orchids, the part being solid and borne above ground.
- Pteridologist*. A student of ferns.
- Pteridophyta*. The ferns and fern allies.
- Puberulent*. Minutely pubescent. *Puberulous*: slightly hairy.
- Pubescent, pubescence*. Covered with short soft hairs; downy.
- Pulp*. The juicy or fleshy tissue of a fruit.
- Pulverulent, pulveraceous*. Dusted as with fine powder.
- Pulvinate*. Cushion-shaped.
- Pulvinus* (-i). A swelling close under the insertion of a leaf; the swollen base of a petiole.
- Punctate*. Dotted with punctures or with translucent pitted glands or with colored dots. *Puncticulate* (-ose): the diminutive. *Punctiform*: in the form of a point or dot. *Punctation*: a minute spot or depression.
- Pungent*. Ending in a rigid, sharp point or prickle; acrid (to the taste or smell).
- Purpurascens*. Becoming or turning purple.
- Pustular*. Having slight elevations like blisters. *Pustulate*: bearing blisterlike swellings or pustules; mostly at the base of hairs. *Pustule*: a pimple or blister. *Pustulose*: blistery or pimply.
- Putamen*. The shell of a nut; the hardened endocarp of stone fruits.
- Pyramidal*. Pyramid-shaped.
- Pyrene*. Nutlet, particularly that in a drupe.
- Pyriform*. Pear-shaped.
- Quadrante, quadrangular*. Square.
- Quadri-*. Latin prefix signifying four.
- Quadrifid*. Divided into four parts to about or below the middle.
- Quadrilateral*. Four-sided.
- Quinquefoliolate*. With five leaflets.
- Raceme*. A simple, elongated, indeterminate inflorescence with each flower subequally pedicelled. *Racemelets*: the diminutive. *Racemiform, racemose*: of the nature or shape of a raceme or in racemes.
- Rachilla*. A small rachis, specifically the axis of a grass spikelet; the diminutive rachis in *Schrankia*.
- Rachis*. The axis of a spike or raceme, or of a compound leaf.
- Radial*. Belong to the ray, as in the flowers of Compositae.
- Radiant*. Radiating as from a center.
- Radiate*. Spreading from or arranged around a common center; bearing rays.
- Radical*. Belonging to or proceeding from the root.
- Radicant*. Rooting, usually applied to stems or leaves.
- Radicle*. That portion of the embryo below the cotyledons.
- Radius* (-i). The ray of the Compositae, the outermost florets when distinct in form from those composing the disk; a partial umbel in Umbelliferae; the structures known as the medullary rays; also the radiating branches of a stellate trichome.
- Rameal*. Belonging to a branch.
- Ramentum* (-a). Thin chaffy scales of the epidermis, as the scales of many ferns.
- Ramose*. Branching or branch. *Ramulose*: with many branchlets.
- Raphe*. The ridge connecting the two ends of an anatropous ovule. *Raphal*: relating to the raphe.
- Raphides*. Needle-shaped crystals in the cells of plants. *Raphidulous*: pertaining to or with raphides.
- Ray*. A primary branch of an umbel; the ligule of a ray floret in Compositae, the ray florets being marginal and differentiated from the disk florets.
- Receptacle*. That portion of the floral axis upon which the flower parts are borne, or, in Compositae, that which bears the florets in the head. *Receptacular*: pertaining to the receptacle or attached to the receptacle.

- Reclined, reclinate.* Turned downward, with the tip resting on the ground.
- Recumbent.* Leaning, reclining, lying.
- Recurved.* Bent backwards; curved downward or backward.
- Reduplicate.* Doubled back; a term of aestivation in which the edges are valvate and reflexed.
- Reflexed.* Abruptly bent downward.
- Refracted.* Bent sharply from the base backward.
- Regular.* Said of a flower having radial symmetry, with the parts in each series alike.
- Relic.* A species long-surviving, its near relatives having become extinct presumably through environmental crises; relics are sometimes narrowly endemic. *Relict* (adj.)
- Remote.* Distantly spaced.
- Reniform.* Kidney-shaped.
- Repand.* With an undulating margin, less strongly wavy than sinuate.
- Repent.* Creeping (prostrate and rooting).
- Replicate.* Folded backward.
- Replum.* The marginate septum of certain pods that persist after the valves have fallen, as in the fruit of Cruciferae.
- Resaca.* A former course or channel of a stream, commonly water-filled to form narrow oxbow or meandering lakes.
- Resiniferous, resinous.* Producing resin.
- Resupinate.* Upside down, inverted by the twisting of the pedicel, as the flowers of orchids.
- Reticulate.* With a network; net-veined.
- Reticulum.* A membrane of cross-fibers found in palms at the base of the petiole.
- Retinaculum.* The gland to which one or more pollinia are attached in orchids; in the Asclepiadaceae a horny elastic body to which the pollen masses are fixed; in most Acanthaceae the funiculus which is curved like a hook and retains the seed until mature.
- Retrogression.* Reversion or development towards simpler organization.
- Retorse.* Bent backward or downward.
- Retuse.* Notched shallowly at a rounded apex.
- Revolute.* Rolled backward from both margins, i.e., toward the underside.
- Rhizoid.* A filamentous rootlike structure on the gametophyte of ferns.
- Rhizome.* An underground stem or rootstock, with scales at the nodes and producing leafy shoots on the upper side and roots on the lower side.
- Rhizomatous:* having a rhizome. *Rhizomatiform:* resembling a rhizome in shape.
- Rhizophore.* A specialized structure in *Selaginella* emitting roots.
- Rhombic.* Somewhat diamond-shaped. *Rhombiform:* rhomb-shaped. *Rhomboidal:* a solid with a rhombic outline.
- Rib.* The primary vein of a leaf, or a ridge on a fruit. *Ribbed:* with prominent ribs.
- Ringent.* Gaping, as the mouth of an open-throated bilabiate corolla.
- Rootcap.* Large cells that form a caplike covering for the smaller cells in rear (growing point).
- Rootstock.* See *Rhizome*.
- Rosaceous.* Rose-color, pink; belonging to or resembling the genus *Rosa*.
- Roseate.* Tinged with rose-color.
- Rosette.* A crowded cluster of radiating leaves appearing to rise from the ground.
- Rostellum.* A little beak; a slender extension from the upper edge of the stigma in orchids.
- Rostrate.* Beaked. *Rostellate:* the diminutive.
- Rostrum.* Any beaklike extension; the inner segment of the coronal lobes in Asclepiads.
- Rosulate.* In the form of a rosette.
- Rotate.* Wheel-shaped; said of a sympetalous corolla with obsolete tube and with a flat and circular limb.
- Rotund.* Rounded in outline.
- Rubellous.* Reddish. *Rubescens:* turning red.
- Ruderal.* Weedy; growing in waste places.
- Rudiment.* An imperfectly developed organ or part. *Rudimentary:* imperfectly developed; vestigial; arrested in an early stage of development.
- Rufous.* Reddish-brown. *Rufescent:* becoming reddish-brown.
- Ruga (-e).* A wrinkle or fold. *Rugose:* wrinkled. *Rugulose:* the diminutive of rugose.
- Ruminant.* Having a chewed or "wadded-up" appearance (as in "ruminant endosperm").
- Runcinate.* Sharply pinnatifid or incised, the lobes pointing downward.
- Runner.* A slender trailing stem rooting at the nodes or end; a very slender stolon.
- Russet.* Reddish-brown.
- Sac.* The cavity of an anther; a pouch or bag. *Saccate:* furnished with a sac or pouch.
- Saccharine.* Sugary; sweet.
- Sagittate.* Shaped as an arrowhead, with the basal lobes turned downward. Cf. *hastate*. *Sagittiform:* arrow-shaped.
- Salient.* Projecting forward.
- Saline.* Of or pertaining to salt; growing in salt marshes.
- Salverform.* A corolla with slender tube abruptly expanding into a flat limb.
- Samara.* An indehiscent winged fruit.
- Saponaceous.* Soapy, slippery to the touch. *Saponifying:* to convert into soapiness.
- Saprophyte.* A plant living on dead organic matter and hence without chlorophyll. *Saprophytic:* state of subsisting on humus or similar material.
- Sap wood.* The new wood in an exogenous tree, so long as it is pervious to the flow of water; the albumum.
- Sarmentose.* Bearing long slender prostrate runners.
- Saxicolous.* Growing on rocks, as ferns, etc.
- Scaberulo-ciliolate.* With minute rough hairs.
- Scabrous.* Rough to the touch, owing to the structure of the epidermis or to the presence of short stiff hairs. *Scabrid:* somewhat rough. *Scabrellate, scaberulous:* minutely roughened. *Scabridulous:* slightly rough. *Scabrate:* made rough or roughened.
- Scalariform.* Ladderlike.
- Scale.* Any thin scarious bract; usually a vestigial leaf. *Scalelet:* a diminutive of scale. *Scaly:* squamose; scarious.
- Scalloped.* Crenate.
- Scandent.* Climbing in any manner.
- Scap.* A leafless peduncle rising from the ground in acaulescent plants. *Scapiform, scapose:* resembling or bearing a scape.
- Scap.* Leafless peduncle arising from the ground that may bear scales or bracts but not foliage leaves and may be one- or many-flowered. *Scapiform:* resembling a scape. *Scapose:* bearing or resembling a scape.
- Scarious.* Thin, dry, and membranaceous, not green.
- Schizocarp.* A pericarp that splits into 1-seeded portions, mericarps.
- Sclerenchymatous* (tissue). Composed of thick-walled cells.
- Sclerotic.* Hardened; stony in texture.
- Scobicular.* In fine grains like sawdust.
- Scoparioid.* Resembling a broom.
- Scorpioid.* Said of a unilateral inflorescence circinnately coiled in the bud.

- Scrobiculate.** Marked by minute or shallow depressions.
- Scrub.** Stunted or densely packed bushes; stunted due to want of water, with strong transpiration.
- Scurfy.** Clothed with small branlike scales; furfuraceous.
- Scutellum (-a).** Any of several small shield-shaped parts or organs; the first leaf in a grass embryo attached at the basal node of the mesocotyl and serving as a food storage organ.
- Secondary.** Not primary, subordinate.
- Secund.** Arranged on one side only; unilateral.
- Seed.** The ripened ovule.
- Seep (s).** A moist spot where underground water comes to or near the surface.
- Segment.** A division or part of a leaf or other organ that is cleft or divided but not truly compound.
- Seleniferous.** Containing or yielding selenium.
- Self-fertile.** Capable of self-pollination.
- Self-incompatible.** Incapable of self-fertilization.
- Semi-** A prefix meaning half.
- Seminiferous.** Seed-bearing; used for the special portion of the pericarp bearing the seeds.
- Sepal.** A leaf or segment of the calyx. **Sepaline:** relating to or resembling sepals. **Sepaloid:** sepal-like.
- Septicidal.** Dehiscence of a capsule through the septa and between the locules.
- Septifragal.** With the valves breaking away from the dissepiments in dehiscence.
- Septum (-a).** A partition between cavities. **Septate:** divided by partitions or septa.
- Seriatic, serial.** Disposed in series of rows.
- Sericeous.** Silky; clothed with appressed fine and straight hairs.
- Serotinous.** Produced or occurring late in the season.
- Serrate.** Saw-toothed, the sharp teeth pointing forward. **Serrature:** the toothing of a serrate leaf. **Serrulate:** finely serrate.
- Sessile.** Attached directly by the base; not stalked, as a leaf without petiole.
- Seta (-ae).** A bristle, or a rigid, sharp-pointed, bristlelike organ. **Setaceous, setose:** clothed with bristles, bristly or bristlelike. **Sctiferous, sctigerous:** bristle-bearing. **Setiform:** in the shape of a bristle. **Setulose:** bearing minute bristles.
- Several.** Fewer than many, perhaps 6 to 8 or 10.
- Shaft.** Used for the flowering stalk in *Agave*.
- Sheath.** The tubular basal part of the leaf that encloses the stem, as in grasses and sedges; the composite bracts or scales that surround the individual bundles of pine needles (leaves). **Sheathing:** enclosed as by a sheath, vaginate.
- Shoulder.** In *Yucca* that part of the ovary that rather abruptly curves inward toward the style; used for similar conditions in other plant organs.
- Shrub.** A woody plant of smaller proportions than a tree, which usually produces several branches from the base.
- Sigmoid.** Doubly curved, like the letter S.
- Silica (Silex).** Silicon dioxide; a white or colorless, very hard crystalline mineral substance. **Siliceous:** pertaining to silica.
- Siliqua.** A narrow many-seeded capsule of the Cruciferae, with 2 valves splitting from the bottom and leaving the placentae with the false partition (replum) between them. **Silicle:** a short siliqua, not much longer than wide.
- Silky.** See sericeous.
- Simple.** Unbranched, as a stem or hair; uncompounded, as a leaf; single, as a pistil of one carpel.
- Sinistrorse.** Directed toward the left.
- Sinuate, sinuous.** With a strongly wavy margin. Cf. *Repand*.
- Sinus.** The cleft or recess between two lobes of an expanded organ such as a leaf.
- Slough.** A wet place or deep mud or mire; a sluggish channel.
- Smooth.** Not rough to the touch; cf. *glabrous*, without hairs, which may be either smooth or scabrous.
- Solitary.** Borne singly.
- Sordid.** Of a dull or dirty hue.
- Soriferous.** Bearing sori.
- Sorus (-i).** A fruit dot, or cluster, on the back of the fronds of ferns.
- Spadix (-ices).** A spike on a succulent axis enveloped in a spathe.
- Spathe.** A broad sheathing bract enclosing a spadix, as in the calla. **Spathaceous:** resembling or having a spathe. **Spathiform:** having the shape of a spathe.
- Spatulate.** Like a spatula, a knife rounded above and gradually narrowed to the base.
- Species.** The aggregate of all those individuals that have the same distinctive characters.
- Spermatozoid.** A ciliated motile male gamete produced within an antheridium.
- Sphacelate.** Dark and withered as though dead.
- Spherical.** Globular, orbicular.
- Spicate.** Having the form of or arranged in a spike. **Spiciform:** spikelike.
- Spike.** An elongated rachis of sessile flowers or spikelets. **Spikelct:** a secondary spike; the ultimate flower cluster in grasses, consisting of two glumes and one or more florets, and in sedges. **Spicule:** a diminutive or secondary spike.
- Spine.** A sharp-pointed, stiff, woody body, arising from below the epidermis; commonly the counterpart of a leaf or stipule, cf. *prickle*. **Spinescent:** more or less spiny, spine-tipped. **Spiniferous:** bearing spines. **Spinous, spinose:** bearing spines. **Spinulose:** bearing diminutive spines.
- Spongiose.** Spongy, soft.
- Sporangium.** A spore case or sac.
- Spore.** The reproductive body of pteridophytes and lower plants, analogous to the seed. **Sporeling:** a young plant from germinated spore. **Sporiferous:** spore-bearing. **Sporogenous:** producing spores.
- Sporocarp.** A receptacle containing sporangia or spores.
- Sporophyll.** A spore-bearing leaf.
- Sporophyte.** The asexual or diploid generation of ferns and their allies, the fern plant itself.
- Spreading.** Diverging almost to the horizontal; nearly prostrate. **Spreading hairs:** not at all appressed, but erect. **Spreading lower lip:** diverging from the main axis of the flower.
- Spur.** A slender, saclike, nectariferous process from a petal or sepal.
- Squama (-æ).** A scale, usually the homolog of a leaf. **Squamella (-æ):** diminutive squama, applied to some types of pappus in Compositae. **Squamellate:** like a little scale. **Squamiform:** scalelike. **Squamose, squamate:** covered with scales; scaly. **Squamulose:** provided with small scales.
- Squarrose.** Spreading rigidly at right angles or more, as the tips of bracts.
- Stalk.** The stem of any organ, as the petiole, peduncle, pedicel, filament, culm or stipe.
- Stamen.** The male organ of the flower, which bears the pollen.
- Staminate, staminal.** Having stamens but not pistils; said of a flower or plant that is male, hence not seed-bearing.
- Staminiferous.** Stamen-bearing.
- Staminode (-ia, -ium).** A sterile stamen (not pro-

- ducing viable pollen) or what corresponds to a stamen.
- Standard.** The upper petal of a papilionaceous flower.
- Stele.** The portion of an axis or stem containing the vascular tissue.
- Stellate.** Star-shaped. **Stellular, stellulate:** resembling a little star or stars.
- Stem.** The axis or axes of a plant arising from its roots.
- Sterile.** Infertile or barren, as a stamen lacking an anther, a flower wanting a pistil, a seed without an embryo, etc.
- Stigma.** The receptive part of the pistil on which the pollen germinates. **Stigmatal, stigmatic:** pertaining to the stigma. **Stigmatose:** provided with stigmas or having them conspicuous. **Stigmatiferous:** stigma-bearing.
- Stipe.** The leaf stalk of a fern; the stalk beneath an ovary. **Stipitate:** having a stipe or stalk, as an elevated gland.
- Stipel.** A minute stipule on a partial petiole of compound leaves. **Stipellate:** furnished with stipels.
- Stipule.** One of the pair of usually foliaceous appendages found at the base of the petiole in many plants. **Stipulate, stipular:** possessing stipules.
- Stolon.** A modified stem bending over and rooting at the tip; or creeping and rooting at the nodes; or a horizontal stem that gives rise to a new plant at its tip. Cf. *Runner*, a very slender stolon, and *Rhizome*, a subterranean stem. **Stoloniferous:** having stolons. **Stoloniform:** having the form of stolons, stolonlike.
- Stomate.** A breathing pore or aperture in the epidermis. **Stomatiferous:** bearing stomates.
- Stomium.** Line of dehiscence in a fern sporangium.
- Stone.** The bony endocarp of a drupe. **Stone cells:** the individual cells that have become hardened by secondary deposit, the components of sclerogen.
- Stool.** The base of a plant from which offsets or layers are taken; several stems arising from the same root, as in wheat.
- Stramineous.** Straw-colored.
- Striate.** Marked with fine longitudinal lines or furrows. **Striolate:** finely striate.
- Strict.** Very straight and upright, not at all lax or spreading.
- Strigose.** Clothed with sharp and stiff appressed straight hairs. **Strigillose or strigulose:** minutely strigose.
- Strobilus, strobile.** Conelike aggregation of sporophylls. **Strobilaceous:** relating to or resembling a cone.
- Strophiole.** An appendage at the hilum of certain seeds, a caruncle. **Strophiolate:** possessing such appendages.
- Style.** The contracted portion of the pistil between the ovary and the stigma. **Style branches** may be only in part stigmatic, the remainder then being *appendage*. **Stylar:** relating to the style. **Styliferous:** bearing a style.
- Stylopodium.** An enlargement or disklike expansion at the base of the style, as in *Umbelliferae*.
- Sub-** Latin prefix meaning somewhat, almost of inferior rank, beneath.
- Suberose.** Corky in texture.
- Submerged, submersed.** Growing under water.
- Subtend.** To be below and close to, as the leaf subtends the shoot borne in its axil.
- Subterranean, subterraneous.** Underground.
- Subulate.** Awl-shaped. **Subuliferous:** bearing sharp points.
- Succulent.** Juicy; fleshy and soft.
- Sucker.** A shoot of subterranean origin; a haustorium, sometimes restricted to the penetrating organ or papilla.
- Suffrutescent.** Obscurely shrubby; very little woody, but not necessarily low.
- Suffruticose, suffruticulose.** With only the lower parts of the stems woody, the upper stems herbaceous and annual. Cf. *fruticulose*.
- Sulcate.** Longitudinally grooved, furrowed or channeled.
- Sulcus (-i).** A furrow or groove.
- Superimposed.** Cf. *superposed*.
- Superior.** Growing above, as an ovary that is free from the other floral organs.
- Superjacent.** Lying above or upon; overlying; superincumbent.
- Superposed.** Placed vertically over some similar or other part.
- Suprabasal.** Above the base.
- Suculose.** Producing suckers.
- Surficial.** Of or pertaining to a surface, as the face of umbelliferous seeds.
- Suture.** The line of dehiscence of fruits or anthers; the line of a natural union or division between coherent parts.
- Swale.** A moist meadowy area lower than the surrounding areas.
- Symmetrical.** Possessing one or more planes of symmetry (i.e., planes which divide the object into mirror-image halves).
- Sympatric.** Growing together with, or having the same range as.
- Sympetalous.** With petals united in a one-piece corolla; gamopetalous.
- Symphodium.** An apparent main axis formed of successive secondary axes, each of which represents one fork of a dichotomy, the other being much weaker or entirely suppressed. **Symphodial:** of the nature of a symposium.
- Syn-** Greek prefix meaning united; adhesion or growing together.
- Synanthesis.** The simultaneous maturing of stamens and pistils.
- Synanthetic.** A plant whose fruit is compounded of many carpels or whose flowers are regularly coalescent (as in species of *Lonicera*).
- Syncarp.** A multiple or fleshy aggregate fruit, as the mulberry or magnolia.
- Syngenesious.** Belonging to the *Compositae*; with anthers cohering in a ring.
- Synonym.** A systematic name, as for a species, that was superfluous when published, or for some other reason is rejected in favor of another for the same taxon.
- Talus.** Rock debris at the base of a cliff or slope, chiefly as the result of gravitational roll or slide.
- Tangential.** At right angles to the radial or medullary rays.
- Taproot.** A primary stout vertical root giving off small laterals but not dividing.
- Tawny.** Dull-brownish-yellow; fulvous.
- Taxon (pl., taxa).** Any taxonomic unit, as an order, genus, species, variety, etc.
- Taxonomy.** The classification of plants or animals in a systematic order.
- Tectiform.** Rooflike; serving as a cover or lid.
- Tendril.** A slender, coiling or twining organ by which a climbing plant grasps its support.
- Tepal.** Used in the plural for sepals and petals of similar form and not readily differentiated, as in *Amaryllidaceae*.
- Teratology.** The study of malformations and monstrosities. **Teratological** (adj.).
- Terete.** Cylindrical; round in cross section.

- Terminal.** Proceeding from, or belonging to, the end or apex.
- Ternary.** Consisting of threes; trimerous. *Ternate:* in threes, as a leaf consisting of three leaflets.
- Terrestrial.** Growing in the ground and supported by soil.
- Tertiary.** Of the third formation, order or rank.
- Tessellate.** The surface marked by checkered work, either as depressions or color patterns.
- Testa.** The outer seed coat.
- Testiculate.** Shaped like the tubers of some orchids and some didymous fruits.
- Tetra.** A Greek prefix to mean four.
- Tetrad.** A group of four similar objects, as the four pollen grains formed from one pollen mother cell, often remaining coalescent.
- Tetradynamous.** Having four long and two short stamens.
- Tetragonal, tetragonous.** Four-angled.
- Tetramerous.** Having the floral organs in fours or multiples of four.
- Tetraploid.** Having four basic chromosome sets (four times the gametic number).
- Thallus.** A flat leaflike organ; used sometimes for entire plant in Lemnaceae.
- Theca (-ae).** An anther; the loculus of an anther.
- Thorn.** Cf. *Spine*, but technically a sharp-pointed stiff woody body derived from a modified branch.
- Throat.** The orifice of a gamopetalous corolla; the expanded portion between the limb and the tube proper.
- Thyrse, thyrus (-i).** A compact, ovate panicle; strictly, with main axis indeterminate, but with other axes cymose. *Thyrsiform:* shaped like a thyrse. *Thyrsoid:* like a thyrse.
- Tomentose.** With tomentum; covered with a rather short, densely matted, soft white wool. *Tomentulose:* the diminutive. *Tomentum:* a covering of such densely matted woolly hairs.
- Tooth.** Any small marginal lobe. *Toothed:* dentate.
- Topotype.** A specimen of a named species from the original or type locality.
- Torose.** Cylindrical with alternate swellings and constrictions, as a rhizome. *Torulose:* the diminutive.
- Tortile.** Twisted or twining.
- Tortuous.** Bent or twisted in different directions.
- Torus.** Cf. *Receptacle*.
- Trabecula (-ae).** A cross-bar. *Trabecular:* like a cross-bar. *Trabeculate:* cross-barred.
- Trailing.** Prostrate but not rooting.
- Transection.** Transverse section.
- Translator.** Employed for the retinaculum of the Asclepiadaceae.
- Translucent.** Transparent to light only.
- Trapeziform:** an unsymmetrical four-sided figure, as a trapezium, almost the same as rhombiform. *Trapezoid:* like a trapezium.
- Tree.** A woody plant with one main stem, and at least four or five meters tall.
- Tri-.** A Latin prefix signifying three, thrice, or triply.
- Triadelphous.** Stamens in three sets.
- Triandrous.** Having three stamens.
- Trichome.** Any hairlike outgrowth of the epidermis, as a hair or bristle.
- Trichotomous.** Three-forked.
- Tricoccos.** Consisting of three cocci.
- Tridentate.** Three-toothed.
- Trifid.** Three-cleft to about the middle.
- Trifoliolate.** Having three leaves, as in *Trillium*. *Trifoliolate:* with three leaflets.
- Trifurcate.** Having three forks or branches.
- Trigonous, trigonal.** Three angled, the faces between planes.
- Trilobed, trilobate.** Three-lobed.
- Trilocular.** Three-celled.
- Trimerous.** Having the parts in threes.
- Trimorphic, trimorphous.** Occurring under three forms, of stamens or styles—long, short and intermediate.
- Tripartite.** Three-parted.
- Tripinnate.** Thrice pinnate. *Tripinnatisect:* thrice pinnatisect.
- Triquetrous.** Three-edged, the faces between concave.
- Tristichous.** In three vertical rows.
- Triternate.** Thrice ternate.
- Trulliform.** Shaped like a bricklayer's trowel.
- Truncate.** As if cut off squarely at the end.
- Trunk.** The main stem of a tree; used for the body of the petal in *Drymaria*.
- Tube.** The narrow basal portion of a gamopetalous corolla or a gamosepalous calyx. *Tubiform:* tubular or trumpet-shaped.
- Tuber.** A thickened, solid, and short underground stem, with many buds. *Tuberous, tuberiferous:* bearing a tuber; resembling a tuber. *Tuberiform:* shaped like a tuber. *Tuberoid:* said of a fleshy-thickened root, resembling a tuber, as in many terrestrial orchids.
- Tubercle.** A small tuberlike prominence or nodule; the persistent base of the style in some Cyperaceae. *Tubercled, tuberculate:* beset with tubercles or warty excrescences; verrucose. *Tuberculose:* consisting of or having tubercles.
- Tubillus.** The tube of the filaments in Compositae; the elongate stylelike inner bracts of the ovule integument in *Ephedra*.
- Tubular, tubiform.** Shaped like a hollow cylinder.
- Tuft, tufted.** Cespitose, clustered or clumped.
- Tumid.** Inflated, swollen.
- Tunicate, tunicated.** Having coats or tunics, as a bulb.
- Turbinate.** Top-shaped; inversely conical.
- Turgid.** Swollen; inflated.
- Turion.** A scaly, often thick and fleshy, shoot produced from a bud on an underground rootstock, as in some species of *Potamogeton*.
- Tylose.** A cell intruding into a duct.
- Type.** A nomenclatural type is that constituent element of a taxon to which the name of the taxon is permanently attached, whether as an accepted name or as a synonym.
- Type specimen.** The original specimen from which a description was written, at least in part.
- Umbel.** A flat or convex flower cluster in which the pedicels arise from a common point, like rays of an umbrella. *Umbellate:* borne in an umbel. *Umbellet:* a secondary umbel. *Umbelliferous:* bearing umbels. *Umbelliform:* umbel-shaped. *Umbellule:* an ultimate umbel in a compound one.
- Umber.** Brown with a reddish hue.
- Umbilicus.** A navel; the hilum of a seed. *Umbilicate:* depressed in the center.
- Umbo, umbone.** A boss or protuberance. *Umbonate:* bearing an umbo or boss or conical projection in the center, as the scale of a pine cone.
- Umbracliform.** Having the general form of a parasol, as the stigmas of *Sarracenia*.
- Uncinate.** Hooked at the tip. *Uncinulate:* the diminutive.
- Undershrub.** A very low shrub.
- Undulate.** Wavy; repand; with less pronounced "waves" than sinuate.
- Unguiculate.** Contracted at base into a claw.
- Uni-.** A prefix, meaning one.
- Uniflorous.** One-flowered.
- Unifoliolate.** One leaf. *Unifoliolate:* with one leaflet only.

- Unilateral.** One-sided, or turned to one side of an axis; secund.
- Unilocular.** Having one locule or cell.
- Uniseriate.** Arranged in one horizontal row.
- Unisexual.** Flowers having only stamens or pistils; of one sex.
- Urceolate.** Urn-shaped or pitcherlike, contracted at the mouth.
- Utricle.** A small, bladderlike one-seeded fruit. *Utricular:* having little bladders; inflated.
- Vaginate.** Loosely surrounded by a sheath. *Vaginiform:* sheath-shaped.
- Valve.** One of the segments into which a dehiscent capsule or legume separates. *Valvate, valvular:* opening as if by valves, as most capsules and some anthers; in aestivation, meeting at the edges without overlapping.
- Varicose.** Abnormally enlarged in places, irregularly swollen.
- Variegated.** Irregularly colored in patches, blotched.
- Variety.** Plants having minor characters or variations that separate them from one or more similarly characterized varieties.
- Vascular.** Provided with conducting cells such as vessels, sieve tubes or tracheids.
- Vegetative, vegetal:** having the power to grow—as stems and leaves—opposed to growth from reproduction.
- Vein.** A vascular bundle of a leaf or other flat organ, cf. *nerve*. *Veinlet:* one of the ultimate branches of a vein.
- Velum.** The membranous indusium in *Isoetes*.
- Velutinous.** Velvety; covered with a fine and dense silky pubescence.
- Venation.** The arrangement of the veins of a leaf; nervation; veining. *Venose:* veiny, abounding in veins. *Venulose:* abounding in veinlets.
- Venter.** Belly; under part.
- Ventral.** Relating to the inward face of an organ, in relation to the axis; anterior; front; opposed to dorsal.
- Ventricose.** Inflated or swelling out on one side or unequally; gibbous.
- Verdigris.** The sea-green "rust" of brass.
- Vermicular, vermiform.** Worm-shaped or wormlike. *Vermiculate:* marked with tortuous impressions, as if worm-eaten. *Vermiculiiform:* shape of a small worm.
- Vermilion.** Scarlet, brilliant red approaching orange.
- Vernal.** Appearing in spring.
- Vernation.** The arrangement of foliage leaves within the bud.
- Vernicose.** As if varnished, shiny.
- Verruca (-ae).** A wart or elevation sometimes of a glandular nature. *Verrucose:* warty; covered with wartlike excrescences; tuberculate. *Verruculose:* very warty, much covered with warts.
- Versatile.** An anther attached near the middle and capable of swinging freely on the filament.
- Verticil.** A whorl, or circular arrangement of similar parts about the same point on an axis. *Verticelled, verticillate:* whorled.
- Verticillaster.** A false whorl, composed of a pair of nearly sessile cymes in the axils of opposite leaves, as in many mints. *Verticillastrate:* possessing false whorls.
- Vesicle.** A little bladder or air cavity. *Vesicular:* pertaining to, or having the form of, a vesicle. *Vesiculate; vesiculous:* as if composed of little bladders.
- Vespertine.** Blossoming in the evening.
- Vestigial.** Reduced to a vestige or trace of a part or organ originally more perfectly developed.
- Vestiture.** That which covers the surface, as hair, scales etc.
- Villous (-ose).** Bearing long and soft and not matted hairs; shaggy. *Villosity:* shagginess, a coating of long weak hairs.
- Vinaceous.** Wine-colored, purplish-red.
- Virgate.** Wand-shaped; slender, straight and erect.
- Viscid, viscous.** Sticky; glutinous. *Viscidulous;* slightly viscid.
- Vitreous.** Transparent, hyaline, formerly used for the light green of glass.
- Vitta.** An aromatic oil tube of the pericarp of most Umbelliferae. *Vittate:* bearing vittae; longitudinally striped.
- Viviparous.** Germinating or sprouting from spores or buds while still attached to the parent plant.
- Whorl.** A ring of similar organs radiating from a node; verticil.
- Wing.** A thin and usually dry extension bordering an organ; a lateral petal of a papilionaceous flower. *Winged:* bearing a wing; alate.
- Woolly.** Having long, soft, entangled hairs; lanate. Cf. *tomentose*.
- Wort.** A plant or herb of any kind, especially a pot herb.
- Xeric.** Characterized by or pertaining to conditions of scanty moisture supply.
- Xerophyte.** A drought-resistant or desert plant. *Xerophytic* (adj.).
- Xylem.** The water and mineral conducting elements of a vascular bundle.
- Zygomorphic, zygomorphous.** Bilaterally symmetrical; that which can be bisected by only one plane into similar halves. *Zygomorphy:* state of being zygomorphic.
- Zygote.** A cell produced by fertilization or conjugation of two gametes.

ABBREVIATIONS AND SIGNS

- Adj., adjacent.
 Adv., adventive.
 Afghan., Afghanistan.
 Afr., Africa.
 Ags. or Aguasc., Aguascalientes.
 Ala., Alabama.
 Alas., Alaska.
 Alt., altitude(s).
 Alta., Alberta.
 Am., America or American.
 Arct., Arctic.
 Arg., Argentina.
 Ariz., Arizona.
 Ark., Arkansas.

 W. Hemis., Western Hemisphere.
 W.I., West Indies.
 Wisc., Wisconsin.
 W.Va., West Virginia.
 Wyo., Wyoming.
 Yuc., Yucatan.
 Yuk., Yukon Terr.
 Zac., Zacatecas.

? = Indicates doubt.

X = Crossed with, the symbol for a hybrid.

Figures or words connected by the short dash indicates the extremes of variation, as "5-10 mm. long; few- to many-flowered," i.e., varying from five to ten millimeters in length, and from few- to many-flowered.

ABBREVIATIONS OF AUTHORS' NAMES

(Arranged alphabetically in regard to the abbreviation and not the full name. Based primarily on the compilation by David D. Keck in Munz' and Keck's "A California Flora" (1959); with permission.)

- Abrams. LeRoy Abrams, 1874-1956, professor of botany, Stanford University, California; author of "Flora of Los Angeles and Vicinity" (1917), "An Illustrated Flora of the Pacific States" (vol. I, 1923, vol. II, 1944, vol. III, 1951, vol. IV (with Roxana Judkins (née Stinchfield) Ferris, 1960).
- Adams. William Preston Adams, 1930- , Dept. of Botany, DePauw University, Greencastle, Indiana; Hypericaceae (*Hypericum*).
- Adams & Robson. W. P. Adams and N. K. B. Robson.
- Adans. Michel Adanson, 1727-1806, French botanist and explorer; author of "Familles des Plantes" (1763); originated some 1600 generic names.
- Aellen. Paul Aellen, 1896- , professor in Basel, Switzerland; student of Chenopodiaceae.
- Agardh. Carl Adolf Agardh, 1785-1859, noted Swedish algologist, professor at Lund (1807-1835); later bishop of Karlstad.
- Ahles. Harry E. Ahles, 1924- , Dept. of Botany, University of North Carolina, Chapel Hill; later University of Massachusetts, Amherst; author (with A. E. Radford and C. Ritchie Bell) of "Guide to the Vascular Flora of the Carolinas" (1964) and "Manual of the Vascular Flora of the Carolinas" (1968).
- Ait. William Aiton, 1731-1793, famous English botanist, Royal Gardener at Kew; issued "Hortus Kewensis" (1789)
- Ait. f. William Townsend Aiton, the son, 1766-1849, director of Kew (1793-1841); issued "Hortus Kewensis," ed. 2 (1810-1813).
- Alef. Friedrich Georg Christoph Alefeld, 1820-1872, German physician and botanist.
- Alex. Edward Johnson Alexander, 1901- , New York Botanical Garden; authority on botany of southeastern United States; Iridaceae (*Iris*).
- All. Carlo Allioni, 1725(?) -1804, Italian physician and botanist, professor of botany, Turin; author of "Flora Pedemontana" (1785).
- Alston. Arthur Hugh Garrit Alston, 1902-1958, English pteridologist, British Museum, London.
- Ames. Oakes Ames, 1874-1950, director of the Botanical Museum, Harvard University; eminent orchidologist and economic botanist; author of numerous works.
- Ames & Correll. O. Ames, and D. S. Correll.
- Ames & C. Schweinf. O. Ames, and Charles Schweinfurth, 1890- , Oaks Ames Orchid Herbarium, Harvard University; eminent orchidologist; author of Orchidaceae in Macbride's "Flora of Peru" (1958-1961).
- Anders. Edgar Shannon Anderson, 1897-1969, Missouri Botanical Garden, St. Louis; experimental taxonomy.
- Anders. & Woods. E. S. Anderson, and R. E. Woodson.
- L. C. Anderson. Loran Crittenden Anderson, 1936- , Kansas State University, Manhattan; Compositae (*Chrysothamnus*).
- Anderss. Nils Johan Andersson, 1821-1880, Swedish botanist, director of the Botanical Museum, Stockholm; collected in California in 1852; *Salix*, *Andropogon*.
- Andrz. Antoni Lukianowicz Andrzejowski, 1784-1868, professor of botany, Vilna, Lithuania.
- Anthony. Margery Stuart Anthony, 1924- , Chico State College, California; Cactaceae (Opuntias of the Big Bend), ecology.
- Ard. Pietro Arduino, 1728-1805, Italian botanist and agriculturist, Padua.
- Arech. José Arechavaleta, 1838-1912, Spanish-born Uruguayan botanist; author of "Flora Uruguaya" (1898-1911).
- Arn. George Arnold Walker Arnott, 1799-1868, Edinburgh and Glasgow botanist.
- Arthur. Joseph Charles Arthur, 1850-1942, authority on plant rusts, Purdue; editor of BOTANICAL GAZETTE.
- Asch. Paul Friedrich August Ascherson, 1834-1913, professor of botany, Berlin.
- Asch. & Graebn. P. F. A. Ascherson, and Karl Otto Robert Peter Paul Graebner, 1871-1933, professor of botany, Berlin.
- Ashe. William Willard Ashe, 1872-1932, North Carolina botanist and forester, U. S. Forest Service; *Panicum*, *Asarum*, *Crataegus*, *Polycodium*.
- Aubl. Jean Baptiste Christophe Fusée Aublet, 1720-1778; French botanical collector and author of a French Guiana flora (1775).
- Aust. Coe Finch Austin, 1831-1880, American botanist; Lemnaceae.
- Averett. John Earl Averett, 1943- , Dept. of Botany, University of Texas, Austin; *Chamaesaracha* (Solanaceae).
- Backeberg. Curt Backeberg, 1894- , cactus specialist, Germany.
- Bailey. Liberty Hyde Bailey, 1858-1954, Cornell University; eminent horticulturist and author, "Standard Cyclopedia of Horticulture" (1914-1917), "Manual of Cultivated Plants" (1925), "Hortus" (1930), etc.; founder of GENTES HERBARUM; student of *Carex*, *Rubus*, palms, Cucurbitaceae.

- Baill. Henri Ernest Baillon, 1827-1895, Paris botanist and physician; author of "Histoire des Plantes" (1827-1895) and many other works.
- Baird. Published on Cactaceae in 1931.
- Baker. John Gilbert Baker, 1834-1920, Keeper of the Herbarium, Kew (1890-1899); student of ferns, Amaryllidaceae, Bromeliaceae, Iridaceae, Liliaceae, Compositae, and the flora of tropical Africa.
- E. G. Baker. Edmund Gilbert Baker, the son, 1864-1949, British Museum, London.
- Baldw. William Baldwin, 1779-1819, Pennsylvania physician and botanist who collected and studied plants of Delaware, Georgia and South America, died while on expedition to Rocky Mountains.
- Ball. Carleton Roy Ball, 1873-1958, Senior agronomist, United States Dept. of Agriculture, Washington; authority on *Salix*.
- Ball & Heywood. P. W. Ball, and Vernon Hilton Heywood, 1927- , professor of botany, University of Liverpool, England; flora of Iberian Peninsula (especially of southeastern Spain), *Digitalis*.
- P. W. Ball. Peter William Ball, 1932- , botanist, University of Liverpool, England; Flora Europaea.
- Banks. Sir Joseph Banks, 1743-1820, British naturalist, traveler, philanthropist and scientist, accompanied Capt. Cook in his first voyage of circumnavigation in 1768; early director of Kew; president of the Royal Society.
- D. Banks. Donald Jack Banks, 1930- , Oklahoma State University, Stillwater; Gramineae (*Paspalum*).
- Barkl. Fred Alexander Barkley, 1908- , Professor of botany Northeastern University, Boston (1965-), formerly University of Texas, Austin (1943-47), U. S. State Dept., Medellin, Colombia (1947-49), Inst. Miguel Lillo, Tucuman, Argentina (1949-51), industrial chemicals (1951-61), University of Baghdad, Iraq (1963-1965); Anacardiaceae; *Begonia*.
- Barneby. Rupert Charles Barneby, 1911- , New York Botanical Garden; student of the North American Great Basin flora; *Astragalus*.
- Barnh. John Hendley Barnhart, 1871-1949, American bibliographer, New York Botanical Garden; Lentibulariaceae.
- Barr. Joseph Barratt, 1796-1882, Connecticut; geologist.
- Bart. William Paul Crillon Barton, 1786-1856, professor of botany, Pennsylvania; author of "A Flora of North America" (1820-1823).
- Bartal. Biagio Bartalini, 1746-1822, Italian botanist.
- Bartl. Friedrich Gottlieb Bartling, 1798-1875, professor of botany, Göttingen.
- Bartlett. Harley Harris Bartlett, 1886-1960, professor of botany, University of Michigan, Ann Arbor.
- Bartr. William Bartram, 1739-1823, American botanist in Philadelphia; author of "Travels through North and South Carolina, etc." (1791).
- Bates. Rev. John Mallory Bates, 1846-1930, Nebraska clergyman, botanist and ornithologist who studied plants of the state; Cyperaceae.
- Batsch. August Johann Georg Karl Batsch, 1761-1802, German botanist and horticultural writer, Jena.
- Baum. Bernard Rene Baum, 1937- , Paris-born Canadian botanist, Plant Research Institute, Ottawa, Canada; *Avena*; *Tamarix*.
- Baumg. Johann Christian Gottlob Baumgarten, 1765-1843, German botanist.
- Baxt. Edgar Martin Baxter, 1903-1967, Cactaceae hobbyist; author of "California Cactus," 1935.
- Beadle. Chauncey Delos Beadle, 1866-1950, Canadian-born botanist with Biltmore Herbarium, North Carolina (1890-1916); botany of southern United States.
- Beadle & Boynt. C. D. Beadle, and F. E. Boynton.
- Beal. William James Beal, 1833-1924, Michigan State University, East Lansing, agrostologist, botanist; author of "Michigan Flora" (1904).
- E. O. Beal. Ernest Oscar Beal, 1928- , North Carolina State University, Raleigh; later Western Kentucky University, Bowling Green; Nymphaeaceae (*Nuphar*), Lemnaceae, Experimental Taxonomy of aquatic plants.
- Beaman. John Homer Beaman, 1929- , Michigan State University, East Lansing; Compositae; high altitude floras of Mexico and Central America.
- L. S. Beard. Luther Stanford Beard, 1929- , University of North Carolina, Chapel Hill and Campbell College, Buies Creek, North Carolina; Leguminosae (*Schrankia*).
- Beaudry. Jean Romuald Beaudry, 1917- , Dept. Biol. Sciences, University of Montreal, Canada; Compositae (*Solidago*).
- Beauv. Baron Ambroise Marie François Joseph Palisot de Beauvois, 1752-1820, French naturalist; Gramineae.
- Bebb. Michael Schuck Bebb, 1833-1895, Illinois; *Salix*.
- Becc. Odoardo Beccari, 1843-1920, Italian botanist and world authority on palms and flora of Borneo.
- Beck. Lewis Caleb Beck, 1798-1853, United States.
- Beer. Joseph Georg Beer, 1803-1873, Austrian writer on orchids and bromeliads.
- Beetle. Alan Ackerman Beetle, 1913- , professor of agronomy, University of Wyoming, Laramie; Gramineae, Cyperaceae.
- Benedict. Ralph Curtiss Benedict, 1883-1965, professor of botany, Brooklyn College, New York; pteridologist; one of the organizers of the American Fern Society.
- Benke. Hermann Conrad Benke, 1869-1946, school teacher, photographer, botanist, Chicago, Illinois.
- Benner. Walter Mackinnett Benner, 1888- , Academy of Natural Sciences, Philadelphia; *Lycopus*; student of flora of Bucks Co., Pennsylvania.
- L. Benson. Lyman David Benson, 1909- , professor of botany, Pomona College, California; author (with Robert A. Darrow) of "A Manual of Southwestern Desert Trees and Shrubs" (1945); "Plant Classification" (1957); *Ranunculus*; Cactaceae.
- L. Benson & Walkington. L. D. Benson, and David Leo Walkington, 1930- , California State College, Fullerton; chemical studies of Cactaceae.
- Benth. George Bentham, 1800-1884, long-time president of the Linnaean Society; outstanding English taxonomist; author of "Plantas Hartwegianae . . . enumerat" (1839); "Handbook of

- the British Flora" (1858, with later editions); "Flora Hongkongensis" (1861); "Flora Australiensis" (1863-1878); and monographic works on Leguminosae, Labiatae, Scrophulariaceae, etc.
- Benth. & Hook. (or B. & H.). G. Bentham, and Sir J. D. Hooker; authors of "Genera Plantarum" (1862-1883).
- Bercht. & Presl. Friedrich Graf von Berchtold, 1781-1876, Austrian botanist, and K. B. Presl.
- Berg. Peter Jonas Bergius, 1730-1790, Swedish physician and botanist.
- Berger. Alwin Berger, 1871-1931, curator of the garden at La Mortola, Italy; student of Cactaceae and other succulents.
- Berl. Jean Louis Berlandier, 1805-1851, French-Swiss physician who collected plants in northern Mexico and Texas; Grossulariaceae.
- Bernh. Johann Jacob Bernhardt, 1774-1850, professor of botany, Erfurt, Germany.
- Bert. Antonio Bertoloni, 1775-1869, professor of botany, Bologna (1815-1869); author of "Flora Italica" (1833-1854).
- Bess. Wilibald Swibert Joseph Gottlieb von Besser, 1784-1842, Austrian botanist, professor in the Wolhynien Lyceum (Poland); student of the flora of Galicia and southwest Russia.
- Betcke. Ernst Friedrich Betcke, b. ? -1865, Mecklenburg, Germany.
- Beyr. Heinrich Carl Beyrich, 1796-1834, Prussian botanist who collected in Georgia, South Carolina and Texas.
- Bickn. Eugene Pintard Bicknell, 1859-1925, New York banker and amateur botanist.
- Bieb. Baron Friedrich August Marschall von Bieberstein, 1768-1826, Stuttgart; German explorer and author of works on the flora of southern Russia and the Caucasus.
- Biehler. Johann Friedrich Theodor Biehler, published in 1807, Germany.
- Bigel. Jacob Bigelow, 1787-1879, professor of botany, Boston; author of "Florula Bostoniensis" (1814), and "American Medical Botany" (1817).
- Bisch. Gottlieb Wilhelm Bischoff, 1797-1854, professor of botany, Heidelberg, Germany.
- Bissell. Charles Humphrey Bissell, 1857-1925, one of a group of authors who published "Catalogue of the flowering plants and ferns of Connecticut growing without cultivation" (1910).
- Biv. Baron Antonio Bivona-Bernardi, 1778-1837, Messina, Sicily.
- Bl. Carl Ludwig von Blume, 1796-1862, Dutch botanist, director of the botanic garden at Batavia and writer (with J. B. Fischer) on the flora of Java (1828-51).
- Blackwell. Will Hoyle Blackwell, Jr., 1939- , Miami University, Oxford, Ohio; Flora of Ohio, Rubiaceae.
- Blake. Sidney Fay Blake, 1892-1959, United States Dept. of Agriculture, Beltsville, Maryland; authority on Compositae, *Polygala*, bibliographer; author of "Geographical Guide to the Floras of the World" (with Alice C. Atwood), Pt. I (1942), Pt. II (1961).
- Blake & Shiller. S. F. Blake, and I. Shiller.
- Blank. Joseph William Blankinship, 1862-1938, botanist and plant pathologist, Montana Agricultural College, Bozeman, later with smelting companies.
- Boeck. Johann Otto Boeckeler, 1803-1899, apothecary-botanist of Oldenburg, Germany; Cyperaceae.
- Boehm. Georg Rudolf Boehmer, 1723-1803, German botanist, Leipzig.
- Bogin. Clifford Bogin, 1920- , New York Botanical Garden; later Woodmere Academy, Long Island, New York; *Sagittaria*.
- Bogusch. Edwin Robert Bogusch, 1905- , biologist, Texas College of Arts and Industries, Kingsville.
- Boiss. Pierre Edmond Boissier, 1810-1885, Swiss botanist and traveller, Geneva; one of the outstanding systematists of the 19th century; author of the monumental "Flora Orientalis" (1867-1884); monographer of the Plumbaginaceae and *Euphorbia*.
- Boiss. & Reut. P. É. Boissier, and Georges François Reuter, 1805-1872, Swiss botanist and traveller, conservator of the Herbarium Boissier, Geneva.
- Boivin. Joseph Robert Bernard Boivin, 1916- , Dept. of Agriculture, Ottawa, Canada; *Thalictrum*.
- Bojer. Wenjel Bojer, 1797-1856, Austrian.
- Bomhard. Miriam Lucille Bomhard, 1898-1952, United States Forest Service, Washington; author of "Palm trees in the United States," U.S.D.A. Bul. 22 (1950).
- Boott. Francis Boott, 1792-1863, American caricologist and physician who settled in London.
- W. Boott. William Boott, 1805-1887, Boston; *Carex*.
- Bor. Alexandre Boreau, 1803-1875, French botanist who wrote a flora of central France (1857).
- Borbás. Vinczé von Borbás, 1844-1905, Hungarian botanist.
- Bosc. Louis Augustin Guillaume Bosc, 1759-1828, French naturalist.
- Boyle. William Sidney Boyle, 1915- , professor of botany, Utah State University, Logan; Gramineae (*Melica*).
- Boynt. Frank Ellis Boynton, 1859- ? botanical collector for the Biltmore Herbarium, Biltmore, North Carolina; Supt. of Biltmore Estates to about 1935.
- Boynt. & Beadle. (cf. Beadle & Boynt.)
- A. Br. Alexander Carl Heinrich Braun, 1805-1877, professor of botany and director of the botanical garden, Berlin; Characeae, *Selaginella*, *Marsilea*.
- N. E. Br. Nicholas Edward Brown, 1849-1934, Kew; authority on the South African flora.
- P. Br. Patrick Browne, 1720-1790, Irish physician and naturalist, explorer of Jamaica, and an author of its natural history (1756).
- R. Br. Robert Brown, 1773-1858, British botanist, librarian and first keeper of botany, British Museum; a chief exponent of the Natural System; noted morphologist and cytologist.
- Brackett. Amelia Ellen Brackett, 1896-1926, Gray Herbarium, Harvard University.
- Brainerd. Ezra Brainerd, 1844-1924, president, Middlebury College, Vermont; *Viola*.
- Brand. August Brand, 1863-1930, German student of Polemoniaceae, Hydrophyllaceae and Boraginaceae.
- Brandeg. Townshend Stith Brandege, 1843-1925, civil engineer and his wife gave their valuable

- herbarium and library to the University of California in 1906; early collector and publisher of flora of Baja California, Mexico (1889, 1894).
- K. Brandeg. Mary Katharine (Layne) (Curran) Brandege, the wife, 1844-1920, California.
- Briq. John Isaac Briquet, 1870-1931, Swiss botanist, director of the Conservatoire Botanique, Geneva; Labiatae, Umbelliferae, Compositae; noted for his work to advance modern nomenclature through the Botanical Congresses.
- Britt. Nathaniel Lord Britton, 1859-1934, director-in-chief, New York Botanical Garden (1896-1930); flora of North America, West Indies, Bolivia; a prolific writer.
- Britt. & Rose. N. L. Britton, and J. N. Rose; authors of "The Cactaceae," 4 vols. (1919-23).
- Britt. & Rusby. N. L. Britton, and Henry Hurd Rusby, 1855-1940, dean of the New York College of Pharmacy, an active collector in South America; leader of the ill-fated South American expedition described in the book, "White Waters and Black" (1926, reprint 1931) by Gordon MacCreagh.
- Brizicky. George Konstantin Brizicky, 1901-1968, Gray Herbarium, Harvard University, Cambridge, Massachusetts; dendrology, forest pathology, researcher on generic flora of southeastern United States and Florida Keys.
- Brongn. Adolphe Théodore Brongniart, 1801-1876, noted paleobotanist and systematist of Paris.
- Brot. Felix di Avelar Brotero, 1744-1828, professor of botany, Coimbra, Portugal; author of "Flora Lusitanica" (1804).
- Broun. Maurice Broun, 1906- , Massachusetts, ornithologist; author of "Index to North American Ferns" (1938).
- Brummitt. Richard Kenneth Brummitt, 1937- , botanist, Royal Botanic Garden, Kew, England.
- B.S.P. N. L. Britton; Emerson Ellick Sterns, 1846-1928; Justus Ferdinand Poggenburg, 1840-1893, United States.
- Buch. Franz Georg Philipp Buchenau, 1831-1906, professor in Bremen; Alismataceae, Juncaceae.
- Buchh. John Theodore Buchholz, 1888-1951, professor of botany, Illinois; authority on the embryology of the Coniferae.
- Buchh. & Palm. J. T. Buchholz, and E. J. Palmer.
- Buc'hoz. Pierre Joseph Buc'hoz (Buchoz), 1731-1807, French (Lorraine) physician and naturalist.
- Buckl. Samuel Botsford Buckley, 1809-1884, state geologist of Texas; collected plants, shells and insects from Georgia to Texas.
- Bullock. Arthur A. Bullock, 1906- , English botanist, Kew; Asclepiadaceae and Periplocaceae (especially of Africa), Rubiaceae of Africa, nomenclature.
- Bunge. Alexander Andrejewitsch von Bunge, 1803-1890, Russian botanist and explorer, professor of botany, Dorpat; author of the flora of Russian and central Asia (1851); *Astragalus*.
- Bur. Edouard Bureau, 1830-1918, French botanist.
- Burgess. Edward Sandford Burgess, 1855-1928, professor of science, Hunter College, New York City, a student of the flora of Chautauqua County, New York; Compositae.
- Burk. Arturo Burkart, 1906- , Instituto de Botánica Darwinian, San Isidro, Argentina; Leguminosae.
- Burn. Johannes Burman, 1706(?) - 1779, Dutch physician and botanist.
- Burm. f. Nicolaas Laurens Burman, the son, 1734(?) - 1793, Dutch physician and botanist.
- Bush. Benjamin Franklin Bush, 1858-1937, postmaster, Independence, Missouri; amateur botanist.
- Butt. & St. John. Frederick King Butters, 1878-1945, professor of Botany, University of Minnesota, and Harold St. John, 1892- , professor of botany, Hawaii, formerly at Pullman; student of the flora of eastern Washington.
- Cabrera. Angel Lulio Cabrera, 1908- , Museo de la Plata, La Plata, Argentina; Compositae, phytogeography, Flora of Jujuy; author of "Manual de la Flora de los Alrededores de Buenos Aires" (1953).
- Camb. Jacques Cambessèdes, 1799-1863, French botanist.
- Camp. Wendell Holmes Camp, 1904-1963, Curator New York Botanical Garden (1936-1949), then professor of botany, University of Connecticut, Storrs, a leader in the founding of the American Society of Plant Taxonomists; Ericaceae (*Vaccinium*).
- A. Camus. Aimee Antoinette Camus 1879- , French taxonomist, specialist on Orchidaceae, and on flora of Indo-China.
- Canby. William Marriott Canby, 1831-1904, Delaware businessman; accumulator of a large herbarium.
- Carr. Elie Abel Carriere, 1818-1896, French horticulturist, Muséum d'Histoire Naturelle, Paris; editor of *Revue Horticole*; Coniferae.
- Caruel. Teodoro Caruel, 1830-1898, Italy.
- Casp. Johann Xaver Robert Caspary, 1818-1887, professor of botany, Königsberg.
- Cass. Alexandre-Henri Gabriel Comte de Cassini, 1781-1832, French botanist; Compositae.
- Cav. Antonio José Cavanilles, 1745-1804, Spanish botanist, professor of botany and director of the botanic gardens, Madrid; author of "Icones et descriptiones plantarum" (1791-1801).
- Čelak. Ladislav Josef Čelakovský, 1834-1902, professor of botany, Prague, Czechoslovakia; author of "Prodromus der Flora von Böhmen" (1867).
- Celarier. Robert P. Celarier, 1921-1959, Oklahoma State University, Stillwater; cytogenetics, experimental taxonomy, Andropogoneae.
- Celarier & Harlan. R. P. Celarier, and J. R. Harlan.
- Cels. Jacques Martin Cels, 1743-1806, French horticulturist.
- Cerv. Vincente de Cervantes, 1759?-1829, professor of botany and director of the botanic garden, Mexico City.
- Chab. S. B. Chabaud, 1833-1915, France.
- Cham. Adelbert Ludwig von (formerly Louis Charles Adelaide Chamisso de Boncourt) Chamisso, 1781-1838, poet-naturalist, Berlin; botanist on the ship *Rurik*, which visited California in 1816.

- Cham. & Schlecht. A. L. Chamisso, and D. F. L. von Schlechtendal.
- Chapm. Alvan Wentworth Chapman, 1809-1899, American botanist, Florida; author of "Flora of the Southern United States" (1860, 2nd ed. 1883, 3rd ed. 1897).
- Chase. Mary Agnes (Merrill) Chase, 1869-1963, Custodian of Grasses, U. S. National Herbarium, Washington; eminent agrostologist; author (with Cornelia D. Niles) of "Index to Grass Species" (1962).
- Chât. Jean Jacques Châtelain, published work in 1760, Switzerland.
- Chaudhri. Mohammad Nazeer Chaudhri 1932- , West Pakistan botanist, Botanical Museum and Herbarium, Utrecht, Netherlands; reviser of the *Paronychiinae* (Caryophyllaceae).
- R. H. Cheney. Ralph Holt Cheney, 1896- , paleobotanist, Brooklyn College and Long Island University, New York; *Delphinium*, *Coffea*, medicinal and drug plants.
- Cherm. Henri Chermезon, 1885-1939, France; student of the flora of Alsace and Haute-Tarentaise.
- Ching. Ren-Chang Ching, 1899- , Chinese pteridologist.
- Chiov. Emilio Chiovenda, 1871-1940, Italian botanist, director of the Botanical Institute of the University, Modena.
- Chod. Robert Hippolyte Chodat, 1865-1934, Switzerland.
- Choisy. Jacques Denis Choisy, 1799-1859, Swiss philosopher, protestant clergyman and botanist, professor in Geneva; collaborator in De Candolle's *Prodromus*; Guttiferae, Convolvulaceae, Nyctaginaceae.
- C. Chr. Carl Frederick Albert Christensen, 1872-1942, Danish student of ferns; author of "Index Filicum" (1905-1912).
- Christ. Konrad Hermann Heinrich Christ, 1833-1933, Swiss authority on ferns; Coniferae, *Carex*, *Rosa*; author of the classic "Pflanzenleben der Schweiz" (1879).
- Christm. Gottlieb Friedrich Christman, 1752- ?, Germany.
- Clark. Robert Brown Clark, 1914- , Missouri Botanical Garden, St. Louis, Missouri, *Bumelia*.
- Clarke. Charles Baron Clarke, 1832-1906, superintendent of the Royal Botanic Gardens, Calcutta; student of the flora of India; Cyperaceae.
- Clausen. Robert Theodore Clausen, 1911- , professor of botany, Cornell University, Ithaca, New York; Ophioglossaceae, *Sedum*.
- Clayt. John Clayton, 1685-1773, physician in Virginia; collector for Gronovius.
- Clem. & Clem. Frederic Edward Clements, 1874-1945, American plant ecologist and climatologist, Carnegie Institution, and Edith Gertrude (Schwartz) Clements, 1877- , ecologist; authors of "Rocky Mountain Flowers" (3rd ed. 1928).
- I. Clem. Ian Duncan Clement, 1917- , American taxonomist, director Atkins Garden and Research Laboratory of Harvard University, Soledad, Cuba (1948-1962), later National Science Foundation, Washington; Malvaceae, tropical economic botany.
- Clewell. Andre F. Clewell, 1934- , botanist, Florida State University, Tallahassee; Leguminosae (*Lespedeza*).
- Clute. Willard Nelson Clute, 1869-1950, professor of botany, Butler University, Indianapolis, Indiana; founder of The American Fern Society; editor of the FERN BULLETIN and the AMERICAN BOTANIST; author of "The Fern Allies of North America north of Mexico" (1905, 2nd ed. 1928), and "Our Ferns: Their Haunts, Habits and Folklore" (1938).
- Cockll. Theodore Dru Alison Cockerell, 1866-1948, professor of Entomology, New Mexico Agricultural College, Mesilla Park; plant explorer and student of southwestern United States and Jamaican natural history.
- Cockll. & Barker, P. and M. T. D. A. Cockerell, and P. and M. Barker; published together in 1901.
- Cogn. Célestin Alfred Cogniaux, 1841-1916, Verviers, Belgium; Cucurbitaceae, Melastomataceae, Orchidaceae.
- Collad. Louis Theodore Frederic Colladon, 1792-1862, French medical botanist.
- Collins. Lawrence Turner Collins, 1937- , botanist, University of Wisconsin, Milwaukee; Orobanchaceae.
- Commers. Philibert Commerson, 1727-1773, France; naturalist of the Bouganville expedition (1767-1769) to South America and Africa.
- Conrad. Solomon White Conrad, 1779-1831, United States.
- Const. Lincoln Constance, 1909- , professor of botany, University of California, Berkeley; student and monographer of Umbelliferae, Hydrophyllaceae, etc.
- Const. & Shan. L. Constance, and Ren-hwa Shan, 1909- , Academia Sinica, Peiping; Umbelliferae (especially of China).
- Cook. Orator Fuller Cook, 1867-1949, U. S. Dept. Agriculture, Beltsville, Maryland; Palmae, *Gossypium*, rubber plants, botanical explorer in Africa and South America.
- Core. Earl Lemley Core, 1902- , professor of botany, West Virginia University, Morgantown; Cyperaceae (*Scleria*), Caryophyllaceae (*Paronychia*, *Siphonochia*), author (with P. D. Strausbaugh) of "Flora of West Virginia" (1952-1964).
- Correll. Donovan Stewart Correll, 1908- , Botanical Museum, Harvard University (1938-1946), U. S. Dept. Agriculture, Beltsville, Maryland (1946-1956), Head, Botanical Laboratory, Texas Research Foundation, Renner, Texas (1956-); ferns, orchids, *Solanum*, flora of southwestern United States; author of "Native Orchids of North America, north of Mexico" (1950), "The Potato and its Wild Relatives" (1962), (with Oakes Ames) "Orchids of Guatemala" (1952-1953), and (with I. W. Knobloch) "Ferns and Fern Allies of Chihuahua" (1962), etc.
- H. Correll. Helen Butts Correll, 1907- , wife of D. S. Correll, botanist and zoologist, Smith College, Northampton, Massachusetts, 1929-1931, Wellesley College, Wellesley, Massachusetts, 1934-1939, Texas Research Foundation, Renner, Texas, 1956-; teacher, botanical collector and researcher; aquatic and marsh plants of southwestern United States; author (with D. S. Correll) of "A collection of plants from Louisiana" (Am. Midl. Nat. 26: 30-64. 1941).
- Cory. Victor Louis Cory, 1880-1964, Southern Methodist University, Dallas, Texas, botanist and collector of Texas plants.

- Cory & Parks. V. L. Cory, and H. B. Parks; authors of "Catalogue of the Flora of Texas" (1937).
- Coss. Ernest Saint-Charles Cosson, 1819-1889, French botanist.
- Coss. & Dur. E. St.-C. Cosson, and M. C. Durieu de Maisonneuve; authors of "Flore d'Algérie" (1854-1867).
- Coult. John Merle Coulter, 1851-1928, professor of botany, University of Chicago; founder and longtime editor of the *BOTANICAL GAZETTE*; author of "Botany of Western Texas" (1891-1894) and "Manual of the Botany of the Rocky Mountain Region" (1885, rev. by A. Nelson, 1909).
- Coult. & Fish. J. M. Coulter, and Elmon McLean Fisher, 1861-1938, Indiana.
- Coult. & Rose. J. M. Coulter, and J. N. Rose.
- Cov. Frederick Vernon Coville, 1867-1937, curator, U. S. National Herbarium (1893-1937); botanist of the Death Valley Expedition in 1891.
- Cov. & Berger. F. V. Coville, and A. Berger.
- Crantz. Heinrich Johann Nepomuk von Crantz, 1722-1799, professor of medicine, Vienna; author of a flora of Austria; Cruciferae, Umbelliferae.
- Crép. François Crépin, 1830-1903, director of the botanic garden, Brussels.
- Cristóbal. Carmen Lelia Cristóbal, 1932- , Facultad de Agronomía y Veterinaria, Corrientes, Argentina; Sterculiaceae (*Ayenia*, *Byttneria*).
- Croizat. Leon Camille Marius Croizat, 1894- , Caracas, Venezuela; Euphorbiaceae, Cactaceae.
- Cronq. Arthur John Cronquist, 1919- , curator, New York Botanical Garden; Compositae; author (with H. A. Gleason) of "Manual of Vascular Plants of Northeastern United States and adjacent Canada" (1963), and (with other authors) "Vascular Plants of the Pacific Northwest" (1955-1964).
- Cronq. & Keck. A. J. Cronquist and D. D. Keck.
- Crosswhite. Frank Samuel Crosswhite, 1940- , University of Wisconsin, Madison; Scrophulariaceae (*Penstemon*).
- Curt. William Curtis, 1746-1799, English botanist, entomologist and editor, founder of the *BOTANICAL MAGAZINE*; author of "Flora Londinensis" (1777-1798).
- M. A. Curtis. Moses Ashley Curtis, 1808-1872; author of "The Shrubs and Woody Vines of North Carolina" (1946, reprinted from Geol. and Nat. Hist. Survey of N. C., 1860).
- Cutak. Ladislaus Cutak, 1908- , Missouri Botanical Garden, St. Louis; Cactaceae, Bromeliaceae, Araceae.
- Cutler. Hugh Carson Cutler, 1912- , Missouri Botanical Garden, St. Louis; *Ephedra*, economic botany.
- Cutler & Anders. H. C. Cutler, and E. S. Anderson.
- Cyr. Domenico Cyrillo, 1739-1799, professor of botany, Naples, Italy.
- Dandy. James Edgar Dandy, 1903- , botanist, Director of British Museum, London; Magnoliaceae, Hydrocharitaceae, Potamogetonaceae.
- Daniels. Francis Potter Daniels, 1869-1947, botanist, ordained minister and linguist, Georgia State College for Women (1923-35); collected and published on Colorado plants (1911).
- Danser. Benedictus Hubertus Danser, 1891-1943, Dutch botanist.
- Darby. John Darby, 1804-1877, New York botanist; author of "Botany of the Southern States" (1855).
- Darl. Josephine Darlington, 1905- , publ. in *Annals Missouri Botanical Garden* in 1934; *Mentzelia*.
- Daveau. Jules Alexandre Daveau, 1852-1929, director, Botanic Garden, Lisbon.
- Davenp. George Edward Davenport, 1833-1907, Massachusetts businessman; student of ferns.
- Davids. Anstruther Davidson, 1860-1932, physician, student of Arizona and California floras; author (with G. L. Moxley) of "Flora of Southern California" (1923).
- L. I. Davis. Louie Irby Davis, 1897- , collected plants in Mexico and Texas in 1941-1965; published on *Verbena* in 1941.
- R. J. Davis. Ray Joseph Davis, 1895- , professor of botany, Idaho State College, Pocatello; author of "Flora of Idaho" (1952).
- Day & V. Grant. Alva Day (*later* Grant), and V. E. Grant.
- Dayton. William Adams Dayton, 1885-1958, dendrologist, U. S. Forest Service, Washington; leader in standardization of English plant names; author of "United States Tree Books," U.S.D.A. Bul. 20 (1952), "Important Western Browse Plants," U.S.D.A. Misc. Publ. 101 (1931), etc.
- DC. Augustin Pyramus de Candolle (also *Décandolle*), 1778-1841, Swiss botanist, professor of botany, Geneva; first in an illustrious line of systematists; founder of the *Prodromus*, a fundamental work in the development of the modern phylogenetic system.
- A. DC. Alphonse Louis Pierre Pyramus de Candolle, the son, 1806-1893, Geneva; author of the last 10 vols. of the *Prodromus*; founder of *Monographiae Phanerogamarum*, a continuation and revision of the *Prodromus*.
- Dcne. Joseph Decaisne, 1807-1882, Belgian botanist, director, Jardin des Plantes, Paris; Asclepiadaceae, Plantaginaceae.
- DeJong. Diederik Cornelius Dignus DeJong, 1931- , Botany Dept., Miami University, Oxford, Ohio; Compositae.
- Delile. Alire Raffeneau Delile, 1778-1850, French botanist and physician who accompanied Napoleon to Egypt.
- Dempst. Lauramay (Tinsley) Dempster, 1905- , research assistant to W. L. Jepson, University of California, Berkeley; Jepson Herbarium; *Galium*.
- den Hartog. Cornelis den Hartog, 1931- , Amsterdam, Netherlands; Alismataceae. Hydrocharitaceae.
- Dermen. Haig Dermen, 1895- , Cytologist, U. S. Dept. Agriculture, Beltsville, Maryland.
- Desf. René Louiche Desfontaines, 1750-1833, French botanist, professor in the Jardin des Plantes, Paris; author of "Flora Atlantica" (1798-1799).
- Des Moul. Charles Robert Alexandre Des Moulins, 1798-1875, France.

- Desr. Louis Auguste Joseph Desrousseaux, 1753-1838, French cloth manufacturer; contributor to Lamarck's Encyclopedia.
- Desv. Nicaise Auguste Desvaux, 1784-1856, French botanist, professor of botany, Angers; editor of *JOURNAL DE BOTANIQUE*.
- Detl. LeRoy Ellsworth Detling, 1898- , professor of botany, University of Oregon, Eugene; Cruciferae (*Dentaria*, *Descurainia*).
- Dev. Rev. Chester Dewey, 1784-1867, professor, University of Rochester, New York; specialist in *Carex*.
- L. H. Dewey. Lyster Hoxie Dewey, 1865-1944, Michigan botanist, published on flora of islands in The French River, Ontario in 1939.
- de Wit. Hendrik Cornelis Dirk de Wit, 1909- , University of Agriculture, Wageningen, Netherlands; Leguminosae (Caesalpiniaceae), aquatic plants, Cryptocoryne.
- Didr. Didrik Ferdinand Didrichsen, 1814- , Museum and Library, Botanic Garden, Copenhagen.
- Dietr. Friedrich Gottlieb Dietrich, 1768-1850, garden director at Eisenach, Germany.
- A. Dietr. Albert Gottfried Dietrich, 1795-1856, German gardener, curator of the Berlin botanical garden.
- D. Dietr. David Nathanael Friedrich Dietrich, 1799-1888, German botanist, Jena.
- Dode. Louis Albert Dode, 1875- , France, botany and forestry.
- Doell & Asch. Johann Christoph Doell, 1808-1885, German librarian and botanist, and P. F. A. Ascherson.
- D. Don. David Don, brother of George, 1799-1841, British botanist, professor in King's College, London; librarian to the Linnaean Society.
- G. Don. George Don, 1798-1856, British plant collector for the Horticultural Society in Brazil, West Indies and Africa.
- Donn. James Donn, 1758-1813, British gardener under Aiton at Kew, later curator of Cambridge Garden; author of "Hortus Cantabrigiensis" (1796), which went through 13 editions.
- Dougl. David Douglas, 1798(?)-1834, ardent Scotch botanical collector in northwestern America, taking nearly 500 species in California alone for the Royal Horticultural Society; collected extensively along the Columbia River; ". . . his cost of maintenance during three years came to £66."
- Drapalik & Mohlenbrock. Donald Joseph Drapalik, 1934- , Georgia Southern College, Statesboro; Asclepiadaceae (*Matelea*), and Robert H Mohlenbrock, 1931- , Southern Illinois University, Carbondale; Leguminosae, Cyperaceae, flora of Illinois.
- Drew. William Brooks Drew, 1908- , professor of botany, Michigan State University, East Lansing.
- Drude. Carl Georg Oscar Drude, 1852-1933, Germany.
- Duchartre. Pierre Étienne Simon Duchartre, 1811-1894, French botanist.
- Duchn. Antoine Nicolas Duchesne, 1747-1827, France; author of a work on useful plants, especially strawberries (*Fragaria*).
- Dufr. Pierre Dufresne, 1786-1836, Geneva, Switzerland.
- Duham. Henri Louis Duhamel de Monceau, 1700-1781, French agronomist, forester and botanist.
- Dum. Count Barthélemy Charles Joseph Dumortier, 1797-1878, Belgian botanist, president of the Belgian Chamber of Deputies.
- Dumont. Georges Louis Marie Dumont de Courset, 1746-1824, French agronomist and horticultural writer.
- Dun. Michel Félix Dunal, 1789-1856, French botanist, professor of botany, Montpellier; Vacciniaceae, Solanaceae, contributor to De Candolle's Prodrômus.
- Durand. Elias Magloire Durand, 1794-1873, Philadelphia pharmacist.
- Durazz. Ippolito Durazzo, 1750-1818, Italy.
- Durieu. Michel Charles Durieu de Maisonneuve, 1796-1878, French botanist, director of the botanic gardens, Bordeaux; student of the flora of southern France, Spain, and especially Algeria.
- Du Roi. Johann Philipp Du Roi, 1741-1785, Germany.
- Duval. Charles Jeunet Duval, 1751-1828, France.
- Dyal. Sarah Creecie (*later* Nielsen) Dyal, 1907- , Cornell University, Ithaca, New York; *Plectritis*, *Valerianella*.
- Eastw. Alice Eastwood, 1859-1953, Canadian-born California botanist, curator of botany, California Academy of Sciences (1892-1950); tireless student of the West American flora and of cultivated plants.
- Eat. Amos Eaton, 1776-1842, American botanist, lecturer and writer, New York; produced first botanical manual in America with descriptions in English.
- A. A. Eat. Alvah Augustus Eaton, 1865-1908, New England and Florida; student of ferns and early collector in Florida for Oakes Ames.
- D. C. Eat. Daniel Cady Eaton, grandson of Amos, 1834-1895, professor of botany, Yale University, New Haven, Connecticut; authority on ferns.
- Ediger. Robert Ike Ediger, 1937- , Chico State College, California; *Senecio* (Compositae).
- Eggert. Heinrich (Karl Daniel) Eggert, 1841-1904, American botanical collector.
- Eggl. Willard Webster Eggleston, 1863-1935, botanist, U. S. Dept. Agriculture, Washington; student of poisonous and drug plants, prodigious and indiscriminate collector of American plants.
- Ehrh. Friedrich Ehrhart, 1742-1795, German botanist of Swiss origin, pupil of Linnaeus; advocate of monomial nomenclature.
- Ehrend. Friedrich Ehrendorfer, 1927- , Botanical Institute, University of Vienna, Austria.
- Eichler. August Wilhelm Eichler, 1839-1887, Berlin; important editor of and contributor to "Flora Brasiliensis" (1829-1833).
- Eifert. Imre János Eifert, 1934- , Department of Botany, University of Texas; Leguminosae (*Hoffmanseggia*, *Caesalpinia*).
- Eiten. George Eiten, 1923- , Instituto de Botanica, Sao Paulo, Brazil; *Oxalis*, vegetation of Brazil.

- Ekman. Erik Leonard Ekman, 1883-1931, Swedish botanist, botanical collector for 17 years in Cuba and Hispaniola for I. Urban and the Berlin Botanical Garden during which time he obtained over 35,000 numbers including about 6 new genera and 2,000 new species.
- Ell. Stephen Elliott, 1771-1830, American botanist, professor in Charleston; author of "A sketch of the botany of South Carolina and Georgia" (1821-1824).
- Elliot. George Francis Scott Elliot, 1862-1934, Great Britain.
- Ellis. John Ellis, 1710(?) - 1776, Irish-born merchant in London.
- W.H.P. Emery. William Henry Perry Emery, 1924- , professor of biology, Southwest Texas State University, San Marcos; Gramineae.
- Endl. Stephen Friedrich Ladislaus Endlicher, 1804-1849, Austrian botanist, professor of botany and director of the botanic garden, Vienna; author of "Genera Plantarum" (1836-1840), and many other large works; student of Coniferae.
- Engelm. George Engelmann, 1809-1884, German-born physician in St. Louis and eminent botanist; painstaking student of North American *Cuscuta*, *Juncus*, Euphorbiaceae, Isoetes, *Yucca*, Cactaceae, *Pinus*, *Abies*, *Juniperus*, *Agave* and *Vitis*.
- Engelm. & Bigel. G. Engelmann, and J. Bigelow.
- Engelm. & Gmy (or E. & G.). G. Engelmann, and A. Gray.
- Engelm. & Prantl. G. Engelmann, and K. A. E. Prantl.
- Engl. Adolf (Heinrich Gustaf Adolf) Engler, 1844-1930, director of the botanic garden and museum, Berlin; founder and editor of *BOTANISCHE JAHRBÜCHER, DIE VEGETATION DER ERDE*, and *DAS PFLANZENREICH*; outstanding systematist and tireless worker; Araceae, monographer of *Saxifraga*.
- Engl. & Graebn. A. Engler, and Karl Otto Robert Peter Paul Graebner, 1871-1933, professor of botany, Berlin.
- Ensign. Margaret Ruth (later Lewis) Ensign, 1919- , Pomona College, Claremont, California; *Forsellestia*.
- Epl. Carl Clawson Epling, 1894-1968, Dept. of Botany, University of California, Los Angeles; specialist on American Labiateae, author of numerous works.
- Erbe & B. L. Turner. Lawrence Wayne Erbe, 1924- , University of Southwestern Louisiana, Lafayette; *Phlox* (annuals), and B. L. Turner.
- Erickson. Ralph Orlando Erickson, 1914- , Missouri Botanical Garden, St. Louis; *Clematis*.
- Eschs. Johann Friedrich Eschscholtz, 1793-1831, zoologist in Dorpat; surgeon and naturalist on the ship *Rurik*, of the Russian Romanzoff Expedition under Kotzebue, which visited California in 1816, and on the *Predpriaetie*, also under Kotzebue, which reached San Francisco and the Sacramento River in the fall of 1824.
- Evans. Walter Harrison Evans, 1863-1941, U. S. Dept. Agriculture Office of Experiment Stations (1891-1933); Cornaceae, Alaskan vegetation.
- Everly. Mary Louise Everly Hammack, 1922- ; Compositae (published on *Perityle* in 1947).
- Ewan. Joseph Andorfer Ewan, 1909- , professor of botany, Tulane University, New Orleans, Louisiana; *Delphinium*, botanical historian; author of "Rocky Mountain Naturalists" (1950).
- Fabr. Philipp Conrad Fabricius, 1714-1774, German physician and botanist, professor at University of Helmstedt.
- Faruqi, Celarier & Mehr. Shamin Ahmad Faruqi, 1933- , University of Karachi, Pakistan; Leguminosae of West Pakistan, Commelinaceae (*Setcreasea*), R. P. Celarier, and K. L. Mehra, 1930- , Central Grasslands Research Institute, Jhansi, U. P. India; Gramineae, Commelinaceae, Leguminosae.
- Farw. Oliver Atkins Farwell, 1867-1944, consulting botanist for Parke, Davis & Co., Detroit, Michigan.
- Fassett. Norman Carter Fassett, 1900-1954, professor of botany, University of Wisconsin, Madison; author of "A Manual of Aquatic Plants" (1940, revised by E. C. Ogden in 1957), "Spring Flora of Wisconsin" (1947), etc.
- Fawc. & Rendle. William Fawcett, 1851-1926, and Alfred Barton Rendle, 1865-1938, English botanists; authors of "Flora of Jamaica" (1910-1936).
- Featherly. Henry Ira Featherly, 1893- , Oklahoma State University, Stillwater; author (with Clara E. Russell) of "The Ferns of Oklahoma" (1939), Gramineae.
- Featherm. Americus Featherman, 1822- ? , Prof. of Romance Languages, Louisiana State Seminary of Learning (later La. State Univ.); collector and author of Louisiana plants (1870-1872).
- Fedde. Friedrich Karl Georg Fedde, 1873-1942, professor and editor in Berlin; Papaveraceae; founder and editor of *FEDDES REPERTORIUM SPECIERUM NOVARUM REGNI VEGETABILIS* (1905-).
- Fée. Antoine Laurent Apollinaire Fée, 1789-1874, French botanist, professor at Strassburg; noted student of cryptogams.
- Fenzl. Eduard Fenzl, 1808-1879, Austrian botanist, curator in Vienna Botanical Museum.
- Ferg. Alexander McGowen Ferguson, 1874- , Texas plant breeder.
- Fern. Merritt Lyndon Fernald, 1873-1950, director of Gray Herbarium (1937-1947); a founder of *RHODORA* (associate editor, 1899-1928, editor, 1929-1950); noted plant geographer and systematist; *Potamogeton*; author of "Gray's Manual of Botany, Eighth Edition" (1950).
- Fern. & Brack. M. L. Fernald, and A. E. Brackett.
- Fern. & Grisc. M. L. Fernald and Ludlow Griscom, 1890-1959, Harvard University research ornithologist.
- Fern. & Rehd. M. L. Fernald, and A. Rehder.
- Fern. & Schub. M. L. Fernald, and B. G. Schubert.
- Fern. & Wieg. M. L. Fernald, and K. M. Wiegand.
- Fieb. Franz Xaver Fieber, 1807-1872, Hungary.
- Fing. Karl Anton Fingerhuth, 1802-1876, German botanist.

- Fisch. Friedrich Ernst Ludwig von Fischer, 1782-1854, director of the botanic garden, St. Petersburg (1823-1850).
- Flory. Walter S Flory, prof. of botany and director of Reynolda Gardens, Wake Forest University, Winston-Salem, North Carolina; Amaryllidaceae.
- Fisch. & All. F. E. L. Fischer, and C. Allioni.
- Fisch. & Mey. F. E. L. Fischer, and C. A. Meyer.
- Fisher. E. M. Fisher; published on *Caesalpinia* in 1892.
- Flügge. Johann Flügge, 1775-1816, German botanist, botanical garden in Hamburg.
- Flyr. Lowell David Flyr, 1937- , Department of Botany, University of Texas, Austin, later Gray Herbarium, Harvard University; Compositae (*Brickellia*).
- Focke. Wilhelm Olbers Focke, 1834-1922, physician in Berne, Switzerland; student of *Rubus*.
- Forsk. Petrus Forsskål (also Pehr Forskål), 1732-1763, Danish student of Linnaeus who traveled to Arabia and wrote a flora of Egypt and Arabia; died on the desert of starvation and exposure after repeated encounters with bandits.
- Forst. Johann Reinhold Forster, 1729-1798, German explorer and botanist, Halle.
- Forst. & Forst. f. J. R. Forster, and his son, J. G. A. Forster, who traveled together to Russia and England and on Captain Cook's Second Voyage.
- G. Forst. Johann Georg Adam (also George Forster) Forster, son of J. R. Forster, 1754-1794, professor of natural history, Cassel, Germany.
- Fort. Robert Fortune, 1813-1880; noted Scottish plant explorer for Royal Horticultural Society in China, Java, etc. (1843-45, 1848-50), introduced tea into India in 1851; author of "Wanderings in China" (1847), etc.
- Fosb. Francis Raymond Fosberg, 1908- , U. S. Geological Survey, Washington; student of the California, South American and Polynesian floras; Rubiaceae.
- Foster. Robert Chighton Foster, 1904- , Gray Herbarium, Harvard University; Iridaceae.
- Foug. Auguste Denis Fougeroux de Bondaroy, 1732-1789, France.
- Fourn. Eugene Pierre Nicolas Fournier, 1834-1884, physician in Paris; Asclepiadaceae.
- Franch. Adrien René Franchet, 1834-1900, French botanist.
- Franch. & Sav. A. R. Franchet, and Paul Amedée Ludovic Savatier, 1830-1891. French marine medical officer and botanist.
- Franco. João Manuel Antonio Paes do Amaral Franco, 1921- , Lisbon, Portugal.
- S. V. Fraser. Samuel Victorian Fraser, 1890- , student of flora of Cloud County, Kansas.
- F. L. Freeman. Florence L. Freeman, 1912- , published on *Psoralea* in 1937.
- J. D. Freeman. John Daniel Freeman, 1941- , Auburn University, Alabama; Liliaceae (*Trillium*).
- Fresen. Johann Baptist Georg Wolfgang Fresenius, 1808-1866, German physician and botanist.
- Friedl. Solomon Friedland, 1912- , New York Botanical Garden; *Hemicarpha*.
- Fries. Elias Magnus Fries, 1794-1878, professor of botany, Uppsala; noted mycologist and student of *Hieracium*.
- R. E. Fries. Robert Elias (i.e., Klas Robert Elias) Fries, 1876- , a student of Northern Rhodesian and Argentine plants.
- Friesner. Ray Clarence Friesner, 1894-1952, botanist, editor and dean, Butler University, Indianapolis, Ind.
- Fritsch. Karl F. Fritsch, 1864-1934, Graz, Austria.
- Gaertn. Joseph Gaertner, 1732-1791, German physician and botanist, Stuttgart; writer on the structure of fruit and seeds.
- Gaertn. f. Carl Friederich von Gaertner, 1772-1850, son of Joseph, German physician and botanist at Calw.
- Gagnebin. Abraham Gagnebin, 1707-1800, Swiss botanist.
- Gaiser. Lulu Odel Gaiser, 1896-1965, Canadian botanist, Barnard College, New York, and Gray Herbarium, Harvard University; Compositae (*Liatris*), flora of Lambton County, Ontario.
- Gal. Henri (Guillaume) Galeotti, 1814-1858, director of botanical gardens, Brussels; collector of and author regarding Mexican plants.
- Gale. Shirley (later Cross) Gale, 1915- , Gray Herbarium, Harvard University, later a housewife; Cyperaceae (*Rhynchospora*).
- Gand. Michel Gandoger, 1850-1926, French botanist and abbé; author of "Flora Europae" (27 vols.); voluminous writer; amasser of a huge herbarium now at Lyon; a "splitter" who named thousands of unacceptable species.
- Garden. Alexander Garden, 1730-1791, physician and amateur botanist of Charleston, South Carolina, for whom Linnaeus named the genus *Gardenia*.
- Garrett. Albert Osburn Garrett, 1870-1948, high-school teacher in Salt Lake City, Utah; author of "Spring Flora of the Wasatch Region" (1911; 1936).
- Gates. Reginald Ruggles Gates, 1882-1962, Canadian-born botanist, Peabody Museum, Harvard University.
- Gatt. Augustin Gattinger, 1825-1903, author of "The flora of Tennessee and a philosophy of botany" (1901), etc. His herbarium housed at the University of Tennessee was regrettably destroyed by fire.
- Gaud. Jean François Aimée (Gottlieb) Philippe Gaudin, 1766-1833, Swiss clergyman and agrostologist, Nyon.
- Gaudich. Charles Gaudichaud-Beaupré, 1789-1854, French botanist and traveller.
- Gay. Jacques Etienne Gay, 1786-1864, French student of the flora of Switzerland and the Pyrenees, systematist and morphologist.
- Gay & Durieu. J. E. Gay, and M. C. Durieu de Maisonneuve.
- Gentry. Howard Scott Gentry, 1903- , botanist, U. S. Dept. Agriculture, Beltsville, Maryland; Amaryllidaceae (*Agave*); economic plants; flora of northwest Mexico; botanical explorer par excellence.
- Geyer. Carl (Charles) Andreas Geyer, 1809-1853, Austrian botanist with Nicolle's expedition;

- collected in northern Idaho and Washington in 1844.
- Gilib. Jean Emmanuel Gilibert, 1741-1814, French botanist, professor in Wilna, Lithuania, later in Lyon, France; author of "Flora Lithuanica" (1785).
- Gill. Lake Shore Gill, 1900—, American forest pathologist.
- Gill. & Arn. John Gillies, 1747-1836, Scotch physician who resided some years in Argentina and collected in Chile, and A. W. Arnott.
- Gill. & Hook. J. Gillies, and W. J. Hooker.
- Gilly. Charles Louis Gilly, 1911—, botanist, Michigan State University, East Lansing.
- Giseke. Paul Dietrich Giseke, 1741-1796, German botanist, pupil of Linnaeus, professor of botany, Hamburg; Compositae.
- Gke. Christian August Friedrich Garcke, 1819-1904, German botanist, curator of the herbarium, Berlin; author of "Flora von Nord- und Mittel-Deutschland" (1849) that went through 20 editions.
- Gl. Henry Allan Gleason, 1882—, assistant director and head curator, New York Botanical Garden; author of "New Britton & Brown Illustrated Flora" (1952), etc.
- Gmel. Johann Georg Gmelin, 1709-1755, German botanist who traveled in Siberia and Kamchatka (1733-1743), and gave first account of their floras; author of the classic "Flora Sibirica" (1747-1769); later professor in Tübingen, Germany.
- C. C. Gmel. Carl Christian Gmelin, 1762-1837, physician in Karlsruhe, Germany; author of "Flora Badensis Alsatica" (1805-1826).
- J. F. Gmel. Johann Friedrich Gmelin, nephew of J. G. Gmelin, 1748-1804, professor in Tübingen, then in Göttingen, Germany; editor of the 13th ed. of Linne's "Systema Naturae" (1788-1793).
- Godfrey. Robert Kenneth Godfrey, 1911—, professor of botany, Florida State University, Tallahassee; floristics, southeastern United States, Compositae; author (with Herman Kurz) of "Trees of Northern Florida" (1962), etc.; botanical collector par excellence.
- Godr. Dominique Alexandre Godron, 1807-1880, French botanist of Nancy.
- Gomes. Bernardino Antonio Gomes, 1769-1823, Portuguese botanist; student of Brazilian plants.
- Goodd. Leslie Newton Goodding, 1880-1967, student of Aven Nelson, botanist, U. S. Soil Conservation Service, Arizona; forest pathology, southwestern flora, conservation.
- C. Goodd. Charlotte Olive (*later* Reeder) Goodding, the daughter, 1916—, Yale University, *later* University of Wyoming; Gramineae (*Bouteloua*, *Muhlenbergia*).
- Goodm. George Jones Goodman, 1904—, professor of botany, University of Oklahoma, Norman; West American genera of Polygonaceae, flora of the Redlands.
- Gould. Frank Walton Gould, 1913—, professor of range and forestry, Texas A&M University, agronomist; author of "Texas Plants—a Checklist and Ecological Summary" (1962), "Grass Systematics" (1968), etc.
- Gould & Kapadia. F. W. Gould, and Zarir Jamasji Kapadia, 1935—, Bangalore, India; Gramineae (*Bouteloua*).
- Grab. Robert Graham, 1786-1845, professor of botany, Edinburgh, Scotland.
- Grant. Adele Lewis Grant, 1881-1969, Missouri Botanical Garden, *later* professor of botany, University of Southern California, Los Angeles; monographer of *Mimulus*.
- A. & V. Grant. Alva (Day) (Hansen) Grant, 1920—, Rancho Santa Ana Botanic Garden, California; Polemoniaceae, and V. E. Grant.
- V. Grant. Verne Edwin Grant, 1917—, cytogeneticist, Rancho Santa Ana Botanic Garden, Anaheim, California, *later* Boyce Thompson Southwestern Arboretum, Arizona; Polemoniaceae.
- Gray. Asa Gray, 1810-1888, professor of botany, Harvard University, preeminent American systematist; author of "Manual of the Botany of the Northern States" (1848, now through 8 editions); (Gamopetalae of California) in Brewer and Watson's "Botany of California" (1876); "Synoptical Flora of North America" (1878-1897); botanical textbooks, numerous reports of collections and revisions.
- Gray & Engelm. (or G. & E.). A. Gray, and G. Engelmann.
- S. F. Gray. Samuel Frederick Gray, 1766-1836 (?28), British naturalist; author of "Natural Arrangement of British Plants" (1821), a work much in advance of its time.
- Greene. Edward Lee Greene, 1843-1915, first professor of botany, University of California (1885-1895), Berkeley, then at Catholic University of America and Smithsonian Institution in Washington; editor of PITTONIA and LEAFLETS OF BOTANICAL OBSERVATION AND CRITICISM; believer in absolute priority in nomenclature, the names of his microspecies are called "chloronyms."
- Greenm. Jesse More Greenman, 1867-1951, curator of the herbarium, Missouri Botanical Garden (1913-1948); *Senecio*.
- Greenm. & Thomps. J. M. Greenman and C. H. Thompson.
- Grenz. Myrle Grenzbach (Mrs. Lawrence Sherod), Missouri Botanical Garden, St. Louis, published on *Bouchea* (Verbenaceae) in 1926; *later* housewife in Ohio.
- Grev. & Hook. Cf. Hook. & Grev.
- Griffiths. David Griffiths, 1867-1935, agronomist, U. S. Dept. Agriculture, Washington.
- Griffiths & Hare. D. Griffiths, and Raleigh Frederick Hare, 1870-1934, plant chemist, New Mexico State University, Las Cruces.
- Griseb. August Heinrich Rudolph Grisebach, 1814-1879, professor of botany, Göttingen, Germany; noted for his "Vegetation der Erde" (1872, ed. 2, 1884), and studies on the West Indian flora (1857-66); Gentianaceae.
- Grub. Valery Ivanovich Grubov, 1917—, botanist at Leningrad; *Rhamnus* and *Frangula*.
- Guill. Jean Baptiste Antoine Guillemin, 1796-1842, French botanist who traveled in Brazil.
- Gürke. Robert Louis August Max Gürke, 1854-1911, Germany.
- Guss. Giovanni Gussone, 1787-1866, professor of botany, Naples; author of valuable works on the flora of southern Italy and Sicily.
- H. & A. W. J. Hooker and G. A. Arnott; authors of "The Botany of Captain Beechey's Voyage" (1830-1841).

- H. & B. Baron Friedrich Wilhelm Heinrich Alexander von Humboldt, 1769-1859, German zoologist, and Aimé Jacques Alexandre Bonpland, 1773-1858, French botanist; authors of the classic "Voyage aux Régions Equinoxiales du Nouveau Continent, etc." (1805-1837).
- Haage & Schmidt. Ferdinand Haage, 1859-1930, and Friedrich Schmidt, 1832-1908, Germany; Verbenaceae.
- Haage f. Friedr. Ad Haage, 1859-1930, son of F. Haage, Germany.
- Hack. Eduard Hackel, 1850-1926, noted Austrian agrostologist.
- Hack. & Arech. E. Hackel, and J. Arechavaleta.
- Hall. Harvey Monroe Hall, 1874-1932, professor of botany, University of California, Berkeley, then staff member Carnegie Institution of Washington; pioneer in experimental taxonomy; student of the Compositae (*Haplopappus*, Madiinae); author (with Carlotta Hall) of "A Yosemite Flora" (1912).
- Hall & Clem. H. M. Hall, and F. E. Clements; authors of "The Phylogenetic Method in Taxonomy" (1923), in which North American *Artemisia*, *Chrysothamnus* and *Atriplex* are monographed.
- C. Hall. Carlotta (Case) Hall, the wife, 1880-1949, California; student of ferns.
- Haller. Albrecht von Haller, 1708-1777, Swiss botanist, physician, poet and statesman; professor in Göttingen, Germany, later in Berne, Switzerland.
- Hallier f. Hans Gottfried Hallier, 1868-1932, Dutch botanist of Buitenzorg and Leiden; student of phylogeny.
- Hamilt. William Hamilton, 1783-1856, British physician and traveler; student of West Indian plants.
- A. Hamilt. Arthur Hamilton, Swiss botanist, Geneva, author of a monograph on *Scutellaria* in 1832.
- Hara. Hiroshi Hara, 1911- , Japanese taxonomist, cytologist, synantherologist.
- Harbison. Thomas Grant Harbison, 1862-1936, naturalist and botanist, curator of Herbarium, University of North Carolina, Chapel Hill; a close colleague of W. W. Ashe.
- Harlan. Jack Rodwey Harlan, 1917- , University of Illinois, Urbana; crop plants.
- Harms. Vernon L. Harms, 1930- , professor of botany, University of Alaska, College, then University of Saskatchewan, Saskatoon, Canada; Compositae (*Heterotheca*, *Petasites*), northwestern U. S. and Canada, *Sparganium*.
- Harper. Roland McMillan Harper, 1878-1966, Maine-born Alabama botanist; unique field botanist and author of works on botany, geology, ecology, etc. of southeastern U. S.
- Harrington. Harold David Harrington, 1903- , professor of botany, Colorado State University, Ft. Collins; author of "Manual of the Plants of Colorado" (1954).
- Hartm. Carl Johan Hartman, 1790-1849, Swedish botanist.
- Harv. William Henry Harvey, 1811-1866, professor of botany and keeper of the herbarium, Trinity College, Dublin; made known the California collections of Thomas Coulter; author (with O. W. Sonder) of "Flora Capensis" (1859-1865).
- Harv. & Gray. W. H. Harvey, and A. Gray.
- L. H. Harvey. LeRoy Hatfield Harvey, 1911- , University of Montana, Missoula; *Eragrostis*.
- Hassk. Justus Carl Hasskarl, 1811-1894, German botanist at Buitenzorg, Java.
- Hassl. Emil Hassler, 1861-1937, student of the Argentine and Paraguayan floras.
- Hausskn. Heinrich Karl Haussknecht, 1838-1903, professor in Weimar; monographer of *Epilobium*.
- Haw. Adrian Hardy Haworth, 1767(?88)-1833, English gardener and entomologist; student of succulents, *Mesembryanthemum*.
- Hawksworth. Frank Goode Hawksworth, 1926- , forest pathologist, U. S. Forest and Range Experiment Station, Ft. Collins, Colorado; *Arceuthobium*.
- Hawksworth & Wiens. F. G. Hawksworth, and Delbert Wiens, 1932- , University of Utah, Salt Lake City; Viscaceae.
- Hayek. August von Hayek, 1871-1928, Austrian plant geographer, University of Vienna; author of a flora of Steiermark.
- Hayne. Friedrich Gottlob Hayne, 1763-1832, professor of botany, Berlin.
- Hayward. Wyndham Hayward, 1903- , Lakemont Gardens, Winter Park, Florida; Amaryllidaceae.
- H.B.K. Baron F. W. H. A von Humboldt, A.J.A. Bonpland, the two forming the most famous scientific expedition to tropical America, and C. S. Kunth, who wrote the text of their descriptive work "Nova genera et species Plantarum" (1815-1825).
- Hegelm. Christof Friedrich Hegelmaier, 1833-1906, professor of botany, Tübingen, Germany; Lemnaceae, *Callitriche*.
- Hegi. Gustav Hegi, 1876-1932, German botanist; author of "Illustrierte Flora von Mittel-Europa" (1906-1931).
- Heimerl. Anton Heimerl, 1857-1942, professor in Vienna, Austria; Nyctaginaceae, *Achillea*.
- Heiser. Charles Bixler Heiser, Jr., 1920- , professor of botany, University of Indiana, Bloomington; Compositae, Solanaceae.
- Heist. Lorenz Heister, 1683-1758, professor in Helmstedt, Germany.
- Heller. Amos Arthur Heller, 1867-1944, Pennsylvania botanist, noted collector of western American plants; founder and editor of *MUHLENBERGIA*.
- Hemsl. William Botting Hemsley, 1843-1924, British botanist, keeper of the herbarium, Kew (1899-1908); author of the 5 vol. work on the botany in Godman and Salvin's "Biologia Centrali-Americana" (1879-1888).
- Henr. Jan Theodoor Henrard, 1881- , Conservator, Rijksherbarium, Leiden; *Aristida*.
- Herb. William Herbert, 1778-1847, English politician and botanist, then a churchman, becoming Dean of Manchester; Amaryllidaceae.
- Herm. Frederick Joseph Hermann, 1906- , U. S. Dept. Agriculture, Beltsville, Maryland, later U. S. Forest Service, Washington; *Carex*, bryophytes.
- Herter. Wilhelm Gustav Herter, 1884-1958, German botanist who resided in Uruguay after 1924; author of an illustrated flora of Uruguay (1939-57).
- Hester. J. Pinckney Hester, contemporary southern California writer on succulents. Resident of Fredonia, Arizona.

- Hevly. Richard Holmes Hevly, 1934—, botanist, Northern Arizona University, Flagstaff; *Martyniaceae* (*Proboscidea*), Pteridophyta.
- Heynh. Gustav Heynhold, 1800—?, Saxony; *Hieracium*.
- Hieron. Georg Hans Emo Wolfgang Hieronymus, 1846-1921, professor in Berlin; student of the Argentine and Andean flora.
- Hildmann. H. Hildmann, about 1891.
- Hill. John Hill, 1716-1775, London apothecary and naturalist, author of herbals and nature books; produced the first flora of England on the Linnaean system.
- A. W. Hill. Arthur William Hill, 1875-1941, South Africa.
- Hitchc. Albert Spear Hitchcock, 1865-1935, botanist, U. S. Dept. Agric., Washington, leading American agrostologist; author of "Manual of Grasses of the United States" (1935) and other works.
- Hitchc. & Chase. A. S. Hitchcock, and M. A. Chase.
- Hitchc. & Maguire. C. L. Hitchcock, and B. Maguire.
- Hitchc. & Moldenke. C. L. Hitchcock, and H. N. Moldenke.
- C. L. Hitchc. Charles Leo Hitchcock, 1902—, professor of botany, University of Washington, Seattle; *Lycium*, *Draba*, *Lepidium*, *Lathyrus*, *Sidalcea*, etc.; senior author of "Vascular Plants of the Pacific Northwest" (1955-1984).
- Hochr. Bénédict Pierre Georges Hochreutiner, 1873-1959, director, Conservatoire de Botanique, Geneva.
- Hochst. Christian Ferdinand Hochstetter, 1787-1860, botanist at Stuttgart.
- Hodg. Albion Reed Hodgdon, 1909—, Professor of botany, University of New Hampshire, editor of *RHODORA* (1962—); student of Cistaceae.
- Hoffm. Georg Franz Hoffman, 1760-1826, professor of botany, Göttingen, later in Moscow (1804-1826); student of lichens, *Salix* and Umbelliferae.
- Hoffmsg. & Link. Johann Centurius Graf von Hoffmannsegg, 1766-1849, Dresden, and J. H. F. Link; authors of "Flore Portugaise" (1809-1840).
- Hogg. Thomas Hogg, 1777-1855, England.
- Hohenack. Rudolph Friedrich Hohenacker, 1798-1874, Switzerland.
- Holmgren. Noel Herman Holmgren, 1937—, botanist, New York Botanical Garden; Scrophulariaceae (*Castilleja*).
- Holz. John Michael Holzinger, 1853-1929, German-born American bryologist, teacher in State Teachers College, Winona, Minnesota.
- Hook. Sir William Jackson Hooker, 1785-1865, director of Kew (1841-1865); author of "Flora boreali-americana" (1833-1840) and many other illustrious works; founder and editor of *JOURNAL OF BOTANY* and *ICONES PLANTARUM*; editor of *BOTANICAL MAGAZINE*.
- Hook. f. Sir Joseph Dalton Hooker, the son, 1817-1911, British botanist and explorer, director of Kew (1865-1885); talented editor and student of New Zealand, Himalayan and Indian floras; visited America in 1877.
- Hook. & Grev. W. J. Hooker and Robert Kaye Greville, 1794-1866, professor in Edinburgh; authors of "Icones Filicum" (1827-1832).
- Höpffer. Carl Höpffer, 1810—, interested in Cactaceae.
- M. Hopk. Milton Hopkins, 1906—, professor of botany, Oklahoma (1936-1945), then editor for publication houses; *Arabis*, *Cercis*.
- Horkel. Johann Horkel, 1769-1846, Germany; Lemnaceae.
- Hornem. Jens Wilken Hornemann, 1770-1841, professor of botany, Copenhagen.
- Host. Nicolaus Thomas Host, 1761-1834, imperial physician in Vienna; author of "Flora Austriaca" (1827-1831).
- Houghton. Arthur Duvernoix Houghton, 1870-1938, California.
- House. Homer Doliver House, 1878-1949, New York state botanist (1914-1948); author of "Wild Flowers of New York" (1918); later "Wild Flowers . . ." (1934).
- Houst. William Houstoun, 1695-1733, British surgeon who collected in Central America and the West Indies.
- Houtt. Maarten Houttuyn, 1720-1794(?), Dutch physician and naturalist.
- Hu. Shiu-ying Hu, 1910—, Arnold Arboretum, Harvard University; student of the Chinese flora, monographer of *Philadelphus*.
- C. E. Hubb. Charles Edward Hubbard, 1900—, agrostologist, Kew.
- F. T. Hubb. Frederick Tracy Hubbard, 1875-1962, librarian in Economic Botany and editor, Botanical Museum, Harvard University; agrostologist.
- H. Huber. Hans Huber, 1919—, University of Basel, Switzerland; primarily interested in bryophytes.
- Huds. William Hudson, 1730-1793, London apothecary and botanist; author of "Flora Anglica" (1762, first of 3 ed.).
- Hult. Oskar Eric Gunnae Hultén, 1894—, professor of botany, Stockholm, student of American Arctic floras; author of "Flora of Kamtchatka" (1927-1929), "Flora of the Aleutian Islands" (1937), "Flora of Alaska and Yukon" (1941-1950).
- Hult. & St. John. O. E. G. Hultén, and Harold St. John.
- Hutchins. John Hutchinson, 1884—, Kew; author of "Families of Flowering Plants" (1959); a new system of phylogeny proposed in 1926, 1934.
- Hylander. Nils Hylander, 1904—, Institution for Systematic Botany, Uppsala, Sweden.
- Iltis. Hugh Hellmut Iltis, 1925—, Czechoslovakian-born American botanist, professor of botany, University of Wisconsin, Madison; Cappariaceae, flora of Wisconsin.
- J. Ingram. John William Ingram, Jr., 1924—, L. H. Bailey Hortorium, Cornell University, Ithaca, New York; Euphorbiaceae (*Argythamnia*), cultivated Liliaceae and Iridaceae.
- Irving. Robert Stewart Irving, 1942—, botanist, University of Montana, Missoula; Labiatae.
- Irwin. Howard Samuel Irwin, 1928—, New York Botanical Garden; Leguminosae; flora of central Brazil.

- Isely. Duane Isely, 1918—, professor of botany, Iowa State University, Ames; Leguminosae.
- Ives. Eli Ives, 1779-1861, professor at Yale.
- R. C. Jackson. Raymond C. Jackson, 1928—, professor of botany, University of Kansas, Lawrence; Compositae, Astereae.
- Jacobi. Georg Albano von Jacobi, 1805-1874, Prussian army general who collected plants in Austria and Bohemia.
- Jacq. Nikolaus Joseph Baron von Jacquin, 1727-1817, professor of botany and director of the botanic garden, Vienna; noted systematist.
- James. Edwin James, 1797-1861, surgeon-naturalist, first botanical collector in Colorado, also probably first botanical collector in Texas, with Major S. H. Long's Expedition to the Rocky Mountains (1819-1820).
- Jeffs & Little. Royal Edgar Jeffs, 1879-1933, professor of botany, University of Oklahoma, Norman; flora of Oklahoma, and E. L. Little, Jr.
- Jaume St.-Hil. Jean Henri Jaume Saint-Hilaire, 1772-1845, French botanist.
- Jeps. Willis Linn Jepson, 1867-1946, professor of botany, California; author of "A Flora of California" (1909-39), "A Manual of the Flowering Plants of California" (1923, 1925, 1950), and other works; founder of the California Botanical Society.
- R. R. Johnson. Raymond Roy Johnson, 1932—, Prescott College, Prescott, Arizona; flora (especially Compositae) of southwestern New Mexico and western Texas, *Porophyllum*.
- I. M. Johnst. Ivan Murray Johnston, 1898-1960, professor of botany, Harvard University; authority on world floras, Boraginaceae, plant explorer, prolific author.
- J. R. Johnst. John Robert Johnston, 1880-1953, American plant pathologist; student of the plants of Guatemala and Venezuela.
- M. C. Johnst. Marshall Conring Johnston, 1930—, Dept. of Botany, University of Texas, Austin; Euphorbiaceae, Rhamnaceae, student of the Texas and Mexican floras; author of numerous papers.
- F. B. Jones. Frederick Butler Jones, 1909—, botanist, Welder Wildlife Foundation, Sinton, Texas; author (with C. M. Rowell, Jr. and M. C. Johnston) of "Flowering Plants and Ferns of the Texas Coastal Bend Counties" (1961).
- G. N. Jones. George Neville Jones, 1904—, professor of botany, University of Illinois, Urbana; author of floras on the Olympic Peninsula (1936), Mt. Rainier (1938), and Illinois (1945).
- M. E. Jones. Marcus Eugene Jones, 1852-1934, Utah mining consultant; assembled very extensive herbarium of Great Basin plants now at Pomona College; published his botanical observations in a private journal, "Contributions to Western Botany," that is marked by his cutting criticism of almost all contemporaries.
- Jord. Alexis Jordan, 1814-1897, Lyon, France; proved the existence of many genetically distinct races (which he elevated to specific rank) in such complexes as *Erophila verna*; such microspecies are now often called "jordanons."
- Juss. Antoine Laurent de Jussieu, nephew of Bernard, 1748-1836, professor in the Jardin de Plantes, Paris; first characterizer of natural families; expounder of his uncle's new system.
- A. Juss. Adrien Henri Laurent de Jussieu, the son of Antoine, 1797-1853, professor in the Jardin des Plantes, Paris.
- B. Juss. Bernard de Jussieu, 1699-1776(?), arranger of the garden of La Trianon at Versailles after a new system of classification which was an outgrowth of the teaching of Tournefort.
- Karst. Gustav Karl Wilhelm Hermann Karsten, 1817-1908, German botanist, professor in Vienna; author of "Flora von Deutschland, Oesterreich und der Schweiz" (1895).
- Kaulf. Georg Friedrich Kaulfuss, 1786-1830, professor in Halle an der Saale, Germany; student of ferns.
- Kearn. Thomas Henry Kearney, 1874-1956, U. S. Dept. Agriculture and California Academy of Sciences; taxonomist and cotton breeder, Malvaceae.
- Kearn. & Peeb. T. H. Kearney, and R. H. Peebles; authors of "Flowering Plants and Ferns of Arizona" (1942), "Arizona Flora" (1951).
- Keck. David Daniels Keck, 1903—, Head Curator, New York Botanical Garden (1951-58), Assistant Director (1956-58); National Science Foundation, Washington (1958-67); emigrated to New Zealand in 1967; Compositae (Madiinae), California flora, *Penstemon*, experimental taxonomy.
- Kell. Albert Kellogg, 1813-1887, San Francisco physician and botanist; a founder of the California Academy of Sciences.
- Keng. Yi Li Keng, 1898—, China.
- Ker. John Bellenden Ker, or John Ker Bellenden, or (before 1804) John Gawler, 1764-1842, British botanist, first editor of EDWARDS' BOTANICAL REGISTER.
- Kern. Ritter Anton Josef Kerner von Marilaun, 1831-1898, professor of botany, Innsbruck, later Vienna; made the first scientific transplant experiments using climatically unlike gardens; author of "Pflanzenleben" (1887-1891).
- King & Rob. R. M. King, and Harold Ernest Robinson, 1932—, botanist, U. S. National Herbarium, Washington; Compositae, bryophytes.
- R. M. King. Robert Merrill King, 1930—, botanist, U. S. National Herbarium, Washington; Compositae (Eupatorieae).
- Kit. Paul Kitaibel, 1757-1817, professor of botany and chemistry, and director of the botanic garden, Budapest.
- Kittell. Sister Teresita Kittell, 1892—, Catholic University of America, Washington, later Holy Family College, Manitowoc, Wisconsin; author of "Critical Revision of the Compositae of Arizona and New Mexico" (1941) (cf. Tidestrom).
- Kl. Johann Friedrich Klotzsch, 1805-1860, curator of the herbarium, Berlin; monographer of Begoniaceae.
- Kl. & Gke. J. F. Klotzsch, and F. A. Garcke.
- Klatt. Friedrich Wilhelm Klatt, 1825-1897, Hamburg; Iridaceae.
- Knerr. Ellsworth Brownell Knerr, 1861-1942, Missouri physician.

- Kneuck. Johann Andreas Kneucker, 1862-1946, director, Karlsruhe, Germany.
- Knight. Ora Willis Knight, 1874-1913, United States; Orchidaceae.
- Knuth. Reinhard Gustav Paul Knuth, 1874-1957, German student of Primulaceae, Geraniaceae, etc.
- Kobuski. Clarence Emmeren Kobuski, 1900-1963, Arnold Arboretum, Harvard University; Theaceae.
- Koch. Wilhelm Daniel Joseph Koch, 1771-1849, German botanist, professor of botany, Erlangen; author or editor of three floras of Germany and Switzerland, Umbelliferae.
- K. (or C.) Koch. Karl Heinrich Emil Koch, 1809-1879. German traveler in the Orient, dendrologist, professor in Berlin; author of "Hortus Dendrologicus" (1853).
- Koehne. Bernhard Adalbert Emil Koehne, 1848-1918, professor in Berlin; Lythraceae.
- Koel. Georg Ludwig Koeler, 1765-1807, professor in Mainz; author of a treatise on the grasses of Germany and France.
- Konig. Karl Dietrich Eberhard Koenig, 1774-1851, German geologist at the British Museum; while in England (most of his life) he was known as "Charles Konig."
- Körn. Friedrich Körnicke, 1828-? (after 1859), German botanist; Eriocaulaceae.
- Koyama. Tetsuo Koyama, 1933- , Japanese-born American botanist, New York Botanical Garden; earlier Botanical Institute, University of Tokyo, Japan; Cyperaceae.
- Kral. Robert Kral, 1926- , Dept. of Biology, Vanderbilt University, Nashville, Tennessee; Cyperaceae, Xyridaceae, Eriocaulaceae, Flora of Alabama and Middle Tennessee.
- Krauskopf. Englebert Krauskopf, 1820-1881, gunsmith and amateur botanist, Fredericksburg, Texas.
- Krok. Thorgny Ossian Bolivar Napoleon Krok, 1834-1921, Swedish botanist, Stockholm; *Valerianella*.
- O. Ktze. Carl Ernst Otto Kuntze, 1843-1907, German traveler and botanist, advocate of strict priority in nomenclature; author of "Revisio Generum Plantarum" (1891) in which the names of over 30,000 species were changed.
- Kuhn. Friedrich Adalbert Maximilian Kuhn, 1842-1894, German student of ferns.
- Kükenth. Georg Kükenthal, 1864-1956, clergyman of Coburg, Germany; authority on Cyperaceae.
- Kunth. Carl Sigismund Kunth, 1788-1850, professor of botany, Berlin; excellent systematist and voluminous writer.
- Kunth & Bouché. C. S. Kunth, and Carl David Bouché, 1809-1881, German botanist.
- Kunze. Gustav Kunze, 1793-1851, German botanist and physician, director of the Leipzig botanical garden; student of ferns.
- Kurtz. Fritz (Frederico) Kurtz, 1854-1920, German botanist who moved to Córdoba, Argentina in 1884 as professor of botany.
- Kütz. Friedrich Traugott (Kuetzing) Kützing, 1807-1893, German algologist, Nordhausen.
- L. Carolus Linnaeus (*afterwards* Carl von Linné), 1707-1778, Uppsala, Sweden; founder of binomial nomenclature and the Sexual System of classification in "Species Plantarum" (1753); the "Father of Botany," as we know and practice it today, a prodigious author.
- L. f. Carl von Linné, the son, 1741-1783, successor to his father in the professorship of botany in Uppsala.
- Labill. Jacques Julien Houtton de Labillardière, 1755-1834, French botanist and explorer.
- Lag. Mariano Lagasca y Segura, 1776-1839, professor and director of the botanic garden, Madrid; his collections were destroyed by a mob, and he was exiled to England.
- Lag. & Rodr. M. Lagasca y Segura, and José Demetrio Rodriguez, 1780-1846, director of the botanic garden, Madrid.
- Lahman. Bertha Marion Lahman (née Sherwood), 1872- , married 1898, United States; Cactaceae.
- La Llave & Lex. Pablo de La Llave, 1773-1833, Spain and Mexico, and Juan José Martínez de Lexarza, 1785-1824, Mexico; authors of "Nov. Veg. Descr. Orch. Opusc." (1824-25).
- Lam. Jean Baptiste Antoine Pierre Monnet de Lamarck, 1744-1829, famous French botanist and zoologist who propounded a theory of evolution by the transmission of acquired characters; first to use dichotomous keys in natural history in his "Flore Française" (1778).
- Lam. & DC. J. B. A. P. M. de Lamarck and A. P. de Candolle.
- Lamb. Aylmer Bourke Lambert, 1761-1842, an original member and vice-president of the Linnean Society in London, patron of botany; author of "A Description of the Genus Cinchona" (1797), "A Description of the Genus Pinus" (1803-1842, in 5 ed.), etc.
- Larisey. Mary Maxine Larisey, 1909- , professor, School of Pharmacy, Medical College of South Carolina.
- Larsen. Esther Louise Larsen (Mrs. Kenneth Doak), 1901- , Missouri Botanical Garden (1927-28); Compositae (*Townsendia*).
- Laws. Peter Lawson, d. 1820, and Sir Charles Lawson, the son (?), 1794-1873, Edinburgh nurserymen.
- Leavenw. Melines Conklin Leavenworth, 1796-1862, student of southern U. S. botany.
- Le Conte. John Eatton Le Conte, 1784(?) - 1860(?), English-born Philadelphia botanist.
- Ledeb. Carl Friedrich von Ledebour, 1785-1851, professor in Dorpat; author of "Flora Altaica" (1829-1833) and "Flora Rossica" (1842-1853).
- Legrand. C. Diego Legrand, contemporary Uruguayan botanist; published on *Portulaca* in 1962.
- Lehm. Johann Georg Christian Lehmann, 1792-1860, director of the botanic garden, Hamburg; authority on *Potentilla* and other genera.
- Lej. Alexandre Louis Simon Lejeune, 1779-1858, Belgian physician.
- Lem. Charles Antoine Lemaire, 1801-1871, French botanist, professor in Ghent; student of Cactaceae and cultivated plants; editor of *FLORE DES SERRES* (1845-1855) and *L'ILLUSTRATION HORTICOLE* (1854-1869).
- Lemm. John Gill Lemmon, 1832-1908, pioneer California botanist and schoolteacher in Sierra Valley, early correspondent of Asa Gray; Coniferae.
- Leonard. Emery Clarence Leonard, 1892- , botanist, U. S. National Herbarium, Washington; authority on the Acanthaceae.
- Less. Christian Friedrich Lessing, 1809-1862, German physician; student of Compositae.

- Lévl. & Van. A. B. H. Léveillé, and Eugène Vaniot, ?-1910 (?)
- H. Lévl. Auguste Abel Hector Léveillé, 1863-1918, France.
- Lewis & Moore. W. H. Lewis, and Dwight Munson Moore, 1891- , Arkansas Technology College, Russellville; flora and ecology of Arkansas.
- W. H. Lewis. Walter Hepworth Lewis, 1930- , Canadian-born U. S. botanist, curator, Washington University and Missouri Botanical Garden, St. Louis; Rosaceae (*Rosa*), Rubiaceae (*Hedyotis*), Portulacaceae.
- Lewton. Frederick Lewis Lewton, 1874-1959, American economic and taxonomic botanist; Malvaceae (*Gossypium*, *Cienfuegosia*).
- Ley. Francis Arline (*later* Fitch) Ley, 1919- , Claremont Graduate School, California; *Holodiscus*.
- L'Hér. Charles-Louis L'Héritier de Brutelle, 1746-1800, celebrated French magistrate and botanist.
- Liebm. Frederick Michael Liebman, 1813-1856, Danish professor of botany and director of the Botanic Gardens, Copenhagen, Denmark; collected 40,000 plant specimens in Mexico.
- Lillo & Parodi. Miguel Lillo, 1862-1931, and L. R. Parodi, Argentine botanists.
- Lindh. Ferdinand Jakob Lindheimer, 1801-1879, German-born collector of Texas plants (1836-1879), and correspondent of Asa Gray and George Engelmann; resided in New Braunfels, Texas.
- Lindl. John Lindley, 1799-1865, professor of botany, London; editor of EDWARDS' BOTANICAL REGISTER (1829-1847), horticulturist, eminent orchidologist, textbook writer.
- Lingelsh. Alexander von Lingelsheim, 1874-1937, professor in Breslau; Oleaceae.
- Link. Johann Heinrich Friedrich Link, 1767-1851, professor of natural science and director of the botanic garden, Berlin.
- Link, Kl. & Otto. J. H. F. Link, and J. F. Klotzsch, and Christoph Friedrich Otto, 1763-1856, garden director of Schöneberg, near Berlin.
- Link & Otto. J. H. F. Link, and C. F. Otto.
- Lint & Epl. Harold LeRoy Lint, 1917- , California State Polytechnic College, Pomona; Labiatae (*Agastache*), Juncaceae (*Juncus*), and C. C. Epling.
- Little. Elbert Luther Little, Jr., 1907- , dendrologist, U. S. Forest Service, Washington; author of "Check List of Native and Naturalized Trees of the United States (including Alaska)" (1953), "Southwestern Trees", U.S.D.A. Handb. 9 (1950), (with F. H. Wadsworth) "Common Trees of Puerto Rico and the Virgin Islands" (1964), etc.
- Lloyd. James Lloyd, 1810-1896, London and Nantes; student of the flora of western France.
- Lloyd & Underw. Francis Ernest Lloyd, 1868-1947, professor of botany, McGill University, Montreal, Canada; author of works on guayule and carnivorous plants (1942), and L. M. Underwood.
- Lodd. Conrad Loddiges, 1738-1826, English nurseryman.
- Loefl. Pehr (Peter) Loeffing, 1729-1756, Swedish student of Linnaeus, who traveled to Venezuela for him and died there.
- Loes. Ludwig Eduard Theodor Loesener, 1865-1941, Germany; student of plants of Mayan region in Yucatan.
- Lois. Jean Louis Auguste Loiseleur-Deslongchamps, 1774-1849, French botanist and physician; author of "Flora Gallica" (1806-1807, 2nd ed. 1828).
- Lott. Henry J. Lott, publ. in 1938 from Arnold Arboretum, Harvard University.
- Loud. John Claudius Loudon, 1783-1843, English horticulturist, prolific author and editor of garden books.
- Lour. João de Loureiro, 1710-1791, Portuguese missionary and naturalist.
- Löve & Löve. Askell Löve, 1916- , Icelandic botanist; University of Lund, Sweden (1940-45), University of Iceland, Reykjavik (1945-51), University of Manitoba, Winnipeg (1951-56), University of Montreal, Canada (1956-64), University of Colorado, Boulder (1964-); Polygonaceae (*Rumex*), arctic-alpine-plants, and Doris (Mrs. Askell) Löve, 1918- , University of Colorado, Boulder; Caryophyllaceae, arctic-alpine plants.
- Lundell. Cyrus Longworth Lundell, 1907- , botanist and chief scientist, founder and director of Texas Research Foundation, Renner; author (with collaborators) of "Flora of Texas" (1942-1969, vols. 1, 2 and 3 publ.), "The Vegetation of Peten" (1936), "The Genus Parathesis of the Myrsinaceae" (1966), student of Texas, Mexican and Central American floras; Celastraceae, Myrsinaceae; author of numerous papers in agriculture and botany; founder of S.M.U. and Lundell herbaria.
- Lunell. Joel Lunell, 1851-1920, North Dakota, advocate of strict priority in nomenclature.
- Macbr. James Francis Macbride, 1892- , Gray Herbarium, Harvard University, *later* Chicago Natural History (Field) Museum; student of the West American flora; author (with collaborators) of "Flora of Peru" (1936-).
- Macbr. & Pays. J. F. Macbride, and E. B. Payson.
- Macf. James Macfadyen, 1798(?1800)-1850, Scottish botanist; author of "The flora of Jamaica" (1837).
- Macfarl. John Muirhead Macfarlane, 1855-1943, professor of botany and director of botanical garden, University of Pennsylvania, Philadelphia.
- Mack. Kenneth Kent Mackenzie, 1877-1934, New York City corporation attorney and noted caricologist.
- Mack. & Bush. K. K. Mackenzie, and B. F. Bush.
- MacM. Conway MacMillan, 1867-1929, state botanist, Minnesota; author of "Minnesota Plant Life" (1899).
- Macoun. John Macoun, 1831(?) -1920, eminent Irish-born Canadian botanist, professor of botany, Albert College, Belleville, Ontario; author of "Catalogue of Canadian Plants" (1883-1902), etc.
- Magnus. Paul Wilhelm Magnus, 1844-1941, German taxonomist; *Najas*.
- Maguire. Bassett Maguire, 1904- , curator, then assistant director, New York Botanical Garden; flora of the Great Basin and northeastern South America.
- Malme. Gustav Oskar Andersson Malme, 1864-1937, botanical explorer and author of a work on the flora of Rio Grande do Sul, Brazil (1936).
- Malte. Malte Oscar Malte, 1880-1933, Chief Botanist, National Herbarium of Canada (1921-1933).

- W. Manning. Wayne Eyer Manning, 1899—, Professor of Botany, Wellesley College, Massachusetts, *later* Bucknell University, Lewisburg, Pennsylvania; Juglandaceae, flora of western Massachusetts and central Pennsylvania.
- Mansf. Rudolf Mansfeld, 1901-1960, assistant in the botanical museum, Berlin; Orchidaceae.
- S. Manso. Antonio Luiz Patricio da Silva Manso, 1788-1818, Brazilian naturalist-botanist.
- Marsh. Humphrey Marshall, 1722-1801, Pennsylvania, the father of American dendrology; author of "Arbustum Americanum" (1785).
- W. T. Marsh. William Taylor Marshall, 1886-1957, Desert Botanic Garden, Papago Park, Phoenix, Arizona; author (with T. M. Bock) of "Cactaceae" (1941), and "Arizona's Cactuses" (1950).
- Mart. Karl Friedrich Philipp von Martius, 1794-1868, German botanist and traveler, professor in Munich; founder of the classic "Flora Brasiliensis" (1840-1906) and prolific writer on systematic botany and zoology.
- Mart. & Gal. M. Martens, and H. G. Galeotti.
- Mart. & Schrad. K. F. P. von Martius, and H. A. Schrader.
- Martens. Martin Martens, 1797-1863, Belgian taxonomist, Löwen.
- Martin. Robert Franklin Martin, 1910—, Division of Plant Exploration and Introduction, U. S. Dept. Agriculture, Beltsville, Maryland, *later* lawyer in West Virginia; Papaveraceae.
- F. L. Martin. Floyd Leonard Martin, 1909—, Claremont Graduate School, and teacher, Mark Keppel High School, Alhambra, California; Rosaceae (*Cercocarpus*).
- Martinez. Maximo Martinez, 1888—, distinguished Mexican botanist; authority on Pinaceae.
- Mason. Herbert Louis Mason, 1896—, professor of botany, University of California, Berkeley; Polemoniaceae, fossil floras of California, author of "Flora of the Marshes of California" (1957).
- Mast. Maxwell Tylden Masters, 1833-1907, England; editor of *THE GARDENER'S CHRONICLE*, contributor to Martius' "Flora Brasiliensis" and Oliver's "Flora of Tropical Africa."
- Math. & Const. Mildred Esther (*later* Hassler) Mathias, 1906—, professor of botany, University of California (Los Angeles); Umbelliferae, and L. Constance.
- Math., Const. & Theobald. M. E. Mathias, L. Constance, and William Louis Theobald, 1936—, Occidental College, Los Angeles, California; Umbelliferae (tribe Peucedaneae: *Lomatium*, *Angelica*, etc.).
- Mattf. & Kükenth. Johannes Mattfeld, 1895-1951, curator of the herbarium, Berlin; Compositae, Caryophyllaceae, Cyperaceae, and G. Kükenth.
- Matuda. Eizi Matuda, 1894—, Instituto de Biologia, Universidad N. A. Mexico; Flora of state of Mexico (diverse groups).
- Maxim. Carl Johann (Karl Ivanovich Maksimovich) Maximowicz, 1827-1891, Russian botanist, director of the botanic garden, St. Petersburg.
- Maxon. William Ralph Maxon, 1877-1948, curator of plants, U. S. National Herbarium, Washington; eminent American pteridologist, prolific author and longtime editor (1934-1947) of the *AMERICAN FERN JOURNAL*.
- Mayr. Heinrich Mayr, 1856-1911, German forester; author of a work on the forests of North America (1890).
- McAtee. Waldo Lee McAtee, 1883-1962, United States Fisheries and Wildlife Service; student of island floras of the U. S. and Alaska, *Viburnum*.
- McCl. Elizabeth May McClintock, 1912—, botanist, California Academy of Sciences; Labiatae.
- McCl. & Epl. E. M. McClintock, and C. C. Epling.
- R. L. McGreg. Ronald Leighton McGregor, 1919—, professor of botany, University of Kansas, Lawrence; Compositae (*Echinacea*), student of flora of the northern United States plains.
- McKelvey. Susan Adams (Delano) McKelvey, 1883-1964, Philadelphia botanist, Arnold Arboretum, Harvard University; author of "Yuccas of Southwestern United States" (1938), "Botanical Exploration of the Trans-Mississippi West" (1955).
- McNair. James Birtley McNair, 1889—, California phytochemist.
- McVaugh. Rogers McVaugh, 1909—, professor of botany, University of Michigan, Ann Arbor; Campanulaceae, student of Mexican flora, botanical history, author (with J. H. Pyron) of "Ferns of Georgia" (1951), etc.
- Mears. James Austin Mears, 1944—, botanist, Academy of Natural Sciences, Philadelphia, *formerly* University of Texas, Austin; Amaranthaceae, *Parthenium* (Sect. *Bolophyta*).
- Medic. Friedrich Casimir Medicus, 1736-1808, German botanist.
- Meerb. Nicolaas Meerburgh, 1734-1814, Dutch gardener.
- Meisn. Carl Friedrich Meisner (*also* Meissner), 1800-1874, Swiss botanist in Basel; Polygonaceae, Lauraceae, Ericaceae, Convolvulaceae.
- T. E. Melchert. Thomas E. Melchert, 1936—, Dept. of Botany, University of Iowa, Iowa City; Compositae (*Thelesperma*).
- Merr. Elmer Drew Merrill, 1876-1956, director of New York Botanical Garden, *later* administrator of the botanical collections, Harvard University; bibliographer, prolific contributor on the flora of the Philippine Islands, China, and Indo-Malaysia; at first a student of American grasses.
- Merr. & Lee. E. D. Merrill, and Henry Atherton Lee, 1894—, Entreprises Agricoles Pan-Americaines, Port-au-Prince, Haiti; plant physiologist, tropical agriculture.
- Mert. Franz Carl Mertens, 1764-1831, professor in Bremen.
- Mertens. Thomas Robert Mertens, 1930—, botanist, Ball State University, Muncie, Indiana; *Polygonum*.
- Mert. & Koch. F. C. Mertens, and W. D. J. Koch.
- Mett. Georg Heinrich Mettenius, 1823-1866, German pteridologist, professor of botany, Leipzig; *Salvinia*.
- Metz. Johann Metzger, 1789-1852, director of botanic garden, Heidelberg.
- C. Metz. Sister Mary Clare Metz, 1907—, Our Lady of the Lake College, San Antonio, Texas.
- Mey. Georg Friedrich Wilhelm Meyer, 1782-1856, German botanist, professor in Göttingen; author of "Flora of Hanover" (1849).

- C. A. Mey. Carl Anton von Meyer, 1795-1855, director of the botanic garden, St. Petersburg.
- E. Mey. Ernst Heinrich Friedrich Meyer, 1791-1858, German botanist, professor in Königsberg; Juncaceae.
- Mez. Carl Christian Mez, 1866-1944, professor in Königsberg; Bromeliaceae.
- Mich. Pietro Antonio Micheli, 1679-1737, Italian botanist, director of the gardens in Florence; Onagraceae.
- Michx. André Michaux, 1746-1802, French botanist and explorer of North America; author of "Flora Boreali-Americana" (1803), *Quercus*.
- Michx. f. François André Michaux, the son, 1770-1855, French botanist; author of "The North American Sylva" (1817-1819, first English ed.).
- Miers. John Miers, 1789-1879, London; student of the South American flora.
- Milde. Carl August Julius Milde, 1824-1871(?), German student of Pteridophyta.
- Mill. Philip Miller, 1691-1771, British gardener; author of "The Gardeners Dictionary" (1731), which went through eight editions.
- Mill. & Standl. Gerrit Smith Miller, Jr., 1869-1956, U. S. National Museum, Washington, zoologist, and P. C. Standley.
- L. Mill. Lillian Wood Miller, 1937- , Jacksonville University, Jacksonville, Florida; Euphorbiaceae (*Acalypha*).
- Millais. John Guille Millais, 1865-1931, English artist and natural historian (game birds).
- Millán. Aníbal Roberto Millán, 1892- , Argentine agricultural and botanical bibliographer.
- Miller. Kim Irving Miller, 1936- , botanist, Jacksonville University, Florida; Euphorbiaceae (*Tragla*).
- Millsp. Charles Frederick Millspaugh, 1854-1923, curator, Dept. of Botany, Field Museum, Chicago (1894-1923); student of Yucatan flora (1903-04), author (with N. L. Britton) of "The Bahama Flora" (1920), prolific writer on floras of West Virginia, California, Florida, West Indies, etc.
- Millsp. & Chase. C. F. Millspaugh, and M. A. Chase.
- Millsp. & Sherff. C. F. Millspaugh, and E. E. Sherff.
- Milne-Redhead & Schweickerdt. Edgar Wolston Bertram Handsley Milne-Redhead, 1906- , Kew, and Herold Georg Wilhelm Johannes Schweickerdt, 1903- , Kew.
- Milstead. Wayne Lavine Milstead, 1932- , East Montana College, Billings; Compositae (*Prenanthes*).
- Miq. Frederik Anton Wilhelm Miquel, 1811-1871, Dutch botanist, professor of botany, Utrecht; Urticaceae, Primulaceae, prolific writer.
- Mirb. Charles François Brisseau de Mirbel, 1776-1854, Paris.
- Mitch. John Mitchell, 1676-1768, English-born Virginia physician.
- Moç. & Ses. José Mariano Moçño, 1757-1820, Mexican physician, and M. Sessé y Lacasta.
- Moench. Conrad Moench, 1744-1805, German botanist, professor in Marburg, Germany.
- Mohr. Charles Theodore Mohr, 1824-1901, German chemist who eventually settled in Alabama; author of "Plant Life of Alabama" (1901).
- Mol. Juan Ignacio (Giovanni Ignazio) Molina, 1740-1829, Chilean Jesuit; author of a natural history of Chile (1782).
- Moldenke. Harold Norman Moldenke, 1909- , New York Botanical Garden (1929-1952), later Director of Trailside Nature and Science Center, Mountainside, New Jersey, then Paterson State College, Wayne, New Jersey; Verbenaceae, Avicenniaceae, Eriocaulaceae, author of "American Wild Flowers" (1949), "Plants of the Bible" (1952); editor and publisher of *PHYTOLOGIA*.
- Moldenke & Lundell. H. N. Moldenke, and C. L. Lundell.
- Moore. Thomas Moore, 1821-1887, curator, Chelsea Botanic Garden, England; student of ferns and orchids.
- A. H. Moore. Albert Hanford Moore, 1883- , American biologist; United Fruit Company.
- T. V. Moore. Thomas Verner Moore, 1877-1969, American priest, educator and psychologist, Catholic University of America, Washington; published on *Rudbeckia* (Compositae).
- W. O. Moore. Winifred Olivia Moore, 1904- , Ann Arbor, Michigan; Cactaceae (1957).
- Moq. Christian Horace Bénédicte Alfred Moquin-Tandon, 1804-1863, French botanist, pupil of A. P. de Candolle; Chenopodiaceae, Amaranthaceae.
- Moretti. Giuseppe Moretti, 1782-1853, professor of botany and director of the botanic garden, Pavia.
- Moric. Moise Étienne Moricand, 1779-1854, Swiss botanist, Geneva.
- Moris. Giuseppe Giacinto Moris, 1796-1869, Italian botanist, professor in Turin.
- Morong. Rev. Thomas Morong, 1827-1894, Massachusetts minister and amateur botanist; Najadaceae, Potamogetonaceae.
- Morris. Edward Lyman Morris, 1870-1913, high school teacher, Washington, D.C.; Plantaginaceae.
- Morton. Conrad Vernon Morton, 1905- , Curator of ferns, U. S. National Herbarium, Washington; eminent pteridologist, prolific author and longtime editor (1945-) of the *AMERICAN FERN JOURNAL*.
- E. Mosher. Edna Mosher, American entomologist, received B.S. at Cornell University in 1908; Gramineae.
- Mouillef. Pierre Mouillefert, 1845(?) - 1903, French dendrologist.
- Moxley. George Loucks Moxley, 1871-(d. after 1920); author (with A. Davidson) of "Flora of Southern California" (1923).
- Muell. Arg. Jean (Argoviensis, i.e., of Aargau) Mueller, 1828-1896, Swiss botanist; Euphorbiaceae, Buraceae, Resedaceae.
- Muell. & Muell. C. H. Muller (formerly Mueller), and Mary Taylor Muller, (?) 1907-
C. Muell. Karl Mueller, 1817-1899, German horticulturist, Berlin.
- F. v. Muell. Baron Ferdinand Jacob Heinrich von Mueller, 1825-1896, German-born Australian botanist, director, Melbourne Botanic Garden; eminent student of the Australian flora.

- Muenchh. Otto Frieherr von Muenchbausen, 1716-1774, German botanist.
- Muhl. Henry Muhlenberg (formerly Gotthilf Heinrich Ernst Muehlenberg, also Heinrich Ludwig Muehlenberg), 1753-1815, German-educated Lutheran minister and pioneer botanist of Pennsylvania.
- Mühlenpfordt. F. Mühlenpfordt, German (Hannover) horticulturist (Cactaceae) of middle 19th century.
- C. H. Mull. Cornelius Herman Muller (formerly Mueller), 1909—, Texas-born and -reared, professor at University of California (Santa Barbara); *Quercus*; author of "The Oaks of Texas" (1951).
- F. J. Mull. F. J. Muller; *Callicarpa*.
- Munro. William Munro, 1818-1880, English general and agrostologist.
- Munson. Thomas Volney Munson, 1843-1913, grape breeder of Denison, Texas.
- Munz. Philip Alexander Munz, 1892—, professor of botany, Pomona College, Claremont, California, later director, Rancho Santa Ana Botanic Garden, Anaheim, California; author of "Manual of Southern California Botany" (1935), "A California Flora" (1959), Onagraceae, *Aquilegia*.
- Munz & I. M. Johnst. P. A. Munz, and I. M. Johnston.
- Munz & Klein. P. A. Munz, and William McKinley Klein, Jr., 1933—, Colorado State University, Fort Collins; Onagraceae (*Oenothera*).
- Murr. Johann Andreas Murray, 1740-1791, Swedish professor of medicine and botany, Göttingen, Germany (1760-1791); student of Linnaeus and editor of some of his later editions.
- Muschler. Reno (Reinhold) Muschler, 1883—, German botanist; student of Egyptian flora.
- Mutis. José Celestino Mutis, 1732-1811, Spanish botanical explorer in Colombia; correspondent of Linnaeus.
- Myint. Tin Myint, 1936—, Burmese botanist, Mandalay; published on *Stylisma* (Convolvulaceae) in 1966.
- Nash. George Valentine Nash, 1864-1921, head gardener, New York Botanical Garden; agrostologist.
- Naud. Charles Victor Naudin, 1815-1899, director of the botanic garden, Villa Thuret, Antibes; student of the flora of the Pyrenees, of the Solanaceae, Melastomataceae, Cucurbitaceae and *Eucalyptus*.
- Neé. Luis Neé, 18th-19th century, botanist with T. Haenke on the Malaspina Expedition, visiting California in 1791; his collections are preserved at Madrid.
- Nees. Christian Gottfried Daniel Nees von Esenbeck, 1776-1858, German botanist, professor in Breslau; prolific botanical writer, Acanthaceae, Cyperaceae, Gramineae.
- Nees & Arn. C. G. D. Nees von Esenbeck, and G. A. W. Arnott.
- Nees & Eberm. C. G. D. Nees von Esenbeck, and Carl Heinrich Ebermaier, 1802-1870, Germany.
- Nees & Mey. C. G. D. Nees von Esenbeck, and Franz Julius Ferdinand Meyen, 1804-1840, German physician and botanical artist who collected in Brazil and Peru.
- Nels. & Cockll. A. Nelson, and Theodore Dru Alison Cockerell.
- A. Nels. Aven Nelson, 1859-1952, professor of botany and president, University of Wyoming, Laramie; student of the Rocky Mountain flora, reviser of Coulter's "New Manual of Botany of the Central Rocky Mountains" (1909).
- A. Nels. & Macbr. A. Nelson, and J. F. Macbride.
- E. Nels. Elias Emanuel Nelson, 1876-1949, Swedish-born American agriculturist, U. S. Dept. Agriculture Experimental Farm, Bend, Oregon; horticulture, forage plants for arid regions, editor, author of "The Shrubs of Wyoming" (1902).
- H. Ness. Helge Ness, 1861-1928, Norwegian-born horticulturalist, Texas A&M University, College Station; *Rubus*, *Quercus*.
- Nevskii. Sergeĭ Arsenjevic Nevskii, 1908-1938, senior agrostologist at Botanical Institute of Academy of Science in U.S.S.R., Leningrad.
- Nicora. Elisa G. Nicora, contemporary Argentine agrostologist, Técnica, Facultad de Agronomía y Veterinaria de Buenos Aires.
- Nieuw. Julius Aloysius Arthur Nieuwland, 1878-1936, professor of botany (1904-1918) and professor of organic chemistry (1918-1936), Notre Dame University, Indiana; founder and first editor of THE AMERICAN MIDLAND NATURALIST.
- Nisbet & Jackson. Gladys T. Nisbet, 1895—, Arizona botanist; *Penstemon* (Scrophulariaceae), and R. C. Jackson.
- Norm. Eliane Meyer Norman, 1931—, Rutgers University, New Brunswick, New Jersey; Loganiaceae (*Buddleja*).
- Nort. John Bitting Smith Norton, 1872-1966, plant pathologist, University of Maryland, College Park.
- Nutt. Thomas Nuttall, 1786-1859, English-American naturalist, botanist and ornithologist who resided in Philadelphia (1808-1841), collector of western America plants; author of "The Genera of North American Plants" (1818), "The North American Sylva" (1842), also a noted ornithologist.
- Oakes. William Oakes, 1799-1848, Massachusetts; student of Vermont flora.
- Ockendon. David Jeffery Ockendon, 1940—, Imperial College, London, England; *Linum*, *Psoralea*.
- O'Donell. Carlos Alberto O'Donell, 1912-1954, Instituto Miguel Lillo, Tucuman, Argentina; Convolvulaceae.
- Oeder. Georg Christian von Oeder, 1728-1791, Danish botanist, professor in Copenhagen; first editor of "Flora Danica" (1761-1771).
- Oerst. Anders Sandøe Oersted, 1816-1872, Danish botanist who collected in Costa Rica and Colombia.
- Ohwi. Jisaburo Ohwi, 1905—, National Science Museum, Tokyo; student of flora of Japan, Gramineae and Cyperaceae of eastern Asia.
- R. Oliv. Royce Ladell Oliver, 1929—, Missouri Botanical Garden, St. Louis; Iridaceae (*Sisyrinchium*).
- O'Neill. Hugh Thomas O'Neill, 1894-1969, curator of the Langlois Herbarium, The Catholic University of America, Washington; Cyperaceae.

- Opiz. Philipp Maximilian Opiz, 1787-1858, zealous Bohemian botanist who named great numbers of "species" of little worth.
- Orcutt. Charles Russell Orcutt, 1864-1929, San Diego, California, botanical collector.
- Ort. Casimiro Gomez Ortega, 1740-1818, Spanish botanist, director of the botanical garden, Madrid.
- Osbeck. Pehr Osbeck, 1723-1805, Sweden.
- Osterh. George Everett Osterhout, 1858-1937, Colorado lumberman and amateur botanist.
- Ottley. Alice Maria Ottley, 1882—, professor of botany, Wellesley College, Massachusetts; *Lotus*.
- Otto & Dietr. Friedrich Otto, 1782-1856, and A. Dietrich, Germany.
- G. Ownbey. Gerald Bruce Ownbey, brother of Marion, 1916—, professor of botany, University of Minnesota; *Argemone*, *Corydalis*.
- M. Ownbey. Francis Marion Ownbey, 1910—, professor of botany, State College of Washington, Pullman; *Calochortus*, *Allium Tragopogon*; co-author of "Vascular Plants of the Pacific Northwest" (1955-1964).
- Pall. Peter Simon Pallas, 1741-1811, German botanist, student of the Russian and Siberian floras; early monographer of *Astragalus* (1800), also eminent as zoologist.
- Palm. & Steyer. E. J. Palmer, and J. A. Steyermark.
- E. J. Palm. Ernest Jesse Palmer, 1875-1962, field collector for Missouri Botanical Garden and Arnold Arboretum (1913-1948); specialist on *Crataegus*.
- Palmer. F. Palmer, published on cactaceae in 1865 (*Echinocereus Blanckii*).
- Pammel. Louis Hermann Pammel, 1862-1931; professor of botany, Iowa State College, Ames; student of poisonous plants, flora of Iowa, etc.
- Panz. Georg Wolfgang Franz Panzer, 1755-1829, German taxonomist.
- Parish. Samuel Bonsall Parish, 1838-1928, pioneer botanist of San Bernardino who made known much of the southern California flora.
- Parker. Kittie Lucille (Fenley) Parker, 1910—, George Washington University, Washington, later U. S. National Herbarium; Compositae (*Hymenoxys*), weeds of Arizona.
- Parks. Harris Braley Parks, 1879-1958, apiculturist, Texas A&M University, College Station; collector of Texas plants and author.
- Parl. Filippo Parlatore, 1816-1877, Italian botanist, professor in Florence and founder of the herbarium; Gnetaceae, Coniferae.
- Parodi. Lorenzo Raimundo Parodi, 1895-1966, agrostologist of Buenos Aires, Argentina.
- Patt. Harry Norton Patterson, 1853-1919, Oquawka, Illinois printer and botanist; published a catalogue of Illinois plants in 1876.
- Pax. Ferdinand Albin Pax, 1858-1942, professor of botany, Breslau; Aceraceae, Primulaceae.
- Pax & K. Hoffm. F. A. Pax, and Kaethe Hoffmann, 1883—, professor in Breslau; made the huge contribution to *Das Pflanzenreich* on the Euphorbiaceae.
- Paxt. Sir Joseph Paxton, 1801(?) - 1865, British gardener and architect, editor of PAXTON'S MAGAZINE OF BOTANY and author of other horticultural works.
- Payne. Willard William Payne, 1934—, botanist, University of Illinois, Urbana; Compositae (*Ambrosia*).
- Pays. Edwin Blake Payson, 1893-1927, professor of botany, University of Wyoming, Laramie; Cruciferae, *Cryptantha*.
- Pearson. Thomas Gilbert Pearson, 1873-1943, New York ornithologist and wildlife conservationist.
- Peck. Morton Eaton Peck, 1871-1959, professor of biology, Wilamette University, Salem, Oregon; author of "A Manual of the Higher Plants of Oregon" (1941).
- Peeb. Robert Hibbs Peebles, 1900-1956, cotton agronomist, U. S. Dept. Agriculture.
- P'ei. Chien P'ei, 1903—, Chinese botanist; collector of the genus *Vitex* (Verbenaceae).
- Penl. Charles William Theodore Penland, 1899—, professor of botany, Colorado College, Colorado Springs; botanized throughout Colorado, published on alpine vegetation of the Rocky Mts. and Ecuadorian Andes (1941).
- Penn. Francis Whittier Pennell, 1886-1952, curator of botany, Academy of Natural Sciences of Philadelphia; authority on Scrophulariaceae; author of "The Scrophulariaceae of Eastern Temperate North America" (1935).
- Perdue. Robert Edward Perdue, Jr., 1924—, botanist, U. S. Dept. Agriculture, Beltsville, Maryland; *Rudbeckia*.
- Perkins. Janet Russell Perkins, 1853-1933, American botanist, longtime worker in Berlin-Dahlem Museum.
- Perry. Lily May Perry, 1895—, botanist, Arnold Arboretum, Harvard University; *Verbena*.
- Perry & Fern. L. M. Perry, and M. L. Fernald.
- Pers. Christian Hendrik Persoon, 1761(?) - 1836, bizarre individual and brilliant mycologist, born in South Africa, studied in Germany, lived in Paris; author of "Synopsis Plantarum" (1805-1807) and other valuable botanical works.
- Peterm. Wilhelm Ludwig Petermann, 1806-1855, Leipzig.
- Peters. Otto Georg Petersen, 1847-1937, Copenhagen, Denmark.
- Pfeiffer. Norma Etta Pfeiffer, 1889—, Boyce Thompson Institute for Plant Research, Yonkers, New York; *Isoetes*.
- Phil. Rudolf Amandus Philippi, 1808-1904, Chilean botanist, director, Museo Nacional and professor of botany, Santiago; student of botany, zoology and paleontology of Chile.
- Pick. Charles Pickering, 1805(?) - 1878, American physician and botanist on the Wilkes Expedition to explore the western slope of the Rocky Mts. in the Columbia River area; plant geographer, ethnologist, historian.
- Pilg. Robert Knud Friedrich Pilger, 1876-1953, director of the botanic garden and museum, Berlin; Plantaginaceae, Coniferae.
- Pinkava. Donald John Pinkava, 1933—, botanist, Arizona State University, Tempe; Compositae; Cactaceae.
- Piper. Charles Vancouver Piper, 1867-1926, professor of botany and zoology, Washington Agric.

- College, Pullman, *later* agrostologist, U. S. Dept. Agriculture; author of "Flora of the State of Washington" (1906).
- Planch. Jules Émile Planchon, 1823-1888, French botanist, assistant to W. J. Hooker (1844-1848), professor of botany, Ghent, Nancy and Montpellier; Ulmaceae, Vitaceae.
- Plum. Charles Plumier, 1646-1704, French Franciscan monk who explored and wrote on the flowering plants and ferns of tropical America.
- Poepp. Eduard Friedrich Poeppig, 1798-1868, Austrian biologist and explorer, professor of zoology, Leipzig; published on plants collected during a trip to Chile, Peru and the Amazon.
- Poepp. & Kunth. E. F. Poeppig, and C. S. Kunth.
- Pohl. Johann Baptist Emanuel Pohl, 1782-1834, Austrian botanist and traveler.
- Poir. Jean Louis Marie Poiret, 1755-1834, French botanist and traveler in North Africa; completed Lamarck's "Encyclopédie Méthodique Botanique" (1783-1817).
- Poit. Pierre Antoine Poiteau, 1766-1854, French botanist and horticulturist.
- Polák. Karl Polák, 1847-1900, Bohemian botanist.
- Pollard. Charles Louis Pollard, 1872-1945, Vermont librarian and plant collector.
- Pollard & Ball. C. L. Pollard, and C. R. Ball.
- Port. & Coult. T. C. Porter, and J. M. Coulter.
- Porter. Thomas Conrad Porter, 1822-1901, professor of botany, Lafayette College, Pennsylvania; author of "Flora of Pennsylvania" (1903).
- D. M. Porter. Duncan MacNair Porter, 1937- , botanist and curator of Panamanian plants, Missouri Botanical Garden, St. Louis; Zygophyllaceae.
- Poselger. Heinrich Poselger, died 1883, Germany; Cactaceae.
- Powell. Albert Michael Powell, 1937- , Sul Ross State University, Alpine, Texas; Compositae (*Perityle*).
- Prantl. Karl Anton Eugen Prantl, 1849-1893, German botanist, professor of botany, Breslau; prepared (with H. G. A. Engler) the classic work "Die natürlichen Pflanzenfamilien" (1887-1915).
- Presl. Karel Bořiwag Presl, 1794-1852, professor of natural history, Prague; in "Reliquiae Haenkeanae" (1825-1835) he described the collections made along the western side of the American continent by Thaddeus Haenke, the first botanist to visit California.
- J. Presl. Jan Swatopluk Presl, the brother, 1791-1849, professor in Prague.
- J. & C. Presl. J. S. Presl, and K. B. Presl; authors of "Flora Čechica" (1819).
- Price. Sarah Frances Price, 1849-1903; author of "Flora of Warren County, Kentucky" (1893).
- Prince. William Robert Prince, 1795-1869, American nurseryman.
- Pursh. Frederick Traugott Pursh, 1774-1820, born in Saxony, settled in Philadelphia; author of "Flora Americae Septentrionalis" (1814).
- Quehl. Leopold Quehl, 1849-1922, Halle an der Saale, Germany; amateur cactologist.
- R. & P. Hipólito Ruiz Lopez, 1754-1815, and José Antonio Pavon, 1754-1844, Spanish botanical explorers and authors of a flora of Peru and Chile (1794 and 1798-1802).
- R. & S. J. J. Roemer, and J. A. Schultes, produced an edition of Linnaeus' "Systema Vegetabilium" (1817-1830).
- Raddi. Guiseppe Raddi, 1770-1829, Italian botanist, student of the Brazilian flora.
- Radlk. Ludwig Adolph Timotheus Radlkofer, 1829-1927, Germany.
- Raeusch. Ernst Adolf Raeuschel, 18th-19th century, longtime professor of botany at Munich, Germany.
- Raf. Constantin Samuel Rafinesque (*or* Rafinesque-Schmaltz), 1783-1840, born in Constantinople, lived in Sicily and Kentucky, brilliant, eccentric pioneer naturalist; profligate author of binomials, with many "species" quite untraceable.
- Raven. Peter Hamilton Raven, 1936- , Stanford University, Stanford, California; Onagraceae of western North America; flora of Chiapas.
- Raven & Gregory. P. H. Raven, and David Palache Gregory, 1930- , Keene State College, Keene, New Hampshire; Onagraceae (pollination studies).
- Raven & Parnell. P. H. Raven, and Dennis Richard Parnell, 1939- , California State College, Hayward; Onagraceae.
- Ray. James Davis Ray, Jr., 1918- , professor of Botany, University of South Florida, Tampa; *Lysimachia*.
- Raymond. Marcel Raymond, 1915- , Curator, Montreal Botanical Garden, Montreal, Canada; Cyperaceae and Gesneriaceae.
- Rech. f. Karl Heinz Rechinger, 1906- , Natural History Museum, Vienna; flora of the Mediterranean and the Near East; *Rumex*.
- Reed. Clyde Franklin Reed, 1918- , professor of biology, Coppin State College, Baltimore, Maryland; student of ferns, Amaranthaceae, Chenopodiaceae, Nyctaginaceae, Bryophytes, etc.
- E. L. Reed. Edward Looman Reed, 1874-1946, Texas A&M University, *then* John Tarleton College, *then* Texas Technological College, Lubbock; collector and student of Texas botany.
- C. G. Reeder. Charlotte Gooding Reeder (cf. C. Goodd.)
- Regel. Eduard August von Regel, 1815-1892, director of the botanic garden, St. Petersburg; editor of *GARTENFLORA*, Betulaceae.
- Rehd. Alfred Rehder, 1863-1949, German-born American botanist, curator of the herbarium, Arnold Arboretum, Harvard University; author of "Manual of Cultivated Trees and Shrubs Hardy in North America" (1927, 2nd ed. 1940).
- Reich. Johann Jakob Reichard, 1743-1782, German physician and botanist, Frankfurt am Main.
- Reichb. Heinrich Gottlieb Ludwig Reichenbach, 1793-1879, German naturalist, professor in Dresden; first editor of "Icones Florae Germanicae et Helveticae" and author of many other extensive works on plants and animals.
- Reichb. f. Heinrich Gustav Reichenbach, 1823(?) - 1889, the son, German professor of botany and director of the botanic garden, Hamburg; famous orchidologist.

- Remy. Ezechiel Jules Remy, 1826-1893, French naturalist and traveller, student of the Andean flora.
- Retz. Anders Johan Retzius, 1742-1821, Swedish botanist, professor in Lund; prolific writer on botany and zoology.
- Reveal. James Lauritz Reveal, 1941- , Brigham Young University, Provo, Utah; later University of Maryland, College Park (1969-); Intermountain Flora, *Eriogonum*.
- Rich. Louis Claude Marie Richard, 1754-1821, French botanist and collector in South America and the West Indies.
- A. Rich. Achille Richard, 1794-1852, the son, physician and botanical demonstrator to the faculty of medicine, Paris.
- A. Rich. & Gal. A. Richard, and H. G. Galeotti.
- Richards. Sir John Richardson, 1787-1865, Scotch botanist and zoologist attached to Capt. Sir John Franklin's expedition to arctic America.
- Ricker. Percy Leroy Ricker, 1878- , agronomist, U. S. Dept. of Agriculture, Washington; Gramineae, Leguminosae.
- Rickett. Harold William Rickett, 1896- , New York Botanical Garden; writer of textbooks, and a series of volumes entitled "Wild Flowers of the United States" (1966-).
- Ridd. John Leonard Riddell, 1807-1865; author of "Catalogus florae ludoviciana" (1852).
- Risso. J. Antoine Risso, 1777-1845, French botanist.
- Robbins. James Watson Robbins, 1801-1879, Massachusetts.
- Roberty & Vautier. Guy E. Roberty, 1907- , Institut d'Enseignement et de Recherches Tropicales, Seine, France; Gramineae, Malvaceae (*Gossypium*), flora and phytogeography of West Africa, and Vautier, French botanist (further data not obtained).
- Robins. Benjamin Lincoln Robinson, 1864-1935, curator of Gray Herbarium, Harvard University (1892-1935); student of Compositae, an editor of Gray's "Synoptical Flora of North America."
- Robins. & Fern. B. L. Robinson, and M. L. Fernald; authors of "Gray's New Manual of Botany," ed. 7 (1908).
- Robins. & Greenm. B. L. Robinson, and J. M. Greenman.
- Robson. Norman Keith Bonner Robson, 1928- , botanist, British Museum (Natural History), London; *Hypericum*.
- Rock. Howard Francis Leonard Rock, 1925-1964, professor of biology, Vanderbilt University, Nashville, Tennessee; Compositae (*Helenium*).
- Roem. Johann Jacob Roemer, 1763-1819, Swiss botanist, professor in Zürich; active editor.
- Rogers. Claude Marvin Rogers, 1919- , Dept. of Biology, Wayne State University, Detroit, Michigan; Linaceae.
- D. Rogers. David James Rogers, 1918- , botanist, University of Colorado, Boulder; Euphorbiaceae (*Manihot*).
- Rohrb. Paul Rohrbach, 1847-1871, Berlin; Portulacaceae, *Silene*.
- Roll. Reed Clark Rollins, 1911- , director of Gray Herbarium, Harvard University; Cruciferae, *Parthenium*.
- Roscoe. William Roscoe, 1753-1831, British historian and amateur botanist, one of the founders of the Liverpool botanic garden.
- Rose. Joseph Nelson Rose, 1862-1928, assistant botanist, U. S. Dept. Agric., later associate botanist, U. S. National Herbarium, Washington; Cactaceae, Umbelliferae, Crassulaceae.
- Rose & Bush. J. N. Rose, and B. F. Bush.
- Rose & Painter. J. N. Rose, and Joseph Hannum Painter, 1879-1908, U. S. National Museum, Washington.
- Rose & Standl. J. N. Rose, and P. C. Standley.
- Rosend., Butt. & Lak. Carl Otto Rosendahl, 1875-1956, professor of botany, University of Minnesota; Saxifragaceae, and Frederick King Butters, 1878-1945, professor of botany, University of Minnesota; authors of works on the flora of Minnesota, and Olga Lakela, 1890- , professor of botany, University of Minnesota (Duluth Branch).
- Rostk. Friedrich Wilhelm Gottlieb Rostkovius, 1770-1848, physician in Stettin, Poland; author (with W. L. E. Schmidt) of "Flora Sedinensis" (1824).
- Roth. Albrecht Wilhelm Roth, 1757-1834, German physician and botanist.
- Rothr. Joseph Trimble Rothrock, 1839-1922, student of Asa Gray, forester, professor of botany, University of Pennsylvania, Philadelphia (1877-1904); surgeon and botanist on Lt. Wheeler's Survey in Colorado, New Mexico and California (1873-75).
- Rottb. Christen Friiss Rottboell, 1727-1797, professor of botany and director of the botanical garden, Copenhagen, Denmark.
- Rowlee. Willard Winfield Rowlee, 1861-1923, American student of *Salix*.
- Roxb. William Roxburgh, 1751-1815, Scotch physician and botanist, director of the Royal Botanic Gardens, Calcutta; author of "Flora Indica" (1820-1824 and later editions).
- Rudge. Edward Rudge, 1763-1846, British botanist and antiquarian.
- Rudolphi. Karl Asmund Rudolphi, 1771-1832, Germany.
- Rugel. Ferdinand Rugel, 1806-1878, German-born plant explorer in southeastern United States.
- Rümpel. Theodor Rümpel, 1817-1891, Germany; Cactaceae, etc.
- Rupr. Franz Joseph Ruprecht, 1814-1870, Czech-born Russian botanist, curator of the herbarium of the Academy of Science, St. Petersburg; Gramineae, Umbelliferae, *Botrychium*, algae.
- Russell. Norman Hudson Russell, 1921- , professor of botany, Central State College, Edmond, Oklahoma, then at Buena Vista College, Storm Lake, Iowa; Violaceae.
- Rydb. Per Axel Rydberg, 1860-1931, Swedish-born American botanist, curator, New York Botanical Garden; author of "Flora of Colorado" (1906), "Flora of the Rocky Mountains and Adjacent Plains" (1917), "Flora of the Prairies and Plains of Central North America" (1932), etc.
- Salish. Richard Anthony (born Markham) Salisbury, 1761-1829, British botanist; early proponent of the natural system of classification.

- Salm-Dyck. Joseph Maria Franz Anton Hubert Ignaz Zu Salm-Reifferscheid-Dyck, 1773-1861, German amateur botanist and horticulturist; owner of a fine living collection of succulents, Cactaceae.
- Salzm. Philipp Salzmann, 1781-1851, born in Germany, botanized in Brazil, Spain, North Africa, south France.
- Sandw. Noel Yvri Sandwith, 1901-1965, eminent English plant taxonomist, curator of plants, Kew: Bignoniaceae, Papaveraceae (*Fumaria*), student of Tropical South America and Mediterranean floras.
- Sarg. Charles Sprague Sargent, 1841-1927, botanist and dendrologist, creator and director of Arnold Arboretum, Harvard University; author of "The Silva of North America" (1891-1902), "Manual of the Trees of North America" (1905), etc.
- Sarg. & Engelm. C. S. Sargent, and G. Engelmann.
- Sartw. Henry Parker Sartwell, 1792-1867; author of "Catalogue of plants, growing without cultivation in the vicinity of Seneca and Crooked Lakes, in western New York" (1845).
- Sauer. Jonathan Deininger Sauer, 1918- , professor of botany, University of Wisconsin, Madison; *Amaranthus, Canavalia*.
- Savi. Gaetano Savi, 1769-1844, Italian botanist; author of a flora of Pisa (1798).
- Sch. Bip. Carl Heinrich Schultz, *Bipontinus* (i.e., of Zweibrücken), 1805-1867, Germany; Compositae.
- J. H. Schaffn. John Henry Schaffner, 1866-1939, professor of botany, Ohio State University; *Equisetum*, phylogeny, author of "Field Manual of the Flora of Ohio and Adjacent Territory" (1928).
- Schauer. Johann Conrad Schauer, 1813-1848, professor at Greifswald, Germany; Verbenaceae.
- Scheele. Georg Heinrich Adolf Scheele, 1808-1864, German botanist who described plants from Texas (1849).
- Scheidw. Michael J. Scheidweiler, 1799-1861, Germany; Cactaceae.
- Schery. Robert Walter Schery, 1917- , Missouri Botanical Garden, St. Louis, later with a commercial seed house; student of the Panamanian flora.
- Schiede. Christian Julius Wilhelm Schiede, ? -1836, German-born physician who collected plants in Mexico.
- Schindl. Anton Karl Schindler, 1879- , Germany.
- Schinz & Thell. Hans Schinz, 1858-1941, director, botanic garden and museum, Zürich, and editor of numerous works on the flora of subtropical Africa, and A. Thellung; authors of the 4th ed. of Schinz and Keller's "Flora der Schweiz" (1923).
- Schkuhr. Christian Schkuhr, 1741-1811, German botanist and "university mechanic" in Wittenberg; student of the German flora.
- Schlecht. Diederich Franz Leonhard von Schlechtendal, 1794-1866, German botanist and botanical editor, professor in Halle an der Saale; Eleagnaceae.
- Schlecht. & Cham. D. F. L. von Schlechtendal, and A. L. von Chamisso.
- Schleid. Matthias Jakob Schleiden, 1804-1881, Germany; author of botanical handbooks.
- Schltr. Friedrich Reichardt Rudolf Schlechter, 1872-1925, Berlin; famous botanical collector, and prolific writer on the Orchidaceae.
- Schmid. Casimir Christoph Schmidel, 1718-1792, German physician and botanist at Erlangen.
- Schneid. Camillo Karl (*formerly* Carl Camillo) Schneider, 1876-1951, Austria and Germany; dendrologist.
- Schoenl. Johann Lucas Schoenlein, 1793-1864, Bamberg, Bavaria.
- Schoepf. Johann David Schoepf, 1752-1800, German physician-botanist who wrote on American medicinal plants.
- Schott. Heinrich Wilhelm Schott, 1794-1865, Austrian botanist, director of the royal garden in Schönbrunn, Vienna; Araceae.
- Schott & Endl. H. W. Schott, and S. F. L. Endlicher.
- Schrad. Heinrich Adolph Schrader, 1767-1836, German botanist, professor in Göttingen; monographer of *Verbascum*.
- Schrank. Franz von Paula von Schrank, 1747-1838, German botanist, professor in Munich; author of floras of Bavaria, Salisburg, and Monaco.
- Schreb. Johann Christian Daniel von Schreber, 1739-1810, German botanist, professor in Erlangen; editor of the 8th ed. of Linnaeus' "Genera Plantarum" (1789-1791).
- Schub. Bernice Giduz Schubert, 1913- , Gray Herbarium, Harvard University (1941-50), Brussels (1950-52), U. S. Dept. Agriculture, Beltsville (1952-61), Arnold Arboretum, Harvard University (1962-), editor, JOURNAL OF THE ARNOLD ARBORETUM (1963-); *Desmodium, Begonia, Dioscorea*.
- Schult. Joseph August Schultes, 1773-1831, Austrian botanist, professor of botany in Vienna, Cracow and Landeshut.
- Schulz. Otto Eugen Schulz, 1874-1936, German taxonomist; Cruciferae.
- K. Schum. (or K. Sch.) Karl Moritz Schumann, 1851-1904, German botanist, curator of the herbarium, Berlin; Cactaceae.
- K. Schum. & Sydow. K. M. Schumann, and Paul Sydow, 1851-1925, German botanist.
- Schum. & Thonn. K. M. Schumann, and Peter Thonning, 1775-1848, Denmark.
- Schuyler. Alfred Ernest Schuyler, 1935- , botanist, Academy of Natural Sciences of Philadelphia, Pennsylvania.
- Schwein. Lewis David von Schweinitz, 1780-1834, German-born Pennsylvania clergyman; noted student of fungi.
- Schwein. & Torr. L. D. von Schweinitz and J. Torrey.
- Schwerin. Graf Fritz von Schwerin, 1856-1934, Germany.
- Scop. Johann Anton (Giovanni Antonio) Scopoli, 1723-1788, Austrian botanist, physician and professor of natural history, Pavia.

- Scora. Rainer Walter Scora, 1928—, University of California, Riverside; Labiatae, Rutaceae, chemosystematics, evolution.
- Scribn. Frank Lamson Scribner, 1851-1938, agrostologist, U. S. Dept. Agriculture, Washington.
- Scribn. & Ball. F. L. Scribner, and C. R. Ball.
- Scribn. & Merr. F. L. Scribner, and E. D. Merrill.
- Scribn. & Sm. F. L. Scribner, and J. G. Smith.
- Seaton. Henry Eliason Seaton, 1869-1893, American student of the Pteridophyta.
- Seem. Berthold Carl Seemann, 1825-1871, German naturalist and world traveler living in England, editor of *BONPLANDIA*, founder of the *JOURNAL OF BOTANY*; author of "Botany of the Voyage of H. M. S. Herald" (1852-1857).
- v. Seem. Karl Otto von Seemen, 1838-1910, German botanist.
- Séguier. Jean-François Séguier, 1703-1784, French botanist.
- Sér. Nicolas Charles Seringe, 1776-1858, French botanist, at first curator of the Candolle herbarium, later professor of botany in Lyon; important collaborator in De Candolle's *Prodromus*; Caryophyllaceae, Rosaceae, Cucurbitaceae, *Salix*, *Aconitum*.
- Ses. Martin des Sessé y Lacasta, 175?-1809, Spanish botanist, director of the botanic garden in Mexico City.
- Ses. & Moç. M. Sessé y Lacasta, and J. M. Moçifio.
- Seub. Moritz Seubert, 1818-1878, professor in Karlsruhe; student of monocots, Amaranthaceae.
- Shafer. John Adolf Shafer, 1863-1918, custodian of the museum, New York Botanical Garden; made the most extensive collections of Cuban plants.
- Sharp. Ward McClintic Sharp, 1904—, U. S. Fish and Wildlife Service, State College, Pennsylvania.
- Shaw. George Russell Shaw, 1849-1937, student of Pinus; author of "Pines of Mexico" (1909).
- E. Shaw. Elizabeth Anne Shaw, 1938—, botanist, Gray Herbarium, Harvard University; Cruciferae.
- Shear. Cornelius Lott Shear, 1865-1956, plant pathologist and agrostologist, U. S. Dept. Agriculture, Washington; collected widely in the Rocky Mts., published with P. A. Rydberg on grasses (1897).
- Sheer. Early 19th century German interested in Cactaceae (*Coryphantha*).
- Sheld. Edmund Perry Sheldon, 1869—, resident first in Minnesota, later in Portland, Oregon, forestry; author of "The Forest Wealth of Oregon" (1904).
- Sherff. Earl Edward Sherff, 1886-1966, botanist, Chicago Teachers College; student of *Bidens* and the Hawaiian flora.
- Shiller. Ivan Shiller, 1895—, U. S. Dept. Agriculture, Brownsville, Texas; economic entomology and botany (Malvaceae of South Texas).
- Shinners. Lloyd Herbert Shinners, 1918—, Canadian-born botanist, professor of botany, Southern Methodist University; student of floras of North-Central Texas, Southeastern U. S., Gulf Southwest of U. S., Convolvulaceae, Compositae, Caryophyllaceae, author of "Spring Flora of the Dallas-Fort Worth Area Texas" (1958), founder and editor of journal "Sida," etc.
- Short. Charles Wilkins Short, 1794-1863, medical botanist, professor in Louisville, Kentucky; author of "A Sketch of the Progress of Botany in Western America" (1836). His herbarium housed at the University of Kentucky was regrettably destroyed by fire.
- Shreve. Forrest Shreve, 1878-1950, Carnegie Institution Desert Laboratory, Arizona; ecologist and taxonomist, one of authors of "The Plant Life of Maryland" (1910), "Vegetation and Flora of the Sonoran Desert" (with Ira L. Wiggins) (1964), etc.
- Shreve & Wiggins. F. Shreve, and Ira Loren Wiggins, 1899—, professor of botany and director of the natural history museum, Stanford University, Stanford, California; student of flora of Sonoran Desert; Malvaceae; Pteridophyta. (cf. Shreve.)
- Shuttlew. Robert James Shuttleworth, 1810-1874, English botanist and conchologist who resided most of his life in Berne; amassed an herbarium of 170,000 specimens now in the British Museum.
- Sibth. John Sibthorp, 1758-1796, professor of botany, Oxford, England.
- Sibth. & Sm. J. Sibthorp, and J. E. Smith; authors of "Flora graeca" (1806-1840).
- Sieb. & Zucc. Philipp Franz von Siebold, 1796-1866, German botanist, made several trips to study the botany, agriculture and ethnography of Japan, and J. G. Zuccarini; authors of a flora of Japan (1835-1870).
- Sims. John Sims, 1749-1831, England; for 25 years editor of *CURTIS' BOTANICAL MAGAZINE*.
- Sm. Sir James Edward Smith, 1759-1828, British botanist, founder and for 40 years president of the Linnaean Society; purchaser of the Linnaean herbarium and library (1784), now at the Linnaean Society of London.
- Sm. & Rydb. J. G. Smith, and P. A. Rydberg.
- E. B. Sm. Edwin Burnell Smith, 1936—, University of Arkansas, Fayetteville; Compositae (*Haplopappus*).
- J. D. Sm. John Donnell Smith, 1829-1928, botanical collector and author of works on Guatemalan plants (1889-1907).
- J. G. Sm. Jared Gage Smith, 1866-1925, agrostologist, U. S. Dept. Agriculture, Washington, later Hawaii; *Sagittaria*.
- L. B. Sm. Lyman Bradford Smith, 1904—, Gray Herbarium, Harvard University, (1930-1947), U. S. National Herbarium, Washington (1947—); taxonomy of flowering plants especially of Latin America, flora of southern Brazil, Bromeliaceae, Begoniaceae.
- Small. John Kunkel Small, 1869-1938, American botanist, head curator, New York Botanical Garden; author of "Flora of the Southeastern United States" (1903), "Manual of the Southeastern Flora" (1933), etc.
- Small & Heller. J. K. Small, and A. A. Heller.
- Small & Penn. J. K. Small, and F. W. Pennell.
- Smyth. Bernard Bryan Smyth, 1843-1913, librarian, Kansas Academy of Science, Topeka.
- Soderstrom & Decker. Thomas Robert Soderstrom, 1936—, U. S. National Herbarium, Washington;

- Gramineae, and Henry Fleming Decker, 1930–, Dept. of Botany, Ohio Wesleyan University, Delaware; grass systematics.
- Soland. Daniel Carl Solander, 1736-1782, England, gifted Swedish student of Linnaeus; accompanied Banks on Capt. Cook's first voyage of circumnavigation.
- Solbrig. Otto Thomas Solbrig, 1930–, Argentine-born U. S. botanist, University of Michigan, Ann Arbor, later Gray Herbarium, Harvard University; cytotaxonomy and genetics of plants.
- Solms. Count Hermann Maximilian Carl Ludwig Friedrich Solms-Laubach, 1842-1915, professor of botany, Strassburg; Lennoaceae.
- Spach. Edouard Spach, 1801-1879, French botanist; author of "Histoire Naturelle des Végétaux Phanérogames" (1834-1848).
- Speg. & Girola. Carlos Luis Spegazzini, 1858-1926, and Carlos De Alberti Girola, 1867-1934, Argentine botanists.
- Spenner. Fridolin Karl Leopold Spenner, 1798-1841, German botanist, professor in Freiburg.
- Sperry. Omer Edison Sperry, 1902–, botanist, Sul Ross State College, Alpine, Texas, later Texas A&M University; author of "A check list of the ferns, gymnosperms, and flowering plants of the proposed Big Bend National Park of Texas" (1938).
- Spreng. Kurt Polykarp Joachim Sprengel, 1766-1833, professor of medicine and botany, Halle; author of works on the flora of Halle, on the Umbelliferae, on the history of botany, and editor of the 18th edition of Linnaeus' "Systema Vegetabilium" (1825-1828).
- Spring. Frédéric Antoine Spring, 1814-1872, professor in Liéttich, Belgium; Lycopodiaceae.
- St.-Hil. Auguste François César Prouvençal de Saint-Hilaire, 1779-1853, French botanist and explorer; collected 7,000 species of plants during extensive travels in Brazil and Paraguay, published many works.
- St.-Hil. & A. Juss. A. Saint-Hilaire, and A. H. L. Jussieu.
- St. John. Harold St. John, 1892–, professor of botany and curator, Bishop Museum, University of Hawaii, formerly at Washington State College, Pullman; student of the flora of eastern Washington.
- St. John & White. H. St. John, and Donald White, b. about 1892–, high school teacher and owner of horticulture firm.
- E. St. John. Edward Porter St. John, 1866-1952, student of Florida ferns.
- R. St. John. Robert Porter St. John, 1869-1960, the brother, student of Florida ferns.
- Standl. Paul Carpenter Standley, 1884-1963, curator, U. S. National Herbarium (1909-1928), Chicago (Field) Natural History Museum (1928-1950), then Zamorano, Honduras; student of the Mexican and Central American floras; also of southwestern United States, author of "Plants of Glacier National Park" (1926), "Trees and Shrubs of Mexico" (1920-1924) and many other notable works.
- Stapf. Otto Stapf, 1857-1933, Austrian botanist on the staff at Kew from 1890, as keeper from 1909-1922; contributor to Harvey and Sonder's "Flora Capensis" and Oliver's "Flora of Tropical Africa."
- Stapf & Hubb. O. Stapf, and C. E. Hubbard.
- Staudt. G. Staudt, contemporary German botanist, Max-Planck Institut, Germany; *Fragaria*.
- Steb. George Ledyard Stebbins, Jr., 1906–, professor of genetics, University of California (Davis); cytogeneticist and cytotaxonomist; *Crepts*, *Antennaria*, Gramineae.
- Steen. Cornelis Gijsbert Gerrit Jan van Steenis, 1901–, Rijksherbarium, Leiden, Netherlands; vegetation, ecology and taxonomy of the flora of Malaysia and adjacent countries.
- Sterrett. William Dent Sterrett, 1881–, American forester, U. S. Forest Service.
- Steud. Ernst Gottlieb Steudel, 1783-1856, German physician and botanical bibliographer; agrostologist.
- Stevens. George Thomas Stevens, 1832-1921, American physician who had an interest in botany.
- S. R. Stewart. Sara R. (later Hinckley) Stewart, 1913–, Hanover, Pennsylvania.
- Steyerm. Julian Alfred Steyermark, 1909–, curator, Chicago (Field) Natural History Museum (1937-1958), botanist, Instituto Botanico of the Ministry of Agriculture, Caracas, Venezuela (1958–); botanical explorer and student of Central and South American floras, *Grindelia*, author of "Flora of Missouri" (1962), floristic works on Central and South American countries, etc.
- Stokes. Jonathan Stokes, 1755-1831, British botanist.
- S. Stokes. Susan Gabriella Stokes, 1868-1954, botanist and high school teacher in San Diego, California; student of *Eriogonum*.
- Stone. Witmer Stone, 1866-1939; author of "The plants of southern New Jersey" (1911).
- Strother. John Lance Strother, 1941–, Herbarium, University of California, Berkeley; Compositae (*Dyssodia*, *Tetradymia*).
- Stuck. Teodoro Stuckert, 1852-1932, Argentina.
- Stuckey. Ronald Lewis Stuckey, 1938–, Ohio State University, Columbus; taxonomy and distribution of angiosperms; Cruciferae (*Rorippa* of North America).
- Stuessy. Tod Falor Stuessy, 1943–, Ohio State University, Columbus; Compositae (Heliantheae: *Melampodium*, *Lecocarpus*).
- Sturm. Jacob Sturm, 1771-1848, German botanical artist.
- Sudw. George Bishop Sudworth, 1864-1927, chief dendrologist, U. S. Forest Service, Washington; author of "Check List of the Forest Trees of the United States, Their names and Ranges" (1898, 1927), "Forest Trees of the Pacific Slope" (1908), etc.
- Suksd. Wilhelm Nikolaus Suksdorf, 1850-1932, German-born American botanist, Bingen, Washington, whose valuable herbarium was bequeathed to State College of Washington, Pullman.
- Sulliv. William Starling Sullivant, 1803-1873, eminent Ohio bryologist for whom the Sullivant Moss Society (now American Bryological Society) was named.
- Svens. Henry Knute Svenson, 1897–, Brooklyn Botanic Garden, American Museum of Natural History, U. S. Geological Survey; *Eleocharis*.

- Sw. Olof Peter Swartz, 1760-1818, Swedish botanist, professor in Stockholm, student of Linnaeus; organizer of the botany of the West Indies in his "Flora Indiae Occidentalis," 3 vols. (1797-1806).
- Swall. Jason Richard Swallen, 1903—, curator, U. S. National Herbarium, Washington; Gramineae.
- Sweet. Robert Sweet, 1783-1835, England, horticulturist and ornithologist; monographer of the Geraniaceae (1820-1830).
- Swezey. Goodwin Deloss Swezey, 1851-1934, professor of astronomy, Nebraska.
- Swingle. Walter Tennyson Swingle, 1871-1952, U. S. Dept. Agriculture, Washington; authority on *Citrus*, introduced commercial date palm into California in 1900 and the fig insect, *Acala* cotton, etc.
- T. & G. John Torrey and Asa Gray; authors of "A Flora of North America" (1838-1840, 1843).
- T. & H. J. Torrey, and Sir W. J. Hooker.
- Tateoka. Tuguo Tateoka, 1931—, National Science Museum, Tokyo, Japan; Gramineae.
- Taub. Paul Hermann Wilhelm Taubert, 1862-1897, Germany.
- Tausch. Ignaz Friedrich Tausch, 1793-1848, Bohemian botanist known for his studies in *Hieracium*.
- Ten. Michele Tenore, 1780-1861, Italian botanist, professor in Naples.
- Terán & Berl. General Manuel de Mier y Terán, ?-1832(?), Mexican, Ft. Terán on Neches River in Tyler Co., Texas, named for him, and J. L. Berlandier.
- Terrac. Achille Terracciano, 1861-1917, Italian botanist.
- Terscheck. Published on the Cactaceae (1843).
- Tharp. Benjamin Carroll Tharp, 1885-1964, Professor of Botany, University of Texas, Austin; student of the Texas flora; author of "Texas Range Grasses" and other works.
- Tharp & Barkl. B. C. Tharp, and F. A. Barkley.
- Tharp & M. C. Johnst. B. C. Tharp, and M. C. Johnston.
- Tharp & L. O. Wms. B. C. Tharp, and L. O. Williams.
- Theil. Albert Thellung, 1881-1928, keeper in the Botanical Institute of the University of Zurich; Cruciferae.
- Thomas. John Hunter Thomas, 1928—, Occidental College, Los Angeles, California; Onagraceae, student of Alaskan and California floras.
- Thomps. Charles Henry Thompson, 1870-1931, Missouri Botanical Garden, St. Louis.
- Thomps. & Zavortink. H. J. Thompson and J. R. Zavortink.
- H. J. Thomps. Henry Joseph Thompson, 1921—, professor of botany, University of California (Los Angeles); Loasaceae, *Dodecatheon*.
- Thornb. John James Tomber, 1872-1962, professor of botany, University of Arizona; student of flora of Arizona and Nebraska.
- Thou. Louis Marie Aubert Du Petit-Thouars, 1758-1831, French taxonomist and botanical writer.
- Thuill. Jean Louis Thuiller, 1757-1822, French gardener, professor in Paris; author of a flora of Paris (1790).
- Thunb. Carl (Pehr) Peter Thunberg, 1743-1828, professor of botany, Uppsala, student of Linnaeus; collected in South Africa, Japan, Ceylon, prolific author of notable works including "Flora Japonica" (1784) and "Flora Capensis" (1820).
- Thurb. George Thurber, 1821-1890, New York; botanist and quartermaster with the Mexican Boundary Survey (1850-53); editor of the AMERICAN AGRICULTURIST.
- Tidest. Ivar T. Tidestrom, 1864-1956, Swedish-born American botanist, professor of botany, Catholic University of America, Washington; author of "Flora of Utah and Nevada" (1925) and (with Sister T. Kittell) "A Flora of Arizona and New Mexico" (1941).
- Tiegel. Interested in the Cactaceae.
- Tomb. Andrew Spencer Tomb, 1943—, Dept. of Botany, University of Texas, Austin; Compositae (Cichorieae).
- Torr. John Torrey, 1796-1873, physician, professor of chemistry and botany, College of Physicians and Surgeons, New York; collector and describer of many western American plants, an outstanding systematist and botanical author.
- Torr. & Frém. John Torrey and John Charles Frémont, 1813-1890, soldier and explorer; first botanical collector in the Sierra Nevada and first presidential candidate of the Republican Party.
- Tourn. Joseph Pitton de Tournefort, 1656-1708, French botanist, professor in the royal garden, Paris; first clear characterizer of genera, his botanical system was the highest pre-Linnaean development.
- Towner & Raven. Howard Frost Towner, 1943—, Stanford University, Stanford, California; Onagraceae (*Calylophus*), and P. H. Raven.
- Traub. Hamilton Paul Traub, 1890—, U. S. Dept. Agriculture, horticulturist; Amaryllidaceae, etc.
- Trel. William Trelease, 1857-1945, director, Missouri Botanical Garden, St. Louis (1885-1912), then professor of botany, University of Illinois, Urbana (1913-1926), first president of the Botanical Society of America; *Yucca*, *Agave*, *Epilobium*, *Quercus*, *Piper*.
- Trew. Christoph Jakob Trew, 1695-1769, physician and naturalist of Nürnberg, Germany.
- Tricker. Published on *Nymphaea* in 1897.
- Trin. Carl Bernhard von Trinius, 1778-1844, Russian court physician, also poet and noted agrostologist.
- Trin. & Rupr. C. B. von Trinius, and F. J. Ruprecht.
- Troncoso. Nelida S. Troncosa, 1914—, wife of A. S. Burkart, Instituto Botánica Darwinion, San Isidro, Argentina; Verbenaceae.
- A. Tryon. Alice Faber Tryon, 1920—, Gray Herbarium, Harvard University; Polypodiaceae (Tribe Cheilantheae, *Pellaea*, *Notholaena*, *Cheilanthes*).
- R. Tryon. Rolla Milton Tryon, 1916—, curator, Missouri Botanical Garden, St. Louis, later curator of ferns, Gray Herbarium, Harvard University; author (with others) of "The Ferns and Fern Allies of Wisconsin" (1940, 1953), "The Ferns and Fern Allies of Minnesota" (1954), "The

- Ferns of Peru Polypodiaceae (Dennstaedtieae to Oleandreae)" in *Contrib. Gray Herb.* 194 (1964), etc.
- Tuckerm. Edward Tuckerman, 1817-1886, professor at Amherst, Massachusetts; lichenologist.
- Tul. Louis Rene Tulasne, 1815-1885, French student of cryptogams.
- Turcz. Nicolaus (Nikilai Stepanovich Turchaninov) Turczaninow, 1796-1864, Russia; author of "Flora baicalensi-daburica." (1842-1856).
- Turner & Horne. B. L. Turner, and David Bertram Horne, 1940- , Sam Houston State College, Huntsville, Texas; Compositae (*Machaeranthera*), Leguminosae (*Baptisia*).
- B. L. Turner. Billie Lee Turner, 1925- , professor of botany, University of Texas, Austin, plant taxonomy, chromosomal studies of higher plants; author of "Legumes of Texas" (1959), (with Ralph E. Alston) "Biochemical Systematics" (1963) and numerous papers, poems and essays.
- Turp. Pierre Jean François Turpin, 1775-1840, French botanical artist and naturalist.
- Tutin. Thomas G. Tutin, 1908- , University College, Leicester, England; flora of the British Isles.
- Uline & Bray. Edwin Burton Uline, 1867-1933, New York high school principal, and William L. Bray, 1865-1953, adjunct and later professor of botany, University of Texas at Austin (1898-1907) where he was first teacher of botany, then forest pathologist, U. S. Dept. Agriculture, later botanist and dean of the graduate school, Syracuse University, New York; student and collector of Texas and southwestern U. S. plants.
- Underw. Lucien Marcus Underwood, 1853-1907, professor of botany, Columbia University, New York; student of ferns; author of "Our Native Ferns and Their Allies" (1880 and subsequent editions).
- Underw. & Cook. L. M. Underwood, and O. F. Cook.
- Urban (or Urb.). Ignatz Urban, 1848-1931, German authority on the flora of tropical America; monographer of *Medicago*, Loasaceae, author of "Symbolae Antillanae . . ." (1898-1908).
- Urban & Gilg. I. Urban and Ernst Friedrich Gilg, 1867-1933, both of the Botanical Museum, Berlin.
- Vahl. Martin Hendriksen Vahl, 1749-1804, Danish botanist, professor in Copenhagen; student of Linnaeus and one of the editors of "Flora Danica."
- Vail. Anna Murray Vail, 1863-1955, librarian, New York Botanical Garden; Asclepiadaceae, Leguminosae.
- Van Eselt. Glen Parker Van Eseltine, 1888-1938, U. S. Dept. Agriculture; Martyniaceae.
- Van Heurck & Muell. Arg. Henri Ferdinand van Heurck, 1838-1909, Belgian botanist and microscopist, and J. Mueller.
- Van Melle. Peter Jacobus Van Melle, 1891-1953, nurseryman of Poughkeepsie, New York.
- v. Ooststr. Simon Jan van Ooststroom, 1906- , Rijksherbarium, Leiden, Netherlands; Convolvulaceae, Borneo flora.
- Vasey. George Vasey, 1822-1893, English-born American botanist, eminent agrostologist, curator, U. S. National Herbarium, Washington.
- Vasey & Hack. G. Vasey, and E. Hackel.
- Vasey & Scribn. G. Vasey, and F. L. Scribner.
- Vatke. Georg Caral Wilhelm Vatke, 1849-1889, assistant in the botanical garden, Berlin.
- Vaughn. Alice Vaughn, published on *Trifolium* in 1939.
- Vell. José Marianno da Conceição Velloso, 1742-1811, Portuguese-Brazilian botanist; posthumously published writer on the flora of Brazil.
- Vent. Etienne Pierre Ventenat, 1757-1808, professor of botany, Paris; horticulturist.
- Vest. Lorenz Chrysanth von Vest, 1776-1840, professor in Graz, Austria.
- Vicé. Frere Marie-Victorin (*formerly* Conrad Kirouac), 1885-1944, director of the botanical institute, Montreal; author of "Flore Laurentienne" (1935), the first flora in which chromosome numbers appeared.
- Vill. Dominique Villars, 1745-1814, physician and professor in Grenoble, *finally* in Strassburg; author of a basic work on the flora of the West Alps.
- Vilm. Several generations of the family of Vilmorin in Paris; seedsmen and authors of many books and memoirs on botany and horticulture; Pierre Philippe André Levéque de Vilmorin, 1746-1804; Pierre Vilmorin, 1816-1860; Henry L. de Vilmorin, died 1899; Maurice Levéque de Vilmorin, 1849-1919; Philippe de Vilmorin, 1872-1917.
- Vitman. Fulgencio Vitman, 1728-1806, Italian botanist.
- Viv. Domenico Viviani, 1772-1840, Italian botanist.
- Vog. Julius Rudolph Theodor Vogel, 1812-1841, German botanist and explorer in Africa.
- Voigt. Johann Otto Voigt, 1798-1843, botanist in Calcutta, India.
- Volk. Albert von Volkart, 1873-1951, Switzerland.
- Voss. Andreas Voss, 1857-1924, German student of conifers.
- J. Voss. John William Voss, 1907- , Pomona College, Claremont, California, school principal; *Phacelia*.
- Wagenkn. Burdette Lewis Wagenknecht, 1925- , Biology Dept., Norwich University, Northfield, Vermont; Compositae.
- Wahl. Göran (Georg) Wahlenberg, 1780-1851, Swedish botanist, professor in Uppsala, plant geographer; author of "Flora Lapponica" (1812), "De Vegetatione et Climate Helvetiae" (1813), "Flora Carpatorum Principalium" (1814), "Flora Upsaliensis" (1820), "Flora Suecica" (1824-1826).
- H. A. Wahl. Herbert Alexander Wahl, 1900- , professor of botany, Pennsylvania State University; *Chenopodium*.
- Wall. Nathanael (*formerly* Nathan Wolff) Wallich, 1786-1854, Danish physician; superintendent of the Royal Botanic Garden, Calcutta, 1815-1841(?).
- Wallr. Carl Friedrich Wilhelm Wallroth, 1792-1857, Danish physician and botanist.
- Walp. Wilhelm Gerhard Walpers, 1816-1853, German botanist; author of "Repertorium Botanices Systematicae" (1842-1853), "Annales Botanices Systematicae" (1848-1868), etc.

- Walraven. Wesley Clifton Walraven, 1936- , Kennesaw Junior College, Marietta, Georgia; Leguminosae (*Rhynchosia*).
- Walt. Thomas Walter, 1740-1789, British-American botanist, Charleston planter; author of "Flora Caroliniana" (1788).
- Wang. Friedrich Adam Julius von Wangenheim, 1747-1800, German forester.
- Ward. George Henry Ward, 1916- , professor of botany, Knox College, Galesburg, Illinois; *Artemisia*, arctic flora.
- Warder. John Aston Warder, 1812-1883, physician and horticulturist, Cincinnati, Ohio.
- Warming. Eugenius Warming, 1841-1924, University Professor and director of Botanic Garden and Museum, Copenhagen; plant geographer.
- Warnock. Barton Holland Warnock, 1911- , professor of botany, Sul Ross State University, Alpine, Texas; student and collector of the flora of Trans-Pecos Texas.
- Warnock & M. C. Johnst. B. H. Warnock, and M. C. Johnston.
- Wasshausen. Dieter Carl Wasshausen, 1938- , Assistant Curator, U. S. National Herbarium, Washington; Acanthaceae.
- Waterfall. Umaldy Theodore Waterfall, 1910- , professor of botany, Oklahoma State University, Stillwater; Solanaceae (*Physalis*), Malvaceae (*Callirhoe*); author of "Keys to the Flora of Oklahoma" (1953-1960, 2nd ed. 1962).
- Wats. Sereno Watson, 1826-1892, assistant to Asa Gray, curator of Gray Herbarium, Harvard University (1888-1892), critical student of West American plants.
- E. E. Wats. Elba Emanuel Watson, 1871-1936, high school biology teacher in Michigan and New York; *Helianthus*.
- P. W. Wats. Peter William Watson, 1761-1830, English horticulturist-dendrologist.
- Watt. David Allan Poe Watt, 1830-1917, Montreal, Canada; student of ferns.
- Weath. Charles Alfred Weatherby, 1875-1949, Gray Herbarium, Harvard University; student of ferns, bibliographer.
- Weath. & Blake. C. A. Weatherby, and S. F. Blake.
- Webb. Philip Barker Webb, 1793-1854, British botanist, botanical traveler and accumulator of a rich herbarium and botanical library, which are now in Florence.
- Webb & Berth. P. B. Webb, and Sabin Berthelot, 1794-1880, French consul on Teneriffe; authors of "Histoire Naturelle des Illes Canaries" (1835-1844).
- Webb & Moq. P. B. Webb, and C. H. B. A. Moquin-Tandon.
- Weber. Frederick Albert Constant Weber, 1830-1903, French botanist with special interest in succulents, particularly the Cactaceae, member of French expedition to Mexico (1865-6).
- G. L. Webst. Grady Linder Webster, 1927- , Texas-born and -reared, University of California (Davis); Euphorbiaceae (American and Pacific).
- Wedd. Hugh Algernon Weddell, 1819-1877, British botanist and traveler, collector in South America.
- Weigel. Christian Ehrenfried Weigel, 1748-1831, professor at Greifswald, Germany.
- Weinm. Johann Anton Weinmann, 1782-1858, director, botanic garden, St. Petersburg, Russia.
- Wendl. Hermann Wendland, 1823-1903, director of the royal garden at Herrenhausen, Hannover, Germany; Palmae.
- West. Richard Weston, 1733-1806, England.
- Wettst. Richard Ritter von Westersheim Wettstein, 1863-1931, director of the botanic garden, Vienna; outstanding systematist, proposer of an important phylogenetic system.
- Wheeler. Louis Cutter Wheeler, 1910- , professor of botany, University of Southern California, Los Angeles; *Euphorbia* and other genera of Euphorbiaceae.
- Wherry. Edgar Theodore Wherry, 1885- , professor of botany, University of Pennsylvania; student of ferns, Polemoniaceae, author of "Guide to Eastern Ferns" (1942), "The Genus Phlox" (1955), "The Southern Fern Guide" (1964), etc.
- White. Theodore Greeley White, 1872-1901, student at New York Botanical Garden; Leguminosae (*Lathyrus*).
- Whiteh. Eula Whitehouse, 1892- , Southern Methodist University, Dallas, Texas; student and collector of flora of Texas, author of "Texas Flowers in Natural Color" (1936, 1948).
- Wieg. Karl McKay Wiegand, 1873-1942, professor of botany, Cornell University, Ithaca, New York; author (with A. J. Eames) of "The Flora of the Cayuga Lake Basin, New York" (1926).
- Wiens. Delbert Wiens, 1932- , University of Utah, Salt Lake City; Viscaceae, Loranthaceae.
- Wiggers. Friedrich Heinrich (Wichers) Wiggers, 1746-1811; author of a "Flora of Holstein" (1780).
- Wight & Arn. Robert Wight, 1797(?) - 1872, British botanist who resided in India (1819-1853); superintendent of the Madras botanic garden and student of the flora of India, and George Arnold Walker Arnott, 1799-1868, Edinburgh and Glasgow botanist.
- Wight & Hedr. W. F. Wight, and Ulysses Prentiss Hedrick, 1870-1951, pomologist, Director of Agricultural Experiment Station, Geneva, New York.
- W. Wight. William Franklin Wight, 1874-1954, U. S. Dept. Agriculture, Palo Alto, California; botanical and agricultural collector in South America, author of "Origin, Introduction and Primitive Culturo of the Potato" in Proc. 3rd. Ann. Meet., Potato Assoc. Am. 3:35-52. 1916.
- Wilbur. Robert Lynch Wilbur, 1925- , professor of botany, Duke University, Durham, North Carolina; *Sabatia*, Cistaceae, Clethraceae.
- Willd. Carl Ludwig Willdenow, 1765-1812, German botanist, director of the Berlin Botanical Garden (1801-1812); produced the 4th ed. of Linnaeus' "Species Plantarum" (1797-1810).
- Willem. Pierre Remi Willemet, 1735-1807, French taxonomist; student of the flora of Lorraine.
- J. S. Wils. James Stewart Wilson, 1932- , Kansas State Teachers College, Emporia, Kansas; ecology of *Persicaria*.
- K. A. Wils. Kenneth A. Wilson, 1928- , professor of botany, University of Michigan, Ann Arbor; Myrtaceae (*Eugenia*), Convolvulaceae.

- P. Wils. Percy Wilson, 1879-1944, New York Botanical Garden; student of flora of North America and West Indies.
- Wimm. Christian Friedrich Heinrich Wimmer, 1803-1868, German philologist and botanist, school official in Breslau.
- Windler. Donald Richard Windler, 1940- , botanist, Towson, Maryland; Leguminosae (published on *Neptunia* in 1966).
- Winkl. Hubert Winkler, 1875-1941, Botanical Garden, Tubingen, Germany.
- With. William Withering, 1741-1799, British physician and botanist; author of a British flora (1776, plus 3 additional editions).
- L. O. Wms. Louis Otho Williams, 1908- , botanist, Botanical Museum, Harvard University, then Escuela Agricola Panamericana, Zamorano, Honduras, then U. S. Dept. Agriculture, Beltsville, later Chicago Natural History (Field) Museum; orchidologist, student and collector of Latin American flora, author of "Orchids of Mexico," Ceiba, Vol. 2 (1951), etc.
- C. B. Wolf. Carl Brandt Wolf, 1905- , botanist, Rancho Santa Ana Botanic Garden, Anaheim, California (1930-1945), published on *Erythronium* in 1941 and *Rhamnus* in 1939.
- v. Wolf. Nathanael Matthaeus von Wolf, 1724-1784, German physician and botanist.
- W. Wolf. Contemporary botanist, St. Bernard College, Alabama; student of Liliaceae (*Erythronium*, 1941).
- Wood. Alphonso Wood, 1810-1881, principal, Brooklyn Female Academy, New York; author of "Class-Book of Botany" (1845, 2nd. ed. 1861), in which dichotomous keys were first employed in America, collected in California in 1866.
- Woods. Robert Everard Woodson, 1904-1963, Missouri Botanical Garden, St. Louis; authority on Asclepiadaceae and Apocynaceae.
- Woodv. William Woodville, 1752-1805, English student of medical botany.
- Woodv. & Wood. W. Woodville, and William Wood, 1745-1808, English botanist; *Cyperus*.
- Woot. Elmer Otis Wootton, 1865-1945, professor of biology, New Mexico State College, Mesilla Park (1890-1911), U. S. Dept. Agriculture, Washington (1911-1935); student of the New Mexican flora, author of "Trees and Shrubs of New Mexico" (1913), etc.
- Woot. & Standl. E. O. Wootton and P. C. Standley; authors of "Flora of New Mexico" (1915).
- Wright. Charles Wright, 1811-1885, world-wide botanical collector but mainly in Texas (1837-1852), Cuba and his native Connecticut; correspondent of Asa Gray and other notables of his time.
- S. H. Wright. Samuel Hart Wright, 1825-1905, New York; published on *Dichromena* (Cyperaceae).
- Y. Wright. Ysabel Wright, published on the Cactaceae in 1937.
- Yates. Harris Oliver Yates, 1934- , David Lipscomb College, Nashville, Tennessee; Gramineae.
- Yunck. Truman George Yuncker, 1891-1962, professor of botany, De Pauw University, Indiana; monographer of *Cuscuta*, *Piper*, *Peperomia*.
- Zavortink. Joyce Robert Zavortink, 1930- , University of California, Los Angeles; Loasaceae.
- Zinn. Johann Gottfried Zinn, 1727-1759, professor of medicine, Göttingen, Germany.
- Zucc. Joseph Gerhard Zuccarini, 1797-1848, German botanist, professor in Munich.
- Zuccagn. Attilio Zuccagni, 1754-1807, Italian botanist.
