23. *Quercus sinuata* Walt. BASTARD OAK. Large trees to 20 m. or more in height, with a trunk diameter of 7.5 dm., the soft gray bark in broad thin scales; twigs 2-4 mm. thick, from sparsely stellate-pubescent quickly glabrate and gray with inconspicuous lenticels; buds 2.5-3.5 mm. long, broadly ovoid to subrotund, obtuse, scales dark-reddish-brown, glabrous or minutely ciliate; stipules early-caducous, membranous, 5-7 mm. long, ligulate or spatulate, stellate-pubescent dorsally; leaves deciduous, somewhat thick and coriaceous or quite thin (especially in shade forms), to 13 cm. long and 6 cm. broad, obovate to oblanceolate, apically broadly rounded, basally cuneate or sometimes rounded, margins entire to regularly or irregularly sinuately toothed or lobed (especially above the middle), minutely revolute, upper surfaces from sparsely minute-stellate becoming glabrate and glossy dark-green, lower surfaces persistently pubescent with minute appressed dense stellate hairs, strikingly silver or appearing green if the pubescence is sparse, occasionally tardily glabrate; petioles to 1 cm. long, sparsely stellate or glabrous; pistillate catkins about 5 mm. long, usually 2-flowered on minutely stellate peduncles; fruit annual, solitary or paired on peduncles to 1 cm. long or sessile; cups to 2 cm. broad and 8 mm. high, saucer-shaped or shallowly cup-shaped, flat or rounded at base, margins not inrolled; cup scales narrowly ovate, only moderately thickened basally, apically loosely appressed, silvery-puberulent all over, the margins dark-red; acorns to 18 mm. long and 17 mm. broad, elliptic to subrotund, glabrous except immediately about the apex, tan-brown, one fourth or less included. *Q. Durandii* Buckl. In moist forests in the timber region of e. Tex. and w. along river courses to the escarpment of the Edwards Plateau; e. to S.C.

23a. *Quercus sinuata* var. *breviloba* (Torr.) C. H. Mull. Shrubs or rarely trees with flaking gray bark; twigs to 3 mm. thick, subterete or fluted, grayish-brown, glabrous or minutely stellate-tomentulose, the numerous minute lenticels not at all conspicuous; buds 2-3 mm. long, broadly ovoid, obtuse or acute, glabrous or sparsely pubescent, dark-reddish-brown or grayish-brown; stipules rather promptly caducous, 3-5 mm. long, filiform-ligulate, pubescent; leaves deciduous, membranous but rather thick and hard or shade forms quite thin, to 8 cm. long and 4 cm. broad, usually smaller, obovate to oblanceolate or oblong, usually broadest above the middle, apices broadly rounded, bases cuneate or obtuse, rarely attenuately narrowed, entire to irregularly toothed or moderately lobed, margin not revolute, upper surfaces glabrous, usually quite lustrous, lower surfaces opaque, apparently glabrous but actually minutely appressed-stellate-puberulent and thereby canescent or (especially in shade forms) green and only sparsely puberulent or quite glabrous; petioles 2-3 mm. long, glabrous or pubescent like the twigs; *staminate catkins* to 8 cm. long, finally rather loosely flowered, tomentulose, the anthers moderately or only slightly exerted; *pistillate catkins* 3-7 mm. long, 1- to 3-flowered, densely short-tomentose; fruit annual, solitary or paired, sessile or on a pubescent peduncle to 7 mm. long; cups to 12 mm. broad and 8 mm. high, goblet-shaped or shallowly cup-shaped, base rounded or constricted, margins thin, smooth, simple; cup scales ovate, obtuse, the tomentose bases slightly or sharply keeled and thickened, the puberulent apices thin, closely appressed, dark-reddish-brown; acorns to 1.5 cm. long and 1 cm. broad, ovoid to elliptic, glabrous, light-brown, one fourth included. *Q. obtusifolia* var. ? *breviloba* Torr., *Q. annulata* Buckl., *Q. San-Sabeana* Buckl., *Q. breviloba* (Torr.) Sarg., *Q. Durandii* var. *breviloba* (Torr.) E. J. Palm. On openly wooded limestone hills at low elev. in cen. Tex.; also n.e. Mex.

24. *Quercus pungens* Liebm. SCRUB OAK. Shrubs or moderate-sized trees; twigs 1-2 mm. thick, fluted, tomentulose to short-velvety-tomentose or farinaceous, tardily glabrate and gray with small inconspicuous lenticels; buds about 2 mm. long, round-ovoid, sparsely pubescent, dark-reddish-brown; stipules persistent or caducous, 3-4 mm. long, subulate, pubescent; leaves evergreen or subevergreen, rather thick, very hard and stiff, to 9 cm. long and 4 cm. broad, usually smaller, elliptic to oblong, apices acute or obtuse, mucronate-tipped, bases rounded or cordulate, very rarely cuneate, coarsely toothed or incised, the teeth or lobes acute, rarely rounded, always mucronate-tipped, margins undulately crisped, not or scarcely revolute, upper surfaces very lustrous, minutely and sparsely stiff-spreading-stellate (therefore harsh and sandpaperlike to the touch), lower surfaces canescent, densely pubescent with two types of hairs, sericeous, appressed simple or stellate hairs covering the whole surface and scattered stiff spreading stellate hairs (therefore

also harsh to the touch), rarely nearly glabrous on both surfaces, the glabrous veins obvious against the pubescent blade; petioles to about 1 cm. long, tomentose like the twigs; pistillate catkins 3-5 mm. long, 1- to 3-flowered; fruit annual, solitary or paired, subsessile or on a peduncle scarcely 3 mm. long; cups to 13 mm. broad and 8 mm. high, shallowly cup-shaped to deeply cup-shaped with the base broader than the margin, base rounded, margin thin and simple; cup scales broadly ovate or the apices often narrowed and oblong, basally thickened or keeled and densely gray-tomentose, apices thin and closely appressed, glabrate or merely puberulent and reddish-brown; acorns to 1 cm. long and broad, broadly ovoid to subcylindric, apex rounded to subacute, light-brown, glabrous, one fourth included. *Q. undulata* var. *pungens* (Liebm.) Engelm., *Q. undulata* var. *Vaseyana* (Buckl.) C. H. Mull., *Q. undulata* Sperry. On dry rocky slopes at moderate elev. in w. Tex.; n. into N.M. and Ariz., s. into n.e. Mex.

24a. *Quercus pungens* var. *Vaseyana* (Buckl.) C. H. Mull. Shrubs or small trees; twigs 1-1.5 mm. thick, fluted, reddish- or grayish-brown, rarely glabrous, short stellate-tomentose or tomentulose, at length glabrate or persistently pubescent, the second season gray with conspicuous or inconspicuous lenticels; buds 1-1.5 mm. long, round-ovoid, obtuse, sparsely pubescent or glabrate, dark-reddish-brown or gray; stipules caducous, about 3 mm. long, subulate, sparsely pubescent; leaves subevergreen to evergreen, membranous or usually rather thick and coriaceous, to 6 cm. long and 2 cm. broad, narrowly lanceolate to usually oblong, apices acute or rarely obtuse, bases cuneate to rounded, coarsely 3- to 5-toothed on each side or shallowly lobed or entire, the teeth or lobes acute or obtuse but mucronate-tipped, margins cartilaginous-thickened, not revolute, upper surfaces dark-green, lustrous, glabrous or very sparsely stellate-puberulent, lower surfaces densely sericeous with minute appressed stellate hairs or these very sparse or wanting and the surface rather lustrous green, the principal veins glabrous and conspicuous against the usually pubescent lower surface; petioles to 5 mm. long, pubescent like the twigs; *staminate catkins* 2.5-3 cm. long, short-tomentulose, rather loosely flowered; *pistillate catkins* 3-5 mm. long, 1- to 2-flowered; fruit annual, solitary or paired, subsessile or on a peduncle 2-3 mm. long; cups to 1 cm. broad, 3-4 mm. high, saucer-shaped to cup-shaped, bases rounded, margin simple and thin; cup scales very broadly ovate, basally much-thickened and short-velvety-tomentose, apex thin, closely appressed, dark-red, glabrous; acorns to about 12 mm. long and broad, ovoid to oblong or subcylindric, light-brown, glabrous, one fifth to one third included. *Q. Vaseyana* Buckl., *Q. undulata Vaseyana* (Buckl.) Rydb., *Q. sillae* Trel. On dry limestone hills at low elev. in s.w. Tex.; also n.e. Mex.

25. *Quercus virginiana* Mill. LIVE OAK, ENCINO. Small or very large spreading trees; bark dark-brown or black and very deeply furrowed; twigs 1.5-3 mm. thick, round or fluted, white-gray or buff with a dense waxy appressed-stellate tomentum, appearing farinaceous to the naked eye, gray the second year and nearly glabrate with numerous inconspicuous lenticels; buds 2-2.5 mm. long, rounded, puberulent, red-brown; stipules immediately caducous, 2-4 mm. long, ligulate, brown, villous; leaves evergreen to subevergreen, thick and chartaceous, 3 or usually 5 to 9 or sometimes 12 cm. long, 1 or usually 2 to 4 or sometimes 6 cm. broad, from usually oblong or elliptic to obovate or oblanceolate, apices from broadly rounded and mucronate to acute, bases from cuneate to rounded or rarely cordate, margins entire to toothed or even lobed, strongly revolute, upper surfaces glossy and glabrous, lower surfaces dully canescent with a thick coating of minute appressed stellate hairs, the pubescence very waxy; veins 6 to 10 on each side with evanescent intermediates, branching and obviously anastomosing well within the margin, strongly raised on both surfaces (including even the ultimate reticulum) or slightly raised on the upper surface within impressions, the tomentum masking the veinlets on the lower surface but the midrib and usually the veins nearly glabrous and prominent; petioles 2 to 7 or rarely 10 mm. long, dorsally flattened and distally slightly winged, stellate-pubescent like the twigs or nearly glabrous like the midrib beneath; *staminate catkins* 2-4 cm. long, sparsely and minutely stellate-tomentose, moderately densely flowered, the perianth ciliate, the pubescent anthers scarcely exerted; *pistillate catkins* to about 2 cm. long, 1- or several-flowered, peduncles canescent like the twigs; fruit annual, solitary, paired or several on a peduncle to 5 cm. long and nearly glabrate; cups to 18 mm. broad and 12 mm. high, deeply goblet-shaped, the bases usually much-narrowed

or rarely nearly rounded, margins flat and smooth; cup scales triangular, moderately thickened basally, the short apices flat, gray-pubescent throughout; acorns ovoid or broadly fusiform, 15-30 mm. long, 12-18 mm. broad, glabrous and shiny-brown except for a ring of stellate hairs around the apex of the persistent style, one fourth or one third included. In timber region of e. and s. Tex., strictly near the coast; from Tex. e. to the Atl. and n. to Va.

25a. *Quercus virginiana* × *Q. stellata*. Several natural hybrids of *Q. virginiana* and *Q. stellata* occur sporadically in Texas. Because of their unusual nature they have been collected in numbers out of all proportion to their importance, some herbaria containing dozens of duplicates of single collections. Such entities occur usually as one or a few trees, and where several are present, they vary greatly.

These hybrids usually appear more like *Q. virginiana* than like *Q. stellata*. They differ from *Q. virginiana* in bearing leaves with the margins coarsely round-toothed or shallowly lobed and the lower surfaces bearing not only the persistent dense waxy pubescence of *Q. virginiana* but spreading stellate hairs typical of some forms of *Q. stellata*. The cups are somewhat peduncled and constricted basally as in *Q. virginiana*, but the acorns are more broadly ovoid as in *Q. stellata*.

This series of plants does not comprise an entity distinct from *Q. virginiana* nor even a unified entity of any sort and it is obviously not worthy of taxonomic distinction.

26. *Quercus fusiformis* Small. Large rhizomatous shrub or a large tree with rough black bark and spreading crown; twigs 1.5-2.5 mm. thick, densely fulvous-tomentulose, glabrescent the second year or persistently pubescent; buds about 1.5 mm. long, subglobose, glossy-dark-red, puberulent; stipules about 2.5 mm. long, subulate, pubescent, usually quickly caducous; leaves evergreen, hard and coriaceous, 2-7 cm. long, 5-20 mm. broad, oblong to elliptic or obovate, very polymorphic (one form elongate and acute, another broad and rounded, with all intermediates), apices very acute or rarely broadly rounded, bases cuneate or rounded, entire or irregularly 1- or several-toothed, margins somewhat revolute or nearly flat, upper surface glossy and glabrous or sparsely stellate-puberulent especially near the base of the midrib, lower surface uniformly dense stellate-tomentulose, the hairs appressed upon a variable layer of waxy puberulence; veins 8 to 10 on each side with occasional intermediates, irregularly branched and anastomosing, very inconspicuous above or slightly raised, scarcely prominent beneath; petioles 2-8 mm. long, densely tomentulose; *staminate catkins* 35-45 mm. long, rather loosely flowered on a sparsely tomentose and glandular peduncle, the hairy anthers somewhat exerted from the moderately pubescent calyx; *pistillate catkins* 15-55 mm. long, 2- or 3-flowered distally or many-flowered along their lengths; fruit solitary, paired or in threes on a coarse peduncle 1.5-8 cm. long; cups 7-12 mm. broad, 7-10 mm. high, goblet-shaped, somewhat constricted basally, the scales moderately thickened basally, densely white-tomentose, the apices dark-red and puberulent; acorns 1.5-2 cm. long, 1-1.3 cm. thick, narrowly ovoid to subfusiform, glabrous and dull-brown, one third or one half included. *Q. virginiana* var. *fusiformis* (Small) Sarg. and var. *macrophylla* Sarg., *Q. oleoides* var. *quaterna* C. H. Mull. (type only), *Q. virginiana* (juvenile) C. H. Mull. The s. Gulf Coast population of this species on deep sand (Aransas Co. southw.) is clearly introgressed by *Q. oleoides* Cham. & Schlecht. which occurs from Tam. southw. in Mex.

27. *Quercus minima* (Sarg.) Small. Shrub 2-10 dm. tall, spreading by rhizomes; twigs 1.5-2 mm. thick, from densely silvery or fulvous-stellate-tomentulose at length glabrate and dark-red; buds about 1.5 mm. long, subglobose, glossy-red, sparingly pubescent; stipules about 3 mm. long, subulate, sparingly pubescent, quickly caducous; leaves evergreen, hard and coriaceous, highly (constantly) polymorphic, the individual plants rarely uniform for one leaf-type, the lower leaves characteristically large and toothed or lobed, the upper usually narrowly oblong and entire, the narrow upper leaves tending to hold their pubescence more persistently than the broad lower ones, the narrow form 2-5.5 cm. long and 5-16 mm. broad, oblanceolate, entire or few-toothed near the acute or rounded apex, the base narrowly cuneate, the broad form 4.5-11.5 cm. long and 2-5 cm. broad, broadly oblanceolate to narrowly obovate, coarsely and irregularly toothed in the upper half or full length, obtuse or acute, broadly cuneate, margins slightly revolute, upper surface glabrous and glossy or sparingly stellate about the base of the midrib, lower surface densely or sparsely silvery appressed-stellate-puberulent, this

persistent or on some of the broad lower leaves variously deciduous, the midrib and principal veins glabrous; veins 4 to 12 on each side, very irregular, the higher numbers in the narrow leaves, much-branched and obviously anastomosing, slightly raised above, rather prominent beneath, the reticulum obscure; petioles 1-5 mm. long, stellate-pubescent; *staminate catkins* 4-5 cm. long, rather loosely flowered, the peduncle fulvous-stellate-tomentulose, the pubescent anthers finally well-exserted from the pubescent calyx; *pistillate catkins* 3-10 cm. long, 2- to several-flowered, the peduncle fulvous-pubescent but glabrate with the twigs; fruit solitary or paired on peduncles 5-30 mm. long; cup 10-15 mm. broad, 8-16 mm. high (in one form only 7 mm. broad and 5 mm. high), deeply goblet-shaped, usually markedly constricted basally, the scales silvery tomentose with puberulent or glabrous red apices protruding, the bases sometimes strongly thickened; acorns 15-20 mm. long, 8-12 mm. thick (in one form smaller), glabrous and rather glossy-brown, one fourth to one third included or more. *Q. virens* var. *dentata* Chapm., *Q. virginiana* var. *minima* Sarg., *Q. oleoides* var. *quaterna* C. H. Mull. (excl. type). Deep sands behind the beach areas of the e. and cen. Tex. Gulf Coast; e. to Fla. and N.C.

Failure to recognize this eastern species resulted in the description of *Q. oleoides* var. *quaterna*, the type of which, however, is *Q. fusiformis*.

27a. *Quercus minima* × *Q. stellata*. This cross occurs quite commonly where sand areas bearing *Q. stellata* invade the Coastal Plain and thus bring the two parents in contact. As in the hybrid between *Q. virginiana* and *Q. stellata*, the progeny more closely resemble the live oak in being evergreen, having fruit like the live oak, and in the foliage turning markedly yellow upon drying. However, the lobing of the leaves and the spreading pubescence of the lower leaf surface indicate in varying degrees parentage by *Q. stellata*. Common with both parents near the coast.

27b. *Quercus minima* × *Q. virginiana*. Where *Q. virginiana* reaches the Coastal Plain (usually on sandy or gravelly soil) it may come in contact with the shrubby plant, *Q. minima*. The resulting hybridization is manifested usually by intermediates in stature as well as leaf form and color. They are usually quite prominent as clones towering several feet above the surrounding shrubby parent. They do not extend far beyond the influence of the lighter soil type. Locally common with both parents near the coast.

28. *Quercus Emoryi* Torr. EMORY OAK. Small or large trees reaching 20 m. in height, with very roughly furrowed black bark; twigs 1-2.5 mm. thick, fluted, dark reddish-brown, from densely gray- or buff-stellate rather tardily glabrate and glossy or persistently pubescent, becoming gray the second season; buds 1.5-2.5 mm. long, ovoid, subacute or rounded, glossy-brown, glabrate; stipules caducous, 5-8 mm. long, ligulate, tan, densely pilose or merely ciliate and apically pilose; leaves subevergreen, thick and coriaceous, usually 3-6 cm. long and 1-2.5 cm. broad, sometimes smaller or larger, from narrowly lanceolate, hastate or oblong to ovate or elliptic, narrowly acute and spine-tipped to obtuse or even rounded, truncate to strongly cordate, entire or sparsely low-toothed to strongly toothed or shallow-lobed, the teeth and lobes aristate-tipped, margins flat or minutely revolute, both surfaces from stellate-pubescent soon glabrate and glossy or persistently stellate-pubescent basally about the midrib, the lower surfaces often bearing a prominent tuft of stellate hairs on either side of the base of the midrib, the basal margin sometimes ciliate; veins rather prominently raised on both surfaces; petioles to 12 mm. long, much-flattened dorsally, tan, from stellate-tomentose tardily glabrate or persistently pubescent dorsally; *staminate catkins* 2.5-5 cm. long, loosely white-villous, rather loosely flowered, the glabrous anthers moderately exerted from the villous perianth; *pistillate catkins* subsessile or short-peduncled, 1- or 2-flowered, stellate-tomentose like the twigs; fruit annual, solitary or paired on peduncles 1-2 mm. long and stellate-tomentose or glabrate; cups to 1 cm. broad and high, hemispheric to cup-shaped or goblet-shaped, the bases rounded or somewhat constricted, margins not inrolled; cup scales broadly ovate, thin, the usually broad apices closely appressed, characteristically glabrous except the ciliate margins or canescent-puberulent, chestnut-brown and glossy where glabrate; acorns 1-1.5 cm. long, 5-9 mm. broad, oblong or broadly ovoid, acute or rounded at apex, reddish-brown, minutely puberulent or glabrate, half included or enclosed at the bases only. Igneous mts. usually above 5,000 ft. elev. in the Trans-Pecos; w. into Ariz. and Chih.

28a. *Quercus Emoryi* × *Q. graciliformis*. Small trees, much-branched, with roughly furrowed black bark; twigs about 2 mm. thick, scarcely fluted, from dull reddish-brown

becoming gray with inconspicuous lenticels, from sparsely stellate-glabrescent; buds about 2 mm. long, ovoid, acute, glabrous; leaves persistent, coriaceous, 5-9 cm. long, 15-25 mm. broad, oblanceolate, the short apices acute, bases cuneate or somewhat rounded, coarsely 4- or 5-aristate-dentate on each side or entire below the middle, from sparsely stellate-puberulent on both sides becoming glossy and glabrous; veins about 5 on each side, passing into the teeth, somewhat prominent on both surfaces; petioles 5-7 mm. long, flattened dorsally, glabrate like the blades and reddish. *Q. Tharpii* C. H. Mull. Igneous slopes at about 4,000 to 6,000 ft. elev. in the Chisos Mts. of Trans-Pecos Tex.

28b. *Quercus Emoryi* × *Q. Gravesii*. Large spreading trees with roughly furrowed brown or black bark; twigs to 3 mm. thick, from densely stellate-hairy tardily glabrate and dark-red-brown, gray the second year; buds 3-4 mm. long, oblong to acutely ovoid, glossy brown, the scales ciliate; leaves deciduous, coriaceous, 6-11 cm. long, 2.5-5 cm. broad, broadly lanceolate to acutely ovate, sometimes attenuate by elongation of the terminal lobe, bases rounded to cuneate or cordate, setaceously 6- or 8-toothed or -lobed with rounded sinuses, rather persistently stellate-pubescent on both surfaces, frequently with a few prominent axillary tufts beneath, dull green on both surfaces, not turning crimson in the fall; petioles to 2 cm. long, stiff, stellate-pubescent or glabrate, red at base, straw-colored above, dorsally flattened; fruit biennial, solitary or paired and one aborted, on a peduncle 5-6 mm. long or subsessile; cups about 12 mm. broad and 8 mm. high; cup scales thin, appressed, the elongate apices narrowly rounded, light-brown, ciliate and densely pubescent dorsally with detachable canescent hairs; acorns to 22 mm. long and 1 cm. broad, oblong or cylindrical, finely pubescent, about one third included. *Q. robusta*. C. H. Mull. Moist wooded canyons in the Chisos Mts. with both parents.

29. *Quercus hypoleucoides* A. Camus. WHITE-LEAF OAK. Small or moderate trees with coarsely furrowed hard black bark; twigs 2-3 mm. in diameter, little-fluted, rather persistently gray-tomentulose, red with scarcely evident lenticels or somewhat pruinose in age; buds about 3 mm. long and 2 mm. broad, ovoid, reddish-brown, glabrescent with ciliate scales; leaves more or less persistent, very thick and leathery, to 10 cm. long or rarely longer, 1.5-3 cm. broad, lanceolate, aristately very acute, rounded or cuneate at base, typically entire or with a few small setiferous teeth or deeply and coarsely serrate, strongly revolute, glabrous or minutely puberulent and glaucous- or bluish-green above, densely canescent-tomentulose beneath; petioles to 15 mm. long, tomentulose or glabrate; *staminate catkins* 3-6 cm. long, white-pilose, rather loosely flowered, the glabrous ellipsoid anthers exerted; *pistillate catkins* 5-10 mm. long, 1- or 2-flowered at the end, the peduncle stellate-tomentulose; fruit annual or sometimes apparently biennial, solitary or unequally paired on more or less hoary peduncles to 15 mm. long; cups turbinate hemispheric, about 1 cm. in diameter, with thin appressed blunt scales markedly tomentulose but readily abraded and then pale-brown; acorns to 14 mm. long and 9 mm. broad, oblong to ovoid, minutely puberulent or glabrescent, about one third included. *Q. confertifolia* Torr., non H. & B., *Q. hypoleuca* Engelm., non Gand. Abundant in moist canyons at elev. of 7,000 to 9,000 ft. in Trans-Pecos Tex.; endemic.

29a. *Quercus hypoleucoides* × *Q. Gravesii*. Small trees to 10 m. tall, with roughly furrowed black bark; twigs 2-2.5 mm. thick, very inconspicuously fluted, reddish-brown, rather persistently tomentulose the second year with inconspicuous lenticels; buds 3-4 mm. long, acute, pubescent; stipules caducous; leaves evergreen or nearly so, 5-10 cm. long, 1.5-4 cm. broad, oblanceolate or oblong to narrowly elliptic, acute, basally cuneate or somewhat rounded, coarsely and aristately 3- or 4-toothed except about the base, margins minutely revolute, from sparsely stellate-puberulent glabrate and shiny above and more or less persistently floccose beneath, petioles 1.5-2 cm. long, from stellate-puberulent glabrate; *staminate catkins* about 25 mm. long, the peduncle hairy, loosely flowered, anthers exerted; *pistillate catkins* 1- to 3-flowered on very short tomentulose peduncles; fruit biennial, solitary or paired, short-pedunculata. *Q. livermorensis* C. H. Mull. Moist canyons at about 8,000 ft. elev. in the Davis Mts., associated with both suspected parents.

30. *Quercus incana* Bartr. SAND JACK, BLUE JACK. Low trees or shrubs to 8 m. tall; twigs 1-2 mm. thick, moderately or markedly fluted, yellowish- becoming gray-puberulent or tomentulose, the pubescence persistent for several years, lenticels scarcely visible; buds 3-7 mm. long, narrowly lanceolate or conic, appressed-pubescent or glabrate and reddish-brown; stipules caducous, about 7 mm. long, ligulate, tan, villous; leaves deciduous,

moderately thin but coriaceous, usually 6-8 cm. long and 2-3 cm. broad, sometimes smaller or larger, lanceolate to oblanceolate or elliptic to oblong, acute or sometimes rounded but always aristate-tipped, basally very acute to sometimes broadly rounded, entire or sometimes aristately few-toothed about the apices or rarely coarsely several-toothed, moderately revolute, rather persistently stellate-puberulent but glossy above, dull beneath with a feltlike gray stellate tomentum or rarely sparsely stellate; petioles to 7 mm. long, somewhat winged by the usually decurrent blade, dorsally and ventrally nearly glabrous, laterally gray-pubescent like the twigs; *staminate catkins* 4-5 cm. long, moderately densely flowered, the peduncle stellate-tomentose, the glabrous elliptic apiculate anthers well-exserted from the ciliate red perianth; *pistillate catkins* subsessile, 1- or 2-flowered; fruit biennial, solitary or rarely paired, subsessile; cups to 18 mm. broad and 7 mm. high, saucer-shaped to goblet-shaped, basally rounded, margins not inrolled; cup scales ovate, the narrow apices rounded, closely appressed, dorsally gray-tomentose, the margins and apices glabrate and glossy brown; acorns 12-15 mm. in diameter, subrotund, gray-puberulent, readily abraded and dull-brown, about one fourth included. *Q. cinerea* Michx., *Q. cinerea* β *dentato-lobata* A. DC. Sandy uplands in the timber belt of e. and cen. Tex.; on Coastal Plain from Va. s. to Fla., w. to Tex.

30a. *Quercus incana* \times *Q. marilandica*. Small trees to 10 m. tall; twigs about 3 mm. thick, stiff, persistently gray-tomentulose or puberulent; buds 6-8 mm. long, narrowly lanceolate, very acute, fulvous-tomentose; leaves to 16 cm. long, 3-7 cm. broad, oblong to narrowly obovate, apically broadly rounded or divergently 3-lobed, basally cuneate to broadly rounded, glabrate and shiny above, persistently floccose beneath especially along the midrib; petioles 6-10 mm. long; pubescent like the twigs; cups about 15 mm. broad, 6 mm. high, shallowly cup-shaped; cup scales fulvous-tomentulose, rather loosely appressed; acorns about 15 mm. long, subrotund, about one third included. Sandy uplands in the timber region of e. Tex. with the two parents and with intermediates.

31. *Quercus laurifolia* Michx. LAUREL OAK, SWAMP LAUREL OAK. Large trees to 18 m. tall, with hard gray or black bark; twigs 1-2.5 mm. thick, pliable, fluted or round, dark-reddish-brown, gray the second season, from densely fulvous-stellate promptly glabrate or remaining sparsely pubescent; buds about 4 mm. long and 2 mm. broad, very acute, slightly quadrangular, nearly glabrous, dark-reddish-brown; stipules quickly caducous, about 4 mm. long, ligulate or spatulate, tan, villous especially about the apex; leaves evergreen, thick and coriaceous or deciduous, 5-10 or sometimes 12-15 cm. long, to 8 cm. broad, characteristically oblanceolate or narrowly ovate, acute to broadly rounded at apex but aristate-tipped, cuneate to cordate at base, entire to variously undulate, margins moderately revolute, from sparsely stellate-puberulent glabrate and glossy above or persistently somewhat pubescent about the base of the midrib, similarly glabrate beneath but dull; petioles to 4 mm. long, rose-color or dark-red, glabrate or sparsely stellate; *staminate catkins* 2-2.5 cm. long, densely villous, moderately densely flowered, the small ellipsoid anthers moderately exerted from the villous perianth; *pistillate catkins* on peduncles 1-3 mm. long, 1- to 3-flowered; fruit biennial, solitary or paired on a short peduncle or subsessile; cups 14-18 mm. broad, 5-7 mm. high, shallowly bowl-shaped, flat basally or turbinate; cup scales tightly appressed, ovate, minutely dense-puberulent, tan and glossy where abraded, margins not inrolled; acorns about 15 mm. long, subglobose to broadly ovoid, apically broadly rounded, basally flattened, tan or brown, minutely and sparsely puberulent, included at base only. *Q. obtusa* (Willd.) Pursh, *Q. rhombica* Sarg. Wet forests, particularly along streams, in s.e. Tex.; e. to the Atl.

32. *Quercus hemisphaerica* Bartr. LAUREL OAK. Shrubs to small trees to 10 m. tall, with smooth gray or furrowed black bark; twigs 1-2.5 mm. thick, very stiff, round or only slightly fluted, dark-reddish-brown, gray the second season, densely fulvous-stellate the first season; buds 3-4 mm. long, 2.5-3 mm. broad, very acute, nearly glabrous, dark-reddish-brown; stipules tardily deciduous, 4-5 mm. long, ligulate, villous; leaves evergreen, highly variable, 3.5-8 cm. long, 1-4 cm. broad, from narrowly oblong to obovate, usually acute and aristate-tipped, basally rounded to cordate or sometimes cuneate, entire or variously apically toothed or basally lobed, the teeth and lobes aristate, margins markedly revolute, upper surface minutely and sparsely puberulent, glossy-green, lower surface similar to upper but dull, more densely and persistently puberulent near the base; petioles 2-3 mm. long, rose-color becoming red with maturity, pubescent as the twigs; catkins and fruit similar to *Q. laurifolia* but smaller; cups 1-1.3 mm. broad, 3-4

mm. high; acorns 1-1.2 mm. long. *Q. myrtifolia* Cory & Parks, non Willd., *Q. laurifolia* C. H. Mull. (p.p.), non Michx. Sandy woodlands, sometimes forming mottes on sandy prairies, often dominating stream terraces, along the Gulf Coast in Tex.; e. to the Atl.

32a. *Quercus hemisphaerica* × *Q. falcata*. Differing from *Q. hemisphaerica* in having large variable leaves 5-17 cm. long and 1.5-12 cm. broad, entire to undulate or deeply and irregularly lobed, persistently pubescent on the lower surface or merely with axillary tufts; cups deeply bowl-shaped, the scales densely tomentose; acorns densely puberulent. Differing from *Q. falcata* in the less lobed thick leaves with sparse pubescence beneath; acorns subglobose. In various sites with *Q. hemisphaerica* e. of the San Antonio River near the Gulf Coast in Tex.

33. *Quercus Phellos* L. WILLOW OAK. Moderate or large trees to 20 m. tall, with a trunk diameter of 7.5 dm. and hard rather smooth bark; twigs 1-2 mm. thick, fluted, glabrous or from stellate-tomentose quickly glabrate or rather persistently floccose, dull-reddish-brown with inconspicuous lenticels; buds 2-4 mm. long, 1.5-2 mm. broad, narrowly ovoid to usually lanceolate, very acute, the scales dark-russet and glabrous except the ciliate edges; stipules caducous, 6-8 mm. long, filiform-ligulate to spatulate, dorsally villous, apically tomentose; leaves deciduous, moderately thin but coriaceous, usually 6-12 (or rarely 16) cm. long and 1-2.5 (or even 4) cm. broad, linear-lanceolate to sometimes oblanceolate or even narrowly ovate or obovate, setaceous acute at apex or sometimes obtuse but aristate-tipped, cuneate or narrowly rounded basally, entire, strongly revolute in the bud and lengthening before unfolding (thus filiform for a time), margins eventually flat or undulate or minutely revolute, upper surfaces dark, dull- or glossy-green, glabrous to tomentose along the midrib toward the base, lower surfaces lighter dull-green, from villous-tomentose to glabrate or with conspicuous axillary tufts or densely tomentose along the midrib; petioles 1-4 mm. long, from densely stellate-tomentose promptly or tardily glabrate; *staminate catkins* 25-35 mm. long, moderately closely flowered, villous, the oval anthers well-exserted from the villous-tomentose perianth; *pistillate catkins* 1-3 mm. long, 1- to 3-flowered; fruit biennial, solitary or paired on peduncles to 5 mm. long or sessile; cups 1-1.5 cm. broad, 4-8 mm. high, saucer-shaped to goblet-shaped, the base flat or markedly constricted, the margin not inrolled; cup scales narrowly ovate, the attenuately rounded apices closely appressed, minutely dense-tomentose except the glabrous brown margin; acorns 1-1.5 cm. long, nearly as broad, subrotund, broadly rounded, densely puberulent or glabrate and dull-brown, one fourth included or enclosed at base only. In moist forests in the timber region of e. Tex.; e. to the Atl. and n. to Ill. and N.Y.

33a. *Quercus Phellos* × *Q. falcata*. Twigs 2-4 mm. thick, glabrate or persistently tomentulose; buds 4-6 mm. long, narrowly lance-ovoid, acute, sparsely fulvous-tomentose about the apex; leaves thin, 8-20 cm. long, 2-10 cm. broad, lanceolate, attenuately acute, cuneate to rounded, very polymorphic, entire or few-toothed to falcately lobed, glabrous and glossy above, persistently somewhat pubescent or even tomentose beneath; petioles to 2 cm. long, glabrate or tomentulose like the twigs; cups 12-15 mm. broad, 6-8 mm. high, deeply or shallowly cup-shaped, the scales buff-tomentulose and somewhat loosely appressed; acorns 1 cm. long or more, subglobose, one half included or less. In moist forests in the coastwise timber region of e. Tex., with both suspected parents.

33b. *Quercus Phellos* × *Q. nigra*. Twigs 1-2 mm. thick, glabrate; buds 2-3 mm. long, ovoid, acute, fulvous-pubescent; leaves very polymorphic, 6-15 cm. long, 1.5-6 cm. broad, linear to clavate or cruciform, cuneate, acute or rounded, aristate-tipped or not, entire to undulate or even coarsely trilobate above the middle, glabrate or with fulvous tufts in the axils of the principal veins beneath. Sparse with both parents in wet lowland forests.

34. *Quercus nigra* L. WATER OAK. Moderate or large trees to 15 m. tall, with boles to 5 dm. in diameter and hard smooth or shallowly furrowed black bark; twigs 1-2 mm. in diameter, fluted, glabrous or from scantily stellate quickly glabrate and glossy dark-reddish-brown with conspicuous pale lenticels or not, gray the second season; buds 3-5 mm. long, 2-3 mm. broad, ovoid, subacute, dark-reddish-brown, densely fulvous-strigose above the middle; stipules caducous, 6-10 mm. long, ligulate to spatulate, tufted at apex; leaves subevergreen, rather thick and leathery, to 14 cm. long and 5 cm. broad, oblong to usually cuneiform or clavate, sometimes oblanceolate, entire or 3-lobed apically or variously toothed or lobed and distorted in cases of heterophylly, broadly rounded or rarely

acute at the apices, attenuately cuneate or rarely narrowly rounded at the bases, margins flat or minutely revolute, from minutely puberulent glabrate and glossy above, dull green or coppery and glabrate beneath or usually with prominent axillary tufts; petioles 3-7 mm. long, prominently winged by decurrence of the blade, from sparingly stellate-tomentose glabrate or persistently pubescent; *staminate catkins* 4-7 cm. long, densely or sparsely arachnoid-tomentose, rather loosely flowered, the anthers well-exserted from the villous perianth; *pistillate catkins* 3-5 mm. long, 1- to 3-flowered; fruit biennial, solitary or paired on a peduncle to 5 mm. long or subsessile; cups 9-15 mm. broad, 2.5-5 mm. high, at most deeply saucer-shaped, basally very flat or somewhat rounded, margins not inrolled; cup scales narrowly ovate, closely appressed, densely fulvous-sericeous-tomentose; acorns 8-10 mm. long, 9-15 mm. broad, hemispheric to subglobose, very flat at base, broadly rounded apically, densely minute-pubescent, dull-brown where abraded, included at base only. *Q. aquatica* Walt., *Q. nigra* var. *tridentifera* Sarg. In wet forests in the timber region of e. Tex.; e. to the Atl. States and n. to Mo. and Del.

34a. *Quercus nigra* × *Q. marilandica*. Twigs 3 mm. thick, stellate-tomentose or tardily glabrate; buds coarser and more densely fulvous-tomentose than in *Q. nigra*; leaves intermediate between the parents or polymorphic; cups similar to *Q. nigra* in form but larger and with the scales loosely appressed. Uncommon with both parents at the edges of wet forests in e. Tex.

34b. *Quercus nigra* × *Q. incana*. Twigs densely short-stellate-tomentose; leaves oblong to narrowly obovate, rounded at apex, acute or rounded at base, stellate-pubescent beneath or tardily glabrate. Sparse with both parents in moist woodlands in e. Tex.

35. *Quercus graciliformis* C. H. Mull. Small trees to 8 m. tall, with slender gracefully arching branches and pendent leaves, the furrowed bark hard and gray; twigs to 1.5 mm. in diameter, markedly fluted, quickly glabrate or persistently stellate toward the terminus, deep-glossy-red to brown, gray the second year with few scarcely evident small buff lenticels; buds 1.5-2 mm. long, 1-1.5 mm. broad, ovoid, acute or rounded, glossy-brown, the scales ciliate; stipules caducous, 3-6 mm. long, setaceous to spatulate, sparsely villous; leaves subevergreen, thin but coriaceous, 8-10 cm. long, 2-3 cm. broad, narrowly lanceolate, long-attenuate and aristate apically, cuneate at the bases, aristately and often unequally 8- to 10-toothed or -lobed with somewhat deep rounded sinuses or these very shallow, soon glabrate and entirely smooth or rarely an axillary tuft beneath, glossy-green above, more dull and slightly coppery beneath; petioles 1.5-2 cm. long, dorsally flattened, glabrate, deep-red at base and shading into straw-color, very flexible; pistillate catkins about 4 mm. long, usually 2-flowered, deep-reddish-brown, usually glabrous; fruit biennial, solitary or sometimes paired, subsessile; cups scarcely 1 cm. in diameter, 3 mm. deep or rarely more, deep-saucer-shaped, the margins not inrolled; cup scales ovate, thin and closely appressed, the rounded apices brown, dorsally canescent, glabrous near the margins, ultimately ciliate; acorns acutely narrow-ovoid, about 15 mm. long and 1 cm. broad, densely fine-pubescent, with longitudinal dark striae, enclosed only at the base. *Q. graciliformis* var. *parvilobata* C. H. Mull., *Q. graciliformis* f. *parvilobata* C. H. Mull., *Q. Canbyi* Cory & Parks, non Trel. In dry rocky canyons in the igneous Chisos Mts. of Trans-Pecos at about 5,500 ft. elev., usually associated with a high water table; endemic.

36. *Quercus shumardii* Buckl. SHUMARD RED OAK, SOUTHERN RED OAK. Large trees to 18 m. tall, with straight boles to 1 m. in diameter and hard furrowed black or plated gray bark; twigs 1.5-3 mm. thick, fluted, from sparsely and irregularly stellate-pubescent promptly glabrate, tan to brown, dull; buds 4-7 mm. long, 2-3 mm. broad, approximately spindle-shaped, very acute or exceptionally broadly rounded, completely glabrous or the apex slightly pubescent, dull straw-color or light-brown, the erose scales becoming quite ragged in time; stipules caducous, 6-10 mm. long, filiform-ligulate, sparingly villous; leaves deciduous, scarlet in autumn, thin but hard and parchmentlike, 8-17 cm. long, 6-15 cm. broad, narrowly ovate to usually ovate or obovate or subrotund in outline, deeply 2- to 4-lobed on each side with narrow rounded open to closed sinuses reaching one half or three fourths the distance to the midrib, each lobe (including the terminal one) bearing few or many irregular long-aristate teeth toward its apex, each tooth or lobe ultimately very acute, bases truncate or subequilaterally rounded or minutely decurrent on the petiole, margins flat or obscurely undulate, minutely cartilaginous-revolute, upper surface from sparsely stellate quickly glabrous and becoming dark-shiny-green, lower surface similarly glabrate but with prominent axillary stellate tufts, duller and lighter green,

somewhat coppery; petioles 3-5 cm. long, straw-colored, basally tinged with rose, glabrate with the blades; *staminate catkins* 8-10 cm. long, sparsely stellate, rather sparsely flowered, the glabrous anthers exerted from the glabrous perianth; *pistillate catkins* 4-8 mm. long, usually 2-flowered, quickly glabrate; fruit biennial, solitary or paired on a peduncle 1-5 mm. long, 2-3 mm. thick; cups 2-2.5 cm. broad, 7-10 mm. high, from shallowly goblet-shaped to usually flat with abruptly raised sides only 5 mm. high, bases flat or somewhat constricted, margins not inrolled; cup scales narrow and elongate, the tips rounded and closely appressed, bases sometimes suberous, minutely tomentose except the extreme apex, shiny brown where abraded; acorns 20-25 mm. long, 18-22 mm. broad, ovoid, obtuse at apex, flat at base, from minutely fulvous-sericeous-tomentose tardily glabrate and brown, included at base only. *Q. coccinea* Coult., non Muenchh., *Q. rubra* Coult., non L., *Q. palustris* Coult., non Muenchh., *Q. texana* Sarg., non Buckl., *Q. Schneckii* Britt., *Q. Shumardii* var. *Schneckii* (Britt.) Sarg. In moist forests in the timber region of e. Tex., w. along waterways to the escarpment of the Edwards Plateau; e. to the Atl. and n. to Mo. and O.

37. *Quercus texana* Buckl. TEXAS RED OAK, SPANISH OAK. Moderate or small trees to 10 m. tall, with hard rough furrowed black or smooth gray bark; twigs 1-2 mm. in diameter, fluted, from sparingly stellate quickly glabrate and shiny dark-reddish-brown with inconspicuous lenticels, dull-gray the second season; buds 3-5 mm. long, 1.5-2.5 mm. broad, lanceolate to narrowly ovoid, acute, dark-reddish-brown, tomentose above the middle or merely at the apex, scales sometimes erose; stipules caducous, 5-10 mm. long, filiform to ligulate, villous; leaves deciduous, scarlet in autumn, thin but hard, 6-14 cm. long, to 12 cm. broad, ovate to obovate or subrotund in outline, deeply 2- or 3- or 4-lobed on each side with narrow rounded sinuses reaching one half to nine tenths the distance to the midrib, the lobes cuneate or usually oblong, each (including the terminal one) several-toothed with long aristae distally, basally cuneate to usually truncate, margins flat or minutely revolute, upper surfaces from moderately stellate-tomentose promptly glabrate and dark-shiny-green, lower surfaces similarly glabrate but with inconspicuous axillary tufts sometimes persistent, lighter green or sometimes coppery; petioles to 5 cm. long, very slender, reddish basally or straw-colored throughout, glabrate with the leaves; *staminate catkins* to 8 cm. long, rather openly flowered, the peduncle sparingly villous, the glabrous anthers exerted from the sericeous-fimbriate perianth; *pistillate catkins* 4-8 mm. long, 1- to 3-flowered, glabrate; fruit biennial, solitary or paired on a peduncle 2-8 mm. long; cups 12-18 mm. broad, 5-11 mm. high, cup-shaped or deeply goblet-shaped, markedly constricted basally, the margins not inrolled; cup scales densely minute-tomentose except the shiny brown apices or the upper margins, closely or rather loosely appressed; acorns 1.4-2 cm. long, 1-1.7 cm. broad, narrowly or broadly ovoid, rounded apically and basally, detachably dense-puberulent, brown and dull when abraded, one fourth or one half included. *Q. rubra* var. *texana* Buckl. On rocky limestone slopes of the cen. Tex. uplands; endemic.

38. *Quercus Gravesii* Sudw. CHISOS RED OAK, GRAVE'S OAK. Small or large trees reaching 13 m. in height and 7.5 dm. in trunk diameter with very roughly furrowed hard black bark, that of the branches smooth and gray; twigs 1-2 mm. thick, fluted, glabrous or from fulvous-stellate glabrate and reddish-brown with few rather inconspicuous lenticels; buds 3-6 mm. long, 1.5-2.5 mm. broad, acute, the ciliate scales dark-red-brown and canescent-tomentose about the apex; stipules early-caducous, 5-10 mm. long, ligulate to broadly spatulate, ciliate and apically tomentose; leaves deciduous, scarlet in autumn, thin but coriaceous, to 14 cm. long and 12 cm. broad, ovate to broadly lanceolate or obovate in outline, attenuately acute to obtuse at apex, basally rounded to occasionally cuneate, typically 2- or 3-lobed on each side with deep rounded sinuses broadly open and reaching only one half or rarely three fourths the distance to the midrib, the lobes typically cuneate and entire or oblong and setaceous few-toothed distally, the terminal lobes much-elongated, entire, toothed or slightly lobed, atypical leaves sometimes merely low-toothed or the lobes occasionally clavately divided, in any event all teeth or lobes aristate-tipped, upper surfaces dark-green, somewhat glossy, from stellate-pubescent early glabrate, lower surfaces light-green or coppery, dull, glabrous or rather persistently but sparsely minute-stellate, with or without dense axillary tufts; petioles to 25 mm. long and 1 mm. thick, glabrous or glabrate; *staminate catkins* 6-7 cm. long, rather loosely flowered, sparsely stellate-villous, the anthers well-exserted from the ciliate-villous red

perianth; *pistillate catkins* to 15 mm. long, 1- to 3-flowered on a glabrate red-brown peduncle; fruit biennial, solitary or paired on a peduncle to 12 mm. long; cups 1-1.5 cm. broad, 5-8 mm. high, deeply turbinate or hemispheric, the base constricted or rounded; cup scales narrowly rounded, closely appressed, light brown, densely minute-tomentose, with glabrous sometimes dark-brown margins; acorns ovoid, 12-15 mm. long and 8-10 mm. broad, apically sericeous-puberulent or glabrate and dull-light-brown, one third to one half included. *Q. texana* Sarg., non Buckl., *Q. stellipila* (Sarg.) Parks, *Q. chesosensis* (Sarg.) C. H. Mull. In igneous mts. of the Trans-Pecos or rarely along arroyos in limestone, above 4,000 or usually 5,000 ft. elev., common in the Davis, Glass and Chisos mts.; s. through the mts. of Coah.

39. *Quercus tardifolia* C. H. Mull. Small erect trees with short stiff branches and hard furrowed bark; twigs about 2 mm. thick, somewhat fluted, densely fulvous-stellate-tomentose the first season, glabrate or nearly so the second season and red-brown with minute inconspicuous lenticels, finally becoming gray; buds 3.5-4 mm. long, 2 mm. thick, acutely fusiform, hairy at the apices, the broadly truncate scales usually split at the end, slightly pubescent and often ciliate; stipules at length deciduous, 5-6 mm. long, setiform to broad-ligulate, pubescent at apex; leaves evergreen, the new ones appearing in dense tomentum about the first of July, rather thick and chartaceous, 5-9 cm. long, 25-55 mm. broad, oblong-ovate to subobovate, 3- or 4-lobed on each side with shallow or moderate sinuses, the lobes aristate-tipped and entire or rarely 2-toothed, short and rather broadly acute like the apices, basally subequilateral and slightly cordate, the upper surfaces dull-blue-green, at length glabrate, lower surfaces detachably stellate-tomentose; petioles 1.5-2 cm. long, 1-1.5 mm. thick, red at base, glabrate with the leaves; fruit biennial, solitary or paired, sessile; scales of young cups thin and closely appressed, short apices truncate, glabrous and brown, tomentose basally. In woodlands at about 7,000 ft. elev. along arroyos in the igneous Chisos Mts. of w. Tex.; endemic.

40. *Quercus falcata* Michx. SOUTHERN RED OAK, SPANISH OAK. Large trees to 20 m. tall, with a trunk diameter of 5 dm. and roughly furrowed hard black bark; twigs 1-3 mm. thick, fluted, from sparsely or densely fulvous-stellate-tomentose tardily glabrate or persistently pubescent, brown, becoming gray the second season with conspicuous or inconspicuous lenticels; buds 4-8 mm. long, narrowly ovoid, acute, somewhat quadrangular or round, deep-red-brown, puberulent, tomentose about the apex or all over; stipules caducous, about 1 cm. long, ligulate, dorsally densely tomentose; leaves deciduous, rather thin and papery, to 23 cm. long and usually smaller, 15 cm. broad, very polymorphic, typically ovate or lanceolate in outline, frequently obovate to cuneiform, apically long-attenuate or obtusely clavate, basally cuneate to round or truncate, typically deeply falcate-lobed with broadly rounded sinuses reaching within 1 or 2 cm. of the midrib or with few broad lobes or entire with 3 lobes at the apex, apical lobes typically elongate, toothed at the ends, all lobes and teeth tipped with aristae, margins finely or coarsely revolute, upper surfaces from densely fulvous-stellate-tomentose glabrate and dark-glossy-green or more or less persistently pubescent especially toward the bases, lower surfaces persistently fulvous-tomentose, some forms very sparingly stellate-villous, especially shade leaves; petioles 1-3.5 cm. long, shorter in some shade forms, dorsally glabrate and ventrally pubescent like the blade; *staminate catkins* 6-8 cm. long, densely fulvous-tomentose, rather loosely or closely flowered, the anthers well-exserted from the ciliate perianth; *pistillate catkins* 5-10 mm. long, 1- to 3-flowered, from fulvous-pubescent tardily glabrate like the twigs; fruit biennial, solitary or paired on peduncles to 1 cm. long and 3 mm. thick; cups 1-2 cm. broad, 6-8 mm. high, goblet-shaped to turbinate, basally rounded or markedly constricted, margins not inrolled; cup scales ovate, somewhat thickened basally, the apices rather loosely appressed, dorsally densely short-fulvous-tomentose except the glossy brown margins; acorns 12-15 mm. long, 8-15 mm. broad, ovoid or flattened basally, rounded apically, sparingly puberulent, dull-brown, about one third included. *Q. digitata* (Marsh.) Sudw., *Q. rubra* var. *leucophylla* Ashe, *Q. rubra* Sarg., non L., *Q. rubra* var. *triloba* (Michx.) Sarg., *Q. rubra* var. *pogodaefolia* (Ell.) Sarg., *Q. rubra* var. *digitata* (Marsh.) Cory & Parks. In moist or wet forests in the timber region of e. Tex., in river bottoms or uplands; ranging e. to the Atl. and n. to N.J. and Mo.

41. *Quercus marilandica* Muenchh. BLACKJACK. Small trees to 10 m. tall, with short trunks to 4 dm. in diameter and very roughly furrowed hard black bark that is reddish or ivory-colored within; twigs to 4 mm. thick, fluted or round, very stiff, from dingy

stellate-tomentulose glabrate and brown or persistently pubescent, gray the second season; buds 4-8 mm. long, ovoid to lanceolate, very acute, reddish-brown and sparsely villous to densely fulvous-tomentulose or strigose; stipules caducous, 6-8 mm. long, narrowly spatulate, membranous, densely villous; leaves deciduous, thick and hard, to 18 cm. long and broad, usually smaller, cuneate to broadly clavate in outline, subtire to distinctly 3-lobed at the broad apices, rarely with a pair of basal lobes, the lobes acute to broadly rounded, aristate-tipped from the veins, apices acute to usually rounded, bases cordate to cuneate, margins cartilaginous-revolute, upper surfaces from densely tomentulose glabrate and glossy-dark-green or persistently pubescent especially about the bases of the midribs, lower surfaces similarly glabrate and dull-light-green or persistently fulvous-glandular puberulent, in either event with prominent stellate axillary tufts, pubescence of both surfaces characteristically a mixture of glandular-puberulence with simple strigose and stellate-villous-pubescence of which the latter is first shed; veins about 6 or 7 on each side, those passing into the lobes prominent; petioles to 15 mm. long, from densely stellate-tomentulose promptly or tardily glabrate with the twigs or persistently pubescent; *staminate catkins* 5-7 cm. long, stellate-tomentulose or villous, rather loosely flowered, the anthers exerted from the perianth pubescent within and dorsally at the apices of the lobes; *pistillate catkins* 3-5 mm. long, 1- or 2-flowered, glabrate with the twigs; fruit biennial, solitary or paired, subsessile or on a peduncle to 1 cm. long; cups to 2 cm. broad and 12 mm. high (or much more by the constriction of the bases), hemispheric to shallowly or deeply goblet-shaped, bases round or much-constricted, margins not inrolled; cup scales narrowly ovate to oblong, thin and closely or loosely appressed or sometimes basally thickened, buff-tomentulose except the narrow glossy brown margins; acorns to 2 cm. long and 15 mm. broad, elliptic, broadly rounded at both ends, from minutely villous glabrate and light-brown, about one third included. *Q. nigra* Coult., non L., *Q. marylandica* var. *Ashei* (Sudw.) Cory & Parks. In upland forests in the timber belt of e. Tex. and w. to cen. Tex., abundant on sand or on clay and gravel hills; e. to the Atl. and n. to N.Y. and Kan.

41a. *Quercus marilandica* × *Q. texana*. Similar to *Q. texana* in the reddish-brown twigs and the deeply lobed and aristately toothed leaves, the terminal lobes sometimes clavate, the blade intermediate in texture between the parents, lacking pubescence beneath or this reduced to axillary tufts, not puberulent; resembling *Q. marilandica* in the buff pubescence of the buds and of the constricted acorn cups. Sparse on wooded banks with both parents.

42. *Quercus velutina* Lam. BLACK OAK. Moderate or large trees to 15 m. tall, with trunk diameter of 5 dm. and coarsely furrowed hard black bark, orange-yellow within; twigs 2-4 mm. thick, coarsely fluted, from fulvous-stellate-tomentulose tardily glabrate and reddish-brown with inconspicuous raised lenticels, gray the second season; buds 6-10 mm. long, ovoid, sometimes quadrangular, acute or rounded, densely fulvous- or gray-tomentulose or strigose; stipules caducous; leaves deciduous, thin and chartaceous or rather thick, to 25 cm. long and 20 cm. broad, ovate or obovate in outline, 2- or 3- or 4-lobed on each side with usually broad open rounded sinuses reaching one half to three fourths the distance to the midribs, apices and lobes acute or truncate, irregularly several-toothed and long-aristate, obtuse to rounded or even cordate at bases, margins minutely cartilaginous-revolute, upper surfaces from minutely sparse-stellate-puberulent glabrate and rather glossy-dark-green or persistently puberulent especially about the bases of the midribs, lower surfaces from rather densely stellate-puberulent and glandular becoming glabrate and dull-light-green except for stellate tomentum along the midribs and conspicuous fulvous tufts in the axils of the veins; petioles 5-7 cm. long, from stellate-tomentulose glabrate with the leaves, straw-colored or basally reddish; *staminate catkins* 10-15 cm. long, tomentulose or pubescent; *pistillate catkins* 8-16 mm. long, 1- or 2-flowered, the peduncle glabrate and reddish-brown with the twigs; fruit biennial, solitary or paired on a peduncle 2-8 mm. long; cups 2-2.5 cm. broad, 1-1.5 cm. high, hemispheric or deeper, usually goblet-shaped by the marked constriction of the base, the margin not inrolled; cup scales narrowly ovate, thin but loosely appressed or the apices spreading, densely tan-tomentulose except for the glossy brown glabrous apices and margins; acorns about 2 cm. long, 16-18 mm. broad, ovoid to elliptic or subglobose, detachably tomentulose or glabrate and dull-light-brown, one third to one half included. In upland forests in the timber region of e. Tex.; e. to Ga. and n. to Ia. and Vt.

42a. *Quercus velutina* × *Q. marilandica*. Small trees intermediate between the parents in leaf size and shape, the basal lobes much shorter than the apical ones; petioles 3-4 cm. long; cups like those of *Q. marilandica*. In upland forests with the parents in n.e. Tex. and Ark.

FAM. 53. ULMACEAE MIRB. ELM FAMILY

Trees or rarely shrubs with watery sap; buds with imbricate scales; leaves simple, 2-ranked, alternate, usually oblique at base, pinnately veined, serrate or rarely entire; stipules deciduous; flowers perfect or unisexual with both sexes on the same plant; perianth 4- or 5-merous, rarely more or less, usually somewhat connate; stamens (in bud) with curved or somewhat sigmoid filaments, as many as or twice as many as the perianth lobes; filaments straight; ovary superior, 1-celled, with 1 suspended anatropous ovule; style 2-parted; fruit a samara, nut or drupe.

About 15 genera with more than 200 species in both hemispheres.

- 1. Leaves 3-veined at base; pairs of veins usually less than 6; winter-buds appressed; parts of perianth free; fruit a globose drupe 1. *Celtis*, p. 492.
- 1. Leaves with 7 or more pairs of parallel veins, the lowest pair not prominent; winter-buds somewhat spreading; perianth more or less connate (2)
- 2(1). Flowers perfect, produced before the leaves or in autumn; fruit flat, winged; leaves usually doubly serrate 2. *Ulmus*, p. 494.
- 2. Flowers at least partly unisexual, appearing with the leaves, the pistillate ones axillary on the young branchlets; fruit an ellipsoid wingless nut; leaves simply serrate
..... 3. *Planera*, p. 496.

1. CELTIS L. HACKBERRY. SUGARBERRY

Trees or rarely shrubs, polygamo-monoecious, deciduous (in our region); bark usually gray, smooth, sometimes with corky warty excrescences; winter-buds small; leaves with fairly long petioles, 3-nerved at base, entire or serrate; flowers appearing with the leaves on the young branchlets; staminate flowers in fascicles towards the base; perfect flowers above, solitary in the axils of the leaves; calyx 5-lobed, persistent; stamens 5 or 6; fruit a subglobose or ovoid drupe with a firm outer coat, usually with scanty sweet pulp and a bony stone with smooth or sculptured surface, ripening in autumn but persisting long after leaf-fall.

About 80 species in the temperate regions of the Northern Hemisphere and in the tropics. Commonly planted as shade trees or for ornament.

- 1. Plants armed with spines; leaves usually less than 2 cm. wide
..... 1. *C. pallida*.
- 1. Plants unarmed; leaves usually much more than 2 cm. wide (2)
- 2(1). Leaves typically elliptic-lanceolate to ovate-lanceolate and mostly sharply acute to long-acuminate; distribution mainly in east and south Texas (3)
- 2. Leaves typically broadly to narrowly ovate and obtuse to acute or abruptly long-acuminate (then coarsely serrate); distribution mainly in central, west and north-west Texas, rarely in east Texas (4)
- 3(2). Lower leaf surface softly pubescent; fruits usually light-brown; endemic to the country south of San Antonio 2. *C. Lindheimeri*.
- 3. Lower leaf surface essentially glabrous or with coarse pubescence mainly on the veins; fruits mostly reddish or orange; widespread in east and south Texas
..... 3. *C. laevigata*.
- 4(2). Leaves typically 45 mm. long or less, the margins mostly entire
..... 4. *C. reticulata* (typical phase).
- 4. Leaves mostly 50 mm. long or more, the margins commonly more or less coarsely serrate (5)

- 5(4). Distribution in Panhandle; leaves typically abruptly acuminate-attenuate
5. *C. occidentalis*.
5. Distribution in east Texas; leaves obtuse to subacute (6)
- 6(5). Leaves typically ovate-elliptic, thinnish or rarely subcoriaceous; in southeast Texas
6. *C. tenuifolia*.
6. Leaves typically broadly ovate, thickish; in northeast Texas
4. *C. reticulata* (large-leaved phase).

1. *Celtis pallida* Torr. GRANJENO, DESERT HACKBERRY. Shrub rarely to 3 m. high, with numerous spiny flexuous spreading white-puberulent branches; spines in pairs, to 25 mm. long; leaves ovate to ovate-oblong or elliptic, to 3 cm. long and 2 cm. wide, usually smaller, rounded to acutish at the apex, entire or sparingly crenate-dentate, thickish, somewhat scabrous; flowers small, white, in polygamous cymes of 3 to 5 flowers that exceed the petiole, the lower flower mostly staminate with rudimentary pistils, the terminal flower perfect; styles thick, cleft nearly half their length; fruit ovoid, glabrous, about 6 mm. long, orange, yellow and red, with an acid juicy pulp. *C. spinosa* Spreng. var. *pallida* (Torr.) M. C. Johnst. On mesas, foothills, thickets and brushlands of w. and s. Tex.; from Tex. to Ariz. and n. Mex.

A close relative of this species, *C. iguanaea* (Jacq.) Sarg., a shrub with serrulate leaves 3-5.5 cm. wide and short-pilose fruits, has been attributed to coastal Texas but we have seen no material of this species from the state. It occurs from Mexico southward.

2. *Celtis Lindheimeri* Engelm. A much-branched wide-spreading tree, occasionally to 10 m. high with a trunk diameter to 15 dm.; bark of the trunk and main branches with numerous corky warts; twigs and branchlets villous-pubescent; leaves rather firm, ovate to ovate-lanceolate or oblong-lanceolate, 4-7 cm. long, 2-3.5 cm. wide, obtuse to acute or shortly acuminate at apex, rounded to subcordate at the oblique base, entire or sometimes with a few serrations on the margins, deep-green and somewhat scabrous-pubescent above, pale and tomentose beneath; petioles stout, 3-4 mm. long, tomentose; pedicels sparingly pubescent, curved, 1-1.5 cm. long; drupe subglobose, 7-9 mm. in diameter, light-brown, translucent, smooth and shining; seeds globose, strongly 4-ribbed, prominently reticulate. *C. Helleri* Small. In arroyos and brushlands, apparently endemic in the country s. of San Antonio (Bexar Co.).

3. *Celtis laevigata* Willd. TEXAS SUGARBERRY, PALO BLANCO. Tree to 30 m. high, with spreading often pendulous branches to form a broad crown; bark light-gray, smooth or covered with corky warts; branchlets pubescent at first, eventually glabrous; leaves with petioles 6-10 mm. long, thin and membranaceous to coriaceous, uniformly pale-green on both surfaces, with conspicuous veins, lanceolate to oblong-lanceolate or sometimes ovate-lanceolate, entire to somewhat serrate, the typically long-acuminate apex commonly prolonged and often curving at the tip, leaves of the fruiting branchlets less than one half as broad as long, 4-10 cm. long, 15-45 mm. wide; drupes subspherical, 5-8 mm. in diameter, beakless, orange to brown or red, on pedicels 6-15 mm. long; stone 4.5-7 mm. long, 5-6 mm. broad. *C. mississippiensis* Bosc., *C. Berlandieri* Kl. In sandy loam, rocky soil or alluvial soil along streams in woodlands, palm groves and thickets in the e. two thirds of Texas, w. to Hardeman, King and Val Verde cos., s. to Cameron Co.; from Fla. to Okla. and Tex., n. to Va., Ill., Mo. and Kan.; also n.e. Mex.

Several variants of this species are attributed to Texas. The var. *laevigata* has essentially entire membranous lanceolate to oblong-lanceolate leaves that are smooth or only sparingly hirtellous above, while var. *texana* Sarg. has more ovate-lanceolate leaves that are essentially entire, coriaceous, pubescent on the veins beneath, and often scabrous above. The var. *Smallii* (Beadle) Sarg. has rather thin usually copiously serrate leaves.

4. *Celtis reticulata* Torr. NETLEAF HACKBERRY, PALO BLANCO. Small trees or tall shrubs rarely to about 16 m. high, the trunk rarely to 6 dm. in diameter; bark gray, with corky ridges; branches somewhat compressed, the younger ones villous; leaves with petioles about 6 mm. long, ovate, obtuse to acute or sometimes subacuminate, rounded to somewhat cordate at base, 3-7 cm. long, 1.5-4 cm. wide, entire or occasionally somewhat serrate above the middle, rather thick, the upper surface shining and scabrous, strongly reticulate-veined and usually pale or somewhat yellowish beneath; flowering branches elongating rapidly; fruit spherical, reddish or reddish-black, often beaked, the flesh

sweet, 8-9 mm. in diameter, the pedicel exceeding the petiole. *C. laevigata* var. *reticulata* (Torr.) Benson. On limestone hills, shinnery oak dunes, breaks and rocky canyon slopes, and in arroyos, mesquite groves and about tanks, ponds, and along watercourses from Tex., Okla. and Colo., w. to Wash., Ida., Calif. and n. Mex.

This species is represented by two phases in Texas. Typical material with leaves mostly less than 45 mm. long is frequent in the Texas Panhandle, south to the Trans-Pecos and on the Edwards Plateau to Tom Green, Brown and Sutton counties, with apparently disjunct stations in Newton County in southeast Texas and Denton County in the West Cross Timbers. A phase with larger leaves occurs in east Texas, south to Henderson County. It is quite possible that this larger-leaved form should be separated varietally from typical *C. reticulata*, but for the time being it seems best to combine the two phases.

5. *Celtis occidentalis* L. HACKBERRY, BEAVER-WOOD. Large or small tree or low shrub greatly varying in response to habitat; old bark deeply furrowed and checkered or warty; branchlets mostly pubescent; leaves of fruiting branchlets (those subtending flowers and fruits) broadly to narrowly and obliquely ovate, coriaceous, scabrous, definitely with 10 to 40 serrate teeth on at least the broader (often on both) margin, mostly two fifths to four fifths as broad as long, abruptly long-acuminate, mostly 3-12 (averaging 8) cm. long and 1.2-9 (averaging 4.5) cm. wide; blades of leading shoots longer; drupe orange-red to fuscous, on pedicels to 15 mm. long, spherical or nearly so, 8-11 mm. long, commonly with a thick beak; stone 7-9 mm. long, 5-8 mm. thick. Incl. var. *crassifolia* (Lam.) Gray, *C. crassifolia* Lam. On sandy or rocky banks of rivers, in alluvial soils in open woodlands along streams and in dry rocky soils in canyons in the Panhandle; from Mass. to Ida., s. to n. Fla., Tenn., Ark., Okla. and n. w. Tex.

Typically broadly ovate and abruptly acuminate scabrous leaves with conspicuously serrate margins are a combination of characters that distinguish this species from *C. reticulata*, the only other species of *Celtis* found in the Texas Panhandle.

6. *Celtis tenuifolia* Nutt. DWARF HACKBERRY. Shrub or small tree to about 8 m. high, glabrous to somewhat pubescent; leaves of fertile branchlets entire or very sparingly toothed (on sprouts mostly toothed), ovate to occasionally ovate-elliptic, thin and smooth to coriaceous and scabrous above, one half to three fourths as broad as long, 2-8 cm. long, 1-4 cm. broad, blunt, acute or merely short-acuminate at apex, gray-green on both surfaces or darker green above; drupes spherical, beakless, 5-8 mm. in diameter, glaucous, orange to brown or cherry-red, not much puckered in drying, on pedicels 3-13 mm. long; stone 5-7 mm. long and 5-6 mm. broad. On hardwood slopes and along streams in open woodlands in s.e. Tex.; from Fla. w. to e. Tex. and Okla., n. to Pa., Ind., Mo. and Kan.

This large shrub or small tree with ovate to ovate-elliptic bluntish leaves is found in east Texas from San Augustine southward. The var. *georgiana* (Small) Fern. & Schub. differs from the smooth thin-leaved var. *tenuifolia* in having larger coriaceous leaves that are more or less scabrous on their upper surface and pubescent beneath.

2. ULMUS L. ELM

Deciduous or rarely semievergreen trees; buds conspicuous; leaves short-petioled, commonly in 2 rows, usually oblique at base, strongly straight-veined, mostly doubly serrate; flowers perfect, appearing in spring before the leaves or in autumn in the axils of the leaves, in fascicles or racemes; calyx campanulate, 4- to 9-lobed with an equal number of stamens; filaments long and slender; fruit a 1-celled and 1-seeded compressed nutlet surrounded by a broad or rarely narrow membranous wing, ripening a few weeks after flowering.

About 45 species in the temperate regions of the Northern Hemisphere. Ornamental trees much planted as street or shade trees.

1. Flowers appearing in autumn in the axils of the leaves; calyx divided beyond the middle; leaves typically oblong-elliptic and obtuse-rounded at apex, mostly less than 5 cm. long 1. *U. crassifolia*.
1. Flowers appearing in spring before the leaves; calyx lobes short; leaves acute or acuminate, mostly more than 5 cm. long (2)

- 2(1). Flowers with slender pedicels, drooping; fruits ciliate; leaves smooth above and doubly serrate; leaf buds glabrous or only slightly whitish pubescent (3)
- 2. Flowers with short pedicels, not pendulous, in dense clusters; leaves scabrous above or simply serrate; leaf buds with long rusty hairs to essentially glabrous (4)
- 3(2). Fruit glabrous except the ciliate margin; leaves obovate-oblong to elliptic; branches not corky; flowers fascicled2. *U. americana*.
- 3. Fruits pubescent; leaves ovate-oblong to oblong-lanceolate; branches usually more or less corky; flowers racemose3. *U. alata*.
- 4(2). Leaf buds covered with long rusty hairs, obtuse; leaves usually 100 mm. or more long, scabrous on upper surface, doubly serrate; fruit noticeably pubescent in the middle4. *U. rubra*.
- 4. Leaf buds pale-pubescent or glabrous; branchlets smooth, glabrous or pubescent; leaves 75 mm. or less long, smooth on upper surface, usually simply serrate; fruit glabrous5. *U. pumila*.

1. *Ulmus crassifolia* Nutt. CEDAR ELM, OLMO. Tree to 25 m. high, with flat scaly-ridged light-brown bark; branches often with 2 opposite corky wings; buds essentially glabrous; leaves ovate to ovate-oblong or elliptic, 2.5-6 cm. long, to 3 cm. wide, obtuse to acute, often nearly simply serrate, subcoriaceous, subpersistent or tardily deciduous, shiny-green and rough above, soft-hairy beneath; flowers in short-stalked 3- to 5-flowered fascicles; calyx deeply divided beyond the middle into 4 to 8 equal lobes; samara oblong, flat, about 1 cm. long. In woodlands, ravines and open slopes in cen. and s. Tex., July-Oct.; from Miss. to Ark. and Tex.

This species flowers in autumn while all our other native species of elm flowers in early spring.

2. *Ulmus americana* L. AMERICAN ELM, WHITE ELM. Tall tree with the limbs usually gradually spreading outward to form a wide-spreading crown with pendulous branches, to 30 m. high; bark light-gray, scaly and deeply fissured with broad forking scaly ridges; branchlets pubescent when young or sometimes nearly glabrous; buds ovoid, obtuse to acute, glabrous or only slightly whitish short-pubescent; leaves with petioles 5-8 mm. long, in 2 rows, ovate-oblong, 7-15 cm. long, 5-7.5 cm. wide, unequal at base, acuminate at apex, doubly serrate, glabrous and more or less scabrous above, pubescent or nearly glabrous beneath; flowers with elongated unequal pedicels 1-2 cm. long; calyx with 5 to 8 unequal short lobes; stamens 7 or 8, exerted; stigmas white; samaras elliptic, flat, about 1 cm. long, deeply notched at apex, the incision reaching the nutlet, ciliate. Along streams and rivers in lowland areas with rich soil in e. third of Tex., Feb.-Apr.; from Fla. n. to Nfld., w. to foot of Rocky Mts.

Extensively planted as a shade tree in the United States, but threatened by Dutch elm disease.

3. *Ulmus alata* Michx. WINGED-ELM, WAHOO, CORK-ELM. Small tree with spreading branches to form a round-topped oblong crown, to 15 m. high; bark thin, light-brown, irregularly fissured; branchlets nearly glabrous, usually developing 2 broad opposite corky wings; buds acute, essentially glabrous; leaves with petioles 1-3 mm. long, ovate-oblong to oblong-lanceolate or elliptic, 3-10 cm. long, to 4 cm. wide, acute to acuminate at apex, rounded to subcordate at the oblique base, doubly serrate, mostly shiny-dark-green and glabrous above, soft-pubescent beneath, with axillary tufts, subcoriaceous, turning dull yellow before falling; racemes short, few-flowered; stamens usually 5; samaras ovate-elliptic to oblong, flat, about 8 mm. long, narrow-winged, with slender incurved beaks at the apex, villous. Along streams, woodlands and thickets in e. Tex., Feb.-Mar.; from Fla. to Tex., n. to Va. and w. to Ill. and Mo.

Sometimes planted as a street tree in the southern states.

4. *Ulmus rubra* Muhl. SLIPPERY ELM, RED ELM. Tree with spreading branches to form usually a broad open crown, to 20 m. high; bark dark-brown, deeply furrowed, the inner bark mucilaginous; branchlets stiffish, pubescent and scabrous, red-brown or orange; buds large, fulvous-pubescent with long hairs; leaves with petioles 4-8 mm. long, obovate to ovate or elliptic, 1-2 dm. long, 5-7.5 cm. wide, long-acuminate at apex, very asymmetric at base, doubly serrate, dark-green and very rough above, densely soft-pubescent beneath,

turning dull-yellow in fall; flowers short-stalked, in dense clusters; stamens 5 to 9; stigmas pinkish; samaras suborbicular to obovate or broadly elliptic, flat, 1-2 cm. long, slightly notched, rufous-pubescent in the center. *U. fulva* Michx. Mostly in woodlands and thickets along rivers and streams in the e. third of Tex.; from Fla. to Tex., n. to Que. and w. to the Dakotas.

The mucilaginous inner bark was formerly used in medicine.

5. *Ulmus pumila* L. ASIATIC ELM, CHINESE ELM, SIBERIAN ELM. A usually small tree with rounded crown and rough bark; branches slender, glabrous or glabrate; twigs hairy when young; buds essentially glabrous; leaves in 2 rows, narrowly elliptic to lanceolate, 25-75 mm. long, short-pointed, essentially symmetrical, simply serrate, thick, smooth and dark-green above, becoming smooth beneath; flowers small, greenish, in clusters in early spring; stamens 8; fruits flattened, round-obovate, glabrous, about 13 mm. in diameter.

Widely cultivated in Texas as an ornamental, but it is highly susceptible to cotton root-rot and canker-disease. A native of Asia but occasionally escaping.

3. PLANERA J. F. GMEL.

A monotypic genus.

1. *Planera aquatica* (Walt.) J. F. Gmel. WATER-ELM, PLANER-TREE. Small deciduous polygamo-monoecious tree with spreading branches to form a low broad crown, to about 12 m. high, the short trunk with reddish-brown scaly and flaky bark; branchlets puberulous; winter-buds subglobose, minute; leaves with petioles 3-6 mm. long, rhombic-ovate to ovate-oblong, 3-8 cm. long, to 25 mm. wide, unequal at the rounded to cuneate base, acute at apex, unequally serrate, scabrate above, pinnately veined, at maturity glabrous; calyx deeply 4- or 5-lobed; staminate flowers in clusters at base of the young branchlets; stamens 4 or 5; perfect flowers 1 to 3 in the axils of the young leaves; fruit ellipsoid, about 8 mm. long, with irregularly crested fleshy ribs. In water of streams and lakes and in alluvial floodplains subject to periodic flooding, often forming large stands, in e. Tex.; from Fla. to Tex., n. to s. Ill. and Ky.

FAM. 54. MORACEAE LINK

MULBERRY FAMILY

Deciduous trees or shrubs, sometimes herbs, with milky sap; leaves alternate or rarely opposite, entire to serrate or lobed; stipule present, sometimes persistent; flowers unisexual, small, regular, usually in aments or heads or affixed to a variously shaped torus or on the inside of a hollow receptacle; corolla none; *staminate flowers* 2- to 6-merous, the parts free or more or less united; stamens as many as the sepals and opposite them, straight or inflexed and elastic; sepals of *pistillate flowers* 4, more or less united; stigmas 1 or 2; ovary superior or inferior, 1-celled, 1-ovuled; fruit a small achene or drupe usually enveloped by the fleshy perianth, sometimes on a fleshy gynophore, often assembled into an aggregate fruit (syncarp).

About 55 genera and 1,400 species, chiefly tropical. Most of the species in our region have distinctive leaves. The same plants may have entire leaves as well as variously lobed leaves, some of which are "mitten-shaped."

1. Flowers in a hollow receptacle; filaments straight; leaves entire or lobed, convolute in bud; stipules connate, enclosing the terminal bud, leaving a ringlike scar 4. *Ficus*, p. 498.
1. Flowers in aments or heads; leaves folded or involute in bud; stipules free, not leaving a ringlike scar (2)
- 2(1). Leaves with entire margins; branches spiny; flowers of both sexes in heads or clusters; syncarp globose, with a crustaceous rind . . . 2. *Maclura*, p. 498.
2. Leaves serrate or dentate, undivided or lobed; branches never spiny; staminate flowers in aments; stamens inflexed (3)

- 3(2). Syncarp ovoid to cylindric, fleshy, juicy; buds with 3 to 6 scales; leaves alternate1. *Morus*, p. 497.
 3. Syncarp globose, at maturity exerted on fleshy gynophores; buds with 2 or 3 scales; leaves sometimes opposite3. *Broussonetia*, p. 498.

1. MORUS L. MULBERRY. MORAL

Deciduous unarmed monoecious or dioecious trees or shrubs; bark usually scaly; buds with 3 to 6 imbricate scales; leaves undivided or lobed, serrate or dentate, with 3 to 5 nerves at base; stipules lanceolate, deciduous; flowers unisexual, both sexes in stalked axillary pendulous aments; calyx 4-parted; stamens 4; filaments inflexed in bud, later partly enclosed by the involute sepals; stigmas 2; fruit an ovoid compressed achene, covered by the succulent white to black calyx, aggregating into an ovoid to cylindric edible syncarp that resembles a blackberry.

About 12 species in temperate and subtropical regions of the Northern Hemisphere. Trees grown for their edible fruit, their ornamental nature or for their leaves which constitute the chief food of the silkworm.

1. Petioles usually less than 1 cm. long; mature leaf blades 7 cm. or less long, very scabrous on both surfaces1. *M. microphylla*.
 1. Petioles 1 cm. or more long; mature leaf blades usually more than 8 cm. long, slightly (if at all) scabrous on only one surface (2)
 2(1). Leaves glabrescent or only slightly pubescent in axils of largest veins on lower surface, often variously lobed2. *M. alba*.
 2. Leaves soft-pubescent on lower surface, usually unlobed3. *M. rubra*.

1. *Morus microphylla* Buckl. MOUNTAIN MULBERRY, TEXAS MULBERRY. Shrub or small scrubby tree to 7 m. high, with a trunk 15 cm. in diameter; bark light-gray, smooth, becoming fissured and scaly; leaves with a petiole to 15 mm. long, ovate, 3-7 cm. long, often 3- to 5-lobed, rounded to subcordate at base, abruptly pointed at apex, serrate or crenate-serrate, scarious above, pubescent or sometimes glabrous beneath; staminate catkins 1-2 cm. long; fruit ovoid, purple or blackish when ripe, 1-1.5 cm. long, juicy, edible. In canyons, limestone and igneous slopes in the w. two thirds of Tex., Mar.-Apr.; from Tex. to Ariz. and s. to Mex.

2. *Morus alba* L. WHITE MULBERRY, RUSSIAN MULBERRY, SILKWORM MULBERRY, MORAL BLANCO. Small tree to 15 m. high with spreading branches to form a round-topped crown; branchlets slightly pubescent at first or glabrous; leaves with petioles 1-2.5 cm. long, ovate to broadly oval, to 2 dm. long, rounded to cordate at the oblique base, subobtuse to short-acuminate at apex, coarsely toothed with obtusish teeth, often variously lobed, light-green and usually smooth above, hairy-tufted in axils beneath or nearly glabrous; pistillate spikes 5-15 mm. long, the staminate spike about twice as long; flowers small and greenish; syncarp ovoid to oblong-cylindric, 1-2.5 cm. long, white, pinkish to purplish-violet, or reddish, edible, sweet but insipid. *M. nigra* L. In woodlands and rocky areas mostly in cen. and s. Tex., Mar.-Apr.; a nat. of China but naturalized in much of N.A. and Eur.

The leaves of this species are the main food of silkworms.

3. *Morus rubra* L. RED MULBERRY, MORAL. Tree to 20 m. high, with a short trunk and stout spreading branches to form a broad round-topped crown, the bark smooth or scaly; branchlets pubescent at first; leaves with petioles 2-3 cm. long, broadly ovate to ovate-oblong, entire to variously lobed, dark-green, turning bright-yellow in autumn, to 2 dm. long, usually much smaller, truncate to subcordate at base, abruptly long-acuminate at apex, rather closely and sharply serrate, scabrous or sometimes nearly smooth above, soft-pubescent beneath; staminate catkins 2-5 cm. long; pistillate catkins 2-2.5 cm. long; syncarp 2-3 cm. long, juicy, finally dark-purple, edible. In upland woods and floodplains mostly in e. and cen. Tex., Mar.-May; from Mass. to Fla., w. to S.D., Neb., Kan. and Tex.

The Lampasas mulberry, var. *tomentosa* (Raf.) Bur., has exceptionally large fruits and leaves that are glossy above and whitish-tomentose beneath.

2. MACLURA Nutt.

A monotypic genus.

1. *Maclura pomifera* (Raf.) Schneid. BOIS D'ARC, OSAGE ORANGE, NARANJO CHINO, BOW-WOOD. Medium-sized spiny deciduous dioecious tree with an open irregular round-topped crown, to 20 m. high, sometimes forming thickets; bark deeply furrowed, dark yellowish-brown; sap milky; branchlets light-green, soon glabrous, with axillary thorns, becoming light-brown the first winter; spines to 25 mm. long, stout; leaves with petioles 3-5 cm. long, entire, ovate to elliptic-lanceolate, broadly cuneate to subcordate at base, acuminate at apex, bright-green and lustrous, turning clear-yellow in fall, to 12 cm. long; stipules minute; flowers unisexual, 4-merous; clusters of pedicelled staminate flowers 25-35 mm. long; heads of sessile pistillate flowers 2-2.5 cm. across; syncarp globose, to 15 cm. in diameter, the mammillate rind wrinkled; seed nearly 1 cm. long. *Toxylon pomiferum* Raf. In and on edge of fields, fence rows, ravines and waste places generally, most frequent in e. half of Tex., Apr.-May; also Ark. and Okla.; widely cult. as a hedge plant and escaping in various places through s. U.S.

3. BROUSSONETIA Vent.

About 8 species native to eastern Asia and Polynesia.

1. *Broussonetia papyrifera* (L.) Vent. PAPER MULBERRY. Small deciduous dioecious tree to 16 m. high, with widespreading branches to form a broad rounded crown; sap milky; bark smooth, tan-gray; branchlets stout, pubescent; leaves with petioles to 1 dm. long, alternate or occasionally opposite, ovate to oval, to 2 dm. long, broadly rounded to cordate at base, acuminate at apex, coarsely dentate, often deeply and irregularly lobed (especially on young plants), scabrous above, grayish and velvety-pubescent beneath; stipules ovate-lanceolate, distinct, deciduous; flowers greenish, 4-merous, unisexual; staminate cylindric catkins 6-8 cm. long, pendulous; syncarp a dense globose head about 2 cm. in diameter, orange-color, the protruding fruits red, showy. *Papyrius papyrifera* (L.) O. Ktze. Often planted for ornamental and sometimes as a street tree; nat. of China and Japan, occasionally naturalized from N.Y. to Fla., Tex. and Mo.

4. FICUS L.

About 800 species in the tropical and subtropical regions of both hemispheres.

1. *Ficus carica* L. COMMON FIG, FIGUERA. Usually a spreading deciduous shrub with long occasionally procumbent branches, rarely a small tree with short stem and wide-spreading branches to form a broad flattened crown, to 10 m. high, usually much smaller; branchlets stout, grayish, glabrous; leaves alternate, with petioles 2-5 cm. long, 3- to 5-lobed, rarely undivided, to 2 dm. long and about as wide, usually cordate at base, palmately nerved, the lobes usually obovate and obtuse at the apex and irregularly dentate, scabrous above and below with stout stiff hairs; stipules connate, enclosing the terminal bud, caducous to leave a ringlike scar; flowers unisexual, borne inside of a hollow receptacle with a narrow orifice; *staminate flowers* with 2- to 6-parted perianth and 1 or 2, rarely 3 to 6 stamens; *pistillate flowers* usually with more segments; style eccentric, short or filiform, with a peltate to filiform stigma; receptacle axillary and solitary pyriform, at maturity 5-8 cm. long, greenish or brownish-violet. A nat. of w. Asia; cult. since early times for its edible fruit which is of great commercial importance. Many pomological varieties are distinguished. Occasionally escaped and established.

FAM. 55. URTICACEAE Juss.

NETTLE FAMILY

Annual or perennial herbs, sometimes with stinging hairs, frequently succulent and with watery sap; leaves simple, alternate or opposite, mostly stipulate; flowers minute, greenish, unisexual or rarely perfect, in simple or branched spikes or clusters; calyx 2- to 5-cleft or of separate sepals; petals none; stamens as many as the calyx lobes or sepals

and opposite them, the filaments inflexed; ovary superior, 1-celled; style simple, with a capitate or filiform stigma; ovule solitary, erect or ascending, orthotropous; fruit an achene, often tipped with the persistent style or enclosed by the accrescent calyx.

About 45 genera and 600 species of wide geographic range, but mostly tropical and subtropical.

1. Leaves alternate (2)

1. Leaves opposite (3)

2(1). Margin of leaves essentially entire1. *Parietaria*, p. 499.

2. Margin of leaves dentate2. *Boehmeria*, p. 500.

3(1). Calyx of pistillate flowers tubular or cupuliform, enclosing the achene; plants without stinging hairs2. *Boehmeria*, p. 500.

3. Calyx of pistillate flowers of 2 to 5 separate or nearly separate sepals (4)

4(3). Plants more or less pubescent, beset with stinging bristles; achene enclosed by the calyx3. *Urtica*, p. 501.

4. Plants glabrous, smooth and shining, without stinging bristles; achene longer than the calyx4. *Pilea*, p. 502.

1. PARIETARIA L. PELLITORY

Annual or perennial herbs, often flimsy, with simple or diffusely branched and tufted stems devoid of stinging hairs; leaves alternate, more or less petiolate, exstipulate, usually opaquely punctate, entire, prominently 3-nerved; involucre of 2 to 6 free or somewhat united bracts; flowers polygamous, in clustered axillary cymes; *staminate flowers* with a perianth of 4 more or less united sepals and 4 stamens, the ovary rudimentary; *pistillate flowers* with a perianth similar to that of the staminate flowers, the included free ovary with a tufted stigma; achenes nearly ovoid, enclosed in the brownish 4-nerved calyx, with a shiny crustaceous pericarp.

About 30 species, widely distributed.

1. Mature calyx campanulate, subglobose to subcylindric, mostly 2 mm. or less long, mostly noticeably exceeded by the involucral bracts; stems simple or sparsely branched, finely pubescent1. *P. pensylvanica*.

1. Mature calyx cylindric, mostly 2-3 mm. long, about equaling or exceeding the involucral bracts; stems much-branched, more or less shaggy-pubescent (2)

2(1). Leaves elliptic to elliptic-lanceolate or linear-lanceolate, the larger blades 3 times or more as long as wide2. *P. obtusa*.

2. Leaves suborbicular-ovate to rhombic-ovate or sometimes ovate-lanceolate, the larger blades about twice as long as wide3. *P. floridana*.

1. *Parietaria pensylvanica* Muhl. HAMMERWORT. Slender annual, finely pubescent; stems weak, ascending or reclining, to 4 dm. long, simple or sparsely branched at base, sparsely to densely pubescent with mostly curled or hooked hairs; leaves with slender petioles, thin and flimsy, rhombic-lanceolate to elliptic-lanceolate or linear-lanceolate, to 7 cm. long, entire, obtuse at the narrowed apex, cuneate at base, minutely scabrous-pubescent; flower clusters sessile, in all but the lowermost leaf axils; bracts of the involucre linear, obtuse, 4-5 mm. long, much-exceeding the calyx; calyx lobes acute; achenes ovoid, shining, minutely apiculate, 1 mm. long. On shaded banks and about large boulders, uncommon in e. and cen. Tex., n. to the High Plains, Mar.-May; from Fla. to Tex. and Mex., n. to Ont. and B.C.

2. *Parietaria obtusa* Rydb. Slender annuals, more or less shaggy-pubescent; stems usually much-branched at the base, the branches spreading, to about 4 dm. long; leaves with slender petioles, elliptic to linear-lanceolate, obtuse at the often attenuated apex, minutely scabrous-pubescent, to about 6 cm. long; bracts of the involucre linear-elliptic to narrowly lanceolate, obtuse to acute, 3-4 mm. long, about equal to calyx; calyx lobes ovate, obtuse or rarely acutish. *P. pensylvanica* var. *obtusa* (Rydb.) Shinners. In rich moist soil, usually in shade of trees, shrubs or boulders, mainly in the Edwards Plateau and Trans-Pecos, Mar.-July; from n. Mex. and Tex., n. to Colo., Ut. and s. Mo.

3. *Parietaria floridana* Nutt. Slender annual, often densely shaggy-puberulent or pubescent; stems ascending or spreading, to about 3 dm. long, usually much-branched at base; leaves with slender filiform petioles, thin, numerous, usually ovate to subrhombic, rarely more than 3 cm. long, usually less than 2 cm. long, obtuse at the apex or sometimes short-acuminate but obtuse, entire, rounded to cuneate at base, palmately 3-veined; flower clusters in nearly all the axils; bracts of the involucre linear to linear-lanceolate, 2-3 mm. long, obtuse to acute; about equal to the calyx; achenes ovoid, shining, with a flanged stipe, symmetrically apiculate, usually less than 1 mm. long. *P. debilis* of Am. auth. In sandy-gravelly soil on brushy slopes, in cedar brakes and palm groves, rarely in salt marshes, mainly along the coast and w. to the Trans-Pecos, Feb.-June; from Fla. w. to Calif. and Mex., n. to N.H.

Typical *P. floridana* has small suborbicular-ovate to broadly ovate leaves with the three main nerves rising at its truncate to rounded base. Our small-leaved coastal specimens referred to this species do not conform entirely since the lateral veins arise somewhat above the base of the leaf blade.

2. BOEHMERIA JACQ. FALSE NETTLE

Herbs, shrubs or small trees, devoid of stinging hairs, monoecious or dioecious; leaves opposite or alternate, stipulate; flowers clustered, axillary; *staminate flowers* minute, with a 4-parted calyx and 4 stamens; *pistillate flowers* with a tubular or urceolate entire or 2- to 4-toothed calyx enclosing the ovary; style filiform-subulate, persistent, stigmatic and papillose down one side; fruit formed by the dry accrescent calyx that closely invests the elliptic achene.

About 100 species mostly in tropical regions of both hemispheres.

- 1. Plant dioecious; leaves alternate; flowers in axillary or lateral compound clusters 1. *B. nivea*.
- 1. Plants monoecious; leaves opposite; flowers in glomerules on branches (2)
- 2(1). Leaf blades thinnish, coarsely serrate; petioles usually about as long as the blades 2. *B. cylindrica* var. *cylindrica*.
- 2. Leaf blades leathery, finely serrate; petioles much shorter than the blades 2. *B. cylindrica* var. *Drummondiana*.

1. *Boehmeria nivea* (L.) Gaud. RAMIE. Perennial shrubby plant to 3 m. high; stem and branches more or less woody; leaf blades broadly ovate, to 3 dm. long, the margins dentate, the upper surface rough, the lower surface densely white-pubescent; achene about 1 mm. long. *Ramium niveum* (L.) Small. In waste places and cult. soils and along roadsides in s.e. Tex., summer-fall; from Fla. to Tex., n. to S.C.

This species that produces the important fiber, ramie, is a nat. of Asia that has become introd. and naturalized in s. U.S.

2. *Boehmeria cylindrica* (L.) Sw. BOG-HEMP, FALSE NETTLE, BUTTON-HEMP. Perennial, usually dioecious, glabrous to pubescent or even scabrous, erect, to about 12 dm. high, the stem simple or rarely branched; leaves mostly long-petioled, opposite or rarely alternate, ovate to ovate-lanceolate or oblong-lanceolate, the blade to about 15 cm. long and 8 cm. wide, rather thin to leathery, smooth to scabrous, acuminate at apex, rounded to somewhat cordate at base, serrate, 3-nerved; stipules distinct; flowers about 2 mm. broad, unisexual, the two kinds sometimes intermixed, the small clusters densely aggregated in simple and elongated axillary spikes, the staminate spikes interrupted, the pistillate spike often continuous and frequently leaf-bearing at apex; fruit ovate to suborbicular, compressed, minutely winged, apiculate, hairy, to 1.5 mm. wide. In bogs, marshes, swamps, seepage areas and in wet soil and water along rivers and streams in sun or shade, mostly in e. Tex. but extending w. to Val Verde Co. in w. Edwards Plateau and n. to Hemphill Co. in the High Plains, June-Oct.; from Fla. to Tex., n. to Ont. and Que., w. to Minn., Neb. and Ill.

Those plants that are usually in more exposed situations than var. *cylindrica* and have

narrower, oblong-lanceolate, thicker leaves with petioles mostly 2 cm. or less long and harshly scabrous above and pubescent beneath are segregated as var. *Drummondiana* Wedd. (*B. scabra* Small). The leaves also are commonly recurved to give the plant a drooping appearance, and the fruiting spikes are more dense and thicker and the fruits larger than in var. *cylindrica*.

3. URTICA L. NETTLE

Annual or perennial herbs with stinging hairs, dioecious or monoecious; stem simple or branched; leaves opposite, petioled, dentate or serrate, stipulate; flowers clustered in geminate racemes or heads; staminate calyx deeply 4-parted and with 4 stamens; pistillate calyx with unequal sepals, the longer inner ones enclosing the flattened achene; stigma essentially sessile, tufted.

About 50 species of wide distribution, mostly in the North Temperate Zone.

1. Inflorescences distinctly branched (2).

1. Inflorescences simple, unbranched (4)

2(1). Plants annual; petioles mostly more than half as long as the usually ovate-elliptic blades, usually exceeding the inflorescences; distribution Rio Grande Valley ...
.....5. *U. chamaedryoides* var.

Runyonii.

2. Plants perennial; petioles mostly less than half as long as the elliptic-lanceolate to narrowly lanceolate blades, mostly shorter than the inflorescences; distribution Plains Country and Trans-Pecos region (3)

3(2). Plant usually densely pubescent throughout, without or with few scattered bristles; leaves mostly elliptic-lanceolate1. *U. Serra.*

3. Plant very sparsely pubescent to essentially glabrous and more or less bristly throughout; leaves mostly linear-lanceolate2. *U. gracilis.*

4(1). Plants coarse; inflorescences densely cylindric, mostly 2 cm. or more long; distribution in mountains of the Trans-Pecos region3. *U. gracilentata.*

4. Plants delicate; inflorescences usually capitata or only slightly ellipsoid, usually about 1 cm. long; distribution east of the Trans-Pecos region (5)

5(4). Cystoliths on upper leaf surface dense and pimply, minute, round, darkish; uppermost leaves not greatly different in size and shape from lower ones, the marginal teeth typically triangular with straight margins4. *U. urens.*

5. Cystoliths on upper leaf surface irregular and scattered, mostly linear-cylindric, whitish; uppermost leaves rather abruptly much-reduced from lower ones and narrowly lanceolate, the marginal teeth usually ovate-elliptic and with convex margins
.....5. *U. chamaedryoides* var.

chamaedryoides.

1. *Urtica Serra* Bl. Perennial 1-2 m. high, the stem stout, throughout nearly glabrous or with short-strigose pubescence and with scattered or no bristles; leaves with petioles that are about one third the length of the blade, ovate-lanceolate to elliptic-lanceolate, rounded to subcordate or cuneate at base, acuminate at apex, coarsely toothed, to 1 dm. long, sparsely strigose above but becoming glabrate with age, velvety-pubescent beneath with short fine hairs; flower clusters dense, much shorter than the leaves; achenes usually much shorter than the inner sepals, dull-olive-brown, sparsely papillate-roughened. *U. Brewerii* Wats. Low ground and stream banks in mts. of the Trans-Pecos, July-Oct.; from w. Tex. to Ut., s. Calif. and adj. Mex.

2. *Urtica gracilis* Ait. TALL WILD NETTLE. Slender perennial, to 1 m. high, mostly monoecious or very rarely dioecious; stem glabrous or somewhat setulose and sparingly pilose; leaves slender-petioled, lanceolate to linear-lanceolate, rounded to cuneate at base, glabrous on both surfaces or sparingly pilose beneath; leaves with petioles about one third to one fourth as long as blades, those subtending the lowest inflorescences to 15 cm. long, very coarsely toothed; stipules thin, narrowly lanceolate to linear, acuminate, greenish or stramineous, glabrous to pilose, very much shorter than petioles; inflorescences

usually forking, slender, mostly moniliform or interrupted. In thickets, springy places and along streams, in rich soil in the Plains Country and Trans-Pecos, June-Aug.; almost throughout temp. N.A.

This plant is closely allied to, if not conspecific with, *U. dioica* L. of Eurasia.

3. *Urtica gracilentata* Greene. Coarse annual, to 15 dm. high; stem stout, simple or sparingly branched from base or on upper part of stem, nearly glabrous to downy and with stinging bristles; petioles of the lower leaves more than half as long as to longer than the blades; leaf blades thin, broadly ovate (at least the lower ones), to 1 dm. long, often nearly as wide, cordate to subcuneate at the base; marginal teeth of leaves triangular to broadly triangular-ovate, narrowly obtuse to acuminate, sometimes with minute marginal teeth, directed only slightly upward; stipules small, lanceolate; racemes slender, cylindrical, to 4 cm. long at maturity, unbranched. In moist shaded canyons and on high mt. slopes in the Trans-Pecos, July-Oct.; also N.M. and Ariz.

4. *Urtica urens* L. BURNING NETTLE, DOG NETTLE, ORTIGA. Erect or ascending annual, to 6 dm. high, with stinging bristles; stem branching from base or occasionally simple; leaves with slender petioles about as long as or shorter than the blade or sometimes longer than the blade, suborbicular-ovate to ovate-oblong or elliptic, subcordate to cuneate at base, rounded to acute at apex, thin, essentially glabrous, to 4 cm. long and 3 cm. wide, deeply and sometimes doubly incised-serrate; cystoliths small, round; stipules oblong, 1-4 mm. long; flower clusters rather dense, mostly much shorter than the petioles; flowers white or pale-yellow, androgynous, mainly pistillate, both kinds mixed in the same clusters; fruiting calyx with hispid-ciliate margins; achene 2 mm. long. In sandy or clayey soils in open woodlands and waste places in the s. third of Tex., Feb.-Aug.; a nat. of Eur. that is widely distributed over much of N.A.

5. *Urtica chamaedryoides* Pursh. ORTIGUILLA. Slender annual to 7 dm. high, with spreading stinging bristles; stems erect, branched from base and sometimes with axillary branches on mainstems; leaves with petioles slender, about as long as or shorter than the blade, broadly ovate to elliptic-lanceolate or (on upper part of stem) narrowly lanceolate, obtuse to acute at apex, cordate to truncate or cuneate at base, thin, sometimes purplish on lower surface, the margin coarsely serrate, the marginal teeth usually rounded and with convex sides, to 6 cm. long and 4 cm. wide, usually much smaller; cystoliths mostly linear-cylindrical; stipules linear-lanceolate, 1-4 mm. long; flowers in globular heads that are usually supported by short slender peduncles that are much shorter than the subtending petioles, 2 to several in each axil. Among boulders in humus of wooded slopes, in bottomlands and on shell mounds and rocky slopes mainly in cen. and s. Tex., Feb.-July; from Fla. to Tex. and Mex., n. to W.Va., Ky., Mo. and Okla.

Those plants found in extreme south Texas whose leaves have large, more triangular, teeth and whose inflorescences are typically cylindrical and often branched, are segregated as var. *Runyonii* Correll.

This species and the Old World *U. urens* are superficially very similar. However, besides the difference in the shape of the cystoliths noted in the key, the upper leaves of this species, that are greatly and usually abruptly reduced, are typically narrowly lanceolate while the gradually and less reduced upper leaves of *U. urens* are typically elliptic to rhombic-elliptic. The teeth of the leaves of this species also tend to be more rounded than the more triangular teeth of *U. urens*. Several collections, especially from north-central Texas, show evidence of possible introgression with *U. urens*.

4. PILEA LINDL.

RICHWEED. CLEARWEED

About 400 species, mainly in the tropics.

1. *Pilea pumila* (L.) Gray. Low annual to 7 dm. high, usually much smaller, simple to bushy-branched, the bases of large plants decumbent, essentially glabrous throughout; leaves opposite, with petioles about one third as long as to longer than the blade, to 15 cm. wide, lustrous, translucent, ovate, rounded to cuneate at base, with a conspicuous linear entire apex, with as many as 17 coarse rounded teeth on each margin, when dried the surface covered with small whitish lines (cystoliths), the primary nerves rising from base and narrowly winged; flowers unisexual, green or whitish, in axillary cymes to 3 cm. long; *staminate flowers* with 3 or 4 sepals and stamens, often mixed with the *pistillate*

flowers; calyx of *pistillate* flowers deeply 3-parted, each of the unequal segments subtending a concave scalelike staminodium; ovary free, with a sessile stigma; fruit a compressed thin-walled achene that is subtended by the persistent calyx, ovate, pale green, smooth and unspotted or with purple markings, 1.3-2 mm. long. *Adicea pumila* (L.) Raf. In moist or wet rich soils of woods, especially in seepage and along streams, in e. Tex., June-Nov.; from e. Can. and N.E., s. to Fla. and Tex., w. to S.D., Ia. and Kan.

Most of our material is referable to var. *Deamii* (Lunell) Fern. which is more southern in distribution than var. *pumila*, and has leaves more rounded at the base and with 11 to 17 teeth on each margin, whereas the largest leaves of var. *pumila* are mostly cuneate at the base and have only 3 to 11 teeth on each margin.

FAM. 56. VISCACEAE MIQ.⁴³

MISTLETOE FAMILY

Plants shrubby or herbaceous, aerial parasites on other seed plants, pubescent or glabrous, monoecious or dioecious; stems evergreen, usually forked, brittle and much-branched, with generally swollen and articulated nodes; leaves opposite, simple, entire, evergreen or sometimes reduced to scales; flowers minute (about 2 mm. or less long), monochlamydeous (corolla absent), unisexual, solitary or clustered at the nodes or in axillary spikes or cymes; perianth segments 2 to 4, valvate; *staminate* flowers with stamens opposite, adnate or free and equal in number to the tepals, sometimes with a vestigial style; pollen spherical; *pistillate* flower with a simple style and terminal stigma; ovary inferior, 1-celled and without ovules, the embryo sac originating from a short placental column; fruit baccate, with a viscous layer and persistent tepals.

A family of about 11 genera and 450 species, found on all continents but with the greatest development in tropical and subtropical regions. Two genera occur in the contiguous United States.

1. Plants yellow-green to orange, leafless parasites on pines, usually less than 2 dm. tall; stems generally angled; anthers 1-celled, with a flattened ringlike pollen chamber surrounding a central nonsporogenous connective; pistillate flowers usually with 2 perianth segments; fruit greenish or purplish with a distinct transverse median line, at maturity pedicellate, reflexed, compressed and explosive . . .
 1. *Arceuthobium*, p. 503.

1. Plants green, with or without foliaceous leaves, usually over 2 dm. tall; stems terete; anthers 2-celled, upright, without an obvious connective; pistillate flowers usually with 3 perianth segments; fruit white or pinkish, without a distinct transverse median line, at maturity sessile, erect, not compressed or explosive
 2. *Phoradendron*, p. 504.

1. ARCEUTHOBIUM BIEB.⁴⁴

DWARF MISTLETOE

Shrubs or herbs parasitic on coniferous trees, glabrous, angled (at least when young), dioecious; stems variously colored from greenish-yellow to orange, reddish and black, not deciduous, without central xylem cylinder; leaves reduced to minute opposed connate scales; flowers decussate on young shoots, 2-3 mm. across; *staminate* flowers with perianth segments 3- or 4-merous, bearing a sessile 1-celled circular anther at the base of each perianth segment; *pistillate* flower manifestly epigynous, with one style; perianth segments persistent, adate to ovary, 2-merous; ovary 1-chambered; fruit an ovoid berry, 1-seeded, mucilaginous and bicolored (distal and basal portions of different shades), explosive at maturity.

A group of approximately 28 species mostly in the western United States and Mexico; three species in the Old World.

⁴³ Heretofore the American mistletoes have been placed in the family Loranthaceae, which was subdivided into two subfamilies, the Loranthoideae and Viscoideae. These subfamilies have recently been formally raised to family status by Bryan Barlow. The family diagnosis and key to genera supplied by Delbert Wiens.

⁴⁴ Contributed by F. G. Hawksworth and Delbert Wiens.

- 1. Parasite on *Pinus ponderosa*; largest shoots over 3 mm. in diameter at base, orangish
1. *A. vaginatum* subsp. *cryptopodum*.
- 1. Parasite on pinyon pines; largest shoots less than 3 mm. in diameter at base, greenish-yellow to brownish2. *A. divaricatum*.

1. *Arceuthobium vaginatum* (Willd.) J. Presl subsp. *cryptopodum* (Engelm.) Hawksworth & Wiens. Bush to 3 dm. thick; stems nonglaucous, generally orange; basal internodes 10-15 mm. long, 3-5 mm. thick; staminate flowers 3- (sometimes 4-) merous, about 3 mm. across; mature fruits 4-5 mm. long. Incl. f. *cryptopodum* (Engelm.) Gill, *A. robustum* Engelm. Parasitic on *Pinus ponderosa* in the Davis and Guadalupe Mts. (not known for the Chisos Mts. although it is common in the nearby Sierra del Carmen in Coah.), May-June; Ut. and n. Colo., s. to Son., Chih. and Coah.; other subsp. occur in Mex.

2. *Arceuthobium divaricatum* Engelm. Bush to 2 dm. thick; younger shoots glaucous, older portions nonglaucous; shoots greenish to brown, older portions darker; basal internodes 7-10 mm. long, 2-3 mm. thick; staminate flowers 3- or 4-merous, 2-3 mm. across; mature fruits 3-4 mm. long. *A. campylopodum* f. *divaricatum* (Engelm.) Gill. Parasitic on *Pinus edulis* and *P. cembroides* in the Davis Mts., Aug.-Sept.; Calif., Ut. and Colo., s. to Baja Calif., s. Ariz. and s. N.M.

2. PHORADENDRON NUTT.⁴⁵ MISTLETOE

Shrubs parasitic on other woody plants, dioecious (in Texas species); leaves (and sometimes stems) chlorophyllous, opposite, evergreen, either well-developed or reduced to connate scales in some species; flowers unisexual, about 2 mm. across, borne in spike-like or thin-cylindrical axillary inflorescences from a few mm. to a few cm. long, with the flowers sunken in the rachis; perianth segments 3- (rarely 2- or 4-) merous, distinct, deltoid, scalelike, persistent, seldom erect and never spreading; *staminate flower* bearing a sessile 2-celled anther at base of each perianth segment; *pistillate flower* manifestly epigynous, with 1 style, the perianth segments persistent; ovary 1-chambered; fruit a small drupe (but without an obviously indurated endocarp), 1-seeded with a glutinous mucilaginous mesocarp, usually whitish.

A New World genus of wide distribution, but primarily tropical, with about 250 species.

- 1. Pistillate inflorescence usually with 1 segment and 2 flowers; internodes usually less than 2 cm. long; leaves either reduced to inconspicuous scales or well-developed, usually less than 25 mm. long or 5 mm. broad; parasitic on juniper and cypress (2)
- 1. Pistillate inflorescences with 2 or more segments and more than 2 flowers per segment; internodes generally over 2 cm. long; leaves well-developed and broad, usually more than 25 mm. long and 10 mm. broad; parasitic on dicotyledons (4)
- 2(1). Leaves reduced to connate scales about 1 mm. long1. *P. juniperinum*.
- 2. Leaves clearly developed and usually more than 5 mm. long (3)
- 3(2). Anthesis from December through February; plants stellate-pubescent2. *P. capitellatum*.
- 3. Anthesis from June through September; plants glabrous or young tissues only slightly puberulent3. *P. Bolleanum* subsp. *Hawksworthii*.
- 4(1). Anthesis from approximately July through September; fruit pubescent, at least with a ring of short hairs below the calyx; plants densely stellate-pubescent at apices (moderately so on older parts), often appearing frosty; parasitic almost exclusively on *Quercus*4. *P. villosum* subsp. *Coryae*.
- 4. Anthesis from November through March; fruit glabrous; plants glabrous or glabrate, sometimes parasitic on *Quercus* but common on *Celtis*, *Fraxinus*, *Platanus*, *Populus*, *Prosopis*, *Salix*, *Ulmus*, etc.5. *P. tomentosum*.

⁴⁵ Contributed by Delbert Wiens.

1. *Phoradendron juniperinum* Gray. Small bush to 4 dm. thick; stems at maturity woody at base, glabrous; internodes 5-12 mm. long; leaves reduced to scales about 1 mm. long, often finely ciliate; *staminate* inflorescence with 1 or 2 segments, the individual segments with 5 to 9 flowers; *pistillate* inflorescence with 1 segment and 2 flowers; fruit white to pinkish, 4 mm. thick. On *Juniperus* in the Chisos, Davis and Guadalupe Mts. (also on *Cupressus* in the Chisos Mts.) of the Trans-Pecos, July-Sept.; Ore., Ut. and Colo., s. to Mex.; another subsp. known from the Pac. Coast.

2. *Phoradendron capitellatum* Trel. Bush to 6 dm. thick; stems at maturity becoming woody at base; internodes 5-15 mm. long, glabrate; leaves oblanceolate-linear, 8-14 mm. long, 1-2 mm. broad, acute or obtuse at apex, attenuate or sessile at base, the venation inconspicuous; blades densely stellate-pubescent when young to lightly stellate-pubescent in age; inflorescence moderately stellate-pubescent; *staminate* inflorescences with 1 to 3 segments, individual segments with 6 to 15 flowers; *pistillate* inflorescences with 1 or 2 segments, individual segments with 2 or 3 flowers; fruit pinkish-white, about 3 mm. thick. *P. Bolleanum* var. *capitellatum* (Trel.) Kearn. & Peeb. On *Juniperus*, reported from "w. Texas," Dec.-Feb.; s. N.M., w. Tex., Chih. and Son.

3. *Phoradendron Bolleanum* (Seem.) Eichler subsp. *Hawksworthii* Wiens. Bush to about 25 cm. thick; stem bases becoming woody at maturity, glabrous or slightly puberulent on younger portions; internodes 6-12 mm. long; leaves oblanceolate-linear, subsessile, 6-25 mm. long, 1.5-3 mm. broad, obtuse to rounded at apex, often subterete, the venation inconspicuous; *staminate* inflorescence with 1 segment and 3 to 6 flowers; *pistillate* inflorescence with 1 segment and 2 flowers; fruit white to pinkish, 4 mm. thick, glabrous. In mts. of the Trans-Pecos, on *Juniperus*, July-Sept.; other subspecies occur in the mts. of w. U.S., and n. Mex.

Subsp. *densum* (Trel.) Wiens is not presently known from Texas, but it occurs in the adjoining Sierra del Carmen in Coahuila; it is distinguishable from subsp. *Hawksworthii* by its wider (usually over 2 mm.), more flattened leaves, and increased number of flowers (6 or more) per segment on the staminate inflorescence.

4. *Phoradendron villosum* (Nutt.) Nutt. subsp. *Coryae* (Trel.) Wiens. Bush to about 1 m. thick, most parts densely whitish-stellate-pubescent at apices, moderately so on older parts; stems at maturity becoming generally woody; internodes 15-38 mm. long; leaves obovate-elliptic to orbicular, 13-27 mm. long, 1-2 cm. broad, rounded to acute at apex, subtruncate to acute at base, the veins usually inconspicuous or occasionally evident on lower surface; inflorescences densely stellate; *staminate* inflorescences with 2 to 5 segments, individual segments with 14 to 45 flowers; *pistillate* inflorescences with 2 or 3 segments, individual segments with 6 to 12 flowers. *P. Coryae* Trel., *P. Harvardianum* Trel. On *Quercus* species in the Chisos, Davis and Guadalupe Mts. of the Trans-Pecos, July-Sept.; Ariz., Chih., Coah., N.M. and Tex.; other subsp. occur in w. U.S. and Mex.

5. *Phoradendron tomentosum* (DC.) Gray. INJERTO. Bush to 1 m. or more thick, most parts glabrate, the younger parts often densely short-stellate-pubescent; internodes 8-59 mm. long; leaves elliptical-obovate to orbicular, 16-48 mm. long, 9-29 mm. broad, obtuse-rounded at apex, rounded to attenuate at base, the veins evident to obscure; petioles 2-4 mm. long or obsolescent, often more densely pubescent than the blade; *staminate* inflorescence with 2 to 7 segments, individual segments with 15 to 60 flowers; *pistillate* inflorescence with 2 to 6 segments, individual segments with 6 to 20 flowers; fruit white, 4-6 mm. thick, essentially glabrous. Our most abundant mistletoe, found on a variety of woody plants but usually on *Celtis*, *Fraxinus*, *Platanus*, *Populus*, *Prosopis*, *Quercus* and *Salix*. Widely distributed in the state and represented with us by 2 subsp. as follows:

Subsp. *tommentosum*: Plant moderately to densely short-pubescent, especially on the younger parts, becoming moderately to lightly so on older parts; internodes 8-39 mm. long; leaves obovate-elliptic, 16-40 mm. long, 9-22 mm. broad; inflorescences moderately to densely pubescent; *staminate* inflorescences with 2 to 6 segments, individual segments with 15 to 42 flowers; *pistillate* inflorescence with 2 to 6 segments, individual segments with 6 to 11 flowers. *P. flavescens* of auth., *P. serotinum* var. *pubescens* (Engelm.) M. C. Johnst. Trans-Pecos, Edwards Plateau, Rio Grande Plains and Plains Country, late Nov.-Mar.; from Tex. n. to Okla., s.e. Kan., e. Ark. and La., s. to Coah., N.L., Dgo. and Tam.; plants becoming glabrate in e. Tex. and perhaps conspecific with *P. serotinum* (Raf.) M. C. Johnst. which occurs farther east.

Subsp. *macrophyllum* (Engelm.) Wiens. Plants glabrous (in Tex.) or glabrate; internodes 22-59 mm. long; leaves obovate, to elliptic-orbicular, 23-48 mm. long, 15-29 mm. broad; inflorescences subglabrous to moderately short-pubescent; *staminate* inflorescence with 2 to 7 segments, individual segments with 15 to 60 flowers; *pistillate* inflorescence with 2 to 5 segments, individual segments with 6 to 20 flowers. Primarily on *Populus*, along the Rio Grande from El Paso to vicinity of Presidio, Dec.-Mar.; Calif., Baja Calif., Ariz., N.M., Tex., Coah., Chih. and Son.

FAM. 57. SANTALACEAE R. BR. SANDALWOOD FAMILY

Trees, shrubs, herbs and subherbs (in ours) with simple exstipulate leaves and regular flowers commonly in racemes, panicles or corymbose clusters, sometimes parasitic; perianth 4- to 5-cleft, valvate in bud, its tube coherent with the 1-celled inferior ovary; stamens borne on a fleshy disk in the perianth tube; pistil one; ovules 2 to 4, suspended from the apex of a stalklike free central placenta that rises from the base of the cell; fruit an indehiscent 1-seeded nutlet that is crowned by the persistent perianth lobes.

Several hundred species in about 30 genera in Eurasia and North America.

I. COMANDRA NUTT. BASTARD TOAD-FLAX

Characters of the family. Plant a root-parasite; leaves alternate; flowers perfect. About 5 species in North America and Europe.

1. *Comandra pallida* A. DC. Plant herbaceous but perennial, to 3 dm. tall; stems arising at intervals from a slender underground stoloniferous rootstock, simple or frequently with widespreading branches, leafy throughout; leaves linear to linear-lanceolate, entire, acute, firm, usually glaucous, to about 2 cm. long and 3 mm. wide; flowers white and pink, in corymbose clusters; perianth segments petaloid, elliptic-lanceolate, marginally ciliolate, 3-4 mm. long, with a tuft of long erect hairs arising below the middle on the inner surface; fruit ovoid to subglobose, about 8 mm. long, green becoming yellowish. On dry breaks and hills, deep sandy soil, rocky grassy slopes and plains, frequent in the Plains Country, rare e. to Cooke Co. in n.-cen. Tex., Apr.-June; from Man. to B.C., s. to Minn., Tex., N.M. and Ariz.

This species is known to parasitize a number of species in many different plant families.

FAM. 58. ARISTOLOCHIACEAE JUSS.⁴⁰ BIRTHWORT FAMILY

Twining shrubby vines or low herbs; leaves essentially sessile to petioled, exstipulate, mostly cordate at base and entire; flowers perfect, 3-merous, regular or irregular (in ours); calyx conspicuous, usually bizarre in shape and lurid in color, valvate in bud and coherent (at least at base) to the 6-celled ovary; corolla absent or vestigial; stamens 6 in ours, more or less united with the style; anthers adnate, extrorse; fruit a capsule or berry, many-seeded; seeds anatropous.

About 400 species in 7 genera, mostly tropical.

I. ARISTOLOCHIA L. BIRTHWORT. TACOPATE

Perennial herbs or vines; leaves alternate, sessile or petiolate, palmately veined; flowers perfect, irregular, solitary or fascicled in the axils of the leaves, the perianth 3-merous; calyx tubular, corollalike, S-shaped or U-shaped, more or less 3-lobed at summit or straight and with a single unilateral terminal lobe, with or without a utriculus on the convex side of the unpaired limb segment; stamens 6; anthers sessile and adnate to the

⁴⁰ Adapted partly from Howard W. Pfeifer in Ann. Missouri Bot. Gard. 53: 115-196. 1966.

3- to 6-lobed style; ovary wholly adnate or partially inferior; style short and stout; fruit a septicidal 6-lobed or 6-angled capsule that opens from the base or from the apex; seeds numerous, horizontal, flat or concave-inflated.

About 350 species of wide distribution. Some species are highly ornamental. Some recent authors have, with apparent good reason, followed Rafinesque in segregating the species in our region into three genera. We have maintained the traditional treatment.

1. Erect herbs; flowers borne at the base of the stem in the lowermost leaf axils; capsule always open from the top with the valves spreading (2)
1. Twining vines or viney plants with weak spreading or trailing stems; flowers borne in the leaf axils on the upper part of the stem; capsule opening from the bottom or irregularly (4)
- 2(1). Leaves essentially sessile and clasping, firm and thickish, prominently reticulate-veined beneath; plant manifestly pubescent with stiff spreading hairs 1. *A. reticulata*.
2. Leaves petioled, thin and herbaceous, not prominently reticulate-veined; plant sparingly pubescent with soft hairs (3)
- 3(2). Leaves ovate to ovate-oblong, not conspicuously hastate, typically 30 mm. wide or more; capsule usually about 10 mm. long 2. *A. Serpentaria*.
3. Leaves narrowly triangular to lanceolate, conspicuously hastate, typically 25 mm. wide or less; capsule mostly 6 mm. long or less 2. *A. Serpentaria* var. *hastata*.
- 4(1). Coarse high-climbing twining vine; leaves broadly rounded, mostly more than 1 dm. wide; plants in eastern third of Texas 3. *A. tomentosa*.
4. Small spreading plants with slender nontwining stems; leaves not as above, less than 1 dm. wide; plants in western two thirds of Texas (5)
- 5(4). Leaves linear to narrowly lanceolate, tapering at base; plants of sandy soils in south Texas 4. *A. longiflora*.
5. Leaves typically triangular-ovate, with a broad sinus and somewhat auriculate at base (6)
- 6(5). Leaves thin, more than 4 cm. long, essentially glabrous; on alluvial soils of the Rio Grande Valley 5. *A. Marshii*.
6. Leaves thickish, rarely to 4 cm. long, mostly pubescent; in rocky areas in the Edwards Plateau and Trans-Pecos regions (7)
- 7(6). Limb of calyx broadly elliptic to suborbicular; plants villous to villous-hispidulous 6. *A. Coryi*.
7. Limb of calyx lanceolate to linear-lanceolate and attenuate; plants usually somewhat velvety and tawny (8)
- 8(7). Calyx 6-7 cm. long 7. *A. Wrightii*.
8. Calyx 3.5-4 cm. long 7. *A. Wrightii* var. *texana*.

1. *Aristolochia reticulata* Nutt. TEXAS DUTCHMAN'S-PIPE. Perennial from a slender fibrous-rooted rootstock, to 4 dm. high; stems usually several, erect or decumbent, angled, simple or branched below, zigzag, hirsute; leaves few, bright-green, nearly sessile and clasping, oblong to oval or broadly ovate, firm, obtuse to subacute at apex, to 12 cm. long and 65 mm. wide, often undulate, prominently reticulate-veined beneath, more or less pubescent along the veins on both sides; inflorescence a several-flowered bracted raceme that arises from the lowest nodes of the stem, often covered by fallen leaves; bracts ovate to suborbicular; perianth dark-brown, pubescent, 8-10 mm. long; anthers shorter than the broad trilobate style; capsule reddish-brown, prominently 6-angled, subglobose, to about 15 mm. in diameter; seeds deeply concave, adorned with minute grayish irregularly shaped tubercles on the rounded face, ovate-cordate in outline, about 5 mm. long. In humus of pine-hardwood forests, pine-savannahs and rocky woodlands in e. Tex., May-July; also w. La. and s.w. Ark.

This species would be placed in the segregate genus *Endodeca* along with *A. Serpentaria* if this genus were divided. The basal inflorescences, peculiar seeds and habit of the plant are the obvious common characteristics of these two species.

2. *Aristolochia Serpentaria* L. VIRGINIA DUTCHMAN'S PIPE, VIRGINIA SNAKE-ROOT. Plant a herbaceous perennial, to 6 dm. tall, thinly pubescent; stems erect, slender, from a knotty rhizome; leaves slender-petioled, thinnish, ovate to ovate-oblong or narrowly lanceolate, cordate to hastate or sagittate at the base, acuminate at apex, to 15 cm. long and 8 cm. wide, reduced to scales below; flowers solitary on short slender scaly peduncles that arise from the lowest nodes of the stem and are to 8 cm. long; perianth strongly curved, 1-2 cm. long, pubescent, deep-purple to brownish; limb broad, flaring, madder-purple, obtusely 3-lobed; capsule ellipsoid to subglobose, to 13 mm. in diameter; seeds obovoid, 4-5 mm. long, adorned with minute scattered papillae on the face. *Endodeca Serpentaria* (L.) Kl. In moist or dry upland woods, about ledges and on wooded rocky slopes on the Edwards Plateau and in e. Tex., Apr.-June; from Tex. to Fla., n. to Mo., Ill., s. N.Y. and Conn.

Plants with extremely narrow sagittate leaves, especially common in the south, are usually segregated as var. *hastata* (Nutt.) Duchartre (*A. hastata* Nutt.)

3. *Aristolochia tomentosa* Sims. WOOLLY DUTCHMAN'S PIPE, PIPE-VINE. A high-climbing woody twining vine, to 25 m. long or more, more or less densely white-pubescent throughout (especially when young); leaves petioled, ovate to broadly orbicular-reniform, cordate at base, broadly rounded at apex, densely tomentose beneath, to 2 dm. long and wide; peduncles axillary, solitary or paired, downy, bractless; perianth about 4 cm. long, densely tomentose, with an oblique dark-purple orifice and a rugose reflexed yellowish or greenish-yellow 3-lobed limb; capsules cylindrical, to about 8 cm. long and 3 cm. in diameter; seeds triangular, flat, grayish, about 1 cm. long. *Isotrema tomentosa* (Sims) H. Huber. In shaded areas along streams, in bottomland forests along rivers and in post oak woods in n.-cen. and e.-cen. Tex., Mar.-May; from Fla. to Tex., n. to Okla., Mo., Ill. and N.C.

4. *Aristolochia longiflora* Engelm. & Gray. SWAN-FLOWER. Plant a low perennial, ascending to spreading or often entirely prostrate, to about 25 cm. across, from a long aromatic rootstock; stems elongated, slender, with short internodes, somewhat pubescent; leaves short-petioled, mostly linear-elongated to setaceous, often with a few oblong-lanceolate, all with base and apex acute, to 13 cm. long and 15 mm. wide, scarcely pubescent above, glabrate below; perianth with a short tomentose peduncle, elongated, to about 1 dm. long and 1 cm. wide; tube more or less arcuate, mauve, to about 3 cm. long, the orifice grayish; limb linear to narrowly lanceolate, obtuse to acute at the narrow apex, to about 7 cm. long, purplish-brown; capsule obovoid-subquadrate, glabrous, about 2 cm. long; seeds dark brown, triangular, about 5 mm. long. In hard packed sandy silt and in sandy loam in open grassy areas or in shade in s. Tex., Mar.-Nov.; also in adj. Mex.

5. *Aristolochia Marshii* Standl. Herbaceous twining vine; stem slender, simple or branched, sparsely pilose with short lax hairs, the internodes elongated; leaves thin-herbaceous, with a slender petiole 1-3.5 cm. long, triangular-ovate and entire to deeply 3-lobed almost to the base, to 9 cm. long and 75 mm. wide, deeply cordate at the base, the sinus wide open, green above with sparse short hairs, somewhat paler beneath, slightly pilose on the nerves and between the nerves puberulent to glabrous, 5-nerved at the base, the terminal lobe narrowly oblong and gradually attenuated from the base to the apex, the much smaller semioval lateral lobes obtuse; flowers axillary, solitary, the hirsute peduncle 5-10 mm. long; bracts linear-lanceolate to lanceolate, acute, about 1 cm. long; perianth reddish-purple, about 35 mm. long, shortly hirsute; utricle obovoid, 6-8 mm. long; tube nearly upright, 5-10 mm. long; limb 2-3 cm. long, triangular-lanceolate, more or less auriculate at base, narrowly attenuated to the obtuse apex, to about 1 cm. wide at base, the margins incurved. In alluvial soil in the Rio Grande Valley, spring-summer; also Coah.

6. *Aristolochia Coryi* I. M. Johnst. Prostrate perennial herb that arises from a deep fusiform succulent root; stems many, slender, often with elongated branches towards the base, to 4 dm. long and 1.5 mm. thick, sparsely hispidulous-villous; leaves green, with petioles to 25 mm. long, triangular to triangular-ovate in outline, obtuse to acute at apex, conspicuously auriculate as to be 3-lobed, to 5 cm. long and 4 cm. wide, usually much smaller, with ciliolate margins, more or less sparsely and inconspicuously villous to villous-hispidulous, the large rounded divergent auricles separated by a broad sinus and to 15 mm. long and 1 cm. wide; flowers solitary in leaf axils, on peduncles to 8 cm. long, subtended by a foliaceous ovate bract; perianth 2-3.5 cm. long, brownish or

brownish-purple marked with yellow, more or less minutely villous; utricle to 7.5 mm. long and 6 mm. wide, somewhat asymmetrical, glabrous within; tube lightly falcate-arcuate, to 15 mm. long and 3 mm. wide, bearing hairs within above the middle; limb to 18 mm. long and 1 cm. wide, broadly and obliquely elliptic to suborbicular; capsule shortly stipitate, angular, elliptic to obovoid or depressed-globose, to 2 cm. long and 15 mm. wide; seeds blackish-brown, flat and triangular, about 6 mm. wide. *A. brevipes* and its var. *acuminata* of auth. In crevices of ledges and cliffs, on rim rock and rocky slopes in the Edwards Plateau and s. Trans-Pecos, Apr.-Sept.; also n. Mex.

The broadly elliptic to suborbicular limb of the tube readily distinguishes this species from the vegetatively similar *A. Wrightii*.

7. *Aristolochia Wrightii* Seem. Prostrate perennial herb that is very similar in appearance and habit to *A. Coryi*, the entire plant usually somewhat velvety and tawny; leaves broadly ovate-triangular to subreniform in outline, with broad rounded auricles and an obtuse to acute apex, to about 4 cm. long and wide; perianth 3.5-7 cm. long; utricle to about 6 mm. long and 3 mm. wide; tube almost straight to only slightly curved, to about 12 mm. long and 3 mm. wide; limb to 45 mm. long and 1 cm. wide across the auriculate base, lanceolate to linear-lanceolate and often attenuate to a pointed apex; capsule shortly stipitate, angular, subglobose-quadrant, 10-15 mm. long and wide; seeds blackish, triangular, lightly emarginate at apex, flat, about 5 mm. wide. *A. brevipes* var. *Wrightii* (Seem.) Duchartre. On walls of canyons, among boulders and on rocky hills in the mts. of the Trans-Pecos, Mar.-June; also n. Mex.

Those plants, more frequent with us, whose perianths are 3.5-4 (not 6-7) cm. long, are segregated as var. *texana* I. M. Johnst.

Aristolochia Watsonii Woot. & Standl., of New Mexico and Arizona, has been reported from west Texas but we have seen no material from the state. It is similar in habit to *A. Coryi* and *A. Wrightii* but its subtomentose leaves are much narrower and more elongated than in those species, being to 85 mm. long, and the basal lobes are very much narrower and more elongated.

FAM. 59. RAFFLESACEAE DUM.

RAFFLESIA FAMILY

Fleshy parasitic plants on the roots, stems or branches of various trees and shrubs; leaves scalelike, inconspicuous, only a few of them subtending the flower outside tissue of host plant; flowers minute (in ours) to very large, solitary or rarely spicate, rarely perfect, usually unisexual by abortion; calyx somewhat epigynous with 4 to 10 imbricate or less commonly valvate segments, similar to subtending scales (in ours); anthers sessile, arranged in 1 to 3 series around a fleshy central column, the latter expanded at apex into a fleshy disk; pistillate flowers with a ring-shaped stigma around the margin of a fleshy disk surmounting the column; ovary inferior, 1-celled, with several placentae extending inward almost to center; ovules numerous, with a single integument; seeds minute, numerous.

About 50 species in 8 genera, primarily in the tropics. It is of interest that the family to which our tiny plant belongs includes a plant that has the largest of all known flowers, *Rafflesia Arnoldii* R. Br., a native of Malaysia.

1. PILOSTYLES GULL.

Characters of the family. About 20 species, mostly in the American tropics, but also in Africa, Persia and Australia.

1. *Pilostyles Thurberi* Gray. Vegetative part of plant entirely imbedded in the stems and branches of host plant, only the small brownish flowers with their subtending scales exerted from the bark of the host plant; floral bracts 4 to 7, broadly ovate to suborbicular, 1-1.5 mm. long, fleshy at the broad base, gradually thinner toward apex, irregularly erosulate along the margins; flowers solitary on fleshy peduncles to 1.5 mm. long, unisexual, with 4 or 5 distinct obovate yellowish perianth segments about 1.5 mm. long that are similar to the subtending bracts, with a thick central column expanded at apex into a fleshy disk (about 1 mm. in diameter) that bear under its margin the anthers in

staminate flowers and the ring-shaped stigma in pistillate flowers; ovary inferior; capsule many-seeded. *P. Covillei* Rose. Parasitic on *Dalea formosa* and *D. frutescens* in our area, mostly in w.-cen. and n.w. Tex., May-July; from Tex. to Calif. and n. Mex.

FAM. 60. POLYGONACEAE JUSS. KNOTWEED FAMILY

Caulесcent or rarely аcaulescent herbs or herbaceous vines; leaves alternate or rarely opposite or whorled, the blades entire or rarely lobed or toothed; petioles usually present; stipules (ocreae) present, usually sheathing the nodes, variously long-sheathing or short-sheathing or sometimes deeply or shallowly lobed and sometimes fringed, rarely seemingly absent (*Eriogonum*; *Brunnichia*); flowers small, hypogynous, perfect or unisexual, usually in racemes or in involucrate clusters, sometimes solitary at the nodes; calyx of 2 to 6 usually nearly entirely separate sepals, sometimes developing keels or wings, often corolla and whitish or pinkish; corolla absent; stamens 2 to 9, the filaments often dilated basally; anthers 2-celled, each cell with a longitudinal slit; ovary 1-celled, usually trigonous (3-carpellate) or less commonly lenticular (when one of the carpels is suppressed); styles 3 or 2, usually not much united; ovule solitary, orthotropous; endosperm horny or mealy, usually copious; fruit a trigonous or lenticular achene, usually falling still covered by the remains of the calyx and androecium.

A widely distributed family of about 35 conservative genera or upwards of 45 narrowly drawn ones. Some of the species are good honey plants. The Buckwheat, *Fagopyrum sagittatum* Gilib., is a member of this family; it does not do well in cultivation so far south as Texas, but has been grown in experimental plots.

- 1. Vines with tendrils; endosperm ruminant (2)
- 1. Herbs or if vines then tendrils absent; endosperm not ruminant (3)
- 2(1). Flowers rose-color or white6. *Antigonon*, p. 526.
- 2. Flowers greenish or yellowish7. *Brunnichia*, p. 527.
- 3(1). Flower or flower clusters in involucre of whorled partially united bracts; stamens 9; ocreae absent1. *Eriogonum*, p. 510.
- 3. Flowers not so borne, the bracteal leaves when present always solitary; stamens 4 to 8; ocreae present though in some species reduced (4)
- 4(3). Sepals of widely disparate size, the outer ones not enlarged, the 3 inner ones erect and greatly enlarged in fruit; stigmas peltate, tufted2. *Rumex*, p. 516.
- 4. Sepals not greatly disparate in size at fruiting time; stigmas not tufted (5)
- 5(4). Branches appearing to emerge from internodes due to a brief coalescence of the lower parts of the branch and the stem internode; plants heathlike with very short internodes and minute leaves3. *Polygonella*, p. 519.
- 5. Branches emerging directly from nodes (6)
- 6(5). Flowers not in terminal spikelike or racemelike inflorescences or if so then a joint (zone of abscission) present between blade and petiole or else the plants vinelike4. *Polygonum*, p. 519.
- 6. Flowers in terminal spikelike or narrowly racemelike inflorescences; blades never jointed to petioles; styles never indurate and persistent or if so less than 0.5 mm. long; plants often aquatic or semiaquatic, never vinelike5. *Persicaria*, p. 523.

I. ERIOGONUM MICHX.⁴⁷ WILD BUCKWHEAT

Annual, biennial or perennial herbs, subshrubs or shrubs, with basal or cauline alternate exstipulate entire leaves; inflorescences simple to compound, umbellate, cymose or racemose, subtended by scalelike or foliaceous whorled bracts; perianth white, red, purple or yellow, glabrous to glandular or pubescent, 6-merous in two whorls of threes, stipitate or not stipitate on pedicels that exert the flowers from the sessile or peduncled

⁴⁷ Contributed by James L. Reveal.

turbinate to campanulate 4- to usually 5- or 10-lobed or -toothed involucre; stamens 9, the filaments usually pilose at the base; achenes glabrous or tomentose, winged in some, 3-angled; embryos straight or curved in mealy endosperm.

About 225 species, mainly in western North America.

1. Plants perennial (Doubtful cases should be keyed under both alternatives) (2)
1. Plants annual or biennial (16)
- 2(1). Perianth stipitate (3)
2. Perianth not stipitate (5)
- 3(2). Plants tall and erect, leafy; perianth and achenes densely white- to silvery-tomentose; throughout much of Texas 6. *E. longifolium*.
3. Plants low and spreading; bracts foliaceous; perianth sparsely pubescent; achenes glabrous or only sparsely pubescent (4)
- 4(3). Perianth cream-color to greenish-white, often becoming pinkish-orange in fruit; north and west Texas 7. *E. Jamesii*.
4. Perianth bright-yellow or greenish-yellow; Texas Panhandle 8. *E. Correllii*.
- 5(2). Perianth glabrous externally (6)
5. Perianth not glabrous externally (11)
- 6(5). Tall erect herbs; achenes not winged, 4-9 mm. long (7)
6. Low spreading subshrubs; achenes not winged, less than 4 mm. long (8)
- 7(6). Plants from deep taproots, the roots often chambered; leaves glabrous except for the midveins and margins; achenes winged the entire length, 5-9 mm. long; north and west Texas 1. *E. alatum*.
7. Plants from branching woody spreading caudices; leaves strigose on both surfaces; achenes winged at the apices, 4-6 mm. long; central Texas 2. *E. Nealleyi*.
- 8(6). Calyx segments similar (9)
8. Calyx segments dissimilar (10)
- 9(8). Leaves 5-20 mm. wide, subglabrous to glabrous above; inflorescences cymose; northwest Texas 11. *E. Fendlerianum*.
9. Leaves 1-3 mm. wide, densely tomentose above and below; inflorescences racemose; west Texas 12. *E. Wrightii*.
- 10(8). Leaves oblanceolate, finely silky-pubescent; involucre deeply 6-lobed; rare, west Texas 13. *E. suffruticosum*.
10. Leaves elliptic to deltoid or orbicular, densely tomentose; involucre shallowly 5-lobed; common, west and central Texas 17. *E. tenellum*.
- 11(5). Plants glandular with hirsute hairs; perianth strigose; rare, south Texas 5. *E. Greggii*.
11. Plants not glandular or with hirsute hairs (12)
- 12(11). Perianth sparsely white-pilose externally (13)
12. Perianth densely white- or silvery-pubescent externally (15)
- 13(12). Stems glabrous; perianth white, sparsely pubescent externally; central Texas .. 2. *E. Nealleyi*.
13. Stems strigose or woolly; perianth yellow or maroon, usually conspicuously pubescent (14)
- 14(13). Perianth yellow; west Texas 3. *E. hieracifolium*.
14. Perianth maroon to reddish-purple; Chisos Mts., west Texas 4. *E. hemipterum*.
- 15(12). Stems tomentose; involucre 3-4 mm. long; inflorescences sparsely branched; north Texas 9. *E. lachnogynum*.
15. Stems glabrous; involucre 1.5-2.5 mm. long; inflorescences of several branches; west Texas 10. *E. Havardii*.

- 16(1). Stems leafless, glabrous; outer calyx segments fan-shaped; mainly west Texas
 19. *E. rotundifolium*.
16. Stems leafy, tomentose or nearly so (17)
- 17(16). Perianth white-pubescent internally; plants to 10 dm. high or more (18)
17. Perianth glabrous internally; plants mostly less than 5 dm. high; west Texas (19)
- 18(17). Outer calyx segments obovate; involucre 2.5-4 mm. long, densely tomentose; throughout most Texas except for the coastal region
 14. *E. annuum*.
18. Outer calyx segments oblong-cordate; involucre 2-2.5 mm. long, glabrous to sparsely tomentose; mainly central and east Texas 15. *E. multiflorum*.
- 19(17). Involucres sessile and closely appressed to the stems, the lobes erect; outer calyx segments fan-shaped 16. *E. polycladon*.
19. Involucres often peduncled, the lobes long and reflexed at maturity; outer calyx segments orbicular-cordate 18. *E. Abertianum*.

1. *Eriogonum alatum* Torr. Short-lived monocarpic perennial herb from stout chambered taproots, strigose, sparsely so to glabrous above, 5-20 dm. high; leaves basal and cauline; basal leaves linear-lanceolate to lanceolate or oblanceolate, 5-15 cm. long, 3-15 mm. wide, glabrous except for the strigose margins and midveins, the petioles often winged or margined and 2-5 cm. long, the rosettes persistent for 2 to 5 years; cauline leaves 1-6 cm. long, becoming reduced above; stems erect, 3-10 dm. high; inflorescences paniculate cymes 2-10 dm. long; involucre campanulate, strigose, 2-4 mm. long and wide; perianth yellowish, 1.5-2.5 mm. long in anthesis; calyx segments lanceolate, becoming 3-6 mm. long in fruit and often reddish; achenes reddish-brown, 5-9 mm. long, 3-winged the entire length, exserted. *E. triste* Wats. On open grasslands in the low mts. of w. Tex., June-Sept.; n.e. Mex. to n.w. Neb., w. to Ariz. and Ut.

Var. *glabriusculum* Torr. Erect plants 1-2 m. high; inflorescences and involucre glabrous or nearly so, 2-6.5 dm. long. On open grasslands in the Panhandle of n. Tex., May-Nov.; n. Tex. and cen. Okla.

2. *Eriogonum Nealleyi* Coult. Erect perennial herb, 5-12 dm. high, from branched woody spreading caudices, glabrous nearly throughout; leaves basal and cauline; basal leaves oblanceolate to spatulate, strigose on both surfaces, to 8 cm. long, 5-15 mm. wide, the petioles slightly winged and 1-2.5 cm. long; cauline leaves few or absent and highly reduced, oblanceolate, to 4 cm. long, 3-8 mm. wide; inflorescences open paniculated cymes; peduncles 1-8 cm. long, erect or ascending; involucre broadly turbinate to campanulate, 2-3 mm. long, 2-4 mm. wide; perianth white, 1.5-2 mm. long in anthesis, glabrous or sparsely strigose externally; calyx segments elliptic to oblong, becoming 2.5-3 mm. long in fruit and pink or reddish; achenes reddish-brown, 4-6 mm. long, winged at the apices, exserted. Infrequent and locally common on rocky or gravelly soils in open grasslands of cen. Tex., Aug.-Sept.; endemic.

3. *Eriogonum hieracifolium* Benth. Tall erect perennial herb to 7 dm. high, from branched woody caudices, strigose or woolly nearly throughout; leaves basal and cauline; basal leaves oblanceolate to spatulate, 3-15 cm. long, 5-20 mm. wide, sparsely to densely strigose, the petioles 5-50 mm. long; cauline leaves few, 1-7 cm. long, 3-10 mm. wide; inflorescences open paniculated cymes; peduncles 5-30 mm. long, slender, erect; involucre campanulate, 2.5-4 mm. long, 2.5-5 mm. wide; perianth yellow, 1.5-2.5 mm. long in anthesis, white-pilose externally; calyx segments narrowly ovate, becoming 3-5 mm. long in fruit and often reddish; achenes brownish- or yellowish-green, 4-6 mm. long, the upper half winged, exserted. *E. pannosum* Woot. & Standl. Open areas in grasslands and pinyon woodlands in the low mts. of w. Tex., June-Oct.; w. Tex. across N.M. to e. Ariz.

4. *Eriogonum hemipterum* (T. & G.) S. Stokes. Erect perennial herb, 2-6 dm. high, with branched woody caudices, strigose nearly throughout; leaves basal and cauline; basal leaves oblanceolate to elliptic or spatulate, strigose, 2-7 cm. long, 5-15 mm. wide, the petioles winged and 5-30 mm. long; cauline leaves few, 1.5-5 cm. long, 2-9 mm. wide, reduced above; inflorescences open paniculate cymes; peduncles 5-30 mm. long, slender and erect; involucre broadly turbinate to campanulate, 2-4 mm. long, 1.5-4 mm. wide; perianth red to reddish-purple or maroon, 1.5-2.5 mm. long in anthesis, be-

coming 2.5-3.5 mm. long in fruit, strigose externally, the calyx segments spatulate to obovate; achenes reddish-brown, 3.5-5 mm. long, upper third winged, exserted. *E. hieracifolium* f. *atropurpureum* Standl. Locally common on loamy soils in heavy shrub growth in the canyons of the Chisos Mts., Brewster Co., June-Nov.; w. Tex. and adj. Coah. in the n. Sierra del Carmen.

5. *Eriogonum Greggii* T. & G. Erect perennial herb. 1-4 dm. high, from branched caudices, glandular-pubescent with tack-shaped glands scattered among hirsute hairs nearly throughout; leaves basal and at the nodes; basal leaves broadly spatulate, glabrous except for the ciliate margins and midribs or uniformly stipitate-glandular, to 1 dm. long, 5-20 mm. wide, gradually tapering to broad petioles; cauline leaves oblanceolate to obovate or spatulate, 3 to 10 per node, 5-40 mm. long, 2-15 mm. wide; inflorescences cymose and often with one side suppressed, branching 3 to 15 times; peduncles 1-7 cm. long, slender, erect or ascending; involucre broadly campanulate, 1.5-3 mm. long, 3-5 mm. wide, strigose and glandular; perianth reddish to reddish-brown, 1.5-2 mm. long in anthesis, becoming 2.5-3.5 mm. long in fruit, strigose externally, the calyx segments oblong to lanceolate; achenes reddish-brown, 3-4 mm. long, the beaks slightly winged, exserted. Locally common on plains and grasslands, known in Tex. only from Hidalgo Co.; extreme s. Tex. to N.L. and Coah.

6. *Eriogonum longifolium* Nutt. Tall erect leafy perennial herbs 1-2 m. high, the stems sparsely pubescent or more commonly glabrous; basal leaves oblong to lanceolate or oblanceolate, 1-2 dm. long, 1-3 cm. wide, thinly pubescent below, nearly or quite glabrous above, the petioles 4-10 cm. long and winged at the base; cauline leaves similar to the basal ones only more reduced and sessile; inflorescences paniculate cymes, about one half the length of the plants with numerous branches, glabrous or nearly so; peduncles (when present) to 3 cm. long, erect; involucre turbinate to turbinate-campanulate, 4-6 mm. long, 2.5-4 mm. wide; pedicels 5-10 mm. long; perianth stipitate, densely white- to silvery-pubescent externally, yellow and glabrous internally, 4-5 mm. long in anthesis; calyx segments lanceolate to oblong-lanceolate, the segments becoming narrower and the perianth (including the stipe) 5-8 mm. long in fruit; achenes 4-4.5 mm. long, densely white-tomentose. Incl. var. *plantagineum* Engelm. & Gray, *E. vespinum* Shinn. On sandy soil mainly on the edges of pine and oak woodlands throughout much of e. Tex., June-Aug.; s. Mo. and n. Ark., e. Okla. and e. Tex. to w. La.; morphologically grading into var. *Harperi* (Goodm.) Reveal in n.w. Ala., var. *gnaphalifolium* Gand in cen. Fla., and the following variety.

Var. *Lindheimeri* Gand. Plants 3-20 dm. tall, the stems pubescent nearly throughout; leaves shorter, the basal leaf blades 0.5-1.8 cm. long, 3-25 mm. wide, densely tomentose below, subglabrous to tomentose above, with petioles to 7 cm. long; inflorescences of few to several branches, about one third the length of the plant; peduncles (when present) to 6 mm. long; involucre mostly campanulate, 4-6 mm. long, 3-6 mm. wide, with pedicels 4-8 mm. long; achenes 4-6 mm. long. Incl. subsp. *diffusum* S. Stokes, *E. texanum* Scheele, *E. texanum* Coult. & Fish., *E. cortaceum* Coult. & Fish. On calcareous clay or sandy soils throughout much of the n.e. part of the Panhandle and w. Tex., e. to cen. Tex., June-Oct.; cen. Kan. and w. Okla. to Tex.

7. *Eriogonum Jamesii* Benth. Erect perennial herb from freely branching woody spreading caudices; leaves mainly basal, 1.5-5 cm. long, 1-2.5 cm. wide, oblong or elliptic to oval or suborbicular, densely whitish- or greenish-tomentose below, finely tomentose to glabrate and green above, the petioles about as long as or longer than the leaf blades; flowering stems 1-3 dm. high, tomentose; inflorescences cymose, with foliaceous bracts similar to the basal leaves only highly reduced; involucre turbinate, 3-7 mm. long, 3-5 mm. wide, with 5 to 8 shallow lobes, tomentose; perianth greenish-white to cream, often becoming pinkish-orange in fruit, 3-6 mm. long, the stipe 1-2 mm. long, the calyx segments broadly oblong to obovate and pubescent externally; achenes brown, 2-3 mm. long, sparsely pubescent at the apices. On dry plains and hillsides in the w. part of the Panhandle, becoming more frequent in the low mts. of w. Tex., July-Oct.; s. Colo. and Kan. to n. Mex., w. to Ariz.

Var. *undulatum* (Benth.) S. Stokes. Plants spreading and forming large mats, 1-2.5 dm. high and to 1 m. across; leaves 1-2.5 cm. long, the margins crispate. *E. undulatum* Benth. On dry talus slopes in the Chisos Mts. of w. Tex., July-Oct.; w. Tex. and n.e. Mex.

8. *Eriogonum Correllii* Reveal. Robust erect perennial herb from large woody caudices; leaves basal, lanceolate to oblong, 4-15 cm. long, 1-3.5 cm. wide, densely white-tomentose below, sparsely tomentose to glabrous and green above, the pubescent petioles 4-10 cm. long; flowering stems tomentose, 2-4 dm. high; inflorescences cymose, with large foliaceous bracts that become reduced above; involucre turbinate to campanulate, 3-5 mm. long, 2-4 mm. wide, with 5 to 7 shallow lobes, tomentose; perianth yellow or greenish-yellow, 3-7 mm. long, the stipe 1-2 mm. long, pubescent externally; calyx segments dissimilar, the outer whorl of segments 3-5 mm. long and to 2 mm. wide, the inner segments 4-7 mm. long and to 3 mm. wide in fruit; achenes brown, 3.5-6 mm. long, sparsely pubescent at the apices. *E. Jamesii* var. *flavescens* of Tex. ref. On clay mounds, caprock and in protected areas on rocky ledges, locally common in the Panhandle of n. Tex., July-Oct.; endemic.

9. *Eriogonum lachnogynum* Torr. Erect perennial herb, 1-3.5 dm. high, with branching woody matted caudices; stems grayish-tomentose, 1-2 dm. long; leaves basal, lanceolate to oblanceolate or narrowly elliptic, 1-3 cm. long, 3-5 mm. wide, densely white- or silvery-tomentose, the petioles 5-25 mm. long; inflorescences short, subcapitate to cymose or somewhat umbellate, to 6 cm. long; peduncles 2-15 mm. long, tomentose; involucre campanulate, 3-4 mm. long, sessile or peduncled; perianth yellow internally, densely pubescent with abundant short white hairs externally, 2.5-4 mm. long in anthesis, becoming 3.5-4.5 mm. long in fruit, the calyx segments lanceolate; achenes brown under the dense white tomentose hairs, 3-4 mm. long. *E. tetraeuris* Small. On sandy to gravelly or clay soils in the n. Panhandle of Tex., June-Sept.; e. Colo. and Kan., s. to n. Tex. and N.M., w. to extreme e. Ariz.

10. *Eriogonum Havardii* Wats. Erect perennial herb 3-6 dm. high, with branched woody caudices; stems glabrous except among the leaves, 5-25 cm. long; leaves basal, narrowly elliptic to oblanceolate, 1-5 cm. long, 2-10 mm. wide, densely white- or silvery-tomentose, the petioles 5-20 mm. long; inflorescences cymose, glabrous, 1-4 dm. long; peduncles 5-60 mm. long, slender, erect; involucre campanulate, 1.5-2.5 mm. long, 2-3 mm. wide; perianth yellow internally, densely pubescent with abundant short white hairs externally, becoming 2.5-3 mm. long in fruit; achenes brown, glabrous, 2-2.5 mm. long. *E. leucophyllum* Woot. & Standl. On gravelly, rocky or slate soils derived from limestone in the low mts. of w. Tex., June-Sept.; also s.e. N.M.

11. *Eriogonum Fendlerianum* (Benth.) Small. Subshrubby perennial, 1.5-4 dm. high; leaves on the lower two thirds of the plants, lanceolate to elliptic, 2-4 cm. long, 5-20 mm. wide, densely white-tomentose below, subglabrous to glabrous and green above, the petioles 5-20 mm. long; lower stems tomentose among the leaves, subglabrous to glabrous above; inflorescences cymose, open; involucre sessile along the branches, peduncled for 1-5 mm. in the forks of the branches, turbinate, 2.5-4 mm. long, 1.5-3.5 mm. wide; perianth white, 2.5-4 mm. long, the calyx segments elliptic to oblong; achenes brown, 2-2.5 mm. long. *E. Ainsliei* Woot. & Standl. On sandy to gravelly or clay soils in n.w. Tex., July-Sept.; s.w. Colo. and adj. n. N.M. to Tex.

12. *Eriogonum Wrightii* Torr. Low highly branched and spreading perennial subshrub from branched woody caudices, 1.5-4 dm. high; leaves on the lower half of the plants, crowded, oblanceolate to elliptic, 5-15 mm. long, 2-5 mm. wide, entire or crenulate, densely white-tomentose above and below or subglabrous and green above, the petioles 2-5 mm. long; flowering stems several, tomentose or rarely glabrous, to 3 dm. long; inflorescences racemose, 5-30 cm. long; involucre turbinate, 2-2.5 mm. long, tomentose, solitary; perianth white, 2.5-3.5 mm. long, the calyx segments obovate; achenes brown, 2.5-3 mm. long. On rocky slopes in the low mts. of w. Tex., July-Sept.; w. Tex. and adj. n. Mex. to Ariz. with several vars. along the Pac. Coast.

13. *Eriogonum suffruticosum* Wats. Low spreading highly branched perennial subshrub from branching woody caudices, 1-2 dm. high; leaves tufted at the ends of the branches, elliptic, revolute, 5-8 mm. long, 1-2.5 mm. wide, silky-tomentose, the petioles 1-2 mm. long; flowering stems 1-3 cm. long; inflorescences cymose, to 1 cm. long; involucre campanulate, 2-3 mm. long, tomentose, the deeply divided 6 lobes 1-1.5 mm. long and spreading outwardly to become reflexed; perianth white to yellowish-white with large reddish to maroon midribs; calyx segments dissimilar, the outer whorl of segments

fan-shaped and 2-4 mm. long and wide, the inner segments oblanceolate and 3.5-6 mm. long, becoming erect in fruit; achenes light-brown, 3-3.5 mm. long. On rocky slopes in the low mts. of w. Tex., rare, Apr.-May; endemic.

14. *Eriogonum annuum* Nutt. Tall leafy biennial or late-flowering annual herb, 5-20 dm. high, floccose to densely white-tomentose nearly throughout; leaves mostly on the lower three fourths of the plant, alternate, oblong to oblanceolate, to 7 cm. long, 3-15 mm. wide, rarely revolute in some, densely tomentose below, less so above, the petioles mostly less than 5 mm. long; inflorescences open cymes or umbels, rarely compacted cymes; involucre turbinate to campanulate, 2.5-4 mm. long, 2-3 mm. wide, on short stout peduncles less than 5 mm. long or sessile, densely tomentose; perianth white to rose, maturing to dark-red-brown, 1-2 mm. long, glabrous externally, densely long-white-pubescent externally; calyx segments dissimilar, the outer whorl of segments obovate, the inner segments narrowly ovate to oblong; achenes brown, 1.5-2 mm. long, glabrous or sometimes tangled in the pubescence of the perianth so as to appear to be pubescent. *E. Lindheimerianum* Scheele, *E. cymosum* Benth. On sandy to gravelly soils in open grasslands or more commonly in disturbed places in fields and along highways throughout most of Tex. except for the immediate Gulf Coastal Plains, Apr.-Nov.; s. Mont. and N.D. to n.e. Mex.

15. *Eriogonum multiflorum* Benth. Tall leafy annual (probably biennial) herb, 5-20 dm. high, floccose to whitish- or brownish-tomentose nearly throughout; leaves mostly on the lower three fourths of the plant, lanceolate or oblanceolate to elliptic or ovate, to 4 cm. long, 4-15 mm. wide, entire or some undulate or even revolute, densely tomentose below, floccose above, sessile or short-petioled; inflorescences short, rather compact, cymose; involucre turbinate, 2-2.5 mm. long and wide, on short stoutish peduncles less than 4 mm. long or sessile, glabrous to sparsely tomentose; perianth white, maturing tan with large red-brown to brown midribs, 1.5-2 mm. long, glabrous externally, sparsely white-tomentose internally; calyx segments dissimilar, the outer whorl of segments oblong-cordate and 1.5-2 mm. long and wide, the inner segments oblong to lanceolate; achenes brown, 1.5-2 mm. long, glabrous. On sandy to gravelly soils in oak or pine forests and woodlands, or occasionally in open places throughout most of cen. and e. Tex., (Apr.) Sept.-Nov.; s.e. Okla. and Tex. to La. and n.e. Mex.

16. *Eriogonum polycladon* Benth. Erect annual herb, 1-6 dm. high, densely white-tomentose nearly throughout; leaves cauline, narrowly oblanceolate to broadly elliptic, 1-3 cm. long, 5-15 mm. wide, the petioles 3-10 mm. long; inflorescences narrow, strict, cymose, more than half the length of the plant; involucre sessile, appressed to the stems, prismatic, 1.5-2.5 mm. long, tomentose to glabrous; perianth white to pink, 1.5-2 mm. long; calyx segments dissimilar, the outer segments broadly fan-shaped and 1-1.5 mm. wide, the inner segments narrowly lanceolate to narrowly oblong and 0.4-0.6 mm. wide; achenes dark-brown, 1-1.3 mm. long. On sandy to gravelly soil in w. Tex., July-Oct.; Tex. and n. Mex. to Ariz. and s. Ut.

17. *Eriogonum tenellum* Torr. Erect perennial herb from branched woody caudexes, the stems to 5 dm. high, glabrous and glaucous; leaves strictly basal, matted, elliptic to ovate or orbicular, 3-15 mm. long, 3-10 mm. wide, densely grayish- or whitish-tomentose, the petioles 4-20 mm. long; inflorescences of erect dichotomous branches, spreading in the crown; peduncles 5-60 mm. long, slender, erect; involucre turbinate, 2-4 mm. long, 1.5-3 mm. wide; perianth white or pink, 1.5-2.5 mm. long in anthesis, becoming 3-3.5 mm. long in fruit; calyx segments dissimilar, the outer whorl of segments ovate to obovate or suborbicular and 2 mm. wide, the inner segments narrowly oblong and 0.5-1 mm. wide, shorter than the outer segments; achenes brown, 2-3 mm. long. Incl. var. *leptocladon* Benth. On rocky slopes, ledges or crevices, or on open rock outcrops in grasslands in w. Tex., June-Oct.; e. Colo. to n.e. Mex.

Var. *ramosissimum* Benth. Leaves elliptic to deltoid, densely sheathing up the stems to 15 cm.; leaf blades 3-12 mm. long, 2-7 mm. wide; inflorescences open, usually with several slender branches; plants subcespitose. *E. tenellum* var. *caulescens* T. & G. On granite ledges and crevices in flat outcrops in cen. Tex., June-Sept.; endemic.

Var. *platyphyllum* (Torr.) Torr. Leaves ovate to suborbicular or orbicular, sheathing up the stems to 2 dm. and often at the lower nodes; leaf blades to 3 cm. long and wide;

inflorescences open, with few branches; plants often subshrubby, 2-6 dm. high. *E. platyphyllum* Torr. On gravelly to rocky soils or on rocky ledges in w. Tex., July-Oct.; w. Tex. and n.e. Mex.

18. *Eriogonum Abertianum* Torr. Profusely branched spreading or erect annual herb with few to several appressed-hirsute stems to 5 dm. long; leaves basal and cauline, all loosely villous to hoary pubescent; basal leaves ovate to oblong, 1-4 cm. long, 1-3 cm. wide, the petioles to 6 cm. long; cauline leaves obovate-lanceolate to linear, sessile or nearly so; peduncles (when present) to 6 cm. long, hirsute; involucre broadly campanulate, the tubes 2-3 mm. long, with 5 oblong lobes 4-6 mm. long and 1-2 mm. wide, reflexed at maturity, villous-canescens; perianth white to pale-yellow, often becoming tinged with rose or reddish, 3-4.5 mm. long; calyx segments dissimilar, the outer whorl of segments orbicular-cordate and 3-4 mm. long and wide, the inner segments spatulate to lanceolate and 0.7-1.2 mm. wide and 3-4.5 mm. long; achenes dark-brown, 0.6-1 mm. long. Incl. var. *neomexicanum* Gand., *E. cyclosepalum* Greene, *E. lappulaceum* Greene, *E. pinetorum* Greene. On sandy to gravelly flats or slopes in open grasslands and occasionally along the highways in w. Tex., flowering the year around but mainly from Mar.-Nov.; w. Tex. to s. Ariz., s. to cen. Mex.

Exceedingly variable in size and dimensions of all parts and in the amount of pubescence; the kind of plant depending upon the local environment and the time of the year the collection is made.

19. *Eriogonum rotundifolium* Benth. Spreading annual herb to 4 dm. high and to 1 m. across, glabrous and glaucous nearly throughout; leaves basal, orbicular or cordate, 1-2 cm. long, 15-25 mm. wide, densely white-tomentose below, subglabrous and green above, the petioles 1.5-4 cm. long; inflorescences open to densely branched cymes, with the several branches arising from near the base of the plant and spreading outwards to form low flat-topped crowns; peduncles stoutish, 3-15 mm. long, erect; involucre turbinate to campanulate, 1-2 mm. long, 1.5-2.5 mm. wide; perianth white, maturing brownish-white or rose to red, 1-2 mm. long; calyx segments dissimilar, the outer whorl of segments flabellate, the inner segments lanceolate, the perianth tube often dark brown; achenes dark-brown, 1.5-2 mm. long. Incl. var. *angustum* Goodm. On sandy to gravelly soils in grasslands or occasionally along the highways in w. Tex., with an outlying population in Knox Co., Mar.-Oct.; w. Tex. and n. Mex. to e. Ariz.

In Gould's *Texas Plants* (1962), the following species of *Eriogonum* were attributed to the state: *E. arcuatum* Greene, a synonym of *E. Jamesii* var. *flavescens* Wats. of New Mexico and Arizona north into Utah and Colorado; *E. atrorubens* Engelm., a species restricted to northern Mexico; *E. cernuum* Nutt., a widespread species but as yet apparently not actually represented from Texas; *E. racemosum* Nutt., a species that occurs from New Mexico and Colorado westward to California, but not expected to be in Texas.

2. RUMEX L.⁴⁸ DOCK

Annual or perennial herbs; leaves alternate, flat, undulate or crisped, narrowed to cordate or auricled at base; ocreae thin, brittle, often brownish; flowers greenish, on pedicels that are jointed to and terminate short peduncles, in distant or approximate whorls disposed usually in elongate panicles; sepals 6, the inner 3 usually developing entire, toothed or spiny wings one or each of which usually bears a grainlike tubercle, in fruit greatly increasing in size compared to their size at anthesis and erect and usually loosely coherent to the achene (called *valves* in fruit); the 3 outer sepals much smaller than the inner ones, usually lanceolate or subulate and slightly spreading or arcuate; stamens 6; ovary sessile; styles 3, the stigmas peltate and tufted; achene trigonous.

About 200 species widespread in the world. The sap usually is quite acid and in some species has been used in tanning leather, especially the "canaigre," *R. hymenosepalus*.

1. Flowers unisexual or polygamous; leaves usually hastately lobed (2)

1. Flowers usually bisexual; leaves never hastately lobed (3)

⁴⁸ Adapted partly from K. H. Rechinger, Jr. in *Field Mus. Nat. Hist., Bot. Ser.* 17(1): 1-151. 1937.

- 2(1). Valves (inner sepals) not larger than the achenes . . . 1. *R. Acetosella*.
- 2. Valves distinctly overtopping the achene 2. *R. hastatulus*.
- 3(1). Stems erect, ascending or procumbent; axillary shoots present (4)
- 3. Stems usually erect; axillary shoots absent (8)
- 4(3). Pedicels (2) 2.5 to 5 times as long as the valves . . . 3. *R. verticillatus*.
- 4. Pedicels at most twice as long as the valves (5)
- 5(4). Valves 7-8 mm. long, 8-12 mm. broad 4. *R. spiralis*.
- 5. Valves much smaller (6)
- 6(5). Leaves ovate-lanceolate, broadest below the middle; valves more than 4.5 mm. long 5. *R. altissimus*.
- 6. Leaves usually narrower, lanceolate or linear-lanceolate, if exceptionally broad then the fruits much smaller (7)
- 7(6). Leaves small and thickish, in the dry state olive-green, often undulate, somewhat obtuse, with strongly prominent nerves beneath; panicles interrupted, most whorls remote 6. *R. chrysocarpus*.
- 7. Leaves larger, rather thin, in the dry state pale-green, acute; nerves scarcely prominent; fruiting panicle not interrupted or only in the lower part 7. *R. mexicanus*.
- 8(3). Valves not tuberculate and as measured (including the basal lobes) altogether about 14 mm. long, 11 mm. broad or more 8. *R. hymenosepalus*.
- 8. At least one of the valves bearing a tubercle dorsally (9)
- 9(8). Valves entire-margined (10)
- 9. Valves denticulate (11)
- 10(9). Leaves small, flat and truncate; valves very small, scarcely broader than the thick grains; whorls remote and nearly all with bracteal leaves 10. *R. conglomeratus*.
- 10. Leaves large, somewhat crisped or undulate, often narrowed at base, seldom truncate; valves (3.5-) 5-6 mm. long; only the lower whorls with bracteal leaves and occasionally remote 9. *R. crispus*.
- 11(9). Perennial; basal leaves at most 2.5 times as long as broad, cordate at base 11. *R. pulcher*.
- 11. Plant annual or biennial; basal leaves 3 times as long as broad 12. *R. violascens*.

1. *Rumex Acetosella* L. SHEEP SORREL. Perennial herb, low and slender; leaves linear to lanceolate, hastate; flowers usually unisexual, occasionally polygamous; valves entire, not enlarged after anthesis, not longer than the achene and without tubercles dorsally. *Acetosella Acetosella* (L.) Small. Rare in waste places, near railroads, cen. Tex. and perhaps elsewhere, probably not a persistent member of our flora, spring; Euras. weed, now widely adv.

2. *Rumex hastatulus* Ell. HEART SORREL. Perennial herb, 15-80 cm. tall, slender, erect; leaves pale-green, often crowded near the base, the basal ones 2-10 cm. long and 3-18 mm. broad, lanceolate to oblong-linear or usually with a hastate bladelike portion and a long narrow basal portion; inflorescence leafless, narrow; flowers unisexual; valves 2.5-3 mm. long, 2.7-3.2 mm. broad, longer than the achene, not tuberculate; achene 0.9-1 mm. long, 0.6-0.7 mm. thick. *R. Engelmannii* Meisn. Very abundant in open sandy ground in e., s.e. and n.-cen. Tex., spring; Gulf States, n. to N.C., Ill., Mo. and Okla., a waif even farther n. The name, through error, has sometimes been spelled "*hastulatus*."

3. *Rumex verticillatus* L. SWAMP DOCK. Perennial herb; stems erect, 4-10 dm. tall, slender, commonly purplish; basal leaves linear-lanceolate, 5 to 7 times as long as broad; cauline leaves narrowly linear-lanceolate, 6 to 9 times as long as broad; fruiting pedicels (2) 2.5 to 5 times as long as the valves; valves at maturity 4-5 mm. long, 2.5-4 mm. broad, each dorsomedially with a pronounced tubercle. Infrequent in low ground, often wet meadows, s.e. Tex., spring; s.e. Can. and e. U.S., w. to Mo., Ark. and Tex.

4. *Rumex spiralis* Small. Perennial herb from creeping rootstocks; stems erect, usually purplish, to 1 m. tall; leaves of lower part of stem ovate to oblong-lanceolate, 10-15 cm. long, 35-55 mm. broad, 2.5 to 5 times as long as broad; pedicels (2-) 3-5 mm. long, even in fruit shorter than the valves; valves 7-8 mm. long, 8-12 mm. broad, somewhat cordate, each dorsomedially with a pronounced tubercle. Local in poorly drained or seasonally moist calcareous clay soil, Rio Grande Plains, spring; endemic.

5. *Rumex altissimus* Wood. PALE DOCK. Perennial herb; stems erect or basally procumbent, to 8 dm. tall; leaves of lower part of stem broadly ovate-lanceolate to oblong-lanceolate, 12-18 cm. long, 40-55 mm. broad, 2.5 to 4 times as long as broad; leaves of upper part of stem smaller; inflorescences rather crowded; valves 4.5-6 mm. long, 3-4 (-5) mm. broad, each with or without a dorsomedial tubercle or 1 with and 2 without; achene about 3 mm. long and 2 mm. broad. *R. ellipticus* Greene. Frequent in wet places, e. and n.-cen. Tex., Plains Country and parts of Edwards Plateau, spring; most of U.S. except Pac. States.

6. *Rumex chrysocarpus* Moris. AMAMASTLA. Perennial herb from creeping rootstocks; stems erect or basally procumbent, usually only 4-6 dm. tall, often reddish; leaves linear-lanceolate to oblong-linear, 5-12 cm. long, 3.5 to 5 times as long as broad, drying a rather dark olive-green; inflorescence usually interrupted, never leafy; valves dark-reddish-brown, tough, 3.5-4.5 mm. long, 3-4 mm. broad, triangular to rotund-triangular, each one dorsomedially with a pronounced tubercle; infructescence often crowded; achene 2.5-3 mm. long, 1.5-2 mm. broad. *R. Berlandieri* Meisn., *R. Langloisii* Small. Abundant in low seasonally wet places, s.e. Tex. and Rio Grande Plains, less frequent n. to n.-cen. Tex., Edwards Plateau and the Trans-Pecos, spring-summer; La., Tex., Tam., Ver. and Michoac.

7. *Rumex mexicanus* Meisn. Very similar to *R. chrysocarpus* but the inflorescences and infructescences more crowded; leaves larger, thinner and much paler green and more acute; valve 1.8-2.5 mm. long; achene only about 2 mm. long. *R. triangulivalvis* (Danser) Rech. f. Infrequent in the El Paso region in the Trans-Pecos, spring; Que. to B.C. and s. to Mo., Tex. and cen. Mex.

8. *Rumex hymenosepalus* Torr. CANAIGRE. Perennial herb with clusters of tuberous roots; stems erect, stout and coarse, 3-10 dm. tall; basal leaves oblong- to narrowly obovate-lanceolate, the stem leaves narrowly lanceolate; valves 14-15 mm. long (including the lateral lobes at base), 11-12 mm. broad, or even larger, never having dorsal tubercles, their texture thin-membranous; achene 4-5 mm. long. Locally abundant in the Trans-Pecos and sparingly e. on the Edwards Plateau and in the Plains Country, usually in deep sand, spring; Baja Calif., Calif., Nev., Wyo., Ariz., Colo., N.M., Chih. and Tex.

9. *Rumex crispus* L. YELLOW DOCK, CURLY DOCK. Perennial herb; stems straight, erect; leaves cuneate at base, wavy-margined; petiolar bases of leaves canaliculate on upper side; panicle elongate, the whorls usually dense and approximate, only the lower whorls (if any) with bracteal leaves; pedicels about 1.5 times as long as the valves; valves rotundly ovate, subcordate, marginally entire, each with a dorsomedial tubercle or occasionally only one of the valves tuberculate. Local in seasonally moist usually disturbed ground; n.-cen., e. and s.e. Tex., Edwards Plateau and Trans-Pecos, spring; a Euras. weed, now widely adv. in temp. areas.

10. *Rumex conglomeratus* Murr. Rather similar to *R. crispus*; lower leaves cordate at base, flat; branches of the panicle divergent, whorls of inflorescence each with a bracteal leaf, remote; pedicels usually not longer than the fruit; valves entire-margined, 2.5-3 mm. long, each with a large tubercle dorsally. Rare in wet sandy spots in e. Tex and perhaps elsewhere, probably not a persistent member of our flora, spring; nat. of Eur., now widely adv.

11. *Rumex pulcher* L. FIDDLE DOCK. Perennial herb; stems erect; lower leaves small, cordate at base, somewhat crisp marginally, often pubescent beneath; branches of the panicle very divergent, often intricately enmeshed at fruiting time; some of the whorls with bracteal leaves, all remote; pedicels thick, not longer than the fruit, jointed in the middle; valves denticulate-margined, 4.5-6 mm. long, 2.5-4.5 mm. broad, usually all dorsomedially tuberculate but the tubercles of disparate size even in the same flower; achenes 3-4 mm. long. Frequent and widespread in seasonally moist usually disturbed ground in e. half of Tex., spring; Medit. region, now widely adv. in warm-temp. regions.

Reports of *R. obtusifolius* L. in Texas are apparently based on misdetermined specimens

of *R. pulcher*. It differs from *R. pulcher* primarily in having its whorls of flowers mostly contiguous, its pedicels longer than the calyx in fruit, and its lower stem and lower petioles only slightly, not densely, pubescent.

12. *Rumex violascens* Rech. f. Annual or biennial or perhaps perennial at times; stems stoutish, to 8 dm. tall, often in the upper part more or less zigzag; basal leaves 3 times as long as broad, oblanceolate to elongate-obovate, the stem leaves smaller and proportionately narrower and longer; valves 2.5-3 mm. long, 2-3 mm. broad, marginally denticulate and each dorsomedially tuberculate but the tubercles often disparate in size in the same flower; achenes 1.7 mm. long. Locally frequent near El Paso in the Trans-Pecos, spring; Tex., N.M., Ariz., Calif., Son. and Coah.

3. POLYGONELLA MICHX.⁴⁹ JOINTWEEDS

Plants subherbaceous annuals or (suffrutescent) perennials from woody taproots; stems erect or prostrate; branches usually profuse, appearing internodal in origin because of a brief coalescence of the stem and branch internodes; leaves alternate; inflorescences racemelike; flowers small, usually bisexual; calyx petaloid, with 2 outer and 3 inner sepals; outer sepals enclosing the others in bud and often slightly accrescent, the inner ones distinctly accrescent; stamens 8 in 2 series, 3 inner and 5 outer, the inner ones opposite the 3 inner sepals and with filaments dilated abruptly above the base; achene trigonous. *Gonopyrum* Fisch. & Mey.; *Thysanella* Gray.

A genus of 8 species restricted to eastern and southern North America.

1. Subherbaceous annual; ocreae ciliate 3. *P. Parksii*.
1. Suffrutescent perennials; ocreae not ciliate (2)
- 2(1). Styles and stigmas 0.5-1 mm. long at anthesis; leaves about as thick as wide ...
..... 2. *P. americana*.
2. Styles and stigmas altogether only 0.1-0.13 mm. long at anthesis; leaves narrowly clavate to widely spatulate 1. *P. polygama*.

1. *Polygonella polygama* (Vent.) Engelm. & Gray. OCTOBER-FLOWER. Suffrutescent perennial from long woody taproots; leaves narrowly clavate to widely spatulate, (2.5-) 4-16.2 (-36) mm. long, (0.3-) 0.6-3.6 (-5) mm. broad, the margins hyaline at least along the apical half, obtuse at apex, cuneate at base; ocreae not ciliate; styles and stigmas altogether only 0.1-0.13 mm. long; achene and the calyx at maturity (1.3-) 1.4-1.8 (-2.1) mm. long. *P. brachystachya* Meisn. var. *lamtnigera* Fern., *P. Croomii* Chapm. Infrequent in loose sands, e. and s.e. Tex., June-Oct.; Coastal States, Va. to Tex.

2. *Polygonella americana* (Fisch. & Mey.) Small. Suffrutescent perennial from long woody taproots; leaves about as thick as wide, (4-) 5.2-12 (-19) mm. long 0.5-0.9 (-1.2) mm. broad, the margins not hyaline, frequently scarious and erose at apex; ocreae not ciliate; styles and stigmas together 0.5-1 mm. long; achene and calyx at maturity (2.5-) 3-3.6 (-4) mm. long. *P. ericoides* Engelm. & Gray, *Gonopyrum americanum* Fisch. & Mey. Local in loose sands of e., s.e. and n.-cen. Tex. and the Plains Country, summer; S.C., Ga., Ala., Mo., Ark., La., Tex., Okla. and N.M.

3. *Polygonella Parksii* Cory. Subherbaceous annual from woody taproots; young stems erect, 5-15 dm. tall; leaves linear, 1-15 mm. long, 0.3-0.8 mm. broad, obtuse at apex; ocreae with several awnlike bristles; achenes about 2 mm. long. Very rare and local in deep loose sands of Atascosa, Leon and Wilson cos., spring-summer; endemic.

4. POLYGONUM L.⁵⁰ KNOTWEED. SMARTWEED

Herbs or herbaceous-textured vines without tendrils; leaves alternate; petioles present but sometimes obscure and seeming to be incorporated into the sheathing stipules (ocreae); flowers on short pedicels, solitary or in small groups at the upper nodes, (the upper nodes in some species so crowded that a spikelike inflorescence results); calyx

⁴⁹ Adapted partly from James H. Horton in *Brittonia* 15: 177-203, 1963.

⁵⁰ Treatment of the first two species by Thomas R. Mertens.

5- or 6-parted, 3 of the sepals (only slightly if at all larger than the rest) exterior and usually covering the angles of the achene, usually white or pink; achene lenticular or trigonous.

A cosmopolitan genus of about 200 species.

1. Leaf blade and short petiole (to which the ocrea is united) separated by a joint or zone of abscission (2)
1. Leaf blade not jointed to petiole (7)
- 2(1). Strong perennials, often rhizomatous (3)
2. Taprooted annual or rarely weak perennials (4)
- 3(2). Leaves prominently striate-nerved and rigid 3. *P. striatulum*.
3. Leaves not prominently striate-nerved and not rigid . . . 4. *P. texense*.
- 4(2). Achenes dull to mildly shiny, mildly to coarsely striated, inequilaterally trigonous 1. *P. aviculare*.
4. Achenes generally smooth and shiny (5)
- 5(4). Achene in calyx about 3 mm. long, equilaterally trigonous, each face of achene being smooth, black and shiny but having striated margins; stems more or less 4-angled or very narrowly 4-winged below the ocreae . 6. *P. tenue*.
5. Achene entirely smooth, not black; angling of stem less pronounced (6)
- 6(5). Achene very shiny, reddish-brown at maturity, about 2 mm. long, trigonous with one face slightly broader than the other two; upper leaves reduced to minute bracts and upper internodes very short so that flowers are crowded in terminal spikelike clusters 5. *P. argyrocoleon*.
6. Achene mahogany-colored, equilaterally trigonous, sharp-angled, very mildly striate to smooth, shiny, 2-3 mm. long; closely appressed calyx characteristically yellowish-green, consisting of 6 sepals 2. *P. ramosissimum*.
- 7(1). Plants with erect or ascending stems, not at all vinelike; styles persistent, deflexed, hook- or hornlike, rigid, about 4 mm. long . . . 10. *P. virginianum*.
7. Plants vinelike or with long weak reclining stems; styles not rigid, persistent and elongate (8)
- 8(7). Stems 4-angled, weak and reclining, not twining (Sect. *Tracaulon*) 7. *P. sagittatum*.
8. Stems twining (9)
- 9(8). Calyx after anthesis becoming about 3.5 mm. long, closely investing the achene, the 3 outer sepals minutely keeled but never winged 9. *P. Convolvulus*.
9. Calyx after anthesis eventually about 6 mm. long, the 3 outer sepals with dorsomedial wings 0.25-1 mm. broad 8. *P. cristatum*.

1. *Polygonum aviculare* L., *sens. lat.* KNOTWEED. Taprooted annual or very weak perennial, very diverse in habit, either with an upright mainstem and ascending branches (when growing among dense herbaceous vegetation) or usually prostrate and rooting at the very numerous nodes (when on flat bare ground); leaves few to numerous, sparse to crowded; blades caducous or long-persistent, linear to usually narrowly oblong or narrowly elliptic, (2-) 3-15 (-25) mm. long, green, flat, without conspicuous nervation; flowers solitary or in 2's or 3's at some of the nodes, crowded or not; pedicels filiform, much shorter than the ocreae so that the flower and fruit are always erect; sepals 5 (calyx never opening, perhaps indicating cleistogamy), 3 of them exterior over the angles of the achene and 2 inner ones over 2 of the achene faces. Widespread but local nearly throughout Tex. (except extreme s.), May-Nov.; very widespread in temp. regions, perhaps originally nat. to Eur.

On the basis of achene and calyx characters 3 species in the *P. aviculare* aggregate may be differentiated as follows: (1) plants having achenes with 2 convex and 1 narrowly concave side are referred to *P. arenastrum* Bor.; achenes mildly striated, reddish-brown, about 2 mm. long; the persistent calyx covering the achene is divided for about half its

length; (2) plants designated as *P. buxiforme* Small have reddish-brown striated achenes 2-2.5 mm. long, cordate in shape, with 1 broad flat face and 2 more or less equal concave sides; the persistent perianth is divided for about two thirds its length and is characterized by having lateral papery margins or wings; (3) achenes of *P. aviculare* (*sens. str.*) are typically coarsely striated, dull, 2.5-3 mm. long and narrower, and less heart-shaped than those of *P. buxiforme*; the persistent perianth completely covers the achene, is divided almost to the base and lacks the lateral papery margins characteristic of *P. buxiforme*.

2. *Polygonum ramosissimum* Michx. Taprooted annual (in some situations the taproot becoming ligneous and as much as 1 cm. thick late in the season), rather variable in habit but (except in injured specimens) having only one ascending or usually erect mainstem near ground level, the whole plant (2-) 3-12 dm. tall and usually with numerous ascending or erect branches; leaf blades of midstem lanceolate or linear, (4-) 7-22 mm. long, green, flat, without conspicuous nervation, either persistent or falling, uppermost (bracteal) leaves with smaller blades, persistent or falling; flowers solitary or in 2's or 3's at the nodes of the upper 1-2 cm. of the stem and branches, not crowded; pedicels filiform, at least some of them on the plant at fruiting time long enough to bend over (i.e., exerted from ocreae) so that the yellowish-green fruiting calyx (which completely covers the achene) is drooping; sepals nearly always 6 (very rarely 5); achenes mahogany-colored, equilaterally trigonous, sharp-angled, mildly striate to smooth, usually shiny and 2-3 mm. long. Widespread though local over the state in seasonally wet low areas, absent only from the Rio Grande Plains, summer-fall; most of e. U.S. s. to Del., Pa., O., Ind., Ill., Mo., Tex. and N.M.

3. *Polygonum striatulum* Robins. Strongly perennial herb with woody crowns to 2 cm. thick and short; rhizomes 2-3 mm. thick; stems 2-4 (-5) dm. tall, numerous from the base, arcuate-ascending; lower blades nearly linear, 1-3 cm. long, acute at both ends, rather rigid, markedly longitudinally striate as viewed under a lens, many of them persistent even until fruiting time; upper leaves striate but mostly reduced to mere bracts, the blades 1-2 (-5) mm. long and linear, persistent; flowers erect, the pedicels included in the ocreae; calyx and achene much as in *P. texense*. Rare and local in Brooks and Kleberg cos. in coastal s. Tex., (Apr.-) May-July; endemic.

The name *P. camporum* Meisn. (or *P. brasiliense* Koch) has been applied to this species, apparently erroneously.

4. *Polygonum texense* M. C. Johnst. Perennial herb to 6 dm. tall, each shoot from a short reddish-brown fibrous (from ocreae remnants) caudex 2-3 (-10) mm. thick, usually (perhaps always) with brown rhizomes 2-3 mm. thick and with internodes to 4 cm. long; aerial shoots with solitary ascending stems 1-2 mm. thick from each crown, with some ascending branches at irregular intervals but usually unbranched in their distal halves or thirds; leaf blades of the innovations (emerging in April) lanceolate, 15-24 mm. long, 4-7 mm. broad, green, flat, without conspicuous nervation, blunt at apex, narrowed and with an abscission joint at base, falling by May; petiole about 2 mm. long, inconspicuous and appearing as part of the ocrea; ocreae 6-11 mm. long; lower part of ocrea strongly nerved and clasping the petiole, the upper part hyaline (except for the nerves) and with 3 acute lobes, eventually becoming shredded into fibers and lost; uppermost leaves reduced to bracts with subsistent blades 2-10 mm. long, those of the upper 2 to 10 cm. of stem usually less than 4 mm. long and quite inconspicuous; flowers solitary or in 2's or 3's at the upper nodes, erect or somewhat nodding; pedicels filiform, about 2 mm. long, almost all included in the lower part of the ocreolae; calyx about 2 mm. long, 5-parted to below the middle with the lobes broadly oblong, rounded at apex, white with some medial reddish or greenish markings and at anthesis spreading; achene 2-2.5 mm. long, ovoid in over all outline, in transection almost equilaterally triangular (one side, the one not furnished with an inner sepal, usually slightly smaller and more concave than the others), dark brown at maturity, rather lustrous. Infrequent in seasonally moist places on Edwards Plateau and s. part of Plains Country (Andrews, Crockett, Howard, Sutton and Val Verde cos.), summer-fall; endemic.

5. *Polygonum argyrocoleon* Kunze. Taprooted annual, the roots becoming ligneous toward fall and simulating the perennial habit; stems striate, erect with several ascending branches, the whole plant 2-5 dm. tall; upper parts of ocreae hyaline and long-lacerate;

petioles adnate to and as long as ocreae; blades jointed to petioles, green, membranous, at midstem lance-linear, 1-3 cm. long, narrowed to both ends; upper leaves reduced to minute bracts and the upper internodes shortened so that the flowers are crowded in terminal spikelike clusters 2-5 cm. long or more; calyx about 1.5 mm. long at anthesis, about 2 mm. long in fruit, divided nearly to base; achenes trigonous, reddish-brown, with one face broader than the others, about 2 mm. long, very lustrous. Infrequent or rare in seasonally moist places in w. Tex. (Brewster, Hudspeth, Pecos and Upton cos.), May-Oct.; nat. of Near and Middle East, now adv. in Calif. and Tex.

6. *Polygonum tenue* Michx. Slenderly taprooted annual, the roots and mainstems about 1-2 mm. thick; stems erect, somewhat branched, 2-3 (-4) dm. tall, stems (and branches) more or less 4-angled or very narrowly 4-winged below the ocreae which have 2 long subulate lobes; petiole as long as and adnate to ocrea; blade jointed to petiole, linear, 5-30 mm. long, 1 (-3) mm. broad; flowers solitary or in 2's (or 3's) at the upper nodes, nearly sessile, always erect; calyx about 3 mm. long; sepals 5; style 0.3-0.4 mm. long, 3-parted to near the base; achene triquetrous, about 3 mm. long, black, smooth and shiny at maturity, margin of face of achene characteristically dull and striate. Pollen of *P. tenue* is of the *Duravia*-type thus indicating that this species should be assigned to *Polygonum* Sect. *Duravia*. Rare in e. half (Denton and Gonzales cos.) of Tex., in sterile oak woods, Sept.-Nov.; e. half of U.S.

7. *Polygonum sagittatum* L. TEARTHUMB, ARROW-VINE. Basally stoloniferous or sub-rhizomatous, probably perennial; stems ascending, thin, weak and reclining or scandent, to 2 m. long, 4-angled and finely channeled, armed on the angles with minute recurved prickles; leaf blades lanceolate or broadly so, 1-12 cm. long, sagittate-cordate basally, apically acute; petioles long in lower leaves, short in upper ones; inflorescences terminal and axillary (a very small tight head of white or pale-pink flowers on a very long peduncle longer than leaves); calyx 5-parted; stamens 8; achene triquetrous, 3-3.5 mm. long, black or brownish, smooth. *Tracaulon sagittatum* (L.) Small. Infrequent at margins of lakes, swamps, marshes and bogs in e. Tex., June-Oct.; Nfld. to Sask., s. to Fla. and Tex.

The related species *P. Meisnerianum* Cham. & Schlecht. has repeatedly dichotomously branched peduncles and the bases of the blades are nearly sessile and only very shallowly (if at all) cordate; it has been reported to occur in Texas, but we have seen no specimens.

8. *Polygonum cristatum* Engelm. & Gray. Short-lived perennial vine (flowering first year); stems annual, twining; leaf blades deltoid to shallowly sagittate-deltoid, 2-9 cm. long, only very slightly (if at all) acuminate; flowers reflexed (pendulous) on very slender pedicels several mm. long, at the middle nodes borne in twos or threes but on some of the distal parts of the stems borne in racemelike masses; calyx after anthesis eventually about 6 mm. long, 3 of the sepals with flat, toothed or crimped wings 0.25-1 mm. broad; achenes lustrous, trigonous, 3-3.5 mm. long. *Tiniaria cristata* (Engelm. & Gray) Small, *Bilderdykia cristata* (Engelm. & Gray) Greene, *P. scandens* L. var. *cristatum* (Engelm. & Gray) Gl., *Reynoutria scandens* (L.) Shinnars var. *cristatum* (Engelm. & Gray) Shinnars. Edges of woods in e. and n.-cen. Tex. (possibly also canyons in Plains Country), Aug.-Oct.; Tex., Ark., Okla. and La.; sparingly elsewhere where probably adv.

Polygonum scandens L. has been reported to occur in Texas (Wheeler Co.) but we have seen no specimens; it has more deeply sagittate leaves and denser inflorescences and infructescences, the mature calyxes about 1 cm. long and with wings 1.5-3 mm. broad at summit.

9. *Polygonum Convolvulus* L. BLACK BINDWEED. Annual vine, glabrous but minutely scurfy; stems twining, 1-12 dm. long; leaf blades ovate-deltoid or usually ovate-sagittate, 15-60 mm. long, acuminate; flowers borne usually in pairs or threes at the same nodes or toward the ends of the branches flowers in racemelike inflorescences; pedicels very slender, 2-3 mm. long, reflexed; calyx after anthesis becoming about 3.5 mm. long, closely investing the achene, the 3 outer sepals minutely keeled; achene 3.5-4 mm. long, triquetrous, black. *Bilderdykia Convolvulus* (L.) Dum., *Tiniaria Convolvulus* (L.) Webb & Moq., *Reynoutria Convolvulus* (L.) Shinnars. Infrequent or rare, usually in disturbed soil and often in gardens and flowerbeds, nearly throughout Tex., except extreme Trans-Pecos, Apr.-Sept.; a Eur. weed now widely adv.

10. *Polygonum virginianum* L. JUMP SEED. Annual herb; stems erect or reclining, 3-15 dm. tall; ocreae marginally truncate and ciliate; leaf blades ovate to elliptic-ovate or

ovate-lanceolate, 3-16 cm. long, acute; flowers in long terminal very loose and interrupted wandlike or spikelike aggregations; pedicels about 3 mm. long; calyx greenish-white, about 4 mm. long, 4-parted to near the middle; achene lenticular, strongly biconvex, 3.5-4 mm. long, ovoid-oblong, topped by the 2 persistent deflexed and hooked (hornlike) rather rigid styles about 4 mm. long. *Antenorion virginianum* (L.) Roberty & Vautier, *Tovara virginiana* (L.) Raf. Local in rich woodlands, e., s.e. and n.-cen. Tex., June-Oct.; Que., Ont. and most of e. U.S.; also Pue. and Hgo.

5. PERSICARIA MILL.⁵¹

Herbaceous glabrous or appressed-pubescent annuals or perennials with alternate stipulate (sheathlike ocreae) leaves; flowers small, mostly in spikelike racemes, 4- to 6-merous; sepals distinct, petaloid; stamens 6 to 8; anthers small, linear, occasionally highly colored; styles 2 or 3, joined at or near base; fruit a lenticular or trigonous 1-celled dark-brown or black achene.

About 120 species, world-wide.

1. Ocrea (stipular sheath) with marginal cilia less than 1 mm. long (2)
1. Ocrea with marginal cilia 1.5 mm. long or more (8)
- 2(1). Peduncles with numerous stalked glands (3)
2. Peduncles without stalked glands (sessile ones may occur) (5)
- 3(2). Styles and stamens of the same length (or nearly so), not exerted from calyx; achene lenticular, flat or nearly so on both surfaces; flowers white to pink; annual 3. *P. pensylvanica*.
3. Styles or stamens exerted; achene lenticular and with at least one side convex or ridged (4)
- 4(3). Racemes 1 or 2, terminal; achene plump, strongly biconvex; leaves and ocreae obviously pubescent (at least when young); sepals in fruit more than 4 mm. long, strongly veined; flowers pinkish-red; stems green; perennial 1. *P. coccinea*.
4. Racemes numerous, lateral and terminal; achene ridged or with only one strongly convex face; leaves and ocreae glabrous or nearly so; sepals in fruit usually less than 4 mm. long; flowers white or pink; stems usually cherry-red (at least at nodes); annual 2. *P. bicornis*.
- 5(2). Racemes usually nodding; sepals with prominent anchor-shaped veins near apex; achene lenticular, flat, about 2 mm. long; annual ... 4. *P. lapathifolia*.
5. Racemes erect; sepals without anchor-shaped veins; achene biconvex, oval in cross section; annual or perennial (6)
- 6(5). Leaf blades less than 2 times as long as wide, long-petioled (usually 25 mm. long or more); mature ocrea short, about as wide as high; petioles, stems and peduncles copiously pubescent with strigose hairs; calyx 3.3 mm. long or more, pink to pinkish-red; annual 5. *P. orientalis*.
6. Leaf blades more than 2.5 times as long as wide, short-petioled (less than 20 mm. long); mature ocrea at least 1.5 times longer than broad; petioles, stems and peduncles glabrous or pubescent; calyx 2-4.5 mm. long, white or pinkish-red (7)
- 7(6). Peduncles and ocreolae strigose or stipitate-glandular; stamens or styles strongly exerted from the flowers; calyx in fruit 4 mm. long or more, pinkish-red; racemes 1 or 2, terminal 1. *P. coccinea*.
7. Peduncles and ocreolae not strigose or stipitate-glandular (glands, if present, sessile); stamens and styles mostly included; calyx in fruit less than 3.5 mm. long, white or pinkish-white; racemes numerous, terminal and lateral 6. *P. densiflora*.

⁵¹ Contributed by James S. Wilson.

- 8(1). Leaf blades less than twice as long as wide; petioles usually 25 mm. or more long; mature ocrea short, about as wide as high; petioles, stems and peduncles copiously pubescent with strigose hairs; flowers pinkish-red; robust annual 5. *P. orientalis*.
8. Leaf blades at least 2.5 times as long as wide; petioles usually less than 20 mm. long; mature ocrea at least 1.5 times as long as broad (9)
- 9(8). Calyx glandular (10)
9. Calyx without glands (12)
- 10(9). Achenes biconvex, oval in cross section; styles 2; stems stout, usually over 7 mm. in diameter at base; perennial 6. *P. densiflora*.
10. Achene mostly trigonous, triangular in cross section; styles 3; stems less than 6 mm. in diameter at base (11)
- 11(10). Achenes black, lustrous, smooth; young flower buds white or green-tipped; inflorescence erect 7. *P. punctata*.
11. Achenes black, dull, minutely pitted; young buds pinkish; inflorescence usually nodding 8. *P. Hydropiper*.
- 12(9). Achenes trigonous; styles 3 (13)
12. Achenes lenticular; styles 2 (15)
- 13(12). Racemes usually less than 4 cm. long, mostly rounded at the apex; marginal cilia of ocrea usually less than 3 mm. long; achene ovoid, longer than wide, lenticular or trigonous (if trigonous, the faces slightly concave) 9. *P. vulgaris*.
13. Racemes usually more than 4 cm. long, tapering to the apex; marginal cilia of ocrea usually 3 mm. long or more; achenes trigonous, about as wide as long, the sides or faces flat (14)
- 14(13). Ocrea with marginal cilia usually 6 mm. or more long; leaves usually 15 mm. or more wide; stems usually 7 mm. or more in diameter at base 10. *P. setacea*.
14. Ocrea with marginal cilia usually less than 6 mm. long; leaves usually less than 15 mm. wide, if wider then the ocrea usually less than 5 mm. long; stems less than 7 mm. in diameter at base 11. *P. hydropiperoides*.
- 15(12). Racemes usually less than 4 cm. long, mostly rounded at the apex; marginal cilia of ocrea usually less than 3 mm. long; achene lenticular or trigonous (if trigonous, the faces slightly concave); annual 9. *P. vulgaris*.
15. Racemes usually more than 4 cm. long, tapering to the apex; marginal cilia of ocrea usually 3 mm. or more long; perennial (16)
- 16(15). Peduncles and ocreolae strigose or stipitate-glandular; stamens or styles strongly exerted from the flowers; calyx in fruit 4 mm. long or more, pinkish-red; racemes 1 or 2, terminal 1. *P. coccinea*.
16. Peduncles and ocreolae not strigose or stipitate-glandular (glands, if present sessile); stamens and styles mostly included; calyx in fruit less than 3.5 mm. long, white or pinkish-white; racemes numerous, terminal and lateral 6. *P. densiflora*.

1. *Persicaria coccinea* (Muhl.) Greene. Perennial from subterranean rhizomes; stems mostly erect, greenish, to 15 dm. high; leaf blades lanceolate, usually pubescent (particularly beneath), acute to truncate at base, 5-25 cm. long, 1-6 cm. wide; ocrea usually ciliate, pubescent, much longer than wide; peduncles stipitate-glandular or strigose-pubescent; racemes terminal, 1 or 2; calyx pink to reddish-pink, 4 mm. long or more in fruit; stamens included or exerted (always of different length than the styles); styles 2, included or exerted; achenes infrequent, biconvex, turgid, 2.8-4 mm. long, black, lustrous. *Polygonum coccineum* Muhl. Ponds, rivers, streams, lakes and ditches in e. Tex., June-Oct.; throughout N.A.

2. *Persicaria bicornis* (Raf.) Nieuw. PINK SMARTWEED. Annual from taproot; stems erect, much-branched, cherry-red (at least at the nodes), 1-20 dm. high; leaf blades lanceolate, punctate, glabrous except for a few appressed hairs, 5-18 cm. long, 1-4 cm.

wide; ocrea eciliate or occasionally with cilia less than 1 mm. long, higher than wide; peduncles stipitate-glandular; racemes erect, numerous, terminal and lateral; calyx pinkish, 5-parted, 2.7-4.6 mm. long; stamens 6 to 8, included or exerted (always of different length than the styles); styles 2, included or exerted; achene lenticular, ridged or humped on at least one face, dark-brown or black, lustrous, 2.5-3.5 mm. long and nearly as wide. *Polygonum bicorne* Raf., *Polygonum longistylum* Small. Wet areas, ditches and disturbed habitats (often a first year invader) throughout Tex., May-Jan.; Neb. to Colo. and s. to Tex., Calif. and Mex.

The plants in southern Texas often have slightly fringed ocreolae (fringe absent in north) and more pronounced ridges on the achene than their northern counterparts.

3. *Persicaria pensylvanica* (L.) Small. SMARTWEED. Annual from taproot; stems erect, much-branched, usually greenish, mostly glabrous, 1-20 dm. high; leaf blades lanceolate, punctate, glabrous or with some scattered appressed hairs, 5-22 cm. long, 1-5 cm. wide; ocrea eciliate, longer than wide, thin and brittle; peduncles stipitate-glandular or stipitate-glandular and pubescent; racemes numerous, erect, terminal and lateral; calyx white to pinkish, 5-parted, 3.1-4.2 mm. long; stamens of nearly the same length as the styles and not exerted from the calyx; styles 2; achene lenticular, flat or concave on both faces, dark-brown or black, lustrous, 2.5-3.4 mm. long and nearly as wide. *Polygonum pensylvanicum* L. Wet or disturbed areas in (mostly) e. Tex., May-Nov.; throughout N.A.

4. *Persicaria lapathifolia* (L.) Small. Annual from taproot; stems erect, much-branched, greenish, 1-25 dm. high; leaf blades lanceolate, punctate, glabrous (occasionally densely white-tomentose beneath in aquatic forms), 5-30 cm. long, 1-5 cm. wide; ocrea eciliate, glabrous, strongly ribbed, higher than wide, brittle; peduncles glabrous or somewhat appressed-pubescent, occasionally glandular; racemes mostly nodding but on small specimens usually erect, numerous; calyx white to pinkish-white, 4- or 5-parted, 2-2.9 mm. long, 1.1-1.9 mm. wide, bearing anchor-shaped veins near the apex of each sepal; stamens included; styles 2; achenes lenticular, dark-brown or black, 2-2.5 mm. long, 1.8-2.4 mm. wide, usually concave on one side. *Polygonum lapathifolium* L. Wet areas, disturbed habitats, throughout Tex., Apr.-Dec.; introd. from Eur. and now throughout N.A.

5. *Persicaria orientalis* (L.) Spach. PRINCESS-FEATHER. Annual from taproot; stems erect, branched, usually green, strigose, 4-30 dm. high; leaf blades obovate, commonly truncate at base, strigose beneath, 6-22 cm. long, 4-12 cm. wide; ocrea usually ciliate, about as wide as high; peduncles tomentose; racemes numerous, erect; calyx 5-parted, pink to reddish-pink, epunctate, 4-4.5 mm. long in fruit; stamens included; styles 2; achenes lenticular, turgid, oval in cross section, black, lustrous, 3-3.5 mm. long, 1.8-2.6 mm. wide. *Polygonum orientale* L. E. Tex., June-Nov.; a garden escape in e. U.S.; nat. of Eur.

6. *Persicaria densiflora* (Meisn.) Moldenke. Perennial; stems erect, branched, usually 7 mm. or more wide at base, usually glabrous, 6-20 dm. high; leaf blades lanceolate, mostly glabrous, 5-25 cm. long, 2-5 cm. wide; ocrea ciliate or eciliate, brittle, longer than wide; peduncles occasionally glandular or slightly pubescent; racemes numerous, long, often appearing compound, mostly erect; calyx whitish to whitish-pink, 5-parted, 2.3-3.2 mm. long; styles 2; achene lenticular, turgid, oval in cross section; lustrous, dark-brown to black, 1.9-2.5 mm. long. *Polygonum densiflorum* Meisn. Wet areas (often in water) along the Coastal Plain, June-Nov.; infrequent but throughout e. U.S. and southw.

7. *Persicaria punctata* (Ell.) Small. WATER SMARTWEED. Annual or perennial; stems ascending, green, glabrous or nearly so, 1-10 dm. high; leaf blades lanceolate, punctate, 3-15 cm. long, 5-20 mm. wide; ocrea 2 to 4 times as long as wide, ciliate, the bristles usually less than 6 mm. long; peduncles usually glabrous, glandular; racemes numerous, usually erect, mostly moniliform; calyx dotted with yellowish glands, mostly green or greenish-white, excluding the stipe less than 3 mm. long (in ours); stamens included; styles 3; achenes dark-brown or black, lustrous, trigonous (occasionally lenticular-turgid), 1.8-3 mm. long and about three fourths as wide. *Polygonum punctatum* Ell. Wet areas throughout but more common in e. Tex., Feb.-Dec.; throughout N.A. and S.A.

Often confused with *P. Hydropiper* which has dull achenes and nodding racemes.

8. *Persicaria Hydropiper* (L.) Opiz. WATER SMARTWEED. Annual or perennial; stems ascending, glabrous or nearly so, green, 1-10 dm. high; leaf blades lanceolate, punctate, 3-16 cm. long, 5-20 mm. wide; ocrea 2 to 4 times as long as wide, ciliate, the bristles usually less than 6 mm. long; peduncles usually glabrous, glandular; racemes numerous,

moniliform, commonly nodding or drooping; calyx yellow-glandular, green or greenish-white (pink at tip on young buds), 2.5-4.1 mm. long in fruit; stamens included; styles usually 3; achenes dark-brown or black, dull, minutely pitted, mostly trigonous, 2-3.3 mm. long. *Polygonum Hydropiper* L. Rare, mostly e. Tex., June-Dec.; throughout N.A. and also parts of Euras.

Similar to and often confused with *P. punctata*.

9. *Persicaria vulgaris* Webb & Moq. LADY'S-THUMB, MOCO DE GUAJOLOTE. Annual; stems much-branched, ascending, glabrous or nearly so, green or occasionally marked with red, 1-10 dm. high; leaf blades lanceolate, nearly glabrous, 3-15 cm. long, 5-18 mm. wide; ocrea brittle, 2 to 4 times as high as wide, ciliate, the bristles usually less than 3 mm. long; peduncles usually glabrous; racemes numerous, usually less than 3 cm. long (rarely to 5 cm.), dense; calyx without glands, white, pink or purple, 2.2-3.2 mm. long; stamens included; styles 2 or 3; achenes dark-brown or black, lustrous, lenticular or trigonous (if trigonous, the faces slightly concave), 2-2.7 mm. long. *Polygonum Persicaria* L. Common in disturbed areas or wet ground throughout Tex., June-Dec.; introd. from Eur. and now throughout N.A.

Similar to and often confused with *P. hydropiperoides*.

10. *Persicaria setacea* (Baldw.) Small. Perennial; stems large, the base (usually 7 mm. or more in diameter) often decumbent and rooting at the nodes, greenish above, to 2 m. high; leaf blades lanceolate, scabrous to strigose, 7-24 cm. long, 1-6 cm. wide; ocrea 6-18 mm. long, pubescent, ciliate, the bristles 6-22 mm. long; peduncles strigose to glabrous; racemes numerous, erect, tapering to the apex, usually over 4 cm. long; calyx without glands, white to pinkish-white, 2-2.9 mm. long; stamens included; styles 3; achenes dark-brown to black, lustrous, trigonous (the faces flat), 1.5-2.5 mm. long and about three fourths as wide. *Polygonum hydropiperoides* var. *setaceum* (Baldw.) Gl. Wet areas in e. Tex. and Gulf Coast, June-Oct.; s.e. U.S. and southw.

Overlapping with *P. hydropiperoides* var. *opelousana* in many characteristics.

11. *Persicaria hydropiperoides* (Michx.) Small. Annual or perennial; stems erect, often rooting at nodes, glabrous or nearly so, to 1 m. high; leaf blades lanceolate, minutely scabrous to strigose, 3-17 cm. long, 8-15 mm. wide; ocrea ciliate, the bristles usually less than 5 mm. long, scabrous to strigose, at least twice as long as wide; racemes mostly 4-8 cm. long, numerous, usually tapering to the apex; calyx white to pink, without glands, 2-3.2 mm. long; stamens included; styles 3; achenes dark-brown or black, lustrous, trigonous (the faces flat), 1.6-2.3 mm. long (usually about 1.9 mm. long). *Polygonum hydropiperoides* Michx. Wet areas throughout Tex., June-Nov.; throughout N.A.

Many intergrades occur between the two varieties of this taxon and between them and *P. setacea*.

Var. *opelousana* (Ridd.) J. S. Wils. Differing from var. *hydropiperoides* in narrower leaves (rarely over 1 cm. wide), longer cilia on the ocrea (usually over 5 mm. long) and shorter achenes (usually about 1.7 mm. long). *Polygonum opelousanum* Ridd., *P. hydropiperoides* var. *opelusanum* (Ridd.) Stone. Wet areas in e. Tex., Apr.-Nov.; throughout s.e. U.S. and n. Mex.

The most common variety in Texas, being particularly abundant in wet ditches, swales, etc. In many areas, this taxon is hardly, if at all, separable from var. *hydropiperoides*.

6. ANTIGONON ENDL.

PRIVY-VINE

A tropical American genus of about 8 species.

1. *Antigonon leptopus* H. & A. QUEEN'S WREATH, COAMECATL, CORONA DE LA REINA. Perennial vine from enlarged somewhat tuberlike roots; stems annual (at our latitude), tendril-bearing; leaves alternate, thin, reticulate-veined, ovate, 2-13 cm. long, entire, usually deeply cordate at base and acuminate at apex; flowers pendulous in branched inflorescences, pink or less often white; fruiting calyx commonly 5-10 mm. long; endosperm ruminant. Commonly planted in s. and e. halves of Tex., in the s. part occasionally volunteering (especially about old homesteads), summer-fall; nat. of Mex., widely introd. in warm temp. regions.

One of our most desirable ornamentals; eagerly sought by bees and hummingbirds.

7. BRUNNICHIA GAERTN. EARDROP VINE

A monotypic North American genus.

1. *Brunnichia ovata* (Walt.) Shinn. Perennial vine; stems perennial at least in part, climbing by means of tendrils; leaves alternate, entire, ovate or ovate-lanceolate, truncate or subcordate at base, acute to acuminate at apex, 3-15 cm. long; flowers in terminal paniced spikelike racemes, with calyx greenish or yellow-green; achene trigonous, about 6 mm. long, closely invested by the accrescent and leathery somewhat winged hypanthium that becomes nearly 3 cm. long. *B. cirrhosa* Gaertn. Infrequent on edge of and in woods near streams, lakes and ponds in e. Tex., spring-summer; Gulf States, n. to Mo., Tenn. and S.C.

There is some question regarding the name of this plant since the names "ovata" and "cirrhosa" were published within a few months of each other, and it is not certain which has priority.

FAM. 61. CHENOPODIACEAE VENT.⁵²
GOOSEFOOT FAMILY

Herbaceous weedy plants, glabrous or pubescent, with inconspicuous flowers; stems more or less succulent, often articulate; leaves opposite or alternate, with no stipules nor scarious bracts, sessile or petiolate; blades flat, broad or often succulent and cylindrical or subterete, sometimes reduced to scales, entire, dentate or lobed; flowers perfect, unisexual or polygamous, usually regular, minute, usually green, with the free calyx imbricated in the bud, usually solitary in small cymose glomerules that are spicate, axillary, paniculate or cymose, or flowers axillary and solitary, sometimes arranged in terminal strobiles or sunken in depressions in the stem; stamens as many as lobes of the flower or occasionally fewer and inserted opposite them or on their bases; ovary 1-locular, becoming a 1-seeded thin utricle or rarely an achene; styles or stigmas 2, rarely 3 to 5; perianth simple, persistent, mostly enclosing the fruit; embryo coiled into a ring around the mealy endosperm (if any is present) or conduplicate or spiraled.

About 100 genera and 1,400 species, world-wide, many weeds. Represented in Texas by 16 genera and about 48 species.

1. Embryo annular, hippocrepiform, conduplicate or semiannular, partly or wholly surrounding the endosperm; perianth segments slightly if at all imbricate (2)
1. Embryo spirally coiled; endosperm lacking or divided by the embryo into two parts (14)
- 2(1). Fruit opening after ripening or at termination of a lid; flowers perfect 1. *Beta*, p. 528.
2. Fruit indehiscent (3)
- 3(2). Leaves well-developed; stems not jointed; flowers usually glomerate or solitary in the axils (4)
3. Leaves reduced, scalelike; stems jointed; flowers in fleshy spikes or sunken in joints of the stems, perfect, ebracteolate (13)
- 4(3). Fruit naked when ripe; flowers perfect, spicate, ebracteolate 11. *Corispermum*, p. 546.
4. Fruits when ripe enclosed by the perianth or by bracts (5)
- 5(4). Pubescence of inflated stellate or glandular hairs, or these sometimes lacking (6)
5. Pubescence sericeous; flowers usually perfect, mostly ebracteolate (12)
- 6(5). Flowers mostly perfect, ebracteolate (7)
6. Flowers usually unisexual, the pistillate ones bracteate (9)

⁵² Contributed by Clyde F. Reed; cf. his treatment in C. L. Lundell, *Flora of Texas* II: 21-88. 1969 for complete synonymy.

- 7(6). Stamen 1; perianth segment 1 2. *Monolepis*, p. 528.
 7. Stamens usually 3 to 5; perianth segments 3 to 5 (-8)
 8(7). Perianth horizontally winged in fruit 3. *Cycloloma*, p. 529.
 8. Perianth not winged 4. *Chenopodium*, p. 529.
 9(6). Pubescence of branched hairs; seed vertical; perianth none in the pistillate flowers 8. *Eurotia*, p. 545.
 9. Pubescence of inflated hairs or lacking; seed vertical or horizontal (10)
 10(9). Bracts of pistillate flowers strongly obcompressed, carinate dorsally; pistillate flowers bibracteate 7. *Suckleya*, p. 545.
 10. Bracts of pistillate flowers usually compressed, never strongly obcompressed; pistillate flowers without a perianth (11)
 11(10). Stigmas 4 or 5; leaves and stems glabrous; bracts united to near the apex 5. *Spinacia*, p. 538.
 11. Stigmas 2 or 3; leaves and stems with inflated hairs, at least when young 6. *Atriplex*, p. 538.
 12(5). Perianth segments horizontally winged in fruit 9. *Kochia*, p. 545.
 12. Perianth segments all or some of them produced into an elongate spine in fruit 10. *Bassia*, p. 546.
 13(3). Bracts subtending the flowers alternate, fleshy, peltate, persistent or tardily deciduous; flowers forming dense cylindric sessile spikes; seed smooth; endosperm copious 12. *Allenrolfea*, p. 547.
 13. Bracts subtending the flowers opposite, united, persistent; flowers sunken in depressions of the branches; seed pubescent; endosperm none 13. *Salicornia*, p. 547.
 14(1). Flowers ebracteolate, the staminate ones consisting of stamens arranged beneath a peltate scale in an amentlike spike 14. *Sarcobatus*, p. 548.
 14. Flowers bracteolate, mostly perfect, never in amentlike spikes (15)
 15(14). Bractlets small, scalelike, shorter than the perianth; embryo plano-spiral 15. *Suaeda*, p. 549.
 15. Bractlets equaling or longer than the perianth; embryo usually conic-spiral 16. *Salsola*, p. 551.

1. BETA L.

About 6 species native to Europe and the Mediterranean region.

1. *Beta vulgaris* L. BEET. Annual or biennial herb, usually glabrous throughout, the roots (hypocotyl) much-thickened, often grown as a vegetable; stems 6-12 dm. tall, one of several from each root, paniculately branched above, green or often red; leaves alternate, the petioles of lower rosulate ones often equaling the blades; blades oval or ovate-oblong, often undulate, fleshy; flowers perfect, in glomerules, sessile in the axils of leaves or terminal in simple spikes that become elongated and interrupted with age; perianth urceolate, 5-lobed, adherent to the base of the ovary, in fruit closed and indurate; calyx tubes oblong, becoming linear, obtuse and strongly carinate; stamens 5, perigynous; stigmas 2 to 5, connate at the base; pericarp attached to the perianth below and free from the seed; seed horizontal, orbicular or reniform, 1.5-2 mm. broad, smooth; embryo annular, surrounding the copious endosperm.

Cultivated for its beet-root and leaves as vegetables and its root for sugar; occasionally escaped from cultivated areas.

2. MONOLEPIS SCHRAD.

About 6 species in both the New World and Old World.

1. *Monolepis Nuttalliana* (Schult.) Greene. POVERTY WEED. Annual herb, low and branched at the base, with pale-green foliage; stems stout, decumbent or ascending,

much-branched, 1-3 dm. tall, succulent, rather mealy when young, becoming glabrate in age; leaves alternate, fleshy, short-petioled or subsessile, the upper leaves sessile, the leaf blades triangular to lanceolate, 1-6.5 cm. long, with a pair of divergent lobes toward the base, sometimes a few teeth above, otherwise entire; flower clusters sessile, densely many-flowered with bracts, often reddish in age; sepals single, entire, persistent, bractlike, fleshy or coriaceous, oblanceolate or spatulate, acute or acutish; stamen 1 or lacking in pistillate flowers; styles 2, filiform; stigmas 2, subulate, connate at the base; pericarp or utricle ovoid, compressed, evenly pitted at maturity, adherent to the seed; seed 1 mm. in diameter, vertical, flattened, dark-brown or black, the margin entire; embryo annular, surrounding the mealy endosperm; radicle inferior. In alkaline and dry soils, Man. to Alta., s. to Calif., Tex., Mo. and Son.; on ballast in Me.; Sib.; Patagonia.

3. CYCLOLOMA Moq.

A monotypic genus.

1. *Cycloloma atriplicifolium* (Spreng.) Coult. **TUMBLE RINGWING, WINGED PIGWEED.** Annual herb 1.5-8 dm. tall and of equal diameter; stems erect or spreading, divaricately branched, striate, the branches slender, obtusely angled, loosely and thinly woolly, more or less glabrate in age except around the flowers; leaves alternate, sessile or short-petioled (2-15 mm. long); blades lanceolate to ovate 2-8 cm. long, 6-15 mm. broad, coarsely sinuately dentate, thin, acute at the apex, cuneate at the base; flowers polygamous (perfect and pistillate), in paniculate spikes, without bracts; sepals 5, keeled, the perianth developing at maturity into a horizontal wing; calyx wings white-hyaline, irregularly lobed and toothed, 4-5 mm. in diameter, covering the utricle, becoming red or purple in age; stamens 5; ovary densely tomentulose; styles 2 or 3, partially united; utricle depressed-globose, enclosed in the calyx; seed flat, about 1.5 mm. wide, horizontal, black, smooth; pericarp membranaceous, free from the seed; embryo annular, enclosing the mealy endosperm; radicle centrifugal. Weedy, often found in sandy fields, Man. to Ind., s. to Ariz. and Tex.; adv. in e. U.S. and Eur.

4. CHENOPODIUM L. GOOSEFOOT. PIGWEED

Annual or perennial weedy herbs, rarely suffrutescent, often strongly scented, usually with mealy-coated or glandular foliage but sometimes glabrate; stems sometimes quite rough and nearly woody; leaves alternate, usually petiolate, flat, varying from linear to ovate or hastate to lanceolate, the blade entire, toothed or lobed, quite variable; flowers perfect or rarely unisexual, in axillary or terminal spikes or glomerules; perianth usually 5-parted, calyxlike; sepals persistent, flat or keeled; stamens 1 to 5; ovary superior, usually depressed, 1-celled; styles 2 to 5; utricle containing one horizontal or vertical seed; pericarp usually adherent to the seed, sometimes fleshy; embryo curved or annular, surrounding the mealy endosperm; radicle inferior or centrifugal.

A large genus of weedy plants, represented in Texas by 26 species. Some species are used as potherbs while *C. quinoa* Willd. is a valuable cereal plant in South America.

- 1. Plants variously both pubescent and glandular; perianth parts separate or fused only at the base (2)
- 1. Plants glabrous or farinose but not glandular or pubescent (5)
- 2(1). Seeds vertical, 0.5-0.7 mm. broad; flowers in small glomerules in the axils of the lobed leaves 1. *C. pumilio*.
- 2. Seeds chiefly horizontal, 0.6-1 mm. broad (3)
- 3(2). Flowers in small glomerules or short spikes, these chiefly bracteate in an extensive paniculate inflorescence; well-developed leaves usually more than 6 cm. long; lower leaf surfaces glandular; perianth parts inconspicuously glandular, usually glabrous 4. *C. ambrostoides*.
- 3. Flowers in dichotomous cymes; leaves chiefly less than 3 cm. long; perianth and lower surface of leaves glandular or else these glabrous and young branches inconspicuously whitish vesiculous-pubescent; leaves sinuate-pinnatifid (4)

- 4(3). Glands on perianth parts chiefly stalked; stems densely glandular; perianth parts acute to attenuate, not keeled or tuberculate; cymes contracted in usually dense racemes 2. *C. Botrys*.
4. Glands on perianth parts chiefly sessile or lacking; stems moderately to sparingly pubescent or glandular; perianth parts acute or obtuse, keeled or tuberculate, glandular; cymes diffuse, in racemes or panicles 3. *C. incisum*.
- 5(1). Seeds vertical or both vertical and horizontal in the same inflorescence; plants glabrous or farinose but if conspicuously farinose on lower leaf surfaces then farinules inconspicuous or lacking on the perianth parts; perianth parts chiefly 3-parted (4- or 5-parted in horizontal flowers which are terminal in the glomerules), the divisions entire or apiculate; stigmas not over 0.5 mm. in length; annuals (6)
5. Seeds horizontal, rarely and exceptionally a few vertical; plants variously farinose, usually prominently so and at least as much so on the perianth parts as on the leaves; perianth 5-parted (7)
- 6(5). Perianth parts 3 or 4 (of flowers with vertical seeds), united nearly to the tip; stigmas 0.2-0.3 mm. long, usually ascending in a V; leaves glabrous, deltoid to rhombic or spatulate, shallowly denticulate to entire; free tips of sepals minutely but definitely apiculate 5. *C. chenopodioides*.
6. Perianth parts usually 5 (of flowers with vertical seeds), free nearly to the base or some but not all in each flower united above the middle; stigmas scarcely exceeding 0.1 mm., horizontally spreading; leaves densely white-farinose below, ovate or narrowly ovate, undulate or serrate, not hastate, the teeth and tips obtuse; perianth parts glabrous; horizontal seeds largely exposed by the sepals, numerous in the glomerules; glomerules chiefly ebracteate in small axillary or terminal spikes 6. *C. glaucum*.
- 7(5). Principal leaves linear to narrowly ovate or oblong, usually less than 15 mm. broad and occasionally to 20 mm. across the basal lobes, 3 times as long as broad, entire or with basal lobes and sometimes with low teeth in thin-leaved forms, 1- to 3-nerved or occasionally pinnately veined; petioles shorter than the blades; pericarp separable and smooth or attached and glandular-roughened, never reticulate or alveolate; sepals without definite apiculate tips, exposing the mature fruit laterally and dorsally; seeds maturing nearly uniformly in the cymes (8)
7. Principal leaves deltoid to deltoid-rhombic or ovate, 1 to 3 times as long as broad, pinnately veined, entire; sepals with definite apiculate tips (12)
- 8(7). Principal leaves oblong to lanceolate or ovate-lanceolate, moderately thin to almost fleshy, entire or if with prominent basal lobes then the terminal lobe lanceolate and less than 8 mm. broad; plant upright to low and spreading; pericarp separable 7. *C. desiccatum*.
8. Principal leaves linear or nearly so, chiefly fleshy, one-nerved, the margins entire; pericarp attached to the seed (9)
- 9(8). Sepals united to or above the widest part of the seed, appendaged by an undulate collar from the sinuses, not carinate; seeds 1.5 mm. broad, rugose, strongly flattened, umbonate 8. *C. cycloides*.
9. Sepals without an undulate collar from the sinuses, carinate; pericarp green or greenish (10)
- 10(9). Seeds 1.2-1.5 mm. wide; pericarp tuberculate-roughened; sepals sparingly farinose and appearing "water-soaked"; calyx closed in fruit; plants to 6 dm. tall, nearly glabrous 9. *C. pallelescens*.
10. Seeds 0.8-1 mm. wide; sepals densely farinose; calyx open in fruit; plants densely farinose (11)
- 11(10). Plants usually less than 4 dm. tall, not ill-scented; calyx scarcely covering the fruit 10. *C. leptophyllum*.
11. Plants 4-8 dm. tall, ill-scented; calyx cleft nearly to the base, yellowish tinged with green, erect at maturity to expose the fruit ... 11. *C. hians*.

- 12(7). Leaf blades deltoid to rhombic-deltoid or variously ovate but otherwise nearly entire (13)
12. Leaf blades ovate or rhombic-ovate to deltoid, 2-10 (-20) cm. long, longer than broad, at least the lower ones conspicuously deeply or shallowly toothed above the basal lobes (18)
- 13(12). Branches weak, often prostrate; leaves broadened above the base but not hastate; sepals variously united, at least some for three fourths their length 12. *C. Vulvaria*.
13. Branches erect or if spreading not weak or prostrate; leaves with or without basal lobes; sepals united less than half their length (14)
- 14(13). Pericarp separable (15)
14. Pericarp adherent to the seed (17)
- 15(14). Leaves membranaceous to coriaceous, less than 3 cm. broad, the blades with a basal lobe; seeds 0.9-1.1 mm. broad, maturing relatively uniformly and covered by the sepals; plants profusely branched, low and bushy 15. *C. incanum*.
15. Leaves thin, the blades deltoid or ovate; seeds averaging more than 1 mm. broad, maturing mixed in the glomerules and exposed at maturity; plants upright, strict or variously branched (16)
- 16(15). Leaf blades deltoid, 1-4 (rarely 5) cm. broad, scarcely longer than broad, the base with prominent hastate lobes; seeds mostly 1.1-1.5 mm. broad 13. *C. Fremontii*.
16. Leaf blades ovate, 1.5 cm. broad or less, only occasionally with a basal lobe; seeds mostly 1-1.3 mm. broad 14. *C. atrovirens*.
- 17(14). Seed 1 mm. broad; flowers in small axillary glomerules shorter than the leaves 16. *C. carnosulum*.
17. Seed 1.3-1.5 mm. broad; flowers in rather large glomerules, these in dense stout narrowly paniculate spikes 17. *C. neomexicanum*.
- 18(12). Leaves thin; fruit maturing very prominently mixed so that mature fruit and young perfect flowers are present in the glomerules at the same time; sepals weakly or not at all keeled, largely exposing mature fruit; pericarp usually separable; seeds more than 1 mm. broad (19)
18. Leaves thin to membranaceous or coriaceous; flowers in glomerules in nearly the same stage of development (20)
- 19(18). Leaves rounded or tapering at the base, the teeth short and ascending, gradually reduced to entire bracts subtending most of the inflorescence branches; pericarp smooth, strongly separable; seeds 1.1-1.5 mm. broad 18. *C. Standleyanum*.
19. Leaves rounded to truncate or cordate at the base, the teeth usually long-tapering and spreading; inflorescence ebracteate or the main branches subtended by rather well-developed leaves; seeds 1.5-2.5 mm. broad, umbonate-lenticular, their margins obtuse to moderately acute; pericarp thin and delicate, cellular-reticulate, readily separable or attached 19. *C. gigantospermum*.
- 20(18). Leaves all strongly deltoid and prominently sinuate-dentate or only the few uppermost reduced to entire lanceolate bracts; stigmas short (0.1 mm. or less) and stout; seeds 1.2-1.5 mm. broad, the margins acute, the surface irregularly roughened; pericarp strongly adherent; sepals keeled, farinose, obtuse, largely exposing the fruit; plants rarely exceeding 4 dm. in height; inflorescence somewhat cymose, shorter than the leaves 20. *C. murale*.
20. Leaves rhombic-ovate, variously toothed, gradually reduced upward to entire lanceolate bracts; stigmas long or short but not stout (21)
- 21(20). Seeds and pericarp foveolate-reticulate, 1-1.5 mm. broad; style base often prominent (though less than 1 mm. long); leaves thin to coriaceous; sepals with a prominent winged keel often equaling half the width of the sepal 26. *C. Berlandieri*.

21. Seeds essentially smooth; pericarp smooth or inconspicuously irregularly roughened; leaves mainly membranaceous in texture; sepals usually not strongly keeled, the keel rarely as much as one fourth the width of the sepal; style divided essentially to the base (22)
- 22(21). Pericarp thin and strongly separable; leaves moderately thin; sepals strongly farinose to the tip21. *C. albescens*.
22. Pericarp usually attached but varying to separable; sepals with a hyaline or yellowish less farinose border (23)
- 23(22). Leaves large, the blades 6-14 cm. long, the lower ones doubly sinuate-dentate with sharp teeth, the upper ones reduced to sharply serrate or occasionally entire bracts, strongly farinose, the farinules often tinged red on young leaves; plants robust, 1-3 m. tall25. *C. giganteum*.
23. Leaf blades rarely exceeding 6 cm. long, variously toothed but scarcely sharply doubly sinuate-dentate, the upper ones reduced to entire lanceolate bracts; sepals largely covering the fruits; inflorescences densely flowered (24)
- 24(23). Seeds 0.9-1.2 mm. broad; plants flowering in second week of September; lower and median leaves not more than 1.5 times as long as wide, coarsely toothed (the lower ones more or less doubly so at the base)24. *C. missouriense*.
24. Seeds mostly 1.1-1.5 mm. broad; plants not restricted in flowering time; sepals largely covering the fruit (25)
- 25(24). Leaf blades scarcely longer than broad, the basal lobes often bipartite; sepals united to or above the broadest part of the fruit, usually strongly keeled
.....22. *C. opulifolium*.
25. Leaf blades 1.5 or more times as long as broad; sepals not united to broadest part of fruit, variously keeled23. *C. album*.

1. *Chenopodium pumilio* R. Br. RIDGED GOOSEFOOT. Annual herb, pubescent and glandular throughout; stems several from the base, ascending, spreading or prostrate, 2-4 dm. long; leaves ovate or oblong to lanceolate, 1-3 cm. long, with 2 to 4 coarse teeth on each side, lobed, densely beset with large yellow glands beneath, the petioles half as long as the blades; flowers small, in glomerules forming spikes 2-5 mm. long in all axils, occasionally in short terminal spikes; calyx beset with large yellow glands; stamen usually 1; fruiting calyx dry; seed small, vertical. *C. carinatum* of recent auth., not R. Br., 1810. Nat. of Austral.; naturalized in waste places in Calif. and Tex.; also in Mass., N.Y., Mo., N.J. and D.C.

2. *Chenopodium Botrys* L. JERUSALEM OAK. Annual herb, with a strong but not unpleasant aromatic scent; stems erect, 2-6 dm. tall, densely glandular-viscid throughout, much-branched, the branches ascending; leaves oblong or oval, 1-5 cm. long, sinuate-pinnatifid, entire or sinuately lobed, the lobes obtuse or rounded, truncate to cuneate at the base, petioles half as long as or shorter than the blades, the blades of leaves in the inflorescence reduced and often entire; inflorescence of numerous densely many-flowered cymes, the whole finally forming a narrow elongate nearly naked panicle; flowers subsessile, 1 mm. long; calyx cleft nearly to the base, the lobes oval or oblong and acute or acuminate, densely glandular-pubescent, imperfectly enclosing the fruit at maturity; pericarp thin, whitish, firmly attached to the seed; seed subglobose, 0.6 mm. in diameter, dark-brown, dull, vertical or horizontal. Nat. of Eur., Asia and Afr.; adv. and naturalized as a weed throughout U.S. and Can. in waste places, ditches, cinder dumps and railroad beds; also S.A.

3. *Chenopodium incisum* Poir. Annual herb, strong-scented; stems erect, 2-6 dm. tall, simple or branched at the base, the branches ascending, paniculately branched, sparsely puberulent or glabrate, often tinged with red; leaves deltoid-ovate or oblong to narrowly oblong, 2-6.5 cm. long, 1.5-3 cm. wide, obtuse or acuminate at the apex, truncate or narrowed and cuneate at the base, sinuate- or laciniate-pinnatifid, the lobes oblong or deltoid, bright-green, glabrous or minutely viscid-villous on the upper surface, covered beneath with yellow glands; inflorescence of numerous loosely few-flowered axillary cymes, these finally forming narrow elongate naked panicles; flowers sessile in the forks

of the branches and solitary at the ends of the slender lateral branches, the pedicellate flowers usually abortive with their pedicels spinose; calyx deeply cleft, the lobes oval or oblong and acute or obtuse, corniculate-appendaged, covered with yellow or orange-yellow sessile glands, incompletely enclosing the fruit; seed horizontal, 0.5-0.8 mm. broad, depressed-globose, dark-brown, the pericarp adherent. Dry places, s. Colo. and w. Tex. to Ariz., s. to C.R.; adv. in Mass. and Me.; also in Afr. and S.A.; June-Sept.

A medicinal plant in Mexico.

4. *Chenopodium ambrosioides* L. MEXICAN TEA, WORMSEED, EPAZOTE. Annual or perennial herb, glabrous or glandular, ill-scented; stems erect or ascending, 3-10 dm. tall; branches stout, simple or paniculately branched, glabrous or puberulent below, usually glandular-villous or tomentulose about the inflorescence but occasionally glabrous; leaves oblong to ovate or lanceolate, 2-12 cm. long, 15-55 mm. broad, sinuate-dentate or sinuate-pinnatifid, the lobes acute or obtuse, copiously gland-dotted or the glands absent, puberulent to short-villous or glabrous; flowers solitary or usually glomerate in dense or interrupted slender or stout elongate spikes, these naked or leafy (the blades much smaller than the lower ones, lanceolate to oblanceolate or spatulate to linear, obtuse to acute or attenuate); calyx about 1 mm. high, glabrous or short-villous, usually gland-dotted, the lobes rounded-ovate and obtuse, completely enclosing the fruit; stamens exerted; pericarp very thin and deciduous; seed horizontal or vertical, 0.6-0.8 mm. broad, nearly black, the margin obtuse. Incl. var. *anthelminticum* (L.) Gray. Waste places, cult. grounds and shores, salt marshes, a weedy and medicinal herb, Ont. and Me., s. to Fla., Tex. and Calif.; summer-fall; Berm.; naturalized in Eur., Asia and Afr.; nat. of trop. Am., W.I. and Mex. and C.A. to S.A.

5. *Chenopodium chenopodioides* (L.) Aellen. Annual herb; stems prostrate and low-branching or upright; leaves glabrous or promptly glabrate beneath, rhombic or spatulate, shallowly sinuate or entire; flowers terminal and lateral in glomerules, these either separate or forming contracted spikes in the axils of leaves or bracts, or in small or large panicles, the terminal flowers with horizontal seeds, the lateral flowers with vertical seeds; perianth parts (with vertical seed) 3 or 4, united nearly to the tips, the free tips minutely but definitely apiculate; stigmas chiefly 0.2-0.3 mm. long, usually ascending as in a *V. C. rubrum sensu* N. A. auth., *C. humile sensu* N. A. auth. Saline habitats, Wash. to Calif., Nev., Wyo., Col. and Tex.; also N.Y.

6. *Chenopodium glaucum* L. Annual herb; stems erect or prostrate, branched throughout, the branches stout and 1-4.5 cm. long, glabrous, often reddish; leaves with petioles equaling or shorter than the blades, oblong to ovate-oblong, 1-5 cm. long, 5-15 mm. broad, obtuse, narrowly or broadly cuneate at the base, the margins sinuate-angled or sinuate-dentate, the teeth obtuse or acute, pale-green and glabrous on the upper surface, densely farinose beneath; flowers sessile in dense glomerules, these arranged in slender interrupted axillary and terminal simple or paniculate naked spikes 1.5-4 cm. long, the inflorescence glabrous; calyx herbaceous, deeply cleft, the lobes 5 (rarely 3 or 4), obovate-oblong, obtuse, imperfectly enclosing the fruit; stamens 5 or 1 to 3 in the lateral flowers; pericarp green, free; seed vertical or horizontal, 0.6 mm. broad, dark-reddish-brown, nearly smooth, the margin acutish. Nat. of Eur., Asia, Afr., Austral. and Greenl.; adv. from N.B. to Va., Neb. and Tex.

7. *Chenopodium desiccatum* A. Nels. THICKLEAF GOOSEFOOT. Annual herb; stems erect, 1-5 dm. tall, usually much-branched throughout, the stout branches ascending or spreading, copiously farinose or finally glabrate, often tinged with red; leaves with short petioles about half as long as the blades, oblong to ovate-oblong, 8-20 (-40) mm. long, 4-10 mm. broad, obtuse or acutish at the apex, cuneate and 3-nerved at the base, entire, densely and coarsely farinose on both sides or becoming glabrate on the upper surface, the upper blades little-reduced; flowers in rather dense glomerules crowded to form short stout paniculate spikes; calyx densely and coarsely farinose, the obovate lobes obtuse and carinate, completely enclosing the fruit; pericarp free; seed horizontal, 1-1.5 mm. broad, turgid, nearly smooth, shining, dark-reddish-brown to black, the margin obtuse. In arid regions and dry soils, S.D. to Ida. and Wash., s. to Kan., Mo., Tex., N.M. and Calif., July-Sept.

Var. *leptophylloides* (Murr.) H. A. Wahl. Annual herb; stems erect, 2-8 dm. tall, much-branched throughout or simple below, the branches ascending or suberect, glabrate

or farinose; leaves lanceolate to oblong-elliptic, obtuse or acute at the apex, cuneate at the base, 2-6 cm. long, 4-18 mm. wide, the petioles about half as long as the blades, 3-nerved, entire or the larger ones commonly with a short rounded tooth on each side near the base, thick, densely farinose beneath, usually glabrous and bright-green on the upper surface, the upper blades reduced; flowers in dense glomerules; calyx lobes obtuse, rough and white-margined, green on the back, slightly to strongly carinate, completely enclosing the fruit; pericarp free; seed horizontal, 1-1.5 mm. broad, smooth, shining, black, the margin obtuse. *C. pratericola* Rydb. In arid soils and in waste grounds, Sask. to Wash., s. to Mo., Tex., N.M., Calif. and n. Mex., occasionally adv. in e. U.S., July-Sept.

8. *Chenopodium cycloides* A. Nels. Annual herb; stems erect, 3-4 (often to 12.5) dm. tall, much-branched, the slender branches ascending, usually from a spreading base, mostly simple, glabrous or very sparsely and finely farinose, usually reddish; leaves narrowly linear, 1-1.5 cm. long, 1-1.5 mm. broad, 1-nerved, obtuse or acutish, thick, bright-green, glabrous on the upper surface, minutely and sparsely farinose beneath; flowers in rather large glomerules, these in slender or stout short dense or interrupted narrowly paniculate spikes, the inflorescence nearly naked; calyx sparsely farinose, shallowly lobed, the lobes broadly rounded at the apex and rounded on the back, the margins scarious, the whole calyx broadly spreading and slightly accrescent in fruit; pericarp adherent, bright-red, minutely tuberculate; seed horizontal, strongly compressed, 1.5 mm. broad, very smooth, black, shining, the margins acutish. On sand hills, s.w. Kan. to Tex. and s. N.M.

9. *Chenopodium pallescens* Standl. Annual herb; stems erect, 3-6 dm. tall, much-branched throughout, the branches subdichotomous, stout, erect, spreading or ascending, obtusely angled, striate, pale-green, glabrate or sparsely and finely farinose; leaves linear, 15-35 mm. long, 1.5-3 mm. broad, 1-nerved, obtuse or acutish, attenuate at the base, entire and thick, pale-green, glabrous or very sparsely and closely farinose, the petioles 2-5 mm. long, the upper blades shorter and narrower; flowers in large glomerules, these in short interrupted broadly paniculate or cymose-paniculate spikes, the inflorescences sparsely leafy; calyx slightly farinose, deeply cleft, the lobes rounded-ovate, fleshy, green, carinate, completely enclosing the fruit; pericarp thickish, firmly adherent to the seed, finely tuberculate; seed horizontal, 1.2-1.5 mm. broad, nearly smooth, black, shining, the margins rounded. Barrens and sand dunes, Ind., Mo. to Okla. and cen. Tex., s.e. Colo. and s.e. N.M.

10. *Chenopodium leptophyllum* Wats. Annual herb; stems erect, simple or branched below, green or reddish, 2-8 dm. tall, much-branched above, striately angled, branches densely farinose or becoming glabrate; leaves 1-6 cm. long, 2-3 (rarely 6) mm. broad, densely white-farinose, becoming glabrate above, obtuse, thick, 1-nerved, the petioles very short; flowers in large glomerules, these in dense erect paniculate spikes; calyx densely farinose, slightly to strongly carinate, scarcely covering the seed; seed 0.8-1 mm. broad, black, shining, with the pericarp firmly attached, horizontal. Dry places, canyons, slopes, Man. and Alta., southw. to Tex., N.M., Ariz., Calif. and Mex.; adv. eastw.; on sandy beaches from Me. to N.J.; adv. in Eur.; June-Sept.

11. *Chenopodium hians* Standl. Annual herb, ill-scented; stems 4-8 dm. tall, usually simple at the base or with a few short slender weak branches, sparsely branched above, the branches stout, erect or nearly so, copiously and coarsely farinose, obscurely and obtusely angled; leaves alternate; petioles stout, half as long as the blades or shorter; blades elliptic-oblong to oblong or narrowly lance-oblong, 1.2-3 cm. long, 3-8 mm. wide, rounded or obtuse at the apex, very shortly apiculate, cuneate at the base, green and glabrate on the upper surface, densely and rather coarsely white-farinose beneath, thick, the upper blades sometimes linear; flowers in large glomerules, these in very stout dense erect axillary or narrowly paniculate spikes; calyx densely farinose, cleft nearly to the base, the lobes rounded-oblong or ovate, obtusely carinate, yellowish tinged with green, erect at maturity and exposing the fruit; pericarp closely adherent; seed horizontal, 0.8-1 mm. broad, black, shining, nearly smooth, the margin obtuse. Dry hillsides, waste places, rangelands and roadsides, Wyo., Nev., Ut., N.M. and w. Tex.

12. *Chenopodium Vulvaria* L. Annual herb, with fetid odor, strongly white-mealy throughout; stems erect or ascending, widely branched from the base, the branches 1-5 dm. tall, slender or stout; leaves broadly ovate, 1-3.5 cm. long and as wide, obtuse or

acute, entire, rounded or broadly cuneate to the petiole, glabrescent above, copiously farinose beneath; inflorescences few, of small glomerules in compact leafy spikes, chiefly from the axils of the upper leaves; calyx segments densely farinose, obtuse, rounded on the back, completely enclosing the fruit; pericarp adherent to the seed; seed dull, black, about 1 mm. wide, slightly punctulate, horizontal, depressed-globose, the margins rounded. Nat. of Eur.; sparsely adv. from Fla. to Tex. and Calif.; also Wisc., Md., Ont. and Que.

13. *Chenopodium Fremontii* Wats. Annual herb; stems erect, 2-10 dm. tall, the branches slender, ascending, often flexuous, sparingly white-mealy to light-green, glabrous; leaves broadly triangular to rhombic, sinuate-dentate, 15-65 mm. long and nearly as broad, rounded and mucronate at the apex, the base with a prominent hastate lobe, the lobes oval to rounded-obovate, the slender petiole about half as long as the blade; flowers in clusters, these forming slender spikes or an open panicle; calyx usually sparsely farinose, deeply cleft, strongly carinate, nearly covering the fruit; stigmas short; pericarp free; seed horizontal, smooth or slightly rugulose, black, shining, fully 1 mm. broad, the margin obtuse. Canyons and bushy areas, moist places, Sask. and B.C. to N.D., s. to w. Tex., N.M., Nev., Ariz. and n. Mex.; May-Sept.

Forma *farinosum* Aellen. Plants more bushy in form and smaller; leaves smaller, thicker, more grayish-farinose, resembling those of *C. incanum* but with the habit and seed characteristics of typical *C. Fremontii*. Mainly in mt. areas, Ida. to Tex.

Var. *Pringlei* (Standl.) Aellen. Very similar to typical *C. Fremontii* except the leaves are serrate. N.D. to Tex. and Mex.

14. *Chenopodium atrovirens* Rydb. Annual herb; stems erect, 1-5 dm. tall, usually much-branched, the branches slender or stout, ascending, green, striate, glabrate; leaves broadly oblong to triangular-oblong or ovate, 1.5-3 cm. long, 5-15 mm. broad, obtuse or rounded at the apex, rounded to cuneate at the base, entire or rarely with 2 small rounded lobes at the base, usually thick, thinly farinose beneath when young but soon glabrate, the petioles slender and about two thirds as long as the blades; inflorescence sparsely farinose, the large glomerules dense and arranged in interrupted paniculate spikes or the spikes often simple, naked or nearly so; calyx deeply cleft, the obovate lobes rounded or emarginate, white-margined, sharply carinate, completely enclosing the fruit; pericarp free; seed horizontal, 1-1.3 mm. broad, dark-reddish-brown, shining, faintly rugulose, the margins obtuse. Mont. to e. Ore., s. to Colo., Tex. and Calif.

15. *Chenopodium incanum* (Wats.) Heller. Annual herb; stems erect, 1-5 dm. tall, much-branched throughout, the branches very stout, spreading or ascending, angled and striate, densely farinose; leaves triangular-rhombic to rhombic-orbicular, 1-3 cm. long and often as wide, obtuse or rounded and apiculate at the apex, rounded to broadly cuneate at the base, hastately lobed with rounded or obtuse lobes, very thick, densely white-farinose or often glabrate on the upper surface; flowers in large dense glomerules arranged in dense stout crowded paniculate spikes, the inflorescence leafy or naked, the leaves often oblong and entire; calyx densely farinose, the lobes carinate; stamens often exerted; pericarp free; seed horizontal, 0.9-1.1 mm. broad, smooth, black, shining, the margin obtuse. Dry plains and hillsides, sandy wastes, especially in "prairie-dog towns," Sask. and Alta. to S.D., s. to Neb., Ut., Nev., s. Calif., Tex. and Mex.; adv. in Mo. and Me.; May-Aug.

16. *Chenopodium carnosulum* Moq. Annual herb; stems erect or ascending, much-branched, the slender branches spreading, striate, 1-3 dm. tall, sparsely farinose when young, glabrate in age; leaves rhombic-deltoid to ovate-oblong or elliptic, 4-8 mm. long, 2-4 mm. wide, obtuse or acute, cuneate to rounded at the base, thick and succulent, sparsely farinose when young but soon glabrate, entire or shallowly lobed near the base, the lobes broadly rounded, the lateral veins vague, the petioles 1-2 mm. long; inflorescence densely leafy; flowers in small axillary glomerules shorter than the leaves; perianth 5-lobed, the lobes rounded, farinose, succulent, subcarinate, imperfectly enclosing the fruit; pericarp adherent to the seed, thin, green; seed horizontal, 1 mm. broad, nearly black, the margin obtuse. Tex. and Mex. s. to Ecu., Bol., Chile and Arg.

17. *Chenopodium neomexicanum* Standl. Annual herb, ill-scented; stems erect, 6-7 dm. tall, simple below, sparsely branched above, the branches slender, strongly ascending, sparsely and very finely farinose, nearly terete, often tinged red; leaves deltoid to

orbicular-ovate or rhombic-ovate, 15-28 mm. long, rounded at the apex and scarcely apiculate, truncate or rounded at the base, subhastate with low rounded or acutish lobes, very thin, green and very finely farinose beneath, the upper smaller blades often ovate to oblong, entire, acute; flowers in rather large glomerules, these in dense stout narrowly paniculate spikes, the inflorescence nearly naked; calyx rather sparsely farinose, cleft to the middle or lower, the lobes rounded-obovate, green, slightly carinate, completely enclosing the fruit; pericarp adherent to the seed; seed horizontal, 1.3-1.5 mm. broad, nearly black, shining, punctulate, the margin obtuse. Mts. of Trans-Pecos Tex. to s.w. N.M. and s.e. Ariz.

18. *Chenopodium Standleyanum* Aellen. Annual herb; stems erect or arched, slender, to 1 m. tall or to 2.5 m. long in woodland situations; leaves thin, green or sparsely white-mealy, those of primary axis larger than those of the branches, long-lanceolate to ovate-lanceolate or rarely ovate, to 8 cm. long and 1 cm. wide, acute, entire or the primary ones with a few low teeth (serrate-margined), acute or cuneate at the base, the upper leaves entire; flowers single or few in small glomerules, these forming short interrupted spikes, the latter grouped into a loose open slender often nodding terminal panicle; calyx more or less white-mealy, rounded, scarcely more than curling over the margins of the mature fruit; pericarp smooth, papery, fragile, easily separable from the seed; seed black, lustrous, 1-1.5 mm. in diameter, smooth to faintly striolate, longitudinally striolate over the radicle. Dry open woods, stream banks, waste areas and open grounds, also on cliffs, s. Que., Conn., N.Y. and Ind. to S.D., s. to Va., Fla., Ark., e. Tex. and N.M.

19. *Chenopodium gigantospermum* Aellen. Annual herb; stems erect, 6-13 dm. tall, green, glabrous, angled, the branches spreading; leaves rhombic-ovate or triangular-ovate, 4-17 cm. long, long-acuminate, rounded or subcordate at the base, sharply sinuate-dentate, with 1 to 4 large teeth on each side or the uppermost entire; flowers in large open leafless panicles; calyx with the sepals oblong, slightly keeled, partly covering the fruit; pericarp moderately thin, greenish-hyaline, less reticulate, separable or attached to the seed; seed umbonate-lenticular, tapering from the raised center to the sharply defined margin, punctate, about 2 mm. thick, black. *C. hybridum* of Am. auth., non L. A nat. plant of weedy habit, widely distributed in waste places in N.A., except in the s.e. states, Que. to B.C., s. to Va., Wash., Calif., Tex. and N.M.; June-Aug.

20. *Chenopodium murale* L. Annual herb, deep-green, somewhat mealy, stout and succulent; stems loose, erect or decumbent, 1-6 dm. long, simple or commonly branching from the base, glabrous or sparingly farinose; leaves thin, ovate to rhombic-ovate, 2-8 cm. long, 2.5-5 cm. wide, acute or obtuse, subtruncate to cuneate at the base, coarsely sinuate-dentate, glabrate or often copiously farinose (at least beneath), lustrous on the upper surface, the petioles equaling or shorter than the blades; flowers sessile, more or less farinose, in naked clusters or glomerules, arranged in lax or dense axillary and terminal cymes or panicles; calyx deeply cleft, the oblong lobes obtuse, herbaceous, green, obscurely carinate, partially enclosing the fruit; stamens exerted; styles short; pericarp green, adherent to the seeds; seed horizontal, sharp-angled, 1.2-1.5 mm. broad, blackish, dull, pitted or finely punctulate, the margin acute. Sandy wastes, draws, cult. soils, a common weed in yards and waste places, nat. of Eur., Asia and Afr.; widely adv. and established nearly throughout N.A. from s. Can. to Guat. and the W.I.; Mar.-Oct.

21. *Chenopodium albescens* Small. Annual herb; stems erect, 4-10 dm. tall, much-branched, the branches stout, obtusely angled, strongly ascending, pale-green, striate, copiously and finely farinose; leaves broadly rhombic-ovate to oval, 2-4.5 cm. long, 13-25 mm. wide, mostly obtuse or rounded at the apex, usually short-cuspidate or apiculate, obtuse to cuneate at the base, shallowly sinuate-dentate, often with only 2 shallow rounded lobes at the base, thick, pale-green and glabrate on the upper surface, densely and finely farinose beneath; inflorescence usually copiously leafy, with smaller ovate-oblong to lanceolate or elliptic and acute or acuminate leaves, the petioles half as long as the blades; flowers in small glomerules, these in short stout dense paniculate spikes; calyx densely farinose to the very tips, deeply cleft, the lobes rounded-ovate and slightly carinate, completely enclosing the fruit; pericarp thin, free; seed horizontal, 1 mm. long, very smooth, black, shining, the margin obtuse. In dry soils, w. Kan. and Ia. to Colo., w. Tex., Nev. and N.M.; June-Aug.

22. *Chenopodium opulifolium* Schrad. Annual herb; stems erect or ascending, 3-10 dm. tall, much-branched, the branches slender or stout, ascending from a widely spreading base, the lower branches usually elongate, obtusely angled, dark-green, sparsely farinose or glabrate; leaves very broadly ovate-rhombic, 2-4 cm. long and usually as broad, rounded at the apex or obtuse, broadly cuneate to subtruncate at the base, often shallowly 3-lobed, sinuate-dentate with obtuse or acutish teeth, thin, bluish-green, glabrate on the upper surface, sparsely and very finely farinose beneath, the upper blades smaller, rhombic-ovate and often entire; flowers in rather small glomerules, these in stout dense paniculate spikes, the inflorescence commonly narrow and copiously leafy; calyx densely farinose, the lobes rounded-ovate and carinate, completely enclosing the fruit; pericarp adherent to the seed; seed horizontal, 1.1-1.5 mm. broad, nearly smooth, black and shining, the margin rounded. *C. viride sensu* Standl., non L. Nat. of Eur., Asia and N. Afr.; adv. at e. coast seaports from N.Y., N.J., Pa., Del. and Md.; also in Ill., Mo. and Tex.

23. *Chenopodium album* L. PIGWEED, LAMB'S-QUARTERS. Annual herb, pale-green, sometimes turning reddish; stems erect, stout, 6-30 dm. tall, usually simple below the inflorescence, paniculately branched above, usually white-mealy throughout to glabrous, obtusely angled, striate; leaves oval-rhombic, rarely ovate or lanceolate, 2.5-8 cm. long, usually conspicuously longer than broad, obtuse or rounded and apiculate at the apex, often shallowly 3-lobed, irregularly sinuate-dentate, rarely subentire, mostly thick, pale-green and glabrate above, very finely and commonly densely farinose beneath, the reduced upper blades ovate to lanceolate, usually entire, acute and mucronate, not hastate; flowers in large glomerules, these in dense axillary or terminal stout erect or ascending paniculate spikes to 3 dm. long, the inflorescence usually narrow and compact, rarely lax, grayish-green, sparsely leafy; calyx copiously and finely farinose, deeply lobed, the lobes green, white-margined, acutely keeled, completely enclosing the fruit; pericarp adherent to the seed; seed horizontal, black, shining, 1.1-1.5 mm. broad, nearly smooth to minutely pitted, the margin obtuse. *C. viride* L. A Euras. weed., Nfld. to Fla., w. to Yuk. and B.C., s. to Mex. and S.A.; N. Afr.; Apr.-Sept.

24. *Chenopodium missouriense* Aellen. Annual herb; stems to 15 dm. tall, glabrescent or farinose; leaves thin, rhombic-ovate, rarely exceeding 6 cm. long, variously toothed, the lower and median ones not more than 1.5 times as long as wide, coarsely toothed, the lower leaves more or less doubly toothed at the base, the upper leaves reduced to entire lanceolate bracts; inflorescence relatively flexuous and arching, densely flowered; flowers in glomerules in nearly the same stage of development, flowering about the second week of Sept.; calyx slightly farinose, the lobes sharply keeled, largely covering the fruit; pericarp closely adherent; seed 0.9-1.2 mm. broad, often punctulate. Roadsides, streets and alleys, in vacant lots, waste places and in cult. fields, widely distributed s. of N.E. and the Great Lakes Region in e. N.A., s. and w. to Mo., Tex. and Mex.

25. *Chenopodium giganteum* D. Don. Annual herb; stems erect, 1-3 m. tall, much-branched, the branches stout, ascending or erect from a spreading base, sharply angled, bright-green, striped with red, sparsely and finely farinose; leaves broadly rhombic, 6-14 cm. long and the lower ones fully as broad, obtuse or rounded at the apex, not apiculate, broadly cuneate to subtruncate at the base, usually shallowly 3-lobed, rather finely and irregularly sinuate-dentate, often doubly dentate with obtuse or acutish teeth, rather thick, bright deep-green on the upper surface, finely farinose beneath when young but soon glabrate, the smaller upper blades rhombic-ovate to oblong or elliptic, usually dentate, rarely entire, bright-red (at least when young); flowers in small glomerules, these in dense stout broadly paniculate spikes; calyx copiously farinose, usually reddish, the lobes slightly carinate. A cult. Eur. plant, sometimes escaping; adv. in s. Ga. and n. Fla., Tex. and Cuba; Arg.

26. *Chenopodium Berlandieri* Moq. PITSEED GOOSEFOOT. Annual herb, usually ill-scented but not always; stems erect, 4-15 dm. tall, much-branched, often simple at the base, the branches ascending, often from a spreading base, slender or stout, obtusely angled, striate, pale- to deep-green, glabrate; leaves rhombic-ovate or oval to oblong, 1.2-3 (rarely 4) cm. long, 6-13 mm. wide, acute or obtuse and mucronulate, irregularly sinuate-dentate, the teeth obtuse or acute, the blades usually not at all 3-lobed, broadly cuneate or rounded at the base, thick or rarely thin, often densely farinose when young,

becoming glabrate in age; leaf blades of the inflorescence reduced, ovate to linear-lanceolate, acuminate, often entire; flowers in small glomerules, these in slender or stout dense or interrupted paniculate spikes, the branches of the inflorescence usually slender, sometimes spreading, sparsely leafy; calyx densely farinose, deeply cleft, the broadly ovate lobes obtuse or acute and sharply keeled, completely enclosing the fruit; pericarp adherent to the seed; seed horizontal, 1-1.5 mm. broad, punctulate or smooth, black, shining, the margin obtuse or rounded. *C. texanum* Murr., *C. Palmeri* Standl. Dry soils, mainly on the Coastal Plain from Tex. and Mex. to Fla. and N.C.; adv. in N.E.; also Eur.; July-Sept.

Var. *Zschackei* (Murr.) Murr. Annual herb; stems 2-10 dm. tall; leaves thin to coriaceous, variable in size and shape but larger than in the other varieties; sepals usually strongly keeled; inflorescence leafy; seed 1.2-1.5 mm. thick. Cen. and w. U.S. and Can., e. to Ont., Ill., Ark. and Tex.; also in s.e. Pa. and s.w. Va.

Var. *Boscianum* (Moq.) H. A. Wahl. Annual herb; stems erect, 3-10 dm. tall, simple below; leaves very thin and membranaceous, 2-6 cm. long, the lower leaves broadly triangular-oblong to lanceolate, not prominently 3-lobed; calyx very slightly keeled, very sparsely farinose, the lobes obovate-orbicular, bright-green, white-margined; pericarp free from the seed; seed horizontal, 1.3 mm. broad, black, shining, the margin obtuse. In open woods, thickets, waste grounds and roadsides, s.w. Que. and s. Ont. to Minn., N.D. and Neb., s. to N.E., Ga. and Tex., most common from e. Tex. to Fla.; July-Oct.

Var. *sinuatum* (Murr.) H. A. Wahl. Annual herb; stems sparsely branched; leaves 25 mm. long, yellow-green, dusty, long-petioled, the lower and middle leaves definitely 3-lobed, the lateral lobes barely divaricate and 2-parted, the terminal lobe elongate, toothed (1 to 4 teeth) with the margins parallel nearly to the tip, the upper leaves narrow, simply hastate; inflorescence leafy, sparsely spicate-glomerulate, the glomerules yellow-dusty; keel of the perianth segments small; seed 1-1.3 mm. thick. Kan. to Tex., w. to Calif. and Mex.

5. SPINACIA L.

Three species that are native to the Mediterranean region and central Asia.

1. *Spinacia oleracea* L. SPINACH. Annual glabrous herb; stems stout, erect, 30-45 cm. tall, simple or branched; leaves alternate, numerous, the petioles 1-4 cm. long; blades triangular-ovate or oval, hastate or subhastate, 4-10 cm. long, acutish, entire or sinuate-dentate, the upper blades narrower than the lower ones, cuneate at the base; flowers unisexual or rarely perfect with both sexes on same plant; staminate glomerules arranged in interrupted terminal spikes; *staminate flowers* with a 4- or 5-parted perianth, the oblong segments obtuse, with 4 or 5 stamens inserted at the base of the perianth, the anthers exserted; *pistillate flowers* usually axillary, without a perianth, subtended by 2 bracts; fruiting bracts 2-4 mm. long, sessile, green, united except at apex and enclosing the utricle, usually with 2 stout divaricate spines; ovary subglobose; stigmas 4 or 5, capillary, connate at the base, long-exserted; ovule subsessile; utricle included in the cartilaginous or indurate bract tube; pericarp membranaceous, adherent to the seed; seed fuscous, dull, erect, rounded, slightly compressed, acute at base; embryo annular, surrounding the farinaceous endosperm; radicle inferior. Eur. garden plant, widely cult. over the World and occasionally escaped; spring-summer.

6. ATRIPLEX L. SALTBUSSH

Annual or perennial herbs or shrubs; stems usually furfuraceous; leaves alternate or opposite, sessile or petioled, entire, dentate to serrate or irregularly lobed or cleft; flowers solitary or clustered, axillary or in terminal spikes or panicles; staminate and pistillate flowers on the same or separate plants, either mixed in the inflorescence or the staminate flowers in axillary glomerules superior to or terminal to the pistillate axillary glomerules; *staminate flowers* ebracteate, with a 3- to 5-parted perianth, the obtuse segments oblong or obovate; stamens 3 to 5, inserted on the perianth base, the filaments united at the base or distinct, the anthers 2-celled; rudimentary ovary conical or lacking; *pistillate flowers*

each subtended by 2 bracts which enclose the fruit, distinct or united, fleshy, spongy or ligneous, the margins entire or variously indented, the backs smooth or variously appendaged, the perianth none or rarely of 1 to 5 squamellae or a 3- to 5-lobed membranaceous calyx, the stamens absent; ovary ovoid or depressed-globose; stigmas 2, subfiliform but thickened or compressed near the connate base; ovule either oblique or erect and with a short funiculus, or inverted and suspended from the end of an elongated funiculus; utricle with a membranaceous pericarp, this usually free from the seed; seed erect or inverted, rarely horizontal, the coats membranaceous to coriaceous or subcrustaceous; embryo annular around the farinaceous endosperm; radicle inferior, lateral or superior.

About 200 species, mostly in temperate and subtropical regions; ours mostly in saline or alkaline soils in desertic regions.

1. Radicle inferior; pistillate flowers all alike, without a perianth; bracts not inflated or spongiöse; annuals (2)
1. Radicle superior; plants never bright-green, with entire unappendaged bracts; annuals or perennials (3)
 - 2(1). Staminate perianth 4-cleft; plants decumbent, bright-green, glabrate; leaves mostly opposite (at least below); leaf blades usually hastate; fruiting bracts rounded-deltoid or ovate-deltoid 1. *A. patula* var. *hastata*.
 2. Staminate perianth 5-cleft; plants erect, densely furfuraceous; leaves all alternate; leaf blades all or most of them dentate, never linear; fruiting bracts rhombic to cuneate-orbicular 2. *A. rosea*.
- 3(1). Male and female flowers on the same plant; plants never fruticose, rarely suffruticose at the base; bracts united at least at the base (4)
3. Male and female flowers on separate plants, or polygamous (15)
 - 4(3). Fruiting bracts orbicular, pedicellate, 3 mm. long, finely and regularly radiate-dentate to the base, strongly compressed, the sides of the bracts smooth; terminal tooth of bract similar to the lateral ones 3. *A. elegans*.
 4. Fruiting bracts not orbicular or if so not radiate-dentate to the base nor strongly compressed (5)
 - 5(4). Fruiting bracts obovoid-globular, scarcely compressed, not flattened at the top, of loose fibrous and spongy consistency, the faces not appendaged, the margins entire 4. *A. holocarpa*.
 5. Fruiting bracts subtriangular, cuneate-orbicular to rhomboidal, the faces smooth or appendaged, the margins variously dentate (6)
 - 6(5). Leaf blades mostly deltoid to deltoid-ovate or broadly ovate, broadest at or near the base, usually entire; annuals (7)
 6. Leaf blades never deltoid nor ovate, usually broadest at or above the middle, the lower surface paler than the upper; bracts not truncate (10)
 - 7(6). Leaf blades truncate to cordate or clasping-cordate at the base (8)
 7. Leaf blades subhastate or angled at the base; fruiting bracts all alike on the same plant; bracts dentate well below the apex, compressed, the sides smooth or with a few short obtuse tubercles, the margins usually shallowly dentate (9)
 - 8(7). Fruiting bracts of 2 kinds on each plant; leaf blades petiolate, 1-3 cm. long, white, gray or scurfy 5. *A. saccaria*.
 8. Fruiting bracts all alike; leaf blades sessile, less than 1 cm. long, densely canescent-farinose, greenish-yellow 6. *A. Klebergorum*.
 - 9(7). Upper leaves short-petiolate, the lowest opposite, the margins smooth or sparsely tuberculate or cristate 7. *A. argentea*.
 9. Upper leaves sessile, the lowest alternate, the margins irregularly dentate or entire 7. *A. argentea* subsp. *expansa*.
- 10(6). Bracts red and succulent at maturity; perennial 8. *A. semibaccata*.
10. Bracts never succulent at maturity, usually herbaceous; annuals (11)

- 11(10). Leaf blades dentate (12)
 11. Leaf blades entire (13)
- 12(11). Staminate glomerules in elongate usually paniculate spikes; bracts 2-2.5 mm. long, their sides usually unappendaged; leaves white beneath, green above 9. *A. Wrightii*.
12. Staminate glomerules axillary or in very short simple spikes; bracts 3 mm. long, their sides tuberculate; leaves densely white-furfuraceous beneath, grayish-green and glabrate on the upper surface 10. *A. pentandra*.
- 13(11). Sides of bracts smooth, reticulate-veined; bracts compressed, 2-2.5 mm. long, longer than broad; staminate glomerules chiefly in terminal spikes 13. *A. Wardii*.
13. Sides of some of the bracts conspicuously tuberculate or cristate; leaf blades concolorous (14)
- 14(13). Staminate glomerules terminal or in terminal and axillary spikes; seeds about 2 mm. long; leaf blades 4-15 mm. wide 11. *A. arenaria*.
14. Staminate glomerules axillary; seed 1.5 mm. long; leaf blades 3 mm. wide or less 12. *A. texana*.
- 15(3). Bracts 4-winged longitudinally 14. *A. canescens*.
15. Bracts never longitudinally 4-winged, the sides smooth or variously appendaged (16)
- 16(15). Leaves opposite or nearly all opposite, the blades 1-1.5 mm. wide; bracts 2-3 mm. long, rounded at the apex 15. *A. matamorensis*.
16. Leaves alternate or only the lowest opposite (17)
- 17(16). Leaf blades dentate; perennial; fruiting bracts 8-15 mm. long, usually long-pedicellate, the sides with numerous long flattened appendages 16. *A. acanthocarpa*.
17. Leaf blades entire (18)
- 18(17). Perennial, usually less than 6 dm. tall; bracts 4-13 mm. long, sessile, the sides sparsely tuberculate or crested near the base, rarely smooth 17. *A. obovata*.
18. Perennial; tall shrubs with spinose branches, fruticose nearly throughout, to 6 dm. tall; bracts much longer than broad, 5-13 mm. long, entire or sparsely dentate, nearly sessile, the sides smooth, densely furfuraceous . 18. *A. confertifolia*.

1. *Atriplex patula* L. var. *hastata* (L.) Gray. Annual herb; stems erect to decumbent or procumbent, 3-9 dm. long, usually much-branched, the branches slender or stout, ascending or spreading, obtusely angled, sparsely or densely furfuraceous when young, often glabrate, green or stramineous; leaves usually opposite below, the others alternate, the petioles of the lower leaves up to half as long as the blades, the upper leaves very short-petioled; blades of the lower leaves broadly triangular to hastate or oval-hastate, 2.5-7 cm. long and nearly as broad, acute or obtuse at the apex, truncate at the base or with a rounded sinus, the margins entire or more usually sinuate-dentate or shallowly repand-dentate, the basal lobes acute, spreading or reflexed; blades of the upper leaves hastate-oblong to lanceolate and smaller, all the blades thin or succulent, bright-green or densely furfuraceous; flowers of both sexes usually on same plant, in slender or stout dense or interrupted naked simple or broadly paniculate spikes and usually also in axillary fascicles; staminate perianth usually 4-cleft; fruiting bracts sessile, rounded-deltoid or ovate-deltoid, 3-7 mm. long, herbaceous, united only at the truncate or rounded base, often reddish in age, acute, the margins denticulate or rarely entire, the sides usually short-tuberculate, densely furfuraceous or glabrate; seed 1.5-2.5 mm. long, nearly black; radicle inferior. Saline soils and salt marshes in rich soils, both coastal and inland, Nfld. to S.C., O., Ind., Ill., Mo., w. to B.C., Ore. and Calif., s. to Tex.; Eur., Asia and N. Afr.; June-Nov.

2. *Atriplex rosea* L. Annual herb; stems erect, 2-10 dm. tall, much-branched or simple at the base, the branches slender or stout, arched-ascending or rarely spreading, terete, stramineous or whitish, coarsely furfuraceous or glabrate; leaves alternate, the petioles

one third as long as the blades; blades ovate to rhombic-ovate or oval, 2-8 cm. long, 1-5 cm. wide, obtuse or acute, mucronulate, broadly cuneate or rounded at the base, sinuate-dentate above the base, with acute or obtuse teeth, thin, sparsely or densely furfuraceous, green or grayish, the uppermost leaves reduced, often entire or subhastate; flowers of both sexes on same plant, in many- or few-flowered axillary glomerules, usually also in interrupted naked terminal spikes; staminate perianth deeply 5-cleft; fruiting bracts sessile, rhombic to cuneate-orbicular, 4-5 mm. long, united at the base, acute, the margins dentate, the sides usually short-tuberculate; seed dark-brown, dull, orbicular, 1.5-2 mm. in diameter; radicle inferior. Roadsides, waste places, cult. areas, in alkaline soils, Wyo. to s. Wash., s. to s. Calif. and Mex.; adv. from N.Y. to Fla.; Eur., w. Asia, N. Afr. and Austral.; Aug.-Oct.

3. *Atriplex elegans* (Moq.) D. Dietr. WHITE-SCALE SALTBUSH. Annual or sometimes perennial herb; stems much-branched, the branches slender or stout, obtusely angled, 1.5-5 dm. long, ascending or procumbent, furfuraceous when young, usually glabrate in age; leaves alternate, numerous, sessile or short-petioled; blades oblong to oblanceolate or linear, 7-22 mm. long, 2-6 mm. wide, obtuse or acute at the apex, mucronulate, cuneate to attenuate at the base, remotely and irregularly repand-dentate or the upper ones entire, thin, closely white-furfuraceous beneath, usually green and glabrate on the upper surface; flowers of both sexes on same plant, in few-flowered axillary glomerules; calyx 5-parted; fruiting bracts short-pedicellate, 3 mm. long, orbicular, strongly compressed, coherent, the margins rather broad, green, deeply laciniate-dentate at the base, the sides carinate, furfuraceous, not appendaged; seed 1 mm. long; radicle superior. In alkaline soils, w. Tex. to s. Ariz., Baja Calif. and s. into Mex.

4. *Atriplex holocarpa* F.v.Muell. POP SALTBUSH. Perennial herb with a hard almost woody base; stems branching, diffuse or procumbent, 15-30 cm. tall, softly mealy-tomentose; leaves alternate, the petioles rather long; blades obovate or rhombic, irregularly toothed, 1-3 cm. long; flowers of both sexes on same plant, all axillary, the male flowers in the upper axils surrounded by female flowers, the female flowers only and usually few together in most axils, very small and globular at time of flowering; fruiting perianth obovoid-globular, scarcely compressed, not flattened at the top, about 1 cm. thick, of a loosely fibrous and spongy consistency, with a thin membranaceous epidermis and a thin inner membrane scarcely distinguishable from the pericarp and sometimes hardening over the seed as it ripens; summit of the perianth with a small orifice closed by 2 erect appressed entire or 3-toothed valves, rarely over 1 mm. long; seed with a superior radicle. Nat. of Austral.; a good forage plant, cult. in Wyo.; also known from Taylor Co., Tex.

5. *Atriplex saccaria* Wats. Annual herb; stems erect, terete, 1-5 dm. tall, much-branched to form a globose plant, stout, angled, roughly furfuraceous throughout; leaves alternate, numerous, 1-3 cm. long, all petiolate or the upper ones sessile, the petioles 2-5 mm. long; blades broadly cordate-ovate or subreniform, cordate or some broadly truncate at the base, acute at the apex, entire, thick, gray or whitish-scurfy; flowers of both sexes on same plant; *staminate glomerules* in the upper axils or in short naked terminal spikes; *pistillate flowers* usually in fascicles of 1 to 3 in the lower axils; calyx 5-cleft; fruiting bracts of 2 kinds; larger fruiting bracts on pedicels 4-6 mm. long, united at the base, round-triangular or suborbicular, 4-6 mm. long, irregularly and coarsely dentate; smaller fruiting bracts in the same axils, oblong to cuneate, 3 mm. long, truncate at the apex, dentate only at the summit, the faces smooth; seed brown, 1.5-2.2 mm. long; radicle superior. Dry alkaline ground, dry plains and hillsides, s.w. Wyo. to e. Ut. and Nev., s. to Tex., n.w. N.M., Colo. and Ariz.

6. *Atriplex Klebergorum* M. C. Johnst. Annual herb with a ligneous vertical taproot 5-9 mm. thick, pale-barked; stems erect, diffuse, the branches alternate, numerous, 15-40 cm. long, horizontal or distally ascending, terete, densely white-farinose when young, glabrate in age, acquiring thin flaky pale-brownish-white bark, the internodes mostly shorter than 1 mm.; leaves alternate, the lowermost subopposite, sessile, the larger ones 1 cm. long, ovate-deltoid, acute at the apex, truncate or slightly clasping at the wide base, the margins entire or toothed, rather firm and flat, very densely canescent-farinose with a greenish-yellow tinge; flowers unisexual with both sexes on same plant, sessile, axillary, inconspicuous, mostly in leafy lateral branches with extremely short internodes,

arising toward the tips of the secondary branches; *staminate flowers* solitary in the most distal axils, about 2 mm. wide, of 5 curved elliptic mucronulate mostly hyaline tepals, farinose dorsally and about 1.5 mm. long, the 5 large anthers opposite the tepals and nearly filling the perianth, the white filaments filiform and 1-1.3 mm. long; *pistillate flowers* densely farinose on the outside, the bracts inseparable from the ovary; styles 2, brown, filiform, about 3 mm. long, diverging from the apical depression between the teeth; fruit indehiscent, nutlike; fruiting bracts densely and coarsely furfuraceous, ovate-orbicular, 4-6 mm. in diameter, variably and irregularly 3- to 7-cleft around the margins, the divisions truncate and irregularly and indistinctly doubly cristate laterally; seed round-lenticular, about 1.5 mm. in diameter, dark-reddish-brown, shining; embryo peripheral, almost encircling the copious white endosperm; radicle superior. In silty or clayey soils, s. coastal Tex.; endemic.

7. *Atriplex argentea* Nutt. Annual herb; stems 15-60 cm. tall, erect, branched from the base, the plants globoid in outline, the branches rather stout, angled, furfuraceous when young; leaves opposite below, subsessile or petioled above, 2-5 cm. long; blades triangular-ovate to rounded-ovate, the margins smooth or sparsely tuberculate or cristate, gray-furfuraceous but sometimes glabrate, the upper surface greener; flowers of both sexes on same plant, the staminate ones in the upper axils or in short dense spikes or the staminate and pistillate flowers mixed in axillary clusters at least at the middle of the plant; fruiting bracts 4-8 mm. long and as wide, united to the middle or above, obovate to cuneate-orbicular, the margins green, subentire to laciniate, the faces smooth or appendaged; seed brown, 1.5 mm. long; radicle superior. Alkaline grounds, plains and valleys, Sask. to Ore., s. to N.M., Tex. and Calif.; introd. in e. U.S.; also in w. Minn. and w. Mo.

Subsp. *expansa* (Wats.) Hall & Clem. Annual herb or perennial; stems erect, 3-12 dm. tall, much-branched, forming clumps 3-10 dm. broad, finely mealy-scurfy; leaves alternate, with petioles 2-21 mm. long on the lower leaves; blades 3-nerved at the base, ovate to lanceolate-ovate or deltoid-ovate, irregularly dentate or entire, 25-75 mm. long and often as broad, the upper leaves reduced to sessile and more or less cordate floral bracts as broad as long or broader than long; spikes elongated, slender; flowers in small axillary glomerules or the glomerules in short naked terminal spikes; perianth 5-cleft; fruiting bracts sessile to subsessile, roundish, mostly 3-nerved, 5-7 mm. long, 2-4 mm. broad, the margins sharply dentate, the sides smooth or with a few irregular green projections or crests, or unappendaged; seed brown, 2 mm. long; radicle superior. Low alkaline valleys and bottomlands, Colo., Ut. and Nev., s. to w. Tex., Calif. and Mex. The more common form in the west.

8. *Atriplex semibaccata* R. Br. AUSTRALIAN SALTBUSH. Perennial herb from a woody elongated taproot; stems prostrate, diffusely spreading from the base, 6-12 dm. long, woody below, much-branched, the slender branches terete and 3-10 dm. long, whitish, sparsely furfuraceous or glabrate; leaves numerous, alternate, short-petioled; blades oblong or obovate-oblong, 1-3.5 cm. long, 2-9 mm. wide, obtuse or acute, cuneate to attenuate at the base, remotely repand-dentate or the upper ones entire, thin, densely and finely white-furfuraceous beneath, usually glabrate and green on the upper surface; flowers of both sexes on same plant, solitary or in small clusters in the axils, the staminate and pistillate flowers usually mixed in the same cluster or the staminate clusters in terminal glomerules; fruiting bracts sessile, red, slightly succulent, rhomboidal, acute, stipelike at the base, united for about one half, toothed at the lateral angles, 3-5 mm. long, smooth on the 3-nerved sides; seed 2 mm. long, dark-brown; radicle lateral. Nat. of Austral.; cult. as a forage plant and becoming spontaneous in Calif. and Ariz. to s. N.M. and Tex.

9. *Atriplex Wrightii* Wats. Annual herb; stems erect and ascending, 1.5-10 dm. tall, sparsely branched or simple at the base, the branches stout, obtusely angled, furfuraceous when young, usually glabrate in age; leaves numerous, alternate, sessile or short-petioled; blades linear to oblong, 15-75 mm. long, 3-25 mm. broad, rounded to acute at the apex, mucronate, cuneate to long-attenuate at the base, coarsely sinuate-dentate or entire, thin, densely and closely white-farinose beneath, usually green and glabrous on the upper surface; flowers of both sexes on the same plant; *staminate flowers* in glomerules, small, forming slender usually dense naked terminal narrowly paniculate spikes, the panicles 6-30 cm. long; *pistillate flowers* in few-flowered axillary clusters; calyx 5-cleft; fruiting

bracts short-pedicellate, cuneate-orbicular or broadly cuneate, 2-2.5 mm. long, united below, compressed, the apex rounded, acutely 5-dentate, the sides 3-nerved, usually not appendaged, rarely obscurely tuberculate; seed 1 mm. long, pale-brown; radicle superior. In alkaline soils, s. Calif. and Nev. to N.M. and Tex., s. to Mex.

10. *Atriplex pentandra* (Jacq.) Standl. Annual or perennial herb, often suffrutescent at the base; stems much-branched, the branches stout or slender, obtusely angled, ascending or procumbent, 3-8 dm. long, finely furfuraceous when young, glabrate in age; leaves alternate, sessile or short-petioled; blades oblong or rhombic-ovate to broadly obovate or narrowly oblong, 1-3 cm. long, 3-15 mm. broad, rounded to acute at the apex, mucronate, cuneate at the base, repand-dentate or sinuate-dentate to undulate or the upper ones entire, thin, densely white-furfuraceous beneath, grayish-green and usually glabrate on the upper surface; male and female flowers on the same plant; *staminate flowers* in short dense naked terminal spikes; *pistillate flowers* fascicled in the axils; calyx 5-cleft, the lobes with green keels; fruiting bracts sessile, broadly cuneate-orbicular, 3 mm. long and usually broader, united only at the truncate or broadly cuneate base, compressed, much-thickened at maturity, the margins deeply and acutely dentate, the sides with 2 dentate crests or covered with irregular conic-acute corky tubercles; seed brown, 1.5 mm. long; radicle superior. Sandy seashores, s. Fla. to Tex.; W.I.; Venez. and Col. to Peru.

11. *Atriplex arenaria* Nutt. QUELITE. Annual herb; stems erect, ascending or procumbent, much-branched, 1-5 dm. long, stout, obtusely angled, furfuraceous when young, glabrate in age; leaves alternate, short-petioled or sessile; blades oblong or oval to broadly obovate or narrowly oblong, 1.2-4 cm. long, 4-15 mm. broad, rounded to acute at the apex, mucronate, rounded to cuneate at the base, entire or undulate, rarely with 1 or 2 teeth, thin, densely whitish-furfuraceous beneath, grayish-green and glabrate on the upper surface; male and female flowers on same plant; *staminate* glomerules terminal or in dense or interrupted terminal or axillary naked spikes; *pistillate* flowers fascicled in the axils; fruiting bracts subsessile, cuneate-orbicular, 3-5 mm. long, usually broader, compressed, united to the middle, the apex rounded, 3- to 5-dentate with the teeth subequal, the sides irregularly tuberculate or with 2 lateral dentate crests, rarely not appendaged; seed reddish-brown, 2 mm. long; radicle superior. Sandy seashores, N.S. to Tex.; Berm. and Cuba.

12. *Atriplex texana* Wats. Annual herb from a long slender taproot, scurfy-pubescent; stems erect or ascending, rarely decumbent, sparsely and finely furfuraceous, terete, 1-5 dm. long, much-branched; leaves alternate, numerous, short-petioled or sessile; blades oblong-spatulate to oblong-oblongate, 6-25 mm. long, acute or obtuse at the apex, entire or unevenly repand-dentate, narrowed into short petioles, very closely furfuraceous; flowers of both sexes on same plant, in few-flowered axillary clusters, the *staminate* glomerules sessile in the uppermost axils; calyx 5-cleft; styles exserted; fruiting bracts sessile or subsessile, broadly cuneate to suborbicular, 2.5-4 mm. long, united at the base, with coarse equal triangular teeth, the faces reticulated and crested with 2 rows of acute tubercles, the margins green, deeply or shallowly dentate; seed 1.5 mm. long, reddish-brown; radicle lateral. *A. tuberculata* Coult. On hillsides, s. and w. Tex. to Mex.; spring-summer.

13. *Atriplex Wardii* Standl. Annual herb, rather rigid in appearance; stems erect, 1.5-2 dm. tall, much-branched, the branches stout, obtusely angled, ascending, furfuraceous; leaves alternate, sessile or nearly so; blades oblong, 1-2 cm. long, 2-5 mm. wide, obtuse or acutish at the apex, mucronate, cuneate at the base, entire, thin, densely white-furfuraceous beneath, glabrate on the upper surface; male and female flowers on the same plant; *staminate* glomerules in short dense naked terminal spikes; *pistillate* flowers densely fascicled in the axils; calyx 5-cleft; fruiting bracts sessile, broadly cuneate-obovate, 2-2.5 mm. long, 1.5-2 mm. broad, compressed, united to above the middle, thin even in age, the apex acutish, the free margin obscurely denticulate, the sides reticulate-veined, not appendaged; seed brown, 1 mm. long; radicle superior. In the Rio Grande Plains and Valley; endemic.

14. *Atriplex canescens* (Pursh) Nutt. FOUR-WING SALTBUSSH. Perennial herb, usually over 4 dm. (to 25 dm.) tall, woody throughout, loosely to densely branched; stems erect, rather stout, gray-scurfy; leaves 1-5 cm. long, sessile or nearly so, linear-spatulate to

narrowly oblong, cuneate at the base, usually obtuse at the apex, entire, rather thick, with a gray scurf, becoming glabrous; male and female flowers on separate plants, rarely on same plant, the staminate flower in glomerules in dense spikes of long terminal panicles that are leafy below; body of fruiting bracts little-compressed, united to the summit, conspicuously 4-winged from the sides and back of the bracts, faces smooth or with small appendages, the whole bract 4-15 mm. long, rarely longer; seed brown, 1.5-2.5 mm. broad; radicle superior. Dry mesas and alkaline valleys, prairies and hillsides, the most widely distributed species in Tex., Apr.-Oct.; Alta. and S.D. to Wash., s. to Ariz., Tex., Mex. and Calif.

15. *Atriplex matamorenensis* A. Nels. **QUELITE CENIZO**. Perennial herb from a woody taproot, somewhat scurfy; stems erect or ascending, 1-4 dm. tall, woody below, branched at the base, sparsely branched above or simple, the slender branches densely leafy and rather sparsely and closely furfuraceous, terete; leaves mostly opposite, sessile; blades thick, oblong or oblong-lanceolate, 2-5 mm. long, about equaling the nodes or surpassing them, acute, broadest at the base, densely grayish-furfuraceous; male and female flowers on separate plants, the pistillate ones solitary or in small axillary glomerules in stout leafy spikes; fruiting bracts sessile, suborbicular, 2-3 mm. long and broad, strongly compressed, united to above the middle, dentate nearly to the base, the triangular teeth acute, the faces 3-nerved, the sides not appendaged, furfuraceous; seed yellowish, 1 mm. broad; radicle superior. *A. oppositifolia* Wats., non Vill. In alkaline soils, s.w. Tex. and adj. Mex.; summer-fall.

16. *Atriplex acanthocarpa* (Torr.) Wats. Perennial evergreen shrub from a woody root, appressed-scurfy; stems erect, 3-10 dm. tall, branched, woody especially below; leaves alternate or the lowest opposite, silver-gray, short-petioled or subsessile; blades oblong to oblong-lanceolate, commonly subhastate, 1.5-5 cm. long, 5-25 mm. broad, acute, entire or sinuate, cuneately narrowed; male and female flowers on separate plants, the *staminate* ones in large glomerules in dense interrupted sparsely leafy paniculate spikes, the *pistillate* flowers fewer to solitary in axillary clusters; calyx 5-cleft, densely furfuraceous; mature bracts 8-15 mm. long, on slender or stout pedicels 4-20 mm. long, united to the linear apex, spongy, the edges deeply lacinate, the faces appendaged with flattened tubercles (to 8 mm. long); pedicel of fruit to 12 mm. long; seed 1.5-2 mm. long, broad; radicle superior. In alkaline soils, used for windbreaks, roadside cover and as ornamentals, w. Tex. to adj. Mex. and s. N.M.; summer-fall.

17. *Atriplex obovata* Moq. Perennial herb forming roundish bushes 2-5 dm. tall (rarely to a meter); stems erect, woody and fruticose at the base or sometimes nearly throughout, much-branched below, the branches slender or stout, terete, furfuraceous; leaves alternate or the lowest opposite, numerous, short-petioled or sessile; blades oblong to broadly oval or rounded-ovate, 1-2 cm. or rarely 3 cm. long, 6-13 mm. wide, round at the apex, obtuse to cuneate at the base, entire, usually thick, densely furfuraceous; male and female flowers on separate plants; *staminate* glomerules in slender or stout axillary or simple (or terminal and paniculate) naked spikes; *pistillate* clusters few-flowered, axillary, forming mostly naked simple or paniculate spikes; calyx 5-cleft; fruiting bracts cuneate-orbicular, usually sessile, 4-8 mm. long and somewhat broader (5-7 mm.), united only at the base, the margins herbaceous, denticulate, the sides sparsely tuberculate or crested near the base or rarely smooth; seed 1-1.5 mm. broad, reddish-brown; radicle superior. *A. Greggii* Wats. In alkaline soils and dry ground, w. and s.-cen. Colo., s. to w. Tex. and s. N.M. to Mex.

18. *Atriplex confertifolia* (Torr. & Frém.) Wats. Perennial shrub, compact and round, to 6 dm. tall, rigidly branched; stems, branches and twigs becoming spiny; leaves alternate, ovate to obovate or rarely elliptic, commonly caducous, 12-41 mm. long, 8-21 mm. wide, entire, the apex obtuse or rounded, abruptly cuneate at the base, the petioles 1-7 mm. long; axillary bud leaves ovate or obovate to elliptic, 1-12 mm. long, 1-7 mm. wide, persistent; male and female flowers on separate plants, in subpaniculate spikes, in fruit very dense; fruiting bracts sessile, ovate or elliptic, 5-13 mm. long, 5-10 mm. wide, convexly united and ligenous around the fruit, free, herbaceous and divergent above, not constricted basally, the margin entire or rarely undulate to denticulate or serrulate; seed oval, 1-2 mm. long, reddish-brown. Widely spread over alkaline desert valleys and hills, or bluffs, in Trans-Pecos Tex. and the Panhandle; e. Ore. to w. N.D., s. to Ariz., N.M., Tex. and Mex.

7. SUCKLEYA GRAY

A monotypic genus of southwestern United States.

1. *Suckleya suckleyana* (Torr.) Rydb. POISON SUCKLEYA. Annual succulent herb; stems stout, terete, diffusely branched, 2-4 dm. long, prostrate or ascending, sparingly scurfy-mealy or glabrate; leaves alternate, with petioles equaling or exceeding the blades; blades orbicular to rhombic-ovate, 1-3 cm. long, rounded at the apex, abruptly short-cuneate at the base, repand-dentate with short triangular acute or obtuse teeth, sparsely furfuraceous when young, soon glabrate; male and female flowers on same plant, in dense clusters in the axils of nearly all the leaves; *staminate flowers* in upper axils, without bracts or bractlets; calyx subglobose, membranaceous, 3- or 4-parted, 2 of the segments larger than the others, spatulate, not appendaged; stamens 3 or 4, their short filaments broad and flattened; *pistillate flowers* bibracteate; bracts conduplicate, ovate-rhombic and subhastate, obcompressed, carinate, connate below the middle, in fruit narrowly winged dorsally, the wings crenulate, glabrous or nearly so; with 2 short filiform stigmas; utricles enclosed by the bracts, compressed, the pericarp thinly membranaceous, free; seed ovate, compressed, orbicular, filling the cavity, 3 mm. long, reddish-brown; embryo hippo-crepiform or subannular, surrounding the copious endosperm; radicle superior. Valleys, along streams, Mont. and Colo. to Tex.; July-Aug.

Known to cause cyanide poisoning in livestock.

8. EUROTIA ADANS.

About 8 species in the Old World and New World.

1. *Eurotia lanata* (Pursh) Moq. COMMON WINTER-FAT. Perennial shrub, woody only at the base; stems 2-8 dm. tall, the branches stout, erect, densely white or brownish stellate-pubescent, mixed with slender long hairs; leaves alternate, sessile or short-petioled; blades 1.5-5 cm. long, linear to lanceolate, pubescent, entire, the margins strongly revolute; inflorescence in panicles, conspicuously pilose, appearing cottony, the indurate apices of the bracts noticeable in the hair; flowers usually imperfect, the plants usually either staminate or pistillate and only a few flowers of the other sex present, in axillary glomerules or in terminal spikelike clusters; *staminate flowers* with 4-parted villous perianth and 4 stamens; *pistillate flowers* without perianth, enclosed by a pair of long villous bracts which are united into a villous 2-beaked tube, connate below, accrescent and enclosing the utricles in fruit, finally dehiscent; styles 2; pericarp free from the seed, membranaceous; seed erect, compressed, vertical; embryo nearly annular; radicle inferior. Dry plains and slopes in w. and n.w. Tex., Apr.-Sept.; Sask. to Wash., s. to w. Kan., Tex., N.M. and Calif.; a valuable browse, being succulent throughout the winter.

Var. *subspinosa* (Rydb.) Kearn. & Peeb. BUSH WINTER-FAT. Perennial shrub; stems 4-10 dm. tall, the branches slender, ascending or spreading, becoming more or less spinescent in age, densely and finely stellate-pubescent with whitish hairs; leaves alternate or fasciculate; blades linear to linear-oblong, 5-30 mm. long, 1-4 mm. wide, obtuse, finely stellate-pubescent, the margins revolute; fruiting bracts 6 mm. long, the horns about 2 mm. long. Stony hillsides, Ut. and Nev. to s. Calif., n. Mex. and w. Tex.

9. KOCHIA ROTH SUMMER-CYPRESS

Annual or perennial herbs or low shrubs, woody at the base; stems erect, much-branched often to form pyramidal or rounded bushes, pubescent or rarely glabrous; leaves alternate or opposite, linear, often terete, entire, fascicled; flowers mostly perfect or some pistillate only, axillary, sessile, solitary or in small glomerules, without bracts; calyx herbaceous, 5-cleft, persistent over the fruit and finally developing horizontal scarious or membranaceous wings; stamens 3 to 5, usually exerted, the filaments compressed; ovary subsessile, depressed, the stigmas 2 or rarely 3, the styles filiform; utricles depressed-globose, with membranaceous persistent pericarp which is free from the seed; seed horizontal; embryo nearly annular, green; endosperm none.

Nearly 100 species, all but one in the Old World.

1. Annual herb; leaves petiolate, the thin blades lance-linear; calyx wings minute
 1. *K. scoparia*.
 1. Perennial herb; leaves sessile, the succulent blades terete or nearly so; calyx wings
 large and conspicuous 2. *K. americana*.

1. *Kochia scoparia* (L.) Roth. BELVEDERE. Annual herb; stems erect, much-branched, the branches erect or ascending, 3-15 dm. tall, very leafy, glabrous or short-pilose, becoming bright-red with age; leaves alternate, linear to linear-acute, 2-7 cm. long, 3-8 mm. broad, usually prominently 3- to 5-veined, tapering at the base to a slender petiole, those of the inflorescence smaller and without evident petioles, much-exceeding the small flower clusters, sometimes pilose-sericeous; flowers sessile, clustered in the axils of the leaflike but reduced bracts, forming short dense leafy spikes, pilose or glabrate in age; calyx 1.5-2 mm. broad, strongly winged horizontally, the triangular wings obtuse and 0.6 mm. long or less, not nerved; seed 1.5 mm. in diameter. *K. alata* Bates. A wasteland weed, nat. of Eur.; escaped from cult. in many parts of the U.S.; June-Aug.

Var. *culta* Farw. MEXICAN FIRE-BUSH. This is the most common form in cultivation; grown primarily for its globular dense habit and the foliage which turns purplish-red in autumn. Escaped from cult. in many areas of the U.S.

2. *Kochia americana* Wats. PERENNIAL SUMMER-CYPRESS. Perennial herb from a woody base; stems numerous, erect, 1.5-5 dm. (to 13 dm.) tall, loosely branched at or just above the base, simple above or occasionally with few erect branches, usually more or less villous-tomentose when young but soon glabrate; leaves numerous, sessile, often fascicled; blades 6-25 mm. long, terete but flattish when dry, fleshy, acutish, erect or spreading, sparsely sericeous or glabrous; flowers solitary or in 2's or 3's, white-tomentose; perianth in fruit 2 mm. broad, the flabellate wings 2 mm. long, distinct, membranaceous, crenulate, finely nerved; utricle glabrate; seed 2 mm. in diameter. Roadside alkaline plains and marshes, Wyo. and Colo. to w. Tex., n.w. N.M. and Calif.; summer.

10. BASSIA ALL. SMOTHER-WEED

About 10 species that are native to the Old World.

1. *Bassia hyssopifolia* (Pall.) O. Ktze. Annual herb; stems erect, 2-5 dm. tall, much-branched from the base, tomentose and villous, the branches terete or angulate; leaves alternate, numerous, sessile, linear to oblanceolate or narrowly oblong, obtuse to acute, 1-4 cm. long, often succulent, entire, reduced above, green or grayish-green, silky villous to appressed pilose; spikes numerous, about 4 mm. in diameter; flowers perfect, about 1 mm. broad; perianth 5-lobed, densely woolly, the teeth becoming prolonged into red hooked spines in the fruit; stamens 5, exerted, hypogynous; ovary ovoid, attenuate to a short or elongate style, with 2 or 3 capillary stigmas, the ovule subsessile; utricle with a transverse wing, enclosed in the perianth, membranaceous or indurate at the apex, indehiscent, the pericarp free from the seed; seed grayish-brown, dull, horizontal or nearly vertical; embryo annular, enclosing the scanty endosperm; radicle centrifugal. Waste places, especially in alkaline soils, nat. of Euras., introd. from w. Asia; Mass. to N.Y., w. to Pac. States; Trans-Pecos Tex., s. N.M. to n. Mex.; June-Sept.

11. CORISPERMUM L. TICKSEED

Annual caulescent herbaceous plants; stems much-branching, glabrous or pubescent, the pubescence of stellate hairs; leaves alternate, sessile, entire, 1-nerved, those of the inflorescence reduced to shorter but broader scarious-margined bracts; flowers perfect, solitary or in glomerules in the axils of the bracts, arranged in dense or lax spikes, green and small; perianth segments 1 to 3, minute, unequal, the posterior one largest, erect, 1-nerved, scarious, unchanged in the fruit; stamens 1 to 3, rarely 5, hypogynous, exerted, one of them longer; ovary exerted, with 2 stigmas, recurved and connate at the base; utricle ellipsoid to orbicular, plano-convex, indurate, the margins winged or merely acute; pericarp membranaceous and adherent to the seed; seed erect; embryo annular, surrounding the copious endosperm; radicle inferior.

About 60 species in the North Temperate Zone.

1. Fruit 3.5-4.5 mm. long; lower bracts as broad as or broader than the fruit
1. *C. hyssopifolium*.
1. Fruit 2-3.5 mm. long; lower bracts narrower than the fruit
2. *C. nitidum*.

1. *Corispermum hyssopifolium* L. Annual herb; stems slender, 1-6 dm. tall, spreading, much-branched, glabrous or finely stellate-villous, striate, often tinged with red, sparsely leafy; leaves often deciduous early, sessile; blades linear or linear-lanceolate, 1-7 cm. long, 1-3 mm. broad, cuspidate, glabrous or stellate-pubescent; spikes loosely or densely flowered, 2-8 cm. long, 4-8 mm. thick; bracts often overlapping, 4-10 mm. long, ovate or lanceolate, long-acuminate, scarious-margined, stellate-pubescent or glabrous, concealing the fruits; fruit (achenes) blackish, 3.5-4.5 mm. long, broadly ovate to elliptic or obovate to orbicular, to 0.5 mm. wide, short-mucronate, with a narrow firm wing; seed vertical; radicle inferior. Introd. from Euras., sandy or gravelly banks, shores of Great Lakes, Ont. and N.D., Alta. and Wash., s. to N.Y., Kan., Mo., Tex., Colo., Ariz. and Mex.; adv. along railroads and waste places elsewhere.

2. *Corispermum nitidum* Schult. Annual caulescent herb with villous foliage or glabrous at maturity; stems much-branched, 2-5 dm. tall, striate, tinged with red, glabrous or sparsely stellate-villous; leaves alternate, 1-5.6 cm. long, 1-2 mm. wide, narrowly linear, cuspidate, finely stellate-pubescent to glabrate, ascending or spreading; spikes slender, usually laxly flowered, 3-4 mm. in diameter; bracts scarcely imbricate; upper bracts 2-8 mm. long, ovate-lanceolate, scarious-margined, as broad as the fruit, stellate-pubescent; lower bracts linear or linear-lanceolate, 8-20 mm. long, narrower than the fruit; fruit greenish-black, 2-3.5 mm. long, narrow but conspicuously winged, pale. Introd. from Euras., in sandy fields and dry soils, Arctic Am. to Wash., Tex. and Ariz.; shores of Lake Mich., in Ind. and Ill.; adv. in waste places in Mo., N.D. to Ida., southw.; summer-fall.

12. ALLENROLFEA O. KTZE.

Four species that are native to America.

1. *Allenrolfea occidentalis* (Wats.) O. Ktze. PICKLE-WEED. Perennial suffrutescent succulent glabrous shrub 3-15 dm. tall; stems alternate, green or more or less glaucous, much-branched, the articulate branches ascending or spreading, the younger ones 1-3 mm. in diameter, the joints 2-10 mm. long; leaves alternate, very short, reduced to scales, triangular, clasping, acute or acutish, soon deciduous or often nearly obsolete; spikes very numerous, 6-25 mm. long, 2.5-4 mm. thick, obtuse; flowers perfect, sessile, with fleshy peltate bracts in dense cylindrical spikes; perianth much-reduced, obpyramidal, fleshy, angled, usually 4- or 5-lobed, unchanged in the fruit which it encloses; stamens 1 or 2, the filaments exerted, the anthers broadly oblong or orbicular; stigmas 2 or 3, short, usually distinct; utricles ovoid, compressed, enclosed in the spongy fruiting calyx; pericarp membranaceous and free; seed erect, oblong, smooth, brown or reddish-brown, about 0.6 long; embryo partly enclosing the copious endosperm; radicle inferior. In strongly alkaline places, Ore. to w. Tex., Baja Calif. and Son.; Apr.-Sept.

13. SALICORNIA L. GLASSWORT. SALADILLA

Annual or perennial herbs or subshrubs, often suffrutescent and succulent; stems much-branched, glabrous, fleshy, with opposite articulate branches, the joints dilated at the apex into a short sheath; leaves scalelike, opposite; flowers perfect or polygamous, sunk in the cavities of the internodes, 3 to 7 together on opposite sides of the joints, partly crowded by the sheathing fleshy bracts, the flowering joints forming cylindric terminal spikes, the flowers usually connate and adnate to the joints; perianth obpyramidal, fleshy, with a 3- or 4-toothed or truncate border, spongiose in fruit; stamens 1 or 2, the anthers exerted and didymous, the filaments filiform or subulate; style lacerate above or ending in 2 subulate stigmas; ovule subsessile; utricle included in the perianth, ovoid or oblong, the pericarp membranaceous; seed erect, oblong or ellipsoid, compressed, covered with short or long straight or curved hairs; endosperm none; embryo conduplicate; radicle inferior.

About 35 species in temperate and tropical regions of both hemispheres.

1. Stems annual; middle flowers higher than the lateral ones; seed 1.5-2 mm. long 1. *S. Bigelovii*.
1. Stems perennial with prolonged subligneous depressed stems and rhizomes; flowers nearly equal in height (2)
- 2(1). Primary branches of stems prostrate, rooting freely, the erect or ascending flowering branches usually simple and slender; spikes 2.5-3 mm. thick 2. *S. virginica*.
2. Primary branches erect or decumbent, not rooting, usually much-branched, the branches stout; spikes 4-5 mm. thick 3. *S. utahensis*.

1. *Salicornia Bigelovii* Torr. Annual herb, stout and succulent; stems erect, 1-6 dm. tall, green, with few to many stout spreading or ascending branches, the joints 7-25 mm. long and 2-3 mm. thick; sheaths 2-lobed, the lobes acutely mucronate, 2-4 mm. long, ovate to triangular-ovate, acuminate, at length spreading; spikes obtuse, 2-12 cm. long, 4-6 mm. thick, the joints 2-3.5 mm. long and 4.5-6 mm. thick; flowers 3 in each group; lateral flowers contiguous below the acute lower angle of the central one; middle flower slightly higher than the lateral ones, reaching very nearly to the edge of the joint; seed nearly black, 1.5-2 mm. long, covered with short curved hairs. Salt marshes and flats along the Atl. and Gulf coasts of N.A. from N.S. to Fla. and Tex., s. to Yuc., W.I. and Bah. I.; also Calif.; Aug.-Nov.

2. *Salicornia virginica* L. Perennial succulent herb, forming extensive mats, from subligneous rhizomes freely forking in sand; stems decumbent or trailing, rooting freely at the nodes, the branches 1-7 dm. long, greenish, turning lead-colored or pale-brown; spikes 1-6 cm. long, 2.5-3 mm. thick, mostly solitary at the tips of the ascending branches or peduncled along some axes, loosening in age, the sheaths rounded or the lobes acutish; joints 2.5-3 mm. long, 3-4 mm. thick; flowers in groups of 3; central flower cuneate-obovate, truncate across the top, scarcely surpassing the obliquely ovate lateral ones; mature scales broader than high, broadly ovate, with prominent horizontally divergent firm margins; seed 0.7-1 mm. long, a little longer than broad, densely covered with slender curved hairs. *S. perennis sensu* Standl., non Mill. Coastal salt marshes and flats, sea coasts, s. N.H. to Fla and Tex.; Alas. to Calif.; widely distributed in the W.I., w. Eur. and N. Afr.; Aug.-Oct., year round southw.

3. *Salicornia utahensis* Tidestr. UTAH SAMPHIRE. Perennial herb, suffrutescent at the base; stems 1.5-3 dm. tall, solitary or clustered, erect or decumbent, not rooting, sparsely- or much-branched, the branches erect or decumbent; joints 7-18 mm. long and 2-5 mm. thick; scalelike leaves connate, broadly triangular, about 3 mm. long, scarious-margined; spikes few, 1-2 cm. long, 4-5 mm. thick, on short lateral branches; flowers 3 in each cluster, subequal, of about the same height, extending nearly to the top of the joint, the bracts broader than long. Edge of saline lakes and along shores and on islands, Ut., N.M. and Tex.

14. SARCOBATUS NEES

A North American genus of 1 or 2 species. Known to be toxic to sheep.

1. *Sarcobatus vermiculatus* (Hook.) Torr. GREASEWOOD. Perennial shrub; stems 3-30 dm. tall, erect, much-branched; branches rigidly stout, becoming grayish, the younger ones yellow-white, glabrous or pubescent with short white branched hairs, the ultimate branchlets stout and spinose; leaves linear to linear-filiform, 1-4 cm. long, entire, fleshy, glabrous or sparsely stellate-pubescent, obtuse or acute at the apex, narrowed at the base, the lower leaves of the branchlets opposite and often shorter than the others; staminate flowers in terminal catkinlike spikes 7-30 mm. long; perianth lacking but each flower subtended by a peltate stipitate bract, with 3 or less stamens per flower; scales rhombic-orbicular, sometimes abruptly acuminate, sometimes tinged with red, glabrous or pubescent; pistillate flowers sessile, solitary or 2 together in the axils of the leaves, with a perianth, this margined by narrow borders which (in fruit) develop into broad membranaceous horizontal wings 6-12 mm. wide, sometimes tinged with red, the axis of the fertile inflorescence often prolonged and bearing 1 to 8 staminate flowers; perianth

of the fertile flowers compressed, turbinate, confluent with the ovary; stigmas 2, subulate, recurved; fruit coriaceous, winged at the middle, the broad wing scarious, veined and crenulate, the lower part of the fruit turbinate, the upper part conical, minutely stellate-pubescent (at least when young), the body 4-5 mm. long and 2.5-3.5 mm. broad; seed erect, orbicular; embryo spirally coiled; endosperm none. Flat ground, barren or alkaline soils, w. N.D. to Alta. and Sask., s. to Tex., Colo., N.M. and Calif.

15. SUAEDA SCOP. SEA BLITE. SEEPWEED

Annual or perennial herbs, sometimes shrubby plants, more or less fleshy; leaves alternate, narrow, usually linear or terete and relatively small; flowers perfect or polygamous, solitary or clustered in the upper axils, bracteate; sepals 5, keeled or narrowly winged at maturity; stamens 5, with short filaments; ovary 1-celled, rounded or flat on the top; styles often 2; utricle compressed, surrounded by the calyx; seed horizontal or vertical; embryo coiled in a flat spiral; endosperm absent or scant.

More than 100 species of cosmopolitan distribution; mostly along sea coasts and in saline soils.

1. Calyx lobes (at least some of them) corniculate-appendaged or winged; leaves broadest at the base, ascending or spreading, those of the inflorescence ovate or ovate-lanceolate; flowers and leaves crowded 1. *S. depressa*.
1. Calyx lobes not appendaged nor winged, often cucullate or carinate (2)
- 2(1). Annuals or perhaps sometimes perennial but not suffrutescent at the base; all the calyx lobes equally carinate (3)
2. Perennials, suffrutescent at the base (4)
- 3(2). Seed 1-1.5 mm. broad 2. *S. linearis*.
3. Seed 0.8 mm. broad or less 3. *S. mexicana*.
- 4(2). Stems and leaves glabrous or nearly so; leaves subterete to distinctly flattened (5)
4. Stems and leaves densely tomentulose or villous when young, sometimes glabrate in age; leaves terete and green (8)
- 5(4). Leaves green (6)
5. Leaves glaucous, mostly less than 1 cm. long (7)
- 6(5). Leaves 3-7 mm. long, 1-3 mm. broad, compressed . 4. *S. duripes*.
6. Leaves 10-30 (-40) mm. long, 1-1.5 mm. broad, subterete 5. *S. Torreyana*.
- 7(5). Calyx segments deltoid; plants blackish (when dry) or purplish (when alive) ..
..... 6. *S. nigrescens* var. *glabra*.
7. Calyx segments obtuse; plants blue-gray 7. *S. conferta*.
- 8(4). Calyx glabrous or nearly so; flowers 1.5-2 mm. broad, globose-obovoid, 1 to 5 per axil; seed horizontal, 1 mm. in diameter 8. *S. tampicensis*.
8. Calyx densely pubescent; flowers 1-1.5 mm. broad, globose, 3 to 9 per axil; seed vertical, 0.7 mm. in diameter 9. *S. suffrutescens*.

1. *Suaeda depressa* (Pursh) Wats. Annual or perennial herb; stems erect to decumbent, low, simple or freely branching from the base, glabrous and glaucous, 2-10 dm. tall or long; leaves green or glaucous, linear, semiterete, 7-40 mm. long, often crowded, acute, usually broadest at the base, subulate; bracts 2-3 mm. long, ovate-lanceolate, rather crowded on the branchlets; flowers crowded, 3 to 7 in each axil; spikes slender, short or elongate; calyx cleft to the middle, the lobes distinctly unequal, 1.5-2 mm. wide at maturity, the upper 1 or 3 sepals prominently cucullate; stamens 5; stigmas 2 to 5; seed about 1 mm. broad, slightly reticulate, black, horizontal. In saline or alkaline soils, w. Minn. and Sask., w. to Mont. and Wash., s. to Kan., Neb., Mo., Tex., Nev. and Calif.; July-Oct.

Var. *erecta* Wats. Stems simple or branched at the base, strictly erect, 15-45 cm. tall, glabrous, often glaucous; leaves 2-3 cm. long, acute; flowering branchlets dense, their

short leaves ovate-acuminate; calyx lobes somewhat unequal, with a conspicuous horizontal wing on the back. Alkaline soils, coastal Calif. e. to the Rocky Mts. and Tex.

2. *Suaeda linearis* (Ell.) Moq. Annual herb; stems glabrous, erect or ascending, 2-9 dm. tall, profusely branched; leaves deep-green, not glaucous, narrowly linear, plano-convex, nearly terete, the primary ones to 5 cm. long, those of the branches progressively shorter; spikes often elongate, usually dense; bracts 4-7 mm. long; calyx at maturity about 2 mm. wide, deeply cleft, the lower 4 or 2 sepals round on the back, the upper 1 or 3 distinctly cucullate; seed horizontal, 1-1.5 mm. wide, smooth, shining and black. Salt marshes, sandy coasts, Coastal Plain from Me. to Fla., w. to Tex.; W.I. and Bah. I.; Aug.-Oct.

3. *Suaeda mexicana* (Standl.) Standl. Annual herb; stems glabrous, pale-green, 3-12 dm. tall, mostly branched at the base, the numerous branches ascending or nearly erect and elongate; leaves numerous but not crowded, linear, the lower ones 12-25 mm. long and 1.2 mm. broad, acuminate or attenuate, those of the inflorescence shorter; inflorescence paniculately branched, the branches erect; flowers crowded in the axils and forming spikes 4-5 mm. thick; calyx deeply cleft, the lobes rounded, becoming enlarged, strongly cucullate in age, the fruiting calyx 3 mm. broad; stamens exserted; seed 0.8 mm. in diameter, horizontal, shining, dark-brownish-red. A halophytic gypsophile, w. Tex. to S.L.P.

4. *Suaeda duripes* I. M. Johnst. Plants succulent, herbaceous or fruticose; stems slender, 5-30 cm. tall, ascending or decumbent, smooth or obscurely vesiculate-tuberculate, glabrous or very sparsely and minutely pilose; leaves succulent, linear or oblong-ovate, 3-7 mm. long, 1-3 mm. broad, compressed, gradually contracted to the base, very short-petioled, broadly affixed from the base to about 1.5 mm. above, indurate and persistent on the stem, obtuse or round at the apex; glomerules many-flowered, borne at the base of leaves, indurate; bracteoles inconspicuous, soon deciduous, membranaceous, triangular or lanceolate-triangular, usually entire; perianth lobed below the middle, succulent before anthesis, at maturity vesiculate and suberose, incrassate, depressed, about 2-2.5 mm. in diameter, the lobes prominently convex; seed erect, black, shining and smooth. Trans-Pecos Tex.; endemic.

5. *Suaeda Torreyana* Wats. QUELITE SALADO. Perennial shrub; stems erect, mostly glabrous, green, woody at the base, the herbaceous branches usually slender, ascending, sparsely leafy, 6-10 dm. tall; leaves green, subterete or distinctly flattened, linear to linear-spatulate, 1-3 (rarely to 4) cm. long, 1-1.5 mm. wide, acute or slightly acuminate, those of the inflorescence much-reduced to 2-5 mm. long and abruptly mucronate or obtuse; flowers globose, 1 to 5 in each axil, about 1 mm. broad at anthesis, the branches of the inflorescence slender but not flexuous; calyx deeply cleft, the lobes green, obtuse, closely incurved, rounded on the back and obtuse; utricle obovoid-lenticular, enclosed by the calyx lobes; seed vertical or horizontal, 1-1.5 mm. broad, dark-brown to black, shining, minutely tuberculate. Salt marshes and alkaline soils, e. Ore. and Wyo. to Calif., s. through Nev. to Tex. and w. N.M.; Apr.-Oct.

6. *Suaeda nigrescens* I. M. Johnst. var. *glabra* I. M. Johnst. Perennial shrub; stems 3-6 dm. tall, ascending, erect or decumbent, the branches all glabrous and often glaucous, the young branches rarely very sparsely pilose and pale; leaves succulent, more or less glaucous, glabrous, 3-4 mm. long and roundish; flowers in glomerules at the base of the upper leaves, barely conspicuous, subspicate; fruiting calyx glabrous, turbinate, 1.5-2 mm. in diameter; seed black, shining, obliquely ovoid, erect or horizontal, about 1 mm. long. Irrigation ditches, saline plains and salt flats, N.M., Tex. and Mex.

7. *Suaeda conferta* (Small) I. M. Johnst. Perennial shrub; stems erect or ascending, 4-10 dm. long, the branches prostrate or spreading, forming dense tufts, very brittle, glabrous; leaves numerous, glabrous, the blades fleshy and blue-gray, mostly less than 1 cm. long and 1-2 mm. broad, oblong; flowers solitary or clustered in the axils of the rather approximate leaves, especially numerous on the branchlets; calyx segments obtuse; seed about 1 mm. broad. Along the sea coast, Tex. and e. Mex.; W.I.

8. *Suaeda tampicensis* (Standl.) Standl. Perennial herb, green; stems much-branched, the branches stout, ascending or decumbent, copiously short-villous, paniculately branched; leaves terete, 7-15 mm. long, acute or acuminate, spreading, those of the inflorescence little-reduced; flowers 1.5-2 mm. broad, globose-obovoid, 1 to 5 in each

axil; bractlets acuminate; calyx glabrous or nearly so, cleft to below the middle, the lobes rounded at the apex, fleshy, rounded on the back; seed usually horizontal, 1 mm. broad, black and shining. Coastal sandy areas, s. Tex. and Mex.

9. *Suaeda suffrutescens* Wats. **DESERT SEEPWEED.** Perennial shrub, often making mounds 12-15 dm. across; stems woody, erect, green, much-branched, 5-9 dm. tall, the branches diffuse or spreading, paniculately branched, leafy, the herbage tomentose; leaves numerous, pubescent, terete, mostly 5-13 mm. long, acute, not crowded, those of the inflorescence much-reduced, ascending or spreading; flowers small, 1-1.5 mm. broad, globose, clustered in the axils, mostly 3- to 9-flowered, crowded in dense spikes; calyx cleft to below the middle, the obtuse lobes thin and rounded on the back, densely pubescent; bractlets acuminate or attenuate; stamens exserted; seed mostly vertical, 0.7 mm. broad, obscurely tuberculate, black. On saline and alkaline plains and valleys, w. and n.w. Tex. to Ariz. and s. Calif., s. to Mex.; spring-fall.

16. SALSOLA L.

About 150 species cosmopolitan in distribution; mostly maritime or in saline soils.

1. *Salsola Kali* L. **RUSSIAN THISTLE, TUMBLEWEED.** Annual herb, much-branched from the base, becoming hemispherical; stems 3-8 dm. tall, glabrous to pubescent or short-villous, conspicuously green and purple-striped, often tinged with red, the very stout branches ascending or spreading and glabrous to scabrous or short-villous; leaves usually alternate, linear to filiform, almost terete, sessile or clasping, pungent-tipped, usually 1.2-3 cm. long and thick but occasionally to 7 cm. long and more fleshy or succulent, often bluish-green, scabrous or glabrous, 1.5-2 mm. wide, the upper leaves often shorter and broader, their bases much-thickened and indurate in age and closely enclosing the fruit; bracteal leaves usually 5-8 mm. long; flowers perfect, sessile, small, subtended by two bractlets in addition to the leaf, solitary in the axils or sometimes several together; perianth 5-parted, the segments oblong or lanceolate, concave, becoming strongly transversely carinate and horizontally winged in the fruit, the basal portions free or connate, the apices free and usually inflexed; fruiting calyx 3-10 mm. wide when well-developed, those of the lowest flowers often merely carinate across the back, the segments sharp-pointed; wings of the calyx persistent, membranaceous, whitish or pinkish, making the fruit 3-8 mm. in diameter; stamens 5 or fewer, hypogynous or rarely inserted in a small disk, the filaments subulate or linear, the anthers short or elongate; stigmas 2 or rarely 3, subulate; ovule subsessile or suspended from a long funicle; utricle flattened, broadly ovoid, or orbicular, the apex concave or convex, included in the perianth; pericarp fleshy or membranaceous, free from the seed; seed horizontal, rarely inverted, erect or oblique, orbicular, 1.5-3 mm. broad, black, shining; endosperm none; embryo spiral or cochleate-spiral, usually green. Incl. var. *tenuifolia* Mey., *S. pestifer* A. Nels. Dry plains and valleys, common along roadsides and in cult. fields, Euras.; perhaps nat. along the e. seacoast and rarely adv. inland; thoroughly naturalized in w. N.A. from Minn. and Sask. to Wash., Calif. and Tex.; July-Oct.

FAM. 62. AMARANTHACEAE JUSS.⁵³

AMARANTH FAMILY

Weedy herbs and subshrubs, annuals or perennials, with erect to prostrate or scandent stems; leaves alternate or opposite, petioled or sessile, without stipules; flowers perfect to imperfect or polygamous, solitary or glomerulate, racemose, spicate or capitate, each flower or flower cluster subtended by imbricate bracts; perianth of 2 to 5 distinct scarious or chartaceous tepals, rarely 1 or entirely absent in some species of *Acnida*; corolla absent; stamens 2 to 5, opposite the tepals; ovary superior, 1-celled; styles 1 or 2 and terminal or absent; fruit a membranous utricle, circumscissile, irregularly dehiscent or indehiscent; seeds erect or inverted, lenticular, oblong or reniform-orbicular, smooth or nearly so, lustrous; embryo annular, the cotyledons incumbent, the radicle inferior or superior.

⁵³ Contributed by Clyde F. Reed; cf. his treatment in C. L. Lundell, *Flora of Texas II*: 89-150. 1969 for complete synonymy.

About 850 species in 65 genera, cosmopolitan but mostly tropical; represented in Texas by 62 species and 6 varieties in 13 genera.

1. Ovules 2 or more; stamens 5 and hypogynous; filaments subulate or filiform, connate at the base into a short cup; anthers 4-celled; leaves alternate; erect or scandent herbs 1. *Celosia*, p. 552.
1. Ovules solitary; stamens hypogynous, rarely perigynous (2)
- 2(1). Anthers 4-celled; filaments distinct or united at the base (3)
2. Anthers 2-celled; stamens 2 to 5; flowers 5-merous (6)
- 3(2). Seed inverted; radicle ascending or superior; stamens 5, rarely 2 or 4; utricle indehiscent; stigma capitate 5. *Achyranthes*, p. 563.
3. Seed erect; radicle inferior (4)
- 4(3). Perianth present in all flowers; stamens 5, rarely 1 to 3; bracts not much-enlarged and not cordate in fruit 2. *Amaranthus*, p. 553.
4. Perianth lacking or only occasionally present in pistillate flowers; stamens 5 (5)
- 5(4). Floral bracts not enlarged 3. *Acnida*, p. 561.
5. Floral bracts much enlarged and broadly cordate in fruit 4. *Acanthochiton*, p. 562.
- 6(2). Most of the flowers unisexual; inflorescence paniculate (7)
6. Few (if any) flowers unisexual; leaves opposite (8)
- 7(6). Leaves opposite; ours erect or scandent herbs 6. *Iresine*, p. 563.
7. Leaves alternate; erect pubescent branched shrubs 7. *Dicraurus*, p. 565.
- 8(6). Style 1 or none; stigma 1 and capitate or bilobed (9)
8. Styles 1 or 2; stigmas typically 2 (11)
- 9(8). Inflorescences mostly terminal; filaments united into a tube; erect or ascending herbs 10. *Froelichia*, p. 568.
9. Inflorescences mostly axillary; prostrate herbs (10)
- 10(9). Filament tube a short cup or adnate to the fused perianth; staminodia absent ... 8. *Guilleminea*, p. 565.
10. Filament tube longer than the ovary and free from the perianth and/or staminodia present 9. *Alternanthera*, p. 567.
- 11(8). Filament tube long; flowers in terminal heads 13. *Gomphrena*, p. 572.
11. Filaments united into a short cup (12)
- 12(11). Perianth stipitate; inflorescence spicate 11. *Philoxerus*, p. 570.
12. Perianth sessile; inflorescence a single flower or the flowers in glomerules 12. *Tidestromia*, p. 571.

1. CELOSIA L.

Annual or perennial herbs and shrubs; stems erect or scrambling; leaves alternate, petiolate, entire or lobed; flowers perfect, in terminal or axillary spikes or axillary glomerules, commonly white, silvery or colored, each flower subtended by a bract and two bractlets; perianth of 5 distinct tepals, in fruit erect and concealing the fruit, scarious, striate; stamens 5, connate at the base; ovary subglabrous, the ovules 2 to several, the style none to short or elongate, the stigmas capitate or subulate; utricle ovoid or subglobose, thin, membranaceous, usually circumscissile at the middle or dehiscing irregularly; seeds 2 to several, lenticular, often erect, lustrous; embryo annular; endosperm starchy.

About 60 species in tropical and temperate regions.

1. Inflorescences usually of simple terminal spikes 15-20 mm. in diameter (larger and cristate in cult. forms); tepals bright-white, pink or red (other colors in cult. forms), 6-9 mm. long 1. *C. argentea*.
1. Inflorescences of terminal or axillary panicles composed of few to numerous spikes 3-10 mm. in diameter; tepals stramineous to dark-brown, 3-6 mm. long, prominently veined (2)

- 2(1). Leaf blades deep-green, deltoid to triangular-lanceolate, not lobed; stigmas 3; stems erect or clambering2. *C. nitida*.
 2. Leaf blades green, hastately lobed, lanceolate to lance-triangular; stigmas 2; stems much-branched, low, shrubby3. *C. Palmeri*.

1. *Celosia argentea* L. COCKSCOMB, CRESTA DE GALLO. Annual herb; stems erect, glabrous, leafy, to 1 m. tall; leaves lanceolate to nearly linear, 8-15 cm. long, usually long-tapering to both ends; spikes terminating the stem and also in the upper axils, sessile or peduncled, 2-15 cm. long, in a variety of colors; tepals lance-oblong, 6-9 mm. long, in wild plants silvery, in cultivated forms also pink, yellow and red; style indurate and exerted at maturity; utricle circumscissile at the middle; seeds 2 to several, lenticular, lustrous. Nat. of trop. Am., where it is widely distributed; occasionally escaped from cult., summer and early fall.

Forma cristata (L.) O. Ktze. COCKSCOMB. Cult. as an annual; leaves ovate with cristate inflorescences, variously crested and branched; flowers red, crimson, yellow, purple or white. Rarely escaped from cult.

2. *Celosia nitida* Vahl. ALBAHACA. Perennial herb from a long woody taproot, with glabrous slender erect or vinelike stems 3-15 dm. long; young stems tinted red, widely branching; leaves alternate, with petioles 5-20 mm. long, drying blackish, lighter beneath, ovate to deltoid-ovate or ovate-lanceolate, 2-7 cm. long, acute to acuminate at both ends; bracts half as long as the tepals, ovate to lanceolate, keeled, acuminate; spikes solitary or paniced, 1-5 cm. long; tepals oblong to elliptic-lanceolate, firm, 3-5 mm. long, acuminate, dark-brown, strongly parallel-veined; style short; utricle included, globose-ovoid, shorter than the perianth; seed lenticular, about 1 mm. long, black, smooth. *C. paniculata* of auth., not L. In sandy soils in thickets and brush, gravelly hills and woods, especially along coasts, extending through the Rio Grande Plains into the Edwards Plateau, Mar.-Nov.; from Fla. Keys to Tex. and n.e. Mex.; W.I., coast of n. S.A.

3. *Celosia Palmeri* Wats. Low perennial shrub; stems much-branched, the branches glabrous and slender; leaves alternate, with slender petioles 3-12 mm. long, lanceolate to lance-triangular, 1.5-5 cm. long, 4-25 mm. wide, more or less asymmetric, hastately lobed, the lobes shallow and rounded, shortly decurrent, green, glabrous or sparsely puberulent beneath; flowers few, sessile in short spikes 1-2 cm. long and 8 mm. in diameter, with 2 to 5 spikes clustered at the end of each branch; rachises of the inflorescence sparsely tomentulose; bracts ovate to ovate-oblong, half as long as the tepals or shorter, acute to acuminate, often with a pungent tip, sparsely villous; tepals 5 mm. long, oblong, acute, pale to dark-brown, thin, many-veined; stamens 5, the filaments equaling or exceeding the ovary and dilated at the base; style longer than the ovary; stigmas 2, shorter than the style; utricle elongate-ovoid, shorter than the tepals; seeds 3 or 4, rounded, 1 mm. in diameter, smooth, black, lustrous. In open woodlands and about boulders in mts. of the Trans-Pecos; also n.e. Mex.

2. AMARANTHUS L.

PIGWEEED. AMARANTH

Annual weedy herbs, especially near irrigated or cultivated places, monoecious; stems erect or prostrate, branching at the base or above; leaves alternate, petiolate, flat, pinnately veined, entire or undulate; flowers unisexual or a few appearing perfect, with staminate and pistillate flowers on the same or separate plants, in dense terminal or axillary spikes or clusters, each subtended by 3 conspicuous red, green or purple bracts; perianth segments (tepals) 2 to 5 (only 1 evident in *A. californicus*), distinct, glabrous; stamens 5, sometimes 1 to 3, separate; anthers 4-celled (appearing 2-celled after dehiscence), opening lengthwise, the filaments distinct; ovary 1-celled, with 2 or 3 stigmas; ovule 1; utricle one-seeded, 2- or 3-beaked at the apex, circumscissile, irregularly splitting or indehiscent; seeds lenticular, erect, compressed, lustrous, smooth; embryo coiled into a ring around the albumen; radicle inferior.

About 60 species, cosmopolitan.

1. Staminate and pistillate flowers borne on separate plants (2)
1. Staminate and pistillate flowers on the same plant with occasional perfect ones (7)

- 2(1). Plants pistillate; tepals 5, at least the inner ones spatulate (3)
2. Plants staminate; outer tepals with heavy midvein, often definitely longer than the inner (5)
- 3(2). Utricle indehiscent, about 3 mm. long; leaf blades coriaceous; plants erect but usually sprawling 3. *A. Greggii*.
3. Utricle circumscissile, about 1.5-2 mm. long; leaf blades membranaceous; plants erect (4)
- 4(3). Longest outer tepal acute or acuminate with midvein excurrent into a rigid point; bract and outer tepals conspicuously longer than the inner tepals; bract with very heavy midrib, excurrent; style branches usually 2, sometimes 3 1. *A. Palmeri*.
4. Tepals all obtuse or retuse, the midveins excurrent slightly or not at all; bract and outer tepals scarcely exceeding inner tepals; bract with extremely heavy midrib, not excurrent far beyond the lamina; style branches usually 2 2. *A. arenicola*.
- 5(2). Outer tepals acuminate, the midveins excurrent as rigid spines; bracts about 4-6 mm. long, about twice as long as perianth 1. *A. Palmeri*.
5. Outer tepals acute or obtuse, apiculate but the dark midvein not excurrent; bracts shorter than the tepals, glabrous; leaf margin smooth (6)
- 6(5). Leaf blades membranous; plants erect 2. *A. arenicola*.
6. Leaf blades coriaceous; plants erect or sprawling 3. *A. Greggii*.
- 7(1). Tepals of pistillate flowers spatulate, usually contracted into a narrow claw at the base, more or less urceolate (at least in age) (8)
7. Tepals of pistillate flowers oblong to obovate, not contracted into a claw (16)
- 8(7). Inflorescence of axillary few- to many-flowered clusters; stems weak, ascending or prostrate (9)
8. Inflorescence of terminal spikes, with clusters of axillary flowers also present; stems stout, usually erect (12)
- 9(8). Pedicels and bracts usually but not always (cf. *A. scleropoides*) much-thickened and indurate (10)
9. Pedicels and bracts neither thickened nor indurate (11)
- 10(9). Utricle indehiscent, the sides wearing thin; style branches usually 2, rarely 3 ... 4. *A. crassipes*.
10. Utricle circumscissile at the middle; style branches usually 3, rarely 2 5. *A. scleropoides*.
- 11(9). Utricle indehiscent; leaf blades oblong-lanceolate; leaves crowded at the ends of the branches 6. *A. Berlandieri*.
11. Utricle circumscissile; leaf blades suborbicular to obovate or oval; leaves not crowded; tepals very faintly nerved 7. *A. polygonoides*.
- 12(8). Utricle indehiscent; leaf blades lanceolate to linear-oblong, 1-3 cm. long 8. *A. obcordatus*.
12. Utricle dehiscent (13)
- 13(12). Stamens 5; inflorescence leafy throughout (14)
13. Stamens 2 or 3 (15)
- 14(13). Bracts shorter than the pistillate perianth; leaf blades obtuse 9. *A. chihuahuensis*.
14. Bracts longer than the pistillate perianth; leaf blades acute 10. *A. Torreyi*.
- 15(13). Tepals of pistillate flowers with fimbriate margins; bracts one half or less as long as the tepals 11. *A. fimbriatus*.
15. Tepals of pistillate flowers with entire or crenulate margins; bracts equaling or exceeding the flowers; axillary glomerules mostly equaling or exceeding the petioles 10. *A. Torreyi*.

- 16(7). Utricle indehiscent; inflorescence usually in short terminal spikes; bracts not pungent, not exceeding the tepals; leaf blades retuse, longer than broad, usually more than 1 cm. long; stems prostrate or ascending, green23. *A. viridis*.
16. Utricle dehiscent (17)
- 17(16). Inflorescence of terminal and axillary simple or paniculate spikes, with glomerules of flowers often present also in the axils of the leaves (18)
17. Inflorescence wholly of axillary glomerules (24)
- 18(17). Spines present in the axils of the leaves; utricle irregularly or imperfectly dehiscent12. *A. spinosus*.
18. Spines lacking; utricle regularly circumscissile (19)
- 19(18). Pistillate tepals rhombic-ovate to broadly spatulate, the edges overlapping; terminal spikes usually recurved from the base13. *A. hypochondriacus*.
19. Pistillate tepals lanceolate to elliptic or oblong to narrowly spatulate, distinct or at most the edges barely touching; spikes erect or the uppermost recurved from the middle (20)
- 20(19). Pistillate tepals usually shorter than the utricle or (if longer) acuminate or acute (21)
20. Pistillate tepals obtuse or truncate, equaling or usually conspicuously longer than the fruit (23)
- 21(20). Bracts obtuse or acutish, equaling or up to 1.5 times as long as the tepals, usually red or purple14. *A. cruentus*.
21. Bracts acute or acuminate, usually twice as long as the tepals, commonly green or pale-reddish (22)
- 22(21). Spikes slender; bracts 3-5 mm. long, thin15. *A. hybridus*.
22. Spikes stout; bracts usually more than 5 mm. long, thick16. *A. Powellii*.
- 23(20). Inflorescence usually tipped with red; pistillate tepals 1.5-2 mm. long; plants nearly glabrous17. *A. Wrightii*.
23. Inflorescence pale-green; pistillate tepals 3 mm. long; plants copiously villous18. *A. retroflexus*.
- 24(17). Tepals in both staminate and pistillate flowers 4 or 5; seed 1.5 mm. in diameter; stems prostrate19. *A. blitoides*.
24. Tepals 1 to 3; seed 0.6-0.8 mm. in diameter; stems erect or prostrate (25)
- 25(24). Tepals of pistillate flowers 2 or 3, all except one reduced to minute scales; stems slender, prostrate20. *A. californicus*.
25. Tepals of pistillate flowers 3, equal or nearly so; stems stout, erect or ascending (26)
- 26(25). Plants densely viscid-pubescent; leaf blades crispate21. *A. pubescens*.
26. Plants not viscid-pubescent; leaf blades not crispate ...22. *A. albus*.

1. *Amaranthus Palmeri* Wats. Plant very weedy, with an elongated taproot to 15 mm. in diameter; stems 6-10 dm. tall, branched at the base and much-branched above, glabrous to villous-pubescent; leaves alternate, with long slender petioles, rhombic-ovate to rhombic-lanceolate, 1-6 cm. long, acute to abruptly acuminate at the apex, cuneate or rounded at the base; staminate and pistillate flowers on separate plants, in slender erect or drooping dense spikes or thyrses 15-30 cm. long, either all terminal on leafy branches or (if leafless) branch thyrses present, these loosely arranged and each subtended by a leaf; bracts 4-6 mm. long, twice as long as the perianth, the midrib moderately heavy in the male, very heavy in the female, excurrent into a spine; *male flowers* with 5 stamens and 5 tepals; inner tepals 2.5-3 mm. long, obtuse or emarginate; outer tepals 3.5-4 mm. long, acuminate, with conspicuous long-excurrent midvein; *female flowers* with 5 recurved tepals, each with conspicuous branched midvein; inner tepals usually 2-2.5 mm. long, spatulate, emarginate, slightly denticulate; outer tepals 3-4 mm. long, acute, with a midvein excurrent as a rigid point; style branches usually 2, rarely 3; utricle 1.5-2 mm.

long, thin, subglobose, circumscissile, somewhat rugose; seed obovate, lenticular, 1-1.3 mm. in diameter, dark-reddish-brown. In silt, sandy and gravelly soils, river banks, valleys, arroyos, drainage basins, irrigation ditches, dumps and gardens, throughout most of Tex., summer-fall; w. Kan. to Calif., s. to Tex. and Mex.; introd. in Mo.; rarely adv. in e. U.S.

2. *Amaranthus arenicola* I. M. Johnst. SANDHILLS AMARANTH. Plant with erect stems to 2 m. tall, whitish, glabrous, striate, simple or branched at the base, branched above; leaves alternate, with slender petioles 5-7 mm. long, oval-oblong to oblong-linear, 1.5-8 cm. long, rounded to acutish at the apex, obtuse to attenuate at the base, yellowish-green, glabrous, the veins conspicuous beneath; male and female flowers on separate plants, in slender dense or interrupted spikes or thyrses to 4 dm. long, either all terminal on leafy branches or (if a few leafless) branch thyrses present, these loosely arranged and each subtended by a leaf; bracts usually 1.5-2.5 mm. long, lanceolate, acuminate, the midrib barely excurrent; *male flowers* with 5 stamens and 5 nearly equal tepals about 5 mm. long, the inner tepals emarginate or obtuse, the outer ones obtuse or acute, all apiculate with dark midveins not excurrent; *female flowers* with 5 recurved spatulate tepals, each with conspicuous usually branched midvein, the inner tepals 1.5-2 mm. long and emarginate or obtuse, the outer tepals 2-2.5 mm. long and obtuse-apiculate; style branches 2; utricle 1.5 mm. long, thin, subglobose, circumscissile, rather smooth; seed round, lenticular, 1-1.3 mm. in diameter, dark-reddish-brown. Sandhills, swales, dried ponds, lakeshores, river sandbars, marshes, fields, roadsides and along railroads, throughout most of Tex., July-Nov.; Kan., Okla. and Ia. to Tex., w. to Colo., Nev. and N.M.

3. *Amaranthus Greggii* Wats. Plant from a taproot, with glabrous or sparsely villous herbage; stems stout, erect or much-branched at the base, the branches ascending or sprawling, 2-9 dm. long, striate, green; leaves few, rhombic-ovate to oblong, 1-3.5 cm. long, thick and fleshy, slightly scabrous, narrowed into slender short petioles to 18 mm. long, rounded at apex, acute to rounded at base, deep-green, sparingly viscid-puberulent or glabrate, prominently veined beneath; male and female flowers on separate plants, in stout elongated spikes or thyrses 5-15 cm. long and 7-10 mm. thick, leafy-bracted, somewhat interrupted below; bracts 1.5-2.5 mm. long, lanceolate to ovate, acuminate, scarious, the midrib barely excurrent; *male flowers* with 5 stamens and 5 nearly equal tepals; tepals usually 2.5-3 mm. long, the inner ones emarginate or obtuse, the outer ones obtuse or acute, all apiculate but the dark midribs not excurrent; *female flower* with 5 recurved nearly equal tepals 2.5-3 mm. long, the inner tepals spatulate and emarginate, the outer ones obovate-oblong and obtuse, all with heavy conspicuously branched barely excurrent midveins; style branches 3; utricle 3 mm. long, oblong, acutish, slightly excurrent or shorter than the tepals, nearly smooth, somewhat fleshy, indehiscent; seed 1.3-1.8 mm. in diameter, obovoid, lenticular, blackish to dark-brown, lustrous. *A. myrianthus* Standl., *A. annectans* Blake. Coastal dunes and beaches along the seacoast from Jefferson Co., Tex. to Tam. and Yuc.; summer-fall.

4. *Amaranthus crassipes* Schlecht. Plant from an elongate taproot; stems prostrate or decumbent, 2-6 dm. long, often sparingly branched, rather fleshy, glabrous; leaves alternate, with petioles 4-40 mm. long, obovate to elliptic, 1-4 cm. long, round or notched at the apex, cuneate at the base, deep-green, glabrate; inflorescences axillary, the short axes much-thickened (to 1 mm.) and indurate; male and female flowers on same plant or occasional flowers appearing perfect; bracts minute, keeled; tepals of the pistillate flowers 4 or 5, spatulate, scarious, 0.2-2.5 mm. long; style bifid or trifid to base; utricle compressed-obovoid, 1.4-1.8 mm. long, obtuse or emarginate, papillate above the middle, coriaceous, indehiscent; seed broadly obovate, 1-1.4 mm. long, dark-brown or black, lustrous. *A. Warnockii* I. M. Johnst. From the coast through the Rio Grande Plains and Edwards Plateau to the Trans-Pecos, June-Oct.; nat. of trop. Am.; naturalized in waste places along the Gulf Coast and rarely adv. at e. seaports, Fla. and the Keys to Tex.; W.I., Bah. I. and n. S.A.

5. *Amaranthus scleroides* Uline & Bray. BONEBRACKT AMARANTH. Stems erect or ascending, 1.5-4 dm. long, stout and succulent, glabrous, whitish; leaves alternate, the slender petioles 5-30 mm. long, narrowly oblong to oblanceolate, 1-4.5 cm. long, rounded or emarginate at the apex, attenuate at the base and decurrent, thick, glabrous or nearly so, pale-green; male and female flowers on same plant, occasional flowers appearing perfect, in small dense axillary clusters; peduncles much-thickened and indurate in age;

bracts finally indurate, ovate-triangular, acute; tepals of the pistillate flowers 5, spatulate, 2 mm. long, 1-nerved, indurate at the base, obtuse or acute; style branches usually 3, rarely 2; stamens 3; utricle subglobose, thin-walled, equaling the tepals, smooth, circumscissile at the middle; seed orbicular to obovate, smooth, black, lustrous, 0.6 mm. in diameter. In sandy wastes, upper Rio Grande Plains, Edwards Plateau and Trans-Pecos, throughout year; undoubtedly also adj. Mex.

6. *Amaranthus Berlandieri* (Moq.) Uline & Bray. Plant with deep-green foliage; stems erect or ascending, 1.5-3 dm. tall, slender, branching from the base, pubescent; leaves alternate, crowded, short-petioled, oblong to oblong-lanceolate, 15-25 mm. long, obtuse or notched at the apex, entire, glabrous; male and female flowers on same plant, crowded in small axillary clusters; tepals delicate, about 2 mm. long, conspicuously 3-nerved, narrowed into claws; bracts about half as long as the tepals; stamens 2; utricle turbinate, thin-walled, included, indehiscent; seed about 1 mm. long, obovoid, black, lustrous. In Rio Grande Valley and Plains, and Edwards Plateau, spring-summer; also n.e. Mex.

7. *Amaranthus polygonoides* L. TROPICAL AMARANTH. Plant with bright-green foliage; stems slender, branched at the base, the branches prostrate or ascending, 1-5 dm. long, often slightly villous or pubescent above; leaves alternate, with petioles 2-7 mm. long, rhombic-ovate to obovate, 1-2 cm. long, obtuse and usually emarginate at the apex, narrowed or cuneate at the base, glabrous or sparingly pubescent beneath; male and female flowers on same plant, occasional flowers appearing perfect, in sessile dense axillary clusters; bract lanceolate, acuminate; tepals of the *staminate flowers* oblong and acute; stamens 2 or 3; tepals of the *pistillate flowers* about twice as long as the bracts, spatulate, oblong-cuneate, 3-nerved, connate at the base, with spreading tips, apiculate, white-margined, scarious; utricle included, circumscissile; seed less than 1 mm. long, dark-brown or black, lustrous. In sandy soil and waste grounds in s. and w. Tex.; from Fla. to Tex., s. to n. S.A.

8. *Amaranthus obcordatus* (Gray) Standl. Stems stout, 1.5-5 dm. tall, with ascending branches, glabrous, whitish, often tinged with red; leaves alternate, with slender petioles 5-20 mm. long, few, soon deciduous, pale-green, glabrous, lanceolate or narrowly oblong to linear-oblong, 1-3 cm. long, truncately rounded at the apex, acute or cuneate at the base; male and female flowers on same plant, occasional flowers appearing perfect, in dense clusters arranged in sparsely leafy or naked terminal spikelike panicles; bracts half as long as the tepals or shorter, broadly ovate, acute; tepals of the *staminate flowers* oblong, obtuse; tepals of the *pistillate flowers* 5, spatulate, 2 mm. long, united at the base, rounded or emarginate at the apex, thin, conspicuously veined, often tinged with purple, the blades spreading in age; stamens 3; style branches 3; utricle narrowly oblong, indehiscent; seed obovoid, 0.6-0.8 mm. long, dark-reddish-brown. In Trans-Pecos Tex.; also s. Ariz. to Mex.

9. *Amaranthus chihuahuensis* Wats. Stems leafy up to the tip, stout, erect, 3-6 dm. tall, the branches ascending, sparsely pubescent, pale-green; leaves alternate, numerous, with slender petioles 5-20 mm. long, yellowish-green, glabrous or sparsely pubescent beneath, ovate to ovate-oblong or elliptic, 2-5 cm. long, obtuse at the apex, acute at the base, those about the middle of the plant being largest at about the beginning of the spikes, those above considerably reduced; male and female flowers on same plant, occasional flowers appearing perfect, in dense clusters, some of these axillary, others aggregated into a slender terminal leafy spike; bracts lance-subulate, shorter than the flowers; tepals 5, those of the staminate flowers oblong, acute; tepals of the pistillate flowers spatulate, 2 mm. long, scarious, united and thickened at the base, spreading in age, 1-nerved, the nerve conspicuously excurrent; stamens 5; style branches 3; utricle ovoid, shorter than the tepals, circumscissile; seed orbicular, dark-reddish-brown, 0.8 mm. in diameter. In Trans-Pecos Tex.; also n. Mex.

10. *Amaranthus Torreyi* (Gray) Wats. Stems erect, stout, 3-10 dm. tall, the branches few to numerous, slender, erect, glabrous to somewhat pubescent; leaves alternate, with slender petioles 1-2.5 cm. long, yellowish-green, glabrous, lanceolate to lance-ovate, 3-7 cm. long, acute at the apex and at the base, strongly veined beneath; male and female flowers on same plant, occasional flowers perfect, in dense glomerules, these mostly axillary but sometimes aggregated in a short leafy spike or a rather lax panicle; bracts lance-subulate, pungent-pointed, slightly exceeding the flowers; tepals 5, those of the *staminate flowers* lanceolate to ovate-oblong and spinulose-cuspidate, more or less scarious-

margined; tepals of the *pistillate flowers* spatulate, obtuse, 1.5-2 mm. long, rounded at the apex, united at the base, emarginate or apiculate, thin, 1-nerved, often tinged with purple; stamens 5, sometimes 2 or 3; utricle globose-obovoid, circumscissile, near the middle, shorter than the tepals; seed nearly orbicular, 1 mm. in diameter, black, lustrous. *A. Pringlei* Wats., *A. Bigelovii* Uline & Bray. In sandy soils, rocky hills, fields and canyons in the Trans-Pecos, July-Aug.; w. to Ariz., s. to Mex.

11. *Amaranthus fimbriatus* (Torr.) Wats. FRINGED AMARANTH. Herbage glabrous, purplish (especially the inflorescence); stems several from the base, 3-6 dm. tall, simple or sparingly branched, the branches erect; leaves alternate, linear, 2.5-5 cm. long, 1-3 mm. wide, narrowed below into a short petiole, glabrous; male and female flowers on same plant, occasional flowers perfect, in rather loose clusters or glomerules, about 7 mm. wide, the clusters scattered or mostly approximate and the upper ones aggregated in a long naked terminal spike; bracts ovate, acute, scarious-bordered, shorter than the perianth; tepals of the staminate flowers oblong, obtuse; tepals of the pistillate flowers broadly fan-shaped with a narrow thickened base and fimbriate margin, 2 mm. long; stamens 2 or 3; ovary globose-ovate; style branches 3 or 4; utricle tubercular-rugose at the summit, circumscissile near the apex; seed lenticular, smooth, dark-brown or black, 0.8 mm. in diameter, acute on the margin, lustrous. Sandy places in Trans-Pecos Tex., Sept.-Oct.; s. and e. Calif., e. to Nev. and Ut., s. to Tex., Mex. and Baja Calif.

12. *Amaranthus spinosus* L. SPINY PIGWEED, QUELITE ESPINOSO. Plant weedy, from a long (to 4 dm.) taproot; stems stout and succulent, erect, branched, 3-12 dm. tall, bearing at most nodes a pair of divergent spines 5-10 mm. long; leaves alternate, ovate-lanceolate to ovate, glabrous to sparingly pubescent, 3-10 cm. long, narrowed to an obtuse mucronate tip, broadly cuneate to the long petiole; male and female flowers on same plant, occasional flowers perfect; spikes numerous, 5-15 cm. long, 6-10 mm. thick, the terminal one often wholly or chiefly staminate, the basal part of each and the axillary clusters mostly pistillate; bracts lanceolate or subulate, usually shorter than the tepals; tepals of the *staminate flowers* lance-oblong, acute or short-acuminate; stamens 5; tepals of the *pistillate flowers* 5, oblong or acutish, 1-1.5 mm. long; utricle 1.5-2 mm. long, imperfectly dehiscent or bursting irregularly, the terminal portion spongy and roughened; seed black, nearly round, 0.7-1 mm. in diameter, lustrous. In waste ground, sandy loamy soil in e. third of Tex., w. to Dallas, Travis and Cameron cos., June-Sept.; probably trop. in origin; now abundant in warmer parts of the world, extending to N.Y., Pa., Me. and Man., Ind. and Mo., often adv. farther n.

13. *Amaranthus hypochondriacus* L. PRINCE'S FEATHER. Stems stout, 12-15 dm. tall, glabrous, green, the branches spreading; leaves alternate, with petioles as long as the blades, elliptic to ovate-oblong, subacuminate, 7.5-20 cm. long, cuneate at the base and decurrent upon the petiole; male and female flowers on same plant, occasional flowers perfect, in a panicle, usually red, composed of several to many drooping spikes; terminal spike nodding, 1-3 dm. long, much-exceeding the lateral ones that are divaricate; tepals of the pistillate flowers obovate to spatulate, with overlapping edges, about 2.5 mm. long, shorter than or equaling the utricle; seed large, about 1 mm. broad, ivory, dull-white, light-brown or dark-brown, smooth, the central albumen prominent. *A. leucocarpus* Wats., *A. caudatus* of Am. auth. Cult. by American Indian in Ariz. in 14th century, by Aztecs in 16th century, Holland and India in 18th century; frequently cult. for ornament and as a grain food, occasionally escaped or adv.; Ariz. and Tex., s. through C.A.; also Asia and Uganda.

14. *Amaranthus cruentus* L. CATERPILLAR, PURPLE AMARANTH, AMARANTO ROJO. Stems 5-20 dm. tall, erect, simple or branched, usually villous above; leaves alternate, with petioles 2-20 cm. long, elliptic to rhombic-ovate, 3.5-30 cm. long, green to purplish, sparsely pubescent or glabrate; bracts lanceolate, pungent-tipped, reddish or purplish, often longer than the tepals; male and female flowers on same plant, rarely perfect flowers, in panicles forming erect red or purple spikes; *staminate tepals* oblong-ovate, acute, with an excurrent nerve; *pistillate tepals* short, oblong, obtuse or erose, scarious, purplish or green; stamens 5; style trifid; utricle globose, circumscissile, conspicuously exceeding the perianth; seed 1 mm. wide, rotund, black or brownish, lustrous. *A. paniculatus* L. Frequently cult. and spread as a weed or waif to roadsides and waste places; from s. Que., southw. and westw.; P.R. and Virg. I.

Although said to be introduced and adventive from Asia as a Chinese ornamental, it

evidently originated as a domesticated grain crop in South America or Guatemala, the only regions where it is found in aboriginal cultivation; used as a dye plant, ornamental, potherb and as a grain amaranth.

15. *Amaranthus hybridus* L. GREEN AMARANTH, QUELITE DE COCHINO, QUELITE MORADO. Plants coarse; stems stout, erect, 6-26 dm. tall, usually branched, glabrous to rough-pubescent and usually somewhat villous above; leaves alternate, long-petiolate, rhombic-ovate to lanceolate, acute or rounded at the apex, cuneate or rounded at the base, pubescent or glabrous, darker green above; male and female flowers on same plant, occasional flowers perfect, red or green, in slender spikes 6-12 mm. wide that are in terminal panicles and also axillary; bracts about twice as long as the oblong scarious tepals, spinulose-tipped; tepals of the *staminate flowers* narrowly oblong to ovate, acute, the midvein excurrent; tepals of the *pistillate flowers* 1.5-2 mm. long, oblong or linear-oblong, acute, the nerve usually excurrent; style trifid; utricle subglobose, circumscissile; seed round, 1.1-1.3 mm. in diameter, black, lustrous. *A. chlorostachys* Willd. Mostly in w. half of Tex., May-Oct.; a nat. riverbank pioneer weed, from milder regions of e. N.A. through Mex. and C.A. to northernmost S.A.; reaching the Medit. region about the 18th century; a naturalized weed in w. N.A., e. Asia, Austral. and S. Afr.

Mixes freely with *A. Powellii* and *A. retroflexus* in weed populations, forming partially fertile hybrids; also hybridizes with *A. hypochondriacus* and *A. cruentus*, the grain amaranths.

16. *Amaranthus Powellii* Wats. Stems stout, 3-20 dm. tall, erect, simple or much-branched, green or whitish, glabrous below, usually villous above; leaves alternate, slender petioles 1-5 cm. long, lanceolate or ovate, 1.5-8 cm. long, 5-40 mm. wide, acute to obtuse at the apex, sometimes emarginate, cuneate to acute at the base, yellowish-green or deep-green, glabrous or sparsely pubescent; male and female flowers on same plant, occasional flowers perfect, numerous, in crowded spikelike terminal and axillary clusters 4-25 cm. long and 1-2 cm. thick, with some dense clusters of flowers in the axils of the upper leaves; bracts 2 or 3 times as long as the tepals, lanceolate or ovate, attenuate to a rigid spinose tip, green and indurate along the midnerve, sometimes puberulent; tepals of the *staminate flowers* lance-oblong, scarious, 1-nerved, acute, the midvein excurrent; tepals of the *pistillate flowers* 2-3 mm. long, oblong or lance-oblong, acute, mucronate, thin, usually longer than the utricle; stamens mostly 3; style branches 3, elongate, erect; utricle subglobose, compressed, equaling or shorter than the tepals, rugulose above, dehiscent at the middle; seed obovate to oval, 1-1.2 mm. long, black, lustrous. *A. obovatus* Wats. Pioneer of canyons, desert washes and open wastes from s.-cen. Tex. and Rio Grande Plains to the Trans-Pecos, June-Nov.; ranging through the western Cordilleran system of N.A. and S.A.; absent in the warmer regions of C.A., adv. in e. N.A.; in n. and cen. Eur.; hybridizes with *A. retroflexus* and *A. hybridus* and the grain amaranths.

17. *Amaranthus Wrightii* Wats. Stems stout, 2-10 dm. tall, often simple, sometimes branched at the base and sparsely branched above, the branches strongly ascending, whitish or tinged with red, glabrous; leaves alternate, with slender petioles 5-40 mm. long, lance-elliptic to rhombic-ovate, acutish to obtuse at the apex, sometimes emarginate, 1.2-6 cm. long, 4-30 mm. wide, cuneate to acute or abruptly acute at the base, yellowish-green, paler beneath, glabrous; male and female flowers on same plant, occasional flowers perfect, in dense stout erect terminal simple or branched spikes 4-25 cm. long, these often leafy, interrupted below, with dense clusters of flowers in the axils of the leaves shorter than the petioles; bracts linear-lanceolate or subulate, longer than the tepals, often twice as long, rigid, greenish, pungent; tepals of the *staminate flowers* oblong, acute; tepals of the *pistillate flowers* 1.5-2 mm. long, oblong-linear, narrowed at the base, rounded to truncate and usually emarginate or retuse at the apex or the outermost one rarely pungent, thin, faintly 1-nerved, the nerve usually not exceeding the apex, sometimes ciliate, erect, united at the base, often tinged with red; stamens 3; style branches 3, short; utricle globose, about equaling the tepals, smooth or nearly so, circumscissile at the middle; seed round, 1 mm. in diameter, dark-reddish-brown, smooth and lustrous. Limestone soils in mts. of Trans-Pecos Tex., Aug.-Sept.; Tex., Ariz., w. N.M. and s. Colo.

18. *Amaranthus retroflexus* L. REDROOT PIGWEED, ROUGH PIGWEED, QUELITE. Coarse weedy herb; stems stout, erect, simple or usually branched, 3-30 dm. tall, roughish-

puberulent below and more or less villous-pubescent above, white-striped; leaves alternate, long-petioled, the slender blades 1.5-8 cm. long, usually villous, at least pubescent along the veins beneath; male and female flowers on same plant, occasional flowers perfect, in dense terminal or axillary usually paniculate densely crowded erect spikes 5-20 cm. long and 8-20 mm. thick, dense clusters also present in the axils of the upper leaves; bracts ovate, tapering into a short subulate green tip, usually twice as long as the tepals (at least in age), 1-nerved, sparsely villous; tepals of *staminate flowers* ovate-oblong to lanceolate, acute or acutish, scarious, 1-nerved, the nerve shortly excurrent; tepals of *pistillate flowers* 3 mm. long, linear-oblong, rounded to truncate at the apex, usually emarginate, often mucronate, scarious and whitish except the whitish midnerve, the base thickened in age; stamens 5; style branches 3, rather short; utricle subglobose, more or less rugulose on the upper half, circumscissile at the middle, shorter than the tepals; seeds round, 1 mm. broad, dark-reddish-brown, lustrous. In sandy-clayey soils in Plains Country to s.-cen. Tex. and the Trans-Pecos, June-Oct.; nat. riverbank pioneer of cen. and e. U.S. and adj. regions of s.e. Can. and n.e. Mex.; spread to Near East, N. Afr. and Asia.

Hybridizes freely with *A. Palmieri*, *A. Powellii* and *A. hybridus*, as well as with the grain amaranths.

Var. *salicifolius* I. M. Johnst. Plants often 2-6 dm. tall and more slender than typical plants; leaves lanceolate, often 3 or 4 times longer than broad; inflorescence pallid, the perianth lobes obtuse or retuse rather than acute as in *A. Powellii*. Tex., Ariz. and Mex.

19. *Amaranthus blitoides* Wats. PROSTRATE PIGWEED, QUELITE MANCHADO. Coarse weedy herbs; stems stout, prostrate, much-branched either at ground level or somewhat above, 1.5-6 dm. long, glabrous or sparsely pubescent, pale-green or whitish, rarely tinged with red or purplish; leaves usually numerous, often crowded, with stout petioles 2-20 mm. long, obovate to oval or spatulate to elliptic, 8-40 mm. long, rounded to acutish at the apex, broadly cuneate to attenuate at the base, pale-green, glabrous, prominently veined, the veins whitish beneath, the smaller leaves often white-margined; male and female flowers on same plant, occasional flowers perfect, in dense axillary clusters that are usually shorter than the petioles; bracts oblong to lanceolate, equaling or slightly longer than the tepals, erect, attenuate at the apex to a short spinose tip, green; tepals 4 or 5, those of the *staminate flowers* scarious, oblong, acute; tepals of the *pistillate flowers* oblong or narrowly oblong, 2.5-3 mm. long, acuminate, 1-nerved, green, white-margined; stamens 3; style branches 3; utricle subglobose, equaling or slightly longer than the tepals, smooth, circumscissile, sometimes tinged with red; seed round, 1.3-1.6 mm. in diameter, black, rather dull. *A. graecizans* of Am. auth. Waste grounds, roadsides, in various soils, throughout much of Tex. but most abundant in the w. half, July-Oct.; Wash. to n. Mex., e. to Kan. and Tex.; also established in e. N.A. from s. Can. southw.; Old World.

20. *Amaranthus californicus* (Moq.) Wats. Stems prostrate from a taproot, stout and rather fleshy, much-branched from the base, 8-50 cm. long, whitish or tinged with red; leaves alternate, numerous, pale-green, with petioles 2-18 mm. long, obovate to oblong, mostly obtuse, prominently mucronate, the veins and margins white, 3-25 mm. long, glabrous, sometimes purplish beneath; male and female flowers on same plant, occasional flowers perfect, in small axillary clusters; bracts lanceolate, acute, subulate-tipped, about equaling the flowers; tepals in *staminate flowers* 3 (or 2), membranous, elliptic-lanceolate to oblong-ovate, mucronate or erosulate; stamens 3 (or 2 or 1); tepals in *pistillate flowers* mostly 1 (or 2 or 3), inconspicuous, one narrowly lanceolate and acute or acuminate, the others usually reduced and scalelike; utricle subglobose, smooth, often tinged with red or purple, tardily irregularly dehiscent; seed dark-reddish-brown, 0.6-0.8 mm. in diameter. *A. microphyllus* Shinn. Moist soils, in beds of dried-up lakes and ponds in Plains Country, July-Sept.; s. Wash. and Alta., s. through Ida. and Ore. to Calif., Nev. and Tex.

21. *Amaranthus pubescens* (Uline & Bray) Rydb. Stems stout, ascending or prostrate, diffuse, spreading from a common rootstock, branches 1-3 dm. long, whitish, densely viscid-pubescent; leaves alternate, with stout petioles 2-10 mm. long, elliptic to oval or obovate, 7-15 mm. long, obtuse or acutish, the midvein excurrent as a spinose awn, cuneate at the base, usually puberulent (at least beneath), thick, conspicuously crispate, strongly nerved, the nerve white beneath; male and female flowers on same plant, occa-

sional flowers perfect, in small dense axillary clusters longer than the petioles; bracts lanceolate or ovate, twice as long as the flowers, with rigid spinose divaricate tips; tepals 3, those of the *staminate flowers* scarious, oblong, acute; tepals of the *pistillate flowers* oblong to elliptic or linear, obtuse or acutish, thick, 1-nerved, green; stamens 3; style branches 2 or 3; utricle globose, about equaling the tepals, circumscissile, thick-walled, slightly rugose; seed rotund, 0.8 mm. in diameter, dark-reddish-brown or black, lustrous. In sandy and alkaline soils in dry open plains and on slopes in the Trans-Pecos, e. to cen. Tex., July-Sept.; s. Colo. to Nev., s. to Tex., Ariz. and N.M.

22. *Amaranthus albus* L. Stems stout, erect, bushy-branched, the branches divaricate or ascending, 2-12 dm. tall, whitish or pale-green, glabrous or sparingly puberulent or villous; leaves alternate, with slender petioles 3-50 mm. long, slender, elliptic to oblong or spatulate to obovate, 1-7 cm. long, cuneate at the base, rounded or mucronate-cuspidate at the apex, prominently veined, the veins white beneath; male and female flowers on same plant, occasional flowers perfect, the staminate ones few, in dense or loose axillary clusters that are usually shorter but sometimes longer than the petioles; bracts green, rigid, 2-4 mm. long, oblong-lanceolate, pungent-pointed and spreading; tepals 3, the *staminate* ones oblong, cuspidate, scarious; *pistillate tepals* oblong to linear, acute, 1-nerved, thin, green along the nerve, often tinged with red; stamens 3; style branches 3; utricle subglobose, circumscissile, rugose, longer than the perianth, sometimes tinged with red; seed lenticular, 0.6-0.8 mm. in diameter, mahogany-colored, lustrous. *A. graecizans* of Am. auth. Waste places and cult. areas throughout most of Tex. but exceedingly rare, Aug.-Dec.; widely distributed throughout N.A.; adv. in Eur., Asia, Afr. and S.A.

23. *Amaranthus viridis* L. Stems slender, erect or prostrate, glabrous, to 1 m. tall; leaves alternate, with petioles 1-2 cm. long, deep-green, broadly ovate or rhombic-ovate, commonly 3-7 cm. long, acute or rounded at the base, deeply emarginate at the apex; male and female flowers on same plant, occasional flowers perfect, in spikes; spikes few to several, the lateral ones ascending, not much shorter than the terminal, forming a panicle 1-2 dm. long; bracts ovate to lanceolate, acute, as long as the tepals or shorter; tepals of the *staminate flowers* oblong, acute; stamens 3; tepals of the *pistillate flowers* 3, oblanceolate, shorter than the utricle, acute; utricle compressed-ovoid, about 1.5 mm. long, very rugose when dry, indehiscent; seed round, sharp-edged, about 1 mm. in diameter, reddish-brown, lustrous. *A. gracilis* Desf. of Am. auth. In waste places and on beaches in s. Tex. and the Rio Grande Plains, Mar.-June; probably nat. of trop. S.A.; W.I.; occasionally adv. in e. U.S.; local in the Gulf States; widely dispersed in trop. regions; also in Old World trop., Eur., Afr., Asia and the Pac. Is.

3. ACNIDA L. WATER-HEMP

Annual herbs; stems erect, glabrous, branched; leaves alternate, petioled, entire; flowers in short panicles that form much more elaborate panicles or spikes; male and female flowers on separate plants; *staminate flowers* with 5 erect membranous or scarious oblong to lanceolate 1-nerved tepals; stamens 5, the anther locules united only at the middle, the anthers linear-oblong; *pistillate flowers* naked, without or with 1 or 2 tepals; ovary flattened, obovate or rotund; style very short or absent; style branches 2 to 5, usually elongate, plumose-hispid; ovule 1; utricle thin-walled or fleshy to somewhat coriaceous, indehiscent, irregularly bursting or circumscissile, usually 3- to 5-angled; seed erect, smooth, reddish-brown or nearly black, lustrous; embryo annular, the endosperm copious.

About half a dozen species in the Western Hemisphere.

1. Plants pistillate (2)

1. Plants staminate (3)

2(1). Tepals completely lacking or irregularly present and rudimentary, less than 1 mm. long and without visible midveins; utricle indehiscent, with conspicuous longitudinal ridges; leaf blade broadly lanceolate . . . 1. *A. cuspidata*.

2. Tepals regularly present and well-developed, at least 1 mm. long and with distinct midveins, 1 or 2, lanceolate to linear; utricle circumscissile, rugose, with faint ridges; leaf blade usually oblong to lanceolate 2. *A. tamariscina*.

- 3(1). Outer tepals without heavy midveins and not appreciably longer than the inner, with excurrent midveins; bracts mostly with slender midribs not over 2 mm. long, the midrib conspicuously excurrent; leaf blades usually lanceolate, more than 1 cm. wide; inflorescence often with several branch thyrses not subtended by leaves 1. *A. cuspidata*.
3. Outer tepals 3 mm. long, with heavy midveins, definitely longer than the inner, the midribs excurrent as rigid spines; bracts with heavy midribs, mostly over 2 mm. long, definitely shorter than the outer tepals; leaf blades usually oblong to linear-oblong 2. *A. tamariscina*.

1. *Acnida cuspidata* Spreng. SOUTHERN WATER-HEMP. Glabrous herb; stems stout, 2-3 (to 9) m. tall, usually much-thickened at the base, smooth, succulent, much-branched above; leaves few to numerous, with slender petioles 2-20 cm. long, narrowly lanceolate to ovate, 6-30 cm. long, 5-14 mm. wide, acuminate or long-attenuate at the apex, rounded to acute at the base, undulate, yellowish or bright-green, prominently veined beneath; inflorescences (thyrses) flexible or moderately stiff, usually 5-10 cm. long, the terminal thyrse often accompanied by leafless branch thyrses and the uppermost of these not subtended by leaves, the branch thyrses somewhat more numerous and more crowded in the male than in the female plants; bracts 1.5-2 mm. long, the midrib moderately heavy in the male and heavy in the female, not conspicuously excurrent in either; *male flowers* with 5 stamens; the 5 tepals approximately equal, 1.2-3 mm. long, the inner emarginate, the outer acuminate with excurrent midveins; *female flowers* without perianth; style branches 3 to 5, short and stout; utricle obovoid to turbinate, 1.5-2.5 mm. long, fleshy, indehiscent, with 3 to 5 prominent longitudinal ridges, not rugose, stramineous; seed flattened, 1-1.25 mm. in diameter, turgid, round, smooth to minutely granulate, dark-reddish-brown to black, lustrous. *Acnida alabamensis* Standl., *Amaranthus australis* (Gray) Sauer. In salt and marshy places, from coastal Tex., n.w. to the Plains Country, May-Aug.; Coastal Plain from Fla. to Tex. and Yuc., W.I., Trin. and Venez.

2. *Acnida tamariscina* (Nutt.) Wood. NUTTALL'S WATER-HEMP. Herb, glabrous or nearly so; stems stout, erect or ascending, simple or branched, 1-2 m. tall; leaves alternate, with slender petioles to 5 cm. long, rhombic-oblong or lanceolate to ovate-lanceolate, to 1 dm. long, attenuate at the base, rounded or obtuse at the apex, sometimes notched, the much-reduced upper leaves narrowly oblong; inflorescence (thyrses) stiff, usually 1-2 dm. long, either all terminal on leafy branches or (if leafless thyrses present) these loosely arranged and each subtended by a leaf; bracts 1.5-2 mm. long, with moderately heavy excurrent midrib in the male, about 2 mm. long, with heavy excurrent midrib in the female; *male flowers* with 5 stamens and 5 tepals; inner tepals about 2.5 mm. long, obtuse or emarginate; outer tepals about 3 mm. long, acuminate, with conspicuous excurrent midveins; *female flowers* with 1 or 2 tepals, the shorter tepal rudimentary, the longer tepal about 2 mm. long, narrowly lanceolate, acuminate, with moderately heavy sometimes branched excurrent midvein; utricle about 1.5 mm. long, circumscissile at the middle, thin, rugose, sometimes with faint ridges corresponding to the 3 or 4 style branches, not angled, often reddish; seed nearly circular, lenticular, about 1 mm. in diameter, dark-reddish-brown. *Amaranthus tamariscinus* Nutt. Sandy fields and wastelands, chiefly in moist soils, swamps, alluvial soils, throughout most of Tex. except extreme w. part, Mar.-Oct.; Ind. to Wisc., S.D. and Colo., s. to N.M., Ark., Tex. and La., occasionally adv. in e. U.S.

4. ACANTHOCHITON TORR.

GREEN STRIPE

A monotypic genus.

1. *Acanthochiton Wrightii* Torr. Annual herb; stems erect, glabrous, 1.5-8 dm. high, with many ascending branches (the lowest ones sometimes decumbent), striate; leaves alternate, with petioles 3-20 mm. long, narrowly lanceolate to linear, 2-8 cm. long, 2-12 mm. wide, rounded at the apex, cuneate or attenuate at base, the veins whitish and prominent beneath, the margins wavy and crispate; male and female flowers on separate plants, in spicate glomerules; *staminate flowers* with bracts 2-3 mm. long that have moderately heavy excurrent midribs; tepals 5, subequal, lance-oblong, 1-nerved, the

inner ones 2.5-3.5 mm. long and emarginate, the outer tepals 3-4 mm. long and acute, all apiculate but the dark midveins not excurrent; stamens 5, the 4-celled anthers distinct; *pistillate flowers* concealed by the large rigid cordate foliaceous bracts; bracts 5 mm. long, recurved, spinulose at apex, the excurrent midribs extremely heavy; tepals usually 5; inner tepals rudimentary and linear, less than 1 mm. long; outer tepals well-developed and broadly spatulate, sometimes 4-5 mm. long, with crenate margins and conspicuous branching venation; ovary ovoid, slightly compressed, the style branches usually 3; utricle about 2 mm. long, circumscissile, somewhat rugose; seed erect, obovoid, 1-1.25 mm. in diameter, lenticular, dark-reddish-brown. *Amaranthus Acanthochiton* (Torr.) Sauer. Dunes, beaches and rocky hills in s.e. Tex. to Plains Country and in igneous soils in mts. of Trans-Pecos, July-Oct.; from w. Tex. to n.e. Ariz. and n. Mex.

5. ACHYRANTHES L. CHAFF-FLOWER

About 100 species, mostly African and Asian.

1. *Achyranthes aspera* L. Annual or perennial herb with decumbent or ascending simple or branched stems, to 1 m. long and pilose; leaves opposite, with petioles 25 mm. long, oval or ovate, 4-20 cm. long, the apex acuminate, the base rounded or narrowed; spikes terminal and axillary, slender, to 3 dm. long, 10-12 mm. thick, loosely flowered below and densely so above, the rachis densely white-villous; flowers perfect, 6-7 mm. long; bracts and bractlets glabrous, ovate, long-aristate; perianth firm, often becoming very hard; tepals 4 or 5, lanceolate, long-acuminate, twice as long as the bracts, 6-7 mm. long, not nerved; stamens 5 or rarely fewer, the filaments filiform-subulate, the anthers 2-celled; style slightly longer than the filaments; utricle oblong, included, truncate at the apex, 6-7 mm. long, membranous, indehiscent, glabrous; seed narrowly oblong, 3 mm. long, fuscous, dull. Waste grounds and wooded areas, only in Hidalgo Co. in the Rio Grande Plains; s. Fla. to Tex.; W.I., C.A. from Mex. to Guat.; Old World trop.; s. coast of Eur. to Afr. and s. Asia.

6. IRESINE P. BR. BLOODLEAF

Annual or perennial herbs and half-shrubs, of varying aspects; stems erect, decumbent or scandent, pubescent or glabrous; leaves opposite, petiolate, entire or serrulate; flowers perfect, usually unisexual (and when so, male and female flowers on same or separate plants), white, scarious, 3-bracted, small or minute, crowded into clusters or spikes aggregated into branching panicles; perianth deeply 5-parted, often bearing long wool; stamens mostly 5, the filaments connate at the base; ovary compressed, the style very short; stigmas 2 or 3, usually filiform, sometimes capitate; ovule 1, pendulous from the apex of an elongate funicle; utricle compressed, subglobose, membranous, indehiscent, very small; seed inverted, smooth; embryo annular, surrounding the farinaceous endosperm; cotyledons narrow; radicle superior.

About 80 species in both hemispheres.

1. Stems conspicuously fruticose nearly throughout, sometimes scandent; tepals of the pistillate flowers about as long as the bractlets 1. *I. Palmeri*.
1. Stems herbaceous throughout, never truly fruticose (2)
- 2(1). Tepals of pistillate flowers faintly 1-nerved, acute, equaling or usually shorter than the utricle; plant perennial with rootstock 2. *I. rhizomatosa*.
2. Tepals of the pistillate flowers 3-nerved, usually obtuse, longer than the utricle; annuals or perennials, herbaceous (3)
- 3(2). Annual; tepals of the pistillate flowers obtuse or acutish; lower leaves similar to the upper ones, acuminate, inconspicuously nerved, thin 3. *I. Celosia*.
3. Perennial; tepals of the pistillate flowers acute or acuminate; lower leaves much broader than the upper ones, obtuse or acutish, conspicuously nerved, with coarse whitish hairs, thick and succulent 4. *I. heterophylla*.

1. *Iresine Palmeri* (Wats.) Standl. PALMER'S BLOODLEAF. Perennial weak shrub, scandent or decumbent; stems much-branched, the branches ascending, slender or stout, sharply angulate, glabrous or sparsely puberulent when young; leaves opposite, with petioles 2-6 mm. long, lanceolate to narrowly ovate or lance-oblong, 1.2-6 cm. long, 5-17 mm. broad, acute to acuminate or rarely obtuse at the base, thick, bright-green, glabrous; male and female flowers on separate plants; pistillate flowers in short or elongate very narrow sparsely leafy panicles; spikelets loosely flowered, sessile or pedunculate; tepals of the pistillate flowers about as long as the bractlets, oval, 1 mm. long, obtuse, sparsely pilose, obscurely veined; bracts and bractlets orbicular, stramineous or fuscous, strongly concave; staminodia lacking; style very short, the stigmas elongate and stout; utricle subglobose, 1 mm. long, reddish-brown. In thickets and groves in the Brownsville region, spring-fall; also Mex.

2. *Iresine rhizomatosa* Standl. Perennial herb, stoloniferous with slender horizontal rhizomes; stems erect, usually simple up to the inflorescence, 5-15 dm. tall, sparsely pubescent or glabrous, pilose at the slightly swollen nodes, the internodes 5-14 cm. long; leaves opposite, thin, bright-green, ovate to ovate-lanceolate, acute to long-acuminate, entire, narrowed at the base, the larger ones 6-15 cm. long and 2-7 cm. broad, with a few short hairs on the upper surface along the veins, sparsely pubescent beneath or glabrous; male and female flowers on separate plants; *staminate panicle* often laxly branched, the spikelets longer; bracts and bractlets ovate, silvery-white, shorter than the tepals; tepals silvery-white, ovate-lanceolate, 1.2-1.5 mm. long, 1-nerved, those of the pistillate flowers subtended by long hairs as a white wool; *pistillate panicles* 7-30 cm. long, 2.5-20 cm. broad, much-branched, the branches erect or ascending, pyramidal, the spikelets opposite or alternate, densely flowered, 5-20 mm. long; utricle round, 2-2.5 mm. long, equaling or longer than the tepals; seed suborbicular, 0.5 mm. in diameter, dark-red, lustrous. *I. celosioides* Michx., non L. Sandy alluvial soils, scattered in e. half of Tex., w. to Denton and Comal cos., Aug.-Oct.; Md. to s. Ill. and Kan., s. to e. Va., Ala., La. and Tex.

3. *Iresine Celosia* L. JUBA'S BUSH. Annual herb or the plant persisting for several years, from a vertical root; stems slender or short, usually much-branched, erect or spreading, sometimes clambering over other plants, 4-30 dm. long, glabrous or sparingly villous at the nodes, with short multicellular hairs, swollen at the nodes, the internodes 4-20 cm. long; leaves opposite, ovate to ovate-lanceolate or the upper ones lanceolate, 5-15 cm. long, 1.5-7 cm. broad, acute or acuminate at the apex, rounded or truncate at the base, slightly decurrent, glabrous or slightly villous with short multicellular hairs, often soft-pubescent on both surfaces, with slender petioles 8-65 mm. long; panicles usually broad and much-branched, 14 cm. long, the branches ascending, divergent or reflexed, slightly villous with whitish hairs; spikelets alternate, opposite or verticillate, sessile or pedunculate, usually densely flowered, 5-25 mm. long, often flexuous; male and female flowers on same plant, white to stramineous, the pistillate ones with copious long white wool at the base; bracts about one half as long as the tepals, ovate to ovate-orbicular, obtuse or acute, often pubescent, usually entire; tepals 1-1.5 mm. long, oblong, obtuse or rounded, those of the pistillate flowers conspicuously 3-nerved; utricle shorter than the tepals; seed 1.5 mm. in diameter, broadly obovoid or suborbicular, dark-red, lustrous. In cen. and Trans-Pecos Tex., July-Oct.; mostly along the coast, N.C. to Fla., w. to Tex.; also W.I., cen. and w. Mex. and southw. through C.A. and much of S.A.

4. *Iresine heterophylla* Standl. Perennial herb from long slender branched woody rootstocks; stems herbaceous, stout, erect or ascending, solitary or several from a single base, 5-10 dm. tall, swollen at the nodes, short-villous at the nodes and sparsely pubescent with short soft hairs elsewhere, the internodes 1.5-10 cm. long; leaves opposite, usually asymmetric, with petioles 2-20 mm. long, the uppermost leaves usually sessile or subsessile; blades of the lower leaves broadly rhombic-ovate, 3-6 cm. long, 2-4 cm. wide, rounded or acutish at the apex, more or less decurrent, yellowish-green, scabrous or smooth on the upper surface, pubescent beneath; inflorescence a narrow dense much-branched panicle, 1.5-4 dm. long, 3-9 cm. broad, the branches erect or ascending, sparsely villous; spikelets stout, densely flowered, 4-23 mm. long; bracts one third to one half as long as the tepals, ovate-orbicular, acute, entire; tepals 1-1.3 mm. long, elliptic-oblong,

yellowish-white, acuminate to acutish, those of the pistillate flowers 3-nerved; utricle shorter than the tepals; seed suborbicular, 0.6 mm. in diameter, dark-reddish-brown, lustrous. In humus on and among boulders, dry rocky hills, sand-gravel and ledges in the Trans-Pecos and Edwards Plateau, May-Oct.; Tex. to Ariz., s. to C.A.

7. DICRAURUS Hook. f.

A monotypic genus. (*Dicrairus*, orthogr. err.).

1. *Dicraurus leptocladus* Hook. f. Perennial shrub 2-10 dm. tall, with numerous simple or sparsely branched stems from a woody base; branches slender, ascending, rigid, often spinescent in age, subangulate, densely villous-sericeous; leaves mostly alternate, with petioles 1-2 mm. long, ovate to ovate-lanceolate or ovate-oblong, 7-25 mm. long, 3-9 mm. wide, acute to acuminate or rarely obtuse, thick and firm, sparsely sericeous on the upper surface or glabrate, densely villous-sericeous beneath or glabrate in age; panicles axillary or terminal, 2-15 cm. long, usually dense and congested, leafless or sparsely leafy below; spikelets short, few-flowered, sessile or short-pedunculate; perianth tercte, the 5 segments distinct, 1-nerved; male and female flowers on same plant, occasional flowers appearing perfect; *staminate flowers* with bracts and bractlets less than half as long as the tepals, subscarios, suborbicular, densely short-villous; tepals elliptic-oblong, 2 mm. long, densely villous; stamens united into a cup, the 5 filaments linear and equaling the tepals, the very short staminodia papillose-dissected at the apex; *pistillate flowers* with bracts and bractlets nearly as long as the tepals, suborbicular, white-stramineous, villous; tepals elliptic-oblong, 1.5 mm. long, obtuse, densely pilose with long soft white hairs; style very short, the stigmas elongate; utricle oval, membranous, indehiscent, subcompressed; seed 1 mm. broad, brown. Rocky hillsides and among boulders in the s. Trans-Pecos, July-Dec.; also Mex.

8. GUILLEMINEA H.B.K.

COTTONFLOWER

Perennial herbs, rarely becoming woody, the stems often procumbent, lanate to nearly glabrous; leaves opposite and extremely variable; radical leaves in rosettes, linear to oblanceolate; cauline leaves linear to ovate with a widely winged petiole; inflorescence a single flower or a spike of 2 to 30 flowers; spikes often densely aggregated at the nodes, subtended by small leaves; flowers sessile, with 2 bracts and a bractlet, pedicellate, perfect, 5-merous, the perianth rotate to erect; tepals 5, 2 more concave than the other 3, covered with silky hairs developing from the rigid tissue, the segments with a sterile membranous fringe, trinerved and often chlorophyllous; stamens 5, the filaments united into a tube, either free from the perianth and cuplike around the base of the pistil or adnate to the fused perianth, the anthers unilocular; staminodia and pseudostaminodia absent; style 1, usually short, sometimes extended, the stigmas capitate and always bilobed; utricle membranous, indehiscent; ovary unilocular with a single falsely apically pendulous ovule; endosperm central and farinose; embryo annular, peripheral and the radicle ascending.

Several American species.

1. Filament tube adnate to the perianth (*Guilleminea*) (2)
1. Filament tube free from the perianth (*Gossypianthus*) (3)
- 2(1). Leaves and flowers not densely aggregated at the nodes; mature flowers less than 1.5 mm. long 1. *G. densa* var. *densa*.
2. Leaves and flowers densely aggregated at nodes on the thick stems; flowers 1.8-2.2 mm. long at maturity 1. *G. densa* var. *aggregata*.
- 3(1). Plant not densely pilose; radical leaves usually 1-9 cm. long, 3-6 mm. wide, lanceolate to linear, acute (4)
3. Plant usually densely pilose with long silky hairs; radical leaves usually 2-8 cm. long, 5-15 mm. wide, oblanceolate and acute to spatulate and obtuse (5)

- 4(3). Longest radical leaves 10-25 mm. long; plants low; stems procumbent; cauline leaves often pilose, 5-8 mm. long, 3-4 mm. wide . . . 2. *G. lanuginosa* var. *lanuginosa*.
4. Longest radical leaves usually 40-90 mm. long, often linear; plants large, often with ascendent stems, often nearly glabrous 2. *G. lanuginosa* var. *tenuiflora*.
- 5(3). All leaves very large; cauline leaves 15-20 mm. long, 8-10 mm. wide, spatulate to ovate; radical leaves 3-8.5 cm. long, 6-12 mm. wide, oblanceolate; leaves densely aggregated on thick stems 2. *G. lanuginosa* var. *Sheldonii*.
5. Some cauline leaves small, 7-18 mm. long, 3-13 mm. wide; radical leaves 1.6-6 cm. long, 4-10 mm. wide, spatulate to lanceolate; leaves not densely aggregated 2. *G. lanuginosa* var. *rigidiflora*.

1. *Guilleminea densa* (Willd.) Moq. Radical leaves 20-25 mm. long, 10-13 mm. wide, lanceolate to spatulate, acute, rarely persisting until fruiting; cauline leaves 3-30 mm. long, 1.5-12 mm. wide, lanceolate; flowers rarely more than 10 grouped into a small capitulum or cylindrical spike; perianth to 2.5 mm. long, slightly longer than the bractlets, usually rotate; tepals united into a 5-parted perianth, the tube densely lanate, the lobes with a central nerve less than two thirds the length of the free lobe; tepal lobes hyaline-membranes except the nerve, lance-ovate, acutish, glabrous, scarious, white, the nerve usually without chlorophyll; filament tube barely visible above the level of adnation to the perianth; bracts ovate, acute, scarious, white, glabrous; bractlets oblong-ovate, obtuse; utricle glabrous; seed compressed-ovoid, 0.6 mm. long, brown, lustrous. In dry stony or sandy soil in Trans-Pecos and Plains Country, May-Oct.; Okla. and w. Tex. to s. Ariz. and southw. to s. Mex.; also s. Bol. to n. Arg.; introd. in S. Afr. and Queensl.

We have the following two varieties in Texas.

Var. *densa*. Flowers less than 1.5 mm. long at maturity of fruit and leaves not aggregated at the node. *Brayulinea densa* (Willd.) Small. The most common variety in N.A.

Var. *aggregata* Uline & Bray. Plants larger and more robust; leaves subtending the nodes often very large and ovate; flowers and leaves densely aggregated on thick stems, the flowers 1.8-2.2 mm. long at maturity. Tex. and Mex.

2. *Guilleminea lanuginosa* (Poir.) Hook. f. Stems all originating above ground, rarely flexuous, often procumbent but sometimes ascendent; radical leaves 1-9 cm. long, 3-15 mm. wide, lanceolate to spatulate with a widely winged petiole without chlorophyll, both surfaces either pilose-sericeous or glabrous; cauline leaves with very short petioles, oval to rounded-obovate, 5-20 mm. long and 3-10 mm. wide, pilose-strigose above, densely pilose-sericeous beneath; inflorescence a small spike of 6 to 12 axillary flowers; perianth 2.5-3 mm. long, densely lanate; tepals lanceolate to linear-lanceolate, trinerved, green along the nerves; filaments free, linear, dilated at the base; styles 0.1-0.3 mm. long at maturity of fruit; seed 1 mm. long, brown, lustrous. In dry soil, s. and w. Tex. to Mex.; Hisp.

We have the following varieties in Texas.

Var. *lanuginosa*. Plants rarely larger than 1 dm. tall, with stems flexuous or ascendent; radical leaves 1-2.5 cm. long and 4-6 mm. wide, lanceolate or oblanceolate and acute; cauline leaves 5-8 mm. long and 3-4 mm. wide; marginal membranes on the tepals less than 10 percent of the total area. *Gossypianthus lanuginosus* (Poir.) Moq. in Rio Grande Plains; also Hisp. and Mex.

Var. *rigidiflora* (Hook.) Mears. Plants larger and more robust than those of var. *lanuginosa*; stems thick, never flexuous, the stems (and leaves) usually densely pilose, rarely worn to glabrous by rain and wind; radical leaves 1.6-6 cm. long, 4-10 mm. wide, oblanceolate and barely acute to spatulate and obtuse; cauline leaves 7-18 mm. long, 3-13 mm. wide, lanceolate, the marginal membrane on the tepals wider than in var. *lanuginosa*. *Gossypianthus rigidiflorus* Hook. From s.-cen. and n.-cen. Tex. to the Edwards Plateau and Rio Grande Plains, Apr.-Oct.; Okla. and Tex. to s.w. Chih., s. to cen. Tam.

The most common variety, seems to be intermediate between var. *lanuginosa* and var. *Sheldonii*. It occurs where both the others do but not where the others occur together.

Var. *Sheldonii* (Uline & Bray) Mears. Stems thicker than in the other varieties; radical leaves 3-8.4 cm. long, 6-12 mm. wide, lanceolate to oblanceolate; cauline leaves 1.5-2 cm. long, 8-10 mm. wide, ovate and acute to obovate and obtuse, the leaves densely tomentose; tepals with 3 chlorophyllous nerves; flowers sometimes basal and bleached by the weather. *Gossypianthus Sheldonii* Uline & Bray. Prairies, Okla. and n.w. Tex. (to Taylor and Terrell cos.).

Var. *tenuiflora* (Hook.) Mears. Radical leaves 3-9 cm. long, 3-6 mm. wide, linear to lanceolate, acute; cauline leaves 8-18 mm. long, 4-6 mm. wide, lanceolate to oblanceolate, acute, the leaves nearly glabrous at anthesis; nodes of the inflorescences farther apart than in the other varieties; marginal membranes on tepals wider than those of var. *lanuginosa*. *Gossypianthus tenuiflorus* Hook. Blackland Prairies of Okla. and Tex., Post Oak Savannah and Gulf Prairies of Tex., w. to Llano Co.; rare in Ark. and Mex.

9. ALTERNANTHERA FORSK. CHAFF-FLOWER

Annual or perennial herbs; stems decumbent or prostrate, erect or ascending; leaves opposite, sessile or petioled, with narrow or broad blades; flowers perfect, in sessile or peduncled headlike spikes that are silvery or white; tepals 5, unequal or equal, 2 more concave than the others; stamens usually 5, sometimes 3, the filaments partially united into a cuplike tube, the staminodia equal to or surpassing the filaments and the 1-celled anthers; ovary 1-celled, the style variable in length, the stigma capitate; ovule solitary; utricle flattened, indehiscent; seed lenticular, smooth.

About 200 species, mostly in tropical and subtropical regions.

- 1. Heads pedunculate; peduncles about 5 cm. long; flowers sessile or nearly so; tepals glabrous; spikes 12-14 mm. in diameter; leaf blades narrow, to 11 cm. long, nearly glabrous5. *A. philoxeroides*.
- 1. Heads seemingly sessile or nearly so; peduncles at most 1 cm. long (2)
- 2(1). Staminiodia equaling the filaments, laciniate at the apex; stamen tube and style elongate; stems erect; leaf blades much longer than broad, the margins undulate or crispate, often variegated4. *A. Bettzickiana*.
- 2. Staminiodia shorter than the filaments, entire or denticulate; stamen tube and style very short; stems prostrate (3)
- 3(2). Tepals never with rigid spinose tips, 3-5 mm. long, sparsely pilose or glabrate; leaf blades twice as long as broad3. *A. polygonoides*.
- 3. Some of the tepals with rigid spinose tips (4)
- 4(3). Tepals 5-7 mm. long, sparsely villous; leaf blades usually as broad as long; staminodia dentate1. *A. pungens*.
- 4. Tepals 3-5 mm. long, densely villous; leaf blades longer than broad; staminodia usually entire2. *A. caracasana*.

1. *Alternanthera pungens* H.B.K. Herbaceous plants with prostrate stems 3-8 dm. long, villous with obscurely scaberulous white hairs; leaves opposite, with margined petioles 2-5 mm. long, orbicular to broadly oval, as broad as long, 1.3-5 cm. long, rounded at the apex, apiculate and mucronate, firm, prominently veined, appressed-pilose when young but soon glabrate; heads solitary, axillary, sessile, 8-10 mm. long; bracts and bractlets lance-oblong, equaling the perianth, attenuate to an aristate apex; tepals oblong or ovate-oblong, 5-7 mm. long, acuminate to a long-aristate rigid tip, 3-nerved; filaments linear, the staminodia slightly shorter, triangular, remotely dentate; style short; utricle strongly compressed, truncate; seed 1.5 mm. long, dark-brown. Sandy soils, rare along the coast, summer; Venez. to Bol. and Urug.; Cuba and Jam.; adv. to e. Tex. and e. Mex., s. Fla. and Ala.

2. *Alternanthera caracasana* H.B.K. VERDOLAGA DE PUERCO, MATT CHAFF-FLOWER. Perennial herb from an elongate tuberous root; stems branched at the base, 1-5 dm. long, forking, sometimes hirsute; leaves somewhat clustered, spatulate to suborbicular, 8-20 mm. long, narrowed into a short petiole, obtuse or abruptly pointed; flower clusters

axillary; tepals unequal, 3-5 mm. long, lanceolate, awn-tipped, the shorter one copiously pubescent with barbed hairs, all 1-nerved; staminodia nearly as long as the filaments, entire (at least above); utricle ovoid, included, with a sharp wing below the apex; seed ovate-orbicular, 1-1.5 mm. long, reddish-brown, lustrous. *A. peploides* (H. & B.) Urban, *A. repens* of Am. auth. In waste places and cult. grounds, from s.-cen. and n.-cen. Tex. and Rio Grande Plains through Edwards Plateau to the Trans-Pecos, Apr.-Nov.; S.C. to Fla., w. to Tex. and Calif.; S.A.

3. *Alternanthera polygonoides* (L.) R. Br. SMOOTH CHAFF-FLOWER. Perennial or annual herb with glabrous or sparingly pilose stems, striate, the branches procumbent or creeping, often rooting at the nodes, 1-8 dm. long; leaves opposite, with petioles 5-10 mm. long (densely white-villous at the base), spatulate to elliptic, glabrous on the upper surface, densely villous beneath, becoming glabrate, 6-25 mm. long, 3-11 mm. wide; flowers solitary or glomerate in dense sessile globose axillary heads 8-12 mm. in diameter; bracts and bractlets half as long as the tepals, ovate, acute, mucronate, glabrous; tepals bright-white, 3-nerved, elliptic to lanceolate, about 3-5 mm. long, somewhat longer than the bracts, pilose below or glabrate; stamens 5, the filaments subulate, the tube very short; staminodia much shorter than the filaments, ovate, toothed at the apex; style very short; utricle globular to obcordate, included, half as long as the tepals; seed orbicular, 1 mm. broad, dark-brown, lustrous. *Achyranthes polygonoides* (L.) Lam. Fields, old lake beds, waste grounds and roadsides in coastal and s. Tex., all year; N.C. to Fla., w. to La. and Tex., on ballast in N.J.; s. to Mex., C.A. (Pan.) and S.A. (Braz.); W.I., Bah. I., Gr. Ant., Guadeloupe and Grenada.

4. *Alternanthera Bettzickiana* (Regel) Standl. Perennial herb or flowering as an annual; stems striate, green or purplish-red, erect or ascending, 1-4 dm. tall, much-branched, villous when young, soon glabrate, the nodes swollen; leaves opposite, green or usually purplish-red, often variegated, rhombic or obovate, 4 cm. long or less, the apex acuminate, the margins crispate or undulate, the petioles as long as or shorter than the blades; flowers whitish, in sessile axillary heads, usually solitary, shorter than the peduncles; bracts and bractlets broadly ovate, acuminate, the lower ones laciniately lobed, glabrous; tepals oblong-lanceolate, acute or acuminate, twice as long as the bracts, 3-nerved, sparsely pilose; staminodia laciniate at the apex, as long as the filaments; filament tube and style elongate; utricle ovoid. Widely planted for ornament, locally escaped from cult.; probably nat. of Braz.; known also in W.I., s. Mex. and trop. Am.

5. *Alternanthera philoxeroides* (Mart.) Griseb. ALLIGATOR-WEED. Perennial aquatic to semiterrestrial herb; stems simple or branched, 3-10 dm. long, the branches glabrous, ascending, prostrate or decumbent, stoloniferous, forming mats, stout, the ascending portion 1-6 dm. long, often rooting at the nodes; leaves opposite, thick and fleshy, glabrous, linear to linear-lanceolate or obovate, 2-11 cm. long, 5-20 mm. broad, usually acute or mucronulate at the apex, entire, narrowed to the sessile base; spikes simple, axillary or terminal, subglobose or cylindric, on peduncles 2-7 cm. long, glabrous or pubescent in lines; flowers sessile in the bractlets, with a sweet resinous odor; bracts one fourth as long as the tepals, broadly ovate, glabrous; perianth silvery-white; tepals at least 4, glabrous, 5-6 mm. long, nearly equal, obscurely 4-veined, lanceolate to ovate-oblong, acute, firm, serrulate near the apex; filaments linear-subulate; staminodia narrow, usually entire, exceeding the anthers, half as long as the tepals, ligulate, lacerate at the apex; style elongate, the stigma entire. *Achyranthes philoxeroides* (Mart.) Standl. In waste places, in ponds, streams, along some rivers, becoming a noxious weed, in s.e. Tex., Mar.-Aug.; on Coastal Plain, N.C. to Fla., w. to La. and Tex., s. throughout C.A. to S.A., where it is nat. from Col. to Braz. and Arg.

This plant, primarily in conjunction with the highly productive water-hyacinth (*Eichhornia crassipes*) and several aquatic species of *Ludwigia*, is rapidly clogging the streams, canals, ponds and other such places in coastal Texas.

10. FROELICHIA MOENCH

SNAKE-COTTON. COTTON-WEED

Annual, biennial or perennial herbs with semiwoody taproots; stems erect or procumbent, woolly to silky or pubescent, simple or branched; leaves opposite, sessile or petiolate, the blades entire; flowers perfect, sessile, spicate on elongated peduncles, with scarious

bracts; perianth tubular, the tube lanate, 5-lobed, the lobes glabrate, longitudinally crested or tubercled in the fruit; stamens 5, the filaments united to form an elongate tube, bearing 5 oblong 1-locular anthers and as many sterile ligulate appendages; ovary ovoid, the style elongate, the stigma capitate; ovule 1, pendulous from the apex of an elongate funicle; utricle ovoid, membranaceous, indehiscent, included in the tube of the filaments; seed inverted, lenticular or obovoid, smooth; embryo annular, with farinaceous endosperm and a superior radicle.

About 20 species, mostly in warm regions in America.

1. Calyx tube (at maturity, i.e., surrounding mature fruit) with lateral rows of distinct spines; plants slender, much-branched (2)
1. Calyx tube (at maturity) with lateral deeply dentate to entire crests; plants stout, sparsely branched (3)
- 2(1). Stems densely white-lanate; faces of the calyx tube tuberculate 1. *F. gracilis*.
2. Stems pubescent with short mostly appressed brownish hairs; faces of the calyx tube each with one or more sharp spines 2. *F. Braunii*.
- 3(1). Calyx crests deeply dentate (4)
3. Calyx crests merely erose or crenulate, or entire (5)
- 4(3). Pubescence on the upper part of the stem of brownish hairs; one or both faces of the calyx tube with 1 or 2 tuberculate or spinose ridges; annual 3. *F. floridana*.
4. Pubescence on the stems white-lanate; one or both faces of the calyx tube with a basal spine; perennial 5. *F. arizonica*.
- 5(3). Annual; leaf blades narrowly oblong or lanceolate, their pubescence fulvous; sides of the calyx tube with 1 or 2 crests 4. *F. Drummondii*.
5. Perennial; leaf blades (at least the upper ones) ovate-orbicular or oval, their pubescence white or gray; sides of the calyx tube naked .. 6. *F. interrupta*.

1. *Froelichia gracilis* (Hook.) Moq. Annual herb with slender stems 1-2 mm. thick, simple or much-branched at the base, the branches 2-6 dm. tall, ascending or procumbent, densely or sparsely villous-tomentose, sometimes viscid above; leaves short-petioled, more numerous at base of plant and often clustered, linear-lanceolate to lanceolate-elliptic, 3-12 cm. long, 2-7 mm. broad, acute or acuminate at the apex, cuneate at the base, sericeous or tomentose; spikes slender or stoutish, 1-3 cm. long, 7-8 mm. thick; bracts and bractlets acuminate, stramineous, fuscous or blackish; calyx tube with 2 lateral rows of distinct spines at maturity, the side of the tube tuberculate near the base; calyx lobes oblong-linear, acute; seed lenticular, 1.5 mm. in diameter, yellowish-brown, lustrous. On gravel and in sandy soils throughout most of Tex. except extreme e. part, Mar.-Nov.; Ia. to Colo., s. to Ark., Ariz., Tex. and Mex.; adv. eastw. to N.Y., N.J., Md., Va., Ky. and O.

2. *Froelichia Braunii* Standl. Annual herb with slender stems, erect or ascending, simple or branched at the base, pubescent with short-appressed brownish hairs, somewhat viscid above, usually villous-tomentose near the base; leaves opposite, the petioles of the lower leaves often half as long as the blades, the upper leaves short-petioled; blades linear to linear-elliptic or narrowly lanceolate, 2-12 cm. long, 2-22 mm. broad, acute to long-acuminate at the apex, acuminate or attenuate at the base, canescent to sericeous-tomentose beneath with brownish or grayish hairs; spikes dense, stout, 5-20 mm. long; bracts and bractlets acute or acuminate, fuscous or stramineous; calyx tube with 2 lateral rows of distant spines at maturity, the side of the tube with one or more sharp spines; calyx lobes lance-oblong, acute; seed 1.5 mm. long, brown, lustrous. Dry soils, Tex.; adv. n. to St. Louis, Mo. and in Ill.

3. *Froelichia floridana* (Nutt.) Moq. Annual herb, tall and wandlike, the stems erect, rather stout, 4-18 dm. tall, to 7 mm. thick, usually simple at the base and sparsely branched above, the branches puberulent or tomentulose with short often viscid whitish or brownish hairs; leaves opposite, short-petiolate, oblanceolate to spatulate or oblong, 3-10 cm. long, 1-2 cm. wide, obtuse to acute at the apex, cuneate at the base, broadest

below the middle, canescent to subscabrous on the upper surface, sericeous-tomentose beneath; spikes dense, 1-10 cm. long, 1-1.3 cm. thick, whitish; bracts acuminate or cuspidate, fuscous to stramineous or blackish; one or both faces of calyx tube with 1 or 2 tuberculate or spinose ridges; calyx lobes oblong, obtuse, greenish-white or pinkish; seed 1.5 mm. long, brown. In sandy soils, throughout Tex., May-Nov.; s. Ga. and Fla. to Miss. and Tex., n. to Del., Md. and N.J.

Var. *campestris* (Small) Fern. Branches sericeous-tomentose with white or brownish hairs, slightly viscid above; leaves canescent or silky on the upper surface, sericeous-tomentose beneath with usually fulvous hairs; peduncles lanate with hairs commonly 2 mm. long and its leaves chiefly spatulate; one or both faces of the calyx tube with a basal spine. Dry fields and hillsides, plains, Minn., Ill., Ind., Wisc. to Neb., Okla., Colo. and Tex.

4. *Froelichia Drummondii* Moq. Annual herb with stout stems, erect or ascending, 3-12 dm. tall, simple or branched at the base, the branches mostly simple, sericeous-lanate, with brownish hairs, often viscid above; leaves opposite, the petioles of the lowest leaves half as long as the blades, the upper leaves short-petioled; blades oblong to oblong-lanceolate, 5-14 cm. long, 1-4 cm. broad, obtuse at the apex, acute or acuminate at the base, canescent on the upper surface, densely sericeous-tomentose beneath with brownish hairs; bracts broadly ovate, acuminate, fuscous or stramineous, the bractlets fuscous or stramineous; calyx tube narrowly winged at maturity, the wings erose, the sides of the tube with one or two low dentate ridges; calyx lobes lance-oblong, acutish; seed 1.5 mm. long, fuscous. Considered by many workers to be merely a race of *F. floridana*. In dry sandy soils, s. Okla. and Tex.

5. *Froelichia arizonica* Thornb. Perennial herb with a rather fleshy taproot; stems stout, usually several, erect, simple or branched, 4-12 dm. tall, with 2 pairs of leaves on the stem below the inflorescence, the base of the stems persistent, becoming woody and forming a small sparsely and strictly branched caudex, sericeous-tomentose with white hairs; leaves opposite, few on the stems, usually crowded at the base; basal leaves to 1 dm. long, 6-27 mm. broad, elliptic to obovate or oval, tapering into the short petiole, acuminate at the base; upper leaves often narrowly oblong, sericeous-tomentose with whitish or grayish hairs; spikes stout, dense, 4 cm. long; bracts broadly ovate, acute, usually fuscous, the bractlets fuscous to rarely stramineous; calyx tube narrowly winged, the wings dentate, one or both sides of the tube with short thick crests or merely tuberculate; calyx lobes narrowly oblong, obtuse or acutish; seed 1.5 mm. long, brown. Dry stony places, hillsides, in calcareous and volcanic areas along arroyos, in Trans-Pecos Tex., fall; from Tex. and s. Ariz., s. to Mex.

6. *Froelichia interrupta* (L.) Moq. TEXAS SNAKE-COTTON. Perennial herb from a woody root, branched at the base; stems rather slender, ascending or decumbent, 3-10 dm. long, simple or sometimes branched, thinly white-tomentose or silky, slightly viscid above; leaves opposite, the petioles of the lower leaves to as long as the blades, those of the upper leaves shorter to sessile; blades oval to ovate-orbicular, rarely oblong to elliptic, 2.5-10 cm. long, 8-38 mm. broad, obtuse to rarely acute at the apex, rounded or obtuse at the base, rarely acute, scaberrulous or canescent on the upper surface, sericeous or floccose-tomentose beneath with whitish or grayish hairs; spikes lax; bracts acute or acuminate, stramineous or fuscous; calyx tube naked, but the calyx deltoid in outline, nearly as broad as long, broadly winged laterally, the thin wings entire or crenulate; calyx lobes lance-oblong, obtuse; seed 1.5 mm. long, brown. Trans-Pecos Tex. to Mex.; W.I.; Col. to Parag. and Chile.

11. PHILOXERUS R. BR.

About 10 species, mostly in coastal regions of the tropics.

1. *Philoxerus vermicularis* (L.) R. Br. SILVERHEAD. Perennial or annual herb, somewhat succulent; stems prostrate, branched, 1-18 dm. long, the branches prostrate or ascending to sometimes 1-5 dm. tall; leaves opposite, thick and fleshy, subterete, linear to linear-oblong or oblong to clavate, 15-55 mm. long, 2-12 mm. broad, acutish or blunt at the apex, narrowed to the sessile base, villous in the axils of the leaves, otherwise glabrous; spikes or heads solitary, subglobose to cylindric, densely many-flowered, bright-white, 13 mm. long, 5-11 mm. thick, obtuse, the rachis lanate; flowers perfect, white; bracts broadly

ovate, chartaceous, 1-nerved, acute or obtuse; bractlets ovate-oblong, slightly shorter than the tepals, acute, glabrous; perianth compressed, thickened at the base, 5-parted, the segments obtuse; tepals 3.5-4 mm. long, obtuse, the outer ones oblong and glabrous, the inner lanceolate and usually lanate near the base; stamens 5, the filaments subulate and connate below, the oblong anthers 2-celled; utricle compressed, broadly ovoid, coriaceous, indehiscent; seed orbicular, 0.8-1 mm. broad, dark-brown, lustrous. Saline soils and dunes along coasts, wet sands, in Rio Grande Plains, summer-fall; Fla. to Tex., s. through Mex. to Pan.; Col. to Braz.; W.I.; Virg. I.; w. coast of trop. Afr.

12. TIDESTROMIA STANDL.

Annual or perennial erect or prostrate herbs, sometimes suffruticose at the base, branched; stems with branched or stellate hairs; leaves opposite, petiolate, the blades broad, the margins entire; flowers perfect, minute, glomerate in the axils of the leaves; bracts and bractlets hyaline and pubescent; perianth 5-parted, the outer 3 segments wider than the inner 2, 1-nerved, membranaceous, ovate-lanceolate, the leaves subtending the inflorescence or glomerules becoming indurate and more or less connate in age to form a sort of involucre; stamens 5, hypogynous; filaments connate at the base, forming a short cup, with or without intervening lobes or staminodia; anthers 2-celled, appearing 1-celled after dehiscence; ovary globose, the style short, the capitate stigma simple or 2-lobed; ovule 1, suspended from the apex of a slender funicle; utricle slightly compressed and glabrous, indehiscent; fruiting calyx not winged, crested or spiny.

About 7 species in southwestern United States and Mexico.

- 1. Annuals, usually prostrate; staminodia very short or absent (2)
- 1. Perennials, erect, ascending or prostrate (3)
- 2(1). Foliage gray-green with stellate hairs 1. *T. lanuginosa* var. *lanuginosa*.
- 2. Foliage yellowish-green, fleshy, nearly glabrous; stems very brittle 1. *T. lanuginosa* var. *carnosa*.
- 3(1). Staminodia absent; plants prostrate, the apex of the caudex with white tomentose gemmae 2. *T. gemmata*.
- 3. Staminodia present; plants erect or ascending (4)
- 4(3). Staminodia acute, nearly half as long as the filaments; leaves basically oblong, the veins prominent 3. *T. oblongifolia*.
- 4. Staminodia very short and broad, sometimes emarginate; leaves basically ovate, the veins not prominent 4. *T. suffruticosa*.

1. *Tidestromia lanuginosa* (Nutt.) Standl. var. *lanuginosa*. ESPANTA VAQUEROS. Annual herb, 10-15 cm. tall, to 1 m. across; foliage gray-green to ashy-white; stems repeatedly forked, the branches 1-6 dm. long, prostrate, decumbent or ascending, turning dull-reddish; leaves with the petioles equaling or shorter than the blades, broadly obovate to rhombic-ovate, 5-30 mm. long, round or obtuse at the apex, cuneate or rounded at the base, both surfaces dense with stellate hairs that disappear from the older stems; glomerules axillary, few-flowered, subtended by small leaves; perianth 1-3 mm. long, 3 times longer than the bracts; flowers and fruits inconspicuous; seed 5 mm. long. Dry ground, along roadsides, clay banks, limestone-sandy soils, gypsum and gravel washes from coastal Tex. through the Rio Grande Plains to the Plains Country and Trans-Pecos, Mar.-Oct.; S.D. and Kan. to Ut. and Nev., s. to Tex., Ariz. and n. Mex.; adv. in waste ground and along railways in Ill. and Mo.

Var. *carnosa* (Steyerm.) Cory. Annual herb; herbage very fleshy, yellowish-green, nearly glabrous; stems more brittle than in the typical variety, glabrescent up to the floriferous branchlets; cauline and involucre leaves small, 4-13 mm. long, 3-9 mm. broad, fleshy (except the uppermost involucre leaves), all the leaves glabrescent. Gypseous saline Upper Cretaceous clays of Brewster Co., s. into Mex.

2. *Tidestromia gemmata* I. M. Johnst. Perennial herb arising from a strong root whose deep apex is beset with conspicuous white tomentose gemmae, occasionally forming a compact lax caudex; stems densely covered with hairs, prostrate or decumbent, reddish, 1-1.5 dm. long, 1.5-2.3 mm. thick, the internodes 1-2.5 cm. long; young leaves white or

cinereous, the older ones yellowing; lower leaves conspicuously petiolate, the blade 12-15 mm. long and 1-1.6 mm. broad, prominently veined beneath, obtuse or rounded at the apex, truncate or obtuse at the base, contracted abruptly into a petiole 4-8 mm. long; upper leaves numerous, ovate, sessile, reduced gradually downward; glomerules 2- to 4-flowered; flowers milky, 2.5 mm. long; perianth lobes to 2 mm. long, lanceolate-ovate or ovate-oblong, more obtuse than the broad bracts (about twice as long), glabrous downward toward the base, tomentose especially toward the middle; staminal tube 0.6-0.7 mm. long; staminodia none; filaments 0.8-1.2 mm. long, the oblong anthers 0.8-1 mm. long. Gypsiferous shales, sandy soils, hills, breaks and clays in the Plains Country and Trans-Pecos, Mar.-Nov.; also n. Mex.

3. *Tidestromia oblongifolia* (Wats.) Standl. Perennial shrub, densely and closely pubescent throughout with short much-branched hairs; stems erect, 2-6 dm. long, ascending or decumbent, slender or stout, much-branched, sometimes suffruticose at the base; leaves opposite, short-petioled, ovate-orbicular to broadly ovate or oblong, 8-40 mm. long, 3-20 mm. wide, obtuse at the apex, rounded to acute at the base, prominently veined; glomerules few-flowered, the small subtending leaves (in age) usually indurate and united at the base to form an involucre; perianth 1 mm. long, 2 to 3 times as long as the bracts, the lobes oblong or oblong-ovate and obtuse or acutish, densely pubescent above; staminodia acute, about half as long as the filaments; seed 0.5 mm. long. Rocky hillsides and crevices in El Paso Co., Aug.-Oct.; w. Nev. and s.e. Calif. to Ariz. and w. Tex.

4. *Tidestromia suffruticosa* (Torr.) Standl. Perennial shrubby herb; stems erect, much-branched, suffruticose at the base or nearly throughout, densely and finely grayish-pubescent with branched hairs, 1-2.5 dm. tall, the stout branches ascending, often swollen at the nodes; leaves short-petiolate, orbicular-ovate to broadly oval, 4-20 mm. long, 3-12 mm. broad, obtuse or rounded at the apex, rounded or obtuse and asymmetric at the base, the lateral veins not prominent; glomerules few-flowered, the small subtending leaves united and indurate at the base in age; perianth 2 mm. long, the lobes narrowly oblong and obtuse or acutish, glabrous below, densely pubescent above; staminodia very short, rounded, emarginate; seed 0.5 mm. broad. In limestone and gypseous soils and gravels in the Trans-Pecos, June-Sept.; Tex. and s. N.M. to Mex.

13. GOMPHRENA L.

GLOBE-AMARANTH

Annual or perennial herbs; stems erect or prostrate, usually enlarged at the nodes and with various pubescent foliage; leaves opposite, the blades entire, sessile or short-petiolate; flowers perfect, in solitary and sessile heads or in short spikes; calyx deeply 5-parted, the tepals concave, mostly acute, usually woolly; stamens 5, included or exerted, the filaments united to the summit into a slender tube; ovary subglobose, the ovule 1; style 1, short or elongate, the stigmas 2 or 3 and commonly elongate; utricle membranous, indehiscent, more or less flattened; seed sublenticular, smooth, inverted; embryo annular, the endosperm farinaceous, the radicle superior.

About 100 species, mostly in warmer regions of Central America and South America.

1. Bractlets not cristate; plants cespitose, low, with each stem bearing 1 or 2 pairs of leaves; leaves grayish, densely appressed-pilose 1. *G. caespitosa*.
1. Bractlets cristate along the keel (2)
- 2(1). Stigmas short, stout, nearly sessile; perennial from a fleshy fusiform root 2. *G. Nealleyi*.
2. Stigmas filiform, on a long style; annuals and perennials (3)
- 3(2). Heads of flowers 8-15 mm. in diameter (4)
3. Heads of flowers 20-28 mm. in diameter (6)
- 4(3). Crests conspicuously widest at the apex of the bractlets, the flower appearing obtuse or acutish; bractlets equaling or shorter than the flowers; crests narrower than the bractlets 3. *G. dispersa*.
4. Crests widest below the apex of the bractlets (if perceptibly widest anywhere), the flower thus acuminate; bractlets much longer than the flowers; spikes usually solitary, sometimes 2 or 3 together, subtended by 2 to 4 leaves (5)

- 5(4). Crests denticulate, often sparsely so; heads about 10 mm. thick, usually tinged with red or pink; plants usually decumbent or spreading
4. *G. decumbens*.
5. Crests laciniate; heads mostly 15 mm. thick, yellowish-white, rarely reddish; plants usually erect5. *G. nitida*.
- 6(3). Annual; leaf blades mostly oblong to ovate6. *G. globosa*.
6. Perennial from a fusiform root; leaf blades oblanceolate to oblong-linear
7. *G. Haageana*.

1. *Gomphrena caespitosa* Torr. Perennial herb from a perpendicular woody root having a woody branched caudex, densely cespitose; flowering branches stout, 3-15 cm. long, decumbent or ascending, usually simple, densely pilose with white hairs, each stem with one or two pairs of leaves; leaves mostly basal, the petioles equaling or shorter than the blades; blades suborbicular to oval, to 25 mm. long and broad, densely appressed-pilose, rounded or obtuse at the apex, abruptly acute at the base, the stem leaves very short-petiolate and orbicular to broadly oval; peduncles naked, 5-60 mm. long; heads subglobose or short-cylindric, 12-18 mm. thick; bracts white, ovate-oblong, obtuse or acute; bractlets one half longer than the bracts, ovate-oblong, acute or obtuse, often denticulate at the apex, white, hyaline; perianth usually shorter than the bractlets, the lobes oblong or linear-oblong and obtuse, sometimes green along the nerve, otherwise white, the tube densely white-pilose; stamen tube slightly shorter than the perianth; seed reddish-brown, 1.5 mm. long, lustrous. Dry stony plains, hillsides and mt. slopes in the Trans-Pecos, Apr.-June; s.w. N.M., Ariz. and Tex. to Mex.

2. *Gomphrena Nealleyi* Coult. & Fish. Perennial herb from a thick fleshy taproot, villous; stems erect or ascending with tendency to become procumbent, 1-3 dm. long, sparingly forked; leaves opposite, oblong to oblong-spatulate, 2-4 cm. long, 6-15 mm. wide, mucronate, copiously pilose-sericeous on the lower surface, glabrate above, half-clasping at the base, green; peduncle slender, often about as long as the main stem; heads solitary, terminating the long peduncles, ovoid or cylindric-oblong, 1-3 cm. long, often rose-tinged, sessile, subtended by 2 leaflike bracts; bracts of the head ovate, acute or acuminate, yellow-white, 2.5-3 mm. long; bractlets 2 to 2.5 times as long as the bracts, long-acuminate, yellowish-white or pinkish, subcoriaceous, narrowly cristate just below the apex, the crest entire or denticulate; perianth about 5 mm. long, rigid at maturity, whitish, linear-lanceolate, densely woolly below, slightly surpassed by the bractlets, somewhat united at the base; stamen tube usually exerted; stigmas 2, short and sessile; seed globose-ovoid, 1.5 mm. long, reddish-brown, lustrous. In sandy or clayey soils in Rio Grande Plains and coastal Tex., n.e. to Aransas Co., Mar.-Oct.; s.w. Tex. and adj. Mex.

3. *Gomphrena dispersa* Standl. Annual or perennial herb; stems slender, widespreading and rooting at the nodes, ascending or prostrate, branched, appressed-pilose, the branches 2-10 dm. long; leaves opposite, with petioles 2-6 mm. long, oblong to obovate, 1.5-5 cm. long, 5-20 mm. wide, acute or obtuse at the apex, narrowed at the base, bright-green, pilose-sericeous, often glabrate on the upper surface; heads mostly solitary, terminal or axillary, white, subglobose to short-cylindric, 9-13 mm. in diameter, subtended by 2 or 3 acute sessile leaves shorter than the spikes; perianth woolly, about as long as the thin bractlets, densely lanate, the lobes oblong-linear and acuminate or attenuate, white; bracts rounded-ovate, acuminate, white, often denticulate; bractlets 5-6 mm. long, about 3 times as long as the bracts, thin, acute to obtuse, white or rarely purplish-red, narrowly cristate at the apex with the crest extending shortly along the keel, denticulate or laciniate; stamen tube short, commonly included; style long, the stigmas slender; seed 1.5 mm. long, reddish-brown, lustrous. Waste and cult. grounds, coastal Tex., summer-fall; Fla. and Tex. to Mex.; C.A.; Gr. Ant.

4. *Gomphrena decumbens* Jacq. Perennial herb, woolly or villous-woolly; stems branched at the base, the branches procumbent or ascending, 1-4 dm. long, dull-gray or brownish; leaves opposite; blades oblong to spatulate-oblong, 2-4 cm. long, acutish or obtuse and mucronulate, entire, narrowed into a petiolelike base which is partly clasping; peduncles mostly simple; heads subglobose to globose-cylindric, 1-2 cm. long, pearly white or rose, subtended by two leaflike bracts; bracts of the head ovate, acuminate, about half as long as the narrower keeled and crested obtuse bractlets; bractlets 5-6 mm.

long, long-acuminate, thin, yellowish, white or tinged with purplish-red, narrowly cristate below the apex with the crest denticulate to entire; tepals about as long as the bractlets, 1-nerved, the outer obtuse and glabrous, the interior villous and less obtuse, white; stamen tube usually exerted; style slender, the stigmas slender; seed 1.5 mm. long, reddish-brown, lustrous. In sandy soils, dry and waste grounds, coastal Tex., summer-fall; s. Tex. to Mex. and Guat.; trop. S.A.; W.I.

5. *Gomphrena nitida* Rothr. Annual herb; stems 2-7 dm. tall, erect, rarely decumbent, simple or much-branched, the branches slender, pilose-strigose; leaves opposite, short-petioled, usually few (the nodes distant), obovate to oblong or oval, 1.5-6 cm. long, 4-25 mm. broad, green, obtuse at the apex, acuminate at the base, appressed-pilose on both surfaces; spikes subglobose, 12-16 mm. in diameter, usually solitary, terminal, each subtended by 2 sessile acute leaves usually shorter than the spike; bracts ovate-triangular, acuminate, white; bractlets twice as long as the bracts, long-acuminate, yellowish-white or tinged with red, cristate from below the apex nearly to the base with the crest laciniate-dentate; perianth much shorter than the bractlets, very lanate, the lobes linear and long-attenuate, white; stamen tube usually included; style elongate, the stigmas slender; seed 1.5 mm. long, brown. Dry stony soils from Rio Grande Plains to the Trans-Pecos, fall-winter; s.w. N.M. and s.e. Ariz. to Tex., s. to Mex.

6. *Gomphrena globosa* L. COMMON GLOBE-AMARANTH. Annual herb; stems stout, usually much-branched, sometimes simple, to 1 m. tall, pubescent to appressed-pilose-strigose, swollen at the nodes, purplish; leaves opposite, with petioles 5-20 mm. long, oblong or elliptic, 3-10 cm. long, acute at the apex, narrowed or obtuse at the base, bright-green, appressed-pilose on both surfaces; heads terminal, peduncled, subglobose, white, yellow, red or purple, 2-2.5 cm. in diameter, subtended by 2 or 3 short leafy bracts; bractlets acute or acuminate, 7-12 mm. long, much-surpassing the very woolly perianth; perianth densely lanate, the lobes lance-subulate, 1-nerved, scarious, white or purplish, green along the nerve; stamen tube longer or shorter than the perianth, the free part of the filaments oblong; style elongate, slender, the stigmas linear, erect; seed ovoid or sublenticular, yellowish, lustrous. Waste grounds in n.-cen. and s.-cen. Tex., July-Sept.; nat. of s. Asia and widely cult.; commonly escaped in most trop. regions, occasionally northw.; Tex. and Mex., through C.A.; W.I.; S.A.

7. *Gomphrena Haageana* Kl. Perennial herb from elongated tuberous roots; stems 2-7 dm. tall, simple or much-branched, the branches erect, pilose or appressed-pilose; leaves opposite, subsessile or with petioles to 2 cm. long, loosely pilose, oblanceolate to oblong-linear, 2-10 cm. long, 3-10 mm. wide, acuminate at the apex, mucronate, attenuate at the base, green, appressed-pilose or loosely pilose, rarely glabrate; heads large, globose or short-cylindric, 2-2.8 cm. in diameter, on elongate peduncles, with subtending sessile leaves shorter than the head, these linear-lanceolate to ovate and long-acuminate; bractlets 2 to 3 times as long as the bracts, 1-1.5 cm. long, very broadly cristate along the keel with the crest serrulate; perianth up to equaling the bractlets, the lobes lance-linear and acuminate, the tube densely lanate; stamen tube slightly shorter than the perianth, rarely longer; filaments with the free part elongate; style elongate, the stigmas short, subdivaricate; seed 1.5 mm. broad, lenticular, brownish-red, lustrous. *G. tuberifera* Torr. In w. Edwards Plateau, summer-fall; also Mex.

FAM. 63. NYCTAGINACEAE JUSS.⁵⁴

FOUR-O'CLOCK FAMILY

Annual, biennial or perennial herbs, shrubs or trees, from a fleshy or woody taproot; stems erect or scandent, procumbent or decumbent, dichotomously or trichotomously branched, glabrous or pubescent, often swollen at the nodes, sometimes armed with spines; leaves mostly opposite, sometimes alternate or verticillate, exstipulate, sessile or petiolate; blades entire or sometimes dentate or lobed, raphidiferous; flowers perfect or unisexual (then plant usually dioecious), regular, sometimes dimorphous, usually arranged in paniculate or corymbose cymes, sometimes solitary, racemose, spicate, umbellulate or capitata, usually bracteate or variously involucrate; involucre of free or connate segments, often calyxlike and enclosing one to many flowers, persistent or deciduous, often

⁵⁴ Contributed by Clyde F. Reed; cf. his treatment in C. L. Lundell, *Flora of Texas II*: 151-220. 1969 for complete synonymy.

accrescent in age, green or brilliantly colored; perianth inferior, simple, herbaceous or corollalike, small or large, usually campanulate or funnellform, persistent or deciduous in fruit and usually accrescent, enclosing the pericarp, the tube short or often elongated, usually indurate at the base in age, the limb persistent or deciduous, truncate or 3- to 5-dentate or -lobed, the segments usually induplicate-valvate; stamens 1 to many, hypogynous; filaments usually united at the base, unequal, filiform; anthers included or exerted, dorsifixed near the base, didymous, opening by lateral slits; ovary included in the perianth tube, sessile or stipitate, 1-celled, membranaceous, usually attenuate at the apex; style short or elongate, sometimes absent, filiform; stigmas simple and capitate, peltate or fimbriate, rarely lateral or the style stigmatose along one side; anthocarp composed of the persistent coriaceous, fleshy or indurate base of the perianth tube enclosing the indehiscent utricle and adherent to it, costate, dentate or alate, often viscous; utricle membranaceous or coriaceous; seed erect, the testa hyaline, the endosperm scanty or abundant and usually farinaceous or fleshy; embryo straight, with broad conduplicate cotyledons (these enclosing the endosperm) or often curved and with broad or narrow cotyledons, the radicle inferior.

Nearly 300 species in about 30 genera, mostly in the American tropics and subtropics.

1. Embryo straight; flowers usually unisexual and cymose; stigma penicillate; trees or shrubs, sometimes armed with spines; leaves opposite; stamens exerted; anthocarp coriaceous, bearing numerous stipitate glands . . . 1. *Pisonia*, p. 576.
1. Embryo curved; flowers perfect; plants usually herbaceous or with vinelike stems (2)
- 2(1). Leaves alternate; perianth changed in fruit, the lower part enlarged and adherent to the fruit, the upper part persistent; flowers in clusters of 3, each adnate to a large colored bract; spiny scandent shrubs 2. *Bougainvillea*, p. 576.
2. Leaves opposite; perianth lobes induplicate-valvate (3)
- 3(2). Stigma linear; inner cotyledon abortive; anthocarp without mucilaginous glands; flowers capitate 13. *Abronia*, p. 597.
3. Stigmas spheric or hemispheric; both cotyledons well-developed; anthocarp often with mucilaginous glands (4)
- 4(3). Flowers involucrate (5)
4. Flowers without an involucre or each flower subtended by 1 to 3 bracts (7)
- 5(4). Involucre polyphyllous, the bracts numerous and surrounding a many-flowered head; anthocarp not winged, merely 10-ribbed; stamens and pistils exerted 3. *Nyctaginia*, p. 576.
5. Involucre gamophyllous; flowers 1 to several (6)
- 6(5). Anthocarp with prominent lateral wings that are often toothed, with 2 rows of glands along the dorsal surface 4. *Allionia*, p. 577.
6. Anthocarp without wings 5. *Mirabilis*, p. 578.
- 7(4). Anthocarp with conspicuous thin membranous wings (8)
7. Anthocarp not conspicuously winged, the wings when present thick and coriaceous (9)
- 8(7). Perianth 4-5 mm. in length; leaves broadly ovate . . . 6. *Ammocodon*, p. 587.
8. Perianth 8 mm. or more in length; leaves linear to lanceolate or ovate 7. *Selinocarpus*, p. 588.
- 9(7). Flowers large, all (except in *A. Wrightii*) 2 cm. long or longer; perianth with a long slender tube and a broad limb, each flower subtended by 2 or 3 small narrow bracts 8. *Acleisanthes*, p. 589.
9. Flowers usually less than 2 cm. long (10)
- 10(9). Anthocarp 5-angled, 5-ribbed or sometimes with low thick wings; perianth campanulate 12. *Boerhaavia*, p. 594.
10. Anthocarp 10-angled or 10-ribbed (11)
- 11(10). Anthocarp asymmetrical; flowers in racemes 9. *Cyphomeris*, p. 591.
11. Anthocarp symmetrical; flowers not in racemes (12)

- 12(11). Anthocarp with conspicuous mucilaginous glands; plants with thin leaves and climbing or reclining stems; flowers in umbels 10. *Commicarpus*, p. 592.
 12. Anthocarp without conspicuous glands; plants erect with usually very thick leaves; flowers irregularly clustered, not in umbels 11. *Anulocaulis*, p. 592.

1. PISONIA L.

About 50 species in the tropics and subtropics.

1. *Pisonia aculeata* L. DEVIL'S-CLAW, COCKSPUR, GARABATO PRIETO. Perennial dioecious shrub, often with a thick trunk, 1-2 m. tall, densely branched; branches stout, elongate, drooping or subscaudent, usually armed with curved sharp spines 6-20 mm. long, the older bark reddish-brown, the branchlets densely puberulent or short-villous or rarely glabrate; leaves mostly opposite, with slender or stout petioles 1-4 cm. long; blades variable, elliptic-oval to ovate-oblong or subrhombic to suborbicular, 2.5-15 cm. long, 1.5-6 cm. wide, abruptly pointed and short-acuminate at the apex, cuneate at the base, thick and leathery, glabrous or pubescent on both surfaces; inflorescence loosely or densely cymose, many-flowered, at anthesis 2-6 cm. broad, the stout peduncles 1-5 cm. long, the pistillate cymes in fruit to 1 dm. broad, pubescence usually viscid, the pedicels in fruit 16 mm. long or less, perianth of 5 united tepals; *staminate perianth* broadly campanulate, 2-4 mm. long, densely puberulent or tomentulose, yellowish-green, the lobes broad; stamens 6, twice as long as the perianth; *pistillate perianth* tubular, 2-3 mm. long, puberulent; anthocarp clavate, 9-12 mm. long, 3-4 mm. in diameter, rounded at the apex, narrowed at the base, thinly coriaceous, 5-angled, each angle with a row of uniseriate or obscurely biseriate glands, the faces glabrate or puberulent; seed cylindric, 7-10 mm. long, 1.5 mm. in diameter, brown. In thickets in Cameron Co. in s. Tex.; from Fla. to Tex. and Mex. s. to Pan.; W.I.; trop. S.A.; on Oceanic Is. and Cont. Is.; trop. Asia.

2. BOUGAINVILLEA COMMERS.

About 18 species, all natives of South America.

1. *Bougainvillea glabra* Choisy. BOUGAINVILLEA. Perennial woody vine, much-branched; stems high-climbing, yellowish- or reddish-brown, puberulent when young but soon glabrate, armed with straight or curved spines 6-12 mm. long; leaves alternate; petioles slender, less than one third the length of the blades; blades broadly ovate to elliptic-ovate or ovate-lanceolate, 4-10 cm. long, 2-5.5 cm. broad, rounded to acute at the base, acute to long-acuminate at the apex, puberulent when young, soon glabrate; inflorescence 3-flowered, on a peduncle 1-2.5 cm. long; bracts purplish-red to red or orange-red, rarely to whitish or yellowish, broadly ovate or oval, subcordate at the base, obtuse to abruptly acute or acuminate at the apex, sparsely pubescent or glabrous; perianth 15-25 mm. long, the tube green, densely puberulent or glabrous, the lower part with prominent obtuse angles; stamens 8; anthocarp turbinate, coriaceous, 7-13 mm. long, 4-5 mm. in diameter, the 5 angles acute; seed with a thin testa adherent to the pericarp. Cult. and planted about homesteads and along roadsides in s. Tex.; widely cult. in trop. and subtrop. N.A. and naturalized in Berm., Cuba, Salvador, Guat. and other trop. areas.

3. NYCTAGINIA CHOISY

A monotypic genus.

1. *Nyctaginia capitata* Choisy. SCARLET MUSK-FLOWER. Perennial herb from a semi-woody taproot to 45 mm. in diameter and 10 cm. long, much-branched from the base; stems erect or decumbent, viscid-puberulent or glabrate in age; branches stout, 1-4 dm. long; leaves opposite; petioles 1-8 cm. long, those of the lower leaves longer than the blades; blades broadly oval to ovate-deltoid or narrowly triangular, 4-9 cm. long, 6-55 mm. broad, subcordate to cuneate at the base and decurrent, usually unequal, rounded to long-attenuate at the apex, thick and slightly fleshy, glaucous beneath, entire or sinuate,

often crispate, copiously viscid-villous when young, often glabrate in age; flowers perfect, in clusters of 8 to 15 per involucre, the clusters 5 cm. or more in diameter, the peduncles 2-14 cm. long; bracts numerous, 6-15 mm. long, the outer ones ovate or oblong and very acute, the inner linear and long-attenuate, densely viscid-villous outside, the limb 10-14 mm. broad; perianth pink to deep-red, funnellform, the tube slender and elongate, constricted above the ovary, abruptly expanded into a 5-lobed induplicate-plicate limb, the lobes entire or emarginate, deciduous; stamens 5 to 8; filaments pubescent; capillary, unequal, dilated and connate at the base, adnate to the perianth tube; anthers didymous, exserted; ovary oblong, the filiform style exserted, the capitate stigma papillose; anthocarp 5-6 mm. long, 4 mm. in diameter, leathery, turbinate, constricted above the base, umbonate at the apex, olive, glabrous, many-ribbed; seed turbinate, 3 mm. long and nearly as broad, abruptly constricted at the base, pale-brown. In sandy or loamy soils, roadsides and fields from coastal Tex. to the Trans-Pecos and Plains Country, spring-fall; from Tex. and s.e. N.M. to Mex.

4. ALLIONIA L.

Annual or perennial herbs; stems prostrate, dichotomously branched, pubescent; leaves opposite, the pair unequal in size, petiolate, entire or subulate; flowers perfect, in axillary paniculate clusters of 3, each cluster subtended by a bract that encloses the fruit; perianth short-funnelform, 4- or 5-lobed, with an oblique tube; stamens 4 to 7; stigmas capitate, the style capillary; anthocarp coriaceous, compressed, the margin entire or dentate, the dorsal face with 2 rows of stipulate glands; seed with the testa adherent to the pericarp; embryo uncinata, the cotyledons broad, enclosing the farinaceous endosperm; radicle slender, elongate and descending.

A small American genus.

- 1. Perennial; outer margins of anthocarps with about 3 broadly triangular nonglandular teeth of each side, usually incurved and covering nearly the entire surface 1. *A. incarnata*.
- 1. Annual; outer margin of anthocarps with several relatively slender gland-tipped teeth on each side, these spreading or moderately incurved 2. *A. Choisyi*.

1. *Allionia incarnata* L. UMBRELLA-WORT, TRAILING ALLIONIA, HERBA DE LA HORMIGA. Perennial herb, from a woody root; stems 2-10 dm. long, slender or stout, sprawling or decumbent, rarely erect, densely villous-viscid or glandular-puberulent, rarely glabrate, often tinged with red, the internodes short or usually elongated; leaves 1-4 cm. long, petioled, oval to ovate or oblong, subcordate or rounded at the oblique base, the apex rounded to acute, entire or sinuate, paler below, villous-viscid or glandular-puberulent (at least when young); involucre on long or short peduncles, the lobes 4-6 mm. long and obovate-orbicular; perianth 5 mm. long or more, purplish-red or pink to rose-magenta or rarely white; anthocarp 3-4.5 mm. long, the inner side 3-nerved, the incurved margins with 3 or rarely 5 broad teeth on each side, rarely entire, glandular within. Dry hills, flats, valleys, dry sandy or gravelly soils, on limestone areas, from coastal Tex. to the Trans-Pecos and Plains Country, Apr.-Sept.; from s.e. Calif. and Nev. to s. Ut. and Colo., s. to Tex., Baja Calif. and cen. Mex. (Pue.); Hisp.; Venez. to Arg. and Chile.

2. *Allionia Choisyi* Standl. SMOOTH UMBRELLA-WORT. Plants annual northward, perennial southward, glabrous or with some viscid indument; stems reddish, 2-8 dm. long, slender, puberulent or villous above, little-viscid, often glabrate below; leaves opposite, unequal, with petioles 3-18 mm. long; blades 1-4 cm. long, ovate-oval or oval to oblong, subcordate to broadly cuneate at the base, rounded or obtuse to nearly acute at the apex, whiter below, puberulent or glandular-puberulent at first, usually soon glabrate; involucre saccate, 5-7 mm. long, puberulent and usually short-villous, often viscid; perianth pink to rose-red, 4 mm. long or less; anthocarp pale-brown or olive, 3-4 mm. long, 3-costate on the inner surface, shallowly rugose, the margin spreading or somewhat incurved, each with 5 to 8 long slender gland-tipped teeth, with about 6 glands in each row. Dry sandy ground in w. Tex., spring-summer; from s.e. Ariz. and N.M. southw. into Mex.; W.I.

5. MIRABILIS L. FOUR-O'CLOCK

Perennial herbs, usually from large tuberous roots; foliage glabrous or pubescent to glandular or hispid; stems erect or sprawling, simple or branched from the base, the branches forking; leaves opposite, fleshy, sessile or petioled, various in shape from linear to lanceolate, obovate, rotund, cordate or elongate, glabrous to pubescent, green or glaucous; involucre axillary or terminal, or both, 1- to 10-flowered, 5-lobed, sometimes enlarged and papery in fruit; perianth colored, the tube elongated and constricted above the ovary, the limb expanding, campanulate to salverform or funnelform, deciduous; stamens 3 to 6, unequal in length; filaments filiform, incurved, united into a fleshy cup at the base; anthocarp conspicuously 5-angled or 5-ribbed, glabrous or pubescent; seed filling the pericarp to which the testa adheres; endosperm mealy.

About 60 species, entirely American.

1. Anthocarp smooth or somewhat 5-angled but not ribbed; involucre not papery or membranaceous and slightly or not enlarged in fruit (2)
1. Anthocarp with 5 prominent ribs; involucre enlarged and papery or membranaceous in fruit (*Oxybaphus*) (6)
- 2(1). Involucre rotate, slightly enlarged in fruit, 3-flowered; stamens 3 (*Allioniella*) 1. *M. oxybaphoides*.
2. Involucre campanulate, not enlarged in fruit (3)
- 3(2). Involucre containing several flowers longer than 25 mm., with a broad limb; fruit dark-brown or black, not angled; stamens 5 (*Quamoclidion*) 2. *M. multiflora*.
3. Involucre 1-flowered; perianth funnelform, with a long slender tube abruptly dilated into the limb; stamens 5 (*Eu-Mirabilis*) (4)
- 4(3). Perianth 7-17 cm. long, white tinged with pink or purple, the tube long-tubular; anthocarp oblong to ellipsoid, 8 mm. long, obtusely 5-angled, tuberculate, densely puberulent between the tubercles 5. *M. longiflora*.
4. Perianth 3-6 cm. long (5)
- 5(4). Perianth 3-5 cm. long, lavender-rose; lobes of involucre lanceolate, 2-3 mm. wide in flower, to 5.5 mm. in fruit; anthocarp 8-9 mm. long, pubescent with rather sparse and weak hairs 3. *M. Lindheimeri*.
5. Perianth 4-6 cm. long, rose-white to yellow; lobes of involucre broadly lanceolate or ovate, 3-4.5 mm. wide in flower, to 7 mm. in fruit; anthocarp 10 mm. or more long, glabrous, often with irregular or roughened surface . 4. *M. Jalapa*.
- 6(1). Anthocarp glabrous (7)
6. Anthocarp more or less pubescent, sometimes with only sparse pubescence of short hairs (11)
- 7(6). Angles of anthocarp covered with coarse distinct tubercles (8)
7. Angles of anthocarp continuous, smooth (9)
- 8(7). Stems glabrous up to the inflorescence; leaf blades of the lower leaves broadly cordate-deltoid 6. *M. glabrifolia*.
8. Stems densely viscid-pilose below; leaf blades ovate . . . 7. *M. rotata*.
- 9(7). Leaf blades linear, 2-7 mm. wide; stems glabrous . . 8. *M. glabra*.
9. Leaf blades lanceolate or broader, 10-40 mm. wide (10)
- 10(9). Stems glabrous 9. *M. exaltata*.
10. Stems densely short-pilose 10. *M. Carletonii*.
- 11(6). Leaves sessile or nearly so, sometimes attenuate to a short stout petiole; blade not sharply differentiated from the petiole (12)
11. Leaves all conspicuously petioled except the uppermost; blades obtuse to cordate at the base and sharply differentiated from the petioles (24)
- 12(11). Leaf blades linear or lance-linear (13)
12. Leaf blades lanceolate or broader (16)

- 13(12). Perianth deep-bright-red, the tube about 4 times as long as the involucre, much longer than broad11. *M. coccinea*.
13. Perianth pink or purplish-red, the tube about twice as long as the involucre, usually broader than long, campanulate (14)
- 14(13). Plant low; stems much-branched and diffuse; inflorescence cymose14. *M. diffusa*.
14. Plants tall, erect, stout; stems simple or sparsely branched; inflorescence paniculate (15)
- 15(14). Stems densely hirsute or long-villous (at least at the base), glaucous12. *M. gausapoides*.
15. Stems glabrous below or nearly so, the upper internodes glabrous or short-pubescent13. *M. linearis*.
- 16(12). Inflorescence axillary; lobes of the involucre broadly ovate or ovate-orbicular, usually shorter than the tube, acute or acutish at the apex (at least in fruit), pilose with white hairs (17)
16. Inflorescence not axillary (19)
- 17(16). Stems hirsute in lines below; leaf blades acute or acutish at the base, linear-lanceolate to broadly lanceolate15. *M. aggregata*.
17. Stems glabrous below (18)
- 18(17). Stems slender, sparingly branched; leaves glabrous; blades linear-lanceolate to oblong-lanceolate, narrowly cuneate at the base, essentially sessile, ciliate; fruit 5-6 mm. long16. *M. decumbens*.
18. Stems stout, much-branched; leaves conspicuously ciliate; blades rounded or subcordate at the base, much longer than the petioles, these long-pilose with white hairs; fruit 3.5-4 mm. long17. *M. ciliata*.
- 19(16). Stems densely hirsute (at least near the base), the middle nodes sometimes glabrate but the nodes always hirsute; leaves sessile or with petioles to 5 mm. long (20)
19. Stems puberulent or glabrate, or sometimes pilose or hirsute above but not near the base (21)
- 20(19). Leaf blades lanceolate to broadly ovate or ovate-oblong, to 10 cm. long; involucre 3-flowered; lower internodes hirsute with brownish hairs 1.5-2.5 mm. long18. *M. hirsuta*.
20. Leaf blades lanceolate to narrowly oblong-lanceolate, to 7 cm. long; involucre 2-flowered19. *M. eutricha*.
- 21(19). Stems densely puberulent throughout; leaf blades ovate to ovate-deltoid20. *M. gigantea*.
21. Stems glabrate below or puberulent only in lines (22)
- 22(21). Stems glabrescent; leaf blades oblong-ovate; anthocarp 4-angulate, rugose21. *M. pauciflora*.
22. Stems glabrate below; leaf blades mostly lanceolate; angles of fruit strongly tuberculate or composed of distinct tubercles (23)
- 23(22). Branches of the inflorescence alternate, forming a cyme; perianth rose; leaf blades thin, tapering at both ends, more or less pubescent22. *M. pseudaggregata*.
23. Branches of the inflorescence opposite or alternate, forming a panicle; perianth white to pink; leaf blades thin to thick, acute to acuminate or blunt-pointed23. *M. albida*.
- 24(11). Anthocarp with 4 conspicuous thick winglike tuberculose ridges forming angles; stems slender, erect, with 1 to 6 nodes produced below ground24. *M. collina*.
24. Anthocarp prominently 5-angulate, the angles smooth or tuberculate; stems usually stout, erect or decumbent and sparsely branched; involucre much-acrescent in fruit, the lobes equal or nearly so (25)

- 25(24). Involucres at anthesis usually glabrous except at the base (there short-pilose or puberulent), the lobes glabrous or nearly so (26)
25. Involucres at anthesis densely viscid-pilose outside, in fruit usually less than 15 mm. broad (27)
- 26(25). Lobes of involucres 15-20 mm. broad in fruit; larger leaf blades 5-12 cm. long, 2.5-10 cm. wide; stems 3-10 dm. tall, 2-6 mm. thick near the base, normally erect with 8 or 9 internodes (the internodes 6-20 cm. long), branches few 25. *M. nyctaginea*.
26. Lobes of involucres to 10 mm. long in fruit; larger leaf blades 2-5 cm. long, 1-3 cm. wide, obtuse; stems 8-12 dm. tall, erect at first, becoming freely branched and half-decumbent, with 8 to 14 internodes; internodes 2-9 cm. long on erect plants, to 23 cm. long on half-decumbent plants ... 26. *M. dumetorum*.
- 27(25). Stems densely puberulent, pilose or pilose below over the whole surface with stiff hairs; leaf blades usually twice as long as broad, ovate or ovate-oblong and obtuse at the base; plant tall, erect, simple or sparsely branched below 27. *M. coahuilensis*.
27. Stems glabrous below and puberulent in lines, very rarely pilose with weak soft viscid hairs (28)
- 28(27). Blades of the upper leaves about as broad as long, rounded or very obtuse at the apex; involucres 10-14 mm. long in fruit 28. *M. Grayana*.
28. Blades of upper leaves usually twice as long as broad or longer, lance-oblong to linear, commonly long-acuminate to attenuate at the apex; involucres rarely over 8 mm. long in fruit 29. *M. oblongifolia*.

1. *Mirabilis oxybaphoides* (Gray) Gray. SPREADING FOUR-O'CLOCK. Perennial herb from a thick fleshy root; stems usually 3-6 dm. tall, ascending or decumbent, much-branched, usually forming clumps, viscid-pubescent to glabrate, the branches swollen at the nodes; leaves opposite, with slender or stout petioles 1-4 cm. long; blades 1.5-7 cm. long, 1.5-6 cm. wide, deltoid or ovate, often broadly so, usually cordate at the base or sometimes truncate, acute at the apex, entire or undulate, viscid-pubescent to glabrate; inflorescence cymose or axillary; involucres 5-6 mm. long in anthesis, subrotate, deeply 5-cleft; perianth 7-9 mm. long, white to pink or purple, sparsely hairy or glabrate; anthocarp 2.5-3 mm. long, smooth or obscurely ridged transversely or black-spotted. Dry hillsides and valleys in the Trans-Pecos; from s. Colo. w. to Ut. and Nev., s. to Tex., Ariz. and Mex.

2. *Mirabilis multiflora* (Torr.) Gray. COLORADO FOUR-O'CLOCK. Perennial herb from a long pithy root 3-6 dm. long; stems erect to spreading or decumbent, 3-6 dm. long, forming clumps to 1 m. in diameter, usually stout, densely leafy, glaucous, pubescent, often viscid to glabrate, the branches ascending; leaves opposite, with slender or stout petioles about half as long as the blades or shorter; blades 3-7.5 cm. long, 15-75 mm. broad, broadly ovate to reniform-orbicular or ovate-oblong, cordate or rounded at the base, acute to rounded and apiculate at the apex, thick and succulent, glabrous to pubescent, often glandular; peduncles slender or stout, 0.5-6 cm. long, solitary in axils and cymose at the ends of branches, the leaves of the inflorescence reduced; involucres 15-35 mm. long, campanulate, usually 6- to 8-flowered, glabrous to glandular-puberulent or short-villous and viscid, green or tinged red; involucre lobes 5, equaling or shorter than the tube, ovate-orbicular to triangular, rounded and apiculate to very acute; perianth 2-6 cm. long, trumpet-shaped, rose-colored to violet or purplish-red, shallowly 5-lobed, glabrous or glandular-puberulent outside, the tube 4-7 mm. thick, expanding into a shallowly 5-lobed limb 2-3 cm. broad; stamens 5, equaling the perianth or slightly exserted; anthocarp 6-10 mm. long, oval, obtuse at each end, smooth or slightly furrowed at the base, dark-brown to nearly black, glabrous. *Quamoclidion multiflorum* Torr. Dry slopes and plains, gypseous soils, on granite, rocky and sandy soils, limestone areas in w. Tex., spring to fall; from Colo. and s. Ut., s. to Tex., Ariz., N.M. and Mex.

3. *Mirabilis Lindheimeri* (Standl.) Shinners. Perennial herb or shrub, with a long turniplike woody tuberous root; stems rather slender, glabrous, usually several, becoming bushy-branched, 5-20 dm. tall; leaves opposite, with slender glabrous petioles half as

long as the blades or longer; blades broadly deltoid-ovate to ovate, thin, short-acuminate or acute, truncate to rounded or narrowed at the base, slightly decurrent upon the petioles; involucre in clusters of about 3 or sometimes solitary, mostly pediceled; perianth lavender-rose, 3-5 cm. long, remaining open overnight and into the next morning, the limb 25 mm. wide, with prominent rounded lobes, the tube almost or quite glabrous; involucre lobes lanceolate to lanceolate-ovate, 2-3 wide at anthesis, to 5.5 mm. in fruit, minutely puberulent, not usually ciliate; stamens about as long as the perianth; anthocarp 8-9 mm. long, ovoid, with 5 inconspicuous broad ribs, not angled, smooth, not tuberculate, pubescent with rather sparse weak hairs. *M. Jalapa* subsp. *Lindheimeri* Standl. Mostly on Edwards Plateau, extending n.e. on the Austin Chalk to Dallas; endemic.

4. *Mirabilis Jalapa* L. COMMON FOUR-O'CLOCK. Perennial herb, with large tuberous woody or fleshy roots; foliage deep-green, glabrous to slightly pubescent or rarely short-villous, often viscid but not glandular; stems erect, 4-10 dm. tall, much-branched, the branches erect or ascending, slender or stout; leaves opposite, with slender petioles about one half as long as the blades (0.3-5 cm. long), the uppermost blades nearly sessile; blades ovate to ovate-deltoid, 4-14 cm. long, 2-8.5 cm. broad, acuminate, sparingly ciliate, entire, truncate or cordate at the base, bright-green, glabrous or rarely pubescent; peduncles 1-2 mm. long, cymosely glomerate at the ends of the branches; inflorescence with numerous reduced leaves; involucre campanulate, 7-15 mm. long, pubescent to glabrous or short-villous, 1-flowered; involucre lobes linear-lanceolate to ovate-lanceolate and twice as long as the tube, acute, usually ciliate, bristle-tipped; perianth trumpet-shaped, 4-6 cm. long, deep-red to purple or white (to many other colors in cult. forms and variegated), more or less blotched, the edge notched, glabrous or sparsely villous outside, the tube 2.5 mm. thick, gradually dilated upward, the limb 2-3.5 cm. broad and shallowly 5-lobed, the lobes broadly rounded; stamens 5, equaling the perianth or slightly exserted; anthocarp ovoid to obovoid or oval, dark-brown to black, 8-10 mm. long, 5-angled, wrinkled-tuberculate, verrucose or rugose, glabrous or puberulent. On plains and prairies, often spread from cult. in w. Tex., spring and summer, until frost; from Tex. through Mex. to C.A. and S.A.; widely cult. as an ornamental and escaping.

5. *Mirabilis longiflora* L. SWEET FOUR-O'CLOCK. Perennial herb; stems erect, 5-15 dm. tall, much-branched, the branches erect or ascending, densely viscid-puberulent or short-villous, the internodes usually longer than the leaves; leaves opposite, with slender petioles less than 1 cm. long in the lowest leaves, the upper leaves sessile or subsessile; blades cordate-ovate to narrowly deltoid-ovate or lance-ovate, 6-11.5 cm. long, 3-7 cm. wide, cordate at the base, acute to long-attenuate at the apex, thin, bright-green, densely viscid-puberulent or rarely glabrate; inflorescence of numerous dense axillary or terminal leafy glomerules, these sometimes subtended by long linear bractlike leaves; involucre on peduncles to 3 mm. long, campanulate, 1-1.5 cm. long, densely glandular-villous with short hairs; involucre lobes slightly unequal, equal to or longer than the tube, triangular to narrowly triangular-lanceolate, very acute to long-attenuate; flowers nocturnal; perianth white to pink or magenta to purplish-red, 7-17 cm. long, densely viscid-villous outside, the very slender tube about 2 mm. in diameter, abruptly expanded into a shallowly 5-lobed limb 2-3 cm. broad; stamens 5, exserted 2-5 cm. or less; anthocarp oblong to ellipsoid, 8 mm. long, 5 mm. broad, constricted at both ends, obtusely 5-angled, tuberculate, densely puberulent between the tubercles. *M. Wrightiana* Gray. In Trans-Pecos Tex. and s. Ariz. to Mex.

6. *Mirabilis glabrifolia* (Ort.) I. M. Johnst. FLAT-TOP FOUR-O'CLOCK. Perennial herb; stems few or solitary, erect or ascending, slender, commonly supported by bushes, 3-10 dm. tall, sparsely branched below, glaucous, glabrous or puberulent, the elongate internodes puberulent or short-villous; leaves usually below the middle of the plant and frequently crowded at the base, with slender petioles 0.5-6 cm. long and glabrous; blades ovate to oblong, truncate, rounded or cordate at the base, 2-8 cm. long, 1-3.5 cm. broad, obtuse or acute at the apex, entire or subsinate, thick and succulent, green on the upper surface, often glaucous beneath, glabrous or obscurely puberulent; inflorescence cymose-paniculate, much-branched, the branches slender, viscid-pilose with short fulvous hairs; bracts few and very small; involucre usually numerous, slender-pedunculate, viscid-pilose, about 4 mm. long at anthesis, 6-10 mm. long in fruit, the short lobes rounded-oval; flowers usually solitary in the involucre, rarely 2 or 3; perianth sparsely pilose, 6-10 mm.

long, the limb 10-12 mm. broad; stamens 3, exserted; anthocarp broadly obovoid, 3.5 mm. long, dark-grayish, glabrous, densely covered with short rounded tubercles; seed oval-obovoid, 2.5 mm. long, pale-brown. *M. corymbosa* Cav. From s.w. Tex. to s. Mex.

7. *Mirabilis rotata* (Standl.) I. M. Johnst. Perennial herb from a taproot; stems few, subsimple, sparingly branched, the branching mostly dichotomous, puberulent throughout but not viscid, almost glabrous below; leaves opposite, with very short petioles or the uppermost leaves sessile; blades ovate, obtuse, cordate at the base, glabrous or the uppermost ones more or less puberulent; inflorescence corymbose to subcymose, the branches slender and covered with reduced bractlike leaves; involucre on slender pedicels 7 mm. long or less, when mature circular in outline or scarcely lobed, sparingly soft-puberulent, about 25 mm. in diameter, ciliolate; perianth purple; anthocarp 4 mm. long, much-narrowed below, obtuse above, 5-ribbed, prominently transversely ridged or tuberculate, glabrous or minutely puberulent. Dry arroyos, gypsum plains, dry open hillsides in Trans-Pecos Tex.; also Mex.

8. *Mirabilis glabra* (Wats.) Standl. SMOOTH FOUR-O'CLOCK. Perennial herb; stems few or solitary, erect, 8-15 dm. tall, usually simple up to the inflorescence or with a few sterile branches below, stout, glaucous, glabrous; leaves distant or crowded below, sessile; blades linear, 5-12 cm. long, 2-7 mm. broad, long-attenuate at the base, gradually narrowed to the obtuse or acute apex, entire, thick and succulent, glaucous beneath, glabrous; inflorescence a loose terminal panicle 1-4 dm. long, much-branched, the branches very slender, opposite, glabrous or sparsely short-pilose with viscid hairs; involucre slender-pedunculate, 3.5 mm. long at anthesis, to 12-15 mm. broad in age, viscid-pilose or glabrous and ciliate, shallowly lobed, the lobes ovate-orbicular and rounded at the apex; flowers usually solitary, sometimes 2 in the involucre, mostly cleistogamous; perianth about 7 mm. long, white or pale-pink, glabrous; stamens 5, short-exserted; anthocarp obovoid, about 5 mm. long, olivaceous, glabrous, the angles acute, narrow, smooth, the sides obtusely short tuberculate or rugose; seed broadly obovoid, 3 mm. long, pale-brown. In dry soils in Trans-Pecos Tex.; from Kan. to Ut., s. to Tex. and Mex.

9. *Mirabilis exaltata* (Standl.) Standl. Perennial herb, from a stout woody root; stems erect, few or solitary, to 1.5 m. tall, nearly simple or sparsely branched below the inflorescence, glabrous throughout, glaucous below, stout, the branches slender, the internodes elongate; leaves opposite; blades narrowly lanceolate, to 7 cm. long and 18 mm. broad, acutish, attenuate at the base to a very short thick petiole or sessile, more or less wavy-margined, glabrous; inflorescence very openly paniculate, the branches slender and opposite; involucre on pedicels about 1 cm. long, mostly glabrous or with a very few minute hairs, 15 mm. in diameter, 3-4 mm. long at anthesis, 10-12 mm. long in fruit, their lobes broadly ovate and rounded, glabrous or with a few minute hairs when young; flowers usually 3 in each involucre; anthocarp obovoid, 4.5 mm. long, obtuse or acutish above, narrowed below, brownish, glabrous, prominently 5-angled, the angles acute, narrow, smooth, the sides transverse-rugulose; seed obovoid, pale-yellow-brown. Restricted endemic centering on the Permian Red Beds area, extending from the Red River to Ward and Comanche cos.; also Okla.

10. *Mirabilis Carletonii* (Standl.) Standl. Perennial herb; stems 6-12 dm. tall, few or solitary, simple or sparsely branched above, densely viscid-pubescent throughout; leaves sessile or subsessile, the petioles not over 4 mm. long; blades 4-8 cm. long, 3 cm. wide or less, deltoid-ovate to broadly ovate or ovate-oblong, sometimes lanceolate, cuneate, subcordate to rounded at the base, obtuse or acute at the apex, thick, short-pilose to puberulent on both surfaces or sometimes glabrate, the margins entire or sometimes wavy; inflorescence paniculate, with subopposite branches and small bracts; involucre 5-6 mm. long at anthesis, enlarging and reticulate in fruit, viscid-pilose, ciliolate, on pedicels about 1 cm. long, these subtended by inconspicuous bracts; flowers usually 3 in each involucre; perianth pink and pubescent; stamens usually 3, exserted; anthocarp obovoid, 5 mm. long, glabrous or rarely pubescent, brown, 5-angled, the angles narrow, acute and smooth, the sides rugulose or obscurely tuberculate, conspicuously raphidulous; seed broadly obovoid, 3-3.5 mm. long, pale-brown. Permian Red Beds area or Rolling Red Plains in s.w. Okla. and adj. Tex.; also Kan. and Colo.

11. *Mirabilis coccinea* (Torr.) B. & H. SCARLET FOUR-O'CLOCK. Perennial herb from an elongate woody root; stems solitary or numerous, erect or ascending, variously

branched, the branches very slender, glaucous, the internodes short or elongate; leaves opposite, sessile, few to numerous; blades filiform or linear, 2-12 cm. long, 1-4 mm. wide, long-attenuate at both ends, thick and succulent, glaucous at least beneath, glabrous; involucre slender-pedunculate, axillary and solitary in young plants and mostly with cleistogamous flowers, in mature plants arranged in loose paniculate cymes, these with slender opposite sparsely short-pilose branches, at anthesis 4-5 mm. long, short-pilose or puberulent, deeply lobed, the oval-ovate lobes acute and slightly accrescent in age; flowers 1 to 3 in each involucre; perianth 15-20 mm. long, scarlet to deep-purplish-red, the tube 3-4 mm. in diameter, gradually widening upward, the limb 11-15 mm. broad, deeply 5-lobed, the lobes retuse; stamens 5, exserted; anthocarp obovoid, 5 mm. long, olivaceous, finely hirtellous, 5-lobed, the angles broad, smooth or tuberculate, the sulci coarsely transversely-rugose; seed broadly obovoid, 2.5 mm. long, yellowish-brown. Dry hillsides in w. Tex., s.w. N.M., s.e. Ariz. and n. Mex.

12. *Mirabilis gausapoides* (Standl.) Standl. Perennial herb; stems solitary or few, erect or decumbent, stout, 3-8 dm. long, sparsely branched, glaucous, densely hirsute at the base, viscid-puberulent or short-pilose above; leaves opposite, distant or crowded, sessile; blades linear to lance-linear, 3-10 cm. long, 1.5-5 mm. broad, attenuate to each end, entire, thick and succulent, glaucous beneath, densely short-pilose or hirsute, rarely glabrate; inflorescence terminal, cymose-paniculate, sparsely branched, the slender branches alternate, viscid-puberulent or densely villous; involucre few, slender-pedunculate, solitary or clustered, at anthesis 3.5-5 mm. long, about 15 mm. broad in age, densely viscid-villous with fulvous hairs, the lobes broadly rounded; flowers usually 3 in each involucre; perianth pink, about 1 mm. long, sparsely short-pilose; stamens 5, exserted; anthocarp obovoid, 4.5-5 mm. long, short-hirtellous, olivaceous, the angles broad, smooth, the sides coarsely transverse-rugose. *M. linearis* var. *subhispidula* Heimerl. In dry soils, N.M. and w. Tex. to Mex.

13. *Mirabilis linearis* (Pursh) Heimerl. Perennial herb from an elongate woody taproot, erect to ascending or procumbent; stems 2-10 dm. tall, simple or branched below, usually glaucous, often very whitish, glabrous or puberulent below, viscid-puberulent or short-villous above; leaves few to many, often crowded, 3-10 cm. long, 1-5 mm. wide, linear to linear-lanceolate, attenuate and sessile or long-cuneate at the base to a short petiole, narrowed to an obtuse or acute apex, thick, gray-green, usually glaucous at least below, glabrous or viscid-puberulent, the margins entire or sparsely dentate; inflorescence axillary or cymose-paniculate; involucre about 4 mm. long at anthesis, densely viscid-villous, usually with 3 flowers; perianth about 1 cm. long, sparsely pilose, purple-red to pink, the limb deeply lobed, the lobes retuse; anthocarp 4.5-5 mm. long, obovoid, brownish-olivaceous, 5-angled, densely pubescent to sparingly strigose, the sides coarsely transversely-rugose; seeds rounded-obovoid, 3 mm. long, pale-yellowish-brown. *M. angustifolia* (Nutt.) MacM., *Oxybaphus linearis* (Pursh) Robins. Dry ground, limestone, sandy plains, igneous soils, a Great Plains species, rather common in the Panhandle, extending s.e. and s. to Hunt, Jack, Nueces and Kleberg cos., spring-summer; from Minn. and S.D. to Mont., s. to Mo., Tex., Ariz. and Mex.; sometimes adv. eastw.

14. *Mirabilis diffusa* (Heller) Reed. Perennial herb from a rootstock; stems much-branched, prostrate or procumbent, diffusely branched from the base, 2-3 dm. long, terete, glabrous and whitened below, the middle part marked with several lines of short curved hairs, the branches immediately below the inflorescence and the inflorescence itself covered with spreading glandular hairs; leaves sessile, thick and green; blades linear-lanceolate, slightly narrowed at the base, the lowest 5-6 cm. long, the upper ones half as long, all acute, the upper surface provided with a grayish margin, the midvein prominent; inflorescence cymose, densely viscid-hairy; involucre densely viscid-hairy, 8-10 mm. wide in fruit, the triangular-ovate to triangular-lanceolate lobes acutish and 2-3 mm. long; flowers 2 or 3 in an involucre, subsessile; perianth pale-rose to white, 6 mm. long, the lobes broadly obovate; stamens 3, exserted; style exserted, anthocarp inconspicuously ribbed, pubescent. N.D., Kan. and Wyo., s. to Tex., N.M. and Ariz.; June-Aug.

15. *Mirabilis aggregata* (Ort.) Cav. Perennial herb; stems branched from the base, terete, striate, hispid, the branches similar; leaves opposite, lanceolate, undulate, the margins hispidulous, obsolete denticulate, shining above, glaucous, the petioles short; peduncles axillary, solitary, short, the flowers aggregated, perianth usually villous, cam-

panulate, partly closing, 3-flowered, rarely 2- or 4-flowered; flowers sessile, 5-parted, the laciniae ovate and unequal, after anthesis growing upward and in the mature fruit expanded, white-reddish; stamens the length of the perianth; anthocarp borne on reflexed peduncles; nutlets 3, often 2 with the other abortive, large, villous, placed across from each other in the enlarged sinuses of the perianth, at first closing, later spreading open. *Oxybaphus aggregatus sensu Gray*, not Vahl. Mex. and Tex.

A very confused name and species. True *M. aggregata* may be only Mexican.

16. *Mirabilis decumbens* (Nutt.) Daniels. Perennial herb; stems decumbent or ascending, 2-8 dm. tall, simple or tufted or sometimes branched above, sparingly pubescent (at least when young), glabrous in age; leaves essentially sessile; blades oblong to linear-lanceolate or rarely oblong-lanceolate, 2-11 cm. long, thick, sometimes slightly acuminate but rather blunt, ciliate, narrow-cuneate at the base; involucre 2- to 5-flowered, terminating solitary axillary peduncles, 1.5-2 cm. wide, the lobes acute or rarely rounded; perianth sparingly pubescent, about 3 mm. broad; anthocarp narrowly obovoid, 5-6 mm. long, pubescent, with prominent ribs and tubercled faces. In dry sandy and gravelly soils, on plains and prairies, spring-summer; from Man. and N.D. to Mo. and Miss., w. to Colo., Wyo., Tex. and N.M.

17. *Mirabilis ciliata* (Standl.) Standl. FRINGED FOUR-O'CLOCK. Perennial herb, low, from a slender woody root; stems few, 2-4 dm. tall, erect, abundantly dichotomously branched (especially near the base), angled (at least when dry), glaucous, glabrous below, with a few scattered weak hairs above, the lower internodes short, the upper ones elongate; leaves opposite, with stout petioles 7 mm. or less long, with a few scattered stout white hairs; blades linear-lanceolate to ovate-deltoid or deltoid-lanceolate, 5-18 mm. broad, blunt-pointed, rounded, cuneate or attenuate at the base, the margins entire or subundulate, succulent, coriaceous when dry, sparsely pilose with a few conspicuous long soft white hairs or glabrate, long-ciliate at least near the base; inflorescence of numerous small dense cymes or of axillary involucre in young plants, the branches slender, puberulent and pilose; involucre 3-flowered, short-pedunculate, about 4 mm. long at anthesis and to 8 mm. in fruit, densely white-pilose, the short lobes broadly ovate or ovate-orbicular and acute at least in age; perianth about 1 cm. long, very sparsely pilose or glabrous, the limb about 15 mm. broad; stamens 5, exerted; anthocarp broadly obovoid, 3.5-4 mm. long, dark-brown, sparsely and finely pilose, the angles broad, obscurely rugulose, the sides also slightly rugulose; seeds globose-obovoid, 2 mm. long, pale-brown. *M. ciliatifolia* (Weath.) Standl., *Allionia ciliata* Standl. Trans-Pecos Tex. and Mex.

18. *Mirabilis hirsuta* (Pursh) MacM. Perennial herb; stems erect or decumbent, 2-10 dm. tall, solitary or few, simple or sparsely branched below the inflorescence, densely hirsute or long-pilose below and usually up to the inflorescence, sometimes merely puberulent but always hirsute near the nodes; leaves sessile or petioled to 5 mm. long; blades 2-10 cm. long, variable in shape, mostly ovate-oblong, sometimes lanceolate to broadly ovate, cuneate to subcordate at the base, narrowed to an obtuse or acute apex, rarely rounded, densely hirsute to viscid-puberulent or glabrate; inflorescence both axillary and cymose-paniculate; involucre 4-5 mm. long at anthesis, densely to sparsely viscid-pilose, usually 3-flowered; perianth 8-10 mm. long, pink to purplish-red, sparsely pilose; stamens 3 to 5, long-exserted; anthocarp narrowly obovoid, 4-5 mm. long, dark-olivaceous, densely pubescent to short-pilose, 5-angled, the angles broad, smoothish the sides rugose or short-tuberculate; seed obovoid, 3 mm. long, brownish-stramineous. Dry often sandy ground, dry fields and hillsides, w. and n.w. Tex., summer-fall; from Man. and Wisc., s. to Mo., La., Tex. and N.M.; rarely adv. eastw.

19. *Mirabilis eutricha* Shinners. Perennial herb, from a vertical soft-woody oblong or fusiform root 5-12 mm. thick; stems erect, 25-50 cm. tall, hirsute throughout with jointed translucent brownish or yellowish hairs 1-1.5 mm. long and spreading nearly at right angles, simple or sparingly branched near the summit, the middle and lower internodes 3-10 cm. long; leaves very short-petioled or sessile, the narrowly winged petioles to 4 mm. long; blades lanceolate or narrowly oblong-lanceolate, acute, spreading-hirsute on both sides with whitish hairs similar to those on the stem but slightly shorter and stiffer, the larger blades 4-7 cm. long and 6-10 mm. broad, the upper ones gradually reduced; branches of the inflorescence with small leafy bracts 3-5 mm. long and 1.2 mm. wide; involucre solitary and axillary or in a small terminal panicle; peduncles becoming

8-10 mm. long in fruit, spreading-hirsute with hairs like those of the stem; involucre 2-flowered, moderately densely spreading-hirsute outside, 6-7 mm. long in flower, to 13 mm. in fruit, the lobes ovate-triangular and subacute or apiculate; anthocarp obovoid, 5 mm. long, 3 mm. thick, covered with large yellow-green warty tubercles, the tubercles sparsely white-hirsute. Sandy prairies, limestone gravel, on rocky slopes in n.-cen. Tex. (Denton, Taylor and Wise cos.); endemic.

20. *Mirabilis gigantea* (Standl.) Shinn. Perennial herb from an elongate woody taproot; stems erect, finely and densely appressed-puberulent throughout, generally 6-9 dm. tall, simple below or freely branched above; leaves almost sessile or petioled to 1 cm. long; blades thick, the lower ones large, 10.5 cm. long and to 8 cm. wide, broadly ovate, obtuse, truncate at the base, the upper leaves oblong (85 mm. long and to 45 mm. wide), obtuse, broadly cuneate or rounded at the base, prominently veined; inflorescence paniculate, rarely axillary, the branches opposite; involucre usually 3-flowered, about 7 mm. high and 10 mm. wide, on peduncles to 1 cm. long, the broadly ovate lobes obtuse and densely and finely puberulent; flowers about 1 cm. long; perianth rose-pink to light purple; stamens slightly exerted; anthocarp 5 mm. long, 5-ribbed, the ribs tuberculate with the spaces between them puberulent, acutish above, somewhat narrowed below. *Allionia gigantea* Standl., *Oxybaphus giganteus* (Standl.) Weath. Endemic to n.-cen. Tex. from the Red River s. to McLennan Co. and from Dallas to Parker Co.

21. *Mirabilis pauciflora* (Buckl.) Standl. Perennial herb; stems erect, glabrous, 3-6 dm. tall, solitary and simple, rarely if ever branched, leafy to the summit; leaves opposite, the short petioles 1-1.6 cm. long; blades oblong-ovate, acute or subobtuse, 5-8 cm. long, 2.5-5 cm. broad, glabrous; flowers axillary on short peduncles 6-12 mm. long; involucre 1- to 2-flowered, the segments obovate and abruptly acute, pubescent; anthocarp oblong, 4-angulate, rugose. Roadsides, on granite outcrops and on white sandy soils on the Edwards Plateau; also Okla.

22. *Mirabilis pseudaggregata* Heimerl. Perennial herb; stems 5-7 dm. tall, erect or spreading, glabrate or scantily pubescent in the lower part, often opposite and paniculately branched, stout, grayish below, greenish above, striate, suffrutescent at the base, the middle internodes 10-14 cm. long (the basal ones much shorter), smooth at the nodes, the branches erect and oblique, small-leaved in the upper parts; leaves of a pair subequal, the lower ones often with petioles 8-12 mm. long, the others and the upper ones sessile or subsessile; blades subsymmetrical, linear-lanceolate, 5-11 cm. long, 12-28 mm. wide, those in the lowest parts broadest, cuneate near the base, long-narrow at the obtuse apex, the margin slightly indulate, firm, grayish, the primary vein prominent, the secondary veins faint, the bracts in the ultimate ramifications 3-5 mm. long, ovate, more acute and reduced; inflorescence paniculate, more or less divaricate, the branches opposite, the primary branches little to not divided, the ultimate divisions more contracted, densely flowered and more elongated, to 13 cm. long, lacking bracts; involucre on very short peduncles 2-4.5 mm. long, more or less deflexed, 2- or 3-flowered, broadly campanulate, 9-10 mm. wide, 5-6 mm. long, 5-parted (rarely 4-parted), membranaceous; involucral lobes about as long as wide (3-3.5 mm.), ovate-triangular, obtusish to acutish, sparsely hirsute inside, densely so outside; flowers often chasmogamous but sometimes cleistogamous, pink, to 1 cm. long, the part near the ovary broadly obovoid, 1.5 mm. long, 1 mm. wide, hirsute, indistinctly 5-costate, the upper part broadly campanulate, hirsute near the base; stamens 3, to 11 mm. long; anthocarp (very few present) 5 mm. long and 2 mm. wide, oblong, grayish-brown, more or less densely hirsute, truncate at the base, slightly constricted above the base, obtusely conical at the apex, costae entire, barely interrupted, moderately prominent. In Trans-Pecos Tex. and Mex.

23. *Mirabilis albida* (Walt.) Heimerl. WHITE FOUR-O'CLOCK. Perennial herb with glabrous foliage, except the viscid-pubescent inflorescence and upper parts of the stem; stems solitary or few, erect, 2-12 dm. tall, 4-angled below, enlarged at the nodes, whitish, smooth and often very short; leaves opposite, the stout petioles 5 mm. long or shorter to sessile; blades narrowly lanceolate to linear or ovate, 3-12 cm. long, 3-28 mm. broad, blunt or pointed at the apex, attenuate to the petiolelike base or nearly sessile, the margins entire or subsinuate, usually thick and succulent, bright-green on the upper surface, glaucous or whitened beneath, glabrous or slightly pilose; inflorescence of axillary involucre in young plants, cymose-paniculate in mature plants, much-branched, the

branches slender or stout, opposite or alternate, puberulent or short viscid-pilose, with numerous reduced bractlike leaves; involucre 1- to 3-flowered, slender-pedunculate, about 4 mm. long at anthesis, 8-14 mm. long in fruit, densely or sparsely viscid-pilose, the short lobes triangular to rounded; perianth pink, rose or whitish, 8-10 mm. long, sparsely pilose, the ovate lobes shorter than the tube; stamens 3 to 5, exserted; style exserted; anthocarp obovoid, 5 mm. long, dark-olivaceous, with tufts of silvery hairs, the angles broad and coarsely tuberculate or composed of distinct tubercles, the sides also tuberculate; seed obovoid, 3.5 mm. long, pale yellowish-brown. Incl. var. *lata* Shinners and var. *uniflora* Heimerl., *Allionia bracteata* Rydb. In dry soils, meadows, hillsides, May-Nov.; from S.C., Tenn., Ala. and Miss. to Kan., Mo. and Tex.

24. *Mirabilis collina* Shinners. Perennial herb, from a vertical elongate fusiform soft-woody root to 12 mm. thick (located as much as 6 cm. below ground), producing one to several bent or branching below-ground stem bases of 1 to 6 nodes; above-ground stems erect, 25-85 cm. tall, finely and rather densely pubescent throughout with jointed translucent whitish rather viscid or glandular spreading hairs 0.5 mm. long, branching mainly in the middle part, the branches ascending, the middle and lower internodes 3.5-19 cm. long; leaves densely pubescent with hairs like those of the stem, the petioles (3-12 mm. long) usually with some long hairs in addition; blades triangular-lanceolate or elongate-triangular, abruptly contracted to subcordate at the base and short-decurrent on the petioles, the larger ones 3-7.8 cm. long and 16-35 mm. wide, the upper and those in the inflorescence gradually reduced and shorter-petioled; earliest involucre solitary and axillary, later ones in at first congested terminal cymes, ultimately forming an open panicle; peduncles becoming 8-11 mm. long, densely pubescent with mixed long and short hairs spreading at right angles; later involucre 3-flowered, pubescent outside with short hairs like those of the stem, 6-8 mm. long in flower, as much as 12 mm. in fruit, the ovate lobes more or less acute; perianth showy, funnellform, about 8 mm. long, lavender-rose; anthocarp narrowly obovoid, 4.2 mm. long, 1.5 mm. thick, with 4 conspicuous thickly winglike tuberculose ridges forming the angles, the very slender body with small tubercles, the ridges and tubercles sparsely hirsute with whitish hairs. Sandy thickets and on hillsides in e. Tex.; endemic.

25. *Mirabilis nyctaginea* (Michx.) MacM. WILD FOUR-O'CLOCK. Perennial herb; stems several from a thick fleshy taproot, erect, 3-10 dm. tall, with broadly spreading forking branches, glabrous or somewhat hairy, ridged and often purplish; leaves opposite, petioled or the upper ones sessile, entire, glabrous or nearly so, ovate-lanceolate to cordate, 5-12 cm. long; flowers perfect, small, 3 to 5 in an involucre; involucre borne on hairy peduncles that are grouped in umbels in forked terminal clusters, 5-6 mm. long in anthesis, 10-15 mm. long in fruit; involucre lobes 5, obtuse, persistent, short-pilose on the margin, sometimes pilose at the base, becoming enlarged, veiny and colored in fruit; perianth pink to purple or reddish, 5-lobed; stamens 3 to 5, exserted; anthocarp a hard nutlet, 4-6 mm. long, cylindrical-obovoid, pilose, rugose, or warty, 5-ribbed and angled, grayish-brown; seed broadly obovoid, 3 mm. long, pale-brown. *Allionia nyctaginea* Michx., *Oxybaphus nyctagineus* (Michx.) Sweet. Weedy places, in dry soils, limestone gravels, sandy Post Oak Belt and West Cross Timbers, spring-summer; from Mont. to Wisc., s. to Tenn., Colo., Ala., Tex. and Mex.; adv. in Calif. and e. U.S.

26. *Mirabilis dumetorum* Shinners. Perennial herb from a vertical oblong or fusiform pithy root to 14 mm. thick; stems erect or spreading and half-decumbent or leaning on other plants, 8-12 dm. long, glabrous, freely branched throughout in larger plants, the branches elongate to 35 cm. long, more or less pubescent with short incurved whitish hairs; stem internodes 2-9 cm. long on erect plants, to 23 cm. long on large sprawling or semidecumbent ones; leaves glabrous, with petioles 5-12 mm. long; blades broadly ovate or rhombic to ovate-lanceolate or elliptic, obtuse, the larger ones 2-5 cm. long and 1.3 cm. wide, gradually reduced upwards, those in the inflorescence ovate-lanceolate to suborbicular and acute; involucre at first solitary and axillary, in more fully developed plants mostly in an eventually diffuse panicle, 2-flowered, sparsely pubescent to glabrous outside except at the base, 3.5-4.5 mm. long in flower, as much as 7 mm. long in fruit; peduncles becoming 4-6 mm. long, pubescent with short upwardly incurved hairs; anthocarp obovoid, 4-angled, 3.5 mm. long, 2.3 mm. thick, densely covered with mixed coarse and small tubercles, these sparsely hirsute with whitish hairs. Ark. and Okla. to s.-cen. Tex.

27. *Mirabilis coahuilensis* (Standl.) Standl. Perennial herb from a long woody taproot; stems erect, stout, to 1 m. tall, pale below, darker above, pubescence soft and short below, becoming more dense above; leaves opposite, with conspicuous petioles 2 cm. long or less (except those of the inflorescence); blades lanceolate, 5 cm. long, to 17 mm. broad, cuneate or rounded at the base, blunt-pointed, densely soft-pubescent on both surfaces, the margins irregular; inflorescence paniculate, the stout branches opposite, very densely viscid-puberulent throughout, the hairs rather long and spreading, those branches with reduced bractlike leaves 5 mm. long or less and ovate, densely viscid-pubescent; involucre 12 mm. wide or less and 8 mm. high, glandular-villous, on short glandular-villous often bracted peduncles; involucre lobes broadly ovate or orbicular, broadly obtuse, short; anthocarp 4 mm. long, obtuse above, slightly narrowed below, with 5 smooth rather prominent ribs, the spaces between the ribs transversely rugulose and hirtellous. Trans-Pecos Tex. s. into Mex.

28. *Mirabilis Grayana* (Standl.) Standl. Perennial herb; stems erect, 3-12 dm. tall, simple or sparsely branched below the inflorescence, glaucescent, glabrous below or bifariously puberulent; leaves opposite, with slender or stout petioles 5-20 mm. long, the uppermost leaves often sessile; blades deltoid or rounded-deltoid, sometimes ovate, 25-55 mm. long, 15-35 mm. wide, subcordate to truncate or rounded at the base, rounded to obtuse or rarely acute at the apex, entire or subundulate, subcoriaceous when dry, often glaucescent beneath, sparsely pilose or glabrous, often ciliolate; inflorescence cymose-paniculate, usually much-branched, the branches slender and mostly opposite, viscid-pilose, usually with numerous reduced bractlike leaves; involucre numerous, 3-flowered, slender-pedunculate, 4-5 mm. long at anthesis, 10-14 mm. long in fruit, densely viscid-pilose, the lobes rounded-ovate and commonly rounded at the apex or rarely acutish; perianth pink, about 1 cm. long, sparsely pilose; stamens usually 5, exserted; anthocarp broadly obovoid, 4 mm. long, finely pilose, dark-brown, the angles narrow, the sides finely and closely tuberculate; seed broadly obovoid, 2.5-3 mm. long, pale-brown. *Oxybaphus Grayanus* Standl. In w. Edwards Plateau and Trans-Pecos; endemic.

29. *Mirabilis oblongifolia* (Gray) Heimerl. Perennial herb with a long slender woody root; stems erect, 3-10 dm. tall, few or solitary, sometimes decumbent, simple or sparsely branched below the inflorescence, glabrous below or puberulent usually in lines, green or glaucescent below, pilose or short-pilose in the inflorescence, the internodes usually elongate; leaves opposite, the petioles 1-5 cm. long, glabrous or puberulent; blades 3-10 cm. long, 8-55 mm. wide, elongate-deltoid to deltoid-ovate or sometimes ovate-lanceolate, truncate or subtruncate at the base, obtuse to acute or attenuate at the apex, glabrous to sparsely viscid-puberulent, thin, bright-green, commonly ciliolate, the margins entire to crisped or subundulate; inflorescence cymose-paniculate, sparsely to loosely branched, the slender branches alternate, viscid-pilose with fulvous hairs, with a few bractlike leaves; involucre few or numerous, short-pedunculate, 3-5 mm. long at anthesis, about 8 mm. long in fruit, densely viscid-pilose, the hairs often blackish and jointed, the oval-oblong lobes usually longer than the tube and rounded at the apex; perianth 10-12 mm. long, purplish-red to white, sparingly pilose, the limb to 2 cm. broad; stamens 3 to 5, long-exserted; anthocarp obovoid, 3-5 mm. long, minutely pilose, 5-angled, the angles broad and usually tuberculate, the sides coarsely or finely tuberculate, brownish or blackish-olivaceous; seed obovoid, 2.3 mm. long, brownish-tan. *M. comata* (Small) Standl., *M. longiflora* var. *Wrightiana* (Gray) Kearn. & Peeb., *Oxybaphus comatus* (Small) Weath., *Alltonia comata* Small, *A. melanotricha* Standl., *A. pratensis* Standl. Meadows and thickets in the mts., sheltered canyons and slopes in the Trans-Pecos; from Tex. to Ariz. and s. Colo., s. into Mex.

6. AMMOCODON STANDL.

MOONPOD

A small American genus.

1. *Ammocodon chenopodioides* (Gray) Standl. GOOSEFOOT MOONPOD. Perennial herb, from a fleshy fusiform rootstock; stems erect, 1.5-3 dm. tall, dichotomously much-branched, the branches rather stout, densely covered with short appressed inflated white hairs when young, glabrate in age; leaves opposite, with petioles 5-45 mm. long; blades

ovate-oval to ovate-oblong or rarely deltoid or suborbicular, fleshy-thickened, 1.5-5 cm. long, 6-40 mm. wide, rounded to subcordate at the base, broadly rounded to acute at the apex, often abruptly apiculate, flat or crispate, paler beneath, pubescent like the stem when young, becoming glabrate, the veins usually conspicuous beneath, broad and white; inflorescence much-branched, with a few reduced leaves, the umbellules few- or many-flowered; flowers often cleistogamous, on slender pedicels 1-4 mm. long; perianth pink to lavender, campanulate, 4-5 mm. long and just as broad or broader, sparsely puberulent outside, constricted above the ovary, shallowly 5-lobed, the lobes induplicate-plicate; stamens 2 or rarely 3; filaments filiform, short-connate at the base, free from the perianth; anthers didymous and exserted; ovary narrowly oblong, the style filiform and exserted, stigmas peltate and smooth; anthocarp 5 mm. long, compressed, the wings about 2 mm. broad, glabrate, the body sulcate between the wings, sparsely puberulent; seed oblong-cylindric, 2.5 mm. long, pale-brown, lustrous. *Selinocarpus chenopodioides* Gray. Dry rocky and sandy soils, on hills, often on limestone soils in the Trans-Pecos, May-Sept.; from Tex. to s.e. Mex.

7. SELINOCARPUS GRAY MOONPOD

Perennial herbs or low shrubs, erect or decumbent; stems dichotomously much-branched, pubescent; leaves opposite, the pair unequal, petiolate; blades thick and succulent, entire or sinuate; flowers perfect, pseudoaxillary, sessile or short-pedicellate, often cleistogamous, each subtended by 2 or 3 very narrow bracts; perianth tubular-funneliform, the tube elongate or rarely short, not constricted above the ovary, rather abruptly expanded into a broad shallowly 5-lobed limb, the lobes plicate; stamens 5 or 6; filaments filiform, adherent to the perianth tube; anthers didymous, usually exserted; ovary oblong, style filiform, stigma peltate, smooth; anthocarp compressed, broadly 3- to 5-winged, the hyaline wings not veined; seed with the testa adherent to the pericarp; embryo conduplicate, the cotyledons enclosing the farinaceous endosperm, the radicle elongate and descending.

About 8 species in southwestern United States and Mexico.

1. Perianth 8-10 mm. long; leaf blades linear or linear-oblong, sessile or short-petiolate 1. *S. angustifolius*.
1. Perianth 25-45 mm. long (2)
 - 2(1). Leaves sessile or on very short petioles, the blades narrowly ovate-oblong or oblong-lanceolate 4. *S. lanceolatus*.
 2. Leaves long-petioled (at least the lower ones), the blades ovate to orbicular (3)
 - 3(2). Upper leaves much-reduced, bractlike; anthocarp 9-10 mm. long 2. *S. parvifolius*.
 3. Upper leaves not reduced; anthocarp 6-7 mm. long ... 3. *S. diffusus*.

1. *Selinocarpus angustifolius* Torr. Perennial herb; stems erect, 1-4 dm. (to 1 m.) tall, fruticose and much-branched at the base, rather sparsely slender-branched above, whitish, glandular-puberulent, with numerous short white appressed flat hairs, glabrate in age, the internodes longer than the leaves; leaves opposite, with petioles to 2 mm. long; blades often sessile; oblong-linear or lance-linear, 8-18 mm. long, 1-3 mm. broad, acute to rounded and apiculate at the apex, thick and fleshy, puberulent, covered with numerous short white appressed hair when young; flowers few, nocturnal, often cleistogamous, on pedicels 2 mm. long or shorter, the bractlets minute and subulate; perianth orange or brownish to greenish, 8-10 mm. long, glandular-puberulent outside, the tube 3 mm. long, the limb 7-8 mm. broad; stamens 5; anthocarp 5.5-7.5 mm. long, the 5 wings 2-2.5 mm. wide, the costate body puberulent and truncate at both ends. In loose volcanic soils, gravelly tablelands and rocky hillsides in the Trans-Pecos, Apr.-Nov.; also Mex.

2. *Selinocarpus parvifolius* (Torr.) Standl. Perennial herb, suffrutescent at the base, much-branched; stems erect, 2-4 dm. tall, the branches stout, glandular-puberulent and bearing numerous short flat white appressed hairs, glabrate in age, glaucous; leaves opposite, the stout petioles 3-6 mm. long; blades oval to ovate-oval, 1-2.2 cm. long, 5-10

mm. broad, obtuse or acute at the base, obtuse or rounded at the apex, thick and fleshy, crispate, puberulent; inflorescence repeatedly dichotomous, dense, bearing numerous orbicular or ovate-orbicular petiolate bractlike leaves 2-3 mm. long; flowers numerous, terminal, short-pedicellate, subtended by broadly ovate minute bracts; perianth 3-4 cm. long, densely glandular-puberulent, the tube very slender, the limb about 13 mm. broad, greenish-yellow; anthocarp 9-10 mm. long, the 5 wings 3-4 mm. broad, the striate body finely glandular-puberulent. In sandy, limestone or gypseous soils in the Trans-Pecos, Apr.-Sept.; endemic.

3. *Selinocarpus diffusus* Gray. SPREADING MOONPOD. Perennial shrub from stout woody roots; stems erect or decumbent, 1-3 dm. tall or long, much-branched from the base and also above, branches rather slender, covered with short appressed inflated white hairs and very sparsely glandular-puberulent or hirtellous, very leafy; leaves opposite, with slender or stout petioles 3-25 mm. long; blades oval to ovate-oblong, 12-25 mm. long, 6-15 mm. broad, rounded to acute at the apex, thick and fleshy, flat or crispate, densely covered with short appressed inflated white hairs when young or glandular-puberulent and scabrous, sometimes glabrate in age; flowers often all cleistogamous, short-pedicellate, the linear-subulate bracts 3-6 mm. long; perianth 35-45 mm. long, densely glandular-hirtellous outside, the tube very slender, the limb 15 mm. broad, pale-greenish-yellow; stamens 5, slightly exserted; anthocarp 6-7 mm. long, the 5 wings 2-3 mm. long, glabrate, the body subtruncate at both ends, puberulent; seed narrowly elliptic, 4.5 mm. long, light-brown. In dry sandy or gypseous soil in n.-cen. and w. Tex. to s. Ut. and Nev.; spring-summer.

4. *Selinocarpus lanceolatus* Woot. GYP MOONPOD. Perennial herb; stems erect or decumbent from a woody base, 1.2-3 dm. long, much-branched, densely leafy, covered throughout with slender short appressed white inflated hairs or glabrate in age, the branches stout; leaves opposite, with stout petioles to 3 mm. long; blades mostly sessile, lance-oblong to lanceolate, the lowest rarely ovate-oblong or ovate-oval, 1.2-8 cm. long, 3-11 mm. wide, cuneate or obtuse at the base, gradually narrowed to the acute or attenuate or rarely obtuse apex, very thick and succulent, flat; flowers numerous, subsessile, the subulate bracts 3 mm. long or shorter; perianth 3-4 cm. long, the slender tube 1 mm. in diameter, the limb about 1 cm. broad, pale-greenish-yellow to yellow or ivory-green; stamens 5; anthocarp 6-7 mm. long, the wings 2-3 mm. broad, glabrate, the body finely costate, truncate at both ends; seed narrowly oblong, 4 mm. long, pale-brown. In dry alkaline soils, on gypsum hillocks, edge of salt flats in Trans-Pecos Tex. and s. N.M.; June-Sept.

8. ACLEISANTHES GRAY TRUMPETS

Perennial pubescent herbs and low shrubs; stems forking; leaves opposite, thick, the blades unequal, entire, petioled; flowers axillary or terminal, each subtended by 1 to 3 small narrow bracts; perianth white, with a very much-elongated slender tube constricted above the ovary, the spreading limb small and 5-lobed; stamens 2 to 5, unequal; filaments slender, united into a cup at the base; style filiform, the stigmas peltate; anthocarp narrowly ellipsoidal, 5-angled or -ribbed, constricted below the apex; seed filling the pericarp to which the testa adheres, the endosperm mealy.

About 10 species in southwestern United States and Mexico.

1. Anthocarp deeply sulcate, the ribs ending above in conspicuous tubercles or glands (2)
1. Anthocarp not deeply sulcate, 5-angulate, without glands above (3)
- 2(1). Glands of anthocarp on globose tubercles at the summit of the ribs; bracts less than half as long as the anthocarp; leaf blades usually rounded at the apex; stamens 21. *A. Wrightii*.
2. Glands of anthocarp in depressions below the tubercles at the summit of the ribs; bracts equaling or exceeding the anthocarp; leaf blades mostly acute or abruptly acute; stamens 52. *A. acutifolia*.
- 3(1). Leaves of a pair very unequal, the smaller one about one fourth as long as the larger; leaf blades oval3. *A. antisophylla*.
3. Leaves of a pair subequal (4)

- 4(3). Anthocarp densely covered with short flat white appressed hairs; leaf blades ovate or ovate-oblong; perianth 4-5 cm. long4. *A. crassifolia*.
4. Anthocarp glabrous or cinereo-puberulent with slender hairs; leaf blades chiefly deltoid in outline (5)
- 5(4). Perianth 90-170 mm. long; leaf blades mostly acuminate or long-acuminate at the apex5. *A. longiflora*.
5. Perianth 35-55 mm. long; leaf blades mostly acute to rounded at the apex
.....6. *A. obtusa*.

1. *Acleisanthes Wrightii* (Gray) B. & H. Perennial herb from a fruticose caudex; stems erect or ascending, 1-5 dm. long, much-branched from the base, the branches scabrous-pubescent; leaves opposite, a pair unequal; petioles 3-15 mm. long, half as long as the blades; blades oval to ovate or suborbicular to ovate-lanceolate, 1-5 cm. long, 4-20 mm. wide, slightly unequal and obtuse or acute at the base, obtuse and apiculate at the apex, thick and firm, often crispate, paler beneath, glandular-hirtellous or puberulent; flowers axillary, solitary, sessile, usually cleistogamous; bracts linear-subulate, hirtellous, one third as long as the fruit or shorter; perianth of the cleistogamous flowers 5 mm. long, densely glandular-hirtellous, with 2 stamens; anthocarp oblong, 6-7 mm. long, truncate at both ends, strongly 5-ribbed and deeply 5-sulcate, glandular-puberulent, the broad costae smooth with each ending above in a globose glandiferous tubercle. On stony plains and prairies, in w. and s. Tex.; endemic.

2. *Acleisanthes acutifolia* Standl. Perennial herb with a thick woody base; stems ascending or procumbent, much-branched at the base, the branches stout, 1-4 dm. long, puberulent and sparsely glandular-hirtellous, glaucous; leaves opposite, a pair unequal, the petioles 3-8 mm. long, the uppermost leaves sessile; blades oblong-elliptic to oval, 1.2-5 cm. long, 4-20 mm. wide, obtuse to acute at the base, obtuse or acute at the apex, usually crispate, thick and fleshy, glaucescent beneath; flowers axillary, sessile or short-pedicellate, usually solitary; bracts linear-subulate, equaling or slightly longer than the anthocarp; perianth 4-4.5 cm. long, glandular-puberulent or hirtellous outside, the slender tube 1.5 mm. in diameter, the limb 2-2.5 cm. broad; stamens 5, short-exserted; anthocarp oval-oblong, 6 m. long, rounded at the base, constricted and truncate at the apex, glandular-puberulent or glabrous, 5-sulcate, the broad costae flat and smooth with each bearing a gland in a depression below the apex. In s.w. Tex. and Mex.

3. *Acleisanthes anisophylla* Gray. OBLIQUE-LEAF TRUMPETS. Perennial herb, prostrate from a stout or slender fruticose root; stems much-branched from the base, the branches slender, cinereo-puberulent; leaves opposite, a pair unequal, the petioles of the larger leaves 3-10 mm. long; blades oval or oblong-oval to oval-rhombic, obtuse or rounded at the base, unequal and short-decurrent, rounded to obtuse at the apex and apiculate, thick and succulent, flat, minutely puberulent when young, becoming glabrate, the blades of the larger leaves 1-5 cm. long and 6-27 mm. broad; flowers axillary, solitary, sessile; bracts linear-subulate, less than half as long as the anthocarp; perianth 4-5 cm. long; anthocarp 5-angulate, costate, sparsely puberulent and soon glabrate. Prairies in w. Tex.; doubtless also adj. Mex.

4. *Acleisanthes crassifolia* Gray. TEXAS TRUMPETS. Perennial herb, sparsely branched; stems procumbent, 2-5 dm. long, stout, scabrous-pubescent, with flat white appressed hairs, glabrate in age, the internodes longer than the leaves; leaves opposite, a pair unequal; petioles half as long as the blades or shorter, stout, 3-10 mm. long; blades flat, succulent, thick, ovate to oblong-ovate or deltoid-ovate, 1-3.5 cm. long, 2-20 mm. broad, acute or obtuse at the apex and abruptly apiculate, undulate, mostly rounded at the base, scabrous on both sides; bracts linear-lanceolate, long-attenuate, less than half as long as the anthocarp; flowers few, sessile; perianth white, 4-5 cm. long, slender, densely cinereo-puberulent; anthocarp oblong-oval, 6-7 mm. long, 4 mm. in diameter, obtusely 4-angled, truncate at both ends, shallowly 5-sulcate, the ribs broad and flat, densely scabrous-pubescent, with short flat white appressed hairs. In dry soil, along and near the Rio Grande in w. Tex., summer-fall; endemic.

5. *Acleisanthes longiflora* Gray. ANGEL TRUMPETS. Perennial herb from long woody rootstocks; stems more or less branched at the base, prostrate or sprawling over shrubs

to 1 m. tall, scabrous-puberulent or rarely short-hirtellous, glabrate below; leaves succulent, a pair unequal, with stout or slender petioles 3-8 mm. long; blades triangular-lanceolate to deltoid or lanceolate to linear-lanceolate, 15-45 mm. long, 3-35 mm. wide, broadly cuneate at the base and decurrent, acuminate or acute to long-attenuate at the apex, thick, glaucous, often crispate, the margins undulate or when dry apparently coarsely dentate, sparsely cinereo-puberulent when young, soon glabrate; flowers axillary, solitary, sessile or subsessile, fragrant, opening in the afternoon and through the night; bracts linear-subulate, half as long as the anthocarp or shorter; perianth 9-17 cm. long, white tinged with purple, sparsely puberulent outside, the very slender tube 1.5-2 mm. in diameter, pinkish-green outside, white inside, the limb 1.5-2 cm. broad; stamens short-exserted; anthocarp narrowly oblong, 5-10 mm. long, with a constriction above the base, truncate at both ends, 5-angulate, puberulent or rarely short-hirtellous, often glabrate. In sandy soils, dry alkaline soils, in granite, calcareous areas, slopes, talus, roadsides in s. and w. Tex., spring-fall; w. to Riverside Co., Calif., s. to Mex.

6. *Acleisanthes obtusa* (Choisy) Standl. Perennial herb or climbing vine, often reaching the tops of small trees, easily propagated from root divisions; stems slender, glabrous or puberulent near the nodes, diffusely branched, the branches prostrate or spreading, 1-4 dm. long or vinelike; leaves opposite, a pair unequal, with petioles 5-20 mm. long, often as long as the blades; blades deltoid-ovate, to 60 mm. long, 15-45 mm. broad, truncate or subcordate at the base, subtruncate to broadly rounded or acute at the apex, rather thin, bright-green, sparsely cinereo-puberulent when young, becoming glabrate; flowers fragrant, opening in the afternoon, in large clusters, axillary or in short-pedunculate 3-flowered cymes; bracts linear-subulate, usually equaling the anthocarp; perianth white to pink, tinged with purple, 35-45 mm. long, sparsely cinereo-puberulent outside, the limb 2 cm. broad; stamens slightly exserted; anthocarp narrowly oblong, 5-6 mm. long, truncate at both ends, obtusely 5-angulate, cinereo-puberulent or short-villous. *A. Berlandieri* Gray, *A. Greggii* Standl. In dry soils in s.w. Tex. and Mex.; summer-fall.

9. CYPHOMERIS STANDL.

Perennial herbs, suffrutescent at the base; stems erect or ascending, more or less pubescent, much-branched, the upper internodes each with a glutinous area along the middle; leaves opposite, the pairs unequal, petiolate; blades broad or narrow, succulent, entire or sinuate; flowers perfect, in elongate spikelike terminal and axillary racemes, pedicellate, each pedicel subtended by a narrow caducous bract; perianth broadly tubular-funnelform, deep bright-red, the very short tube slightly curved and constricted above the ovary, the limb somewhat oblique, shallowly 5-lobed, induplicate-plicate; stamens 5; filaments capillary, exserted, unequal, connate at the base; anthers didymous; ovary fusiform, asymmetrical, the filiform style exserted, the stigma capitate; anthocarp clavate, stipitate, gibbous, pendent or refracted, finely striate vertically, glabrous; seed with a thin testa adherent to the pericarp; embryo uncinat, the cotyledons broad, enclosing the farinaceous endosperm, the radicle elongate, descending.

A small genus in southwestern United States and Mexico.

1. Anthocarp 10-12 mm. long; leaf blades glabrous or sparsely puberulent when young, the uppermost usually linear or nearly so 1. *C. gypsophiloides*.

1. Anthocarp about 7 mm. long; leaf blades permanently and densely puberulent, the uppermost ones as broad as the lower 2. *C. crassifolia*.

1. *Cyphomeris gypsophiloides* (Mart. & Gal.) Standl. RED CYPHOMERIS. Perennial herb, suffruticose at the base; stems erect or ascending, much-branched, the branches slender, glaucous, rarely puberulent below; leaves opposite, the slender petioles 5-25 mm. long; blades narrowly deltoid or lanceolate to ovate-deltoid, the upper ones usually linear, 2.5-7 cm. long, 3-30 mm. broad, subcordate to acute at the base, gradually narrowed to an acute or obtuse apex, entire or rarely slightly sinuate, green above, glaucous beneath, glabrous or sparsely puberulent when young; flowers in slender racemes 5-16 cm. long, the flowers remote, on pedicels 1 mm. long; bracts lanceolate or linear, 4-7 mm. long, glabrous; perianth red, 7-9 mm. long, 3 mm. broad, glabrous; stamens long-exserted;

anthocarp 10-12 mm. long, slender-stipitate, 2-2.5 mm. thick; seed obovoid, about 4 mm. long, rounded at the apex, acuminate at the base, brown. Dry rocky slopes and plains in the Trans-Pecos, summer-fall; also s. N.M., s. to Mex.

2. *Cyphomeris crassifolia* (Standl.) Standl. **SINUATE-LOBED CYPHOMERIS**. Perennial herb, suffruticose below, much-branched; stems 6-10 dm. tall, erect, the branches slender, pale-green, finely and sparsely puberulent, the branches of the inflorescence glabrous; leaves opposite, the petioles 5-25 mm. long; blades rhombic to broadly oblong or rhombic-ovate, 1.5-3 cm. long, 1-2 cm. broad, truncate to rounded or broadly cuneate at the base, obtuse at the apex, coarsely sinuate-lobate, green above, paler beneath, densely and finely puberulent; flowers in racemes 5-10 cm. long, on pedicels 1 mm. long; bracts lance-linear, 4-5 mm. long, green, glabrous; perianth pink, 6-7 mm. long, glabrous, the tube very short, the limb 7 mm. broad; stamens 5, long-exserted; anthocarp 7 mm. long, short-stipitate, 2 mm. thick in the widest part. In s. Tex. and Mex.

10. COMMICARPUS STANDL. WARTCLUB

About 16 species, mainly tropical and subtropical in both hemispheres.

1. *Commicarpus scandens* (L.) Standl. **CLIMBING WARTCLUB, PEGA-POLLA**. Perennial herb; stems decumbent or clambering over vegetation, elongated or often vinelike, glabrous or obscurely puberulent about the nodes, pale, slender, much-branched, to 3 m. long; leaves opposite, the slender petioles 1-2.5 cm. long; blades ovate to broadly cordate-ovate or rhombic-orbicular, rather thin and fleshy, bright-green, paler beneath, 1.5-6 cm. long, 1-4.5 cm. broad, acute to acuminate or obtuse at the apex, cordate or truncate at the base; flowers umbellate on slender peduncles 2-4.5 cm. long, the slender pedicels 5-10 mm. long, glabrous; bracts lanceolate or oblong, 2-3 mm. long, green, ciliolate, caducous; perianth greenish-yellow, short-funnelform, 3-4 mm. long and broad, glabrous or obscurely puberulent; stamens 2 or rarely 3, exserted; filaments slender, unequal, connate at the base; anthers didymous; ovary oblique, stipitate, attenuate to a slender style, the stigma peltate; anthocarp 7-10 mm. long, 2 mm. in diameter, narrowly clavate-cylindric, glabrous, bearing a few or numerous glands irregularly scattered along the costae; seeds with the thin testa adherent to the pericarp. Thickets, hillsides, canyons and arroyos from coastal Tex. and the Rio Grande Valley and Plains to the Trans-Pecos, throughout the year; from Tex. to s.e. Ariz. and Baja Calif., s. to Guat., W.I., Bah. I., Col. and Venez. to Peru.

11. ANULOCAULIS STANDL. RINGSTEM

Perennial or biennial gypsophilous herbs from long thick taproot; stems erect, branched, more or less pubescent, the internodes usually with a viscid ring; leaves opposite, petiolate, few, borne near the base of the stem; blades broad, coriaceous, glandular-dentate or denticulate; flowers perfect, bracteate, umbellate or in axillary glomerules or racemose, the inflorescence much-branched, the small bracts scarious or coriaceous; perianth funnel-form, the elongate tube constricted above the ovary, the limb campanulate and 5-lobed; stamens 3 or 4, exserted, the unequal filaments filiform and connate at the base; anthers didymous; styles filiform, the stigma peltate; anthocarp coriaceous, turbinate or biturbinate, 10-striate, glabrous; seed with the thin testa adherent to the pericarp; embryo uncinata, the broad cotyledons enclosing the copious endosperm, the radicle elongate, descending.

About 5 species in southwestern United States and Mexico.

- 1. Limb of perianth as well as the lobes reflexed; anthocarp turbinate 4. *A. reflexus*.
- 1. Limb of perianth funnelform, the lobes ascending (2)
- 2(1). Perianth villous, 8-10 mm. long; leaf blades long-villous beneath, at least when young; flowers mostly in sessile axillary clusters; biennial, no woody caudex 1. *A. eriosolenus*.
- 2. Perianth usually glabrous, 25-35 mm. long; leaf blades glabrous or nearly so; perennials from a woody caudex (3)

- 3(2). Perianth 3-3.5 cm. long, greenish-white suffused with pink toward the limb; anthocarp turbinate 2. *A. gypsogenus*.
 3. Perianth 2.5-3 cm. long, yellow-green; anthocarp biturbinate (4)
 4(3). Perianth glabrous 3. *A. leiosolenus*.
 4. Perianth villous 3. *A. leiosolenus* var.

lasianthus.

1. *Anulocaulis eriosolenus* (Gray) Standl. BIG BEND RINGSTEM. Biennial (or perennial) herb, never forming a gnarled or woody caudex, the stems and leaves usually flushed with pink or rose; stems erect, 2-10 dm. tall, sparsely branched below, the branches very stout, glabrous, with conspicuous glutinous bands at the middle of the stem internodes; leaves opposite, the stout petioles 1-4 cm. long; blades orbicular-oval to ovate-oval, 2.2-10 cm. long, 2-7 cm. wide, cordate or subcordate at the base, rounded at the apex, coriaceous, glandular-denticulate, sparsely scabrous above with stout conic hairs having dark glandular bases, similarly pubescent beneath with longer hairs, glabrate in age; inflorescence paniculately much-branched, the slender branches naked; flowers in axillary and terminal few-flowered clusters, on slender pedicels 2-4 mm. long; bracts ovate-oblong to lance-oblong, 2-3 mm. long, acuminate, scarious, glabrous, usually ciliolate; perianth pink, sometimes white, 1 cm. long, the slender tube long-villous, very abruptly expanded into a nearly rotate limb 1 cm. broad; stamens 5, short-exserted; anthocarp turbinate, 5 mm. long, the summit broadly obtuse or retuse. *Boerhaavia eriosolena* Gray. Bluffs, gypsum-philous soils, in Trans-Pecos Tex. and Mex., throughout the year.

2. *Anulocaulis gypsogenus* Waterfall. GYP RINGSTEM. Perennial herb from a woody root; stems erect, 8-12 dm. tall, glabrous, usually with an irregular glutinous band on each of the internodes; leaves opposite, mostly free from the crowded lower nodes, thus appearing basal; blades ovate-cordate to reniform-cordate, 7-19 cm. long, 6-23 cm. wide, coriaceous, pallid, glabrous; inflorescence in panicles about two thirds the height of the plant, closely several-flowered; floral bracts ovate to ovate-lanceolate, acuminate at the tips; perianth large, 3-3.5 cm. long, greenish-white suffused with pink toward the limb, the lower part tubular, the upper one third funnellform, 5-lobed, the lobes 4 mm. long, each lobe deeply bifid, with a prominent midvein extending through the tube to the triangular sinus; stamens 3, unequal, exserted, 4-6.5 cm. long, the bases of the filaments unequally united into a short hypogynous tube about as long as the ovary; style filiform, extending about 1 cm. beyond the stamens, the stigma minutely capitate; anthocarp turbinate, 5-7 mm. long, 4-5 mm. wide, surrounded just below the middle with a reflexed wing about 1 mm. wide, the lower part of the fruit narrowly conical, the upper part hemispherical, prominently 10-ridged. Obligate gypsophile. Permian gypsum beds of Culberson and Reeves cos., Tex., in adj. Eddy Co., N.M. and as far n. as the gypsum deposits of the Comanchean Bluffs, e. of Roswell, Chaves Co., N.M., June-Nov.

3. *Anulocaulis leiosolenus* (Torr.) Standl. Perennial herb; stems erect, 6-10 dm. tall, sparsely branched below, the branches stout, glaucous and glabrous; leaves opposite, coriaceous, 1 or 2 pairs at the base of the stem; blades reniform to broadly oval or ovate-oval, 3-15 cm. long, 3-12 cm. broad, deeply cordate to truncate at the base, broadly rounded at the apex, yellow-green on the upper surface and when young tomentulose, beneath glaucescent and tomentulose or villous when young but early glabrate and glandular-tuberculate; inflorescence much-branched, the stout branches naked, the flowers fasciculate or in dense spikes and short-pedicellate; bracts minute, ovate, coriaceous, glabrous; perianth yellow-green, 2.5-3 cm. long, glabrous, gradually dilated above into a narrow limb; stamens 5, short-exserted; anthocarp biturbinate, 5-6 mm. long, glaucous, in age developing at the middle a rigid horizontal wing 6-7 mm. in diameter; seed biturbinate, 3 mm. long, pale-brown. Alkaline soils, in gypsum habitats in Hudspeth Co., Tex. and Mex., Aug.-Nov.

Var. *lasianthus* I. M. Johnst. This variety differs from the typical form by having the perianth puberulent or villous instead of glabrous. Isolated in the Big Bend region, Tex.

4. *Anulocaulis reflexus* I. M. Johnst. Perennial herb; stems erect, 3-10 dm. tall, arising from an erect woody caudex, the branches numerous, very smooth, pale, rigid and ascending, the branches glutinous; leaves opposite, in 2 or 4 pairs at the base, 5-15 cm. long, coriaceous, rigid and brittle when dry; blades cordate or cordate-reniform, 4-11 cm. long, 4.5-9 cm. broad, acute to obtuse or rounded at the apex, the margins more or less

irregularly sinuate, obtuse, denticulate, with brown glands, glandular-tuberculate, the tubercles brown; flowers in a nodding lax inflorescence, rarely congested; perianth rose to flesh-pink, the rarely curved tube about 1 cm. long from the base and gradually widening from about 1 mm. at the base to about 2.5 mm. above, the throat exvaginate (being inside out and reflexed and sheathing the upper 1-3 mm. of the perianth tube), the 5 lobes short to elongate, oblong, 5-10 mm. long and about 2.5 mm. wide, reflexed and parallel the commonly somewhat curved tube; perianth parts after anthesis subtubular, erect, 10-14 mm. long, persistent; stamens 3, unequal, about 1 cm. long, exerted and showy; anthocarp turbinate, 6 mm. long, to 4.5 mm. in diameter, narrowly 5-winged around the middle, the lower part conic and 5-costate, the upper part mainly conic-hemispherical and 10-costate. On gypseous shales, in regions between *A. leiosolenus* and its var. in Tex. and Mex., May-Sept.

12. BOERHAAVIA L. SPIDERLING

Perennial or annual herbs, slender, often diffuse; stems branched and forking, variously pubescent or glandular, often with villous areas in the internodes; leaves opposite, petiolate, the pair subequal, entire or sinuate; flowers perfect, very small to 1 cm. broad, bracteate, cymose-paniculate to racemose, on jointed pedicels; perianth corollalike, campanulate or nearly rotate, constricted above the ovary, the limb shallowly 5-lobed, deciduous; stamens 1 to 5, exerted or inclined; filaments unequal, capillary, connate at the base; anthers didymous; ovary oblique, stipitate, the style filiform, the stigma peltate; anthocarp ovoid or obpyramidal, 3- to 5-angulate (5- to 10-ribbed), rarely 3- to 5-winged, glabrous or pubescent, symmetric; seed with the thin testa adherent to the pericarp; embryo uncinata, the cotyledons enclosing the scanty endosperm, the radicle elongate and descending. Also spelled *Boerhavia*.

About 40 species, mostly tropical and subtropical.

1. Anthocarp pubescent; perennials (2)
1. Anthocarp glabrous (3)
 - 2(1). Flowers capitate or glomerate, sessile or short-pedicellate; anthocarp 5-sulcate, densely glandular-puberulent1. *B. coccinea*.
 2. Flowers solitary on long slender pedicels; anthocarp 5-angulate, short-pilose to puberulent or very rarely glabrate2. *B. gracillima*.
 - 3(1). Plants perennial (Doubtful cases should be keyed under both alternatives) (4)
 3. Plants annual (5)
 - 4(3). Leaf blades suborbicular to broadly ovate; flowers in terminal cymes; stamens 5; perianth 8-13 mm. broad3. *B. anisophylla*.
 4. Leaf blades linear to linear-lanceolate; flowers cymose; stamens 3 or 5; perianth 6-14 mm. broad4. *B. linearifolia*.
 - 5(3). Flowers not racemose; stamens equaling or slightly exceeding perianth (6)
 5. Flowers racemose; anthocarp rounded at the apex; stamens included (8)
 - 6(5). Branches of inflorescence glandular-villous; bracts large, as long as the anthocarp, persistent5. *B. purpurascens*.
 6. Branches of inflorescence puberulent or glabrous; bracts very small, much shorter than the anthocarp, often deciduous; anthocarp not winged but 5-angled (7)
 - 7(6). Anthocarp 3-4 mm. long; perianth 1-1.5 mm. long, white tinged with pink; flowers umbellate-cymose; leaf blades broadly ovate to rhombic or deltoid-ovate to oblong6. *B. erecta*.
 7. Anthocarp 2.2-2.7 mm. long; perianth 1.5-2 mm. long, pink; flowers cymose-paniculate or in few-flowered simple umbels; leaf blades oval or broadly oblong to lanceolate or linear7. *B. intermedia*.
 - 8(5). Anthocarp 4-angulate; bracts persistent, equaling the fruit; stamens 3 or 48. *B. Wrightii*.
 8. Anthocarp 5-angulate; bracts deciduous, small; stamens 1 or 29. *B. spicata*.

1. *Boerhaavia coccinea* Mill. SCARLET SPIDERLING. Perennial herb from a stout or slender fleshy or woody root; stems few to numerous, ascending to procumbent or decumbent, 2-15 dm. long, sparsely branched below, green or brownish, minutely puberulent to viscid-puberulent below (especially at the nodes), densely glandular-puberulent to slightly viscid or glabrate above; leaves opposite, the slender or stout petioles 3-40 mm. long and usually villous; blades suborbicular or broadly oval to ovate-oblong, 15-55 mm. long, 8-50 mm. broad, subcordate to truncate or rounded at the base, rounded to acute at the apex, entire to sinuate, thin or rarely coriaceous, bright-green above, pale beneath, epunctate or brown-punctate, glabrous or obscurely puberulent, villous-ciliate, sparsely villous beneath along the veins or often densely hirsute or hirtellous throughout and viscid; inflorescence of lax terminal and axillary cymes, these much-branched, the slender branches ascending or divergent, glabrous, puberulent or densely glandular-puberulent; flowers subsessile to short-pedicellate, in glomerules of 2 to 4 on the ends of filiform peduncles 3-10 mm. long; bracts minute, lanceolate or ovate, viscid-puberulent, deciduous or persistent; perianth purplish-red to reddish-green, 2 mm. broad, minutely glandular-puberulent; stamens 1 to 3, short-exserted; anthocarp narrowly obovoid, 2.5-4 mm. long, rounded at the apex, densely glandular-puberulent or glandular-pilose, 5-sulcate, the angles and sulci smooth. *B. caribaea* Jacq. Waste places, fields and river banks, Pen. Fla., to s. and w. Tex. and s.e. Calif., southw. through Mex. and C.A. to n. and w. S.A.; throughout W.I.; adv. on ballast in e. N.C.; Bah. I.; Virg. Is.; trop. Afr.

2. *Boerhaavia gracillima* Heimerl. Perennial herb, forming bushes to 1 m. in diameter, from a thick woody deep taproot; stems numerous, decumbent or procumbent, 3-15 dm. long, much-branched, the branches slender, minutely and obscurely puberulent or glabrate, very rarely pilose, glaucous or pale-brown; leaves opposite, the stout petioles 3-25 mm. long; blades broadly rhombic to elliptic-oblong or broadly ovate or oval, 24 mm. long, 1.3-5 cm. wide, subcordate or rounded at the base, rounded to acute or abruptly acuminate at the apex, thick and firm, bright-green or glaucous, whitish beneath, epunctate, entire to slightly sinuate, prominently veined, glabrous or puberulent when young; inflorescence of numerous axillary and terminal cymes, these much-branched, the branches very slender, divergent, glabrous; flowers single, usually on elongate filiform pedicels 5-10 mm. long; bracts 1 or 2 at the base of each flower, minute, lanceolate, glabrous, deciduous; perianth deep purplish-red to wine-red, 5-9 mm. broad, puberulent outside or very rarely glabrate; stamens 2 or 3; anthocarp narrowly oblong-obovoid to clavate, 3.5-4 mm. long, rounded at the apex, short-pilose, puberulent or glabrate, 5-angulate, the angles narrowly rounded, smooth, the sulci smooth. Dry plains, fields, rocky hillsides in Trans-Pecos Tex. and s. N.M. and Ariz. to Baja Calif. and s. Mex.

3. *Boerhaavia anisophylla* Torr. Perennial herb from a thick woody root; stems few to many, ascending or procumbent, 1.5-5 dm. long, sparsely branched, the branches slender, grayish, densely puberulent below and hirtellous or glandular-puberulent above; leaves opposite, the stout petioles 2-10 mm. long; blades oval to broadly deltoid or oval-ovate to oblong, 1-3 cm. long, 5-20 mm. wide, cordate or rounded at the base, broadly rounded to obtuse or rarely acute at the apex, entire or sinuate, coriaceous, green above, glaucous below, scaberulous or short-hirtellous, glabrate in age, minutely brown-punctate beneath; inflorescence cymose, much-branched, the branches slender, glandular-puberulent, the flowers subsessile or short-pedicellate, in few-flowered glomerules; bracts lanceolate or ovate, acuminate or attenuate, thin, persistent, purplish-red to pink or white, ciliate; perianth bright-purplish-red to pink or white, 8-13 mm. broad, puberulent outside; stamens 5; anthocarp obovoid-oblong, rounded at the apex, glabrous, 5-angulate, the angles broad, rounded, smooth, the narrow sulci smooth. Dry rocky hillsides, on limestone boulders, Trans-Pecos Tex. and Mex.

4. *Boerhaavia linearifolia* Gray. Perennial low shrubs from a stout woody taproot; stems few to many, slender, diffusely branched at the base, the branches erect or ascending, 3-9 dm. tall, puberulent, hirsute, more or less glandular-viscid or glabrate; leaves opposite, sessile or nearly so; blades linear-lanceolate to lanceolate, 1-3 cm. long, acute at the apex, rounded at the oblique base, usually revolute, either green on both surfaces or green above and paler beneath, usually brown-dotted, thinly coriaceous, glandular-hirtellous or glabrate; inflorescence cymose, much-branched, nearly naked, the slender branches glandular-puberulent to glabrous; peduncles slender; flowers solitary, on pedicels 1-3 mm. long; bracts minute, persistent, lanceolate, attenuate, brown-dotted; perianth purple or red-purple to pink or magenta, 6-9 mm. long, the rotate limb 6-14 mm. broad,

the tube glabrous to sparingly pubescent outside; stamens 5, cream-color, exserted; anthocarp oblong, rounded at the apex, 3 mm. long, 5-angulate, the angles broad, rounded, smooth, the sulci broad and smooth. *B. Lindheimeri* Standl., *B. tenuifolia* Gray. In arid places, rocky bluffs, open draws in deserts, limestone hills in s. and w. Tex., spring-summer; also s.w. N.M. and Mex.

5. *Boerhaavia purpurascens* Gray. PURPLE SPIDERLING. Annual herb; stems erect, 2-5 dm. tall, much-branched below, the branches slender, brown-punctate, puberulent below, densely viscid-villous or glandular-hirtellous above; leaves opposite, the slender petioles 4-22 mm. long; blades oval to oblong, the uppermost ones lanceolate or linear-oblong, 1.2-3 cm. long, 7-20 mm. broad, rounded or obtuse at the base, broadly rounded to very acute at the apex, often apiculate, entire or subsinuate, thin, bright-green above, paler beneath, often brown-punctate, glabrous or obscurely puberulent; inflorescence cymose-paniculate, sparsely branched, the branches ascending, densely glandular-villous with short hairs; flowers short-pedicellate or sessile, densely cymose-glomerulate at the ends of long slender peduncles; bracts oblong or obovate, equaling or exceeding the fruit, persistent, thin, purplish-red, glandular-villous and long-ciliate; perianth 3-4 mm. long, pink, glandular-punctate; stamens 3, equaling the perianth; anthocarp obovoid, 2.5-3 mm. long, rounded at the apex, acute at the base, stramineous, glabrous, 5-angulate, the angles low, acute, smooth, the sulci broad and smooth. Dry gravelly plains and hill-sides in Trans-Pecos Tex. to s.e. Ariz. and Mex.

6. *Boerhaavia erecta* L. Annual or perennial herb, roughish pubescent or glabrous; stems erect or decumbent, 2-12 dm. tall, simple below or branching at the base, the branches decumbent or spreading, often tinged with red, finely puberulent below, the middle internodes often with brown viscid bands, the uppermost internodes glabrous or minutely puberulent; leaves opposite, the slender petioles 4-40 mm. long, about half as long as the blades; blades mostly broadly ovate-rhombic or deltoid-ovate, 2-8 cm. long, 1.4-5 cm. broad, acute or obtuse and apiculate at the apex, the margins entire to repand or undulate, truncate to rounded or acute at the base, bright-green above, paler beneath or glaucous, usually brown-punctate, the uppermost blades smaller and lanceolate or linear; inflorescence cymose, much-branched, the branches slender, erect or ascending, usually glabrous, rarely with viscid internodes; flowers 2 to 6 in a cluster, on pedicels 1-5 mm. long, irregularly umbellate-cymose or subracemose at the ends of long slender peduncles; bracts minute, linear or lanceolate, reddish, persistent; perianth white or tinged with pink to purple, 1-1.5 mm. long, the tube glabrous or glandular-punctate, the limb campanulate, sparingly pubescent; stamens 2 or 3, exserted; anthocarp green, glabrous, narrowly obpyramidal, 3-4 mm. long, 1-1.5 mm. broad at the truncate apex, 5-angled, the angles obtuse or acute and smooth, the sulci coarsely transverse-rugose. In dry fields, on banks and in cult. grounds, from S.C. to Fla., w. to Ark., Tex. and s. Ariz., s. to Mex., through C.A. to S.A. (Venez. and Col.), W.I., Berm.; spring to fall.

7. *Boerhaavia intermedia* M. E. Jones. Annual herb, young plants tend to be erect, older ones become decumbent; stems erect or procumbent, 2-5 dm. tall, much-branched near the base, the branches slender, elongate, loosely ascending, minutely puberulent, often brown-punctate or tinged with red, the middle and upper internodes usually with viscous rings; leaves opposite, the slender petioles 3-25 mm. long; blades of the lower leaves mostly oval or broadly oblong, the others oblong to ovate or lanceolate to linear, 15-45 mm. long, 3-15 mm. broad, rounded or obtuse at the base, broadly rounded to long-attenuate at the apex, rather thin, glabrous or when young obscurely puberulent, entire or subsinuate, green above, paler or often white beneath, frequently brown-punctate (especially on the upper leaves); inflorescence cymose-paniculate, much-branched, the branches slender and ascending, the internodes usually with viscous rings; flowers on slender unequal pedicels 1-3 mm. long, in few-flowered usually simple umbels at the ends of long slender peduncles; bracts minute, lanceolate, glandular-punctate, persistent; perianth 1.5-2 mm. long, pink or whitish, often glandular-punctate; stamens 2 or 3, equaling or slightly longer than the pericarp; anthocarp narrowly obpyramidal, 2.2-2.7 mm. long, yellowish-green or stramineous, glabrous, truncate at the apex, 5-angulate, the angles smooth and obtuse, the sulci narrow and transverse-rugulose. Dry plains and fields, limestone soils on flats, sandstone hills with some volcanic ash, gypseous and carbonaceous soils in w. Tex. to s.w. Calif., s. to Baja Calif., Dgo., Coah. and Chih.

8. *Boerhaavia Wrightii* Gray. Annual herb; stems erect, 2-6 dm. tall, much-branched, the branches slender or stout, ascending, densely puberulent below and often short-

villous, densely glandular-puberulent and villous above; leaves opposite, the petioles 5-20 mm. long; blades ovate to narrowly oblong or lanceolate, the uppermost ones linear, 2-4.5 cm. long, 3-25 mm. broad, truncate or rounded at the base, obtuse or rounded to long-attenuate at the apex, sinuate or entire, rather thin, green above, paler beneath, brown-punctate, puberulent; inflorescence cymose-paniculate, much-branched, the branches slender, glandular-puberulent to viscid-villous or glandular-hirtellous; flowers on pedicels about 1 mm. long, in dense or somewhat interrupted glabrous racemes; bracts about as long as the fruit, persistent, ovate-orbicular or ovate, abruptly acuminate or long-cuspidate, purplish, short-villous and ciliate; perianth pink, 1.5 mm. long; stamens 3 or 4, included; anthocarp broadly oblong, rounded at the apex, 2 mm. long, over 1 mm. thick, glabrous, usually 4-angulate, the angles broad, acute, smooth, the sulci broad and rugulose. Dry gravelly hillsides, limestone soils, Trans-Pecos Tex. and Nev. to s.e. Calif., s. to Son.

9. *Boerhaavia spicata* Choisy. Annual herb; stems erect or procumbent, 2-6 dm. long, much-branched, the branches slender or stout, puberulent to sparsely glandular-hirtellous or densely viscid-puberulent, often tinged with red; leaves opposite, the slender to stout petioles 5-35 mm. long; blades deltoid-ovate to ovate or lanceolate, 1-4.5 cm. long, 4-25 mm. wide, truncate to obtuse at the base, obtuse to rounded or acute at the apex, margins entire to deeply sinuate, green above, paler beneath, usually brown-punctate, puberulent, viscid-puberulent or glabrate; inflorescence racemose to cymose-paniculate, much-branched, the branches slender, glabrous with viscid internodes; flowers with slender pedicels 1-2 mm. long, in short dense or remotely-flowered racemes; bracts inconspicuous, deciduous, pink, broadly ovate to lanceolate, thin, ciliate; perianth minute, pink or rose-violet to rose-lavender or ivory and whitish, 1-1.5 mm. long, puberulent or glabrous; stamens 1 or 2, included; anthocarp narrowly obovoid, 2.5 mm. long, rounded at the apex, acute to acuminate at the base, stramineous, 5-angulate, the angles thin to thick, acute, the sulci broad, open and rugulose. *B. Torreyana* (Wats.) Standl. In sandy and gravelly soils, plains, hillsides and canyon floors, from cen. Tex. to s.e. Calif., s. to Mex.

13. ABRONIA JUSS. SAND VERBENA

Annual and perennial herbs; stems branched, erect or prostrate, sometimes cespitose and apparently acaulescent, pubescent with viscid hairs, leafy or scapose; leaves opposite, the pair usually unequal, petiolate; blades succulent, entire or sinuate-lobed; flowers perfect, capitate, few to many in each head, the heads long-pedunculate, each subtended by usually 5 distinct scarious bracts; perianth funnel-form to salverform, the slender tube elongate and constricted above the ovary, the limb 5-lobate, withering and often persistent after anthesis; stamens usually 5, with linear-oblong included anthers; ovary ovoid, the style filiform, the stigma fusiform, included; anthocarp turbinate or biturbinate, or fusiform, coriaceous or indurate, eglandular, deeply lobed or winged, the wings or lobes 2 to 5; seed adherent by the testa to the pericarp; one of the cotyledons broad, concave, enclosing the farinaceous or mealy endosperm, the other abortive, making the seed appear monocotyledonous, the radicle exterior, elongate and descending.

A North American genus of about 35 species.

1. Anthocarp fusiform, with 2 to 4 large thin reticulate-veined vertical wings, these completely encircling the body and extended above and below it, the body glabrous or sparsely pubescent, coriaceous, spongy or indurate, often costate between the wings; stems more or less pubescent (*Tripterocalyx*) (2)
1. Anthocarp turbinate or biturbinate, coriaceous or indurate, eglandular, deeply lobed or with 2 to 5 wings; stems villous or puberulent (*Eu-Abronia*) (3)
- 2(1). Perianth about 15 mm. long, the limb greenish; anthocarp 1.5-3 cm. long, the body not costate; peduncles short, always shorter than the subtending leaves; perianth densely glandular-pubescent; bracts 6-10 mm. long, lanceolate to lance-ovate1. *A. micrantha*.
2. Perianth 20-35 mm. long, the limb pink; anthocarp 2-3.5 cm. long, the body 3-costate between the wings; stems sparsely pubescent with short conic or very stout hairs; perianth viscid-puberulent; bracts 12-22 mm. long, ovate or lance-ovate2. *A. carnea*.

- 3(1). Annual; perianth usually purplish-red, sometimes white inside but always reddish outside; bracts 6-12 mm. long, narrow, lanceolate or lance-linear; leaf blades usually longer than broad, ovate or oblong to lanceolate-oblong 3. *A. angustifolia*.
3. Perennials; perianth white or rarely purplish-red; bracts usually large and broad; leaf blades mostly ovate-oblong or deltoid-ovate to lanceolate or elliptic (4)
- 4(3). Anthocarp narrowly turbinate; flowers in heads to 5 cm. in diameter; bracts oblong to obovate, 10-16 mm. long, broadly rounded to acutish; perianth orchid-color, 18-25 mm. long, to 10 mm. wide; leaves ovate to suborbicular 4. *A. Ameliae*.
4. Anthocarp biturbinate; flowers in heads to 3 cm. wide; bracts ovate to oval or obovate, acute or acuminate (5)
- 5(4). Bracts 10-20 mm. long; anthocarp 5-10 mm. long; perianth 10-30 mm. long, the limb white or purplish-red and 7-10 mm. long; leaves deltoid to oblong or lanceolate 5. *A. fragrans*.
5. Bracts 5-8 mm. long; anthocarp less than 7 mm. long; perianth 13-15 mm. long, the limb white and 6-7 mm. long; leaves mostly elliptic or lanceolate 6. *A. Carletonii*.

1. *Abronia micrantha* Torr. Annual herb, much-branched; stems stout, 2-5 dm. long, ascending or procumbent, glaucescent, scabrous or viscid-puberulent with short stout hairs, becoming glabrate; leaves opposite, the petioles 1-5 cm. long; blades lance-oblong to ovate or rhombic-ovate, 2.5-6 cm. long, 1-3 cm. wide, broadly cuneate to truncate at the base, narrowed to an obtuse apex, green above, glaucous beneath, scaberulous when young, becoming glabrate, scaberulo-ciliate; peduncles 1-2.5 cm. long, much shorter than the subtending leaves; bracts lanceolate to lance-ovate, 6-10 cm. long, long-attenuate, glabrous or viscid-puberulent, ciliate; perianth about 15 mm. long, viscid-puberulent outside, the limb 3-4 mm. broad, greenish-white; anthocarp 1.5-3 cm. long, usually 3-winged, retuse or rounded at the apex, the body very thick, loosely spongiöse, coarsely rugose or nearly smooth, glabrous or obscurely puberulent, the thin wings finely veined and scaberulo-ciliate; seed narrowly oblong, 6-8 mm. long, obtusely 3-angled, brown. In sandy soils, from w. Kan. to N.D., Mont., Nev., Ut., n. N.M. and n. Tex.

2. *Abronia carnea* Greene. WINGED SAND VERBENA. Annual herb; stems stout, glabrous below, viscid-pubescent above with short conic hairs, erect or ascending, 2-6 dm. long, sparingly branched; leaves opposite, the petioles 2.5-5 cm. long, as long as the blades; blades oblong to oblong-lanceolate or narrowly ovate, 4-7.5 cm. long, 15-35 mm. broad, obtuse or acutish at the apex, the margin undulate, truncate to rounded or acutish at the base and usually unequal, bright-green above, glaucous beneath, scabrous beneath when young, glabrate in age; peduncles 3-11 cm. long; bracts lanceolate or ovate-lanceolate, acute, 12-22 mm. long, abruptly attenuate, very thin, usually glabrous, ciliate; flowers crowded in a head; perianth bright-pink, 2-3.5 cm. long, gradually enlarged upward, viscid-puberulent or short-villous outside, the limb 8-13 mm. broad, the lobes deeply bilobate; anthocarp conspicuous, 2-3.5 cm. long, the 2 to 4 (usually 3) thin membranous wings sharply veined, completely surrounding the achene, scaberulo-ciliate, suborbicular to oval in outline, the body hard and rigid, 3-costate between each pair of wings, glabrous or obscurely puberulent, the terminal flowers of each head rarely producing an elliptic-fusiform exalate fruit; seed narrowly oblong, 8-9 mm. long, rounded at the apex, acute at the base, pale-brown. *Tripterocalyx cycloptera sensu* Standl., non *Abronia cycloptera* Gray, 1853. In dry places, early spring to late summer; Colo., Tex., N.M., Ariz. and Mex.

3. *Abronia angustifolia* Greene. Annual herb, much-branched; stems ascending or decumbent, 1-5 dm. long, densely viscid-puberulent or short-villous, the branches stout or slender; leaves opposite, the slender petioles 1-7.5 cm. long; blades variable in outline, mostly ovate-oblong to lance-oblong, 1.5-5 cm. long, 5-30 mm. wide, subcordate to narrowly cuneate at the base, obtuse to attenuate at the apex, entire or undulate, rarely shallowly lobed, viscid-puberulent or glabrate, often glaucescent beneath; peduncles 2-7 cm. long, viscid-puberulent or densely viscid-villous; bracts lanceolate or lance-linear, 6-12 mm. long, attenuate, greenish, viscid-puberulent; perianth 15-20 mm. long, viscid-villous or puberulent outside, the limb 6-8 mm. wide, purplish-red; anthocarp

about 6 mm. long, broadly turbinate, deeply lobed, thin-walled, villous above, the lobes acutish, ending above the flat disks; seed lance-oblong, 1.5-2 mm. long, dark-brown or black, lustrous. *A. Torreyi* Standl. In sandy soils, Trans-Pecos Tex. to s. Ariz. and s. into Mex.

4. *Abronia Ameliae* Lundell. AMELIA'S SAND VERBENA. Perennial coarse herb, spreading; stems to 6 dm. high or long, viscid throughout, thick, villous, the hairs variable in length and gland-tipped; leaves opposite, the petioles 1-8.5 cm. long, the lower ones exceeding the blades; blades fleshy, drying chartaceous and brittle, concolorous, ovate to elliptic or orbicular, 3-8 cm. long, 2-6 cm. wide, rounded at the apex, subcordate or subtruncate and decurrent at the base, margins conspicuously sinuate, sparsely viscid-pubescent on both surfaces with short hairs, costae and veins nearly plane; peduncles rather slender, viscid-puberulent, 2.5-12 cm. long; bracts 5 to 7, pale greenish to orchid-color, thin, oblong to elliptic or obovate, 10-16 mm. long, 5-10 mm. wide, the apex broadly rounded and acutish, viscid-villous outside; flowers numerous, forming heads 5 cm. in diameter; perianth orchid-color (tube and limb), 18-25 mm. long, viscid-villous, the tube slender, the limb 1 cm. wide; stamens 5, included; anthocarp narrowly turbinate, 7-9 mm. long, 3-4.5 mm. wide at the apex, 5-winged, not narrowed at the apex, attenuate at the base, the apex rounded or truncate, reticulate-veined, glabrous or with a few scattered hairs at the apex only; seed oblanceolate-oblong, about 25 mm. long. In sandy live oak belts and breaks, in deep sands and along roadsides, from the Rio Grande Plains to the Panhandle, e. to Leon Co., Mar.-June; endemic.

5. *Abronia fragrans* Hook. SNOWBALL, SWEET SAND VERBENA. Perennial herb from an elongate woody root; stems few or numerous, 2-10 dm. long, erect or procumbent, branched, often whitish in color, viscid-puberulent or villous below, rarely glabrate, densely viscid-villous above; leaves opposite, 2-9 cm. long, variable in shape, mostly ovate-oblong or narrowly deltoid-ovate, truncate to rounded or rarely subcordate at the base, rounded or acute at the apex, viscid-puberulent to glabrous; bracts 1-2 cm. long, 4-12 mm. wide, oval-ovate to obovate, acute or acuminate; flowers in heads, numerous in each involucre, fragrant, nocturnal; perianth viscid-puberulent, 1-3 cm. long, the tube gradually enlarged upward, white tinged with pink or lavender, or sometimes greenish to reddish; anthocarp 5-10 mm. long, longer than wide, usually biturbinate and pubescent, narrowing both ways from the middle, the lobes narrowly 5-winged, the wings not prolonged over the top or crested or coarsely wrinkled; seed obovate, 2.5-3 mm. long, dark-brown, lustrous. *A. robusta* Standl., *A. speciosa* Buckl., *A. texana* Standl. Dry ground, grows wherever sandy soils are found in Tex., especially from Rio Grande Plains to the Trans-Pecos, Mar.-Aug.; from S.D. to Ida., s. to Tex. and Mex.

Selections for color made by Edward Lasater of Falfurrias, who by publications made this species a favorite among floriculturists and horticulturists.

6. *Abronia Carletonii* Coult. & Fish. Perennial herb; stems 2-5 dm. tall, few to many, ascending or procumbent, stout or slender, whitish, viscid-puberulent; leaves opposite, the petioles 1-2 cm. long, shorter than the blades, puberulent; blades 1-4 cm. long, 4-10 mm. wide, rounded to cuneate at the base, thick and succulent, puberulent or glabrous, concolorous; peduncles slender, 2-5 cm. long, viscid-puberulent; bracts 5-8 mm. long, ovate or oval-ovate, acute or attenuate at the apex, scarious; perianth whitish or rose-colored to white, viscid-puberulent or short-villous, the tube slender, the limb 6-7 mm. broad, white; anthocarp biturbinate, 4-5 mm. long, the lobes compressed and coarsely reticulate-veined, narrowed but sometimes subtruncate above and compressed at the apex, brownish-olivaceous or stramineous; seed elliptic-oblong, 2 mm. long, nearly black, lustrous. *A. Nealleyi* Standl. Open dry ground in the Trans-Pecos; also e. Colo.

FAM. 64. BATACEAE MEISN.

SALTWORT FAMILY

Maritime somewhat woody-succulent dioecious plants; leaves opposite, exstipulate, fleshy, semiterete, linear to clavate, smooth and glabrous, entire, with a small basal loose flange; flowers small, crowded in axillary sessile or short-peduncled conelike spikes; *staminate spikes* with persistent imbricate scales each subtending a flower; calyx cup-shaped, 2-lobed; corolla absent; stamens 4 or 5, inserted at base of calyx; filaments thick,

alternating with staminodia; *pistillate inflorescence* conelike, 4- to 12-flowered, the scales deciduous, the flowers each consisting of merely a 4-celled ovary with a sessile stigma; ovule 1 in each cell; fruit a fleshy cone.

A monotypic family. Also spelled Batidaceae.

1. BATIS L.

Characters of the family. Monotypic. A second species of dubious merit has been described recently from the Old World.

1. *Batis maritima* L. VIDUILLUS. Plant pale-green, shrublike, strong-scented, with spreading or prostrate often creeping stems to 15 dm. long, the stem commonly rooting at tip and forming large colonies; leaves curved, to 25 mm. long; spikes ovoid-cylindric, 5-10 mm. long; bracts reniform to suborbicular, often apiculate; fruit ovoid to oblong-ellipsoid, 1-2 cm. long, short-stalked, drooping. In salt flats and along muddy flats of the seashore in s. Tex., June-Aug.; widespread on coastal strands in this hemisphere and in H.I.

FAM. 65. PHYTOLACCACEAE R. BR.

POKEWEED FAMILY

Herbs, shrubs, vines or trees, with alternate entire or somewhat undulate mostly exstipulate leaves and perfect or unisexual flowers; calyx 4- or 5-parted, its segments imbricated in bud; petals wanting; stamens as many as the calyx segments and alternate with them, sometimes more numerous, hypogynous or epigynous in *Agdestis*, the filaments distinct or united at base; anthers 2-celled, the sacs longitudinally dehiscent, often nearly separated; ovary several-celled in most of the genera; fruit various.

About 100 species in 12 or more genera, mostly in the tropics.

- 1. Ovary inferior or mostly so; leaves cordate at base; plants scandent; fruit dry, 1-seeded 1. *Agdestis*, p. 600.
- 1. Ovary superior; leaves not cordate; plants usually shrubby (2)
- 2(1). Stems woody, persistent; branches spinose; flowers in abbreviated racemes mostly less than 1 cm. long 2. *Phaulothamnus*, p. 601.
- 2. Stems more or less herbaceous, from a perennial rootstock; branches not spinose; flowers in conspicuous elongated lax racemes or spikes (3)
- 3(2). Flowers subsessile, appressed to the rachis; fruit dry 3. *Petiveria*, p. 601.
- 3. Flowers noticeably pedicellate, not appressed to rachis; fruit baccate (4)
- 4(3). Fruit simple; stamens 4; plant rarely more than 1 m. tall 4. *Rivina*, p. 601.
- 4. Fruit compound; stamens 6 or more; plant much more than 1 m. tall 5. *Phytolacca*, p. 601.

1. AGDESTIS DC.

A monotypic American genus. Considered by some authors to be a member of the Basellaceae; by others to comprise a separate family, Agdestidaceae. Frequently cultivated.

1. *Agdestis clematidea* DC. HIERBA DEL INDIO, ROCKROOT. Plants scandent, climbing to 15 m. or more, the stems copiously branched and mostly herbaceous; roots large, gray, turbinate; leaves long-petioled, ovate to reniform, broadly cordate to somewhat truncate at base, obtuse and apiculate at apex, to about 9 cm. long and wide; panicles many-flowered, mostly about 1 dm. long; flowers perfect, white or greenish-white, stellate, about 12 mm. across, with a slight fetid odor; sepals 4 or 5, oblong to oval, 4-6 mm. long, spreading, persistent and becoming papery; stamens 14 to 20, the filaments slender and the anthers narrow; ovary inferior or mostly so, the style short and the stigmas narrow and introrse; achene turbinate, 1-seeded, the elliptic wings about 6 mm. long and 3 mm. wide. Waste places in e.-cen. Tex., July-Sept.; also Fla. and the Am. trop.

2. PHAULOTHAMNUS GRAY

A monotypic American genus. Placed by some authors in the segregate family Achatocarpaceae.

1. *Phaulothamnus spinescens* Gray. SNAKE-EYES, PUTIA. A diffusely branched erect glabrous shrub to 25 dm. tall, with gray spreading spinescent branches; leaves alternate, deciduous (in ours), spatulate to oblanceolate, rounded to somewhat retuse and mucronate at apex, to 35 mm. long and 12 mm. wide above the middle; flowers sessile, small, unisexual, as many as 12 in short bracteate racemes; calyx segments 4, imbricated and persistent, suborbicular to obovate, concave, with scarious margins, about 2 mm. long; stamens about 12; ovary 1-celled; stigmas 2, filiform; fruits globose, slightly compressed, thin-coriaceous, juicy, transparent, indehiscent, 1-seeded, about 5 mm. in diameter. In clayey soils in s. Tex., Aug.-Sept.; also n. Mex.

3. PETIVERIA L.

A monotypic American genus. Placed by some authors in a separate family, Petiveriaceae.

1. *Petiveria alliacea* L. GARLIC-WEED, HERBA DE LAS GALLINTAS. Perennial erect herbs with the odor of garlic, to 1 m. high; stem slender, ascending or erect, more or less herbaceous, simple or sparsely branched, puberulent to glabrate; leaves short-petiolate, alternate, elliptic to rarely obovate, essentially glabrous, acute to acuminate at apex, to 15 cm. long and 7 cm. wide; stipules minute; spikes to 4 dm. long, bracted, puberulent; flowers subsessile, perfect; calyx 4-parted, the segments linear, 3-4 mm. long, spreading and whitish in flower, erect and greenish in fruit; stamens 4, the filaments subulate, the anthers linear and deeply cleft at apex and base; achenes about 8 mm. long, cuneate, striate, apically notched, appressed to the axis of the spike, the 6 terminal reflexed bristles about 4 mm. long; seed solitary, linear. In dense thickets and open woods in extreme s. Tex., June-Aug.; also Fla. and trop. Am.

4. RIVINA L.

About 5 species in tropical and warm-temperate regions. Placed by some authors in the Petiveriaceae.

1. *Rivina humilis* L. PIGEON-BERRY, ROUGE-PLANT, CORALITO. Stems from a thick perennial rootstock, glabrate or rarely prominently pubescent, erect or becoming vinelike with spreading branches, to 15 dm. tall, usually much smaller; leaves petiolate, alternate, bright-green, ovate to ovate-lanceolate, acute to acuminate at apex, broadly rounded to truncate at base, to 15 cm. long and 9 cm. wide, commonly undulate; pedicels 2.5-4 mm. long, with a minute bracteole just beneath the calyx; flowers white, greenish or rose-color, in axillary or terminal racemes; sepals 4, cuneate to linear-oblong, 2-2.5 mm. long, partly enclosing the simple fruit or reflexed at maturity; stamens 4; berry red or orange-color, 2-3.5 mm. in diameter. *R. laevis* L., *R. portulacoides* Nutt. In moist or alluvial soils, chaparral hills, usually in partial shade of trees or shrubs, in cen., s. and w. Tex., rare eastw., Mar.-Oct.; from Fla. to Tex. and Ark., throughout trop. Am.

Two strikingly distinct forms sometime occur together—plants with reddish-purple flowers and red fruits; plants with white flowers and deep orange-color fruits. The red fruits contain a dark-red juice that yields a dye.

5. PHYTOLACCA L.

About 35 species in tropical and warm-temperate regions.

1. *Phytolacca americana* L. POKEWEEED, POKEBERRY. Plant glabrous, with an unpleasant odor and a large poisonous perennial rootstock (to 15 cm. in diameter) from which arise stout purplish leafy stalks to 3 m. tall; leaves typically elliptic-lanceolate but sometimes ovate-lanceolate, cuneate or sometimes broadly rounded at base, acuminate at apex, to about 25 cm. long and 1 dm. wide; pedicels about 1 cm. long, with 1 or more bracteoles

about the middle; sepals 5, white or pinkish, suborbicular, petaloid, 2-3 mm. long; stamens and styles 10, the ovaries green; berries in long lax racemes, dark-purple, 8-10 mm. in diameter. *P. decandra* L., *P. rigida* Small. Throughout most of Tex. in rich low ground, especially in recent clearings and along roadsides, July-Oct.; from Fla. to Tex., n. to N.E., s. Que., N.Y. and s. Ont.

The very young sprouts, when *properly* and *safely* prepared, are used as a potherb; otherwise, they should not be eaten. *Phytolacca rigida* is described as having permanently erect, not nodding, fruiting racemes and a berry longer, not shorter, than its stalk.

FAM. 66. AIZOACEAE RUDOLPHI CARPET-WEED FAMILY

Annual or perennial often succulent herbs with stems mostly prostrate or ascending; leaves opposite or whorled, entire, with the base of the petioles sometimes dilated; stipules none or (when present) scarious; flowers solitary or clustered in the axils, regular and perfect; calyx 4- or 5-lobed or -parted, the tube free or adnate to the ovary; petals none (in ours); stamens few to many, inserted on the floral cup or hypogynous, the 2-celled anthers oblong or linear; ovary 1- to 20-celled, superior or only half-superior in *Sesuvium*; styles as many as the cells of the ovary; fruit a thin-walled capsule, dehiscent loculicidally or septicidally; seeds mostly numerous.

A family of 130 or more genera and about 1200 species, mainly of the Southern Hemisphere and tropical regions.

- 1. Leaves whorled; capsule dehiscent by valves (2)
- 1. Leaves opposite, commonly unequal; capsule circumscissile (3)
- 2(1). Plants glabrous; flowers with a filiform pedicel; sepals distinct to base; seeds without a strophiole1. *Mollugo*, p. 602.
- 2. Plants tomentulose; flowers essentially sessile; calyx cleft only to middle; seeds with a strophiole2. *Glinus*, p. 603.
- 3(1). Stipules present; ovary 1- or 2-celled; seeds several .3. *Trianthema*, p. 603.
- 3. Stipules none; ovary 3- to 5-celled; seeds numerous ...4. *Sesuvium*, p. 604.

1. MOLLUGO L. CARPET-WEED

Annual nonsucculent profusely branched herbs; leaves rosulate, verticillate or opposite; flowers small, perfect, apetalous, axillary or cymose, with a long filiform pedicel; calyx 5-parted, persistent, the sepals scarious-margined; stamens 3 to 5, rarely more, hypogynous; ovary 3-celled, superior; capsule ovoid to ellipsoid, thin-walled, 3-valved, loculicidally dehiscent; seeds numerous, not strophiolate.

About 20 species, mostly natives of tropical and subtropical regions.

- 1. Stem leaves all linear; sepals with reticulate nerves; stamens usually 5; seeds 0.4 mm. long or less, finely reticulate1. *M. Cerviana*.
- 1. Stem leaves with some spatulate or narrowly oblanceolate; sepals with 3 parallel strong nerves; stamens 3 or 4; seeds 0.5 mm. long or more, provided with several parallel ridges2. *M. verticillata*.

1. *Mollugo Cerviana* (L.) Sér. **THREADSTEM CARPET-WEED.** Annual herb with numerous ascending filiform branches to 2 dm. long; leaves glaucous; basal leaves forming a rosette, linear-spatulate to narrowly oblanceolate, to 15 mm. long and 3 mm. or more broad; stem leaves whorled, linear, to 2 cm. long and 1.5 mm. broad; flowers verticillate, with capillary pedicels often longer than the leaves; sepals elliptic to elliptic-obovate, about 1 mm. long, reticulate-nerved; stamens usually 5; capsule subglobose, 1.5-1.8 mm. in diameter; seeds finely reticulate. A weed of warm-temp. and trop. regions that occurs in sandy fields of s. Tex. and on dunes and in dry canyons of the Trans-Pecos, Aug.-Sept.

In Texas, this plant occurs in sandy desert brushlands usually distant from habitations, and it has all the appearance of being a native species.

2. *Mollugo verticillata* L. **INDIAN CHICKWEED.** Annual herb, glabrous throughout; stems dichotomously branched, prostrate or ascending, to 2 dm. long; leaves verticillate, 3 to

6 in a whorl, spatulate to narrowly oblanceolate or sometimes linear, obtuse at apex, narrowed to a short petiole, to 3 cm. long and 1 cm. wide; flowers 2 to 5 from each node, with filiform pedicels to 14 mm. long; sepals oblong or elliptic, to 2.5 mm. long and 1 mm. broad; stamens usually 3; capsule ovoid to ellipsoid, slightly exceeding the sepals; seeds minute, reniform, dark-reddish-brown, smooth and shining, ridged along the back and sides or rarely without ridges. In waste places and cult. grounds, open sandy woods and brushlands, and on dunes throughout Tex., year around; throughout temp. and trop. Am.

2. GLINUS L.

Annuals with the general habit of *Mollugo*, pubescent or glabrous; leaves verticillate, unequal, entire; flowers in dense glomerules in the leaf axils of upper nodes, on short peduncles; calyx free from the ovary, the 5 sepals distinct; petals none; stamens 3 to 10 or rarely more; ovary superior; fruit a loculicidal 3-valved capsule; seeds numerous, minute, smooth or tuberculate, with a distinct strophiole, the funiculus large, coiled about the seed.

A genus of 12 species, widely distributed in tropical and warm temperate regions.

1. Seeds blackish-brown, tuberculate 1. *G. lotoides*.
 1. Seeds reddish or light-brown, smooth or sometimes pebbly
 2. *G. radiatus*.

1. *Glinus lotoides* L. Plants cinereous-tomentose with branched hairs; stems diffusely branched from the base, prostrate or ascending, to about 35 cm. long; leaves pseudoverticillate, narrowly to broadly obovate, rounded or abruptly acute at the apex, narrowed below to a slender petiole of about equal length, to 25 mm. long and 15 mm. broad; flowers stoutly pedicellate or essentially sessile, in axillary glomerules; sepals lanceolate, stellate-tomentose, to 7 mm. long and 3 mm. broad; stamens 5 to 10; capsule ellipsoid, to 4.5 mm. long; seeds black, tuberculate. Waste places in e.-cen. Tex.; an Old World species that has become introd. in various parts of N.A.

2. *Glinus radiatus* (R. & P.) Rohrb. Annual herb with stellate-tomentose foliage; stems to 5 dm. long; leaves with slender petioles to 6 mm. long, elliptic to obovate or broadly spatulate, rounded to acute or apiculate at apex, to 25 mm. long and 15 mm. wide; flowers in clusters of 10 or more; calyx lobes oblong-elliptic to lanceolate, about 2.7 mm. long, stellate-tomentose; stamens 3 to 5, shorter than the calyx lobes; filaments filiform, about 1 mm. long; anthers about 0.5 mm. long; capsule ellipsoid, 3-3.5 mm. long; seeds numerous, brown, smooth and shining, sometimes pebbly, about 0.4 mm. long. *G. Cambessedesii* Fenzl. In muddy or sandy soils in s. and e. Tex., Apr.-Oct.; from Tex. through Mex. and the W.I. to S.A.

3. TRIANTHEMA L.

About 20 species, with all but ours in tropical and temperate regions of the Old World.

1. *Trianthema Portulacastrum* L. HORSE PURSLANE, VERDOLAGA BLANCA. Annual succulent herb, glabrous, branching from the base; branches decumbent, sometimes to 1 m. long; leaves opposite, in unequal pairs, broadly obovate to suborbicular-obovate or the smaller ones narrower, rounded to notched or apiculate at the apex, the blades to 4 cm. long and 3 cm. wide, with smaller ones on the axillary branchlets; petioles about equaling the blade, dilated at the base; stipules scarious, entire; flowers sessile and usually solitary in the leaf axils, partly concealed in the petiolar sheath; calyx lobes 5, ovate-lanceolate to lanceolate, concave, about 2.5 mm. long, pinkish-purple within, with a dorsal mucronation near the apex; petals none; stamens 5 to 10, perigynous, alternating with the calyx lobes when the same number; ovary superior; capsule about 4 mm. long, cylindrical, somewhat curved, the winged appendages at the apex prominent; seeds reniform, black, rough, about 2 mm. in diameter. In sandy soils of thickets, on dunes and in waste grounds along streams, mostly in s. and w. Tex., May-Oct.; from Fla. to Calif., s. through Latin Am.; also Old World trop.

4. SESUVIUM L. SEA PURSLANE

Annual or perennial succulent herbs or undershrubs, with prostrate or ascending to suberect stems and branches; leaves opposite, fleshy, without stipules, the petiole often dilated and sometimes connate at the base; flowers solitary in the leaf axils, sessile or with short stout pedicels; calyx tube turbinate, adnate below to the ovary; calyx lobes 5, usually horned on the back near the apex; petals none; stamens 1 to many, perigynous, sometimes slightly united into phalanges, the filaments filiform; ovary half-superior, 2- to 5-celled with as many styles; capsule membranaceous, 2- to 5-celled, ovoid, circumscissile; seeds stalked, usually many in each cell, minute, smooth or rarely rugose.

About 10 species widely distributed but mainly maritime or in saline soils in warm temperate, tropical or subtropical America.

1. Stamens 5 (2)

1. Stamens numerous (3)

2(1). Seeds smooth; in southeast corner of Texas1. *S. maritimum*.

2. Seeds conspicuously rugose; in extreme south Texas ...2. *S. trianthemoides*.

3(1). Flowers all distinctly pedicelled; stems rooting at nodes3. *S. Portulacastrum*.

3. Flowers both sessile and with stout inconspicuous pedicels; stems not rooting at nodes (4)

4(3). Distribution in west and northwest Texas; leaves mostly oblanceolate; plants usually drying light-brown4. *S. verrucosum*.

4. Distribution primarily on or near the coast in south Texas (*S. erectum* extending inland along the Rio Grande in Trans-Pecos region); plants drying blackish or dark-gray (5)

5(4). Plants prostrate to decumbent densely covered with crystalline globules; leaves sessile, mostly all linear-oblong5. *S. sessile*.

5. Plants typically erect to erect-spreading, sometimes decumbent, sparsely covered with crystalline globules; leaves mostly oblanceolate .6. *S. erectum*.

1. *Sesuvium maritimum* (Walt.) B.S.P. Plant glabrous and succulent throughout; stems prostrate, procumbent to ascending at tips, freely branched, sometimes forming mats to 2 m. in diameter; leaves spatulate to narrowly oblanceolate or obovate, rounded to obtuse at the apex, tapering at base to a short clasping petiole, to about 25 mm. long; flowers usually solitary in leaf axils, sessile; calyx lobes ovate to ovate-oblong, obtuse, with a subapical dorsal prolonged appendage, pink or purplish within, 2-3 mm. long; stamens 5; capsule ovoid, about 4 mm. long; seeds brownish-black, smooth and somewhat iridescent, 1 mm. long or less. On sea beaches and low sandy banks near and along the coast in s.e. Tex., flowering the year around; from N.Y. to Fla. and Tex.; also W.I.

2. *Sesuvium trianthemoides* Correll. Plant annual, fleshy, brown when dry, branched from the base, the herbage with scattered large crystalline globules; stems to 35 cm. long or more, the internodes 4-5 cm. long; leaves opposite, oblanceolate to spatulate, obtuse at apex, at least 3 cm. long (including the petiole) and 1 cm. wide above the middle, tapered below into a conspicuous petiole; petiole broadly scarious-winged at base and clasping; flowers solitary in the axils of leaves and branches, sessile; calyx lobes triangular-ovate, subacute at apex, strongly nerved, about 3.5 mm. long, with hyaline margins, the dorsal apical appendage small; stamens 5, with slender filaments about 1 mm. long; ovary ovoid, 2-celled; styles 2, about 0.5 mm. long; capsule ovoid-ellipsoid, pointed at apex, 4-5 mm. long, circumscissile; seeds about 10 in each capsule, about 1.5 mm. long, conspicuously rugose with brownish granular irregular ridges, with additional light patches extended in irregular lines from the hilum. In dunes of s. Tex., June-Aug.; endemic.

3. *Sesuvium Portulacastrum* L. CENICILLA. Glabrous fleshy perennial herb; stems trailing, much-branched, often rooting at the nodes, sometimes forming patches 2 m. across; leaves narrowly oblong to oblanceolate or elliptic-obovate, to 6 cm. long and 25 mm. broad, obtuse-rounded to abruptly acute at apex, tapered into a clasping base (with these commonly overlapping); flowers pedicelled, solitary in the leaf axils; calyx lobes

broadly ovate-lanceolate to lanceolate, to 1 cm. long and 6 mm. broad, hooded, pink-purple within, often strongly veined, with a subapical dorsal prolonged appendage; stamens numerous, the filaments about 5 mm. long, the oblong-elliptic anthers about 1 mm. long; ovary ovoid-globose, about 3 mm. long and thick; styles sometimes distinct to base; capsule conic, about 1 cm. long and 5-6 mm. in diameter; seeds black, smooth and lustrous, 1.2-1.5 mm. long. On beaches and in sand or clay dunes along the coast in Tex., rarely inland, flowering the year around; from Fla. to Tex., s. to S.A.; also the Old World trop.

4. *Sesuvium verrucosum* Raf. Freely branched prostrate perennial herb; stems to 9 dm. long, smooth and usually more or less finely verrucose with crystalline globules, when dry brownish-tan to light-grayish-tan in color; leaves oblanceolate to oblong-ovate or sometimes with some linear-oblong, rounded to somewhat subacute at apex, tapered into an expanded scarious clasping base, to 3 cm. long and 1 cm. wide above the middle, those of the branchlets mostly shorter than the internodes; flowers subsessile or with a short stout pedicel; calyx lobes broadly ovate-elliptic to ovate-lanceolate, 4.5-7 mm. long, hooded, with a subapical dorsal prolonged appendage; stamens numerous; capsule conic, about 5 mm. long and 3 mm. in diameter; seeds black, smooth and lustrous, about 1 mm. long. In saline and alkaline soils about lakes, in creek bottoms and on mud flats and clay dunes in w. and n.w. Tex., Apr.-Aug.; a plant of the interior from Mo. and Ark. to Tex., N.M., Ariz. and Calif.; also n. Mex.

5. *Sesuvium sessile* Pers. Succulent sprawling much-branched perennial that spreads by rhizomes, forming mats to 6 dm. or more in diameter, the herbage densely covered and almost completely concealed by crystalline globules, when dry dark-gray to almost blackish; stems prostrate and ascending at tips; leaves essentially sessile, linear to narrowly linear-oblong or some narrowly oblanceolate, obtuse at apex, to 3 cm. long, mostly less than 3 mm. wide, those of the branchlets longer than the internodes; flowers sessile or with short stout pedicels; calyx lobes mostly oblong-elliptic, obtuse, 4-7 mm. long, the outer surface densely covered with crystalline globules, pink within, with a subapical dorsal prolonged appendage; stamens numerous, the anthers pink; capsule triangular-ovoid, about 4 mm. long and 3 mm. wide at base; seeds dark-brown, about 1 mm. long. In moist saline soils about lakes and lagoons, on flats and clay dunes and in open grassy woodlands in extreme s. Tex., very rare inland, flowering the year around; from Tex. to Calif., s. to S.A.

6. *Sesuvium erectum* Correll. Perennial, typically erect to erect-spreading or sometimes decumbent, more or less adorned throughout with crystalline globules; when dry brownish-black to dark-gray; stems to 5 dm. or more long; leaves linear-oblong to oblanceolate or spatulate, obtuse at apex, tapered below to a clasping base, to 4 cm. long and 8 mm. wide; flowers numerous, in the axils of leaves and branches, sessile or with pedicels rarely to 5 mm. long; calyx lobes broadly elliptic to ovate-lanceolate, obtuse to subacute at apex, rose-purple within, 4-8 mm. long, with a subapical dorsal appendage about equal to or greatly exceeding the sepal apex; styles 3 to 5, conspicuous, typically black when dry; stamens numerous; capsule ovoid, blunt and truncate at apex, about 5 mm. long and 3 mm. in diameter; seeds black, plump, about 1 mm. long. Along canals, on shell deposits, and about ponds and in depressions in dunes and sand hills on and near the coast in s. Tex. with an extension inland along the Rio Grande to the Trans-Pecos, Apr.-July; undoubtedly also in n.e. Mex.

FAM. 67. PORTULACACEAE JUSS.⁵⁵

PURSLANE FAMILY

Annual or perennial herbs or rarely shrubs, glabrous or rarely pilose at the nodes, more or less succulent; leaves opposite, alternate or in basal rosettes, entire, often fleshy; stipules scarious, lacerate or modified into hairs, or none; flowers solitary, racemose, paniculate or cymose, terminal or axillary, perfect, regular or nearly so; sepals (sometimes interpreted as bracts) usually 2, persistent or deciduous, scarious or herbaceous; petals (sometimes called sepals) usually 4 or 5, often fugacious or dehiscent; stamens inserted with the petals, sometimes adnate at the base, of the same number as the petals or usually more; filaments filiform; anthers 2-celled, dehiscent longitudinally; ovary 1-celled, superior

⁵⁵ Ref.: Percy Wilson in N. Am. Fl. 21: 279-336. 1932.

or (in *Portulaca*) partly or wholly inferior; styles 2 to 7, more or less united; ovules 2 to many, on a central or basal placenta; fruit a loculicidal or circumscissile capsule, the valves as many as the styles; seeds 3 to many or (by abortion) 1 or 2, mostly round-reniform, compressed, lenticular, the testa often crustaceous and sometimes strophiolate.

A family of at least 19 genera and more than 350 species that are worldwide in distribution.

1. Ovary partly or wholly inferior; capsule circumscissile . . . 1. *Portulaca*, p. 606.
1. Ovary superior; capsule valvate, splitting from the top downward (2)
- 2(1). Sepals deciduous; seeds wingless 2. *Talinum*, p. 608.
2. Sepals persistent (3)
- 3(2). Plants shrubby, the base and older stems woody and dry; capsules with 6-valved endocarp; seeds uncinatate or arcuate; distribution in Trans-Pecos Texas 3. *Talinopsis*, p. 610.
3. Plants herbaceous throughout, succulent; capsules without endocarp; seeds orbicular; distribution in eastern third of Texas 4. *Claytonia*, p. 610.

1. PORTULACA L.⁵⁶ PURSLANE

Diffuse or ascending annual or perennial succulent herbs; leaves alternate or opposite, flat or terete, often in whorls around the flowers; stipules scarious or none, or reduced to hairy tufts; flowers perfect, solitary or crowded at the top of the stem and branches, of various colors; calyx 2-cleft; petals 4 to 6, usually 5; stamens 8 to many, inserted at the base of the petals; ovary partly or wholly inferior; styles 3 to 9; ovules numerous; capsule 1-celled, membranous, circumscissile, many-seeded; seeds reniform or cochleate, with a smooth or minutely tuberculate or sometimes echinate testa.

About 200 species of world-wide distribution, mostly tropical and subtropical.

1. Lower valve of capsule with an expanded circular membranaceous wing just below its rim; annual 1. *P. umbraticola*.
1. Capsule rim without a subtending wing (2)
- 2(1). Leaf axils and inflorescence glabrous or inconspicuously short-pilose; leaves obovate-cuneate to spatulate, thick but flat; annuals (3)
2. Leaf axils and inflorescence conspicuously villous with long white kinky hairs; leaves linear to narrowly oblanceolate, terete to subterete (4)
- 3(2). Seeds usually iridescent, when viewed at low magnification with minute ridges converged into peglike projections that are not crowded, very nearly to fully 1 mm. in greatest diameter; style lobes usually 3 or 4 . . . 2. *P. retusa*.
3. Seeds dark-brown, rounded tuberculate, the tubercles crowded, usually distinctly less than 1 mm. in diameter; style lobes usually 5 or 6 3. *P. oleracea*.
- 4(2). Plant perennial, the taproot and roots tuberous-thickened; stems mostly strictly erect or ascending, more or less woody at base; petals copper-colored or bronze, 7-12 mm. long; capsules mostly more than 3.5 mm. in diameter 4. *P. suffrutescens*.
4. Plants annual, the taproot not tuberous-thickened; stems mostly decumbent or spreading-ascending; petals seldom more than 6 mm. long; capsules less than 3.5 mm. in diameter (5)
- 5(4). Petals yellow to bronze, less than 3 mm. long; capsules 2 mm. or less in diameter 5. *P. parvula*.
5. Petals red-purple, 3 mm. or more long; capsules more than 2 mm. in diameter 6. *P. mundula*.

1. *Portulaca umbraticola* H.B.K. A glabrous prostrate to erect or ascending fleshy annual, with angled stems; leaves rather few, the blades flat, sessile, the lower spatulate

⁵⁶ Ref.: C. Diego Legrand in An. Mus. Hist. Nat. (Montevideo) 7: 1-147. 1962.

or obovate and obtuse to rounded, the upper oblanceolate to oblong and often acute, 1-3 cm. long, 2-11 mm. broad; flowers clustered at the ends of the branches; sepals ovate, obscurely carinate; corolla yellow or orange and partly red; petals spatulate or obovate, acutish or cuspidate; stamens 7 to 27; styles 3 to 6; capsule circumscissile at the middle or above, the rim crowned by a narrow wing, the lid flattish; seeds gray, tuberculate. *P. lanceolata* Engelm., *P. coronata* Small. In sandy soils in prairies, mesquite thickets and salt marsh areas throughout most of Tex., Mar.-Nov.; from Tex. to Ariz. and Baja Calif.; also Ga., Cuba and Jam.

2. *Portulaca retusa* Engelm. Plant glabrous, rather stout, annual, similar to *P. oleracea* in habit but rather more slender and open; leaves cuneate to cuneate-obovate, mostly retuse or emarginate at apex, some of them rounded or nearly truncate at apex, to 25 (rarely 35) mm. long and 1 (rarely 2) cm. broad above the middle; sepals (in bud) obtuse, carinate-winged; corolla yellow, usually 2.5-4 mm. long; stamens 7 to 19; style lobes 3 or 4; capsules 5-6 mm. high; seeds about 1 mm. wide, iridescent, conspicuously echinate-tuberculate or sharply granulate. In gravelly soils, on clay mounds and ledges in s. and w. Tex., June-Sept.; from Ark. and Tex. to Ut. and Ariz.

3. *Portulaca oleracea* L. PURSLANE, VERDOLAGA. Glabrous fleshy annual, with often stout prostrate or ascending branches, the branches spreading radially and 0.6-3 dm. or more long; axillary hairs few and inconspicuous; leaves alternate, the flat blades obovate-cuneate or spatulate, 6-30 mm. long, 0.2-13 mm. broad, occasionally larger, rounded or nearly truncate at the apex; buds flattened, acute; flowers clustered or solitary, sessile, the hairs surrounding them inconspicuous or wanting; sepals broadly ovate to orbicular, 2.8-4.5 mm. long, 2.8-3.8 mm. broad, keeled, acutish; corolla yellowish; petals 3-4.6 mm. long, 1.8-3 mm. broad; stamens 6 to 10; style lobes 4 to 6; capsule 5-9 mm. high, circumscissile at or about the middle; seeds black, 0.7-0.8 mm. (rarely 1 mm.) wide, granulate. On grassy slopes, dunes and in salt marshes and dry soils of perennial pools throughout most of Tex., May-Nov.; in temp. and trop. regions of the world.

4. *Portulaca suffrutescens* Engelm. Erect or ascending herb to 3 dm. high, with creeping tuberous-thickened rootstocks and often rather few hairs in the axils of the leaves, sometimes rather woody at the base; leaves alternate, short-petioled; blades terete, linear, to 25 mm. long and 1.8 mm. broad, often persistent; flowers terminal, in clusters of 2 or 3, surrounded with rather long pale-brown hairs and an involucre of 6 to 8 leaves; sepals broadly triangular-ovate or suborbicular, 6-7 mm. long, 5-8 mm. broad; corolla copper- or buff-colored; petals obcordate or emarginate, 7-12 mm. long; stamens numerous; style lobes 5 or 6; capsule with a stipe about 2 mm. long, subglobose, 3.5-4.2 mm. in diameter, circumscissile a little below the middle, the upper half vernicose and greenish-tan; seeds black, somewhat iridescent, 0.5 mm. wide, rounded-tuberculate. In sandy gravelly soils along streams and on flats in the Trans-Pecos, with an apparently disjunct station on the Edwards Plateau (Colorado River, Austin, Travis Co.), May-Sept.; from Ark. and Tex. to Ariz. and Mex.

5. *Portulaca parvula* Gray. Plant prostrate or ascending from a slender annual root; stems slender, to 15 cm. long, 1-2 mm. thick, loosely branched; leaves to 13 mm. long and 2 mm. broad, succulent, somewhat compressed; leaf axils with white hairs 3-7 mm. long; inflorescence terminal, a capitate cluster of 2 to 10 flowers, after falling of involucre bracts 3-6 mm. in diameter; involucre bracts 3-8 mm. long; sepals becoming reddish, about 2.5 mm. long; petals yellow, orange or bronze, 2-2.5 mm. long; capsule 1.5-2 mm. thick, the basal portion saucer-shaped and with a stipe 1-1.5 mm. long; seeds about 0.5 mm. in diameter, brownish at first but becoming black when mature, covered with minute crowded flattened stellate roughenings. In sandy or gravelly open or brushy areas in cen. and w. Tex., Mar.-Nov.; from Okla. and Tex., w. to s.e. Ariz. and n. Mex.

6. *Portulaca mundula* I. M. Johnst. CHISME. Plant herbaceous, leafy from a taproot, often thickened, apparently nearly always emerging annually; stems 3 to 6, prostrate or laxly decumbent to laxly ascending, 5-15 cm. long, with upward-directed branches (1-5 cm. long) above the middle which are succulent with decidedly abbreviated internodes; leaves fleshy, alternate, often very numerous and congested, 5-15 mm. long, 0.5-1.5 mm. wide, ascending, linear to oblanceolate-linear; hairs of the leaf axils conspicuously kinky, woolly, often white, often 5-7 mm. long and as long as the shortest leaves or longer; flowers terminal, subsessile, 2 to 8 aggregated in villous heads; leaves of the involucre 6 to 10, linear, 5-12 mm. long, succulent; the calyx on upper part of capsule

often about 4 (rarely to 6) mm. long, the lobes triangular to triangular-oblongate; petals purple, obovate, often to 6 mm. or rarely to 7.5 mm. long, 3-4.5 mm. wide, retuse at the apex; stamens often 10 to 15, rarely to 30; styles 3 to 5, oblongate, about 1.8 mm. long; capsule when ripe ovate-globose, circumscissile below the middle; upper part of capsule shiny and deeply hemispherical, invested with the corolla and calyx and withered coherent stamens; lower part of capsule 2.5-3.5 mm. in diameter, lightly stipitate; seeds black, stellate-tubercular, 0.3-0.5 mm. in diameter. *P. pilosa* of auth., *P. pilosa* L. var. *mundula* (I. M. Johnst.) Legrand. In gravelly or sandy soils on slopes and in arroyos mostly in cen. and Trans-Pecos Tex., less common eastw., spring to fall; from Mo. and Kan. s. to n. Mex.

2. TALINUM ADANS. FLAME-FLOWER

Herbs or shrubby plants, often with fleshy tuberous roots; stems sometimes very short or elongate; leaves fleshy, alternate or nearly opposite, entire, flat or terete; flowers often showy, borne on long- or short-peduncled cymes or sometimes 1 to several in the axils of the leaves; sepals 2, deciduous; petals 5 or more, early-withering; stamens few or numerous; filaments filiform; ovary superior; styles 3, more or less united; ovules numerous; capsule 1-celled, 3-valved; seeds flattened, round-reniform, with a smooth or rigid testa.

About 50 species in the warmer parts of both hemispheres.

1. Leaves flat, mostly more than 15 mm. wide; seeds black, muricate (2)
1. Leaves terete or flat, less than 10 mm. wide (3)
- 2(1). Flowers pink or reddish; leaves abruptly acute to acuminate at apex; bracts of inflorescence linear-lanceolate and acuminate; distribution in brushlands of south Texas1. *T. paniculatum*.
2. Flowers yellow or orange; leaves usually broadly rounded at apex; bracts of inflorescence mostly ovate-elliptic and apiculate; distribution in mountains of Trans-Pecos Texas2. *T. chrysanthum*.
- 3(1). Flowers 1 to 3 in the axils of the leaves (4)
3. Flowers in a terminal cyme (7)
- 4(3). Mature seeds with several concentric subcircular ridges on the sides (5)
4. Mature seeds smooth (6)
- 5(4). Petals yellow; stem slender, suffrutescent at the base, stiff; capsule globose, 4-4.5 mm. in diameter; leaves linear throughout, 1.5 mm. wide or less3. *T. angustissimum*.
5. Petals orange to reddish; stem rather stout; capsule ovoid, 5-7 mm. long, 4.5-5.2 mm. in diameter; some leaves more or less dilated to 2 mm. or more in width4. *T. aurantiacum*.
- 6(4). Sepals oval to orbicular, 3-3.7 mm. long, obtuse or nearly so; leaves 1 cm. long or less5. *T. brevifolium*.
6. Sepals ovate-lanceolate to ovate or ovate-elliptic, 6-8 mm. long, acute; leaves more than 1 cm. long6. *T. pulchellum*.
- 7(3). Stamens 4 to 8; sepals 4 mm. long or less; petals 9 mm. long or less; capsule 3.5-4.5 mm. long, 2.8-3 mm. in diameter7. *T. parviflorum*.
7. Stamens 12 or more; sepals 4.5-8 mm. long; petals 10-15 mm. long; capsule 6-7 mm. long, about 4.5 mm. in diameter8. *T. calycinum*.

1. *Talinum paniculatum* (Jacq.) Gaertn. PINK BABY-BREATH, RAMA DEL SAPO. Herb with tuberous roots; stems simple or branched, rather slender, sometimes woody at the base, 25-75 cm. tall; leaf blades elliptic-rhombic or obovate, 2.7-10 cm. long, 13-47 mm. broad, abruptly acute to acuminate at the apex, rounded or tapering at the base into the petiole; inflorescence a terminal panicle, 7-25 cm. long, the branches cymose; bracts of inflorescence linear-lanceolate, acuminate, to 3 mm. long; pedicels slender, 1-2 cm. long, terete; sepals oval to orbicular, 3-4 mm. long, deciduous; petals oval to obovate-elliptic

or orbicular, obtuse, 3.5-4.8 mm. long, red or pink; stamens 15 to 20; capsule subglobose, 3-4.5 mm. in diameter; seeds black, 0.9-1.2 mm. wide, minutely striolate and occasionally minutely tuberculate, shining. In clay soils in thickets of extreme s. Tex., Apr.-July; in s. U.S., Mex., C.A., W.I. and S.A.; introd. in China.

2. *Talinum chrysanthum* Rose & Standl. Perennial from a thick rather fleshy root; stems stout, to about 1 m. high, reddish, simple or little-branched; leaves numerous, thick and fleshy, obovate to oblanceolate, attenuate or cuneate at base, mostly rounded at apex, 10 cm. long or less; inflorescence an elongated and much-branched panicle; bracts of inflorescence mostly ovate or ovate-elliptic and apiculate, 2 mm. long or less; flowers with pedicels about 15 mm. long; sepals very unequal, almost orbicular; petals bright-yellow or orange-color; capsule obtusely triquetrous, reddish; seeds black and shining, minutely papillose. In igneous soil and on ledges in canyons of the Trans-Pecos, June-Sept.; also N.M.

This plant, in the past, has been combined with *T. paniculatum*. It is probably the same one that occurs west of Texas.

3. *Talinum angustissimum* (Gray) Woot. & Standl. Plant to 4 dm. or more in height, often lower, suffrutescent at the base, the branches slender; leaf blades linear or narrowly linear, 1-6 cm. long, 0.5-1.5 mm. broad, mostly acute at the apex, narrowed at the base; flowers usually solitary in the axils of the leaves; pedicels slender, 1-1.8 cm. long, bracted mostly near the base; sepals ovate to broadly ovate, 6-9 mm. long, 5-6 mm. broad; petals obovate, 10-13 mm. long, 3.5-6 mm. broad, yellow, sometimes tinged with orange; stamens 20 or more; style lobes linear; capsule globose, 4-4.5 mm. in diameter; seeds black, 1.2-1.3 mm. wide, with several concentric subcircular ridges on the side. *T. aurantiacum* β *angustissimum* Gray. In sandy or gravelly soils in arroyos, on plains and slopes in s. and w. Tex., May-Sept.; from Tex. to Ariz. and n. Mex.

Extremes of this plant and *T. aurantiacum* are readily distinguished, but the bulk of the material seen tempts one to unite the two, at least varietally as Gray did in first describing this plant.

4. *Talinum aurantiacum* Engelm. FLAME-FLOWER. Erect or ascending herbaceous plant, 15-35 cm. tall or more, with rather stout stems and tuberous roots; leaf blades linear or linear-lanceolate, 15-55 mm. long, 1.5-3.5 mm. broad, fleshy; flowers solitary in the axils of the leaves; pedicels bracted below the middle, reflexed in fruit; sepals ovate, 6-9 mm. long, 3.2-4.5 mm. broad, cuspidate; petals obovate, 9-13 mm. long, 5-6 mm. broad, orange or reddish; stamens 20 or more; stigmas linear; capsule ovoid, 5-7 mm. long, 4.5-5.2 mm. in diameter; seeds black, 1.3 mm. wide, with several concentric subcircular ridges on the side. On rocky slopes of canyons and mts. in w. Edwards Plateau, the Panhandle and Trans-Pecos, June-Oct.; from Tex. to Ariz. and Mex.

5. *Talinum brevifolium* Torr. Fleshy herb with spreading branches and deep root; leaves crowded; blades subterete, narrowly spatulate to clavate or linear, 4-9 mm. long, 1-1.8 mm. broad, obtuse at the apex; flowers solitary in the axils of the upper leaves, borne on pedicels 3-3.5 mm. long; sepals oval to orbicular, 3-3.7 mm. long, 3.8-4.4 mm. broad; petals obovate, 8-10 mm. long, 4-5 mm. wide, rose; stamens about 20; style as long as the ovary, 3-cleft at the summit; capsule globose-ovoid or globose-ellipsoid, 3.5-3.7 mm. long, 3-3.2 mm. in diameter; seeds nearly smooth, 1-1.1 mm. broad, with grayish pellicle. In sandy gravelly soils of the Trans-Pecos, spring-summer; from w. Tex. to n. Ariz. and s. Ut.

6. *Talinum pulchellum* Woot. & Standl. Perennial herb from a much-branched large fleshy root, glabrous; stems several, leafy, spreading, typically branched and to 1 dm. tall; leaves densely but evenly distributed, not rosettelike, sessile; upper blade linear, nearly terete, acute, to 25 mm. long and 1-2 mm. broad; lower blade shorter, broader and manifestly more flat than the upper ones, subtended by a free flattened margin extending entirely around the base below the point of attachment; peduncles axillary, to 15 mm. long (usually 1 cm. or less), 1- to 3-flowered (usually 3); pedicels to 2 cm. long, each with 2 acute bractlets about 2.5 mm. long inserted below the middle, the cluster subtended by 2 acute bracts 4-5 mm. long; sepals 6-8 mm. long, 2.5-5 mm. broad, acute, ovate-lanceolate to elliptic-lanceolate, hyaline-margined; petals obovate, about 12 mm. long, to 8 mm. broad, spreading, light-rose; stamens 18 or more, with filaments 4-5 mm. long; ovary 1 mm. long or more, ovoid; styles less than 1.5 mm. long, entirely

united and early-deciduous; stigma capitate; fruit elliptical, about 4 mm. long and 3 mm. broad; seeds smooth, slightly angular but not concentrically ridged, about 1 mm. in diameter. *T. Youngæ* C. H. Mull. In canyons of the Trans-Pecos, spring-summer; also N.M.

7. *Talinum parviflorum* Nutt. Herb 5-19 cm. high, with fleshy roots, short-stemmed or subcaulescent; leaf blades terete or nearly so, linear, 1.5-5 cm. long, 0.8-2.5 mm. thick, broadened at the base; inflorescence a cyme, bracted at the forks; peduncles slender, 3-15 cm. long; pedicels slender; sepals ovate or oval-ovate, 2.7-4 mm. long, 1.5-2 mm. broad, deciduous; petals pink or pink-purple, obovate or elliptic, 5.5-7 mm. long, 2.2-2.6 mm. broad; stamens 4 to 8, the anthers oblong, 0.9 mm. long; style longer than the stamens; stigmas subcapitate; capsule ellipsoid, 3.5-4.5 mm. long, 2.8-3 mm. in diameter; seeds 0.8-0.9 mm. wide, smooth. In sandy soil in woods and over rock outcrops throughout most of Tex., Apr.-Aug.; from Ark., Tex. and Ariz., n. to Minn. and N.D.

8. *Talinum calycinum* Engelm. Erect herb with a rather thick reddish-brown fleshy rootstock, the stems 3-10 cm. long; leaf blades subterete, 2.5-7 cm. long, 1-2 mm. thick, acute; inflorescence a cyme, bracted at the forks; peduncle slender, 6-23 cm. long; pedicels slender; sepals ovate to ovate-orbicular, 4.5-8 mm. long, 5-6 mm. broad, often persistent in fruit; petals pink or cerise, broadly obovate, 10-15 mm. long, 5-9 mm. broad; stamens 30 or more; stigma capitate; capsule globose-ovoid, 6-7 mm. long, 4.5 mm. in diameter; seeds black, 1-1.1 mm. wide, smooth. In sandy or rocky soil in scrub oak or brushy areas in n.-cen. and n.w. Tex., May-July; from Ark. and Tex., n. to Mo. and Neb.

3. TALINOPSIS GRAY

A monotypic genus.

1. *Talinopsis frutescens* Gray. Plant shrubby from fibrous and tuberous roots, to 6 dm. high, usually much smaller, with slender somewhat compressed-angipitous young stems and branches, with tufts of hairs at the dilated nodes; leaves opposite or fascicled in the axils, fleshy, linear, terete, to 3 cm. long and 1-2 mm. thick; cymes few-flowered, the branches short and angled; flowers sessile; sepals 2, ovate to ovate-elliptic, 7-8 mm. long, about 5 mm. wide, obtuse, several-nerved, persistent in fruit; corolla purple; petals 5, in aestivation imbricate, oval or somewhat obovate, 9-10 mm. long, 4-5 mm. wide; stamens 20 to 25; anthers oblong, 2-celled; style columnar, shorter than the 1-celled ovary; stigmas 3, dilated; capsule ovoid-conic, sharply tapered at apex, 1-1.5 cm. long, 4.5-5 mm. in diameter below the middle, 3-valved, the valves separating from a thin white papery 6-valved endocarp; seeds arcuate or uncinat, 2 mm. long, 1 mm. thick, brown, the surface granulate. Among boulders and shrubs on mt. slopes and in valleys in the Trans-Pecos, July-Sept.; also N.M. and Mex.

4. CLAYTONIA L.

About 20 species in the Northern Hemisphere.

1. *Claytonia virginica* L. SPRING BEAUTY. Perennial herb with globose corm 1-3 cm. thick; stems single or usually several to many from the corm, 1-3 dm. high, glabrous, succulent, erect or ascending; basal leaves petioled, 6-20 cm. long, the blade as long to twice as long as the petiole, succulent, linear-oblongate, 5-15 mm. wide, indistinctly 3-ribbed, acute at both ends; stem leaves short-petioled, opposite, 9-15 cm. long; raceme 6- to 15-flowered, 4-16 cm. long, often with a single small oval bract below the lowest pedicel; pedicel 1.5-4 cm. long, in fruit recurved; flowers perfect, regular; sepals 2, rounded-ovate or oval, usually obtuse or rounded at the apex, herbaceous, persistent, 5-7 mm. long; petals 5, hypogynous, oval, 9-14 mm. long, rounded to obtuse or rarely retuse at the apex, white or rose-colored with pinkish or purplish veins; stamens 5, opposite the petals and adnate to them at the base; ovary 6-ovuled; styles 3, united to near the apex; capsule about 4 mm. long, rounded-ovoid, membranous, 3-valved, the edges of the valves elastically inrolling at dehiscence; seeds 1 to 6, blackish-brown, orbicular, shining, 2 mm. broad. *C. Simsii* Sweet. In sandy soil in rich woods, thickets and clearings in e. third of

Tex., Feb.-Apr.; from s.w. Que. and w. and s. N.E. to s. Ont. and Minn., s. to Ga., Ala., Miss., La. and Tex.

FAM. 68. BASELLACEAE MOQ.⁵⁷

MADEIRA-VINE FAMILY

Somewhat succulent twining glabrous perennial herbaceous vines, usually with tuberous rootstocks; leaves alternate, sessile or petioled, simple, entire, often fleshy-thickened, exstipulate; inflorescence usually spikelike racemes; floral bracts linear, acuminate-attenuate, often exceeding the pedicel in length; flowers numerous, perfect or unisexual; bracteoles just below the perianth, 2 or (when 4) in 2 decussate pairs and sometimes accrescent and connate at base, the upper pair often tepaloid; perianth segments 5, often colored, usually basally connate, imbricate, often accrescent, more or less persistent in fruit; stamens 5, epitepalous; filaments distinct, inserted on the perianth; anthers 2-celled, dorsifixed, dehiscent lengthwise; ovary superior, 1-celled; stigmas usually 3; fruit indehiscent, surrounded by the persistent usually fleshy-accrescent calyx and eventually the keeled or more or less winged bracteoles; seed solitary, globular.

About 15 species in 4 genera, mostly in Tropical America. A family in much need of an exacting study.

1. ANREDERA Juss.

Characters of the family. A small genus of less than 10 species in the warmer parts of America, from Florida, southern Texas and Mexico to central South America.

- 1. Lower pair of bracteoles connate at the base to form a persistent cuplet at summit of pedicel; upper pair of bracteoles cymbiform, slightly exceeding the tepals, with the dorsal keels narrowly winged below1. *A. baselloides*.
- 1. Lower bracteoles free, caducous (2)
- 2(1). Racemes stout, usually less than 10 cm. long, greatly to only slightly exceeding the subtending leaf; upper bracteoles cymbiform, about as long as tepals, broadly and conspicuously winged on back at maturity2. *A. scandens*.
- 2. Racemes slender, lax, elongated, more than 12 cm. long, much-exceeding the subtending leaf; upper bracteoles concave, dorsally carinate but not broadly winged3. *A. leptostachys*.

1. *Anredera baselloides* (H.B.K.) Baill. Glabrous vine with stout stem and branches; leaves with petioles 8-18 mm. long, cordate to subcordate-ovate, acuminate-mucronate, to about 10 cm. long, 2-3.5 cm. wide, cordate to subcordate at base; peduncles slender, to 25 mm. long; racemes usually much longer than the subtending leaf, simple or compound; pedicels 1-2 mm. long; floral bracts linear-subulate; lower pair of bracteoles minute, triangular, somewhat obtuse and concave, united at base to form a cup; upper pair of bracteoles orbicular-elliptic to ovate-orbicular, about as long as tepals; tepals ovate to elliptic, 1-2 mm. long; filaments subulate; anthers oblong; stigmas mostly subsessile and oblong-obovate. *Boussingaultia baselloides* H. B. K. In thickets and among cedars in s.-cen. Tex., all year; also trop. Am.

2. *Anredera scandens* (L.) Moq. Plant a glabrous diffuse high-climbing vine from a perennial tuberous rootstock, to 1 m. long, the slender stem flexuous; leaves with a petiole to 1 cm. long, ovate to rhombic-ovate or subcordate, subtruncate to tapering at base, to 85 mm. long and 6 cm. wide, usually much smaller, the lower leaves obtuse to shortly acuminate at apex, the upper leaves oblong-ovate and long-acuminate; peduncles 6-12 mm. long, slender, sulcate; racemes rather stout, greatly to only slightly exceeding the subtending leaf, rarely more than 10 cm. long and to about 9 mm. thick, at length pendulous; floral bracts narrowly subulate, shorter than the pedicels; pedicels 1-2 mm. long, thickened at apex; lower bracteoles minute, broadly ovate, acutish; upper bracteoles about 2 mm. long, oblong-elliptic, concave, obtuse, at maturity broadly winged and about 4 mm. long; tepals oblong, somewhat acute, about as long as upper bracteoles; fruit

⁵⁷ Adapted, in part, from C. G. G. J. van Steenis, *Flora Malesiana*, 5:300-304. 1957.

terminating in a thickened style, smooth below, rugose above. *A. vesicaria* (Lam.) Gaertn. f. In thickets and brushlands, palm groves and open woods, on gravelly hills and about fences and hedges in s. Rio Grande Plains and Brownsville area, Sept.-Nov.; also Fla., W.I. and Latin Am.

3. *Anredera leptostachys* (Moq.) Steen. SACASILE. A glabrous vine with slender stems and branches; leaves with petioles about 1 cm. long, ovate to ovate-elliptic or subcordate-ovate, to about 7 cm. long and 5 cm. wide, acute to slightly acuminate at apex, thickish, usually gradually or abruptly narrowed at base; racemes slender, lax, elongated, simple or branched, 12-17 cm. long, about 8 mm. thick, much longer than the subtending leaf; floral bracts linear-subulate, flexuous, about as long as the pedicels; lower pair of bracteoles minute, triangular-subulate, concave; upper pair of bracteoles oblong, slightly keeled below; tepals ovate to oblong, 1-2 mm. long; filaments subulate; anthers oblong. *Boussingaultia leptostachya* Moq. Open woodlands in the Brownsville area, all year; also trop. Am.

FAM. 69. CARYOPHYLLACEAE JUSS.* PINK FAMILY

Annual, biennial or perennial herbs or small woody-based plants, with nodose stems; leaves entire, typically opposite or whorled, often united at base, with or without stipules; flowers regular, perfect or rarely unisexual; sepals 4 or 5, persistent, distinct or united into a tube; petals as many as sepals, rarely fewer or none, often toothed or lobed; stamens usually as many as and alternating with the petals; filaments sometimes cohering at the base; styles 2 to 5, distinct or more or less united; ovary free from the calyx, 1-celled or incompletely 2- to 5-celled at base; capsule few- to many-seeded, opening by 2 to 5 entire or bifid valves; seeds small.

More than 1750 species in about 70 genera, cosmopolitan but most abundant in temperate climates.

1. Stipules none (2)
1. Stipules present (14)
- 2(1). Sepals united (3)
2. Sepals free (7)
- 3(2). Flowers and cymes closely subtended by 2 or 3 pairs of scarious broadly ovate-oblong or obovate bracts 1. *Petrorrhagia*, p. 613.
3. Flowers and cymes without subtending scarious bracts (4)
- 4(3). Styles 2 (5)
4. Styles 3 to 5; calyx always strongly ribbed (6)
- 5(4). Calyx cylindric, not strongly angled; petals appendaged 2. *Saponaria*, p. 613.
5. Calyx ovoid, strongly 5-angled; petals not appendaged . 3. *Vaccaria*, p. 613.
- 6(4). Calyx teeth not exceeding the petals 4. *Silene*, p. 614.
6. Calyx teeth long and narrow, much-exceeding the petals. 5. *Agrostemma*, p. 616.
- 7(2). Petals present (8)
7. Petals absent (12)
- 8(7). Petals more or less deeply bifid (9)
8. Petals entire, emarginate or irregularly toothed (11)
- 9(8). Style 1, 3-cleft; capsule 3-valved 6. *Drymaria*, p. 616.
9. Styles 3 or more; capsule opening by twice as many teeth or valves as there are styles (10)
- 10(9). Styles 5 7. *Cerastium*, p. 618.
10. Styles 3 (or varying from 3 to 6) 8. *Stellaria*, p. 620.
- 11(8). Fewer styles (2 or 3) than sepals 9. *Arenaria*, p. 621.
11. As many styles as sepals (4 or 5) 10. *Sagina*, p. 624.
- 12(7). Leaves linear 10. *Sagina*, p. 624.
12. Leaves not linear (13)

* See Appendix.

- 13(12). Styles 5 7. *Cerastium*, p. 618.
 13. Styles 3 or varying from 3 to 6 8. *Stellaria*, p. 620.
 14(1). Outer three sepals with a setaceous tooth on each side; leaves subulate-setaceous, rigid 11. *Loeflingia*, p. 624.
 14. All sepals entire; leaves not subulate-setaceous or rigid (15)
 15(14). Lower leaves usually in closely approximated pairs resembling whorls of 4; small decumbent herbs with tiny flowers about 3 mm. in diameter; styles joined below 12. *Polycarpon*, p. 624.
 15. At least the lower leaves in opposite pairs; styles free to base (16)
 16(15). Petals minute or lacking; sepals with conspicuous awns; stipules conspicuous, silvery, lanceolate and acuminate-attenuate, usually more than 5 mm. long 13. *Paronychia*, p. 625.
 16. Petals more or less equaling the sepals in length; sepals without awns; stipules small, deltoid to setaceous, acute to attenuate, less than 5 mm. long (17)
 17(16). Style 1; petals 2-cleft 6. *Drymaria*, p. 616.
 17. Styles 3 or more; petals entire (18)
 18(17). Styles 5 14. *Spergula*, p. 629.
 18. Styles 3 15. *Spergularia*, p. 629.

1. PETRORHAGIA (SÉR.) LINK

About 20 species that are native mainly to the Mediterranean region.

1. *Petrorhagia prolifer* (L.) Ball & Heywood. CHILDRING PINK. Slender annual with simple or branched stems to 5 dm. high, glabrous or scabrid; cauline leaves to 4 cm. long and 2 mm. wide, linear-oblong, 3-veined; sheath 1-2.5 mm. long, about as broad as long; largest bracts of the head 6-12 mm. long, 3-8 mm. broad, usually obtuse; calyx 10-13 mm. long, the costae 3-veined, the oblong teeth obtuse; petals pink or purplish, 10-14 mm. long, the obcordate limb 2-3.5 mm. wide; seeds 1.3-1.9 mm. long, 0.8-1.1 mm. broad, reticulate. *Dianthus prolifer* L., *Tunica prolifer* (L.) Scop. Scattered in grasses along roadsides and in fields in e. Tex., spring-summer; a nat. of Eur. and N. Afr. that occurs as an escape in various parts of N.A.

This is an extremely aggressive plant. Since its very recent introduction into Texas, probably in contaminated rye grass seed sown along state right-of-ways, it has spread throughout most of east Texas from northeast Texas, where it was originally discovered. It reproduces abundantly.

2. SAPONARIA L.

About 30 species that are native to Eurasia and northern Africa.

1. *Saponaria officinalis* L. SOAPWORT, BOUNCING-BET. Plant perennial, stout, erect, glabrous, to 6 dm. high; stems simple or sparingly branched, leafy; leaves opposite, oval-lanceolate to elliptic or sometimes ovate, subobtuse to acute at apex, narrowed at base to a short broad petiole, to 8 cm. long and 35 mm. wide, prominently 2- to 5-nerved; flowers showy, in dense terminal corymbs; bracts foliaceous or much-reduced and narrow; calyx tube cylindrical or nearly so, naked, obscurely nerved, to 2 cm. long, the 5 lanceolate teeth about 2 mm. long; petals 5, white or pink, cuneate, notched at apex, well-exserted and spreading, crowned with an appendage at the top of the prominent claw; stamens 10; styles 2; ovary 1-celled or incompletely 2- to 4-celled; capsule included, subcylindric, dehiscent by 4 short apical teeth. In fields and waste places in e. Tex., June-Sept.; a nat. of Eur. that is locally naturalized in various places in temp. N.A.

3. VACCARIA MEDIC.

Four species, natives of Eurasia. Differs from *Saponaria* in the winged calyx tube and absence of coronal scales.

1. *Vaccaria pyramidata* Medic. COW-HERB, COW-CKOCKLE. Annual herb with a slender taproot and glabrous dichotomously branched flowering stems that are 3-6 dm. high; leaves opposite, basal leaves oblong-lanceolate, upper leaves ovate-lanceolate and cordate-clasping, all sessile, acute, glabrous and glaucous; flowers in terminal open cymes, slender-pedicelled; calyx tube inflated, glabrous, with 5 sharp angles or wings and 5 triangular teeth, the intervening parts white and scarious; petals well-exceeding the calyx, pale rose-color, the limb cuneate, rounded or somewhat emarginate, toothed; corona scales lacking; stamens 10; styles 2; capsule globular, 4-celled below, opening by 4 teeth; seeds laterally attached, black, 2 mm. across. *Saponaria Vaccaria* (L.) Britt. In waste places and cult. grounds, especially wheat fields, in n.-cen. Tex., a nat. of Euras. that has become naturalized.

4. *SILENE* L.⁵⁸

CATCHFLY. CHAMPION

Annual or perennial herbs with solitary or clustered stems; leaves opposite or whorled, exstipulate; flowers white, pink or red, solitary or in cymes; calyx cylindrical, ovoid or campanulate, 5-toothed or -cleft, 10- to many-nerved, naked at base; petals 5, usually clawed, the blades often cleft or toothed and usually with a scalelike appendage at the base; stamens 10; styles 3 or rarely 4 or 5; ovary 1-celled or incompletely 2- to 4-celled; capsule dehiscent by 6 or rarely 3 apical teeth; seeds numerous, often papillate or tubercled.

About 500 species of wide geographic distribution, especially the Mediterranean region.

1. Annuals; plants mostly weedy (Doubtful cases should be keyed under both alternatives) (2)
 1. Perennials; plants not weedy (3)
 - 2(1). Plant usually glabrous throughout, at least the calyx without pubescence; stems mostly with sticky mucilaginous bands 1. *S. Antirrhina*.
 2. Plant densely pubescent throughout; stems with mucilaginous bands 2. *S. gallica*.
 - 3(1). Leaves 4 per node on the middle portion of stem; petals not differentiated into blade and claw; petal appendages lacking 3. *S. stellata*.
 3. Leaves always only 2 per node; petals usually differentiated into narrow claw and expanded blade with appendages at or near their juncture (4)
 - 4(3). Blades of petals lance-elliptic, entire; appendages entire, linear, 2-4 mm. long 4. *S. subciliata*.
 4. Blades of petals variously shaped, lobed to laciniate; appendages lacerate, triangular-ovate, mostly not over 2 mm. long (5)
 - 5(4). Stem leaves 1-2.5 cm. long and 1-3 mm. wide; petals 2-lobed 5. *S. Plankii*.
 5. Stem leaves usually more than 2.5 cm. long and 3 mm. wide; petals laciniate 6. *S. laciniata*.

1. *Silene Antirrhina* L. SLEEPY CATCHFLY. Erect or ascending annual, to 8 dm. high, paniculately branched, the slender branches and branchlets of the panicle ascending or sometimes loosely spreading, puberulent to essentially glabrous, commonly with a dark glutinous band below the nodes; basal leaves oblanceolate to spatulate, those of the stem becoming linear to lanceolate or oblanceolate, to 7 cm. long and 15 mm. wide; flowers numerous, slender-pedicelled; flowering calyx fusiform, in fruit becoming ovoid-campanulate, to 1 cm. long, glabrous, with 10 straight nerves, the short triangular apical teeth often purplish; petals small, transient, white to pink or purplish, more or less emarginate, mostly exceeding the calyx by 2-3 mm.; capsule subsessile within the closely embracing calyx, ovoid, to 1 cm. long. A weedy plant that occurs in moist grassy areas, fields, open woodlands and in waste places throughout most of Tex., Mar.-Sept.; from s.w. Que., w. to B.C., s. to Mex.

Occasionally individuals without petals are found.

⁵⁸ Adapted from C. Leo Hitchcock and Bassett Maguire in Univ. Wash. Publ. Biol. 13:1-73. 1947.

2. *Silene gallica* L. FORKED CATCHFLY. Annual or biennial, slender, to 45 cm. high; stems simple and erect to much-branched and decumbent, hirsute to hispid, glandular-pubescent above; basal leaves oblanceolate to spatulate, obtuse and usually mucronate at apex, the upper leaves lanceolate, usually about 25 mm. long and 5 mm. wide; racemes simple, 1 sided, to 15 cm. long, the short-pedicelled flowers in the axils of bracteal leaves; calyx tubular-fusiform, to 1 cm. long, rounded at base, 10-nerved, erect or ascending, villous-hirsute, with long lance-attenuate apical teeth, becoming ovoid-inflated in fruit; petals very small, the white to pinkish limb entire or merely crenate or emarginate, usually slightly longer than the calyx and somewhat twisted; capsules ovoid; seed faces excavated. *S. dichotoma* of Tex. auth. A. Eur. plant that has become naturalized along roadsides and in waste places in the e. third of Tex., Apr.-May; from N.S. and Mich., s.w. to Mo. and Tex.

3. *Silene stellata* (L.) Ait. f. STARRY CAMPION. Perennial with strongly branching crown; stems several, stiffish, puberulent to glabrate, ascending, to 1 m. high, usually much smaller; all except the lowest and uppermost leaves in whorls of 4, ovate to linear-lanceolate, long-acuminate, to 1 dm. long and 4 cm. wide, minutely puberulent beneath, smooth to scabrous above; panicle simple and elongate or with a few elongate ascending branches, with small foliaceous bracts; flowers with slender pedicels to 8 mm. long; calyx campanulate, inflated, somewhat scarious with age, to 12 mm. long, the 10 veins not prominent, glabrous or merely puberulent, the broadly triangular apical lobes 2-3 mm. long; corolla about 2 cm. across; petals white, lanate at base, crownless, with the margins cut into a fringe; capsule nearly globose; seeds dark-purplish-brown, uniformly rugose-papillose, about 1 mm. long. In woods or clearings in the e. third of Tex., May-July; from Mass. to Minn., s. to Ga., Ala., Okla. and Tex.

4. *Silene subciliata* Robins. Perennial; stems few from a branched crown, to 11 dm. high, simple or branched above, glabrous; leaves linear to narrowly oblanceolate, to 18 cm. long and 12 mm. wide, rather fleshy, usually attenuate to the petiolar base, entirely glabrous or with scattered cilia on the margins that may be as much as 3 mm. long; bracts greatly reduced, linear-lanceolate; inflorescence elongate, open, few-flowered, sometimes reduced to a solitary terminal flower, the lower floral branches sometimes nearly 1 dm. long, essentially glabrous; calyx tubular, 10-nerved, glabrous and smooth, to 25 mm. long, the lanceolate ciliate apical lobes about 4 mm. long; corolla scarlet, pilose-woolly at base; corolla blades oblong-elliptic, about 15 mm. long, entire to obscurely toothed, not lobed, the claws narrow and slightly auriculate at top, the margins ciliate; appendages 2, linear, tubular, entire, about 4 mm. long; filaments exerted, hairy at base; carpophores 3-4 mm. long, hairy; styles 3, scarcely exerted; seeds dark-brown, subreniform, about 2 mm. long, dorsally verrucose in lines. In sandy soils in open woodlands and scrub areas in s.e. Tex., July-Oct.; also w. La.

5. *Silene Plankii* Hitchc. & Maguire. Low perennial, from multicapital caudex; stems ascending, 10-15 cm. tall, finely retrorsely grayish-puberulent, becoming glandular in the inflorescence; basal leaves oblanceolate, acute, to 23 mm. long and 4 mm. wide; cauline leaves in 5 to 8 pairs, linear to linear-lanceolate, acuminate, 1-2 cm. long, 1-3 mm. broad, finely glandular-puberulent (especially near the inflorescence); inflorescence few-flowered, often of but a single terminal blossom or on or two flowers developing from lower nodes; calyces 2-2.8 cm. long, tubular, slightly constricted below, glandular-pubescent, 10-nerved; calyx lobes 2-4 mm. long, membranous-margined and ciliate; corolla scarlet, the claws glabrous, to 22 mm. long, gradually and uniformly widened to 3-4 mm. at top, scarcely auriculate but abruptly narrowed to blades; corolla blades 5-8 mm. long, obovate, bilobed one sixth to two thirds its length, the revolute lobes entire or rarely deeply crenate; appendages located about 1 mm. above base of blade, 1-1.5 mm. long, oblong, rather deeply crenate-lacerate; carpophore about 5 mm. long, glabrous; filaments well-exserted; styles 3, exerted 2-4 mm.; ovary 1-celled, mature seeds not seen. On moss-covered ledges in Franklin Mts. of extreme w. Tex., June-Oct., also N.M.

6. *Silene laciniata* Cav. MEXICAN CAMPION. Perennial, from a fleshy deep taproot; stems one to several, to 1 m. high, weak, sometimes scandent, densely retrorsely puberulent and stipitate-glandular, the pubescence more dense in the inflorescence; leaves variable to 8 cm. long and 38 mm. broad, linear to lanceolate or oblanceolate and acute and sessile or broadly elliptic to oblanceolate or obovate, then acute or obtuse, sometimes narrowed

to a distinct petiole, entire to rarely finely toothed, pubescence similar to that of stem; flowers solitary or in few-flowered panicles; pedicels 2-4 cm. long, densely glandular; calyx cylindric-tubular, mostly 15-25 mm. long, puberulent and more or less densely glandular, frequently somewhat zygomorphic; calyx lobes lanceolate to oblong or obovate, acute to rounded, narrowly or broadly scarious-margined; petals scarlet, conspicuous, claws mostly glabrous or sometimes ciliolate, equaling or somewhat exceeding the calyx, the auricles inconspicuous; appendages 2, broad, toothed, 1-2 mm. long, occasionally somewhat tubular, translucent area beneath more or less prominent; corolla blade broadly cuneate to oblong in outline, to 15 mm. long, usually deeply cleft into 4 linear or lanceolate lobes, occasionally bifid or with 5 or 6 lobes; stamens exserted, the filaments glabrous; carpophore glabrous, 2-4 mm. long; styles 3, exserted; capsule oblong-ovoid, to 18 mm. long; seeds reddish-brown, 1.2-1.5 mm. broad, marginal papillae conic, prominent. In rich soil, usually in shaded areas, in mts. of the Trans-Pecos, July-Oct.; from Tex., w. to Calif. and s. in Mex. to Oax. and Ver.

Texas plants have been referred to var. *Greggii* (Gray) Hitchc. & Maguire, which are characterized by larger leaves that are elliptic to broadly lanceolate or oblanceolate and up to 8 cm. long and 38 mm. wide. All leaves except the uppermost are also rather abruptly narrowed to a distinct petiole. The calyx is 2-2.5 cm. long.

5. AGROSTEMMA L.

Two species that are natives of Eurasia.

1. *Agrostemma Githago* L. COMMON CORN-COCKLE. Rather coarse erect annual to 1 m. high; stems simple or with a few erect branches, densely pubescent throughout with appressed whitish hairs; leaves linear-lanceolate, acute to long-acuminate at apex, to 12 cm. long; flowers solitary and terminal on the stout elongated peduncles; calyx tube ovoid, 1-1.5 cm. long, the 5 linear foliaceous lobes 2 to 3 times as long as the 10-ribbed tube that is narrowed at the throat; petals 5, purple, varying to white or red, clawed, obovate to cuneate, emarginate, not appendaged, a little shorter than the calyx lobes; stamens 10; styles 5; capsule 1-celled; seeds numerous, black. Fields and waste-places in e.-cen. Tex., Mar.-July; adv. from Eur.

6. DRYMARIA R. & S.⁵⁹ DRYMARY

Annual or perennial glabrous or pubescent herbs, occasionally subligneous below, prostrate, spreading or erect; leaves opposite or pseudovercillate, glabrous to villose or glandular, sessile to long-petiolate, usually with persistent or fugacious small stipules; flowers few to many in dichasial cymes, rarely in pseudovercills, in racemes or solitary or clustered in the leaf axils; sepals 5, not connate; petals 3 to 5 or rarely wanting, white, usually 2-cleft, occasionally appendiculate in the sinus, often auriculate; stamens 2 to 5; anthers versatile, 2-celled; filaments flattened, slightly connate at the base, rarely alternating with prominent staminodia; ovary superior, slightly stipitate; carpels mostly 3, the 3 styles more or less united below; ovules few to many, campylotropous on free central placentae; capsule ovoid to spheroid, usually dehiscent into 3 entire valves; seeds 1 to many, cochleate, vermiculiform, hippocrepiform or ampulliform, usually tuberculate, the embryo curved about the perisperm.

A genus of about 50 species, primarily American.

1. Leaves linear (2)
1. Leaves ovate to reniform or broadly elliptic to suborbicular (3)
- 2(1). Leaves mostly pseudovercillate; petals 4-lobed ... 1. *D. molluginea*.
2. Leaves opposite; petals deeply bilobed 2. *D. leptophylla*.
- 3(1). Stems erect-ascending; leaves opposite; inflorescence a lax few-flowered cyme; petals deeply bilobed 3. *D. laxiflora*.
3. Stems mostly prostrate; leaves pseudovercillate; inflorescence umbelloid; petals 4-lobed 4. *D. pachyphylla*.

⁵⁹ Adapted from James A. Duke in *Ann. Missouri Bot. Gard.* 48:173-268. 1961.

1. *Drymaria molluginea* (Lag.) Didr. Slender erect virgate or dichotomously branched annual to 2 dm. high, the internodes shorter to longer than the leaves, glabrous or with sessile glands; leaves mostly pseudoverticillate, glabrous or scantily glandular, to 25 mm. long and 2 mm. broad, linear, obtuse at apex, attenuate to the sessile base; stipules lance-deltoid, 1-2 mm. long; inflorescences of terminal cymose racemes, only the first 1 or 2 branches cymose, subsequent branching tending to be racemose, the peduncle to 3 cm. long; bracts 1-2.5 mm. long; pedicels 2-5 mm. long, glabrous to minutely stipitate-glandular; sepals 2.5-3.5 mm. long, glabrous or minutely glandular, oblong, obtuse and often cucullate at apex, only the midrib prominent; petals 5, to 25 mm. long and 0.7 mm. broad, provided with usually 4 lobules at apex, the outer lobules one third to one half as long as the trunk, the inner lobules occasionally absent or reduced to mere dentations, the subdeltoid trunk laterally denticulate and truncate or tapered to the minute claw; stamens 5, 1.5-2 mm. long, the oblong to suborbicular anthers 0.4-0.5 mm. long; staminodia absent; ovary at anthesis globose, about 2 mm. long; style 2- to 3-cleft nearly to the base, less than 1 mm. long; stylopodium absent; capsule subglobose, 2-3 mm. long, exceeding the sepals; seeds as many as 17, to 1.4 mm. broad, dark-brown or purplish in age, hippocrepiform, dorsally flat, scarcely umbonate ventrally, minutely corrugated or tuberculate, the tubercles broader than long. *D. sperguloides* Gray. In sandy soils in the Trans-Pecos, July-Sept.; from w. Tex. to Ariz., s. to cen. Mex.

2. *Drymaria leptophylla* (Cham. & Schlecht.) Fenzl. Erect delicate usually sparsely branched annual to 2 dm. high, the internodes much longer than the leaves, glabrous to minutely glandular; leaves opposite, rarely pseudoverticillate, glabrous, linear to narrowly oblong, to 25 mm. long and 1 mm. broad, often involute and circinate, obtuse to acute at apex, tapered to the subsessile base; stipules entire, to 0.8 mm. long, acicular, caducous; inflorescences of terminal many-flowered dichasial cymes, the peduncles to 5 cm. long, glabrous to minutely glandular; bracts ovate, to 1.5 mm. long, equaling or exceeding the pedicels; sepals 1.5-3.5 mm. long, narrowly ovate, acute and often somewhat reflexed at apex, 3-ribbed, glabrous or with a few sessile glands; petals 5, to 2.4 mm. long, bifid about half their length, the linear lobes obtuse or acute; stamens 5, to 1.5 mm. long, the suborbicular anthers about 0.2 mm. long, the filaments basally and briefly connate; ovary at anthesis subglobose; style about attaining the anthers, divided nearly to the base; capsule 1.5-2 mm. long; seeds as many as 20, cochleate, 0.5-0.7 mm. long, evenly tuberculate with rounded tubercles. In soil along streams in canyons and on mt. slopes in the Trans-Pecos, Aug.-Oct.; from Ariz. to Colo., s. to w. Tex., s. Mex., and in Baja Calif.

3. *Drymaria laxiflora* Benth. Glabrous to densely stipitate-glandular diffuse to subcespitose perennial, to 3 dm. high, the internodes mostly longer than the leaf blades; leaves opposite, with petioles to 5 mm. long, glabrous to densely stipitate-glandular, ovate to reniform, to 12 mm. long and 14 mm. broad, trinerved, obtuse to acute and mucronulate at apex, marginally entire, mostly truncate to subcordate at base; stipules bifid or trifid, rarely entire, the divisions setaceous, to 3.5 mm. long; inflorescences of lax few-flowered cymes, the peduncles to 4 cm. long; bracts ovate, strongly 1-ribbed, scarious, apiculate, 1.5-3 mm. long, transparent except for the midrib, mostly shorter than the pedicels; pedicels subglabrous to densely stipitate-glandular, 2-6 mm. long; sepals to 6 mm. long and 2.2 mm. broad, glabrous to densely stipitate-glandular, lanceolate to narrowly ovate, trinerved, acute, the midrib occasionally excurrent; petals 5, to 6 mm. long, bifid one half to two thirds their length, the oblong lobes emarginate, with one dichotomous vein, the trunk as long as or longer than the claw; stamens 4 or 5, 2-4 mm. long, the oblong anthers to 0.8 mm. long; ovary at anthesis ellipsoid, exceeded by the anthers; style elongate, trifid for one third to one half its length, slightly exceeding the anthers; capsule 3- or 4-valved, 2-4 mm. long, many-seeded; seeds 0.5-0.7 mm. broad, evenly tuberculate, the dorsal tubercles conical, the facial tubercles substellate. In soil about base of boulders and in crevices in mts. of the Trans-Pecos, July-Oct.; from w. Tex. through Mex. to Guat.

Drymaria gracilis Cham. & Schlecht., of Mexico, has been reported from Texas, doubtlessly based on misdetermined plants of this species which it strongly resembles.

4. *Drymaria pachyphylla* Woot. & Standl. Glaucous subsucculent annual, the vegetative branching largely confined to radially diverging branches from a slender yellowish root-stock or to terminal pseudoverticillate branch systems, the elongate spreading internodes much-exceeding the terminally crowded leaves; leaves pseudoverticillate, with clasping

petioles to 8 mm. long, glaucous, subsucculent, wrinkling in drying, broadly elliptic to suborbicular, obtuse to acutish at apex, tapering to the petiole, to 14 mm. long and 12 mm. broad; stipules absent; inflorescences of terminal and axillary contracted umbelloid verticils subtended by normal foliage leaves and bracts, the pedicels 1-5 mm. long; bracts ovate, obtuse, scarious and almost nerveless, to 1.5 mm. long; sepals subequal, glabrous, glaucous, ellipsoid, obtuse, to 3.3 mm. long and 2 mm. broad, obscurely 3- to 5-nerved, the central portion green, the margins scarious; petals 5, 2.5-3 mm. long, bifid about half their length, with 2 oblong lobules in the cleft, the serrulate trunk tapered to the base, the claw not clearly delineated; stamens 5, to 1.5 mm. long, the oblong anthers about 0.5 mm. long; ovary at anthesis subglobose, the short style bifid or trifid more than half its length and slightly exceeding the anthers; capsule subglobose, 3-4 mm. long, mostly exceeding the sepals; seeds as many as 25, black, vermiculiform, facially gibbous, more or less tessellate, to 1.8 mm. long, about twice as long as broad. On sand-gravel bars and in silty areas along streams in the Trans-Pecos, often as a pioneer on bare areas, Jan.-Oct.; in w. U.S. and n. Mex.

This plant is known to be toxic to sheep and cattle.

7. CERASTIUM L. MOUSE-EAR. CHICKWEED

Annual or perennial pubescent or hirsute herbs, sometimes viscid; flowers white, few to many, borne in terminal dichotomous cymes, glomerules or singly in leaf axils; sepals 5 or rarely 4; petals of the same number as the sepals or rarely wanting, 2-lobed or -cleft; stamens 10 or rarely fewer; styles equal in number to the sepals and opposite them, rarely fewer; capsule 1-celled, cylindrical, often curved, membranaceous, opening at the summit by twice as many teeth as there are styles, many-seeded; seeds rough.

About 60 species that are widely distributed but mostly in temperate zones.

1. Petals equal to or shorter than the sepals (2)
1. Petals slightly to decidedly longer than the sepals (6)
- 2(1). Leaves subcoriaceous, linear to linear-lanceolate, terminated by a long awn, glabrous, appressed to stems 1. *C. Clawsonii*.
2. Leaves herbaceous, mostly elliptic to obovate or oblanceolate, at most acute, more or or less pubescent or glandular-pubescent, not appressed to stem (3)
- 3(2). Capsule teeth at maturity strongly revolute from tip; pedicels usually 2 to 3 times longer than the capsules; stem nearly naked above . . 2. *C. texanum*.
3. Capsule teeth not revolute but the lateral margins often recurved; pedicels usually about equal to or shorter than the capsules; stem more or less leafy above (4)
- 4(3). Flowers arising singly in leaf axils along much of stem and branches 3. *C. axillare*.
4. Flowers concentrated in glomerules and cymes at apex of stem and branches (5)
- 5(4). All floral bracts green and herbaceous; sepals with long hairs noticeably extending beyond their apex; leaves typically obovate . . . 4. *C. glomeratum*.
5. Uppermost floral bracts with whitish scarious margins; sepals without long hairs extending beyond their apex; leaves typically elliptic 5. *C. vulgatum*.
- 6(1). Capsule teeth at maturity strongly revolute from tip; stem nearly naked above 2. *C. texanum*.
6. Capsule teeth not revolute, at most with the lateral margins recurved; stem more or less leafy above (7)
- 7(6). Flowers in glomerules; pedicels shorter than calyx . 4. *C. glomeratum*.
7. Flowers in lax or somewhat compact cymes (8)
- 8(7). Leaves usually 30 mm. long or less; fruiting pedicels about as long as or shorter or rarely longer than the capsules, straight or at most only gently curved 6. *C. brachypodum*.
8. Leaves usually more than 35 mm. long; fruiting pedicels usually much longer than the capsules, rather abruptly curved just below the calyx 7. *C. nutans*.

1. *Cerastium Clawsonii* Correll. Plant with numerous erect stems from a slender root, apparently annual; stems simple or sparsely branched near base, noticeably grooved and ciliated on the ridges; leaves sessile, glabrous, subcoriaceous, opposite, erect and more or less imbricate up the stems, linear to linear-lanceolate, terminated by a long awn, 5-8 mm. long, 1 mm. wide or less, with a keeled central dorsal nerve that is decurrent on the stem; flowers solitary at apex of stems and branches, on rather stout grooved peduncles; sepals elliptic to elliptic-lanceolate, abruptly tapering to a long rigid awn, the broad hyaline margins ciliate, about 8 mm. long and 2 mm. wide; petals broadly cuneate-suborbicular to suborbicular-obovate, slightly emarginate at the broadly rounded apex, concave, shorter than the sepals; styles 5, united for most of their length, to 4 mm. long, the stigmas capitate; stamens 5, the slender filaments to 4 mm. long; anthers linear-oblong, sagittate at base, about 1.5 mm. long; capsule ovoid (immature). Known only from the type locality 3 miles south of Alpine, Brewster Co., Mar.-May.

2. *Cerastium texanum* Britt. Plants annual, glandular-pubescent, viscid, to 3 dm. high; stems several, slender, nearly erect, leafy below, nearly naked and simple to dichotomously branched above; leaves obovate to oblanceolate or spatulate, acute, to 5 cm. long and 1 cm. wide, usually much smaller; flowers few, scattered on upper part of stem; pedicels filiform to 2 cm. long; calyx lobes ovate to lanceolate, acute, 3-5 mm. long, minutely hairy, 1-nerved; petals 5-7 mm. long, bifid, mostly exceeding the calyx; styles 5; capsule 7-8 mm. long, its teeth revolute from apex. In open oak woods on the Edwards Plateau, Mar.-May; w. to Ariz.

3. *Cerastium axillare* Correll. Plant apparently annual, to 3 dm. high, glutinously glandular-pubescent throughout; stems few or many, suberect or ascending, sparsely branched; leaves typically linear-oblanceolate but occasionally linear-elliptic to elliptic-lanceolate, obtuse to subacute, to 3 cm. long and 8 mm. wide; flowers produced singly in leaf axils along much of main stem and branches; pedicels slender, 1 cm. long or less; sepals elliptic, 4-5 mm. long, obtuse to subacute, densely glandular-pubescent (especially on lower half), with scarious margins, noticeably exceeding the petals; petals elliptic-oblanceolate in outline, 3-4 mm. long, divided to near the middle into linear-lanceolate subacute lobules; capsule about twice as long as the calyx; seeds reddish-brown, tuberculate, about 0.5 mm. in diameter. On open-forested slopes, rocky hills and in grasslands in the mts. of the Trans-Pecos, Apr.-Sept.; also Chih.

This species is distinguished from *C. brachypodum* and *C. vulgatum* by having its flowers produced singly in leaf axils along much of the main stem and branches instead of being produced in apical cymes as in those species. The plant is also densely glandular-pubescent, and the small, deeply lobed petals are conspicuously exceeded by the sepals.

4. *Cerastium glomeratum* Thuill. Erect or ascending viscid annual, simple to freely branched below, to about 3 dm. high; leaves elliptic to narrowly oblong-obovate, rounded to obtuse at apex, hairy on both sides, the median leaves to 3 cm. long; bracts very small, herbaceous; inflorescence at first glomerate, in maturity looser but with the terminal clusters dense; pedicels in anthesis shorter than calyx, in fruit shorter than to but slightly exceeding the calyx; sepals ovate-lanceolate, sharply acute, firm, with scarious margins, 3-5 mm. long, with long hairs noticeably extending beyond their apex; petals oblong, deeply notched, narrow, their margins not meeting, slightly exceeding sepals, rarely wanting; stamens 10, the filaments glabrous; capsules slender, slightly curved, 5-9 mm. long; seeds minute, pale-brown, finely muricate. *C. viscosum* L. *nom. rej.* A nat. of Eur. that has become naturalized in fields, cleared woodlands, along roadsides and in disturbed and waste places, in the e. third of Tex., Feb.-May; from Fla. to Tex. and Calif., n. to N.E., N.Y., O., Ill., S.D. and B.C.

5. *Cerastium vulgatum* L. COMMON MOUSE-EAR. Short-lived matted perennial with depressed basal leafy offshoots; flowering stems to 65 cm. high, hirsute to rarely glandular, the median internodes becoming as much as 12 cm. long; leaves of the season in 3 to 7 pairs, oblanceolate to oblong or narrowly oval, conspicuously white-hirsute on both surfaces, the median leaves to 4 cm. long and 15 mm. wide; bracts similar to leaves but smaller, broadly scarious at summit and margin; inflorescences 3- to many-flowered, forming terminal ultimately very dichotomous cymes, at first rather compact, in fruit with the lower pedicels divergent or reflexed and 2 to 4 times the length of the calyx; sepals 5-7 mm. long, ovate-lanceolate to elliptic-lanceolate, obtuse to acute, scarious-margined, hirsute but glabrous at tip; petals 4-5 mm. long, narrow, about equaling or somewhat

exceeding the sepals, cleft for about 1 mm. at apex, with ciliate claw; capsule narrowly cylindrical, curved, 9-12 mm. long; seeds to 0.9 mm. in diameter, reddish-brown, bluntly tuberculate. *C. triviale* Link. A nat. of Euras. that has become naturalized in fields, along roadsides, and about old homesteads, uncommon in Tex., spring-summer.

The var. *holosteoides* Fries is a glabrescent plant or with minute lines of hairs on the stems; the elliptic to oblong leaves are dark-green, ciliate and round-tipped.

6. *Cerastium brachypodum* (Engelm.) Robins. Annual, pale-green, finely pubescent or puberulent and sometimes viscid, to about 3 dm. high, sparsely branched; leaves linear-oblong to oblanceolate, obtuse to subacute, seldom more than 25 mm. long; flowers in more or less open dichotomous cymes; pedicels about equaling but sometimes shorter than or a little exceeding the capsules, erect or somewhat deflexed, straight or at most gently curved, not hooked below the calyx; calyx about 4 mm. long, the lobes elliptic and acute, very sparsely glandular-puberulent; petals elliptic in outline, about 6 mm. long and 2 mm. wide, exceeding the sepals, notched for about 1 mm. at the apex, the lobules triangular-lanceolate and acute; capsules 2 to 3 times as long as the calyx. Incl. var. *compactum* Robins. In open woods, prairies and meadows, and on slopes, mainly in cen. Tex. but extending s. and w., Feb.-Apr.; from Ga., n. to Va., Tenn., Ill., N.D., Alta. and Wash., w. to Ariz. and Mex.

This species is similar to *C. nutans* but it is a smaller plant and it does not have its pedicels abruptly curved or hooked just below the flowers as in that species.

7. *Cerastium nutans* Raf. Weak annual, the simple or loosely rather flaccid viscid-pilose stem to 6 dm. high, the median internodes to 1 dm. long; leaves oblong-lanceolate to narrowly obovate, acute or acutish, thin, the median leaves to 8 cm. long and 15 mm. wide; bracts similar to leaves but smaller, herbaceous; inflorescence loose, simple to dichotomous, 1- to many-flowered; pedicels filiform, ascending or spreading-ascending, with hooked tips, in fruit to 55 mm. long; sepals 2-5.5 mm. long, oblong-lanceolate, thin, blunt, pilose; petals narrowly obovate, wanting in cleistogamous flowers, with glabrous claws, cleft nearly to middle, exceeding calyx; capsule curved, to 13 mm. long; seeds about 0.5 mm. in diameter, reddish-brown, bluntly papillate. In alluvial soils, on rich wooded slopes and on calcareous rocks, uncommon in Tex., spring-summer; from s.w. Que. and N.E. to B.C., s. to Fla. and w. to Ariz.

8. STELLARIA L. CHICKWEED. STARWORT

Low often diffusely branched annuals or perennials with solitary or cymose flowers; sepals usually 5; petals white, of the same number as the sepals or rarely none, 2-cleft or -parted; stamens 10 or less, hypogynous; ovary 1-celled, many-ovuled; styles 3 or rarely 4 or 5, usually opposite the sepals; capsule ovoid to globose or oblong, 1-celled, dehiscent by twice as many valves as there are styles; seeds several to many, smooth or roughened.

About 120 species that are widely distributed.

- 1. Leaves ovate to ovate-elliptic, typically cuneate or somewhat rounded at base; distribution in eastern third of Texas1. *S. media*.
- 1. Leave ovate to triangular-ovate to subreniform, typically truncate to cordate at base (2)
- 2(1). Seeds with margins coarsely rounded-tuberculate; distribution in mountains of Trans-Pecos Texas2. *S. cuspidata*.
- 2. Seeds with marginal papillae that are peglike; distribution Edwards Plateau and south Texas3. *S. prostrata*.

1. *Stellaria media* (L.) Cyr. COMMON CHICKWEED. Weak annual or perennial with trailing, matted or loosely ascending terete stems, pubescent in lines, to 8 dm. long; lower and median leaves ovate to elliptic, with rounded bases and often ciliate petioles, the blade to 4 cm. long; upper leaves sessile; pedicels subcapillary, ascending to recurved; calyx usually pilose or villous (especially at base); calyx lobes oblong-lanceolate, obtuse to acute, to 6 mm. long; petals shorter than the calyx, 2-parted, sometimes wanting; stamens 3 to 10; capsule ovoid, equaling or exceeding the calyx; seeds tuberculate, about

1 mm. long. A Euras. plant that has become naturalized in waste places, damp woods, thickets and about old homesteads, in the e. third of Tex.

2. *Stellaria cuspidata* Willd. MEXICAN STARWORT. Plants flaccid, usually forming mats over rocks and soil, commonly glutinous to the touch; stems weak, dichotomously branched, glandular-pubescent or rarely subglabrous, to 7 dm. or more long; leaves with slender pilose petioles to 15 mm. long, membranous, triangular-ovate to ovate-oblong, truncate to cordate at base, acute to acuminate at apex, ciliate to subglabrous, to 3 cm. long and 2 cm. wide, usually much smaller; inflorescence leafy, laxly few-flowered; flowers with filiform pilose pedicels to 17 mm. long; sepals ovate-elliptic to elliptic, obtuse to subacute, with scarios margins, 4-6 mm. long, pubescent; petals white, 7-8 mm. long, narrowly cuneate, deeply notched at apex; capsule ovoid-ellipsoid, 6-7 mm. long, the partitions strongly revolute at apex; seeds with margins coarsely rounded-tuberculate. In moist soil in shade and on north-facing ledges, crevices, and at base of cliffs in mts. of the Trans-Pecos, Mar.-Oct.; also n. Mex.

3. *Stellaria prostrata* Baldw. LLOVISNA. Much-branched decumbent annual with glabrous or glandular-puberulent weak stems to about 6 dm. long; leaves broadly ovate to deltoid, acute to acuminate at apex, usually cordate or truncate at base, the blade usually 1-2 cm. long, rarely to 5 cm. long, equaled or surpassed by the slender but margined ciliate petiole; inflorescence open, leafy; pedicels subcapillary, 1-2 cm. long, a cending or erect; sepals ovate to elliptic-lanceolate, obtuse to subacute, to 4 mm. long, surpassed by the petals; capsule ovoid, somewhat longer than the calyx; seed obovoid, 0.7-0.8 mm. long, reddish-brown, papillate, the marginal papillae conspicuous and peglike. *Alsine Baldwinii* Small. Usually in moist soil in shaded areas along streams among brush and in groves in the South Plains, Edwards Plateau and Rio Grande Plains, Feb.-May; from Fla. to Ga. and Tex.

Stellaria crassifolia Ehrh., the linear-leaved northern "fleshy stitchwort" has been reported from the Gulf Coast of Texas, but we have not seen specimens from the state and are doubtful of its actual occurrence in Texas.

9. ARENARIA L.⁶⁰ SANDWORTS

Small usually tufted annual or perennial herbs; stems slender or wiry; leaves sessile to subpetiolate, exstipulate; flowers mostly white, in terminal cymose or capitate inflorescences or rarely axillary and solitary; sepals 5; petals 5 or sometimes wanting, entire to slightly notched or even bifid; stamens 10; styles 2 to 5, usually 3; ovary 1-celled, usually many-ovuled; capsule ovoid to spherical or ellipsoid, splitting into as many or twice as many valves as there are styles; seeds few to many, globose or reniform, often flattened.

About 150 species of wide geographical distribution, mainly in North Temperate Zone.

1. Capsules dehiscent by 6 (rarely 4 or 5) valves or teeth (2)
1. Capsules dehiscent by 3 valves or teeth (8)
- 2(1). Annuals, erect, slender, branching (3)
2. Perennials (Doubtful cases should be keyed under both alternatives) (5)
- 3(2). Sepals obscurely 3- to 5-nerved, puberulent; leaves ovate, 3-5 mm. long; stems uniformly puberulent 1. *A. serpyllifolia*.
3. Sepals prominently 1-nerved or rarely 3-nerved in *A. Benthamii*, usually glabrous; leaves lanceolate to elliptic-oblancheolate, usually more than 5 mm. long; stems glabrous or puberulent in lines (4)
- 4(3). Sepals noticeably dorsally keeled; distribution confined to igneous soils in mountains of Trans-Pecos Texas 2. *A. ludens*.
4. Sepals not prominently keeled; widely distributed in limestone areas mostly in west-central Texas 3. *A. Benthamii*.
- 5(2). Leaves with a distinct herbaceous blade, ovate or obovate to narrowly lanceolate or oblancheolate (6)
5. Leaves narrowly linear and more or less pungent, setaceous or subulate (7)

⁶⁰ Adapted from Bassett Maguire in Am. Midl. Nat. 46:493-511. 1951.

- 6(5). Plant glandular-pubescent throughout or glabrate below; stem strongly angled, the branches often spreading at right angles; leaves on main stem noticeably larger than those on the branches 4. *A. Jamesiana*.
6. Plant at most only minutely pubescent; stems terete, the branches erect-spreading; leaves similar in size throughout 5. *A. lanuginosa*.
- 7(5). Plants low, matted, mosslike, to 2 cm. high; leaves 4 mm. long 6. *A. livermorensis*.
7. Plants more than 5 cm. high; leaves 50-100 mm. long .. 7. *A. Fendleri*.
- 8(1). Perennial 8. *A. stricta*.
8. Annuals (9)
- 9(8). Sepals typically elliptic-lanceolate, acute, strongly 3- to 5-ribbed 9. *A. patula*.
9. Sepals typically ovate, obtuse, not prominently ribbed .. 10. *A. Drummondii*.

1. *Arenaria serpyllifolia* L. THYME-LEAVED SANDWORT. Annual, the stems simple to intricately forking, to 2 dm. high; branches cinereous-puberulent; leaves ovate, sessile, acute to acuminate, ciliate, scabrous, to 7 mm. long; inflorescence a leafy nearly regular panicle of dichotomous cymes; pedicels straight, to 1 cm. long; fruiting calyx 3-4 mm. long, 2-3 mm. broad at base, composed of lanceolate to ovate-lanceolate acuminate 3-nerved scabrous sepals; petals oblong, shorter than the sepals; capsule ovoid to flask-shaped, its 2-cleft olive valves hard and resistant; seeds globose-reniform, opaque, strongly rugose, about 0.6 mm. long. Fields, roadsides and open flats in sandy or rocky soils in e. and cen. Tex., Mar.-July; a Eur. adv. that has become naturalized from Fla. to Tex., n. to Que., Tenn. and Mo.

2. *Arenaria ludens* Shinners. Plant apparently annual, to 45 cm. high, commonly branched from the base; stems slender and erect or spreading, puberulent in lines; leaves opposite, ciliate at base, usually obovate-lanceolate on lower part of stem to linear-lanceolate above, acute to subacuminate, to 2 cm. long and 4 mm. wide; inflorescence few-flowered, laxly cymose, the bracts small; pedicels puberulent, to 2 cm. long; sepals ovate-lanceolate to narrowly lanceolate, acuminate, 3-4 mm. long, scarious, with a green dorsal keel along the solitary nerve that is sometimes ciliate below the middle; petals white, oblong, obtuse, about equal to or somewhat shorter than the sepals; capsule ovoid, with 4 or 6 valves; seeds dark-brown to blackish, about 0.5 mm. in diameter. In igneous soil on cliffs and ledges, and about springs, in the mts. of the Trans-Pecos, Aug.-Oct.; also n. Mex.

This species is closely allied to *A. Benthamii*. Its apparent geographical separation and its occurrence in igneous, not limestone, soils as well as its narrow dorsally keeled sepals set it apart from that species. It is also closely related to *A. lanuginosa*, but it is a more delicate plant with smaller flowers and vegetative parts.

3. *Arenaria Benthamii* Fenzl. Slender spreading or suberect annual, branched from the base, to 5 dm. high, the branches finely pubescent in lines; leaves elliptic-lanceolate to oblanceolate, acute and apiculate, often punctate, narrowed to a sessile more or less ciliate base, to 2 cm. long, usually much smaller, the floral leaves much-reduced; pedicels filiform, several to many times exceeding the sepals; sepals ovate to ovate-lanceolate, acute to acuminate, 3-4 mm. long, the margins scarious; petals elliptic, obtuse, much shorter than the sepals; capsules ovoid, 6-toothed, 3-4 mm. long; seeds dark-brown, minutely tuberculate. On open limestone slopes, among boulders and in open woodlands in n.-cen., cen. and s. Tex., w. to the e. Trans-Pecos, Mar.-July; also Okla.

4. *Arenaria Jamesiana* (Torr.) Shinners. STICKY STARWORT. Plant perennial, glandular-pubescent throughout or glabrate below; stems strongly angled, diffusely branched, erect or ascending, to 35 cm. high; leaves elongated, lanceolate to linear-lanceolate, attenuate to an acute apex, smooth, to 1 dm. long and 15 mm. wide near the closely sessile or clasping base, the leaves on main stem noticeably larger than those of the branches; flowers in loose leafy-bracted terminal or axillary cymes; pedicels about 8 mm. long; sepals herbaceous, oblong-lanceolate, subacute, 4-5 mm. long, scarious-margined; petals retuse to bifid at apex, sometimes cleft for half their length, much-exceeding the sepals; capsule ovoid, shorter than calyx, 6-toothed. *Stellaria Jamesiana* Torr. Rare under conifers

at high elev. in the mts. of the Trans-Pecos, Aug.-Oct.; from w. Tex., w. to Calif. and Wash.

5. *Arenaria lanuginosa* (Michx.) Rohrb. Perennial with more or less creeping subterranean stems; flowering stems lax, weak and reclining or sometimes trailing, to about 6 dm. long, with lines of minute pubescence; leaves thin, lanceolate to narrowly elliptic or linear-oblancoate, acute or pungent, narrowed to a somewhat ciliate base, to 3 cm. long and 8 mm. wide, more or less punctate; flowers axillary, subtended by leafy bracts; pedicels slender, puberulent, to 4 cm. long; sepals lanceolate, acute to acuminate, 3-4 mm. long, somewhat dorsally keeled along the solitary midnerve; petals white, about half as long as sepals, sometimes wanting; capsules about 5 mm. long; seeds smooth, shining, black, flattened, about 1 mm. in diameter. *A. alsinoides* Willd. In loam of damp woods, shaded ditches and other such places mainly in e., cen. and w. Tex., uncommon, June-Oct.; from Fla. to Tex. and Mex., n. to Va.; also W.I. and S.A.

Plants that occur in Culberson and Jeff Davis counties are referable to var. *cinerascens* (Robins.) Shinn. They are somewhat more rigid than in var. *lanuginosa*, grayish throughout with a fine pubescence, and leaves pungent. Also, their flowers have petals that are about half as long as the sepals.

6. *Arenaria livermorensis* Correll. Plants low, perennial, matted, mosslike, to 2 cm. high, mostly much smaller; stems filiform, branched near base, the internodes alternately grooved on opposite sides, often ciliate; leaves opposite, linear, pungent, about 4 mm. long and 1 mm. wide, rigid, prominently 1-nerved, the margins bristly-ciliate, usually with a fascicle of smaller leaves or a short leafy branchlet in leaf axils; flowers solitary in upper leaf axils; pedicel filiform, 6-10 mm. long, usually puberulent; sepals lanceolate, acute to acuminate, concave, 1-nerved, about 3 mm. long; petals absent; stamens about 8, the filaments arising from a fleshy lobulate disk; styles 3, separate to the base; capsule ovoid, 6-toothed, about 1 mm. long; seeds 5, subglobose, brownish, smooth, about 0.5 mm. in diameter. In crevices of cliffs and on bare walls, rare in the Davis Mts. of the Trans-Pecos, Aug.-Oct.; endemic.

7. *Arenaria Fendleri* Gray. Plant grasslike, rather pale and glaucous, finely glandular-pubescent above; stems often numerous, erect, leafy, to about 3 dm. high, closely aggregated at the apex of a thick branched woody rootstock; basal leaves setaceous, gramineous, ciliate or smooth, to 2 dm. long, somewhat pungent; cauline leaves gradually shorter, connate and sheathing at the base; inflorescence dichotomously cymose, glandular-pubescent, few- to many-flowered; pedicels about 1 cm. long at anthesis, glandular; sepals lanceolate to linear-lanceolate, attenuate, glandular, about 6 mm. long; petals obovate, white or pale-yellow, usually exceeding the sepals; capsules ellipsoid, exceeded by the sepals. On ledges and in crevices of cliffs and boulders at high elev. in the mts. of the Trans-Pecos, July-Sept.; from Tex., w. to Wyo., Ut. and Ariz.

8. *Arenaria stricta* Michx. ROCK SANDWORT. Loosely tufted perennial, becoming diffuse, to 3 dm. high, glabrous throughout; stems filiform, wiry, branching from the marcescent leafy base; leaves subulate-setaceous to -linear, strongly ribbed, rigid, the principal ones to 15 mm. long, usually subtending conspicuous dense fascicles of shorter leaves; loosely cymose above, to 30-flowered; sepals firm, ovate to lanceolate, acuminate, strongly 3- to 5-ribbed, 4-5 mm. long; petals oblong-obovate, to twice as long as the sepals; capsule slenderly ovoid, about equaling or slightly overtopping the calyx, the valves entire; seeds nearly black, rugose, 1 mm. long. On rocky hills from s.-cen. Tex. to the High Plains, Apr.-June; from O. to Neb., s. to Ark. and Tex.

Most of our material is referable to var. *texana* Robins. [*A. texana* (Robins.) Britt.], a usually more rigid plant that is 1-2 dm. high; leaves 5-10 mm. long, connate at the enlarged nodes; inflorescence denser; sepals lanceolate, almost cartilaginous, the edges inrolled.

9. *Arenaria patula* Michx. Diffusely branched annual with capillary stems to 3 dm. high; leaves slightly fleshy, linear-filiform to linear-lanceolate, to 4 cm. long and 3 mm. wide; pedicels divergent, to 45 mm. long, often glandular; sepals elliptic to lance-attenuate, acute at apex, often somewhat glandular, to 6 mm. long, strongly 3- to 5-ribbed; petals obcordate, to 3 times the length of the sepals; capsule about equaling or exceeding the calyx, its blunt valves entire; seeds 0.5-0.6 mm. long. In sandy, clayey or gravelly soil in prairies, meadows, fields and on rock outcrops, mostly in e. Tex., Mar.-May; from Ala., Tex. and Ark., n. to e. Kan., O. and Minn.

Var. *patula* may be distinguished from var. *robusta* not only by its smaller more compact size, seldom attaining more than 15 cm. in height, but by its narrower leaves (1.5 mm. wide or less), prominently 5-ribbed sepals, capsules mostly shorter than the calyx, and its corolla scarcely exceeding the calyx.

Var. *robusta* (Steypm.) Maguire is a larger more open plant with wide leaves, 3-ribbed sepals, capsules commonly exceeding the calyx, and corolla prominently exceeding the calyx.

10. *Arenaria Drummondii* Shinnars. Plant annual, to about 2 dm. high, the simple or sparsely branched stems and inflorescence mostly glandular-pubescent; leaves linear to linear-oblong or rarely linear-oblongate, obtuse, essentially glabrous, somewhat succulent, to 35 mm. long and 7 mm. wide, the upper leaves much-reduced but not scarious; flowers large for the plant, in dichotomous racemes; pedicels horizontally spreading, to about 25 mm. long, usually becoming reflexed in age; sepals ovate to elliptic, obtuse, scarious-margined, 5-7 mm. long; corolla white, sometimes greenish at base; petals obcordate, more or less deeply notched at the apex, to 15 mm. long, usually much-exceeding the calyx; capsule ovoid, vermucose, tan-color, about as long as the calyx; seeds muriculate, brownish. *Stellaria Nuttallii* T. & G., not *Arenaria Nuttallii* Pax. In sandy soils mostly in open grassy woodlands in e., s.-cen. and s. Tex., Feb.-June; also Okla.

10. SAGINA L. PEARLWORT

About 25 species that are native to the Northern Hemisphere.

1. *Sagina decumbens* (Ell.) T. & G. Plant annual, usually without a basal rosette; stems capillary, erect, ascending or rarely decumbent, simple or slightly forking, to 17 cm. high; leaves linear-subulate, often spreading-recurved, slenderly mucronate, exstipulate; pedicels filiform, axillary, straight, not hooked after anthesis, glabrous or glandular-pubescent above, to 25 mm. long; sepals 4 or 5, oblong to elliptic, obtuse, with scarious margins, to 2.5 mm. long, closely appressed-ascending; petals none or 1 to 5 and rudimentary or sometimes equaling or slightly exceeding sepals; stamens 3 to 10; styles as many as sepals and alternate with them; capsule slenderly ovoid, 2-3.5 mm. long, 1-2 mm. thick, its valves as many as sepals and opposite them, mostly recurved at apex after dehiscence; seeds reddish-brown, delicately marked with slender ridges, 0.2-0.3 mm. long. In moist or dryish fields, along paths and in open places in woods in e., cen. and s. Tex., Feb.-June; from Fla. to Tex., n. to e. Mass., s. Vt., s. N.Y., Ky., Ill., Mo. and e. Kan.

11. LOEFLINGIA L.

About 7 species in both hemispheres.

1. *Loeflingia squarrosa* Nutt. Small globose plants that are to 15 cm. high and about as wide, more or less glandular-pubescent throughout; stems diffusely much-branched from the base, somewhat rigid, spreading or ascending, often recurved; leaves crowded, subulate-setaceous, 4-6 mm. long, rather rigid and straight or recurved; stipules ovate-lanceolate to linear, much longer than wide; flowers inconspicuous, axillary, sessile, solitary or in fascicles; sepals 5, similar to the leaves but a little shorter, carinate, recurved and conspicuously awned (the 3 outer with a setaceous tooth on each side); petals minute, 3 to 5, sometimes wanting; stamens 3 to 5; style very short or lacking; stigmas 3; ovary 1-celled, triangular; capsule slender, 3-valved, shorter than or equaling the sepals; seeds several, obovate. *L. texana* Hook. Dry soils or loose sands in e., cen. and w. Tex., Feb.-May; from Tex. to Neb. and Calif.

12. POLYCARPON L. POLYCARP

About 16 species of wide distribution in temperate and tropical regions.

1. *Polycarpon tetraphyllum* L. Stems diffusely much-branched from the base, ascending or prostrate, to 15 cm. long, glabrous; leaves opposite or often in fours, flat, broadly oval to obovate, to 15 mm. long and 8 mm. wide, obtuse to rounded at apex, rather

abruptly narrowed to a short petiole; stipules and bracts scarious, lanceolate-acuminate; flowers numerous, small, cymose; sepals 5, scarious-margined, 2-3 mm. long, the prominent keel obscurely serrulate; petals 5, white, very thin, oblanceolate, smaller than the sepals; stamens 3 to 5; styles simple, short, 3-cleft; ovary 1-celled; capsule ovoid, 3-valved; seeds ovoid. In sandy or silty soils along beaches, edge of woods and along beaten paths in cen. and s. Tex., Mar.-July; an adv. from Eur.

13. PARONYCHIA MILL.⁶¹

WHITLOW-WORT

Low tufted annual or perennial dryish herbs, often with a woody base; leaves opposite, sessile, provided with usually conspicuous scarious stipules; flowers small, clustered or scattered in dense or loose cymes or in the forks of the stem, subtended by scarious bracts; calyx 5-parted, the lobes awn-tipped to mucronate or cuspidate; petals none or reduced to setiform staminodia; stamens 2 to 5, inserted at base of calyx; style 2, united nearly to stigmas; utricle membranous, mostly included in calyx, 1-seeded.

About 55 species in temperate and tropical regions of both hemispheres.

1. Plants annual or biennial; branches typically lax and widespreading (2)
1. Plants perennial; branches typically straight and erect or erect-ascending, rarely prostrate (8)
 - 2(1). Leaf blades flat, at least some 2 mm. broad or more (3)
 2. Leaf blades needlelike, always less than 2 mm. broad (5)
 - 3(2). Sepals concolorous, with only a short cusp or mucro on the back of the hood 1. *P. fastigiata*.
 3. Sepals with a distinct white margin, bearing a well-developed white awn at the summit (4)
 - 4(3). Main stem usually branched well above the base, the stoutish branches erect-spreading; distribution Aransas County and eastward 2. *P. Drummondii*.
 4. Main stem usually branched at or near the base, the slender branches commonly spreading on ground; distribution Aransas County and southward 3. *P. Jonesii*.
 - 5(2). Calyx of uppermost flowers noticeably exceeded by the subtending leaves 4. *P. setacea*.
 5. Calyx of uppermost flowers longer than the subtending leaves (6)
 - 6(5). Flowers mostly solitary and separate; calyx (including awn) usually 2 mm. long or less 5. *P. Lindheimeri*.
 6. Flowers mostly clustered; calyx (including awn) more than 2 mm. long (7)
 - 7(6). Plant glabrous, the branches erect-spreading; endemic to the Davis Mts. in Trans-Pecos Texas 6. *P. monticola*.
 7. Plant pubescent or puberulent, the branches widespreading or sprawling; endemic to central Texas 7. *P. chorizanthoides*.
 - 8(1). Sepals with conspicuous white margins and a white awn (9)
 8. Sepals without white margins and a white awn (10)
 - 9(8). Plants spreading, the elongate branches prostrate; leaves spreading, exceeding the stipules; calyx awn about 1 mm. long; in Rio Grande Plains 8. *P. Maccartii*.
 9. Plants pulvinate, the short branches erect or erect-ascending; leaves ascending, shorter than the stipules; calyx awn 1.5-2 mm. long; in Trans-Pecos Texas 9. *P. Wilkinsonii*.
 - 10(8). Plants densely pulvinate; calyx much-exceeded by the bracts or subtending leaves 10. *P. sessiliflora*.
 10. Plants not pulvinate; calyx usually exceeding the bracts or subtending leaves, rarely shorter in *P. Jamesii* (11)

⁶¹ Adapted partly from E. L. Core in Am. Midl. Nat. 26:369-397. 1943.

- 11(10). Sepals narrowly triangular-lanceolate, prominently 3-ribbed, 3-4.5 mm. long (12)
11. Sepals oblong to oblong-elliptic, not noticeably ribbed, usually less than 3 mm. long (13)
- 12(11). Plants strictly erect, when mature reddish-brown . . . 11. *P. Parksii*.
12. Plants mostly weakly ascending; when mature yellowish-green 12. *P. virginica* var. *scoparia*.
- 13(11). Plants completely glabrous; flowers mostly solitary and separate 13. *P. nudata*.
13. Plants scabrous to puberulent or pubescent; flowers mostly clustered (14)
- 14(13). Plants densely short-pubescent throughout; calyx awns short, erect or even turned inward; endemic to the Rio Grande Plains . . . 14. *P. congesta*.
14. Plants scabrous to puberulent or rarely short-pubescent; calyx awns usually prominent and spreading; mostly north of the Rio Grande Plains 15. *P. Jamesii*.

1. *Paronychia fastigiata* (Raf.) Fern. Annual; stem erect, branched well above the base, low and spreading, to 3 dm. tall; branches slender, densely disposed, wiry, short-jointed, pubescent; leaves flat, thickish, oblanceolate to linear-elliptic, to 15 mm. long and 3 mm. wide, pale-green, acute; stipules narrow, slender-tipped; cymes compact; sepals ovate, acute, 3-ribbed, with very narrow or obscure margins, less than 1 mm. long, slightly mucronate; styles 2, very short; utricle obovoid, flat-topped, shorter than the calyx. *Anychia dichotoma* of auth., not Michx. Dry woods or sandy openings in e. Tex., June-Aug.; from Fla. to Tex., n. to Mass. and Minn.

Those plants with bracts longer, not shorter, than the flowers are segregated as var. *paleacea* Fern.

2. *Paronychia Drummondii* T. & G. Annual or biennial; mainstem erect, the branches spreading, minutely pubescent, 10-25 cm. high, branching above into numerous cymes; leaves linear-oblong to oblanceolate, acute, the uppermost short-mucronate, to 25 mm. long and 2 mm. broad or more, ciliate, appressed-pubescent on both surfaces, rigid, attenuate to the sessile base; stipules lanceolate, long-acuminate, silvery, shorter than the leaves; calyx turbinate at the base, with a ring of hooked hairs; sepals cuneate, about 1.5 mm. long, red-brown with broad white margins, dilated into a white hood above, the back produced into a short somewhat recurved horn. In sandy soil in dry oak and pine woods and in loose sand of dunes in s.e. Tex. from Aransas Co. eastw., Apr.-Oct.; endemic.

A recent worker has divided this species into two subspecies as shown in the following key:

1. Leaves often strigose; flowers (1.75-) 2-2.25 (-2.5) mm. long; sepals with a conspicuous hood and awn; receptacle densely hairy; style 0.45-0.6 mm. long and shortly bilobate; ovary slightly papillose subsp. *Drummondii*.
1. Leaves mostly more or less glabrous; flowers 1.5-1.6 (-1.75) mm. long, often glabrous on the sepals but with a ring of hairs in the perigynous zone; hood tip short and the awn 0.25-0.3 mm. long; ovary papillose; style to 0.35 mm. long and often deeply 2-cleft subsp. *parviflora* Chaudhri.

3. *Paronychia Jonesii* M. C. Johnst. Annual herbs, taproot very slender; main stem slender, erect, only 1-2 cm. long, producing above several slender prostrate pseudodichotomous olive-brown pubescent branches as much as 5 dm. long; leaves oblanceolate, apically rounded, basally very long-attenuate, covered with fine white antrorse somewhat viscid spreading hairs, to 4 cm. long and 8 mm. broad; stipules scarious; cymes dense and with numerous minute bractlike leaves; sepals strigose, about 1.5 mm. long, linear-obovate, erect, cucullate and crested dorsally by a divergent mucro less than 0.5 mm. long, with white scarious margins; petals reduced to minute setaceous staminodelike rudiments a third the length of the calyx lobes. In loose coarse sand on dunes and open hills, and in sandy loam of mesquite plains in s. Tex. from Aransas Co. southw., Mar.-Dec.; endemic.

4. *Paronychia setacea* T. & G. Annual; stem glabrous to very rarely finely pubescent throughout, erect to erect-ascending, sometimes glaucous, 12-30 cm. high, branching into the many times dichotomous diffuse cyme; leaves subulate-setaceous, erect or nearly so, 5-30 mm. long, less than 1 mm. wide; stipules shorter than the leaves, lanceolate, attenuate into a long point; uppermost flowers usually much shorter than the subtending leaves; sepals about 2 mm. long, brownish to yellowish-green, oblong-linear, strigose-hirsute at the base, minutely scarious on the margin, the tip hooded and produced into a straight whitish or yellowish awn sometimes about as long as the body of the sepal. On rocky hills, flats, gravel and in sandy or silty soils from s.-cen. Tex., w. on the Edwards Plateau to the Trans-Pecos and s. to the Rio Grande Plains, Apr.-Aug.; endemic.

Those plants with bracts distinctly longer than the flowers are segregated as var. *longibracteata* Chaudhri.

5. *Paronychia Lindheimeri* Engelm. Plant annual or biennial, often glaucous; stems slender, wiry, glabrous or (at most) minutely scabrous, erect to widespreading, to 3 dm. high, much-branched from near base into dichotomous diffuse cymes; leaves sessile, setaceous or filiform, cuspidate, to 15 mm. long, less than 1 mm. wide; stipules narrowly lanceolate, silvery, shorter than the leaves; cymes open; calyx short-pubescent at the base; sepals oblong, slightly hooded within, 1.7-2 mm. long, terminating in a short cusp. In rocky, sandy or gravelly soil and on or about boulders on the Edwards Plateau, with isolated stations in e. and Trans-Pecos Tex., July-Nov.; also s.e. N.M.

Those plants with bracts as long as or longer than the flowers are segregated as var. *longibracteata* Chaudhri.

6. *Paronychia monticola* Cory. Annual, erect, open, as wide as high, glabrous; stems 10-15 cm. tall, 1-1.5 mm. thick, slender, branching at the base or to 3 cm. above the base, more or less repeatedly dichotomous; leaves setaceous, glabrous, shorter than the internodes, 1 cm. long or less; with the stipules lanceolate, silvery, 4 mm. or less long; the cymes loose, with exception of the uppermost the pedunculate cymes divided into 2 parts with a single flower in the axil of the branches, sessile or shortly pedicellate; inflorescences with 2-bracteolate branches, with the bracts agreeing with the leaves, the upper ones small, the last ones shorter than the calyx; calyx greenish-yellow, strigose at the base; sepals oblong, cucullate within, 2-2.5 mm. long, the apical seta 0.25 mm. long or shorter. Rare on summit of the Davis Mts. in the Trans-Pecos, Aug.-Oct.; endemic.

7. *Paronychia chorizanthoides* Small. Annual; stems slender, minutely pubescent or puberulent, 1-2.5 dm. tall, commonly forking near the base; leaves linear-filiform, 5-20 mm. long, less than 2 mm. broad, acute; stipules lanceolate, silvery, acuminate; flowers creamy-white, short-pedicelled or nearly sessile, in clusters; calyx urn-shaped, strigose at the base which is finally much-enlarged; sepals ovate or ovate-lanceolate, about 1.5 mm. long, with a stout midrib, abruptly contracted into rather stout erect or ascending to spreading prominent cusps that are sometimes as long as the body of the sepals. Dry black calcareous soil or sandy-gravelly slopes in s.-cen. Tex. and Edwards Plateau, June-Nov.; endemic.

8. *Paronychia Maccartii* Correll. Perennial (or biennial?), branched from the base; stems weak, prostrate, puberulent, laxly branched; leaves flat, linear-oblong to linear-lanceolate, to 1 cm. long and 1.5 mm. wide, tipped with a prominent white awn, minutely puberulent, with age becoming conduplicate and recurved, usually slightly exceeding the narrowly attenuate silvery stipules; flowers clustered, exceeding the silvery bracts; sepals purplish-brown, conspicuously white-margined, about 3 mm. long (including the apical white recurved awn), adorned on inner surface with a tuft of hairs at base of awn, noticeably pubescent at the swollen base on outer surface; style short. In hard-packed brick-red sand in Webb Co. in the Rio Grande Plains, Mar.-Apr.; endemic.

This is a laxly branched, prostrate plant with distinctive leaves and calyx.

9. *Paronychia Wilkinsonii* Wats. Perennial, with numerous stems from a branching caudex, puberulent throughout, 4-8 cm. high, with many short internodes; leaves flat, linear to linear-subulate, nerveless, attenuate from near the base to the prolonged apex, 4-8 mm. long, exceeding the internodes, to 1 mm. wide, densely puberulent; stipules narrow, scarious, bilobed, as long as the leaves, finally widespreading; flowers in close terminal cymes; bracts shorter than or about equaling the flowers; sepals about 3 mm. long, densely puberulent, the white awns at least half as long as the body of the sepal

and soon widespreading; fruit globose. On novaculite ridges in Brewster Co. in the Trans-Pecos, June-Oct.; also Chih.

Similar in habit and appearance to *P. sessiliflora* of the Texas Panhandle and northward but the white widespreading sepal awns are quite striking in contrast to the brown suberect awns of that species.

10. *Paronychia sessiliflora* Nutt. Plants yellowish-green, arising from a ligneous perpendicular caudex often 1 cm. thick; stems very densely cespitose, 4-10 cm. high, much-branched and crowded; leaves linear-subulate, 4-6 mm. long, chartaceous, spinulose-tipped, often ciliolate, imbricated, the lower erect, obtuse, the upper longer, recurved-spreading, arcuate or ascending, acute or mucronate; stipules subulate, 2 cleft, bicarinate; slightly shorter than the leaves; flowers terminal, solitary (or paired), sessile; bracts carinate, usually equaling the flowers; sepals oblong-linear, 3-nerved, pubescent at the base, 2-3 mm. long, red-brown with narrow scarious margins, arched at the summit within, with divergent setaceous awns often half as long as the body of the sepal. On bare stony hillsides, breaks and ravines in the High Plains, May-Aug.; from Tex. and N.M., n. to Sask. and Alta.

11. *Paronychia Parksii* Cory. Perennial plants becoming reddish-brown with age, densely cespitose, with rigid tight entirely erect stems, inflorescence not included, unbranched, 35-55 cm. tall, to 2 mm. thick, rough and puberulent; leaves subulate, mucronate, 2-2.5 cm. long, 1 mm. wide or less, the lower smaller, the higher longer than the internodes, puberulent and scabrous; stipules linear-lanceolate, long drawn out and silvery, divided to the apex more or less deeply, 6-10 mm. long; cymes 6 to 8 times divided, spreading, clustered and erect, many-flowered; bracts conforming with the leaves, the upper ones equaling the calyx; calyx to 1.5 mm. wide at the base, beyond the center scarcely 0.75 mm. wide, rough; sepals linear, 3-nerved, cuspidate, greenish-yellow, 4-5 mm. long, with a point 1 mm. long or longer, within subcucullate, with a short rough edge. On rocky soil in cen. Tex., July-Sept.; endemic.

This plant appears to be little more than a habit variation of *P. virginica* var. *scoparia*. It is here maintained until further study is made on this genus.

12. *Paronychia virginica* Spreng. var. *scoparia* (Small) Cory. Perennial plants that become yellowish to yellowish-brown with age, from a thick procumbent ligneous base; stems densely cespitose and branching from the base, erect to ascending, nearly simple above, 1.5-4 dm. high, glabrous or minutely puberulent, rigid, wiry; leaves subulate, mucronate, 15-25 mm. long, about 1 mm. wide, exceeding the internodes, erect, 2-sulcate beneath, glabrate or nearly so; stipules linear-lanceolate, long-attenuate, silvery, entire, the adjacent ones more or less united, 8-13 mm. long; cymes many times dichotomous, diffuse, fastigiate, many-flowered; bracts similar to the leaves; sepals linear, 3-ribbed, cuspidate, slightly cucullate at the apex within, yellowish to brown, with a narrow scarious margin, glabrous or sparsely pubescent, about 3 mm. long. *P. dichotoma* (L.) Nutt. On limestone hills and outcrops in the e. Edwards Plateau and n.-cen. Tex., July-Nov.; from cen. Tex., n. through e. Okla. to w. Ark.

13. *Paronychia nudata* Correll. Perennial to 25 cm. high, glabrous throughout except for the basal part of calyx; stems erect or erect-ascending, wiry, branched above, often somewhat glaucous; leaves linear, sharp-pointed, incurved-appressed against stem, to 15 mm. long, becoming greatly abbreviated in the cymose inflorescences; stipules silvery, narrowly triangular-lanceolate and long-attenuate, much shorter than the leaves; flowers solitary, conspicuously exceeding the ovate silvery bracts and greatly reduced adjacent leaves to stand exposed; sepals white or yellowish, 2.5-3 mm. long including the short slightly spreading yellowish apical awn. On limestone ledges and canyon walls, rare in w. Edwards Plateau and the Trans-Pecos, May-Aug.; endemic.

The glabrous and often glaucous stems, leaves abruptly and conspicuously abbreviated in the inflorescence, and essentially naked flowers are distinctive characteristics of this species. It superficially resembles *P. Jamesii*.

14. *Paronychia congesta* Correll. Perennial, about 1 dm. high, all parts (except the scarious stipules and bracts) densely covered with short often porrect hairs; stems clustered, simple or more or less branched, both stems and branches provided at their base with numerous congested imbricate leaves and bracts; leaves linear, sharp-pointed,

typically appressed to stem, those on middle of stem 5-6 mm. long, usually about equal in length to the lanceolate silvery stipules; flowers in clusters at apex of branchlets, noticeably exceeding the bracts and leaves; calyx lemon-yellow; sepals about 2.5 mm. long including the short erect apical spine; style about 0.5 mm. long. On rocky slopes of breaks on Rio Grande Plains, May-July; endemic.

The dense vestiture of short hairs, the numerous, congested imbricate leaves and bracts at the base of the stems and primary branches, the flowers exceeding the bracts and leaves, and the short erect calyx awn are distinctive characteristics of this species.

15. *Paronychia Jamesii* T. & G. Perennial; stems caespitose, much-branched from the base, minutely scabrous to short-pubescent or rarely subglabrous throughout, to 3 dm. high, erect or somewhat spreading, more or less dichotomously branched above, woody below; leaves sessile, linear-subulate, mucronate or cuspidate, to 2 cm. long, less than 1 mm. wide; stipules silvery, linear-lanceolate, setaceous, to 1 cm. long; cymes dichotomous, few-flowered, crowded, the branches ascending or spreading, with a central subsessile flower in each group; sepals strigose-pubescent at the base, linear-oblong, with an ascending or spreading cusp, hooded within at the summit 2-3 mm. long (including the cusp), typically exceeding the subtending leaves; utricle ovoid, less than 1 mm. in diameter. *P. Wardii* Rydb. On rocky slopes and breaks, dunes, sandhills and hard clayey soils, in dry areas on the Edwards Plateau, w. to the Trans-Pecos and n. to the High Plains, May-Nov.; from Tex. to Neb., Colo., Ariz. and Mex.

This species is widespread in the western half of Texas which no doubt accounts, in part, for its perplexing variability. In habit its stems may be weakly ascending to strictly erect and the glaucous to shining green plant may be merely scabrous to densely short-pubescent. The length of the typically spreading calyx awns is also most variable. The calyx usually exceeds or is equal to the subtending leaves, but plants with the calyx exceeded by the leaves are found mainly in west and northwest Texas and are segregated as var. *praelongifolia* Correll. The plants may represent juvenile specimens or new growth as they flower mostly from May to July, but they may also represent a genetical variation.

A recent work segregates as var. *parviflora* Chaudhri those plants with flowers 1.5-1.75 mm. long, and as var. *hirsuta* Chaudhri those plants with stems densely short-hirsute, leaves shortly appressed-pubescent and sepals hirtellous.

14. SPERGULA L.

An Old World genus of several species.

1. *Spergula arvensis* L. CORN-SPURRY. Annual herbs similar to *Spergularia*; stems slender, erect or ascending, branching from the base, to 45 cm. high, essentially glabrous or more or less glandular-pubescent; leaves in whorl-like fascicles at the nodes, mostly narrowly linear, blunt at apex, somewhat fleshy, channeled beneath, to 5 cm. long; stipules minute, connate; flowers white, in loose terminal paniculate cymes; pedicels slender, often reflexed in fruit; sepals and petals 5; sepals ovate, obtuse, 3-5 mm. long, scarious-margined; petals obovate, entire, usually about equaling the sepals; stamens 5 or 10; styles 5, short, alternate with the sepals; capsule ovoid-conical, exceeding the sepals, dehiscent by 5 valves that are opposite the sepals; seeds black, roughened, compressed, acutely angled. A widespread Eur. weed, usually in cult. ground, in n.e. Tex., Mar.-July; from Nfld. to Alas., s. to Va., Mo., Tex. and Calif.

15. SPERGULARIA J. & C. PRESL⁶² SAND-SPURRY

Low branching annual or perennial herbs; leaves opposite or sometimes fascicled, linear to filiform, fleshy or setaceous; stipules scarious; flowers pink or whitish, in terminal racemose bracted or leafy cymes; sepals 5; petals 5, fewer or sometimes wanting, entire; stamens 2 to 10; ovary 1-celled, many-ovuled; styles 3; capsule 3-valved to the base;

⁶² Adapted partly from Ruth P. Rossbach in *Rhodora* 42:57-83, 105-143, 158-193, 203-213. 1940.

seeds reniform-globose or compressed, smooth or roughened, often finely sculptured and sometimes echinate or winged.

About 40 species mostly in saline soils, widely distributed.

1. Plant glabrous throughout; cyme much-compounded; sepals to 1.6 mm. long; mature capsules 1.4-2.6 mm. long; seeds 0.4 mm. long or less, never winged 1. *S. platensis*.
1. Plant more or less glandular-pubescent (at least in the inflorescence); cyme lax; sepals 1.6 mm. long or more; mature capsules 3 mm. long or more; seeds 0.5 mm. long or more, wingless or sometimes winged (2)
- 2(1). Seeds smooth or (at most) minutely papillose, usually dull in appearance 2. *S. marina*.
2. At least some seeds minutely echinate, more or less silver-tinged 3. *S. echinosperma*.

1. *Spergularia platensis* (St.-Hil. & A. Juss.) Fenzl. Annual diffusely branched plants, often forming depressed mats 2-3 dm. across, glabrous throughout, the ultimate branches filiform; leaves narrowly linear to filiform, mucronate, 1-3 cm. long, scarcely 1 mm. wide; stipules deltoid, acuminate, 1-3 mm. long; flowers numerous, in open cymes; pedicels filiform, 2-8 mm. long; sepals broadly lanceolate, 0.8-1.5 mm. long; petals white, minute or rarely none; stamens 5; capsule 1.5-2.5 mm. long; seeds brown, minute, less than 0.5 mm. long, strongly rough-tuberculate, not winged. *Spergula platensis* (St.-Hil. & A. Juss.) Shinners. In low wet saline soils in n.-cen. and s. Tex., Mar.-June; a nat. of S.A., introd. in Calif. and Tex.

2. *Spergularia marina* (L.) Griseb. SALT-MARSH SAND-SPURRY. Annual erect or more often diffuse fleshy plants with branches to 35 cm. long, usually more or less glandular-pubescent; leaves rarely fascicled, linear, bluntly mucronate, to 4 cm. long and 1.5 mm. wide; stipules triangular, about as long as broad or slightly longer, 2-4 mm. long; cymes usually lax, the lower and sometimes the upper bracts foliaceous and elongate or the upper much-abbreviated; sepals ovate to ovate-lanceolate, blunt, 2.5-5 mm. long, much-exceeding the white or pink petals; stamens 2 to 5; capsule ovoid, equaling or exceeding the calyx, 3.5-6.5 mm. long; the lower fruiting pedicels to 1 cm. long; seeds pale-brown or reddish, opaque, not sculptured, smooth or minutely papillose, 0.5-0.9 mm. long, wingless or with a thin friable wing. *S. salina* J. & C. Presl. In saline or brackish soils in depressions in dunes and on flats from e. Tex. along the coast to s. Tex. and apparently isolated along the Rio Grande near El Paso, Mar.-June; from Fla., n. to Que., B.C. and Ill., w. to Tex., Calif. and Wash.; also Euras.

3. *Spergularia echinosperma* Čelak. Annual diffuse plants with stems to 2 dm. long, usually more or less glandular-pubescent throughout; leaves linear, to 35 mm. long and 1.4 mm. wide, usually not fascicled or with only one leaf in the axil; stipules deltoid, 1.4-2.4 mm. long; cymes laxly flowered; sepals ovate, 2.4-3.6 mm. long; petals pink or rosy at the apex, 1.6-2.8 mm. long; stamens as many as 4; styles 3, separated to the base; mature capsule 3.4-5 mm. long, exceeding the calyx by 0.4-1.8 mm.; fruiting pedicels filiform, reflexed or not, 5-11 mm. long; seeds 0.5-0.8 mm. long, deep reddish-brown or nearly black with a silvery tinge, rounded in outline, surface always roughened, echinate, with or without a broad scarious white wing. *S. salsuginea* var. *bracteata* Robins. In salt marshes and flats and in dune pockets in e. Tex., along the coast to Corpus Christi, apparently isolated near Ft. Stockton, Feb.-June; introd. into s. U.S. from the Old World.

FAM. 70. NYMPHAEACEAE SALISB.

WATER-LILY FAMILY

Aquatic perennial herbs with horizontal rhizomes and peltate or cordate leaves floating or emersed, the submerged leaves (when present) capillary-dissected; vernation involute; flowers axillary, solitary, perfect; sepals usually 3 to 6, green to petaloid, free or slightly united, hypogynous; petals 3 to many, showy and inserted on the surface of the ovary, sometimes transitional to stamens; stamens 3 to many, extrorse or introrse; pistils 1 to several; fruit a many-seeded berry or nut, or 1- to 3-seeded, small and indehiscent.

About 75 species in several genera of wide geographic distribution.

1. Carpels united either along their sides or along the outer margins by adnation to a cuplike "receptacle;" stigmas radiate; ovules numerous in each cell; stamens numerous, introrse; fruit an irregularly dehiscent berry, ripening in the water; leaves with a basal sinus (2)
1. Carpels free or (in *Nelumbo*) embedded in the receptacle; ovules solitary or 1 to 3 in each carpel; stamens hypogynous, few to many (3 to 36) and extrorse or slightly introrse, or very numerous and extrorse; fruits leathery or hard, indehiscent; floating or emersed leaves peltate and lacking a sinus (3)
- 2(1). Perianth widespreading, composed of 4 sepals and 12 to 32 showy white, pink, blue or yellow petals; carpels sunken in a cup-shaped fleshy receptacle or hypanthium on the outer surface of which the petals and stamens are inserted, prolonged upward into slender incurved projections (carpellary styles); seeds arillate 1. *Nymphaea*, p. 631.
2. Perianth subglobose, composed of 6 concave yellow (green- or red-tinged) sepals and numerous scalelike or stamenlike "petals" inserted with the numerous stamens on the receptacle beneath the ovary; carpels completely united, the stigmas radiate and sessile on a disk; seeds not arillate 2. *Nuphar*, p. 632.
- 3(1). Perianth of numerous segments, the flowers large and showy; receptacle large, top-shaped, with the many uniovulate carpels sunken separately in cavities on the upper side, only the stigmas protruding; receptacle becoming enlarged greatly in fruit, the carpels maturing into nuts; stamens very numerous, extrorse, hypogynous; all leaves floating or emergent on strong petioles, centrally peltate, large, glaucous; plants lacking mucilage 5. *Nelumbo*, p. 633.
3. Perianth composed of 6 to 8 segments, the flowers small; receptacle small, with 4 to 18 free superior carpels; fruit small, 1- to 3-seeded; leaves all floating or submersed; plants more or less coated with mucilage (4)
- 4(3). Plants with dissected opposite submersed leaves and small peltate floating leaves; perianth petaloid, white or purplish; stamens 3 to 6 . . . 3. *Cabomba*, p. 632.
4. Plants with only undivided alternate peltate floating leaves; sepals persistent, the petals dull-purple; stamens 18 to 36; plants heavily coated (especially on lower leaf surface) with mucilage 4. *Brasenia*, p. 633.

I. NYMPHAEA L. WATER-LILY. WATER-NYMPH

Plants with floating leaf blades and white, pink, blue or yellow flowers; leaves subpeltate, cleft at the base; sepals 4, nearly free, spreading; petals few to many, spreading, the inner petals passing into stamens, the outer petals about as large as the sepals, all borne with the stamens on the hypanthium that encloses the ovary; ovary 12- to 35-celled, the concave summit tipped by a globular projection at the center around which are the radiate stigmas that project at the margin to extend as linear and incurved sterile appendages; fruit depressed-globose, usually covered with the persistent petal- and stamen-bases, maturing under water; seeds enveloped by a saclike aril.

About 50 species, widely dispersed in the tropics.

1. Corolla yellow; rootstock stoloniferous at the apex 1. *N. mexicana*.
 1. Corolla white, pinkish, blue or violet; rootstock not stoloniferous (2)
 - 2(1). Corolla white or pinkish; outer stamens not appendaged at the apex; carpels united at sides; styles subulate; flowers floating 2. *N. odorata*.
 2. Corolla blue or violet; outer stamens with the connective produced into an apical appendage; carpels free at the sides; styles mere blunt protuberances; flowers raised on peduncle above surface of water 3. *N. elegans*.
1. *Nymphaea mexicana* Zucc. YELLOW WATER-LILY, LAMPAZO AMARILLO. Rootstock warty with the persistent petiole bases; leaves oval to suborbicular, to 2 dm. wide, glabrous, bright-green above, purple or crimson on the lower surface; flowers 6-10 cm. wide; sepals lanceolate to narrowly elliptic-lanceolate; petals usually about 25, bright-yellow, more elliptic than the sepals; stamens 50 to 60, the petaloid stamens mostly 2-2.5 cm. long; anthers of the inner stamens 4-6 mm. long; styles 7 to 9; berry ovoid, 2-

2.5 cm. long; seeds 4-5 mm. in diameter. In lakes, ponds and slow streams in e. and s. Tex., spring-summer; also s. Fla. and Mex.

2. *Nymphaea odorata* Ait. WHITE WATER-LILY, ALLIGATOR-BONNET, NINFA ACUÁTICA. Rhizome stout, horizontal, elongate, mostly 2.5-3 cm. thick; leaves arising along the rhizome, suborbicular, to 25 cm. wide, with a narrow sinus, green above, green tinged with red or purplish-red and obscurely veined on the lower surface; flowers very fragrant; sepals often purplish on back, elliptic to ovate or ovate-lanceolate, to 8 cm. long and 25 mm. wide; petals usually more than 25, white, elliptic or slightly broadened upward, thickish; stamens mostly more than 70, the petaloid stamens 3-4 cm. long; styles mostly about 20; berry depressed-globose, mostly 2.5-3 cm. in diameter; seeds ellipsoid, about 2 mm. long. Incl. var. *villosa* Casp. and var. *gigantea* Tricker, *N. spiralis* Raf., *N. lekophylla* (Small) Cory, *Castalia odorata* (Ait.) Woodv. & Wood, *C. lekophylla* Small. In ponds, lakes, slow streams and ditches in s.e. Tex., Mar.-Oct.; from Fla. to Tex., n. to e. Can. and Man.

3. *Nymphaea elegans* Hook. BLUE WATER-LILY, LAMPAZOS. Rootstock stoutish; leaves ovate to oval-orbicular, to 2 dm. wide, usually much smaller, undulate-sinuate or nearly entire, usually dark red-purple and somewhat veiny on the lower surface; flowers usually raised on a slender peduncle 1-2.5 dm. above the water; sepals mostly lanceolate, 4-5 cm. long; petals 6 to 10, lanceolate or sometimes ovate-lanceolate, blue or pale-violet; stamens numerous; styles 15 to 25, mere blunt protuberances; berry depressed-globose, 1.5-3 cm. in diameter; seeds 1-1.5 mm. in diameter. *Castalia elegans* (Hook.) Greene. In ponds, pools and ditches in s. Tex., Apr.-July; also s. Fla. and Mex.

2. NUPHAR SM.⁶³

About a dozen or more species and their variants in the North Temperate Zone.

1. *Nuphar luteum* subsp. *macrophyllum* (Small) E. O. Beal. YELLOW COW-LILY, SPATTERDOCK. Perennial aquatic with procumbent branching cylindrical rhizomes; leaves spirally arranged, with a deep sinus at the base; petioles and peduncles with numerous minute air-cavities; exposed leaves floating or emergent and erect, broadly ovate to suborbicular, to 3 dm. long or more and 25 cm. wide, with overlapping to divergent basal lobes, glabrous to more or less pubescent on lower surface; submersed leaves (when present) thin and translucent, essentially like the floating ones in size and shape; petioles terete to more or less flattened above, glabrous to pubescent; flowers to 45 mm. across, and 25 mm. high; sepals 6, roundish, concave, the inner portion green to yellow, rarely red-tinged; petals numerous, small and thickish, stamenlike or scalelike, truncate to emarginate, inserted with the numerous short stamens on the receptacle under the ovary, not surpassing the disklike 5- to 25-rayed sessile stigma, mostly persistent and at length recurved; anthers 3-7 mm. long, yellow, sometimes red-tinged; fruit ovoid, slightly constricted below the entire to crenate stigmatic disk; stigmatic rays 5 to 23, mostly ending 1-2 mm. from the disk margin; stigmatic disk sometimes red-tinged; seeds numerous, broadly ovoid, 4-6 mm. long, 3.5-5 mm. wide. *Nymphaea microcarpa* Mill. & Standl., *N. ovata* Mill. & Standl., *N. puberula* Mill. & Standl., *Nuphar advena* of Tex. auth., *N. advena* β *tomentosa* Nutt., *N. microcarpum* (Mill. & Standl.) Standl., *N. ovatum* (Mill. & Standl.) Standl., *N. puberulum* (Mill. & Standl.) Standl. In water or on mud in ponds, shallow lakes, streams and springs, mostly on the Edwards Plateau and in e. Tex., Mar.-Oct.; throughout most of e. N.A.; also n. Mex. and Cuba.

Beal, the latest monographer of *Nuphar*, placed all Texas material in subsp. *macrophyllum*. We have found no reason to differ from his conclusions.

3. CABOMBA AUBL.

About a half dozen species in the warmer parts of the Western Hemisphere.

1. *Cabomba caroliniana* Gray. FANWORT. Delicate aquatic herbs rooting in mud; stems slender, branched, to 2 m. long or more, with a thin gelatinous coating; submersed leaves opposite or whorled, with petioles to 3 cm. long, rounded in outline, to 6 cm. wide, palmately dissected into linear-filiform segments; floating leaves few, alternate,

⁶³ Ref: E. O. Beal in Jour. Elisha Mitchell Sci. Soc. 72:317-346. 1956.

peltate, entire, linear-elliptic, mostly slightly constricted at the middle, often bifid at one end, usually pubescent beneath, to about 2 cm. long; flowers solitary on long slender axillary peduncles, to 12 mm. long, white or cream-color, with yellow spots at base and sometimes pink-tinged at tips; sepals 3; petals 3, oval, biauriculate above the abbreviated claw; stamens 6, the short anthers extrorse; carpels 2 to 4, with small terminal stigmas; fruit 3-seeded, indehiscent. In lakes, ponds and quiet streams mainly in e. Tex., Apr.-July; from Fla. to Tex., n. to Va., s. Ill. and e. Mo., somewhat naturalized farther n.

4. BRASENIA SCHREB.

A monotypic genus of wide distribution.

1. *Brasenia Schreberi* J. F. Gmel. PURPLE WEN-DOCK, WATER-SHIELD. Rootstock slender, creeping in mud; stems slender; leaves alternate, long-petioled, centrally peltate, floating, broadly oval to suborbicular, rounded at both ends, entire or rarely very shallowly crenate, thickish, smooth on upper surface, gelatinous on lower surface, to 10 cm. long; flowers axillary, small, dull-purple, emergent; sepals and petals 3 or 4 each, linear-oblong, 1-1.5 cm. long; stamens 18 to 36, the filaments filiform, the anthers slightly introrse; pistils 4 to 18, separate, the stigmas linear; fruits clavate, coriaceous, indehiscent, 6-8 mm. long. *B. purpurea* Casp. In lakes, ponds and slow streams in e. Tex., Apr.-May; from Fla. to Tex., n. to P.E.I., s. Que., s. Ont. and Minn., w. to s. B.C. and Ore.

The stems, petioles and lower surface of the leaves are heavily coated with a viscid, gluey jelly.

5. NELUMBO ADANS. SACRED BEAN

Represented in both hemispheres by one species each.

1. *Nelumbo lutea* (Willd.) Pers. YELLOW LOTUS, WATER-CHINQUAPIN, POND-NUT. Aquatic herb with slender rhizomes rooted in mud; leaves orbicular, centrally peltate, floating or mostly raised above the water on long stout petioles, to 7 dm. in diameter, with the center depressed or cupped; peduncles stout, rising to about 1 m. above the water surface, the solitary pale-yellow flower to 25 cm. broad; sepals and petals numerous, commonly 20 or more, scarcely differentiated, the outermost (external in the bud) green and sepaloid; stamens numerous, spirally inserted and closely surrounding the pistils; anthers extrorse, tipped with a slender hooked appendage; fruiting receptacle prolonged, obconic, to 1 dm. in diameter, the numerous 1-ovuled ovaries sunk in small pits on its flat truncate summit; fruit nutlike, indehiscent, each separately embedded in the accrescent receptacle, about 1 cm. in diameter. In quiet water of ponds and sluggish streams in the e. third of Tex., May-July; from Fla. to Tex., n. locally to s. N.E., N.Y., s. Ont., Minn. and Ia.

The farinaceous storage tubers along the rhizome are edible as well as the seeds.

FAM. 71. CERATOPHYLLACEAE S. F. GRAY HORNWORT FAMILY

Submersed aquatic rootless herbs, with a slender primary stem and scattered lateral branches; leaves whorled, sessile, finely dissected; flowers minute, unisexual, without a perianth, solitary and sessile in leaf axils, subtended by an 8- to 12-cleft involucre in place of a calyx; stamens 12 to 16, the filaments short, the rather large anthers terminating in 2 or 3 sharp points; pistillate flower consisting of a simple 1-celled ovary with a suspended orthotropous ovule; fruit an achene, beaked by the slender indurated style.

A monotypic family.

1. CERATOPHYLLUM L. HORNWORT. COON-TAIL

Characters of the family; plants olive-green; leaves usually 1- to 4-dichotomously dissected into filiform to narrowly linear divisions.

About 10 species that are widely dispersed.

1. Leaves usually forked 1 or 2 times, the divisions conspicuously serrate on one side; achenes without lateral spines 1. *C. demersum*.
1. Leaves usually forked 2 to 4 times, the divisions entire or only obscurely serrulate; achenes with 3 to 5 lateral spines 2. *C. echinatum*.

1. *Ceratophyllum demersum* L. COMMON HORNWORT. Plants entirely submersed; lowest leaves of seedling simple; stems prolonged, sometimes to 3 m. long, branched and forming large masses, brittle or somewhat cordlike and flexuous; leaves as many as 12 in a verticil, finely dissected into capillary to linear and flattened serrate divisions, very variable as to the length, breadth and toothing of the leaf divisions, usually about 15 mm. long; achene compressed, ellipsoid, wingless, smooth, 4-6 mm. long, with 2 basal spines 2-5 mm. long; style 4-6 mm. long. In quiet waters of lakes, ponds and slow streams throughout Tex. but mostly in the e. part of state, summer; from Que. to n. B.C., s. to Mex.; also Old World.

2. *Ceratophyllum echinatum* Gray. Plants entirely submersed, closely resembling *C. demersum*; lowest leaves of seedling cleft; stems prolonged and branched; leaves usually with entire capillary divisions, 1.5-2 cm. long, the uncleft base somewhat expanded; achene narrowly winged by the confluent bases of the lateral spines, with a somewhat tuberculate surface, 5-7 mm. long; style 5-10 mm. long. *C. demersum* var. *echinatum* Gray. In quiet waters of streams, lakes and pools, mostly in e. Tex., summer; from Fla. to Tex. and Mex., n. to s.w. N.B., s. Me., N.Y., O., Mich., Ill. and Minn.

FAM. 72. RANUNCULACEAE JUSS.

CROWFOOT FAMILY

Herbaceous or occasionally woody plants; leaves basal, alternate or in a few genera opposite or whorled; flowers hypogynous, regular or irregular (in *Delphinium*), with all parts free and distinct or the pistils connate in *Nigella*; sepals present, usually imbricate, varying from petaloid to small and caducous; petals present or absent; stamens usually numerous; pistils 1 to many, simple; ovules 1 to many; style 1; stigma lateral or terminal, usually minute; fruit an achene, follicle or berry.

Perhaps about 1,000 species in about 50 genera of world-wide distribution but mostly in the forested parts of the North Temperate Zone.

1. Flowers with large spurs (2)
 1. Flowers with minute spurs or none (3)
 - 2(1). Flowers regular, with each of the 5 conspicuous petals prolonged backward to form a long spur 3. *Aquilegia*, p. 636.
 2. Flowers irregular, with the upper petaloid sepal prolonged backward to form a long spur 4. *Delphinium*, p. 638.
 - 3(1). Leaves linear, entire, basal; flowers minute, in a tight cylindric spike, with each of the tiny sepals prolonged backward to form a short spur 8. *Myosurus*, p. 648.
 3. Leaves and flowers not as above (4)
 - 4(3). Flowers noted primarily by their numerous stamens or carpels; sepals small, early-deciduous 2. *Thalictrum*, p. 635.
 4. Flowers noted primarily by their expanded sepals or petals (5)
 - 5(4). Cauline leaves (at anthesis) in a dense cluster at the top of the woody stem; wood yellow; flowers purplish-brown; staminodia present 1. *Xanthorrhiza*, p. 635.
5. Leaves, wood and flowers not as above (6)
 - 6(5). Leaves opposite or whorled (7)
 6. Leaves alternate or all basal (8)
 - 7(6). Stems scapose, erect or ascending; leaves with some whorled, distinctly palmately lobed 9. *Anemone*, p. 648.
 7. Stems viny, climbing or scrambling; leaves opposite, not distinctly palmately lobed 10. *Clematis*, p. 650.

- 8(6). Petals red or orange-color; plants escaped from cultivation 7. *Adonis*, p. 648.
8. Petals yellow or white; plants native (9)
- 9(8). Petaloid sepals white; plants terrestrial; leaves not finely dissected; follicles usually 4 5. *Isopyrum*, p. 641.
9. Petals yellow or (if white) the plants aquatic and with finely dissected leaves; achenes more than 4 6. *Ranunculus*, p. 641.

1. XANTHORHIZA MARSH.

A monotypic genus.

1. *Xanthorhiza simplicissima* Marsh. BROOK-FEATHER, YELLOWROOT. Plant low, weak, shrubby, with deep-yellow and bitter bark and long roots, to about 6 dm. high; leaves approximate, 1- or 2-pinnate; leaflets mostly 5, ovate to elliptic, 25-75 mm. long, incised-toothed or divided; flowers polygamous, in compound drooping racemes, appearing along with the leaves from large terminal buds in early spring; sepals regular, 5, spreading, deciduous, ovate to ovate-lanceolate, brownish-purple; petals 5, glandlike; stamens 5 or 10, the filaments stout; pistils 5 to 15, with 2 pendulous ovules; follicles elliptic, 1-seeded, 3-4 mm. long, the short style becoming dorsal. In damp woods, thickets and on wooded stream-banks, rare in s.e. Tex., Mar.-May; from N.Y., s. to Fla. and Tex.

2. THALICTRUM L.⁶⁴

MEADOW-RUE

Plants herbaceous, perennial, often polygamous or dioecious; leaves alternate, rather large, twice or thrice ternate with numerous usually cleft or shallowly lobed leaflets, the basal leaves long-stalked; petioles dilated at base; flowers mostly unisexual, small, greenish or yellowish, usually in terminal panicles; sepals 4 or 5, caducous, petaloid or greenish; petals none; stamens numerous, exserted, the filaments filiform or slender-clavate; stigma unilateral; achenes 4 to 15, with longitudinal grooves or ribs extending from base to apex, sometimes inflated.

About 150 species, mostly in the Northern Hemisphere.

1. Leaflets usually rather thick and rigid, mostly longer than wide, entire to usually acutely 3-lobed with the lobes entire; polygamo-dioecious 1. *T. dasycarpum*.
1. Leaflets usually thin and flaccid, about as wide as long or wider, typically 3-lobed with the lobes obtuse to rounded and often notched or crenate; dioecious, rarely polygamous (2)
- 2(1). Distribution confined to Trans-Pecos Texas; plants usually more or less puberulent and stoloniferous; carpels wide-curved or compressed 2. *T. Fendleri*.
2. Distribution in east Texas; plants glabrous, never stoloniferous; carpels erect, the ventral surface symmetrical, neither compressed nor curved (3)
- 3(2). Mature carpels ovoid; stigma 0.5-1 mm. long; plants rigid, erect, with black roots 3. *T. texanum*.
3. Mature carpels ellipsoid; stigma 1.3-3 mm. long; plants decumbent, with brown roots 4. *T. arkansanum*.

1. *Thalictrum dasycarpum* Fisch. & All. PURPLE MEADOW-RUE. Caudex short and thick, erect; stem to 2 m. high, often purple; upper leaves sessile or subsessile, their ovate to suborbicular stipules brown; leaflets firm, obovate in outline, to about 55 mm. long and 4 cm. wide, with veins prominent beneath, provided on lower surface with a fine non-glandular pubescence or glabrous, or sometimes glaucous; inflorescences corymbose-paniculate; sepals lanceolate to narrowly ovate, acuminate, commonly slender-tipped, 3-5 mm. long; filaments filiform, 4-7 mm. long, soon drooping and entangling; anthers

⁶⁴ Adapted from Bernard Boivin in Contr. Gray Herb. 152. 1944.

oblong-linear, 1.5-3.2 mm. long, with subulate tip only 0.1-0.2 mm. long; stigma 2-5 mm. long, about equaling the ovoid to lanceolate body of carpel. In meadows, swamps and damp thickets, on rich wooded slopes or along wooded streams in e. third of Tex. and the n. Panhandle, Mar.-July; from Ont. to Alta., s. to O., Ind., Ill., Mo., Kan., La., Tex., N.M. and Ariz.

The var. *hypoglaucom* (Rydb.) Boivin (*T. hypoglaucom* Rydb.) is an entirely glabrous plant with somewhat thinner leaves that are glaucous on the lower surface, often longer stigmas (2.5-5 mm.), longer filaments (4-7 mm.) and a more elongate receptacle than in var. *dasycarpum*.

2. *Thalictrum Fendleri* Engelm. Plant always more or less pubescent, rarely subglabrous or even glabrous, never waxy nor blue nor glaucous, the stem sometimes purplish, to 15 dm. high, more or less stoloniferous; sepals erose, the staminate ovate to elliptic and 3-5 mm. long, the pistillate ovate to rhombic or broadly lanceolate and about 1.5 mm. long; filaments 4-7.5 mm. long, deep-yellow; anthers oblong to linear, pale- or deep-yellow, 2.2-3.4 mm. long, with acumen to 0.8 mm. long; stigma 1.5-4 mm. long; ovary (densely) green, with the ventral surface ovate to lanceolate, often densely pubescent; mature carpel spreading, ovate to lanceolate, green to brown, more or less pubescent to sometimes glabrous, with a stipe to 2 mm. long, the ventral surface to 9 mm. long and 4.5 mm. wide, with lateral nerves rarely branching and sinuate, never minutely sinuate nor anastomosing nor reticulate, with the nerve curved ventrally rather than dorsally. On moist shaded canyon slopes in mts. of the Trans-Pecos, June-Sept.; from Tex., w. to Ore., Wyo. and Ariz.; also n. Mex.

3. *Thalictrum texanum* (Gray) Small. HOUSTON MEADOW-RUE. Plant rigid, erect, to 45 cm. high, with roots becoming black when dry, not ribbed but irregular; sepals of male flowers 1.7-3 mm. long, of female flowers 0.7-1.5 mm. long; filaments about 1.5 mm. long; anthers 1.4-2 mm. long; stigma 0.5-1 mm. long; mature carpels ovoid, with stipe 0.1-0.3 mm. long, the ventral surface 2.7-3.7 mm. long and 1.4-1.6 mm. wide, with an acute apex, rounded at base, 6- to 8-nerved in fruit. In s.e. Tex., Mar.-May; apparently endemic.

4. *Thalictrum arkansanum* Boivin. Plant decumbent, 2-4 dm. high, with a fascicle of thickened brown roots, ribbed; sepals of male flowers ovate to elliptical and 2-3 mm. long, of female flowers ovate and 1-1.5 mm. long; filaments 2-3 mm. long; anthers 1.8-2.3 mm. long, with the acumen 0.1-0.4 mm. long; stigma 1.5-3 mm. long; mature carpel sessile, with the ventral surface ellipsoid, 3.5-4.5 mm. long, 1.5-2 mm. wide, 10- to 12-nerved in fruit. Rare in low rich woods in n.e. Tex., Mar.-Apr.; also Ark. and Okla.

3. AQUILEGIA L.⁶⁵ COLUMBINE

Perennial herbs from a stout caudexlike rhizome; leaves petiolate, 2 or 3 times ternately compounded; flowers regular, few but conspicuous; sepals 5, short-clawed at base, petal-like, soon deciduous; petals 5, the terminal portion expanded, prolonged backward from the base below the flower into an elongate hollow spur that secretes nectar from an internal gland at its apex; stamens numerous, separate but often more or less connivent, the innermost staminodal; filaments elongate; anthers oval; pistils usually 5, erect, each prolonged into a slender style; fruit a several-seeded slender-beaked follicle.

About 100 species in the North Temperate Zone.

1. Flowers red and yellow, nodding; on Edwards Plateau . 1. *A. canadensis*.
1. Flowers yellow, erect or nearly so; in Trans-Pecos Texas (2)
- 2(1). Sepals about 17 mm. wide; petal blade about 2 cm. long and 16 mm. wide; leaves biternate; in Sierra Vieja Mts. 2. *A. Hinckleyana*.
2. Sepals 5-10 mm. wide or (if wider) the spur more than 1 dm. long; leaves often triternate (3)
- 3(2). Spurs to 4 cm. long; sepals to 2 cm. long; in Guadalupe Mts. 3. *A. Chaplinet*.
3. Spurs much more than 4 cm. long; sepals 2 cm. long or more (4)

⁶⁵ Adapted mainly from P. A. Munz in *Gent. Herb.* 7:1-150. 1946.

- 4(3). Petal blade 8-16 mm. long; spurs 4-9 cm. long, rarely longer; flowers clear-yellow; petioles to 2 dm. long; leaflets about 4 cm. long or less; in Davis Mts. 4. *A. chrysantha*.
4. Petal blade 15-30 mm. long; spurs 10-15 cm. long; flowers pale-yellow; petioles to 3 dm. long; leaflets usually more than 4 cm. long; in Chisos Mts. 5. *A. longissima*.

1. *Aquilegia canadensis* L. WILD COLUMBINE. Stems mostly 2-5 dm. high, branched above, rather sparsely pilose throughout to almost glabrous, slightly glandular; leaves biternate or sometimes triternate, bright-green and glabrous above, glaucous and somewhat pilose beneath; leaflets 1-3 cm. long, usually cleft to below the middle and the main divisions mostly 3-10 mm. wide; flowers nodding, 3-4 cm. long, 2-3 cm. wide; sepals ovate to ovate-lanceolate or ovate-oblong, red or sometimes greenish, 1-2 cm. long, 5-8 mm. wide, acute to acuminate; petal blades yellow, 5-6 mm. long, rounded and truncate; spurs red, 18-25 mm. long, slender or stoutish, narrowed gradually at half their length; styles 12-15 mm. long; follicles 1.5-2 cm. long, slightly spreading at tips. *A. phoenicantha* Cory, *A. australis* of auth. On mossy boulders and ledges in ravines and canyons of the Edwards Plateau, Mar.-May; from Can., s. to Ga., Ala., Tenn., Ark. and Tex.

Our plant is usually referred to var. *latiuscula* (Greene) Munz (*A. latiuscula* Greene) with basal leaves bi- or triternate and leaflets mostly cleft to below the middle, blade of petals 5-6 mm. long and spur 18-22 mm. long.

2. *Aquilegia Hinckleyana* Munz. Stems 5-7 dm. high, glabrous and glaucous below, glandular-pubescent and freely branched in the inflorescence; basal leaves biternate, glabrous and pale-green above, glabrous and more glaucous beneath; petioles glabrous, rather slender, 2.5-3 dm. long, the glaucous primary petiolules subglabrous and 2.5-5 cm. long, the secondary petiolules to 25 mm. long and sparingly pilose; leaflets suborbicular, rather thin in texture, 2-4 cm. long, cleft to about the middle, each segment then with 2 or 3 rounded-oblong teeth or lobes; cauline leaves several, gradually reduced upward; pedicels to about 7 cm. long; flowers suberect, golden-yellow, subglabrous; sepals spreading, ovate, obtuse, about 25 mm. long and 17 mm. wide; petal blades spatulate-obovate, rounded-truncate, about 2 cm. long and 16 mm. wide; spurs slender, straight or slightly curved, about 4 cm. long and 5 mm. wide at base, then gradually narrowed to almost filiform tube and slightly enlarged tip; stamens exerted 6-7 mm.; staminodia 12-14 mm. long, abruptly narrowed at apex; follicles 2-2.5 cm. long, glandular-puberulent, with slightly flaring tips; styles almost glabrous, filiform, about 2 cm. long; seeds about 1.5 mm. long. Apparently endemic to the Capote Falls region in Presidio Co. where it occurs on dripping cliffs about the falls, Mar.-Nov.

3. *Aquilegia Chaplinei* Standl. Stems 2-5 dm. high, glabrous except for the glandular-pubescent upper parts, openly branched; basal leaves biternate to triternate, glabrous and somewhat glaucous above, glabrous to somewhat pubescent and more glaucous beneath; petioles very slender, glabrous, 5-12 cm. long, the primary petiolules glabrous and 1-4.5 cm. long, the secondary petiolules to 2 cm. long; leaflets cuneate-obovate to suborbicular, thickish in texture, 1-1.5 cm. long, cleft to or below the middle, each segment then with 2 or 3 rounded oblong teeth or lobes; cauline leaves several, gradually reduced upward; pedicels to about 1 dm. long; flowers suberect, pale-yellow, somewhat pubescent; sepals spreading, broadly lanceolate, acute or obtuse, 13-16 mm. long, 4-6 mm. wide; petal blades oblong, truncate-rounded, 8-10 mm. long; spurs yellow, slender, straight or spreading, 3-4 cm. long, about 4 mm. wide at base, then gradually narrowed to almost filiform tube and slightly enlarged at tips; stamens exceeding petal blades by almost 1 cm.; anthers pale, about 1 mm. long; staminodia 7 mm. long, plane, rather abruptly narrowed at tip; follicles 18-22 mm. long, glandular-pubescent, with slightly flaring tips; styles pubescent, about 15 mm. long; seeds almost 2 mm. long. On boulders, in shaded crevices and in limestone soils in canyons, mostly along streams, apparently endemic in the Guadalupe Mts. in N.M. and Tex., Apr.-Oct.

This species is near to *A. chrysantha* but it has smaller flowers with a much shorter spur.

4. *Aquilegia chrysantha* Gray. Stems 4-12 dm. high, glabrous at base and glandular-pubescent above or throughout, usually much-branched above; basal leaves mostly triternate, rather thin, glabrous and light-green above, glaucous and glabrous to pubescent

beneath; petioles slender, 5-20 cm. long, glaucous, glabrous or pubescent; primary petiolules 2-5 cm. long, the secondary petiolules about half as long and the tertiary to 25 mm. long; leaflets cuneate-obovate to orbicular-obovate, to 45 mm. long, usually much smaller, cleft to middle or beyond, the main divisions with 2 or 3 round-oblong lobes; cauline leaves well-developed; pedicels to about 1 dm. long; flowers erect, clear golden-yellow throughout, somewhat glandular-pubescent; sepals spreading, lanceolate to ovate-lanceolate, usually acuminate, 2-3.5 cm. long, 5-10 mm. wide; petal blades oblong-obovate, usually rounded at apex, spreading, 8-16 mm. long; spurs usually spreading, 4-7 cm. long, 4-6 mm. wide at base, gradually narrowed to an almost filiform tube with slight apical thickening; stamens usually exceeding petal blades by 8-10 mm.; anthers 1.5-2 mm. long; staminodia 9-12 mm. long, very little crinkled, subacuminate; follicles glandular-pubescent, 2-3 cm. long, the tips spreading; styles pubescent, 12-18 mm. long; seeds about 2 mm. long. With the exception of a possible station at Cat-tail Falls, Chisos Mts., this species, in Tex., seems to be confined to the Davis Mts. where it occurs among boulders and in sheltered crevasses, July-Aug.; from Ariz., Colo., N.M. and Tex., s. to n. Mex.

5. *Aquilegia longissima* Gray. LONGSPUR COLUMBINE. Stems 5-12 dm. high, often forming large clumps, glabrous below and glandular-pubescent above or glandular-pubescent throughout, open-branched above; basal leaves triternate, rather thin, light-green and glabrous to slightly pubescent above, glaucous and glabrous to pubescent beneath; petioles slender, 2-3 dm. long, glabrous to pubescent; primary petiolules 3-5 cm. long, the secondary petiolules 1-5 cm. long and the tertiary to 15 mm. long; leaflets much as in *A. chrysantha*, 15-45 mm. long; cauline leaves well-developed; pedicels to 2 dm. long; flowers erect, pale-yellow, somewhat glandular-puberulent; sepals spreading, lanceolate, acuminate, 25-35 mm. long, 6-13 mm. wide; petal blades spreading almost horizontally, spatulate to spatulate-obovate, 1.5-3 cm. long, rounded to emarginate; spurs filiform, pendent, mostly 9-15 cm. long, 2-3 mm. wide at base, the tips about 1.5 mm. thick; stamens 5-12 mm. longer than petal blades; anthers 1.5 mm. long; staminodia 12-14 mm. long, rather plane, subacuminate; follicles glandular-pubescent, about 25 mm. long, with spreading tips; styles 16-26 mm. long; seeds almost 2 mm. long. Along streams and in wet places among boulders, on ledges and in sheltered crevices in canyons of Chisos Mts. in the Trans-Pecos, June-Nov.; also n.e. Mex.

4. DELPHINIUM L.⁶⁶ LARKSPUR

Annual or usually perennial herbs, with erect to virgate or ascending stems from a usually tuberiform or rhizomatous rootstock; leaves palmately or rarely pinnately cleft or divided; flowers commonly showy, morphologically very similar in our species, in terminal racemes or panicles; sepals 5, irregular, petal-like, the upper one prolonged into a spur at the base; petals 4 or rarely 2 (united into one), irregular, the upper pair continued backward into long spurs that are enclosed in the spur of the calyx, the lower pair with short claws; stamens usually numerous; pistils 3 or fused into 1, forming many-seeded follicles.

This is a complex genus of about 150 species mostly in the North Temperate Zone. Many species and hybrids are valued as ornamentals, and many of the species are known to be poisonous to livestock. The complexity of the genus is emphasized by the existence of multiple hybrids. This fact should be considered when identification of our plants is undertaken.

- 1. Naturalized annuals; upper leaves sessile; petals 2, united into one body; carpels single (2)
- 1. Native perennials; upper leaves petioled; petals 4, distinct; carpels in threes (3)
- 2(1). Floral bracts short, not exceeding the pedicels; flowers blue 1. *D. Ajacis*.
- 2. Floral bracts conspicuous, long, foliaceous, frequently equaling the flowers; flowers larger, purple 2. *D. orientale*.

⁶⁶ Adapted from Joseph Ewan in Univ. Colo. Stud. D. 2:55-244. 1945; also much appreciated personal help from Dr. Ewan.

- 3(1). Flowers bluish-white, cream to buff or drab-brownish (4)
- 3. Flowers pale- to bright-lively-blue to bluish-purple, occasionally whitish or white tinged lavender (7)
- 4(3). Stems (at least) for the most part close-pubescent with spreading (sometimes glandular) hairs; pubescence in floral rachis similar to that of the stem or sometimes with fine appressed canescent hairs (5)
- 4. Stems and floral rachis closely and finely canescent or pannose with appressed hairs, never glandular; pedicels appressed to rachis, the flowers thus vertical (6)
- 5(4). Leaves rarely (if ever) congested in a basal or sub-basal tuft; pedicels more or less spreading away from the rachis, the flowers thus nearly horizontal
.....3. *D. virescens* subsp.
virescens.
- 5. Leaves mostly in a sub-basal cluster, palmatifid into 3 primary divisions, these shortly but broadly toothed; flowers rather loosely arranged in a raceme
.....3. *D. virescens* subsp.
macroceratilis.
- 6(4). Leaves on lower portion of stem but not basal; sinuses of petals 3-4 mm. deep; mostly in the Panhandle and eastern Trans-Pecos ... 3. *D. virescens* subsp.
Penardii.
- 6. Leaves in a conspicuous strictly basal tuft; floral rachis with same type of pubescence as the stem; sinuses of lower petals 4-6 mm. deep; mostly in the Trans-Pecos and western Edwards Plateau, rarely east to Bexar County
.....3. *D. virescens* subsp.
Wootonii.
- 7(3). Distribution in western Edwards Plateau and eastern Trans-Pecos
.....4. *D. madrense.*
- 7. Distribution east of the Edwards Plateau (8)
- 8(7). Racemes narrow, strict, virgate; leaves numerous, from stem base to raceme, the petioles moderate, subequal; flowers 20 or more, vertical or subvertical against the rachis upon appressed pedicels5. *D. carolinianum.*
- 8. Racemes open to diffuse, even laxly subscaudent at times; leaves mostly 2 to 5, chiefly basal, the petioles to 15 cm. long; flowers less than 20, horizontal or nearly so upon spreading pedicels6. *D. vimineum.*

1. *Delphinium Ajacis* L. ROCKET LARKSPUR, ESPUELA DE CABALLERO. Slender annual to about 1 m. high, the stem simple or with ascending branches; leaves several, short-petiolate to sessile, pinnately or palmately divided into very numerous linear to filiform segments; terminal racemes elongate, spiciform, loosely many-flowered, more or less leafy-bracteate or naked; lowermost bracts palmatifid into filiform dissected divisions, not simple; flowers bright-blue to violet or purple to pink, sometimes white (f. *alba* R. H. Cheney), with slender horizontal spur; lateral sepals rhomboid to ovate or suborbicular, 6-11 mm. wide; petals 2, united; follicles 1, ovoid, 1.5-2 cm. long, pubescent; seeds covered with broken ridges. Along roadsides, in waste places and old fields, mostly in cen. and s. Tex., Apr.-Sept.; a nat. of Eur. that has spread from cult. in various parts of Can., the U.S. and Mex.

2. *Delphinium orientale* Gay. Very similar to *D. Ajacis* but the stems stouter, more robust and more glabrous; racemes more compact, usually conspicuously leafy-bracteate; flowers larger, showy, often dark blue-purple; lateral sepals orbicular, 1-1.2 cm. wide. A nat. of s. Eur. and N. Afr. that has escaped on the Edwards Plateau.

3. *Delphinium virescens* Nutt. WHITE or PLAINS LARKSPUR. Tall or rarely low-growing usually stout virgate perennial from a cluster of several woody-fibrous elongated deep-seated roots; stems simple, erect, variously pubescent throughout, to about 15 dm. tall, usually much smaller; leaves abundant, mostly equably distributed along the stem but sometimes in a basal tuft; blade ample, palmatisect into several pectinate primary segments that are repeatedly palmatifid into linear ultimate segments, variously pubescent, mostly ciliolate; raceme usually densely spicate, often lax or curving at unopened tip; flowers variously disposed, borne well above the foliage on short erect

often closely appressed pedicels, more or less white, greenish or faint-bluish but not at all buff-colored, the bracts obsolete; sepals ovate-oblong to oblong, rounded to truncate at apex, crisped, the spur straight or variously curved; limb of lower petals not much exerted, ovate or somewhat sagittiform, usually lightly comose with white hairs, the sinus closed or open; upper petals bifid, obliquely narrow-ovate, nearly as long as the upper sepals; follicles erect, oblong, venose, often puberulent, the cusp thin; seeds trigonous to wedge-shaped, gray, heavily corrugate-echinate.

When eaten in spring or early summer, the herbage is known to be toxic to cattle. The highly poisonous seeds are seldom eaten by livestock.

This species is represented in Texas by the following variants that are segregated in the key.

Var. *macroceratilis* (Rydb.) Cory (*D. macroceratilis* Rydb.). Leaf blade 4-11 cm. wide; sepals 1-1.5 cm. long, 5-8 mm. wide, the spur 1-2 cm. long; sinus of limb of lower petals 2-3.5 mm. deep; follicles 1-1.4 cm. long. In sandy or rocky soils in pastures, open oak woods and slopes in Edwards Plateau, Rio Grande Plains, s. Blackland Prairies and along s. coast on into n.-cen. Tex., Apr.-May; probably also in s. Okla.

Var. *Penardii* (Kunth) Perry. Leaf blades 6-12 cm. wide; sepals about 15 mm. long and 6 mm. wide, the spur about 2 cm. long; sinus of limb of lower petals open, about 5 mm. deep; follicles 17-23 mm. long. On grassy plains in Panhandle and South Plains, Apr.-June; from Tex., n. to Kan., Neb. and Colo.

Var. *virescens*. Leaf blade 7-8 cm. wide; sepals 1-1.2 cm. long, 5-6.5 mm. wide, the spur about 12 mm. long; sinus of limb of lower petals closed or open, 3-4 mm. deep; follicles 15-19 mm. long. Uncommon on hills, prairies, in fields and along ditches from e. Edwards Plateau and n.-cen. Tex. to the Panhandle, Apr.-July; from Tex., n. through cen. U.S. to Can.

Var. *Wootonii* (Rydb.) Ewan. Leaf blades 3-5 cm. wide; pedicels strongly ascending; sepals 12-14 mm. long, 3.5-7 mm. wide, the spur 1.4-2 cm. long; sinus of limb of lower petals close and pilose, 3-5 mm. deep; follicles 12-18 mm. long. On grassy flats, limestone outcrops and caliche grasslands, mostly in w. Edwards Plateau and Trans-Pecos, rare in the Rio Grande Plains, South Plains and Panhandle, Apr.-May; from Tex., to Okla., Colo. and Ariz.

4. *Delphinium madrese* Wats. Graceful slender or subscapose perennial from a slender elongated vertical root crown; stems simple or rarely branching above, 2-6 dm. high, thinly hirsutulose throughout with white curling hairs up to hoary-canescence pedicels; leaves many, with petioles 5-10 cm. long, now green and evident at anthesis, now withering and inconspicuous, mostly lower cauline but sometimes in a basal tuft, 2-4 cm. wide, pentagonal, the primary divisions not approximate, cuneate-obovate, trifid or pinnatifid into a few short abruptly acute ultimate segments, ciliate and thinly hairy on both surfaces; racemes more or less interrupted and spicate, 10- to 14-flowered; bracts linear-subulate, inconspicuous; flowers variable, small, usually rich bright-blue; sepals ovate-oblong to ovate-lanceolate, obtuse to subacute, 9-12 mm. long, 5-7 mm. wide, very thinly hairy on the back; spur 1-1.3 cm. long, nearly straight; limb of lower petals deltoid-rounded, barbate with long hairs, deeply bifid, the lobes sharply acute or rounded, ciliate, the sinus closed or nearly so and 3-3.5 mm. deep; upper petals entire or merely notched; follicles short-ovate, 9-10 mm. long, puberulent, the thin cusp erect or spreading; seeds angulate-ovoid, 1-2 mm. long, acute, verrucose-echinate, not wing-margined, smoky-gray. Rocky areas in draws, canyons and in shallow ditches in Kinney, Val Verde and Terrell cos., Mar.-May; also n.e. Mex.

5. *Delphinium carolinianum* Walt. BLUE LARKSPUR. Slender virgate perennial from a cluster of shallowly-seated short-tuberiform roots; stems simple, to about 1 m. high, puberulent throughout or glandular above and glabrate at base, wholly straw-colored or bluish above; leaves rather equably cauline and of nearly uniform size, evident at anthesis or sometimes withering, 3-7 cm. wide, palmatisect into numerous linear ultimate segments, the primary divisions obscure, glabrate above, more or less thinly puberulent beneath; raceme narrow-spicate, often dense but opening out rather slowly, the flowers usually rich dark-blue or paler and merely bluish-white, on erect pedicels 2-5 (or rarely 7) mm. long, the subulate bracts inconspicuous; sepals ovate- to obovate-oblong, rounded or blunt to acute at apex, 12-15 mm. long, 5-7 mm. wide, the spur 13-18 mm. long; blade

of lower petals included, often paler or whitish, broadly to narrowly ovate in outline, erosulate and fimbriate, scantily bearded with spreading white hairs, the open sinus 3.5-5 mm. deep; upper petals short-included, nearly truncate at tip, merely emarginate; follicles slender, oblong, a little tapering, more or less flaring at tips, 12-15 mm. long, faintly venulose, glabrate in age, the cusp 2-3 mm. long; seeds oblong to quadrate, 1-2 mm. long, light-gray, verrucose-echinate with prominent thin scalelike processes. In dry open woods, sandhills, brushlands, fields and barrens in the Edwards Plateau to n.e. Tex., Apr.-July; from Tex., e. to Ga. and Tenn., n. to Ill.

6. *Delphinium vimineum* D. Don. Tall slender virgate perennial from an unbranched shallowly-seated cornlike narrowly vertical root; stems simple, to 15 dm. tall, finely pubescent to close-villous throughout (especially in inflorescence), at times somewhat glandular; leaves predominantly toward stem base, rather scattered but ample, thin, flaccid, 4-8 cm. wide, palmatifid into 3 or 5 primary segments that are undivided and cuneate-oblong or bifid to pinnatifid into short bluntish ultimate segments, subglabrous above, closely soft-pubescent beneath; racemes loose-interrupted, 3- to 12-flowered, not stiffly spicate; flowers varying in size, usually rather showy, bluish-purple, borne on rather long more or less spreading pedicels, the bracts filiform or almost wanting; sepals broadly ovate, bluntish or rounded, often crisped, 11-15 mm. long, 6-8 mm. wide, the spur straight or a little upcurved and 11-15 mm. long; limb of the lower petals quadrate or ovate, the sinus nearly closed and 2-4 mm. deep; upper petals subrhomboidal, entire, short-included; follicles erect, oblong, 15-16 mm. long, obscurely veiny, short-pubescent, the erect cusp thin and 3.5 mm. long; seeds small, 1.2 mm. long, smoky-brown, wedge-shaped, heavily echinate. In sandy open soils, meadowlands, open grassy woods mainly on the Edwards Plateau eastw. in Tex., Apr.-July; probably in La. and s.w. Ark.

5. ISOPYRUM L.

About 30 species in the North Temperate Zone.

1. *Isopyrum biternatum* (Raf.) T. & G. FALSE RUE-ANEMONE. Slender glabrous perennial 1-3.5 dm. high, with copious slender fibrous roots (some here and there moniliform-thickened); leaves ternately decomposed; leaflets 1-2.5 cm. long, cuneate-obovate or roundish, commonly 3-lobed; flowers solitary, paniced or cymose, usually white; sepals 5 or 6, petaloid, white, deciduous, elliptic to somewhat obovate, 9-12 mm. long; petals none; stamens many; filaments clavate; carpels 2 to 20, sessile or stipitate, several-ovuled; follicles 3 to 6, commonly 4, sessile, about 3-ovuled and 2- or 3-seeded, obliquely ovate in outline, divaricate at maturity, about 5 mm. long (including the subulate-pointed persistent style); seeds smooth, with a prominent raphe. Shady and moist grounds, "Texas, Wright," possibly in n.e. Tex., Mar.-May; from Ont. to Wisc. and s. to Fla. and Tex.

6. RANUNCULUS L.⁶⁷

CROWFOOT. BUTTERCUP

Annual or perennial herbs of various aspects; cauline leaves alternate; flowers regular, perfect, solitary or somewhat corymbed; sepals 3 to 5 or rarely more, green or yellowish; petals commonly 5, more or less in some species, plane or concave, mostly yellow or white, rarely reddish or green, each with a nectariferous pit or scale on inner surface at or near base; stamens mostly numerous, rarely as few as 5; filaments slender; anthers oblong or linear; pistils numerous in a globose to ovoid or cylindrical head; ovule 1; style long or short, straight, curved or hooked; fruit an achene.

About 400 species mostly in colder regions or at high altitudes in the tropics. It is reported that all of the species are acrid or even poisonous.

1. Achenes roughly transversely ridged; petals not glossy, white, the claws sometimes yellow; aquatic plants (2)
1. Achenes or utricles not transversely ridged (except in *R. sceleratus* which has 40 or commonly 100 to 300 minute beakless achenes in an elongate head); petals usually glossy, yellow or rarely red, white or green (3)

⁶⁷ Adapted from Lyman Benson in Am. Midl. Nat. 40:1-261. 1948.

- 2(1). Style largely deciduous after flowering, the achene beak 0.3 or rarely 0.5 mm. long; achenes mostly 30 to 45 or 80 1. *R. subrigidus*.
2. Style persistent after flowering, the achene beak 0.7-1.1 mm. long; achenes about 7 or commonly 15 to 25 2. *R. longirostris*.
- 3(1). Pericarp striate, the nerves 3 or more on each face (these sometimes branched), the ovary wall thin and usually fragile at fruiting time 3. *R. Cymbalaria*.
3. Pericarp not striate nor nerved, thick and firm (4)
- 4(3). Leaves (both cauline and basal) entire, dentate, serrulate or wavy; dorsiventral measurement of the achene not more than twice or thrice the lateral; nectary scale forming a pocket (5)
4. Leaves (either the cauline or the basal) lobed, parted or divided (6)
- 5(4). Petals 5 to 9, large and conspicuous, about twice as long as the sepals; styles in anthesis 0.5 mm. long, filiform, deciduous in fruit; head of achenes hemispheroidal or ovoid 4. *R. laxicaulis*.
5. Petals 1 or 3, minute and inconspicuous, shorter than or equal to the sepals; styles in anthesis 0.1-0.2 mm. long 5. *R. pusillus*.
- 6(4). Achenes covered with spines, hooks or papillae, or with papillae produced into hooked hairs, rarely smooth in *R. Sardous*; dorsiventral measurement of the achene 3 to 6 times the lateral; receptacle in fruit 1 to 3 times its length in anthesis (7)
6. Achenes smooth, sometimes hairy (10)
- 7(6). Petals 1-4 mm. long; mature achenes papillate, the papillae produced into slender hooked spines; nectary scale usually free laterally (8)
7. Petals at least 4 mm. long; mature achenes with stout spines on the face to very rarely glabrous (9)
- 8(7). Flowers pediceled; sepals and petals each 5; achenes about 1.5 mm. wide, the beak prominent 6. *R. parviflorus*.
8. Flowers sessile; sepals and petals each 3; achenes 1 mm. wide or less, the beak minute 7. *R. platensis*.
- 9(7). Mature achenes sparsely papillate or smooth; nectary scale free laterally 8. *R. Sardous*.
9. Mature achenes with stout spines on the faces; nectary scale forming a pocket, much narrower than the adjacent petal surface 9. *R. muricatus*.
- 10(6). Style and achene beak practically lacking, if otherwise, the achene with a corky thickening on the margin of the body; nectary scale either with the gland in a pocket on its ventral surface or else the scale forked and prolonged anteriorly on the surface of the petal or surrounding the gland; aquatic or palustrine plants 10. *R. sceleratus*.
10. Style and achene beak present, the achene neither corky-keeled nor with corky thickening on the margin of the body; nectary scale ventral to the nectary, covering it, apically truncate or rounded (11)
- 11(10). Nectary scale attached to the petal laterally and forming a pocket; dorsiventral measurement of the achene 1 to 2.5 times the lateral; receptacle in fruit (in most species) 3 to 15 times its length in anthesis; sepals usually tinged dorsally with purple or lavender 11. *R. abortivus*.
11. Nectary scale free laterally for at least two thirds its length, not forming a pocket (except in *R. recurvatus* var. *recurvatus*); dorsiventral measurement of the achene 3 to 15 times the lateral; receptacle in fruit (in most species) 1 to 3 times its length in anthesis; sepals usually not lavender- nor purple-tinged but sometimes markedly so (12)

- 12(11). Achene beaks regularly recurved or curved or clearly falcate or hooked at the apices, 2 mm. or less long, usually shorter than the bodies or sometimes equaling them (13)
- 12. Achene beaks not regularly curved or recurved or markedly hooked (if hooked at all, for only about 0.1 mm.), essentially straight (or sometimes bent in pressing), 1.5 or usually 2-4 mm. long, practically always equaling or exceeding the bodies (14)
- 13(12). Petals (when fully expanded) usually 8-18 mm. long, large and conspicuous, about 1.5 to 3 times as long as the sepals12. *R. repens*.
- 13. Petals minute, 2-4 or rarely 6-7 mm. long, shorter than or slightly exceeding the sepals13. *R. recurvatus*.
- 14(12). Achenes 35 or mostly 40 to 130; sepals 6 or mostly 8-10 mm. long; petals 8 to 1814. *R. macranthus*.
- 14. Achenes 10 to 30 or 35; sepals 6-8 mm. long; petals 5 or sometimes more (15)
- 15(14). Stems rooting at the nodes when the plants are in moist ground (as normally they are); plant usually stoloniferous and fibrous-rooted; upper leaves mostly simple; achenes broadly winged on keel, 3.5-4.5 mm. wide15. *R. carolinianus*.
- 15. Stems never rooting; plant with cluster of fleshy roots at base of stem; upper leaves compound; achenes scarcely winged, 1.5-2.5 mm. wide16. *R. fascicularis*.

1. *Ranunculus subrigidus* Drew. Glabrous or essentially glabrous aquatic perennial with filiform roots; stems submersed, rooting at the lowest nodes, to about 6 dm. long, branching, with large air chambers in the cortex; leaves cauline, all submersed and finely dissected into filiform divisions, once- or twice-trichotomous then dichotomous, the leaf as a whole globular, usually not fully collapsing when withdrawn from the water (but sometimes so), usually circinate, 1-2 cm. long, 1.5-3 cm. broad, much shorter than the adjacent internodes; petioles developed only occasionally, the first leaf divisions arising within the stipular leaf base (the leaf base dilated and the ends usually free); pedicels stout, 2-4 cm. long in flower, about 1 cm. longer and markedly recurved at the bases in fruit, glabrous; sepals 5, light-green, spreading, elliptic, 3-5 mm. long, deciduous before the corolla; petals 5, white or the bases yellow, 5-9 mm. long, 2-4 mm. broad, narrowly obovate, the nectary scale nearly or fully obsolete; stamens 5 to 10; achenes 30 to 80, in a globose-ovoid head 4-6 mm. long and 4-5 mm. in diameter, obovoid, 1-1.5 mm. long, roughly transversely-ridged, glabrous, hispidulous or glabrate, the style largely deciduous, the achene beak 0.2-0.5 mm. long; receptacle subglobose, 1 mm. long in flower, 1-1.5 mm. long in fruit, hispidulous. *R. circinatus* Sibth. var. *subrigidus* (Drew) L. Benson. In ponds, lakes or pools, often brackish, in the Rio Grande Valley, spring-summer; from Can. s. to cen. Mex.

2. *Ranunculus longirostris* Godr. WHITE WATER-CROWFOOT. Similar to *R. subrigidus*; leaves firmer, often stiff, the stipular base larger and from three fourths to entirely adnate to the very short petiole; pedicels appearing to be axillary (actually terminal, the stem sympodial), 1-5 cm. long, apparently not recurved in fruit, glabrous; sepals yellowish-green or purplish, spreading, narrowly elliptic, 3-4 mm. long, 1-1.5 mm. broad, early-deciduous; petals 5, white, obovate, 4-9 mm. long, 2.5-6 mm. broad, the nectary scale reduced to a very shallow pocket or a lunate ridge along the base and sides of the gland or wholly absent, the glandular area only 0.2-0.3 mm. in diameter; stamens 10 to 20; achenes 7 to 25 in a subglobose cluster or head 3-5 mm. long and 4-6 mm. in diameter, obovoid, 1.3-1.7 mm. long, roughly transversely-ridged, glabrous or hispidulous, the margin evident, the slender beak 0.7-1.1 mm. long and straight; receptacle globose or pyriform, 1 mm. long in flower, 1-2 mm. long in fruit, densely hispid. Floating in water of streams and lakes, often forming large mats, from the Rio Grande Plains to the Panhandle, Apr.-June; from Can., s. to N.M., Tex., Ark., Ala. and Del.

3. *Ranunculus Cymbalaria* Pursh. Glabrous or sparingly hirsute palustrine perennial; scapes erect, to 3 dm. high, branched or unbranched, with filiform stolons several dm. long, not fistulous; basal leaves with petioles 2-5 cm. long, simple, ovate or reniform to

trapezoidal or rectangular, to 35 mm. long and 2 cm. broad, crenate to dentate or sometimes merely 3-toothed or -lobed at the rounded to truncate apices, cordate to rounded or truncate at base, the stipular leaf bases 2-9 mm. long; pedicels 1-3 cm. long in flower and 2-6 cm. long in fruit, usually pubescent; sepals 5, greenish-yellow, spreading, elliptic, 2-5 mm. long, 1.5-3 mm. broad, glabrous, thick, promptly deciduous; petals 5 or up to 12, bright-yellow, narrowly obovate, 2-8 mm. long, 2-3 mm. broad; nectary scale over-arching the nectary, truncate, the margins free from the blade of the petal; stamens 10 to 30; achenes as many as 300 (usually much fewer) in a cylindroid head 3-13 mm. long and 3-6 mm. in diameter, cuneate-oblong, thin-walled, 1.5-2.3 mm. long, each face with about 4 longitudinal striations or branched nerves, glabrous, the margins noticeable, the triangular beak about 0.3 mm. long and not curved; receptacle cylindroid, 2-3 mm. long in flower, 4-7 mm. long in fruit, hairy. In mud, especially of brackish streams and marshes, in the Panhandle, May-July; across Can. to Alas. and Sib., s. to the Andes of S.A.

The following two variants are found in Texas.

Var. *Cymbalaria*. Stems and petioles mostly 0.5 mm. thick; scapes 2.5-11 cm. high, usually branched; basal leaves cordate to ovate or reniform, 5-22 mm. long, 4-20 mm. broad, crenate or sometimes merely 3-lobed at the apices in some of the leaves, thin; sepals and petals 3-5 mm. long; stamens usually 15 to 25; achenes 40 to 150 in a cylindroid head 3-8 or 13 mm. long and 3-4 or 6 mm. in diameter.

Var. *saximontanus* Fern. Stems and petioles mostly 1 mm. thick; scapes 5-30 cm. high, usually branched; basal leaves cordate to ovate or rarely reniform, 12-40 mm. long, 10-33 mm. broad, mostly crenate, thick; sepals and petal 4-8 mm. long; stamens usually 20 to 35; achenes 100 to 300 in a head 5-12 mm. long and 3-5 mm. in diameter.

4. *Ranunculus laxicaulis* (T. & G.) Darby. Glabrous palustrine annual with filiform roots; stems erect or reclining, rooting adventitiously at only the lowest nodes, 1-5 dm. long, freely branching, fistulous; stem and axis of panicle often proliferating late in season by flabelliform leafy offshoots; basal leaves with petioles 1-7 cm. long or longer when in water, simple, ovate to oblong, to 45 mm. long, 6-18 mm. broad, dentate to serrulate or entire, truncate or rounded at base, truncate or obtuse at apex; the stipular leaf bases about 1 cm. long; upper cauline leaves alternate, sessile, linear or lanceolate to oblanceolate or very narrowly elliptic, acute, 15-35 mm. long, 2-6 mm. broad, dentate; pedicels to 2 cm. long in flower and 6 cm. long in fruit; sepals 5, greenish-yellow, spreading, ovate, 1.5-3 mm. long, about 1.5 mm. broad, glabrous or sparsely hairy, promptly deciduous; petals 5 or rarely as many as 10, yellow, 3-9 mm. long, 1.5-2.5 mm. broad; nectary scale glabrous, forming a pocket 0.3-0.5 mm. long, truncate or prolonged a little on the margins; stamens 10 to 30; achenes 15 to 50 in a hemispheroidal head 2 mm. in radius or an ovoid head 2-4 mm. long and 2-2.5 mm. in diameter, obovate to subglobose, 0.6-0.7 mm. long, smooth and glabrous, the margin inconspicuous, the style about 0.5 mm. long; receptacle pyriform or spheroid, 1.5-2 mm. long in flower, 1.5-3 mm. long in fruit, glabrous. *R. texensis* Engelm., *R. pusillus* of auth., not Poir. Boggy shores of lakes, in depressions, ditches and marshes in s.e. Tex., Mar.-May; from Fla. to Tex., n. to Conn., Ind., Ill., Mo. and Kan.

5. *Ranunculus pusillus* Poir. Glabrous palustrine annual with filiform roots; stems reclining, usually rooting at the lowest nodes, 1-5 dm. long, freely branching, fistulous; basal and lower cauline leaves with petioles 1-6 cm. long, simple, oblong to ovate or rarely cordate, to 5 cm. long, 5-15 mm. broad, entire or a little irregular, truncate or rounded at base, truncate to rounded or acute at apex, the stipular leaf bases to 1 cm. long; upper cauline leaves alternate, sessile, linear or lanceolate to oblanceolate or very narrowly elliptic, 1-5 cm. long, 2-5 mm. broad, entire or sometimes dentate; pedicels to 15 mm. long in flower and 6 cm. long in fruit, glabrous; sepals 5, greenish-yellow, spreading, ovate, 1-2 mm. long, 0.8-1 mm. broad, glabrous or sparsely hairy, promptly deciduous; petals 1 to 3 or rarely 5, yellow, obovate, 1.5-2.5 mm. long, 1 mm. broad; nectary scale glabrous, forming a pocket 0.2 mm. deep, truncate; stamens 5 to 10; achenes as many as 125 in a hemispheroid head about 4 mm. in diameter or an ovoid head 2-4 mm. long and 2-2.5 mm. in diameter or a cylindroid head 5-8 mm. long and 2-3 mm. in diameter, oblong-obovate, about 1 mm. long, smooth (with fine reticulations) or slightly or markedly papillate, glabrous, the margin inconspicuous, the style in anthesis 0.1-0.2 mm. long, the achene beak 0.1-0.2 mm. long; receptacle pyriform or spheroid,

1.5-2 mm. long in flower, 1.5-3 mm. long in fruit, glabrous. Incl. var. *angustifolius* (Engelm.) L. Benson, *R. tener* Mohr. In shallow water and mud of ditches, marshes, bogs, seepage areas and ponds in prairies, open woods and thickets in the e. fourth of Tex., w. to Burnet Co., Mar.-May; from Calif. to Mo. and N.Y., s. to Tex. and Fla.

6. *Ranunculus parviflorus* L. Hirsute terrestrial annual; stems erect, not rooting, 1-3 dm. long, freely branching and diffuse, not fistulose, thinly hirsute; basal leaves with petioles 3-6 cm. long, simple, reniform, 1.5-2 cm. long, 2-2.5 cm. broad, 3-parted or -divided and again lobed, cordate at base, rounded at apex, the ultimate lobes acute, hirsute with fine hairs, pilose, the stipular leaf bases about 1 cm. long; cauline leaves alternate, short-petioled, similar to the basal, the bracts 3-parted; pedicels 1-4 mm. long in flower, 3-18 mm. long in fruit, pubescent; sepals greenish-yellow, spreading, narrowly ovate, about 1 mm. long, less than 1 mm. broad, densely pubescent, promptly deciduous; petals 5, yellow, narrowly elliptic, 1-2 mm. long, less than 1 mm. broad, the truncate nectary scale glabrous and free laterally; stamens about 10; achenes 10 to 20 in a globose head about 4 mm. in diameter, obovate, 1.5 mm. long, with reddish-brown papillae covering both faces of the pericarp which are produced into minute slender hooks, the margin strongly marked, the deltoid beak recurved and 0.5 mm. long; receptacle globose, less than 1 mm. long in flower, 1-1.3 mm. long in fruit, glabrous. On moist hardwood slopes, in grassy copses and along ditches in e. fourth of Tex., Mar.-June; a nat. of the Old World that is naturalized in various parts of N.A.

7. *Ranunculus platensis* Spreng. Plant very similar to *R. parviflorus* except for the sessile flowers, smaller achenes and more shallowly and broadly toothed leaves. In sandy bottomland woods and thickets in s.e. Tex., Mar.-Apr.; recently introd. into La. and s.e. Tex. from s. S.A.

8. *Ranunculus Sardous* Crantz. Hirsute terrestrial perennial with filiform roots; stems suberect, not rooting, 1-5 dm. long, branching freely, not fistulose, hirsute; basal leaves with hirsute petioles 3-16 cm. long, pinnately compound, broadly cordate in outline, 2-3 cm. long, 2-2.5 cm. broad, the 3 leaflets parted and lobed, the ultimate segments deltoid, pubescent, cordate to truncate at base, rounded at apex, appressed-pubescent, the stipular leaf bases 1-1.5 cm. long; cauline leaves alternate, the bracts of about 3 linear divisions, sessile; pedicels 3-5 cm. long in flower, 2-6 cm. long in fruit, thinly appressed-hairy; sepals greenish-yellow, reflexed, ovate-attenuate, 3-5 mm. long, 1.5-2 mm. broad, pilose, promptly deciduous; petals 5, yellow, 8-9 mm. long, 5-7 mm. broad, the truncate nectary scale glabrous and free laterally; stamens 25 to 50; achenes 12 to 25 in a subglobose head 4-6 mm. long and 5-8 mm. in diameter, nearly circular, 2-3 mm. long, usually sparsely papillate or some achenes of the same plant smooth, glabrous, the margin strongly marked, the deltoid beak 0.3 mm. long and curved at the tip; receptacle pyriform, 1 mm. long in flower, 2 mm. long in fruit, covered with long white hairs. Moist grassy slopes in e. Tex., Apr.-June; a nat. of the Old World naturalized mostly about seaports in N.A.

9. *Ranunculus muricatus* L. Glabrous terrestrial annual or sometimes perennial; stems reclining or erect, not rooting, 2-5 dm. long, 2-5 mm. in diameter, freely branching, not markedly fistulose; basal leaves with petioles 4-15 cm. long, simple, broadly cordate to reniform or semicircular, 2-5 cm. long, 2-6 cm. broad, deeply 3-parted, the parts again shallowly crenately lobed, cordate to truncate at base, rounded at apex, the stipular leaf bases 1 or 2 cm. long; cauline leaves alternate, similar to the basal; pedicels 5-20 mm. long in flower, 2-6 cm. long in fruit, glabrous; sepals greenish, spreading, ovate, mucronate, 4-7 mm. long, 2-3 mm. broad, with a few bristles, promptly deciduous; petals 5, yellow, obovate, 5-8 mm. long, 3-4 mm. broad, the truncate nectary scale glabrous and forming a pocket that is much narrower than the adjacent part of the petal; stamens few; achenes 10 to 20 in a globose cluster 1-1.3 cm. in diameter, obovate, about 5.5 mm. long, covered with stout curved spines, glabrous, the margin very prominent, keeled, spineless, produced into the stout falcate beak 2-2.5 mm. long; receptacle subglobose, about 1 mm. long in flower, 2 mm. long in fruit, hispid. On grassy banks, along roads, in sandy marshes, and in wet soil about ponds and along streams, often in shallow water, in e. fourth of Tex., Mar.-May; a nat. of the Old World that is naturalized in various parts of N.A.

10. *Ranunculus sceleratus* L. Glabrous or rarely hirsute palustrine or rarely aquatic annual or short-lived perennial; stems erect, rarely rooting, to 1 m. long, profusely branching, fistulose, inflated; basal leaves with petioles rarely to 25 cm. long, simple, reniform,

to 6 cm. long and 1 dm. broad, deeply 3-parted or -divided, the primary parts or divisions lobed to parted or divided, the ultimate lobes obtuse or rounded, the sinuses rounded, cordate at base, rounded at apex, the broad stipular leaf bases 5-10 mm. long; cauline leaves alternate, the bracts often oblanceolate and entire, sessile; pedicels to 2 cm. long in flower, 1-3 cm. long in fruit; sepals 5, greenish-yellow, spreading, ovate, 2-3 mm. long, 1.5-2 mm. broad, pilose or glabrous, persisting later than the corolla; petals 5, light-yellow, obovate, 2-5 mm. long, 1-3 mm. broad; nectary scale glabrous with the margins prolonged along the blade of the petal, sometimes 1 or both with a free flap at the tip or the scale often completely surrounding the nectary; stamens 10 to 25; achenes 40 to 300 in a cylindroid head 3-10 mm. long and 2-6 mm. in diameter, obovoid, 0.8-1 mm. long, often with minute irregular transverse ridges in the central unthickened portion of each face, the periphery of the pericarp at least somewhat corky-thickened, the surface often with ridges or a circle of "pin-prick" depressions at the inner margin of the thickened zone, glabrous, the marginal keel obscure, the style and the achene beak almost lacking, not recurved; receptacle obovoid or cylindroid, 1-2 mm. long in flower, 2.5-9 mm. long in fruit, pubescent or sometimes glabrous. Borders of lakes, streams and marshland in s.e. and s. Tex., Mar.-June; from Wash. to N.E., s. to Tex., La. and Ga.

The acrid sap of this species is said to raise blisters on human skin.

11. *Ranunculus abortivus* L. Glabrous terrestrial biennial with filiform roots, sometimes enlarged at the base; stems erect or suberect, not rooting, to about 5 dm. long, branching, fistulous, striate; basal leaves with petioles 4-11 cm. long, simple or rarely some trifoliate, reniform to orbicular in outline, to 9 cm. long and 1 dm. broad, usually much smaller, crenulate to crenate or crenately lobed; stipular leaf bases scarious, 1-2 cm. long; cauline leaves alternate, sessile, the bracts deeply once- or twice-parted to form 3 or 5 elliptic lobes or rarely cuneate or obovate and apically shallowly lobed or toothed; flowers as many as 50, with pedicels to 15 mm. long in flower and 9 cm. long in fruit, glabrous; sepals 5, yellowish, spreading, elliptic, 3-5 mm. long, 1-2 mm. broad, glabrous, deciduous after anthesis; petals 5, elliptic, 2.5-3.5 mm. long, 1.3-2 mm. broad, the glabrous nectary scale forming a pocket and emarginate; stamens 15 to 20; achenes 10 to 35 in an ovoid head 3-6 mm. long and 2.5-4 mm. in diameter, discoid-obovate, 1.4-1.6 mm. long, smooth, glabrous, the margin inconspicuous, the beak minute; receptacle fusiform-cylindroid, about 2 mm. long in flower, 2-4 mm. long in fruit, sparsely villous or sometimes glabrous. In moist ground in open areas or rich woodland in e. Tex., Mar.-May; transcontinental from N.S. to Alas., s. to Wash., Colo., Tex. and Fla.

12. *Ranunculus repens* L. CREEPING BUTTERCUP. Hirsute terrestrial or palustrine perennial; stems prostrate to suberect, rooting at least at the lower nodes, commonly but not always with some stoloniferous, to 9 dm. long, branching, not fistulous, hirsute to glabrous or nearly so; leaves compound, deltoid-cordate in outline, to 11 cm. long and 13 cm. broad, usually much smaller, pinnate with 3 sessile or petiolulate leaflets that are cuneate to subtruncate or sometimes rounded or subcordate at the base and lobed and toothed (but acute in outline) at apex, sometimes the leaflets tending to be rounded, the middle petiolule to 4 cm. long, the lateral petiolule to 2 cm. long, the petioles 4-25 cm. long, hirsute to subglabrous, the stipular leaf bases 6-20 mm. long; cauline leaves alternate, like the basal; pedicels 2-10 cm. long in flower, 4-15 cm. long in fruit, pubescent; sepals 5, greenish, spreading, 5-7 mm. long, 3-4 mm. broad, pilose, promptly deciduous; petals 5 or rarely the staminodia forming a "double" flower, cuneate-obovate, 7-13 mm. long, 5-10 mm. broad, the glabrous truncate nectary scale free laterally for two thirds of its length and 1-1.3 mm. long; stamens 50 to 80, the number reduced in "double" flowers; achenes 20 to 25 in a subglobose head 6-7 mm. in diameter, obovoid-discoid, 2.5 mm. long, smooth, glabrous, the margin prominent, the recurved beak stout and 1 mm. long; receptacle subglobose-ovoid, 1-2 mm. long in flower, 3 mm. long in fruit, pubescent or rarely glabrous. This Old World species sometimes occurs as an escape, especially the garden form, var. *pleniflorus* Fern.

13. *Ranunculus recurvatus* Poir. Hirsute terrestrial perennial; stems erect, commonly forming a nearly spherical bulbous base 5-10 mm. in diameter, not rooting, 1.5-7 dm. long, branching mostly above, the lowest internode elongated, fistulous, markedly villous-hirsute or rarely glabrous, the hairs rarely appressed; basal leaves with glabrous or hirsute petioles 5-10 cm. long, simple, cordate-reniform in outline, to 75 mm. long and

9 cm. broad, usually much smaller, 3-cleft to deeply 3-parted with the parts either crenately lobed or toothed, cordate at base, the parts rounded or angled at apex, nearly glabrous or hirsutulous or hirsute; stipular leaf bases deltoid, 1-1.8 cm. long, 5-9 mm., broad, thin; cauline leaves similar to the basal but not usually larger, as deeply parted as the deepest of the basal; pedicels 1-8 mm. long in flower, 1-5 cm. long in fruit, sparsely appressed-pubescent; sepals 5, greenish, reflexed almost their whole length, ovate-acute, 4-5 mm. long, 2-2.5 mm. broad, sparsely pilose dorsally, promptly deciduous; petals 5, narrowly elliptic, 2.5-3.5 mm. long, 1.2 mm. broad; nectary scale forming an obdeltoid pocket, the apical margins truncate or sometimes proliferated into a flat scale not forming a pocket; stamens 10 to 25; achenes 10 to 25 in a globose head 5-7 mm. in diameter, discoid, 1.5-2 mm. long, minutely reticulate-pitted, glabrous, the margin with a minute keel, the recurved beak slender and 1.2-1.4 mm. long, the tip hooked; receptacle broadly or narrowly pyriform, 1 mm. long in flower, 3 mm. long in fruit, conspicuously hispid, densely so at the apex. In swamps, woods and bottomland thickets in n.e. Tex., Mar.-June; from Ont. and Nfld., s. to Fla. and Tex.

14. *Ranunculus macranthus* Scheele. LARGE BUTTERCUP. Strongly hirsute to subglabrous terrestrial perennial with stout roots; stems reclining to suberect, not rooting, to 1 m. long, usually much smaller, fistulous, densely hirsute; basal leaves with hirsute to glabrous petioles to 3 dm. long, compound and dissected or sometimes simple and merely lobed, oblong-ovate in outline, 4-23 cm. long, 3-25 cm. broad, usually of 3 to 7 leaflets that are truncate or obtuse at base and acute or barely obtuse at apex, appressed-hispidulous; pedicels to 11 cm. long in flower and 3 dm. long in fruit, appressed-pubescent; sepals 5, yellowish-green, reflexed, ovate-attenuate, 6-10 mm. long, 3-5 mm. broad, appressed-pilose dorsally, promptly deciduous; petals 8 to 18, yellow, oblanceolate or rarely obovate, sometimes emarginate, 1-2 cm. long, 2.5-10 mm. broad; achenes 35 to 130 in a subglobose or cylindroid head 7-14 mm. long and 7-10 mm. in diameter, elliptic-oblong to obovate, 2.5-4 mm. long, smooth, glabrous, the margin keeled, the straight beak slender and 3-5 mm. long; receptacle cylindroid, 2-3 mm. long in flower, 5-12 mm. long in fruit, hairy but the hair often sparse. In swamps, wet soil in drainage areas, wet woods along creeks, on mud flats about pools and seepage slopes in cen., s. and w. Tex., Mar.-June; in s.w. U.S. and Mex.

15. *Ranunculus carolinianus* DC. Tufted perennial with thick fibrous roots, subglabrous to spreading-pubescent (especially on stem), after flowering developing long trailing or repent leafy branches; earliest basal leaves small, ovate, simple or 3-lobed or 3-cleft; later leaves larger, long-petioled, with 3 mostly petiolulate rhombic cuneate 3-cleft or 3-divided and sharply toothed leaflets; flowering stems slender, flexuous, subglabrous, pilose or spreading-hirsute, elongating to 5 dm. long, finally producing trailing branches; flowers 1 to 10; sepals 3.5-5 mm. long, promptly reflexed; petals oblong, 8-12 mm. long, 2.5-7 mm. broad; fruiting head subglobose, 7-13 mm. in diameter, with only 10 to 20 achenes; fruiting receptacle 4-5 mm. long; achenes obliquely rounded-ovate, with body 3.5-5 mm. long, the marginal wing 0.5-1 mm. wide and separated from the face by a high acute ridge; beak submarginal, erect, lance-subulate, 1.5-2.5 mm. long, with short deciduous terminal stigma. *R. septentrionalis* Poir. var. *pterocarpus* Benson. Low woods, swamps, thickets and shores in e. fourth of Tex., Feb.-Apr.; from Fla. to Tex., n. to Md., W.Va., s. Ind., s. Ill., Mo. and Neb.

Those plants with noticeably spreading-pubescent stems are segregated as var. *villicaulis* Shinnars.

16. *Ranunculus fascicularis* Muhl. PRAIRIE BUTTERCUP. Appressed-pubescent terrestrial perennial; roots filiform or fusiform-tuberous, to 5 mm. in diameter; stems weak, erect or suberect, often scapose, not rooting, silky-canescens, 1-3 dm. long, not fistulous; basal leaves with petioles about 1 dm. long, compound or at least the early ones 3-parted, ovate-oblong in outline, 25-55 mm. long, 2-4 cm. broad, distinctly longer than broad, sometimes the leaf partly bipinnate, the 3 or 5 leaflets or divisions simple and rounded to deeply 3- to 7-parted and again angularly toothed, the ultimate parts blunt or rounded at the apices; stipular leaf bases 15-35 mm. long; cauline leaves usually 1 or 2, alternate, much-reduced; pedicels 1.5-6 cm. long in flower, 2.5-9 cm. long in fruit; sepals 5, greenish-yellow, spreading, ovate-attenuate, 6-8 mm. long, 2-3 mm. broad, usually silvery-pubescent, promptly deciduous; petals 5 or sometimes up to 9, yellow, obovate-oblanceo-

late, 7-15 mm. long, 3-6 mm. broad, the truncate nectary scale glabrous and free almost its whole length; stamens usually 40 to 50; achenes 10 to 30 in a subglobose head 4.5-8 mm. long and 6-10 mm. in diameter, obovate-orbicular but with a short flat stalk, the main body 1.5-3 mm. long, smooth, glabrous, the margin keeled but usually not prominent, the straight beak slender and 2-2.3 mm. long; receptacle fusiform or obovoid, 1.5-2.5 mm. long in flower, 3-7 mm. long in fruit, sparsely hispidulous. In sandy soil in shallow water, low pinelands, meadows and seepage slopes in e. Tex., Feb.-May; widespread in e. N.A., w. to Tex. and Kan.

The two following varieties are found in Texas:

Var. *apricus* (Greene) Fern. (*R. apricus* Greene). Stems 1-3 dm. long; leaflets or leaf segments oblanceolate to narrowly elliptic, shallowly few-toothed apically or entire; petals 5.

Var. *cuneiformis* (Small) L. Benson. Stems 18-25 cm. long; petals 7 to 9, 13-15 mm. long when fully expanded; achenes 3 mm. long, 2.5 mm. dorsiventrally, the margin 0.5 mm. broad, distinctly marked; endemic in Kerr Co.

7. ADONIS L.

About 20 species native to Europe and Asia.

1. *Adonis annua* L. PHEASANT'S-EYE. Annual 2-6 dm. high, the erect stems much-branched; leaves alternate, dissected, 2-5 cm. long; flowers solitary and terminal, deep-red with dark center, not opening wide, about 2 cm. across; sepals 5 to 8, broad; petals 6 to 8, obovate, somewhat erose at the apex, concave, deciduous, not much-exceeding the calyx; stamens many; filaments filiform; pistils many, the ovary 1-ovuled; head of achenes cylindrical, 1-2 cm. long; achenes glabrous, 3-5 mm. long. A cult. plant from Euras. that has become established in our flora in the e. third of Tex., spring-summer.

8. MYOSURUS L. MOUSETAIL

Very small annual herbs, with fibrous roots; leaves in a radical tuft, linear to filiform or at first spatulate, entire; scapes simple, one-flowered, the yellowish or whitish flower succeeded by the slender spike or (in depauperate specimens) oblong head of carpels; sepals 5, spurred at the base; petals 5, small and narrow, raised on a slender claw at the summit of which is a nectariferous pit; stamens 5 to 20; achenes numerous, somewhat 3- or 4-sided, apiculate, crowded on a very long and slender spikelike receptacle, the seed suspended.

About 15 species of local occurrence but widely distributed. It is highly probable that additional species will be found in the state.

1. *Myosurus minimus* L. Leaves narrowly linear to filiform, blunt, 3-10 cm. long; scape 3-15 cm. long; sepals oblong, 2-3 mm. long; spurs slender, acute, 1-3 mm. long; petals linear to narrowly spatulate, sometimes wanting, 2-3 mm. long; fruiting spike 2-5 cm. long, 2-3 mm. thick; mature carpels somewhat quadrate, with broader usually rhomboidal and flat back, traversed by very low keel, ending in a short and appressed or often obsolete pointed tip. In damp argillaceous or calcareous soils, fallow fields, throughout the state but mostly in cen. Tex., Mar.-July; from Fla. to Tex., n. to e. Va., s. Ont., Ill., Minn. and Sask.; also Euras.

Plants in Trans-Pecos Texas approach *M. aristatus* Benth. in having a more prominent achene beak. *Myosurus cupulatus* Wats., with its prominent keel extended from the cuplike dorsum of the achenes, has been reported from Texas, but we have seen no material from the state.

9. ANEMONE L. ANEMONE

Erect perennial herbs; leaves compound or divided, all basal except for several which are opposite or whorled to form an involucre that subtends or is remote from the flower; peduncles 1-flowered, solitary or umbellate; sepals 4 to 20, petaloid, usually showy; petals none; stamens and pistils numerous; fruit a compact or elongate head of numerous flattened ribless pubescent or glabrous achenes, with styles short or elongated.

About 150 species that are widely distributed in temperate or cold regions in both hemispheres.

1. Style at maturity attenuate-filiform, 2-4 cm. long; sepals usually 25 mm. long or more; confined to northwestern part of state 1. *A. patens* var. *Wolfgangiana*.
1. Style at maturity 4 mm. long or less; sepals very rarely more than 25 mm. long (2)
- 2(1). Plant with a tuber and slender rhizomes or stolons; flowering stem glabrous or essentially so below the involucre; tips of the achenes filiform, straight, noticeably projecting beyond the wool; in eastern fourth of Texas 2. *A. caroliniana*.
2. Plant without rhizomes or stolons; spinescent tips of achenes more or less sigmoid, not noticeably projecting beyond the wool (3)
- 3(2). Flowering stems shaggy-pubescent to the very base, always 1-flowered; fruiting spike usually 20 mm. long or more; achenes embedded in wool; distribution throughout most of Texas 3. *A. heterophylla*.
3. Flowering stems glabrescent toward base, typically 2- or more-flowered; fruiting spike usually about 15 mm. long; achenes thinly silvery-pubescent to entirely glabrous and vernicose; endemic to Edwards Plateau 4. *A. edwardsiana*.

1. *Anemone patens* L. var. *Wolfgangiana* (Bess.) Koch. PASQUE-FLOWER, PRAIRIE-SMOKE, HARTSHORN-PLANT. Plant silky-villous, glabrate in age; scape to 4 dm. high, from a brown crown; leaves ternately divided, the lateral divisions 2-parted, the middle ones stalked and 3-parted, the segments and those of the sessile cuplike involucre deeply cleft into linear or narrowly lanceolate acute lobes; flowers erect; sepals 5 to 7, blue to purple or white, to 4 cm. long, widespreading in anthesis; stamens usually accompanied by minute or indistinct glandlike staminodia; carpels numerous in a head, with a long hairy style (in fruit) 2-4 cm. long and plumose as in *Clematis*. *A. ludoviciana* Nutt. On prairies and on exposed slopes in n.w. Tex., Apr.-June; from Arct. n.w. Am., s. to n. Mich., Ill., Mo., Tex., N.M., Ut. and Wash.

The inclusion of this species has as its basis a report of its occurrence in Texas. It may occur in the Panhandle.

2. *Anemone caroliniana* Walt. Stem slender, simple, to 3 dm. high, from a small globular tuber that also produces rhizomes or stolons; radical leaves once or twice 3-parted or -cleft; involucre low on the stem, 3-parted, its cuneate divisions 3-cleft; sepals 10 to 20, linear-oblong, white to roseate or lavender-blue to deep-violet, 1-2.2 cm. long; fruiting head ellipsoid, 1-1.5 cm. long; style about the length of the ovate rather turgid achene, erect, its slender tip projecting from the wool. Mostly sandy soils in e. fourth of Tex., Feb.-Apr.; from Fla. to Tex., n. to N.C., Ind., Wisc., Minn. and S.D.

Our plants have a small tuber from which are produced not only the stem and basal leaves but also one or more prominent succulent rhizomes or stolons. Because of this rhizomatous nature some question arises as to whether or not our plant is correctly referable to this species. For the present it is maintained here by tradition.

3. *Anemone heterophylla* Nutt. Plant to 3 dm. high, from an oblong tuberous root; leaves usually appressed-pubescent or at least ciliate-hirsute, 3-foliolate; leaflets petiolulate or sessile, broad, ovate to ovate-oblong or obovate, crenate-dentate or shallowly and obtusely cleft; involucre very dissimilar, borne at or above the middle of the 1-flowered stem, subsessile, its three leaves short, once- (or more rarely twice-) palmatifid-cleft to below the middle, its linear segments mostly entire; sepals 10 to 20, usually white within, blue-lavender to violet without; head of fruit cylindrical, 2-4 cm. long; style not half the length of the orbicular flat achenes, at length inflexed, completely covered by the wool of the achene. *Anemone decapetala* Ard. var. *heterophylla* (Nutt.) Britt. In calcareous clays or in sandy clays throughout much of Tex., including the Trans-Pecos, Feb.-Apr.; from Ala. to Tex., Okla. and Ark.

4. *Anemone edwardsiana* Tharp. Corms brown, oblong-obovate, 2-4 cm. long, 1-2 cm. thick; leaves several, 3-foliolate, glabrous, the petioles 8-15 cm. long; petiolules to 25 mm. long; leaflets reniform in outline, to 25 mm. broad, deeply 2- to 4-cleft, the lobes coarsely crenate; scapes 2-5 dm. tall, glabrous below, upwardly increasingly appressed

silvery-pubescent to become densely so just beneath flowers; primary involucre bracts 3, each 2-5 cm. long, 3-cleft into linear-oblong divisions, with the lateral divisions occasionally again 2-cleft, sparingly soft-pubescent; lateral branches potentially 3 (one in each bract axil), each with 2 bracts similar to those of the primary involucre except smaller and more densely pubescent, each having a potential bractless flower stalk in its axil; maximum potential number of flowers on each compound scape 10 (1 on the central scape and 3 each on the 3 lateral branches); central flowers 2.5-3 cm. broad, the others smaller; sepals whitish to greenish-white, sometimes reddish- or purplish-tinged on back; fruiting head oblong-elliptic, 1.5-3 cm. long, 6-8 mm. thick; achenes tan-color, broadly ovate, plump, margined, each with a short erect beak and a tuft of fine basal hairs as long as the pubescent to glabrous body. *A. tuberosa* of auth., not Rydb. Rich moist soil along limestone ledges in crevices of boulders and in shaded locations at the bases of bluffs on the Edwards Plateau, Feb.-May; endemic.

Those plants with achenes and receptacle entirely glabrous and vernicose are segregated as var. *petraea* Correll. This plant grows wedged in crevices of boulders and ledges below Edge Falls in Kendall County.

10. CLEMATIS L.⁶⁸

CLEMATIS

Herbaceous perennial vines that climb by twining of the petiolules or erect suffrutescent herbs; leaves opposite, simple or variously compound; flowers solitary or in panicles, terminal or axillary, often nodding; sepals usually 4, rarely 5 or 6, thin to coriaceous, white to variously colored, valvate in the bud, the margins often induplicate; petals none or small, transitional into stamens; stamens numerous, with adnate anthers; achene bodies compressed, usually more or less rimmed; achene tails plumose to pubescent or nearly naked.

About 250 species widely distributed in temperate and subtropical regions, with several in temperate regions.

1. Flowers relatively small; sepals mostly less than 15 mm. long, white or whitish, in cymose panicles (2)
1. Flowers large; sepals mostly more than 15 mm. long, variously colored, solitary and mostly nodding on rather long peduncles (4)
- 2(1). Leaflets entire or rarely with an entire lobe, coriaceous; some or all flowers perfect; sepals tomentose on back along margins, glabrous in center 1. *C. dioscoreifolia*.
2. Leaflets more or less coarsely toothed, herbaceous to subcoriaceous; flowers unisexual; sepals dorsally sericeous (3)
- 3(2). Panicles many-flowered; leaflets usually 50-75 mm. long; sepals about 8 mm. long; achene tails about 4 cm. long; confined to the forest region of east Texas .. 2. *C. virginiana*.
3. Panicles sparsely flowered; leaflets to about 35 mm. long; sepals about 12 mm. long; achene tails becoming 8 cm. long or more; distribution west of east Texas 3. *C. Drummondii*.
- 4(1). Sepals thin, petaloid; petaloid staminodes present .. 4. *C. alpina*.
4. Sepals thick, leathery; without petaloid staminodes (5)
- 5(4). Leaves glaucous (especially on lower surface); achene tails always plumose (6)
5. Leaves not glaucous; achene tails plumose to subglabrous (8)
- 6(5). Plants confined to Edwards Plateau; sepals carmine-red; leaflet tips blunt, rounded or emarginate 5. *C. texensis*.
6. Plants confined to extreme east Texas; sepals lavender to purplish; leaflet tips acute to rounded, not emarginate (7)

⁶⁸ Adapted partly from R. O. Erickson in Ann. Missouri Bot. Gard. 30:1-62. 1943.

- 7(6). Leaves membranaceous, not conspicuously reticulate-veined; sepals reddish-purple or purplish; achene tails tawny-plumose 6. *C. glaucophylla*.
7. Leaves coriaceous, reticulate-veined; sepals blue-lavender, commonly greenish or whitish toward the tip; achene tails silvery- or pale yellowish-plumose 7. *C. versicolor*.
- 8(5). Leaves not conspicuously reticulate-veined (9)
8. Leaves more or less distinctly and usually strongly reticulate-veined (10)
- 9(8). Sepals with wide undulate or crisped margins; achene tails finely appressed-pubescent, not plumose 8. *C. crispa*.
9. Sepals without a margin or narrow-margined; achene tails plumose 9. *C. Viorna*.
- 10(8). Achene tails plumose (11)
10. Achene tails partially glabrous to long silky-pubescent but not plumose (12)
- 11(10). Leaflets coriaceous, extremely strongly and closely reticulate-veined, more or less rounded at apex 10. *C. reticulata*.
11. Leaflets thinner, more finely and distantly reticulate-veined, acute to acuminate at apex 11. *C. Beadlei*.
- 12(10). Filaments and usually the anthers consistently densely pilose; achene tails noticeably tapered from base to apex and silky-pubescent to the tip or nearly so, very rarely glabrous above the middle; leaves usually pinnate; leaflets 4-10 cm. long; sepals usually ovate, without a margin or sometimes moderately margined; distribution east of Trans-Pecos Texas 12. *C. Pitcheri*.
12. Filaments and anthers glabrous or very rarely somewhat pilose at their apex; achene tails abruptly filiform and glabrous or nearly so beyond the middle, shortly pubescent below the middle; leaves usually pinnate-ternate; leaflets mostly 4 cm. long or less; sepals lanceolate, moderately margined; rarely east of Trans-Pecos Texas 13. *C. filifera*.

1. *Clematis dioscoreifolia* Lévl. & Van. High-climbing glabrous vine, to 3 m. long or more; leaflets usually 5, coriaceous, triangular-ovate to broadly ovate, obtuse to acuminate, rounded to cordate at base, to 3 cm. long or more, the margins mostly entire, the terminal leaflet conspicuously long-petiolulate; flowers numerous, in corymbiform panicles; sepals white, 10-15 mm. long, densely tomentose along margins on back; achenes minutely appressed-silky; styles 2-3 cm. long, plumose. Climbing on trees and shrubs in s.e. Tex. (Hardin Co.), well-established, July-Sept.; nat. of Japan, frequently cult. and occurring as an escape.

2. *Clematis virginiana* L. VIRGIN'S-BOWER, DEVIL'S DARNING-NEEDLE. Plant almost glabrous; leaves simply 3-foliolate, very rarely pinnately 5-foliolate; leaflets thin, ovate, often subcordate, 5-7.5 cm. long, incisely few-toothed or somewhat lobed, glabrous or sparingly pilose and glabrate on lower surface; panicles corymbiform, with numerous creamy-white flowers; sepals 6-12 mm. long; anthers 0.6-1.5 mm. long; achenes brown or rufescent, pilose or villous-hirsute, the styles 1-3 cm. long. Low grounds, thickets and borders of woods, edge of swamp forests, commonly climbing in trees, in e. Tex., July-Sept.; from e. Can. to Man., s. to Ga., Ala., Miss., La., Tex. and e. Kan.

3. *Clematis Drummondii* T. & G. TEXAS VIRGIN'S BOWER, BARBAS DE CHIVATO, OLD MAN'S BEARD. Plant cinereous-pubescent; leaves mostly pinnately 5- or 7-foliolate, uppermost ones simple and 3-cleft; leaflets 12-25 mm. long, mostly divergently 3-cleft or sometimes parted; principal leaflet lobes ovate-oblong to lanceolate, acute to acuminate, entire or incisely 1- to 3-toothed; peduncles sparsely flowered, sometimes simple and with a pair of leafy bracts next to the base, commonly trichotomous and with higher bracts on the lateral pedicels; sepals sericeous on outer surface, about 12 mm. long; the narrow and copious sterile filaments of the fertile flowers as long as sepals; achene tails very slender, becoming 7.5-10 cm. long. In dryish soils, dry washes and rocky canyons, commonly climbing over trees and shrubs, in cen., s. and w. Tex., Apr.-Sept.; from Tex. to Ariz. and n. Mex.

4. *Clematis alpina* Mill. Plant somewhat suffrutescent; stems slender, to 15 dm. long, with prominent joints becoming swollen with age, appressed-pubescent; leaves once- or twice-ternate; leaflets short-petiolulate, ovate to ovate-lanceolate, irregularly serrate to incised or simply 3-foliolate with some or all of the leaflets 2- or 3-parted; sepals 4, bright-blue, upright, appressed-pubescent; stamens numerous, petal-like, devoid of anthers. In mts. of the Trans-Pecos, spring; from w. N.A. to Sib. and cen. Eur.

5. *Clematis texensis* Buckl. SCARLET CLEMATIS. Herbaceous or slightly woody climbers, glabrous or nearly so, the slender stem somewhat glaucous; cauline leaves with 4 or 5 pairs of leaflets; rachis slender, geniculate, terminated by a tendril-like filament; leaflets simple, 2- or 3-lobed or rarely 3-foliolate, subcoriaceous, ovate or orbicular, rounded to cordate at base, obtuse to rounded or occasionally emarginate at apex and usually with a small mucro; basal leaflets 3-9 cm. long, long-petiolulate, glabrous on both surfaces, glaucous below, moderately to strongly reticulated; peduncles axillary, 1- to 7-flowered; lowest pair of floral leaves approximating in size and character the cauline leaflets but with a short petiole; flowers ovoid, 2-3 cm. long, bright-carmine or scarlet; sepals ovate-lanceolate, recurved at the tip, glabrous on outer surface, glaucous, the margins scarcely expanded, white-tomentose; achene bodies orbicular, essentially symmetrical, 6-7 mm. broad, prominently rimmed, closely appressed-pubescent; achene tails plumose, tawny, 6-7 cm. long, loosely intertwined or spreading. *C. coccinea* Engelm., *Viorna cocctnea* (Engelm.) Small. On limestone cliffs, rocky slopes and trailing over shrubs, usually along streams, on the Edwards Plateau, Mar.-July; endemic.

6. *Clematis glaucophylla* Small. Stem rather slender, ribbed, glabrous; cauline leaves with 4 or 5 pairs of leaflets, the rachis somewhat geniculate and terminating in a slender filiform appendage or minute leaflet; leaflets (at least the basal ones) usually deeply 3-lobed or 3-foliolate but also simple, ovate, acute- to obtuse-tipped, cordate or subcordate at base; basal leaflets 3-7 cm. long, thickish, with a few prominent veins but not reticulate, glabrous on both surfaces, glaucous on lower surface; peduncles axillary, 1- to 3-flowered; floral leaves simple, sometimes small, sometimes larger than the cauline leaflets, approximating the latter in shape and character but with a short petiole; flowers ovoid, 2-2.5 cm. long, reddish-purple; sepals ovate-lanceolate, spreading slightly at the tip, glabrous, the margins unexpanded and white-tomentose; achene bodies suborbicular, inequilateral, 2-6 mm. broad, with a moderately wide rim; achene tails 6 cm. long, plumose, tawny, loosely intertwined or spreading. In rich woods or along streams from Va., s. to Fla. and w. to s.e. Okla. and e. Tex.

7. *Clematis versicolor* Britt. A slender vine, simple or little-branched; stems ribbed, glabrous, glaucous; cauline leaves with 4 pairs of leaflets; rachis slender, geniculate, terminating in a tendril-like filament; leaflets simple or rarely 2- or 3-lobed, ovate, obtuse to subcordate at base, acute to rounded and mucronate but not emarginate at apex; basal leaflets 3-7 cm. long, with slender petiolules, glabrous, glaucous above, glaucous below, reticulate; peduncles axillary, 3- to 7-flowered, the lowest pair of floral leaves similar in shape and character to the cauline leaflets but smaller and short-petioled; flowers subglobose, 15-25 mm. long, blue-lavender, fading to whitish or green toward the tips; sepals narrowly ovate to lanceolate, scarcely recurved at the tips, glabrous to puberulent and glaucous, the margins unexpanded, white-tomentose; achene bodies orbicular to ovate and usually somewhat inequilateral, 5-6 mm. broad, moderately rimmed, closely appressed-pubescent; achene tails 3-6 cm. long, plumose, silvery or pale yellow, loosely intertwined or spreading. In barrens and sandy or stony woods and sandhills in e. Tex., May-Sept.; from s. Mo., Ky. and Tenn. s. to Okla. and e. Tex.

8. *Clematis crispa* L. BLUE JASMINE. Plant climbing freely, glabrous or nearly so, often flowering when only 3 dm. high; leaves compounded with 2 to 5 pairs of leaflets; leaflets from ovate to lanceolate or even linear, cuneate to cordate at base, acute to acuminate at apex, entire to rarely 3-foliolate, membranaceous, little-reticulated; peduncle naked, arising between a pair of compound or rarely simple leaves; calyx cylindrical-campanulate or urceolate-campanulate, rose-colored varying to violet; sepals 2.5-5 cm. long, recurved or spreading from near the middle, the spreading portion with broad undulate thinnish margins; achenes 6-9 mm. broad; style canescent to somewhat villous in flower, in fruit 2-3 cm. long and either almost glabrate (and the upper part falling away in age) or finely appressed-pubescent. *C. cylindrica* Sims, *Viorna crispa* (L.)

Small. Frequently in wet soils, climbing on shrubs, along streams in low woodlands or sometimes on coarse dry sandhills with available water in e. Tex., w. to Calhoun and Williamson cos., Mar.-Oct.; from Fla. to Tex., n. to s.e. Va., Ill. and Mo.

The plant which typically flowers when low and has narrowly lanceolate to linear leaflets (6-8 mm. wide) and whose sepals are artificially outspread is referred to var. *Walteri* Gray.

9. *Clematis Viorna* L. LEATHER-FLOWER, VASE-VINE. Herbaceous or slightly woody climbers, glabrous or nearly so; leaves not glaucous nor coriaceous, 3- to 9-foliolate; leaflets ovate to ovate-lanceolate, subcordate at base, often acute at apex, membranaceous, inconspicuously reticulated, those of the peduncle or inflorescence ovate or cordate; calyx thick, barely 25 mm. long, glabrous or minutely furfuraceous-canescens on outer surface, dull-reddish or purplish; sepals oblong-lanceolate, acuminate, the slender tip recurving; achenes 3-6 mm. broad; achene tails densely plumose, light yellow or brownish.

This species is included here based on a report of its occurrence in Texas. It should be in woods of east Texas. Its distribution is given as from Ga. to Tex., n. to Pa., O., Ind., s. Ill. and s.e. Ia.

10. *Clematis reticulata* Walt. Herbaceous or slightly woody climbers, glabrous or nearly so; stem slender, sparsely pubescent at the nodes; cauline leaves long-petioled, with about 4 pairs of leaflets, the rachis terminating in a tendril-like filament or minute leaflet; leaflets long-petioluled, entire or rarely 2- or 3-lobed, usually elliptical with a rounded and mucronate tip but varying to ovate and acute-tipped, 2-6 cm. long or longer, coriaceous, very strongly and closely reticulated on both the upper and lower surfaces; peduncles axillary, 1- to 3-flowered, the floral leaves usually less than 4 cm. long, otherwise simulating the cauline leaflets; flowers nodding, 15-25 mm. long; sepals purplish-red to mauve or pink-lavender, equaling or somewhat exceeding the stamens, densely covered with yellow canescent pubescence on the outer surface, the tips acute and recurved, the margins narrowly expanded and tomentose; achene bodies suborbicular, symmetrical, 4 mm. broad, with a prominent rim, appressed-pubescent; achene tails 4-6 cm. long, plumose, pale yellow-brown, loosely intertwined. *C. subreticulata* Harbison, *Viorna reticulata* (Walt.) Small. In sandy soils in forests of e. Tex., often climbing on shrubs, w. to Van Zandt Co., Apr.-July; from S.C. to Fla., w. to Ark. and Tex.

11. *Clematis Beadlei* (Small) Erickson. Stem slender, 6-angled, reddish-brown, glabrous or slightly pubescent at the nodes; cauline leaves with 3 or 4 pairs of leaflets; rachis slender, finely pubescent, geniculate, terminating in a tendril-like appendage; leaflets ovate, acute or acuminate, simple and entire or the basal ones commonly 2- or 3-lobed, 2.5-8 cm. long, thin and chartaceous, moderately and distantly reticulate; peduncles axillary, 1-flowered; floral leaves 25 mm. long, simple and entire, short-petioled; flowers not seen; fruiting heads 5 cm. in diameter; achene bodies ovate, inequilateral, 4.5-5.5 mm. broad, moderately rimmed, not greatly compressed, long appressed-pubescent; achene tails 5-6 cm. long, plumose, loosely intertwined. Reported from Ga. to Tex., May-July.

Very close to *C. reticulata* if not referable to it; we have seen no material from the state.

12. *Clematis Pitcheri* T. & G. LEATHER FLOWER, BLUEBELL. Freely climbing more or less herbaceous vine; stem simple or somewhat branched, 6-angled or -ribbed, reddish-brown, nearly glabrous or sparsely pubescent; cauline leaves with 3 or 5 leaflets, the slender rachis terminating in a slender tendril-like filament; leaflets simple, slightly or deeply 2- to 5-lobed or 3-foliolate, chartaceous or coriaceous, nearly glabrous or quite pubescent below, obscurely to very strongly reticulate but not so closely as in *C. reticulata*, the lowest leaflets 4-10 cm. long; ultimate leaflets varying greatly in size and shape from narrowly ovate or elliptical to broadly ovate-cordate, blunt to acute-tipped, mucronate; peduncles axillary, as many as 7-flowered; floral leaves similar to but usually smaller than the cauline leaflets; flowers nodding, ovoid or urceolate; sepals slightly exceeding the stamens to twice their length, ribbed, short appressed-pubescent and dull-purple to brick-red without, deeply colored or greenish within, the margins unexpanded or moderately expanded above the middle, white-tomentose, spreading or recurved at the tip; achene bodies orbicular to suborbicular or obscurely quadrangular, more or less inequilateral, 6-8 mm. broad, with a broad thick rim, appressed-pubescent; achene tails about 3 cm. long

but usually broken and hence much shorter, slender and tapering, sparsely appressed-pubescent or nearly glabrous to silky or villous but not plumose. *Clematis Simsii* and *Viorna Simsii* of auth., *Viorna Pitcheri* (T. & G.) Small. Climbing on shrubs in thickets, open woodlands, along streams and in low places, mostly in n.-cen. Tex., the Edwards Plateau and along the coast, Apr.-Sept.; from Ind. to e. Neb., s. to Tex.

13. *Clematis filifera* Benth. Woody vine with branches to 1 m. long or more; leaves much-divided; leaflets ovate, obtuse to acute or acuminate, rather small, very rarely more than 4 cm. long, strongly reticulated, more or less densely pubescent or tomentose beneath; sepals rose-color to dark-lavender or purplish-black, about 25 mm. long, lanceolate, acuminate at the recurved apex, always with expanded margins above the middle; achene 8-10 mm. in diameter, the very slender tails nearly naked. *C. Pitcheri* var. *filifera* (Benth.) Robins. In crevices of canyon walls, climbing on shrubs and over boulders in canyons at base of cliffs in the Trans-Pecos, Apr.-Sept.; also N.M. and adj. Mex.

The cultivated plant, Love-in-a-mist (*Nigella damascena* L.), occasionally occurs as a waif in waste places. It may be distinguished by its solitary flower subtended by an involucre of finely cut leafy bracts and its pinnately compound leaves whose leaflets are cut into threadlike segments.

FAM. 73. BERBERIDACEAE JUSS.

BARBERRY FAMILY

Shrubs or herbs with alternate often stipulate leaves; sepals and petals imbricated in the bud and usually in 2 rows of 3 each; stamens hypogynous, as many as the petals and opposite them or twice as many as the petals (in *Podophyllum*); anthers opening by 2 hinged valves or along the sides; pistil solitary, becoming a 1- to few-seeded berry or pod; seeds anatropous, with albumen.

About 9 genera and more than 600 species, mainly of the North Temperate Zone.

1. Succulent herbs with a rather large solitary white to rose-colored flower between 2 broad lobulate leaves (sometimes at base of one leaf); confined to the eastern fourth of Texas 1. *Podophyllum*, p. 654.
1. Shrubs with small yellow flowers in racemes on the branches among prickly coriaceous leaves; from central Texas westward 2. *Berberis*, p. 654.

1. PODOPHYLLUM L.

MAY-APPLE. MANDRAKE

A genus of 11 species, with all but the following in eastern Asia; often placed in a distinct family, Podophyllaceae.

1. *Podophyllum peltatum* L. Perennial herb forming gregarious colonies, with creeping rhizomes and thick fibrous roots; stem erect, to 5 dm. high, terminated by a solitary leaf or 2 leaves and a single nodding short-pedunculate flower; leaves peltate, large, orbicular, radially 3- to 9-parted, to 3 dm. or more in diameter; flower buds with 3 green bractlets that are early-fugacious; sepals 6, fugacious; petals 6 or 9, obovate, waxy-white to rose-colored, to 4 cm. long; stamens twice as many as the petals; anthers linear-oblong, opening longitudinally; ovary ovoid, with a large sessile ruffled stigma; fruit a large ovoid many-seeded berry to 5 cm. long, yellow to purplish when ripe, sweet and edible; seeds covering the large lateral placenta, in many rows, each seed enclosed in a pulpy aril. In rich woods, thickets, open pastures and on edge of forests in e. Tex., Mar.-Apr.; from w. Que., s. Ont. and Minn., s. to Fla. and Tex.

The rare variant, f. *Deamii* Raymond, with pink to rose-colored or purplish pigment in flowers, ovary, fruit and seeds, has recently been found in northeast Texas (Upshur Co.).

2. BERBERIS L.

BARBERRY

Evergreen shrubs with yellow flowers and wood; leaves trifoliolate to pinnately lobed, rarely simple; flowers in drooping or rigidly projecting racemes; petals 6, obovate, con-

cave, with a pair of glandular spots at the base; stamens 6, sensitive, the anthers opening by valves; stigma circular, depressed; seeds elliptic to obpyriform, with a crustaceous integument.

About 450 species, mostly in Asia, but also in Europe, Africa and America.

1. Leaves palmately trifoliolate; leaflets sessile at apex of petiole 1. *B. trifoliolata*.
1. Leaves pinnately lobed; leaflets 5 or more (2)
- 2(1). Bracts of inflorescence foliaceous; fruits globose, about 12 mm. in diameter, grading in color from white to brilliant-red, shiny; in west-central Texas 2. *B. Swaseyi*.
2. Bracts of inflorescence not foliaceous; fruits ellipsoid to subglobose, less than 10 mm. in diameter, purple to deep-red, with a bloom; in mountains of Trans-Pecos Texas (3)
- 3(2). Lowermost pair of leaflets arising 10 mm. or more above base of petiole; fruiting pedicel about 8 mm. long; plant rather rigidly erect, usually much more than 3 dm. tall; fruits red 3. *B. haematocarpa*.
3. Lowermost pair of leaflets arising within 3 mm. of base of petiole; fruiting pedicel about 5 mm. long; plant prostrate or weakly ascending, mostly less than 3 dm. tall; fruits purple 4. *B. repens*.

1. *Berberis trifoliolata* Moric. AGARITO, ALGERITAS, CURRANT-OF-TEXAS. Shrub to 2 m. tall or more, with rigid ascending or spreading branches; leaflets rigidly coriaceous, commonly grayish-green and sometimes glaucous, elliptic to narrowly lanceolate, to 7 cm. long, 3- to 7-lobed or -toothed, with the teeth and tip spinescent, the apical lobe usually narrowly triangular-elongate; flowers saffron-scented; fruits globose, red, often with a bloom, 8-10 mm. in diameter, acidulous, edible; seeds reddish-brown to brownish-black, vernicose, 3-4 mm. long. *Mahonia trifoliolata* (Moric.) Fedde. On rocky slopes and flats of pastures, thickets and open woods from coastal s. Tex. northw. and westw. into the Trans-Pecos, Feb.-Apr.; also s. Ariz. and n. Mex.

Those plants with glaucous foliage are usually segregated as var. *glauca* (I. M. Johnst.) M. C. Johnst. (*Mahonia trifoliolata* var. *glauca* I. M. Johnst.) An excellent jelly is made from the fruits of this species.

2. *Berberis Swaseyi* Buckl. TEXAS BARBERRY. Small intricate shrub to 1 m. or more tall; leaflets 5 to 9, thinly coriaceous, grayish-green or yellowish-green on upper surface, paler and conspicuously venose on lower surface, elliptic to elliptic-lanceolate or subquadrate, the 7 to 20 spines relatively weak, turning a deep red in fall; bracts of inflorescence resembling the leaves in miniature; fruits about 12 mm. in diameter, juicy, edible; seeds brown, plump, about 3.5 mm. long. In limestone ridges and canyon walls of the Edwards Plateau, reported from Bailey Co. in the Panhandle, Feb.-Apr.; endemic.

3. *Berberis haematocarpa* Woot. RED BARBERRY. Shrub much-branched, to about 2 m. tall; leaflets 5 to 9, stiffly coriaceous, ovate-subquadrate to elliptic-lanceolate, to 55 mm. long, usually much smaller, typically with 5 to 7 spinescent teeth; racemes laxly 5- to 7-flowered; floral bracts ovate, acute, concave, brown-membranous, about 2 mm. long; fruit 8-10 mm. long, ellipsoid, edible; seeds reddish-brown, about 4 mm. long. *Mahonia haematocarpa* (Woot.) Fedde. In grasslands, on rocky slopes and canyons of mts. in the Trans-Pecos, Mar.-June; also N.M., Ariz. and Mex.

The shrub could become a desirable ornamental. Its flowers are fragrant and a delicious jelly can be made from its attractive fruits.

4. *Berberis repens* Lindl. CREEPING BARBERRY. Dwarf depressed or prostrate shrubs, rarely to 3 dm. tall; leaflets 5 or 7, rarely some leaves with 3, broadly ovate to ovate-elliptic, rounded to slightly cordate at base, mostly with obtuse to rounded apex, to 5 cm. long and 3 cm. wide, pale or glaucous, with 11 to 21 rather weak spinulose teeth; racemes densely 15- or more-flowered; floral bracts tan-color, membranous, suborbicular-ovate, apiculate, concave, 2-3 cm. long; fruit 6-8 mm. long, purple. On walls of wooded canyons and in pine forests of the Guadalupe Mts. in the Trans-Pecos, Mar.-Apr.; from w. Tex., N.M. and Ariz., n. to Wyo. and B.C., w. to Calif.

FAM. 74. MENISPERMACEAE JUSS.

MOONSEED FAMILY

Dioecious woody twining and climbing vines with palmately veined exstipulate petiolate leaves and racemes or panicles of small white or greenish unisexual flowers that are mostly trimerous, regular and hypogynous; sepals and petals similar, distinct, in 3 or more rows, imbricated in the bud; stamens 6 to 12; ovary of 3 to 6 separate pistils, apparently only one maturing with a fruit; fruit a 1-seeded drupe.

A primarily tropical family with about 65 genera and 400 species.

1. Petals and sepals both present; stamens 6, the anthers 4-celled; seed incurved or crescent-shaped; leaves not apically lobed 1. *Cocculus*, p. 656.
1. Petals none; stamens 12, the anthers 2-celled; seed saucer-shaped; leaves deeply several-lobed above middle 2. *Calycocarpum*, p. 656.

1. COCCULUS DC.

CORALBEAD

Flowers in axillary racemes or panicles; sepals, petals and stamens each 6, alternating in threes; pistils 3 or 6, with the stigma entire; drupe globular, with a flattened somewhat roughened stone.

About a dozen species worldwide in distribution, mostly tropical and subtropical.

1. Leaves very variable in shape, typically ovate in outline, the lower surface downy ..
..... 1. *C. carolinus*.
1. Leaves typically oblong, rarely suborbicular, the lower surface glabrous
..... 2. *C. diversifolius*.

1. *Cocculus carolinus* (L.) DC. RED-BERRIED MOONSEED, SNAILSEED. Plant climbing to 3 m. or more, minutely pubescent; leaves ovate or cordate, entire or sinuately or hastately lobed, acute or mucronate at apex, rarely as much as 16 cm. long and wide; flowers greenish, 3-4 mm. across, the petals in the staminate flowers auriculate-inflexed below around the filaments; drupe red, about 8 mm. in diameter, said to be edible but we haven't tried it. Rather frequent in rich woods and thickets in the e. half of Tex., rare westw., July-Aug.; from Fla. to Tex., n. to s.e. Va., Ky., s. Ill., Mo. and s.e. Kan.

2. *Cocculus diversifolius* DC. CORREHUELA. Plant climbing to 2 m. or more, essentially glabrous throughout; leaves not so variable as in *C. carolinus*, linear-oblong to oblong or sometimes ovate or suborbicular, mucronate, sometimes deeply retuse with a mucro in the sinus, to 6 cm. long and 4 cm. wide; flowers white or yellowish; fruit dark-purple, frequently with a bloom, about 6 mm. in diameter. In brushlands, palm hammocks and along resacas in s. Tex., June-Aug.; also s. Ariz. and Mex.

2. CALYCOCARPUM T. & G.

CUPSEED

A monotypic genus.

1. *Calycocarpum Lyonii* (Pursh) Gray. High-climbing vine; leaves large, thin, to 2 dm. long and about as wide, deeply 3- to 5-lobed, cordate at base, the lobes acuminate; flowers greenish-white, about 5 mm. across, numerous in long racemose panicles to 2 dm. long; sepals 6, petaloid; petals none; stamens 12; pistils 3, fusiform, tipped by a dilated many-cleft stigma; drupe ellipsoid, about 25 mm. long, black when ripe, the stone deeply excavated on one side with the incurved margin somewhat erose. In rich soils and swampy areas in e. Tex., May-June; from Fla., w. to Tex., n. to Ky., s. Ill., Mo. and e. Kan.

FAM. 75. MAGNOLIACEAE JUSS.

MAGNOLIA FAMILY

Trees, rarely shrubs or vines with bitter aromatic bark and with the leaf buds covered by membranous stipules; leaves alternate, petiolate, entire, pinnately-veined; flowers solitary or several clustered, usually large and fragrant, polypetalous, hypogynous, with many stamens; perianth segments (3 sepals and 6 to 9 petals) similarly colored, decidu-

ous, imbricated in the bud; stamens numerous, linear, caducous; anthers adnate; carpels numerous, crowded together to cover the prolonged receptacle, cohering with each other and in fruit forming a fleshy or rather woody conelike fruit; mature carpels opening on the back from which the 1 or 2 anatropous arillate seeds hang by an extensile thread.

About 230 species in 12 genera, worldwide in distribution.

- 1. Leaves 4-lobed; mature carpels samaralike, indehiscent 1. *Liriodendron*, p. 657.
- 1. Leaves not lobed, sometimes merely auricled at the base; mature carpels dehiscent or berrylike (2)
- 2(1). Twining shrubs with unisexual flowers; stamens 5, connate into a 5-lobed disk; fruit a spike of berries 2. *Schisandra*, p. 657.
- 2. Erect trees with perfect flowers; stamens numerous, distinct; fruit a head of imbricated follicles 3. *Magnolia*, p. 657.

1. LIRIODENDRON L. TULIP-TREE. YELLOW POPLAR

Two closely related species; the other in China.

1. *Liriodendron tulipifera* L. Tree to 60 m. tall or more, with a straight gray-barked trunk to about 3 m. in diameter; leaves alternate, stipular, long-petioled, to 14 cm. long, about as wide, broadly retuse at apex, 4-lobed or occasionally with small additional lobes or even entire; flowers perfect, solitary at the end of branches; sepals 3, pale-green, soon reflexed; petals 6, broadly ovate, adherent to form a cup-shaped corolla, 4-5 cm. long, greenish-yellow with a large orange blotch at the base within; stamens many, the anthers extrorse; pistils many, on an elongate long-persistent receptacle that ripens into a cone-like fruit 3-4 cm. long; each pistil dry, woody, flattened, samaralike, eventually deciduous. Nat. in rich woods from Fla. to La., n. to Vt., Mich. and Mo.; planted and becoming somewhat naturalized in e. Tex.

An ornamental tree valued for its wood.

2. SCHISANDRA MICHX.

About 25 species, all but one of which is in Asia. Some authors segregate this genus as the basis for the family Schisandraceae.

1. *Schisandra coccinea* Michx. WILD SARSAPARILLA, BAY STAR-VINE. Woody vine climbing into small trees; leaves slender-petioled, deciduous, alternate or somewhat clustered at the nodes, rather thick, ovate to elliptic or oval, 5-15 cm. long, obliquely cuneate at base, somewhat abruptly acuminate at apex, the margins entire or with a few remote teeth; flowers few in axillary clusters, slender-stalked, unisexual; sepals and petals 7 to 12, not differentiated; sepals ovate to oval, 3-6 mm. long; petals obovate-cuneate, mostly crimson; stamens 5; fruit spike 4-7 cm. long; berries about 1 cm. long. In rich woodlands probably in e. Tex., Apr.-July; from Fla. to Tex. (reported from but not seen) and Ark., n. to S.C.

3. MAGNOLIA L. MAGNOLIA

Characters of the family. About 80 species, mostly Asiatic.

- 1. Leaves persistent or sometimes deciduous, leathery-coriaceous or thick-membranous, scattered along the branches, typically elliptic and widest about or below the middle, rounded or cuneate at base; leaf buds tomentose or silky-pubescent (2)
- 1. Leaves deciduous, thin-herbaceous, more or less crowded at the summit of the flowering branches, typically elliptic-obovate and widest above the middle, prominently auriculate at base; leaf buds glabrous or tomentose (3)
- 2(1). Fruits tomentose; leaves leathery-coriaceous, persistent, with a rusty tomentum on lower surface 1. *M. grandiflora*.
- 2. Fruits glabrous; leaves thick-membranous, subsistent or deciduous, minutely pubescent and pale or whitish on lower surface 2. *M. virginiana*.

- 3(1). Leaf blades typically rhombic-obovate, abruptly acute; stamens 4-6 mm. long 3. *M. pyramidata*.
 3. Leaf blades elongate-obovate to oblong-spatulate, gradually pointed at the apex; stamens 9-12 mm. long 4. *M. Fraseri*.

1. *Magnolia grandiflora* L. SOUTHERN MAGNOLIA. Evergreen pyramidal or cylindrical tree to 30 m. tall, with a straight trunk occasionally to 2 dm. in diameter, the smoothish bark tight or rarely flaky; branchlets and buds rusty-pubescent; leaves typically elliptic, to 2 dm. long and 9 cm. wide, rounded to shortly obtuse at apex, cuneate at base, bright-green and lustrous on upper surface, ferruginous-pubescent on lower surface, firmly coriaceous; petioles stout, rusty-tomentose, about 2 cm. long; flowers large, cup-shaped, to 2 dm. across, white, fragrant, with a stout tomentose pedicel; sepals 3, petaloid; petals usually 6 or rarely 9 to 12, obovate, thick; filaments purple; fruit ovoid, rusty-tomentose, 7-10 cm. long, 4-6 cm. thick; seeds red, obovoid, somewhat flattened, about 12 mm. long. *M. foetida* Sarg. In low moist woods, especially along streams, in e. and s.e. Tex., July-Aug.; from e. N.C., s. to Fla. and Tex.

A Texas (if not a national) law should exist forbidding the cutting of these noble trees, whose wood has been used primarily for railroad ties and furniture.

2. *Magnolia virginiana* L. SWAMP BAY, SWEET BAY. A slender semievergreen tree to 20 m. tall, with a trunk to 15 cm. in diameter or rarely shrubby and deciduous; branchlets slender, bright-green and hoary-pubescent when they first appear, usually soon glabrous; buds pubescent; leaves elliptic to oblong-lanceolate, 10-15 cm. long, to 6 cm. wide, acute or obtuse at apex, broadly cuneate or sometimes rounded at base, pale or whitish on lower surface and silky-pubescent at first; petioles slender, 1-2 cm. long; silky-pubescent to glabrous; flowers subglobose, 5-7 cm. across, white, fragrant of lemon, on slender peduncles; sepals thinner and shorter than the petals, spreading; petals 9 to 12, obovate, obtuse to acutish, 3-6 cm. long, concave; fruit ellipsoid, 4-5 cm. long, about 12 mm. thick, dark red, glabrous; seeds red, obovoid, flattened, about 7 mm. long. *M. glauca* L. In swamps, low woods, along boggy streams and on seepage slopes in e. Tex., Apr.-June; from Mass., s. to Fla. and Tex.

Those plants in our region that have young branchlets and petioles more or less persistently densely silky pubescent, and tomentose pedicels, are referable to var. *australis* Sarg.

3. *Magnolia pyramidata* Pursh. Tree to 10 m. high; leaf buds and branchlets glabrous; leaves with a petiole 2-4 cm. long, thin, crowded at the end of branchlets, broadly obovate to rhombic-obovate or rhombic-spatulate, abruptly narrowly obtuse to acute at apex, auriculate at base, to 23 cm. long, somewhat glaucescent on lower surface; flowers creamy-white, 8-12 cm. across; sepals oblong-obovate, much shorter than the petals; petals oblong, gradually narrowed to the base, acuminate at apex; fruit oblong, bright-rose-color, 5-7 cm. long; tips of mature carpels incurved. In rich woodlands in s.e. Tex. (Jasper Co.), Apr.-May; from s. Ga. and n.w. Fla., w. to Tex.

This species, *M. Fraseri*, *M. Ashei* Weath. and *M. macrophylla* Michx. form a complex group. *Magnolia Ashei*, which has been reported from Texas and for which no material has been seen from the state, can be distinguished by its typically larger leaves (more than 35 cm. long) with glaucous-white lower surface and pubescent twigs, petioles and buds. Trees of the huge-leaved *M. macrophylla* are known to be under cultivation in east Texas, leading to the possibility that it might eventually become an escape.

4. *Magnolia Fraseri* Walt. MOUNTAIN MAGNOLIA, EAR-LEAVED UMBRELLA-TREE. Deciduous tree to 20 m. tall, essentially glabrous throughout, with a straight trunk to 3 dm. in diameter and spreading slender branches; leaves clustered at summit of flowering branches, with slender petioles that may become as much as 1 dm. long, elliptic-obovate, only slightly constricted below the middle, auriculate at base, obtuse to acute at apex, to 3 dm. long and 18 cm. wide, bright-green on upper surface, slightly paler on lower surface; flowers on a glaucous peduncle that is to 4 cm. long, creamy-white, sweetly scented, 20-25 cm. in diameter; sepals narrowly obovate to oblanceolate, rounded at the apex, 10-12.5 cm. long, deciduous almost immediately after opening of bud, somewhat shorter than the petals; petals 6 or 9, obovate to oblanceolate, thin, rounded to acute at

the apex, conspicuously narrowed below into a claw, 3-6 cm. wide; fruit oblong, glabrous, bright-rose-red when fully ripe, to 12 cm. long and 5 cm. thick, the mature carpels ending in long subulate persistent tips; seeds red, obovoid, compressed, about 15 mm. long. Rich wooded slopes in s.e. Tex. (Jasper Co.), Mar.-Apr.; from uplands of Va., W.Va. and e. Ky., s. to Ga., Ala., La. and Tex.

FAM. 76. ANNONACEAE JUSS. CUSTARD-APPLE FAMILY

Tree or shrubs with naked buds and aromatic wood and leaves; leaves alternate, entire, exstipulate, pinnately-veined; flowers axillary, solitary, perfect, composed of 3 sepals and 6 thickened petals that are arranged in 2 whorls, imbricate or valvate in bud, hypogynous; stamens numerous or rarely few, distinct, spirally arranged, the large connectives usually extending beyond the anthers; filaments thickened, short; anthers adnate, extrorse; pistils several or many, separate or cohering in a mass, the ovules one to many; fruit (in ours) fleshy or pulpy (a berry); seeds anatropous, large, the minute embryo at the base of the ruminated endosperm.

A family of about 900 species in 75 genera, mainly tropical.

1. ASIMINA ADANS. AMERICAN PAWPAW

Shrubs or small trees; leaves deciduous, usually broadest above the middle; flowers solitary from the axils of leaves of preceding year; sepals early-deciduous; petals accrescent after the bud opens, those of the outer whorl larger than those of the inner whorl; stamens numerous, in a globular mass; pistils as many as 15, ripening into 1 to 5 thick-cylindric pulpy-creamy edible fruits; seeds several, horizontally placed, flat or turgid, brown-coated, enclosed in a fleshy aril.

About 8 species, entirely American.

1. Flowers 3-4 cm. in diameter; seeds flattish; leaves typically obovate-elliptic 1. *A. triloba*.
1. Flowers 1-2 cm. in diameter; seeds turgid; leaves typically cuneate-oblongate ... 2. *A. parviflora*.

1. *Asimina triloba* (L.) Dun. PAWPAW. Large shrubs or small trees, 3-12 m. tall; young shoots and expanding leaves at first clothed with a rusty down, soon becoming glabrescent; leaves elliptic-obovate, abruptly short-acuminate, the midnerve on upper surface provided with reddish-brown hairs, when mature 1.5-3 dm. long, 7 cm. or more wide above the middle; petioles 5-10 mm. long; flowers appearing with the leaves, 3-4 cm. in diameter, on villous pedicels to 3 cm. long; petals dull-purple, veiny, orbicular-ovate to ovate, very unequal, the outer ones spreading and three to four times as long as the calyx; style definite; fruits 5-12 cm. long, 3-4 cm. thick, green or dark-brown when fully ripe, the pulp sweet and edible in autumn; seeds somewhat flattened, 1.5-2 cm. long. Rich woods and banks of streams in n.e. Tex., Apr.-May; from Fla. to Tex., n. to N.J., w. N.Y., s. Ont., Mich., Ill., s.e. Ia. and s.e. Neb.

The fruit, which usually drops while still hard, green and acrid, must be slightly frozen or kept until ripe before they are eaten. The ripening treatment is similar to that for the fruits of the persimmon. The creamy pulp is sweet and luscious.

2. *Asimina parviflora* (Michx.) Dun. DWARF PAWPAW. Shrub 5-20 dm. tall; leaves firmer than in *A. triloba*, oblanceolate-cuneate to narrowly oblanceolate-obovate, broadly rounded to very shortly apiculate-acute at apex, rusty-appearing on lower surface, midnerve on upper surface glabrous except at the very base, 5-17 cm. long, usually much less than 6 cm. wide above the middle; flowers appearing with the leaves, 1-2 cm. in diameter, on tomentulose pedicels to 6 mm. long; petals livid-green, ovate to oblong-elliptic, subequal; stigma sessile; fruits 3-6 cm. long, about 2 cm. thick; seeds plump, 1-1.5 cm. long. In dryish pinelands, thickets and oak woods in s.e. Tex., Apr.; from n. Fla. to Tex., n. to s.e. Va.

FAM. 77. LAURACEAE JUSS.

LAUREL FAMILY

Aromatic trees or occasionally shrubs with alternate simple persistent or deciduous leaves, or sometimes twining parasitic vines with greatly reduced scalelike leaves, without stipules; flowers small, clustered, greenish or yellowish, without petals; calyx of 4 to 6 sepals that are imbricate and free from the ovary, mostly fewer than the stamens; stamens basically 12, in 4 series of 3 each, any one or more series reduced to staminodia or altogether lacking; anthers 2- or 4-celled, opening by 2 or 4 uplifted valves; ovary 1-celled, the ovule solitary and pendulous; style simple; fruit a 1-seeded berry or drupe; seeds anatropous, suspended.

A family of more than 2,000 species in about 32 genera, chiefly tropical and subtropical.

1. Flowers in peduncled racemes; anthers 4-celled and 4-valved; leaves entire and persistent or (if deciduous) lobed (2)
1. Flowers sessile or short-stalked in small clusters; anthers 2-celled and 2-valved; leaves entire and deciduous (4)
- 2(1). Leaves frequently lobed; fruiting pedicel strongly clavate 1. *Sassafras*, p. 660.
2. Leaves entire; fruiting pedicel not noticeably swollen (3)
- 3(2). Axils of the principal leaf veins with glandular pits; calyx cup truncate 2. *Cinnamomum*, p. 660.
3. Axils of veins without glandular pits; calyx cup 6-lobed 3. *Persea*, p. 661.
- 4(1). Shrubs or small trees with well-developed leaves .. 4. *Lindera*, p. 661.
4. Parasitic orange to green twining viny herbs with leaves reduced to scales 5. *Cassytha*, p. 661.

1. SASSAFRAS TREW

Several species in America and eastern Asia.

1. *Sassafras albidum* (Nutt.) Nees. SASSAFRAS. Trees dioecious, to 35 m. high, usually much smaller, with spicy aromatic bark and very mucilaginous pale-green twigs and foliage, with a trunk to 6 dm. in diameter, the young twigs glaucous or nearly so; leaves deciduous, ovate to elliptic in outline, tapering to a long petiole (to 4 cm. long), obtuse to acute at apex, entire or with some 2- or 3-lobed or rarely more-lobed, at first silky on lower surface but usually soon glabrescent, to 16 cm. long and 1 dm. wide; flowers greenish-yellow, naked, in clustered and peduncled racemes, appearing with the leaves, involucrate with scaly bracts; calyx 6-parted, spreading; fertile stamens 9, inserted on the base of the calyx in 3 rows, the inner row with a pair of stalked glands at the base of each filament, without staminodia; anthers 4-celled and 4-valved; pistillate flowers with 6 rudimentary stamens and an ovoid ovary; drupe subglobose to ovoid, dark-blue, about 1 cm. long, with a clavate and rather fleshy reddish pedicel. *S. officinale* Nees & Eberm., *S. variifolium* (Salisb.) O. Ktze. In sandy woods, old fields, on road cuts and along fence rows in e. third of Tex., Mar.-Apr.; from Fla. to Tex., n. to N.E., w. to Mich., Ia., Mo., Kan. and Ark.

Most of our plants are referable to var. *molle* (Raf.) Fern., characterized by having a persistent pubescence on the lower surface of the leaves. The bark of the roots is steeped to produce a pleasant drink, known as "sassafras tea."

2. CINNAMOMUM L.

About 250 species, mainly native to Asia.

1. *Cinnamomum camphora* (L.) Nees & Eberm. CAMPHOR-TREE. Small tree to about 15 m. tall, usually much smaller, glabrous throughout, the buds enclosed by large imbricate scales; leaves with slender petioles about 3 cm. long, alternate, persistent, ovate

to elliptic or elliptic-lanceolate, rounded to cuneate at base, abruptly short-acuminate at apex, to 12 cm. long, pale on lower surface, prominently 3-nerved, when bruised having the odor of camphor; flowers perfect, in slender-peduncled panicles; sepals 1-1.5 mm. long, all deciduous to form a truncate cup surrounding the base of the fruit; fertile stamens 9 in 3 rows, the innermost 3 with extrorse anthers and biglandular at base, a fourth inner row reduced to staminodes; anthers 4-celled and 4-valved; style slender, the stigma minute; drupes subglobose, bluish-black, 6-9 mm. in diameter. A nat. of e. Asia, cult. in s. Tex. and becoming naturalized, Apr.-May; also along the Gulf Coast to s. Fla.

3. PERSEA MILL.

About 150 species primarily of tropical America, of which the avocado (*P. americana* Mill.) is best known.

1. *Persea Borbonia* (L.) Spreng. RED BAY. Tree to 20 m. tall or more, with ascending branches and densely rusty-tomentose to thinly puberulent or sometimes glabrous twigs; leaves alternate, entire, coriaceous, lanceolate to elliptic or elliptic-oblong, tapering into the petiole (to 25 mm. long), broadly rounded to abruptly short-acuminate at apex, to 2 dm. long and 6 cm. wide, persistent, thinly tomentose on lower surface but commonly glabrescent with age; flowers perfect, in small panicles, peduncle to 7 cm. long, usually less than 3 cm. long; calyx 6-parted, surrounding base of fruit; inner row of sepals elliptic, at least twice as long as the outer row and with the upper two-thirds early-deciduous; fertile anthers 9 in 3 rows, the innermost 3 with extrorse anthers and biglandular at base, a fourth inner row reduced to staminodes; anthers 4-celled and 4-valved; drupes subglobose, dark-blue or blackish, about 1 cm. long, 1-seeded. *P. pubescens* (Pursh) Sarg., *P. palustris* (Raf.) Sarg. In woods, swamps, along streams and about shores in s.e. Tex., May-June; from Fla. to Tex., n. to Del.

4. LINDERA THUNB.

A large genus of about 100 species, primarily in eastern Asia.

1. *Lindera Benzoin* (L.) Bl. SPICEBUSH. Deciduous polygamo-dioecious shrub or slender tree, much-branched, to 5 m. tall; leaves obovate to obovate-elliptic or elliptic, cuneate at base into the short petiole (to 12 mm. long), acute to abruptly acuminate at apex, to 15 cm. long and 6 cm. wide, pale and usually pubescent on lower surface, deep-green on upper surface; flowers yellow, in almost sessile lateral umbel-like clusters that appear before the leaves, the clusters composed of small groups of umbels each of 2 to 6 flowers that are surrounded by an involucre of 4 deciduous scales, with a 6-parted open calyx; fertile stamens 9 in 3 rows, the 3 innermost each with a pair of stalked glands at base; anthers 2-celled and 2-valved; pistillate flowers with 15 to 18 rudiments of stamens in 2 forms and a globular ovary; drupe bright-red, subglobose-obovoid, about 1 cm. long. *Benzoin aestivale sensu* Nees. On rich wooded slopes and in rocky areas along streams on the Edwards Plateau, Mar.-Apr.; from s.e. Va., s. to Fla. and Tex., w. to O., Mich., Mo. and Ark.

Our plants are referable to var. *pubescens* (Palm. & Steyererm.) Rehd., characterized by having the lower leaf surface and young branches permanently pubescent.

5. CASSYTHA L.

About 15 species, mainly tropical and subtropical.

1. *Cassytha filiformis* L. WOE-VINE, LOVE-VINE. Parasitic vine superficially resembling *Cuscuta*, with yellowish or pale-green wiry entwined stems and branches with a spicy fragrance; leaves wanting or reduced to spirally arranged scale; flowers perfect, subtended by a minute bract and 2 similar bracteoles, 2 to several at irregular intervals in a slender spike; sepals 6, in 2 unequal series, topping the accrescent fruit; the several inner sepals triangular-ovate, about 1.5 mm. long, much larger than the outer bractlike sepals; fertile stamens 9 in 3 rows, the innermost 3 with extrorse anthers and basal glands, a fourth

inner row reduced to 3 cordate staminodia; anthers 2-celled and 2-valved; drupe globose, blackish, to about 7 mm. in diameter. Parasitic on various herbaceous and woody plants mostly along coastal Tex., rare, May-July; from Fla. and Tex.; also Latin Am. and Afr.

FAM. 78. PAPAVERACEAE JUSS. POPPY FAMILY

Plants herbaceous, sometimes rhizomatous, with acrid usually colored sap; leaves rosulate or usually alternate, rarely opposite, exstipulate; inflorescence terminal and cymose, rarely paniculiform; flowers solitary or clustered, subtended by a leaf or bract, perfect, hypogynous or rarely perigynous, essentially regular; perianth cyclic, 2- or 3-merous; sepals large, enclosing the buds until anthesis, then caducous; petals twice as many as sepals and biseriata, occasionally polypetalous or rarely apetalous; stamens many; ovary 1-celled with 2 or more parietal placentae; fruit a 1-celled capsule, dehiscent by 2 or more valves.

About 200 species in 26 genera, mostly of the subtropics and temperate regions of the Northern Hemisphere.

1. Acaulescent herbs; petals 8 or more, not crumpled in the bud; stigmas over the valves of the capsule1. *Sanguinaria*, p. 662.
1. Caulescent herbs or (of subcaulescent) confined to the Trans-Pecos; petals 4 to 6, mostly crumpled in the bud; stigmas over the placentae (2)
- 2(1). Perianth and stamens borne on the rim of the hypanthiumlike expansion of the receptacle; sepals united into a calyptra; fruit conspicuously ribbed 2. *Eschscholzia*, p. 662.
2. Perianth and stamens strictly hypogynous; sepals not united into a calyptra; fruit not ribbed (3)
- 3(2). Herbage not prickly; flowers on long pedicels; capsules dehiscent by means of small openings just beneath the truncate summit ... 3. *Papaver*, p. 663.
3. Herbage prickly; flowers on short pedicels; capsule dehiscent from the apex by 4 to 6 valves 4. *Argemone*, p. 663.

1. SANGUINARIA L.

A monotypic genus.

1. *Sanguinaria canadensis* L. BLOODROOT, RED PUCCOON. Low perennial, with a thick prostrate rhizome containing an abundant red-orange acrid sap, producing in earliest spring a palmate-lobed or undulate leaf and a 1-flowered scape; leaves orbicular in outline, at full-development of flowers usually nearly reaching them, pale-green or sometimes strongly glaucous beneath, membranaceous to subcoriaceous, becoming at maturity to 3 dm. broad, the margins of the broad basal lobes and summits of the upper narrower ones coarsely dentate or crenate; mature petiole to 4 dm. long, distinctly overtopping the mature capsule; flowers handsome, the bud erect; sepals 2, caducous; petals 8 or more, oblong-spatulate, white or rarely pinkish; stamens about 24; capsule ellipsoid, 1-celled, bivalved, 3-5 cm. long; seeds with large crest. In rich woods in e. Tex., uncommon, Feb.-Mar.; from Que. s. to Fla., w. to Tex.

Our plant has been segregated as var. *rotundifolia* (Greene) Fern., dubiously distinct from var. *canadensis*.

2. ESCHSCHOLZIA CHAM. CALIFORNIA POPPY. GOLD POPPY

About a dozen species confined to western North America.

1. *Eschscholzia mexicana* Greene. MEXICAN GOLD POPPY, AMAPOLA DEL CAMPO. Annual herb with yellowish sap, to about 4 dm. high; stem leafy and branching above; leaves ternately dissected, smooth, glaucous; flowers solitary and erect on long pedicels or in small loose clusters at the ends of the branches; petals 4, orange or yellow, 1.5-3 cm. long; outer rim of hypanthium distinct, usually at least 0.5 mm. wide, nearly as wide as

to wider than the scarious inner rim, after anthesis more or less cartilaginous and flaring or revolute; fruit a slender 1-celled 2-valved several-seeded longitudinally ribbed capsule; mature seeds dark-colored, rugose-reticulate. On limestone slopes of the Franklin Mts. near El Paso, Mar.-May; from w. Tex. to s. Ut., s.e. Calif. and n. Mex.

3. PAPAVER L. POPPY

Annual, biennial or perennial herbs, with whitish or colored juice and large showy usually long-peduncled flowers that terminate the stem and branches; flower buds nodding; sepals 2, deciduous; petals usually 4, thinnish, white or colored; stamens numerous, extrorse; ovary of 4 to many carpels, the placentae parietal but deeply intruded toward the center; stigmas as many as the carpels, sessile and radiating upon a disk that rests on the summit of the ovary and capsule; capsule short and turgid, opening by pores under the edge of the stigma.

About 100 species mostly in the North Temperate Zone.

1. Cauline leaves cordate-clasping, glabrous 1. *P. somniferum*.
1. Cauline leaves not clasping, densely hirsute 2. *P. Rhoeas*.

1. *Papaver somniferum* L. OPIUM POPPY, COMMON POPPY. Plant smooth, glaucous; stem rather stout, to 1 m. tall; leaves sessile, cordate-clasping, oblong in general outline, wavy, coarsely toothed or shallowly lobed; flowers purple or red to white; capsule subglobose or broadly ovoid, glabrous; stigmatic rays 8 to 12. Nat. of Euras.; widely cult. as an ornamental from which it tends to escape.

The small seeds are commonly used in baking. Opium is derived from the milky juice of the unripe capsule.

2. *Papaver Rhoeas* L. CORN POPPY, AMAPOLA. Plant bristly, to 1 m. tall; stems sparsely branched; leaves deeply pinnatifid with the divisions somewhat lobed or incised; flowers usually bright-scarlet, varying to purple or whitish; petals broadly flabelliform; capsule subglobose to broadly obovoid, turbinate, glabrous; stigmatic rays 8 to 14, usually 10. A nat. of Euras. and N. Afr. that has been introd. and become naturalized in cen. Tex. and elsewhere, Apr.-June.

4. ARGEMONE L.⁶⁹ PRICKLY POPPY

More or less glaucous annual, biennial or rarely perennial herbs, with prickly bristles and yellow to orange-red sap (latex); leaves sessile or clasping, sinuate-lobed and with prickly teeth, often blotched or lined with white or light-blue; flower buds erect, short-peduncled; flowers large and showy; sepals caducous, usually 2 or 3, often prickly and with a subterminal fistulose horn; petals 4 to normally 6; stamens mostly numerous, with filiform filaments; style almost none; stigmas 3 to 6, radiate; capsule ellipsoid, fluted on the sutures, prickly, opening by 3 to 6 valves at the top; seeds blackish-brown, crested.

About a dozen species confined to the Americas.

1. Petals pale-lemon-yellow to bright-yellow or bronze (2)
1. Petals white or some shade of lavender (3)
- 2(1). Flowers 3-7 cm. broad when fully expanded; stamens 20 to 75
..... 1. *A. mexicana*.
2. Flowers 7-12 cm. broad when fully expanded; stamens 150 to 250
..... 2. *A. aenea*.
- 3(1). Petals of some shade of lavender (4)
3. Petals white (6)
- 4(3). Uppermost leaves clasping; lower leaves lobed to less than two-thirds the distance to the midrib 7. *A. polyanthemos*.
4. Uppermost leaves not clasping; lower leaves lobed to four-fifths of the distance to the midrib or more (5)

⁶⁹ Adapted from G. B. Ownbey in Mem. Torrey Club 21:1-59. 1958.

- 5(4). Stems not closely prickly; capsules narrowly to broadly elliptic; longest dimension of seeds about 1.5 mm.; southern Texas5. *A. sanguinea*.
5. Stems often closely prickly; capsules narrowly elliptic-lanceolate or ovate-elliptic; longest dimension of seeds 1.8-2.2 mm.; western Texas6. *A. chisosensis*.
- 6(3). Leaf surfaces prickly on the primary and secondary veins above and below and also minutely hispid or prickly (often closely so) between the veins; stems usually closely prickly (7)
6. Leaf surfaces prickly almost exclusively on the primary and secondary veins above and below, sometimes essentially smooth; stems usually with more widely spaced prickles or almost smooth (8)
- 7(6). Largest capsular spines 15-35 mm. long; latex reddish-orange when fresh3. *A. aurantiaca*.
7. Largest capsular spines 8-15 mm. long; latex pale-lemon-yellow to yellow when fresh4. *A. squarrosa* subsp. *glabrata*.
- 8(6). Largest capsular spines compound, that is with few to many smaller spines or prickles arising from the basal portion, usually 8-35 mm. long (9)
8. Largest capsular spines simple, 4-12 mm. long (10)
- 9(8). Largest capsular spines 15-35 mm. long, always definitely compound; latex reddish-orange when fresh3. *A. aurantiaca*.
9. Largest capsular spines 8-15 mm. long, sometimes not clearly compound; latex pale-lemon-yellow to yellow when fresh4. *A. squarrosa* subsp. *glabrata*.
- 10(8). Prickles of sepals and those of the sepal horns (when present) perpendicular; lower cauline leaves mostly lobed to four-fifths or more of the distance to the midrib (11)
10. Prickles of sepals and sepal horns (when present) ascending or sepals smooth; lower cauline leaves often lobed to less than one-half the distance to the midrib (12)
- 11(10). Stems not closely prickly; capsules narrowly to broadly elliptic; longest dimension of seeds about 1.5 mm.; southern Texas5. *A. sanguinea*.
11. Stems often closely prickly; capsules narrowly ovate-elliptic to elliptic-lanceolate; longest dimension of seeds 1.8-2.2 mm.; west Texas ..6. *A. chisosensis*.
- 12(10). Sepal horns 7-15 mm. long7. *A. polyanthemus*.
12. Sepal horns 3-6 mm. long8. *A. albiflora* subsp. *texana*.

1. *Argemone mexicana* L. DEVIL'S FIG, YELLOW PRICKLY POPPY, CARDO SANTO, CHICALOTE, MEXICAN POPPY. Annual with bright-yellow latex; stems mostly solitary, to about 8 dm. tall, often branched from near the base, rather sparingly prickly with perpendicular or slightly reflexed prickles; leaves glaucous, the light-blue markings over the veins conspicuous, the lower ones oblanceolate, progressively broadly elliptical to ovate above, the middle and upper ones mostly very evidently clasping the stem, the lower surfaces sparingly prickly on the main veins, the upper surfaces very distinctly prickly on the main veins or totally smooth, lobed to one-half or more of the distance to the midrib in the lower leaves, more shallowly lobed in upper leaves; leaf lobes oblong, the sinuses comparatively narrow, the acute marginal teeth tipped with a slender spine; buds subspherical or barely oblong, to 15 mm. long and 13 mm. wide, very sparingly prickly; flowers to 7 cm. in diameter, closely subtended by 1 or 2 foliar bracts; sepal horns terete, 5-10 mm. long (including the apical spine), smooth; petals bright- or pale-yellow, the outer ones obovate, the inner ones obovate to obcuneate; stamens 30 to 50, the filaments pale-lemon-yellow, the anthers yellow; stigma purple, 1.5-4 mm. wide, 1-2 mm. high, the lobes pressed against each other and appressed to the style at anthesis; style 1-3 (usually 1) mm. long in fruit; capsules 4- to 6-carpellate, oblong to broadly elliptical, the width (excluding the spines, if present) 1.2-2 cm., the length (including the stigma and style) 25-45 mm., the surface spinescent; capsular spines mostly large and rather even-sized, the

longest 6-10 mm., with very few lesser spines or prickles sometimes present, the capsular surface clearly visible through the armature; seeds 1.6-2 mm. long. In waste places, fields and along roadsides in s.-cen. Tex., spring; from N.E., w. to Ill., s. to n. S.A.

2. *Argemone aenea* G. Ownbey. Annual, biennial or short-lived perennial with bright-yellow latex; stems 1 or few, to about 8 dm. tall, moderately branched, sparingly to quite evidently prickly with usually slender perpendicular or visibly reflexed prickles; leaves glaucous, the veins prominently blue-lined, the lower ones pinnatifid, the middle and upper ones sometimes less deeply cut, the lobes oblong with acute prickle-tipped marginal teeth, the broad sinuses rectangular, the surfaces somewhat prickly on the veins below and smooth or very sparingly prickly on the veins above; buds at flowering time elliptic-oblong, to 24 mm. long and 16 mm. broad, moderately prickly; flowers usually about 9 cm. broad, mostly closely subtended by 1 or 2 foliar bracts; sepal horns approximately round in cross section, to 14 mm. long, smooth or with a few prickles on the herbaceous base, spine-tipped; petals yellow to golden or bronze, suborbicular to very broadly obovate-obcuneate, the outer margins erose; stamens about 150, the filaments red or purplish, the anthers purplish-yellow, the stamens and ovary subequal at flowering time; stigma purple, 3-6 mm. wide, 2-3 mm. high, the lobes characteristically sinuate; capsules 4- or 5-carpellate, narrowly elliptic to elliptic-oblong, the length (including the stigma) to 35 mm., the width (exclusive of spines) to 16 mm., coarsely spiny, the larger spines interspersed with smaller ones, the longest spines usually to about 8 mm. long, the capsular surface clearly visible through the armature; seeds 1.5-1.7 mm. long. In dry plains, low hills and drainage areas of s. and w. Tex., Feb.-Apr.; also n.e. Mex.

3. *Argemone aurantiaca* G. Ownbey. Annual or biennial, with reddish-orange latex, at maturity more or less flat-topped; stems usually 1 from the base, to about 8 dm. tall, stout, widely branched upward, the primary branches few in number and surpassing the main axis, moderately to copiously prickly throughout with long slender perpendicular prickles; leaves bluish, the basal and lower cauline leaves oblanceolate and deeply cut to four-fifths the distance to the midrib to form oblong lobes, the leaves progressively elliptic to ovate upward and less deeply lobed, the uppermost leaves only shallowly lobed and often clasping the stem, all the leaves with secondary angular lobes and marginal points with the points terminated by a usually weak spine or prickle, the leaves sparingly to copiously prickly on the veins (especially below) with slender prickles and also sometimes very sparingly prickly on the surfaces between the larger veins (especially below); buds oblong, often very large, to 25 mm. long and 18 mm. broad, sparingly to densely prickly, the larger prickles sometimes compound; flowers closely subtended by 1 or 2 reduced leaves, 8-12 cm. in diameter; sepal horns angular, often dorsiventrally flattened, 8-12 mm. long, prickly to the indurated apical spine; petals white; stamens 150 or more, the filaments pale-yellow, the anthers yellow; stigma purple, 3.5-5 mm. wide, 2.5-3.5 mm. high, 5- or 6-lobed; capsules 5- or 6-carpellate, ovate, 4-5 cm. long (including the stigma), 15-25 mm. broad (exclusive of armature), densely covered with long herbaceous erect or reflexed spines that are to 35 mm. long, often branched, provided with numerous secondary prickles for three-fourths their length and terminated by a slender indurated point; capsule also provided with small simple prickles arising between the large spines, the surface partially but not completely obscured; seeds 2.5-3 mm. long. In fields and pastures, hilly often rocky country and sandy soils in s.-cen. Tex., Mar.-Aug.; endemic.

4. *Argemone squarrosa* Greene subsp. *glabrata* G. Ownbey. Perennial with yellow latex, at maturity more or less flat-topped; stems 1 to several from the base, to 6 dm. tall, widely branched in the upper portion, the branches stout, moderately to copiously prickly with slender rather even-sized perpendicular prickles; leaves distinctly bluish, deeply lobed below with the segments oblong, less deeply to shallowly lobed upward, the uppermost leaves distinctly clasping the stem, the margins with acute points or secondary lobes that are terminated by a rigid prickle, sparingly prickly on the main veins beneath, smooth or very sparingly prickly on the main veins above, the areas between the larger veins essentially smooth both above and below; buds subspherical, 1.6-2 cm. long and broad, sparingly prickly; flowers closely subtended by 1 or 2 reduced leaves, 8-11 cm. in diameter; sepal horns more or less angular in cross section, 8-11 mm. long, very sparsely prickly, terminated by a rigid spine; petals white; stamens 150 or

more, the filaments pale-yellow, the anthers yellow; stigma purple, 3-4 mm. broad, 2-3 mm. high, 4- or 5-lobed; capsules 4- or 5-carpellate, oblong-elliptic to lance-ovate, the width (exclusive of armature) 14-18 mm., the length (including the stigma) 2.5-5 cm., armed with stout scattered basally herbaceous spreading or reflexed spines, the largest spines 8-12 mm. long and provided with a few secondary prickles, the spines terminated by a stout indurated point; capsules provided with few to numerous very uneven-sized small spines and prickles; seeds to 2.5 mm. long. In arid valleys and on slopes in w. Tex., Apr.-Aug.; also s.e. N.M.

5. *Argemone sanguinea* Greene. RED POPPY. Annual, biennial or short-lived perennial with pale- to bright-yellow latex; stems 1 to few, to 12 dm. tall, simple below, widely branched above, sparingly prickly with perpendicular to recurved prickles; leaves glaucous, the veins conspicuously light-blue-lined, the basal and lower cauline leaves deeply lobed to four-fifths the distance to the midrib, the middle and upper cauline often less deeply lobed, the oblong lobes with marginal acute prickle-tipped teeth, the lower surfaces moderately prickly on the main veins, the upper surfaces almost smooth to sparsely prickly on the main veins; buds broadly elliptic-oblong, to 2 cm. long, 15 mm. broad, moderately prickly with spreading prickles; flowers 6-9 cm. in diameter, usually closely subtended by 1 or 2 small foliar bracts; sepal horns basally slightly prickly, often angular in cross section, 5-10 mm. long (including the indurated sometimes slightly flattened apical spine); petals white to lavender, broadly obovate-obcuneate to sub-orbicular, distally erose; stamens 150 or more, about equaling the ovary in length at anthesis, the filaments lemon-yellow to red, the anthers yellow to lavender; stigma purple, not sinuate, 2.5-5 mm. wide and 1.5-3 mm. high; capsules 3- to 5 (-6)-carpellate, narrowly to broadly elliptic, the width (exclusive of spines) to 18 mm., the length (including the stigma) to 5 cm., armed with stout often recurved spines interspersed with smaller spines and prickles, the largest spines commonly 5-7 (-10) mm. long, the capsular surface clearly visible; seeds strongly apiculate at the micropyle, the longest dimension about 1.5 mm. (excluding the micropylar beak). *A. pinatifida* Nort. In disturbed areas as roadways, fields, embankments and vacant lots or on chaparral plains in s. and s.w. Tex., Feb.-Apr.; also n.e. Mex.

6. *Argemone chisosensis* G. Ownbey. Biennial or perennial with yellow latex, the older plants with a stout fleshy caudex; stems 1 to few, to 8 dm. tall, sparingly branched, sparsely to copiously prickly with long slender perpendicular prickles; lower leaves lobed to near the midrib, the middle and upper ones usually less deeply lobed, the lobes distant with the larger ones oblong and the margins with acute teeth, the lower leaf surfaces stoutly armed on the mid-vein and less so on the secondaries, the upper surfaces almost smooth or weakly armed on the main veins; buds broadly elliptic, to 2 cm. long and 15 mm. wide, mostly moderately prickly with strong perpendicular prickles; flowers 7-10 cm. in diameter, usually closely subtended by 1 or 2 foliar bracts; sepal horns terete or angular in cross section, to 12 mm. long, the basal portion usually prickly with perpendicular prickles, the long indurated apical spine sometimes flattened at its juncture with the herbaceous basal portion; petals white to pale-lavender, suborbicular to obcuneate-obovate; stamens about 150 or more, the filaments pale-lemon-yellow or red, the anthers yellow or purplish; stigma purple, 2.5-3.5 mm. wide, 1.5-2.5 mm. high; capsules 3- or 4-carpellate, mostly narrowly elliptic-lanceolate, sometimes elliptic-ovate, the width (excluding the armature) to 13 mm., the length (including the stigma) to 45 mm., armed with scattered stout spreading or slightly recurved spines interspersed with a few smaller spines and prickles, the largest spines to about 1 cm. long, the capsular surface clearly visible through the armature; seeds 1.8-2.2 mm. long. On arid plains and mts., often along drainages in w. Tex., Mar.-June; also n. Mex.

7. *Argemone polyanthemos* (Fedde) G. Ownbey. Annual or biennial with a deep taproot and bright-yellow latex; stems 1 to 5, to 12 dm. tall, cymosely branched, sparingly prickly with stout perpendicular or recurved prickles; leaves glaucous, succulent, the lower ones oblanceolate and lobed to two-thirds the distance to the midrib with the lobes oblong, the middle and upper leaves elliptic-ovate and more shallowly lobed, the uppermost leaves definitely clasping the stem, with scattered perpendicular or recurved prickles on the main veins beneath, totally smooth above; buds elliptic-oblong, to 22 mm. long and 15 mm. broad, rather sparingly to moderately prickly with spreading prickles; flowers

mostly 7-10 cm. in diameter, usually rather closely subtended by 1 or 2 foliar bracts but sometimes the bracts distant; sepal horns essentially terete, to 15 mm. long, usually completely devoid of prickles; petals white, very rarely lavender, the inner ones broadly obovate-obcuneate, the outer ones suborbicular, with the outer margins minutely erose; stamens 150 or more, the filaments lemon-yellow, the anthers bright-yellow, equaling the stigma in length at anthesis; stigma purple, 3-4.5 mm. broad, 2-3 mm. high, 3- or 4-lobed; capsules 3- or 4-carpellate, narrowly to broadly elliptic, the width (exclusive of armature) to 17 mm., the length (including the stigma) to 3 cm., stoutly spinescent with widely spaced spreading or recurved simple spines (8-10 mm. long) that are commonly interspersed with a few smaller spines, the capsular surface clearly visible; seeds about 2 mm. long. *A. intermedia* of auth. In sandy or gravelly soils on prairies, foothills and mesas, and roadsides, fields, pastures and waste grounds in the n. half of Tex., Apr.-June; from S.D. to e. Wyo., N.M. and Tex.

8. *Argemone albiflora* Hornem. subsp. *texana* G. Ownbey. **WHITE PRICKLY POPPY.** Annual or biennial with a deep taproot and yellow latex; stems usually solitary, to 15 dm. tall, sparsely to rather moderately prickly with usually slender perpendicular or recurved prickles; basal and lower cauline leaves often lobed to near the midrib, the middle and upper leaves more shallowly lobed, entirely smooth or with a very few weak prickles mainly on the midrib above; bud broadly elliptic to subspheric, sparingly to rather closely covered with slender spreading simple prickles; flowers usually rather closely subtended by 1 or 2 foliar bracts, the interval between flower and nearest bract sometimes as much as 5 mm. at fruiting time; sepal horns to 1 cm. long, smooth or sparingly prickly at the base; petals white; stamens equal to or shorter than the pistil at anthesis; stigma 2-3.5 mm. broad, 1.5-2 mm. high; style sometimes evident; capsules 3- to 5-carpellate, typically narrowly elliptic, the width (exclusive of spines) to 14 mm., the length (including the stigma) to 4 cm., moderately armed with usually slender spreading basally herbaceous simple spines as well as numerous uneven-sized smaller spines and prickles, the largest spines to 12 mm. long, the capsular surface partially obscured; seeds about 1.7 mm. long. Incl. var. *texana* (G. Ownbey) Shinnars. In sandy or gravelly soils on embankments and in vacant lots, pastures, waste places, hills, and along fence rows, roadsides and railroad right-of-ways throughout most of Tex., Mar.-June; from n. Ark. and s. Mo. to Tex.

FAM. 79. FUMARIACEAE DC.

FUMITORY FAMILY

Plants herbaceous, with watery sap; leaves rosulate or alternate, glabrous, dissected, exstipulate; inflorescence terminal or axillary, bracteate, racemose or cymose; flowers perfect, hypogynous, bilaterally symmetrical or irregular; perianth cyclic, 2-merous; sepals 2, small and bractlike, not enclosing the buds at anthesis; petals 4, in 2 pairs, very rarely sympetalous, 1 or both outer petals more or less saccate or spurred at base, the inner petals apically connate; stamens 6, in 2 sets of 3 each, 1 or both median stamens basally spurred and/or nectariferous; anthers applied to the lobed and flattened stigmatic mechanism; ovary 1-celled with 2 parietal placentae; fruit 2-valved, rarely indehiscent.

About 450 species in 16 genera, native to the North Temperate Zone and southern Africa.

1. Style persistent; fruit an elongated bivalved capsule, several-seeded; annuals or biennials 1. *Corydalis*, p. 667.
1. Style articulated and deciduous; fruit a globose indehiscent 1-seeded hard nut; adventive annuals 2. *Fumaria*, p. 670.

1. CORYDALIS VENT.⁷⁰

SCRAMBLED EGGS

Annual, biennial or rarely perennial pale or glaucous herbs from a taproot, tuberous root or rhizome; stems monopodial or sympodial; leaves basal or cauline, alternate, usually

⁷⁰ Adapted from G. B. Ownbey in Ann. Missouri Bot. Gard. 34:187-258. 1947.

more or less petioled, pinnately dissected, the pinnae deeply once- or twice-divided and incised; inflorescence a panicle or raceme, terminal, bracteate; flowers short-pedicel, bilaterally symmetrical; sepals 2, minute, scarious, appressed, often fugacious; petals 4, elongate, pale- to bright-yellow, free or somewhat coherent at the base, in 2 whorls of 2 petals each; outer petals dissimilar with 1 spurred and the other sometimes gibbous at the base, both are more or less distinctly keeled or hooded at the apex; inner petals similar, connate at the apices, clawed; stamens in 2 groups or phalanges opposite the outer petals, each phalange with 3 anthers, the outer 2 of which are monotheical, the central dithecal, the phalange opposite the spurred petal having a distinct glandular spur that is adherent to the inner surface of the petal spur except at the tip; stigma persistent, flattened, sometimes bilobed, with 4 to 8 papillary stigmatic surfaces; style distinct, slender; fruit a bicarpellate many-seeded capsule with 2 sterile valves and 2 persistent placentae, often torulose, terminated by the style; seeds numerous, black, with a distinct chalazal appendage or caruncle, lustrous, smooth or variously decorated under magnification.

About 320 species of the North Temperate Zone.

1. Fruits densely beset with transparent clavate pustules or vesicles; spurred petal 16-22 mm. long, the hood with a very high crest, the wing margin very broad 1. *C. crystallina*.
1. Ovary and fruit essentially glabrous although sometimes granulose along the sutures; spurred petals 18 mm. or less long, the wing margin moderately broad to narrow (2)
 - 2(1). Plants often bearing cleistogamous flowers; spurred petal of normal flowers 10-15 mm. long, the hood with a low regular undulate or obsolescent crest; seeds about 1.5 mm. in diameter, nearly smooth under magnification (3)
 2. Plants seldom bearing cleistogamous flowers; spurred petal mostly 14-18 mm. long; seeds about 2 mm. in diameter, essentially smooth to variously decorated under magnification (5)
- 3(2). Normal-flowered racemes not greatly exceeding the leaves, often short; spur usually somewhat globose at tip; fruits often stout, commonly 1-1.5 cm. long ... 2. *C. micrantha* var. *micrantha*.
3. Normal-flowered racemes often greatly exceeding the leaves, elongated; spur not globose at the tip; fruits slender, 1.5-3 cm. long (4)
- 4(3). Stems usually weak and not strongly striate when dry; foliage green to glaucous; fruits 1.5-2 cm. long 2. *C. micrantha* var. *australis*.
4. Stems usually stout and strongly striate when dry; foliage glaucous; fruits 2.5-3 cm. long 2. *C. micrantha* var. *texensis*.
- 5(2). Seeds distinctly muricate or muriculate under magnification (6)
5. Seeds never muricate though sometimes muriculate at the margin under magnification (7)
- 6(5). Hood crestless or with a moderately well-developed crest; fruits 26-34 mm. long, usually abruptly acute; seeds distinctly muricate under magnification 3. *C. curvisiliqua* var. *curvisiliqua*.
6. Hood with a well-developed crest; fruits 20-25 mm. long, gradually tapered; seeds muriculate under magnification 3. *C. curvisiliqua* var. *grandibracteata*.
- 7(5). Racemes usually surpassed by the leaves; hood sometimes crested; fruits spreading or pendent, usually 18-24 mm. long; seeds with no ring margin 4. *C. aurea* var. *aurea*.
7. Racemes usually surpassing the leaves; hood usually not crested; fruits erect, often incurved, usually 12-20 mm. long; seeds usually with a ring margin 4. *C. aurea* var. *occidentalis*.

1. *Corydalis crystallina* Engelm. Glaucescent winter annual; stems 1 to several, to 4 dm. tall, erect or ascending; leaf blades pinnate, the segments pinnatifid and once again incised, the ultimate lobes broadly lanceolate to linear-lanceolate and subapiculate; racemes surpassing the leaves, as many as 18-flowered; bracts ovate to ovate-acuminate, to 12 mm. long and 6 mm. wide, usually much-reduced upward; pedicels stout, erect, about 1 mm. long; sepals 2 mm. or less long, broadly ovate to cordate, somewhat attenuate; spurred petal 16-22 mm. long, the hood always crested with the crest very high and undulate or toothed, the broad wing margin reflexed upon the hood, the spur 6-8 mm. long and with the blunt tip distinctly globose; stamen spur 3.5-5 mm. long, clavate, curved or bent near the apex; fruits erect, 14-18 mm. long, stout, straight or moderately incurved toward the floral axis, densely beset with transparent pustules that often break open at maturity; seeds black, about 2 mm. in diameter, distinctly submuricately decorated under magnification, without a ring margin. *Capnoides crystallinum* (Engelm.) O. Ktze. In prairies, fields, open woods and wastelands in e.-cen. Tex., Mar.-May; from Mo. to Tex.

This species is distinguished from all other species of *Corydalis* by the peculiar type of pubescence of the fruit. The pustules sometimes appear ligulate when desiccated or, as is often the case, when they rupture at maturity. The crest and margins of the hood of the outer petals are more highly developed than in any other yellow-flowered species.

2. *Corydalis micrantha* (Engelm.) Gray. Glaucescent or nearly green winter annual; stems 1 to several, to 6 dm. tall, usually less than 3 dm. tall, erect to ascending, sparingly branched, sometimes striate when dry; leaf blade pinnate, the 5 or 7 primary segments pinnatifid and again incised, the ultimate leaf segments ovate to oblong-elliptic or obovate and acute to subapiculate; normal-flowered racemes more or less exceeding the leaves, 6- to 20-flowered, not surpassed by the few-flowered secondary racemes; cleistogamous-flowered racemes (when present) inconspicuous, 1- to 5-flowered; bracts ovate to elliptic, the lowermost 5-8 mm. long and 2-4 mm. broad, the upper much-reduced; pedicels erect or spreading, the lower 3-6 mm. long, gradually decreasing in length upward; flowers pale-yellow, somewhat crowded or distant throughout anthesis; sepals ovate, 1.5 mm. or less long, often undulate or toothed on the margin; spurred petal 11-15 mm. long, sometimes arcuate, the hood with a low crest that is undulate or rarely obsolescent, the wing margin well-developed, the spur 4-7 mm. long and blunt or distinctly globose at the apex; stamen spur 2-4 mm. long, usually about three-fifths the length of the petal spur, straight or curved, sometimes clavate; fruits erect or incurved, slender, to 3 cm. long (including the beak), straight or moderately incurved; seeds about 1.5 mm. in diameter, black, shiny, turgid, concentrically but mostly moderately decorated under magnification, obtuse at the border, with no ring margin.

Var. *micrantha* usually can be distinguished from var. *australis* and var. *texensis* by its less elongated racemes, generally smaller flowers, globose-tipped spur and generally shorter (15 mm. or less long) stouter fruits. Along bluffs, rocky hills, open woods and on river banks in n.e. Tex., Mar.-May; from Minn. to Ill., Kan. and Tex.

Var. *australis* (Chapm.) Shinnery [subsp. *australis* (Chapm.) G. Ownbey, *C. Halei* (Small) Fern. & Schub., *C. campestris* (Britt.) Buchh. & Palm.] is best distinguished by its elongate normal-flowered racemes, its short saccate spur which is never clearly globose at the tip, its slender erect fruits, and its minute nearly smooth seeds. In disturbed often sandy soils in abandoned fields, along roadsides, in open woods and wastelands in e. and s. Tex., Feb.-Apr.; from s. Mo. and e. Kan. to Tex., Fla. and N.C.

Var. *texensis* (G. Ownbey) Shinnery (subsp. *texensis* G. Ownbey) is closely comparable to var. *australis* but it is easily distinguished by its longer fruits (2.5-3 cm. long) and more strongly arcuate spurred petals. In habit and foliage it is very similar to *C. curvisiliqua* var. *curvisiliqua* with which it is often confused. It can be distinguished from the latter by its nonmuricate seeds and shorter spur which is not globose at the tip. In moist often sandy soil, open ground of alluvial plains and uplands in s. coastal Tex., Feb.-Apr.; endemic.

3. *Corydalis curvisiliqua* Engelm. Glaucescent winter annual or (perhaps) biennial; stems 1 to several, erect to ascending, to 4 dm. long, often somewhat branched; leaves pinnate, the pinnae twice-pinnatifid and rarely again incised; ultimate leaf segments oblong to obovate, obtuse to rounded; peduncles usually surpassing the leaves, usually about 12-flowered; bracts ovate to acuminate, sometimes conspicuous, to 15 mm. long and 6 mm. wide, the lowest sometimes foliose, much-reduced upward; pedicels stout,

spreading, 2-3 mm. long; sepals broadly ovate to ovate-attenuate, often more or less toothed or undulate on the margin, about 1 mm. long; flowers bright-yellow, often strongly arcuate, at first crowded on the raceme, becoming more distant during anthesis; spurred petal 15-18 mm. long, with a very broad wing margin, the crest absent to well-developed and undulate or toothed, the spur 7-9 mm. long and often somewhat globose at the blunt tip; stamen spur clavate, bent near the apex, 4-6 mm. long, about two-thirds the length of the spur; fruits slender, erect, moderately to strongly arcuate or incurved toward the floral axis, 2-3.4 cm. long; seeds about 2 mm. in diameter, black, muricate, with little or no ring margin at maturity.

Var. *curvisiliqua* is most easily recognized by its extremely long (26-34 mm. long), erect, incurved fruits, and its seeds that are distinctly muricate under magnification. The latter characteristic is approached nowhere else in the genus. The well-developed wing margins of the outer petals, the much-reduced clawlike basal portion of the unspurred outer petal, and the well-developed spur which is about one-half the total length of the spurred petals are floral characters that aid in the recognition of this plant. In disturbed soil, sandy bottoms, abandoned fields, open woods, hillsides and valleys in cen. and w. Tex., Feb.-May; endemic.

Var. *grandibracteata* Fedde [subsp. *grandibracteata* (Fedde) G. Ownbey] is best distinguished by its slender, lanceolate, erect, incurved fruits (2-2.5 cm. long), its relatively large flowers, the usually highly developed crest and wing margin, and the large ovate floral bracts (1-1.5 cm. long). Usually in sandy soils, open ground, alluvial plains, roadsides, prairies and slopes in n.e. Tex., Apr.-May; from s. Kan. to Tex. and e. Ia.

4. *Corydalis aurea* Willd. Glaucous winter annual or biennial from a more or less branched rootstock; stems erect to prostrate-ascending, to 6 dm. long, usually about 25 cm. long; leaves barely or occasionally reduced in size upward, with 5 or 7 pinnae that are pinnatifid and again incised; ultimate leaf segments oblong to broadly or narrowly elliptic, as much as 5 times as long as broad; peduncles short, terminal; racemes shorter than to barely exceeding the leaves, 4- to 20-flowered; bracts elliptic to linear, to 1 cm. long and 2 mm. broad, rarely larger, often denticulate at the apex, much-reduced upward; pedicels erect when young, often reflexed or recurved in fruit, to 1 cm. long; sepals ovate to ovate-attenuate, irregularly toothed, 1-3 mm. long; flowers pale- to bright-yellow; spurred petal 13-18 mm. long, the hood usually not crested, the crest (when present) low and incised, the wing margin moderately to well-developed; spur blunt, straight or slightly incurved, 4-9 mm. long, the tip somewhat globose; stamen spur 2-6 mm. long; fruits commonly 16-24 (rarely to 30) mm. long, stout or slender, erect to pendent at maturity, straight to moderately arcuate, sometimes moniliform, the valves often torulose when dry; seeds about 2 mm. in diameter, black, shiny, turgid, obscurely decorated to nearly smooth under magnification, broadly acute at the edge, without or with a narrow ring margin. *C. euchlamydeum* Woot. & Standl. In gravelly or sandy soil on hillsides, prairies, plains, gravel pits, creek bottoms, road cuts and burned-over areas in the w. half of Tex., Feb.-Sept.; also n. Mex.

Var. *aurea* is best distinguished on the basis of its generally weak racemes and slender, pendent or spreading fruits. The racemes ordinarily do not exceed the leaves except in early stages of growth.

Var. *occidentalis* Engelm. [subsp. *occidentalis* (Engelm.) G. Ownbey] is best distinguished from var. *aurea* by its more strongly monopodial growth form, its stouter racemes, generally larger flowers and longer spurs (5-9 mm.), and the stouter (16-18 mm. long), more strongly curved, erect or semierect fruits.

2. FUMARIA L. FUMITORY

Annual glaucous glabrous herbs with diffusely branching to erect or scandent stems; leaves decompose, with small narrow segments; racemes terminal or opposite the leaf; flowers zygomorphic; sepals 2, scalelike, closely appressed; petals 4, elongate, erect-connivent, the 2 outer dissimilar with one of them spurred, the inner pair narrow and coherent at apex, carinate or crested on back; stamens 6, diadelphous, opposite the outer petals; style filiform, with a small entire or obscurely 2-lobed stigma; ovary with 1 ovule near the base; fruit subglobose, indehiscent, 1-seeded.

An Old World genus of about 55 species.

- 1. Sepals at least 2 mm. long and 1 mm. wide; fruit truncate to emarginate at apex; bracts shorter than the fruiting pedicels; leaf segments flat 1. *F. officinalis*.
- 1. Sepals at most 1.5 mm. long and 0.8 mm. wide; fruit obtuse to apiculate or beaked at apex; bracts about equal to fruiting pedicels; leaf segments with channeled lobes 2. *F. parviflora*.

1. *Fumaria officinalis* L. COMMON FUMITORY. Plants glabrous and glaucous; stems diffusely branched, spreading or ascending, to 8 dm. long; leaves petioled, finely dissected into narrow linear or cuneate segments; racemes narrow, dense, to about 5 cm. long; bracts small; pedicels 2-4 mm. long; sepals ovate to ovate-lanceolate, acuminate, 2-3.5 mm. long, 1-1.5 mm. wide; corolla reddish-purple, darker at the apex, 7-9 mm. long; nutlet depressed-globose, about 2.5 mm. in diameter. In waste places, mostly in cen. Tex., spring-summer; adv. from Eur. in various areas of s. U.S.

2. *Fumaria parviflora* Lam. Plant suberect to diffuse or sometimes climbing, noticeably glaucous; leaf segments with channeled linear or subulate lobes; inflorescence often about 20-flowered, subsessile, dense in flower, lax in fruit; bracts linear-oblong, cuspidate, about equaling the suberect or ascending fruiting pedicels; sepals broadly ovate, acute, 1-1.5 mm. long, 0.6-0.8 mm. wide, somewhat lacinate-dentate; corolla 5-6 mm. long, white or flushed with pink, with a blotch at the base of the wings and with the tips of the lateral petals blackish-red; upper petal dorsally compressed, truncate; fruit suborbicular to ovate-orbicular, about 2 mm. long, little-compressed but distinctly keeled, obtuse to beaked at apex. In waste or arable lands in cen. Tex., spring-summer; adv. from Eur.; also in Mex. and S.A.

FAM. 80. CRUCIFERAE JUSS.⁷¹ MUSTARD FAMILY

Herbs with watery and mostly pungent sap, infrequently suffrutescent and subshrubby; leaves alternate (rarely opposite), entire to lobed or pinnately divided and without stipules; flowers bisexual, usually tetradynamous, mostly regular and ebracteate in terminal racemes, infrequently solitary and pedunculate; sepals 4, deciduous, usually oblong, erect and appressed to the corolla or spreading at anthesis; petals 4 (rarely absent), hypogynous, entire or emarginate, rarely lobed or fimbriate, yellow, white or lavender; stamens 6 (rarely fewer or more) in two whorls, outer single stamens 2, inner paired stamens 4; ovary with 2 locules (rarely with a single locule); fruit a dry usually dehiscent silique with a wide range of shapes from narrowly linear to depressed-globose; seeds without an endosperm; embryo curved with radicle usually folded retrorsely along cotyledon margins (accumbent), or along the back of one cotyledon (incumbent), or in a somewhat intermediate position; embryo rarely straight as in *Leavenworthia*.

About 375 genera and over 3,000 species. Nearly cosmopolitan, but mostly in the temperate and cold parts of the world. At high elevations elsewhere. Many species have become widespread weeds.

- 1. Siliques linear, at least 3 times longer than broad (2)
- 1. Siliques variously shaped from globose to orbicular or triangular, didymous or flattened, less than 3 times longer than broad (37)
- 2(1). Stamens distinctly exerted, nearly equal and unpaired; siliques distinctly stipitate; stipe 3-20 mm. long (3)
- 2. Stamens included or only slightly protruding, unequal, tetradynamous; siliques sessile or with a short stipe (4)
- 3(2). Petals yellow; stipes 10-20 mm. long 1. *Stanleya*, p. 674.
- 3. Petals white to lavender; stipes less than 4 mm. long .. 2. *Thelypodium*, p. 675.
- 4(2). Siliques dehiscent by longitudinal linear valves (5)
- 4. Siliques with a transverse partition, indehiscent except by breaking into jointed segments (34)

⁷¹ Treatment prepared by Reed C. Rollins, Elizabeth A. Shaw and Ray J. Davis.

- 5(4). Calyx urn-shaped; flowers at least slightly irregular to markedly irregular
 3. *Streptanthus*, p. 676.
5. Calyx with plane sepals, not constricted; flowers regular (6)
- 6(5). Petals definitely lobed in the blade portion 7. *Dryopetalon*, p. 679.
6. Petals entire or at most emarginate (7)
- 7(6). Siliques flattened parallel to the septum (8)
7. Siliques terete or if compressed, then flattened contrary to septum (16)
- 8(7). Stems arising from a basal rosette of leaves or a branched caudex, or with
 rhizome leaves present (9)
8. Stems with lower leaves separated by internodes, no basal rosette or tuft of leaves
 present (14)
- 9(8). Petals white to lavender; inflorescences racemose, none of the flowers peduncu-
 late; styles less than 3 mm. long (10)
9. Petals yellow; at least some flowers pedunculate or styles over 5 mm. long; pedicels
 much-elongated (13)
- 10(9). Valves not extending to silique margin, elastic and rolling up after dehiscence . .
 14. *Cardamine*, p. 685.
10. Valves extending to edge of the replum margin, not elastic and rolling upon de-
 hiscence (11)
- 11(10). Siliques linear-elliptical; seeds wingless, in two distinct rows in each loculus . .
 27. *Draba*, p. 692.
11. Siliques linear; seeds winged, in a single row in the loculus (12)
- 12(11). Leaves entire to dentate; pedicels expanded below receptacle
 5. *Arabis*, p. 677.
12. Leaves pectinate to pinnatifid; pedicels not expanded below receptacle
 8. *Sibara*, p. 679.
- 13(9). Leaves lyrate-lyobed to entire; siliques flattened, not thick and spongy or mar-
 gined; styles less than 2 mm. long 26. *Leavenworthia*, p. 692.
13. Leaves pinnately or bipinnately dissected; siliques thick, spongy and margined or
 styles over 5 mm. long 25. *Selenia*, p. 691.
- 14(8). Sepals and petals lavender to deep-purple; buds acute; petals showy, over twice
 the length of the sepals 3. *Streptanthus*, p. 676.
14. Sepals greenish; petals white to light-lavender; buds obtuse; petals not showy, less
 than twice the length of the sepals (15)
- 15(14). Cauline leaves petiolate or cuneate at base, upper ones entire
 5. *Arabis*, p. 677.
15. Cauline leaves sessile and auriculate, upper ones lobed . 8. *Sibara*, p. 679.
- 16(7). Siliques compressed contrary to septum, densely pubescent with whitish branched
 trichomes; stigma conical or sagittate 12. *Nerisyrenia*, p. 684.
16. Siliques terete, densely pubescent or glabrous; stigmas capitate or bifid but not
 sagittate or conical (17)
- 17(16). Leaves entire or lobed, never divided as far as midrib (18)
17. Leaves (at least some) pinnately lobed to bipinnate, the primary lobes cut to the
 leaf rachis (29)
- 18(17). Flowers white to lavender, never yellow (19)
18. Flowers yellow or yellowish, never white to lavender (25)
- 19(18). Siliques densely pubescent, grayish (20)
19. Siliques glabrous or nearly so, greenish (21)
- 20(19). Stigmas entire, not noticeably bilobed 11. *Halimolobos*, p. 684.
20. Stigmas strongly bilobed or horned 17. *Matthiola*, p. 688.

- 21(19). Flowering stems arising from a flat basal rosette; leaves dimorphic 13. *Arabidopsis*, p. 685.
21. Flowering stems arising from leaves with definite internodes; basal and cauline leaves somewhat similar (22)
- 22(21). Upper cauline leaves auriculate 8. *Sibara*, p. 679.
22. Upper cauline leaves petiolate or cuneate at the base (23)
- 23(22). Trichomes of leaves and stems many-branched; petals barely exceeding sepals 6. *Pennellia*, p. 678.
23. Trichomes of leaves and stems mostly simple or plants glabrous; petals at least half again as long as sepals (24)
- 24(23). Lower cauline leaves auriculate; cotyledons accumbent 4. *Iodanthus*, p. 677.
24. Lower cauline leaves petiolate or cuneate at base; cotyledons incumbent 9. *Sisymbrium*, p. 680.
- 25(18). Trichomes closely appressed, bifurcate or trifurcate 16. *Erysimum*, p. 687.
25. Trichomes spreading or absent, mostly simple if present (26)
- 26(25). Siliques with a definite beak in addition to style .. 21. *Brassica*, p. 689.
26. Siliques blunt at apex or tipped with a style but no beak present (27)
- 27(26). Cauline leaves auriculate-clasping; pedicels unexpanded at summit, nearly same diameter as siliques 18. *Conringia*, p. 689.
27. Cauline leaves cuneate at base or petiolate; pedicels expanded at summit (28)
- 28(27). Pedicels slender, 10-15 mm. long 19. *Diploaxis*, p. 689.
28. Pedicels short, less than 5 mm. long 15. *Rorippa*, p. 686.
- 29(17). Trichomes mostly highly branched; stems and leaves often grayish from a dense pubescence; leaves often bipinnate to tripinnate ... 10. *Descurainia*, p. 682.
29. Trichomes mostly simple or absent; stems and leaves greenish; leaves at most pinnate plus secondary lobing (30)
- 30(29). Petals yellow or yellowish (31)
30. Petals white to light-lavender (33)
- 31(30). Siliques with a definite beak in addition to the style; seeds globose 21. *Brassica*, p. 689.
31. Siliques blunt at apex or tipped with a style but no beak present; seeds elongated, ovoid or compressed (32)
- 32(31). Lower flowers bracteate; bracts usually pinnatifid . 20. *Erucastrum*, p. 689.
32. Lower flowers ebracteate 9. *Sisymbrium*, p. 680.
- 33(30). Plants aquatic or of very wet habitats; valves of siliques nerveless; cauline leaves pinnate to bipinnate 15. *Rorippa*, p. 686.
33. Plants terrestrial and of dryer habitats; valves of siliques nerved; cauline leaves entire or at most lobed 9. *Sisymbrium*, p. 680.
- 34(4). Upper member of silique flattened, smaller and usually shorter than the lower member 22. *Eruca*, p. 690.
34. Upper member of silique larger and longer than the lower member (35)
- 35(34). Upper member of silique globose, roughened, abruptly narrowed to a slender beak 37. *Rapistrum*, p. 705.
35. Upper member of silique elongate, smooth, gradually narrowed toward apex (36)
- 36(35). Plants glabrous, fleshy, of sandy beaches and shores 24. *Cakile*, p. 690.
36. Plants hirsute, not fleshy, weed of cultivated or waste places 23. *Raphanus*, p. 690.

- 37(1). Siliques deeply constricted above and below producing two subglobose or sub-orbicular halves separated by the replum (38)
37. Siliques globose, triangular, flattened or elongated but not fully constricted to form separate halves (39)
- 38(37). Siliques with orbicular flattened nonrugose halves; trichomes highly branched ..
.....40. *Dithyrea*, p. 706.
38. Siliques with subglobose rugose halves; trichomes mostly simple
.....39. *Coronopus*, p. 705.
- 39(37). Siliques strongly flattened at right angles to septum, the replum much narrower than silique width (40)
39. Siliques inflated or compressed parallel to septum, the replum equaling the silique width (45)
- 40(39). Siliques broader above than below, more or less triangular to heart-shaped in outline (41)
40. Siliques orbicular to broadly oblong, not markedly asymmetrical (42)
- 41(40). Siliques densely pubescent with branched trichomes; ovary white from the dense indument 32. *Synthlipsis*, p. 698.
41. Siliques glabrous; ovary greenish 28. *Capsella*, p. 694.
- 42(40). Seeds one in each loculus (43)
42. Seeds two or more in each loculus (44)
- 43(42). Siliques indehiscent; valves obtuse at the margin .. 30. *Cardaria*, p. 697.
43. Siliques dehiscent; valves winged or sharply keeled at the margin
.....29. *Lepidium*, p. 694.
- 44(42). Siliques winged, glabrous; flowers white 31. *Thlaspi*, p. 698.
44. Siliques not winged, pubescent; flowers yellow 34. *Lesquerella*, p. 699.
- 45(39). Siliques compressed to strongly flattened parallel to septum (46)
45. Siliques globose to pyriform, sometimes slightly longer than broad or broader than long but not compressed laterally (49)
- 46(45). Leaves pinnately to bipinnately dissected; petals yellow
.....25. *Selenia*, p. 691.
46. Leaves entire or merely lobed; petals white to lavender (47)
- 47(46). Siliques orbicular; trichomes bifurcate and appressed
.....36. *Lobularia*, p. 705.
47. Siliques elongated; trichomes simple to multiple branched and spreading (48)
- 48(47). Flowering stems arising from a basal rosette; siliques strongly flattened
.....27. *Draba*, p. 692.
48. Flowering stems without a basal rosette; siliques slightly compressed but not flattened parallel to the septum 33. *Mancoa*, p. 699.
- 49(45). Siliques with an evident style but no beak formed by the valves
.....34. *Lesquerella*, p. 699.
49. Siliques with an evident beak in addition to the style (50)
- 50(49). Siliques keeled over replum margin, dehiscent ... 35. *Camelina*, p. 704.
50. Siliques not keeled over margins, indehiscent 38. *Myagrurn*, p. 705.

I. STANLEYA NUTT.

Six species in western North America.

1. *Stanleya pinnata* (Pursh) Britt. var. *integrifolia* (James) Roll. DESERT PRINCE'S PLUME. Subshrubby glabrous perennial; stems several to many from a woody base, usually branched above, glabrous, to 1 m. tall; basal leaves absent; cauline leaves petioled, glabrous and glaucous, thick, ovate to linear-oblongate, usually entire; inflorescence

dense, racemose, 1-2 dm. long, elongating farther in fruit; buds clavate; sepals yellow at anthesis, spreading, linear-oblong; petal blade yellow, the claw brownish, pilose on inner face; stamens nearly equal, exserted; anthers coiled after pollen discharge; pedicels widely spreading, about 1 cm. long; gynophore slender, 1-2 cm. long; siliques linear, nearly terete, 2-4 cm. long; stigma entire, nearly sessile; seeds oblong, wingless; cotyledons incumbent. Clay or silty flats and desert washes, Trans-Pecos, Apr.-May; Kan. to Wyo. and Ut.

2. THELYPODIUM ENDL.

Biennial herbs with mostly erect branching stems; leaves petiolate, entire to pinnately lobed; inflorescences dense, racemose, terminating the branches; flowers white to purplish; sepals nonsaccate, spreading at anthesis, oblong; petals spatulate; stamens exserted, nearly equal, spreading at anthesis; anthers recurved; siliques terete to slightly flattened parallel to septum, stipitate, narrowly linear; stigmas small, entire; seeds oblong, wingless or nearly so; cotyledons accumbent to obliquely incumbent.

About 20 species in western United States and adjacent Mexico.

1. Leaves entire or at most dentate; plants 10-20 dm. high, widely branching toward summit 1. *T. Wrightii*.
1. Leaves pinnately lobed and with the lobes dentate; plants less than 6 dm. high, branching somewhat compact beginning just above base (2)
- 2(1). Pedicels rigidly and widely divaricate, less than 15 mm. long; inflorescence ebracteate 2. *T. texanum*.
2. Pedicels very slender, divaricately ascending, 20-30 mm. long; lower portion of inflorescence bracteate 3. *T. tenue*.

1. *Thelypodium Wrightii* Gray. Paniculately branching biennial to 2 m. tall; branches slender; lower leaves tending to be dentate or lobed but not pinnate, upper leaves lanceolate and usually entire; inflorescences dense, terminating the branches; flower white to purplish-tinged; sepals and petals spreading at anthesis; petals oblanceolate; stamens nearly equal, exserted, spreading at anthesis; anthers recurved, about 2 mm. long; pedicels slender, spreading at right angles to slightly descending; siliques stipitate, narrowly linear, torulose, widely spreading, 5-7 cm. long, less than 1 mm. wide; styles about 1 mm. long; seeds oblong, wingless. *Stanleyella Wrightii* (Gray) Rydb. Cliffs, canyon walls and lower mt. slopes, mainly in the Juniper Belt, w. Tex., Aug.-Oct.; Okla. and Tex. to Nev. and Ariz.

2. *Thelypodium texanum* (Cory) Roll. Annual, usually with a single stem, branched beginning just above the base, stems to 6 dm. tall; leaves pinnate, the lobes dentate, decurrent on the rachis, petiolate, not auriculate; flowers in a dense raceme; sepals, petals and stamens spreading at anthesis; sepals oblong, 2-3 mm. long; petals white, narrowly oblanceolate, 4-6 mm. long; stamens exserted, nearly equal; anthers purplish, recurved; pedicels spreading at right angles to rachis to slightly ascending, to 15 mm. long; infructescence very dense, to 3 dm. long; siliques stipitate, nearly terete, slightly flattened parallel to septum, 3-6 cm. long; stipe less than 1 mm. long; style slender, to 1.5 mm. long; stigma small, entire; seeds broadly oblong, wingless, just over 1 mm. long. *Stanleyella texana* Cory. Barren hillsides and gravelly creek beds, Big Bend area of w. Tex., Feb.-Apr.; endemic.

3. *Thelypodium tenue* Roll. Annual; stems single, branched, glabrous; leaves pinnately lobed, petiolate, basal ones 1-2 dm. long, the lobes irregularly dentate; inflorescence dense, elongated; pedicels very slender, divaricately ascending, glabrous, 2-3 cm. long; sepals, petals and stamens spreading at anthesis; sepals greenish to slightly tinged with purple, nonsaccate, 4-5 mm. long; petals white, narrowly spatulate, 7-8 mm. long; stamens exserted; filaments nearly equal; anthers purplish, recurved; siliques stipitate, terete or nearly so, the stipe less than 1 mm. long; styles slender, narrowing toward apex; stigma circular, entire, small. Known only from bed of Fresno Creek, Presidio Co., Tex., Jan.-Mar.; endemic.

3. STREPTANTHUS NUTT. TWIST-FLOWER

Annual single- or few-stemmed herbs, often somewhat succulent and leafy, glabrous, often glaucous; stems erect, simple or branched, 3-10 dm. high; calyx closed, mostly purplish; petals showy and purplish or narrow, dull and rust-colored; stamens included to exserted; flowers of several species irregular; pedicels mostly short (less than 1 cm.) and stout; siliques erect to divaricately ascending; valves 1-nerved (at least below); seeds winged; cotyledons accumbent.

About 35 species in southwestern United States and adjacent Mexico.

1. Upper cauline leaves petiolate or at least cuneate at base (2)
1. Upper cauline leaves auriculate and clasping the stem (3)
- 2(1). Cauline leaves entire, cuneate at base or short-petioled; petals equally developed 1. *S. hyacinthoides*.
2. Cauline leaves runcinate, long-petioled; petals unequal, the lower petals with blades absent or poorly developed 7. *S. Cutleri*.
- 3(1). Petal blades poorly developed, not showy, about the same width as the claw 6. *S. carinatus*.
3. Petal blades well-developed, showy, at least twice as wide as the claw (4)
- 4(3). Lower cauline leaves auriculate (5)
4. Lower cauline leaves petiolate (6)
- 5(4). Siliques less than 2.5 mm. wide; lower cauline leaves entire or at most shallowly sinuate-dentate 2. *S. maculatus*.
5. Siliques 5-6 mm. wide; lower cauline leaves pinnatifid to somewhat lobed 5. *S. sparsiflorus*.
- 6(4). Infructescences fully bracteate; mature pedicels terete; siliques less than 3 mm. wide 3. *S. bracteatus*.
6. Infructescences ebracteate or lower pedicels infrequently subtended by bracts; mature pedicels angular, striated; siliques 4-6 mm. wide 4. *S. platycarpus*.

1. *Streptanthus hyacinthoides* Hook. Glabrous throughout; stems erect, stiff, virgately branched above or simple, to 1 m. tall; basal leaves absent; cauline leaves linear-lanceolate, short-petiolate to sessile, to 15 cm. long; flowers at right angles to pendent, slightly irregular; buds acuminate; sepals purplish; petals deep-purple to magenta; upper stamen pair exserted with filaments free or fused, lower stamen pair included with filaments fused; siliques divaricately ascending, nearly sessile to short-stipitate, 6-10 cm. long, to 2 mm. wide; styles to 1 mm. long; seeds uniseriate, flattened, winged. *Euklisia hyacinthoides* (Hook.) Small. Sand hills and sandy areas in oak woods, May-June; Tex. and Okla.

2. *Streptanthus maculatus* Nutt. Glabrous annual; stems erect, simple or branched, leafy, to 8 dm. tall; basal leaves absent; cauline leaves ovate to oblong, acute, entire to shallowly dentate, auriculate and clasping; flowers showy, divaricately ascending; sepals purplish; petals purple and magenta-spotted, the blades broad and reflexed; siliques divaricately ascending, sessile, 6-10 cm. long, less than 3 mm. wide, 1-nerved from base to apex, acute; seeds oblong, winged. Moist lands in woods, n.e. Tex., Apr.-May; also e. Okla. and w. Ark.

3. *Streptanthus bracteatus* Gray. BRACTED TWIST-FLOWER. Stems erect, glabrous, simple or branched above, 6-12 dm. tall; lower cauline leaves petiolate, irregularly lobed and irregularly dentate, to 15 cm. long; middle and upper cauline leaves ovate, sagittate, entire to shallowly dentate; lower bracts of inflorescence leaflike, upper bracts reduced; mature pedicels terete, papillose or glabrous, divaricately ascending; siliques subsessile, 8-12 cm. long, to 4 mm. wide; seeds flattened, broadly oblong, winged. Wooded slopes and sandy river margins, s.-cen. Tex., Apr.-May; endemic.

4. *Streptanthus platycarpus* Gray. Stems stiff, usually branched, glabrous or pubescent above, 4-10 dm. tall; lower cauline leaves petiolate, sinuate to deeply lobed, glabrous,

fleshy, to 2 dm. long; upper cauline leaves sessile, auriculate, ovate, sinuate to entire, reduced upward; lower flowers occasionally bracteate; sepals erect, purplish at anthesis; petals with a conspicuous blade, purplish, spreading or reflexed; both sets of paired stamens nearly equal, included; anthers about equaling filaments in length, 4-5 mm. long; fruiting pedicels divaricately ascending, usually pilose, sometimes glabrous; siliques erect to divaricately ascending, subsessile, 6-10 dm. long, 4-6 mm. wide; seed orbicular to slightly oblong, widely winged. Cliff ledges, canyon-walls, talus slopes and rocky inclines, w. Tex., mostly w. of the Pecos, Mar.-Apr.; endemic.

5. *Streptanthus sparsiflorus* Roll. Stems erect, usually branched above, glabrous, 3-6 dm. tall; lower leaves sessile, auriculate, pinnatifid, some nearly runcinate, 8-12 cm. long, 2-4 cm. wide; upper cauline leaves ovate, entire to shallowly dentate, auriculate and clasping the stem; flowers less than ten in a raceme; sepals purplish, erect; petals purplish, the blade well-developed and reflexed; upper stamen pair exerted, lower stamen pair included; pedicels divaricate, glabrous, less than 1 cm. long; siliques divaricately ascending to erect, 4-7 cm. long, 5-7 mm. wide, subsessile; seeds flattened, orbicular, widely winged. Shady places in gravel and among boulders, Guadalupe Mts. in the Trans-Pecos, May-June; endemic.

6. *Streptanthus carinatus* Wright. Glabrous; stems usually branched just above base and upward, 3-6 dm. tall; lower leaves pinnatifid, usually runcinate, petiolate, about 1 dm. long; cauline leaves auriculate, clasping, ovate to narrower, often attenuate, usually entire; calyx urn-shaped, purplish, closed; petals narrow, strap-shaped, twisted, dull-white with purple veins to purplish; upper stamen pair exerted, lower pair shorter with longer anthers; pedicels divaricate, glabrous, 1-2 cm. long, lower sometimes bracteate; siliques subsessile, 3-6 cm. long, 3-5 mm. wide; seeds widely winged, flat, orbicular. Cliff bases, gravelly slopes, canyons and dry creek beds in the Trans-Pecos, Mar.-Apr.; endemic.

7. *Streptanthus Cutleri* Cory. Glabrous throughout; stems branched above base and upward, 5-8 dm. tall; lower leaves petiolate, runcinate, to 2 dm. long, the segments acute; cauline leaves similar to basal leaves, reduced upward; flowers irregular; calyx deep-purple; upper petals with broad erect purplish-lavender blades, lower petals with blades absent; upper paired stamens exerted, lower pair with longer anthers and nearly included; pedicels slender, divaricately ascending, 1.5-3 cm. long; siliques sessile, erect, 3-5 mm. wide; seeds widely winged. Talus slopes, rocky hillsides and gravelly dry streambeds, Big Bend area of w. Tex., Feb.-Apr.; endemic.

4. IODANTHUS STEUD.

Four species from central United States and Mexico.

1. *Iodanthus pinnatifidus* (Michx.) Steud. PURPLE ROCKET. Perennial; stem usually single from base, branched above, leafy, glabrous or rarely sparsely pubescent, with simple trichomes below, 3-8 dm. tall; leaves glabrous, ovate to lanceolate, petiolate or the upper sessile and cuneate, irregularly serrate, lower leaves usually with a winged petiole and auricles clasping the stem; inflorescence narrowly racemose, elongated; sepals oblong, erect, often purplish, 6-8 mm. long; petals white to light-lavender, spatulate to narrowly obovate, 7-14 mm. long; pedicels widely spreading, glabrous, 4-10 mm. long; siliques linear, widely spreading to divaricately ascending, straight, nearly terete, glabrous, 2-4 cm. long, sessile or with a short stipe; seeds oblong, wingless, 1-1.5 mm. long; cotyledons accumbent. Alluvial soil of river bottoms and in rich woods, cen. and e. Tex., Apr.-June; Pa. to Ia., Ala. and Tex.

5. ARABIS L. ROCK-CRESS

Annual, biennial or perennial herbs; stems erect, stiff, simple or branched, glabrous to pubescent; basal leaves petiolate; cauline leaves petiolate or sessile; inflorescence racemose, ebracteate; flowers tetradynamous; sepals erect, oblong; petals spatulate to oblong, white, cream or lavender; siliques sessile, straight to curved, erect to pendulous, flattened parallel to partition; styles evident, entire; seeds orbicular to oblong, winged; cotyledons accumbent.

About 150 species in North America, Asia, Europe and Africa.

1. Upper cauline leaves sessile and auriculate; perennials with a woody base 3. *A. Fendleri*.
1. Upper cauline leaves petiolate or cuneate at base; annuals or biennials without a woody base (2)
- 2(1). Siliques erect; lower leaves deeply lobed; flowers lavender 1. *A. petiolaris*.
2. Siliques pendulous; lower leaves entire or at most dentate; flowers whitish to cream 2. *A. canadensis*.

1. *Arabis petiolaris* Gray. Annual; single stem simple below, branched above, pubescent with simple trichomes below, becoming glabrous upward, 4-10 dm. tall; leaves ranging from pinnately lobed below to entire above, petioled; lower leaves pubescent, the upper usually glabrous; sepals oblong, glabrous; petals lavender, spatulate, 6-8 mm. long; pedicels glabrous, divaricately ascending, straight, 8-12 mm. long; siliques straight, flattened, broad, acuminate, erect to divaricately ascending, 4-8 cm. long, 3-4 mm. wide; styles slender, 1-2 mm. long; seeds orbicular, widely winged, 3-4 mm. across including wings, uniseriate. Open woods, rocky knolls, wooded bluffs and among boulders, cen. Tex., Apr.-May; endemic.

2. *Arabis canadensis* L. SICKLEPOD. Biennial; single stem erect, often branched above, 4-9 dm. tall, sparsely hirsute below, glabrous above; basal leaves short-petiolate, entire to dentate, pubescent with simple and bifurcate trichomes on both surfaces; cauline leaves becoming sessile and cuneate at base on upper part of stems; sepals 2-4 mm. long, pubescent; petals white to cream, narrowly oblanceolate to oblong, 3-5 mm. long; pedicels recurved, 8-12 mm. long; siliques falcate to arcuate, pendulous, 5-9 cm. long, 2-3 mm. wide; seeds uniseriate, narrowly winged. Sandy woods and shaded slopes, n.e. Tex., Apr.-June; Tex. to Minn., Vt. and Ga.

3. *Arabis Fendleri* (Wats.) Greene. Perennial, woody at base; stems one to several from a simple or branching caudex, hirsute near base, glabrous above; basal leaves oblanceolate, short-petiolate, entire to dentate, sparsely to densely hirsute with simple or branched trichomes, ciliate, 3-6 cm. long; cauline leaves sessile, auriculate, lower imbricated on the stem; pedicels slender, ascending at anthesis, arching downward in fruit, 1-2 cm. long; sepals erect, oblong, 3-5 mm. long; petals spatulate, white to light-lavender, 5-8 mm. long; siliques glabrous, pendulous, straight to slightly bent inward, 3-6 cm. long, 1.5-2.5 mm. wide; seeds orbicular to slightly oblong, narrowly winged. Rocky hillsides and rock crevices in full sun, w. Tex., Mar.-Apr.; Tex. and Mex. to Colo. and Nev.

6. PENNELLIA NIEUW.

Biennials or perennials with branched trichomes (at least below); stems slender, erect, simple or branched above; basal leaves ovate to oblanceolate, more or less toothed, often early-deciduous; stem leaves linear to lance-linear, usually entire; calyx with one pair of sepals somewhat broader than the other; petals small, barely exceeding sepals, purple to whitish; anthers at length spirally curved; siliques linear, terete to slightly flattened parallel to septum.

About 6 species in southern North America and temperate South America.

1. Siliques pendent; sepals becoming purple; petals purple to whitish; pedicels arched downward 1. *P. longifolia*.
1. Siliques erect; sepals greenish; petals white, pedicels straight, divaricately ascending to erect 2. *P. micrantha*.

1. *Pennellia longifolia* (Benth.) Roll. Biennial or perennial; stems single from base, 5-12 dm. tall, usually branched above; basal leaves 3-6 cm. long, shallowly toothed, linear-oblanceolate, densely pubescent, early-deciduous; cauline leaves linear, cuneate at base, pubescent, entire to somewhat toothed; flowers remote in elongated narrow racemes, cup-shaped; petals just exceeding sepals; pedicels about 1 cm. long, very slender; siliques 5-8 cm. long, about 1 mm. wide; styles less than 1 mm. long; seeds oblong, wing-

less, plump. *Thelypodium longifolium* (Benth.) Wats. Open oak woodlands in mts. in the Trans-Pecos, July-Aug.; N.M. and Ariz. to Guat.

2. *Pennellia micrantha* (Gray) Nieuw. Biennial or perennial; stems one to few from base, branched above, 5-10 dm. tall; basal leaves 3-5 cm. long, oblanceolate, coarsely dentate to lobed, densely pubescent with dendritic trichomes; cauline leaves often glabrate, oblanceolate to linear, remotely toothed to entire, 3-10 cm. long; flowers remote; racemes elongate, narrow; pedicels 4-6 mm. long, straight, erect to divaricately ascending; siliques erect, straight, 3-5 cm. long; stigmas nearly sessile. *Thelypodium micranthum* (Gray) Wats. Canyons and cliffs, mts. in the Trans-Pecos, July-Sept.; N.M. and Ariz. to s.-cen. Mex.

7. DRYOPETALON GRAY

Four species in southwestern United States and northern Mexico.

1. *Dryopetalon runcinatum* Gray. Biennial or perennial; stems one to several, densely hirsute below with simple spreading trichomes, glabrous or nearly so above, 2-6 dm. tall; basal leaves petiolate, hirsute, pinnately divided to deeply lobed, the lobes dentate, terminal lobe larger than lateral lobes; upper cauline leaves less pubescent than lower leaves; inflorescence crowded, racemose; sepals oblong to obovate, hyaline-margined, usually with a few trichomes present; petals white, obovate to spatulate, 5- to 9-lobed; stamens minutely papillose to sparingly pilose at base; pedicels sparsely hirsute to glabrous, straight, divaricately ascending, 1-2 cm. long; siliques linear, glabrous, divaricately ascending to slightly arcuate, 3-5 cm. long, about 1 mm. wide; seeds oblong, wingless; cotyledons accumbent. Cliffs and shady areas among rocks in the mts. of extreme w. Tex., Mar.-Apr.; Tex. and N.M. to Ariz. and n. Mex.

8. SIBARA GREENE

Annual or biennial herbs; stems single to several from the base, glabrous to sparsely pubescent; leaves pectinate to pinnatifid, sometimes runcinate; upper cauline leaves sometimes entire; inflorescence racemose, lax; flowers small, not at all showy; sepals oblong, nonsaccate or the outer pair slightly saccate; petals white to pale-lilac, spatulate; pedicels divaricately ascending, straight, not expanded at summit; siliques linear, flattened parallel to septum, the valves nerveless to nerved below; seeds oblong to nearly orbicular, winged; cotyledons accumbent.

Eleven species, primarily of southwestern United States and Mexico.

1. Styles obsolete to less than 0.5 mm. long; cauline leaves not auriculate; pedicels glabrous, mostly less than 4 mm. long 1. *S. virginica*.
 1. Styles 2-4 mm. long; cauline leaves auriculate; pedicels sparsely hirsute, 5-10 mm. long 2. *S. runcinata*.

1. *Sibara virginica* (L.) Roll. Annual herb; stems arising from rosette of basal leaves, erect or decumbent, usually hirsute toward base, 1-3 dm. tall; leaves pinnatifid with narrow lateral segments, terminal lobe somewhat broader; cauline leaves petiolate, not auriculate; flowers small and inconspicuous; petals white to faintly pinkish, oblanceolate to narrowly oblong, 1.5-3 mm. long; pedicels divaricately ascending, short, mostly less than 4 mm. long; siliques narrowly oblong to linear, flattened parallel to septum, obtuse above and below, 15-25 mm. long, 1.5-2 mm. wide, glabrous; seeds nearly orbicular, flattened, narrowly winged. Old fields, roadsides and open areas, s., cen. and e. Tex., Mar.-Apr.; s. Calif. and Okla. to O., Va. and Fla.

2. *Sibara runcinata* (Wats.) Roll. Annual herb; stems erect to decumbent, weak, several arising from the base, branched above, hirsute with simple trichomes below, glabrous above, to 6 dm. tall; lower leaves petiolate, lyrate-pinnatifid to runcinate-pinnatifid, hirsute with simple trichomes; cauline leaves sessile, auriculate, reduced upward, upper leaves often entire; sepals glabrous to sparsely pilose, oblong; petals spatulate, white to light-lavender, 4-8 mm. long; pedicels divaricately ascending, usually pilose, 5-10 mm. long; siliques linear, glabrous, subsessile, flattened parallel to septum, 1.5-4 cm. long,

1.5-2 mm. wide; seeds oblong, narrowly winged. Incl. var. *brachycarpa* Roll., *S. Viereckii* (Schulz) Roll. Among boulders and in brushlands of mesas and hills, lower Rio Grande Valley, Feb.-Apr.; also Mex.

9. SISYMBRIUM L.

Annual or biennial herbs, glabrous or with simple trichomes; stems usually branched above base; leaves monomorphic or dimorphic, green or glaucous; sepals nonsaccate; petals yellow, white or lavender; inflorescences dense, elongating in fruit; siliques narrowly cylindrical or long-subulate, erect to divaricately ascending; seeds in a single row, oblong, marginless; cotyledons incumbent.

About 90 species, mainly in Eurasia, the Mediterranean region and temperate Africa, North America and South America.

1. Middle and upper cauline leaves petiolate or cuneate at base, not auriculate or if auriculate then pinnately divided (2)
 1. Middle and upper cauline leaves sessile, auriculate and clasping the stem, entire or dentate (7)
 - 2(1). Inflorescences leafy; flowers borne from near base to apex of plants, usually in fascicles 1. *S. polyceratium*.
 2. Inflorescences without bracts; flowers borne in terminal racemes (3)
 - 3(2). Siliques subulate, 1-2 cm. long, borne on short stout pedicels closely appressed to rachis 2. *S. officinale*.
 3. Siliques linear, terete, 3-10 cm. long; pedicels (and siliques) loosely spreading or ascending (4)
 - 4(3). Leaves entire; cauline leaves linear to lanceolate .. 6. *S. linearifolium*.
 4. Leaves pinnately divided; cauline leaves ample, broadly oblong to broadly oblanceolate in outline (5)
 - 5(4). Segments of upper leaves filiform to very narrowly linear; siliques widely spreading at same angle as pedicels and same diameter as pedicels 3. *S. altissimum*.
 5. Segments of upper leaves lanceolate or oblong, terminal segment triangular or broadly ovate; siliques more erect than the spreading pedicels or much greater in diameter than pedicels (6)
 - 6(5). Flowers yellow; sepals and petals subequal; petals linear and without blade and claw; pedicels much more slender than siliques ... 4. *S. Irio*.
 6. Flowers white; petals showy, distinctly exceeding sepals and differentiated into blade and claw; pedicels nearly same diameter as siliques 5. *S. auriculatum*.
 - 7(1). Lower leaves deeply dentate, petiolate, oblong to oblanceolate in outline 7. *S. Purpusii*.
 7. Lower leaves entire, sessile or at least with a winged petiole, obovate 8. *S. Shinnersi*.

1. *Sisymbrium polyceratium* L. Annual; stems simple or branched near base, glabrous, 2-5 dm. tall; lower leaves petiolate, oblanceolate, dentate to nearly lobed, glabrous or with a few simple tapering trichomes; cauline leaves hastate to oblong, entire to dentate, subtending one or more flowers in each axil; flowers minute, occurring from near base of plant to ends of branches; sepals erect, with one or a few trichomes on exterior at apex; petals white, equal to or barely exceeding the sepals; pedicels stout, closely appressed to the stem, usually less than 2 mm. long; siliques terete, tapering from base to apex, erect to somewhat curved away from stem, 1-2 cm. long, the valves somewhat persistent; seeds wingless. Roadsides and waste places, occurring sparingly as an introd. weed, Mar.-May; nat. to Euras.

2. *Sisymbrium officinale* (L.) Scop. HEDGE-MUSTARD. Annual, widely branching; stems to 1 m. tall, hirsute at least at base; leaves petiolate, irregularly pinnately lobed, the

lobes dentate, reduced upward, sparsely hirsute with simple trichomes; flowers small, in terminal spiciform racemes that greatly elongate in fruit; petals pale-yellow, about 3 mm. long; siliques subulate, closely appressed to rachis, 1-2 cm. long, pubescent with simple trichomes to glabrous; styles 1-2 mm. long; seeds plump, wingless, variable in shape, cotyledons obliquely incumbent. The most widespread form has glabrous fruits and has received the name var. *leiocarpum* DC. Weedy, in fields, thickets and waste places, Apr.-June; nat. of Eur.

3. *Sisymbrium altissimum* L. TUMBLE-MUSTARD. Annual; stems loosely branched above, to 1.5 m. tall, hirsute toward base with large spreading simple trichomes; lower leaves petiolate, hirsute, pinnately lobed, the lobes oblong and dentate, gradually changing upward on the plant to leaves with linear-filiform entire segments; flowers loosely racemose; petals pale-yellow, 6-9 mm. long; pedicels straight, widely spreading, similar in diameter to siliques; siliques terete, straight, long-linear, widely spreading and extending same angle as pedicel, 5-10 cm. long, glabrous; styles 1-2 mm. long; seeds wingless, plump, oblong, about 1 mm. long, cotyledons incumbent. Weedy, fields, roadsides and waste places, May-Aug.; nat. of Eur.

4. *Sisymbrium Irio* L. LONDON ROCKET. Annual; stems branched near base and above, to 6 dm. tall, glabrous or sparingly hirsute above; leaves petiolate, pinnately lobed or the upper nearly entire, glabrous to sparsely hirsute with simple trichomes on petioles and lobe margins, terminal lobe larger than laterals; flowers small; petals pale-yellow, oblanceolate, barely exceeding sepals, to 4 mm. long; pedicels slender, divaricately ascending, glabrous or sparsely hirsute on the adaxial surface; siliques slender, terete, glabrous, straight, divaricately ascending, 3-5 cm. long, about 1 mm. wide; seeds oblong, wingless, less than 1 mm. long; cotyledons incumbent. Fields, roadsides, waste places and open deserts, Dec.-May; introd. weed, nat. of Eur.

5. *Sisymbrium auriculatum* Gray. Annual or biennial, sparsely pilose with long simple trichomes to nearly glabrous; stems erect, branched above, to 1.5 m. tall, mostly less than 1 m.; leaves ample, thin, petiolate; basal leaves irregularly incised or lobed, broadly oblanceolate; cauline leaves lobed with terminal lobe larger than laterals, triangular to ovate, auricles present at base of petiole, often clasping stem; inflorescences dense at apex, greatly elongating in fruit; sepals nonsaccate, pale- to light-lavender, sparsely pilose or glabrous; petals white or light-lavender, strongly differentiated into blade and claw, 7-9 mm. long; pedicels widely spreading nearly at right angles to rachis, 6-12 mm. long, pilose to glabrous; siliques divaricately ascending, terete, sparsely pilose to glabrous, sessile, 2-4 cm. long, less than 1 mm. wide; styles 1-2 mm. long; seeds plump, wingless, small, less than 1 mm. long, enmeshed in tissue of septum. *Thelypodium auriculatum* (Gray) Wats., *Coelophragmus auriculatus* (Gray) Schulz. Shallow washes, open flats and borders of thickets, w. Tex., Mar.-Nov.; also Mex.

6. *Sisymbrium linearifolium* (Gray) Pays. Perennial, glabrous, glaucous, branched above, 5-15 dm. tall; leaves petiolate to cuneate at base; lowest leaves oblanceolate, denticulate to entire, usually missing in older plants; cauline leaves entire, linear-lanceolate to narrowly linear; inflorescences loosely racemose; sepals light-lavender, outer pair saccate, inner pair apiculate; petals showy, lavender, veiny, strongly differentiated into blade and claw, 12-18 mm. long; pedicels divaricately ascending, slender, 1-2 cm. long; siliques erect, terete, sessile or subsessile, 4-8 cm. long, about 1 mm. wide; styles 1-2 mm. long; seeds plump, angular, about 1 mm. long; cotyledons obliquely incumbent. *Hesperidanthus linearifolius* (Gray) Rydb. Ledges, crevices of rocks, steep hillsides and open brushland, mts. and hills, w. Tex., Apr.-Oct.; Tex. and Mex. to Colo., Ut. and Ariz.

7. *Sisymbrium Purpusii* (Brandeg.) Schulz. Annual, glabrous throughout; stems single from the base, branched above, leafy, 3-7 dm. tall; lower leaves sinuate-dentate to somewhat lobed, thin, petiolate, oblanceolate, obtuse, 6-15 cm. long, 1-3 cm. wide, the petiole winged; cauline leaves becoming entire upward, overlapping; middle and upper leaves sessile, auriculate, lanceolate; petals spatulate, with a slender claw, white, 4-5 mm. long; anthers oval, less than 1 mm. long; pedicels slender, divaricately ascending to nearly erect, straight, 1-1.5 cm. long; siliques narrowly linear, terete, ascending, slightly divergent to nearly erect, 4-7 cm. long; styles about 1 mm. long; seeds plump, wingless, less than 1 mm. long; cotyledons incumbent. *Thelypodium Purpusii* Brandeg. Partial to dense shade of trees, boulders or cliffs, Fresno Canyon, Presidio Co., Feb.-Apr.; Tex. and Mex. to Ariz.

8. *Sisymbrium Shinnersii* M. C. Johnst. Annual, glabrous and glaucous; stems simple or usually branched beginning just above base, 3-7 dm. tall; basal leaves with a winged petiole, obovate, denticulate, to 1 dm. long, 3-5 cm. wide; cauline leaves sessile, entire, auriculate and clasping the stem, ovate to somewhat pandurate, obtuse; sepals light-lavender, outer pair slightly saccate; petals white, narrowly spatulate, scarcely differentiated into blade and claw, barely exceeding sepals; pedicels slender, divaricately ascending, 6-10 mm. long; siliques divaricately ascending, nearly straight, terete, 4-6 cm. long, less than 1 mm. wide; styles nearly obsolete; seeds plump, wingless, less than 1 mm. long. *Thelypodium Vaseyi* Coult., not *Sisymbrium Vaseyi* Wats. Edges of thickets and under trees in partial shade, lower Rio Grande Valley, Oct.-Apr.; also Mex.

10. DESCURAINIA WEBB & BERTH. TANSY-MUSTARD

Herbaceous annuals or biennials pubescent (more or less densely) with branched trichomes, these sometimes intermixed with simple trichomes and/or stalked glands, the latter especially frequent on the axes of the racemes; leaves tripinnate to pinnate; flowers small; petals less than 3 mm. long, white to bright-yellow; infructescences usually much-elongated at maturity; siliques narrow, linear or clavate, the valves more or less distinctly 1-nerved; style short or obsolete; seeds uniseriate to biseriate; cotyledons incumbent.

Three species in Texas (one introduced from Europe); about 50 species in temperate and cold parts of North America and South America, Europe and Asia, also in the Canary Islands.

- 1. Siliques subclavate; seeds usually biseriate, rarely nearly uniseriate 3. *D. pinnata*.
- 1. Siliques linear; seeds strictly uniseriate (2)
- 2(1). Leaves 2- or 3-pinnate; siliques 10-30 mm. long; petals shorter than or about as long as the sepals 1. *D. Sophia*.
- 2. Leaves simply pinnate; siliques 8-15 mm. long; petals longer than the sepals (3)
- 3(2). Plants not glandular 2a. *D. Richardsonii* subsp. *incisa*.
- 3. Plants glandular 2b. *D. Richardsonii* subsp. *viscosa*.

1. *Descurainia Sophia* (L.) Webb. Annual or biennial, subglabrous to sparsely pubescent but not glandular; stem usually single from the base but branched above, erect, to 8 dm. high; basal leaves 2- or 3-pinnate, the segments sometimes toothed or incised, usually withered and lost early; cauline leaves 2- or 3-pinnate, the segments usually linear, sometimes elliptic to obovate; infructescences loose and elongated; fruiting pedicels to about 15 mm. long, spreading at about 45°; sepals erect, narrowly elliptic to more or less linear, obtuse; petals about as long as the sepals or slightly shorter, clawed, yellowish-green; siliques 1-3 cm. long, linear and narrow, terete, usually more or less torulose, curved or (less often) straight; style short; seeds 0.8-1.5 mm. long, oblong-ellipsoid, uniseriate. *Sophia sophia* (L.) Britt. On disturbed and/or sandy soil in w. and n.w. Tex., early spring through summer; introd. from Eur. and now occurring throughout the U.S.

2a. *Descurainia Richardsonii* subsp. *incisa* (Engelm.) Detl. Biennial, subglabrous to pubescent with branched trichomes, generally not glandular; stems single from the base but branched above, to 12 dm. high; basal leaves bipinnate to pinnate, the segments broad and obtuse, withering early; cauline leaves pinnate, the segments entire to incised; infructescences elongated and rather loose; pedicels 4-10 mm. long, spreading from the axis at 45°-80°; sepals 1-1.5 mm. long, oblong; petals 1.5-2 mm. long, spatulate, pale-yellow; siliques 8-15 mm. long, linear but tapered at both ends, sometimes torulose, usually arcuate, often nearly parallel with the axis of the raceme; seeds about 0.8 mm. long, oblong to ellipsoid, uniseriate. *Sisymbrium incisum* Engelm. El Paso Co. (*vide* L. E. Detling); in the Rocky Mts. from N.M. to s. Mont., also in s. and cen. Calif. in the Sierra Nevada; Baja Calif. and Chih.

2b. *Descurainia Richardsonii* subsp. *viscosa* (Rydb.) Detl. Differs from subsp. *incisa* in that the upper parts of the stems, the axes of the racemes, pedicels, and sometimes the

foliage bear clavate glands. *Sophia viscosa* Rydb., *Descurainia Rydbergii* Schulz. Trans-Pecos (Mt. Livermore, Davis Mts. and Chisos Mts.), June-Sept.; also N.M., n.e. Ariz., and through the Rocky Mts. to s. Alta.

3. *Descurainia pinnata* (Walt.) Britt. Annual, sparsely pubescent to densely canescent with usually branched trichomes, sometimes glandular on the stems, inflorescences and leaves; stems to 8 dm. high, several from the base and branched or simple but then often branched above; basal leaves to 1 dm. long, usually bipinnate, the segments often deeply incised, the upper leaves gradually reduced in size and usually simply pinnate, the lobes narrow and linear to broadly obovate; infructescences elongated and rather loose; fruiting pedicels to 25 mm. long, ascending to horizontal or slightly reflexed; sepals more or less oblong to ovate, sometimes with rose or magenta pigmentation; petals spatulate to obovate and clawed, whitish to bright-yellow; siliques 4-20 mm. long, clavate (sometimes broadly so), slightly latiseptate, usually straight; style very short or obsolete; seeds to 1 mm. long, more or less ellipsoid but flattened, biseriate or rarely crowded so as to appear uniseriate. In sandy soils and waste places throughout Tex., spring through early summer; throughout the U.S., also in Can. and n. Mex.

In L. E. Detling's treatment of *Descurainia* in North America (Am. Midl. Nat. 22: 481-520. 1939), five of the eleven subspecies of *D. pinnata* there recognized (these five later treated as varieties by L. H. Shinnars in Field & Lab. 17: 145. 1949) are shown as occurring in Texas. These are here treated with the synonyms relevant to the Texas flora and with brief descriptions adapted from Detling's treatment.

Var. *pinnata*. Plants single-stemmed or branched near the base, moderately to densely canescent, the stems and flowering axes glandular; basal leaves bipinnate, the upper ones simply pinnate but the pinnae divided with the segments obovate and obtuse; sepals 1-2 mm. long, the petals slightly longer and whitish; pedicels spreading at 70°-90°; siliques 5-9 mm. long, clavate; seeds always biseriate. *Sisymbrium canescens* Nutt., *Descurainia multifoliata* Cory. According to Detling, in cen., s. and e. Tex.

Var. *ochroleuca* (Woot.) Shinnars. Plants several-stemmed, widely branching from the base, densely canescent but not glandular; lower leaves bi- or tripinnate; upper leaves bipinnate or simply pinnate with the ultimate segments obovate, short and obtuse; sepals 1.5-2 mm. long, often with some rose or magenta pigmentation, the petals about as long and whitish; pedicels spreading at about 40°-80°; siliques 9-13 mm. long, broadly clavate; seeds biseriate. *Sophia ochroleuca* Woot., *Descurainia Menziesii* var. *ochroleuca* (Woot.) Schulz, *D. pinnata* subsp. *ochroleuca* (Woot.) Detl. S.w. Tex., n. to Lubbock.

This is one of the best marked varieties of *D. pinnata* and can be recognized by the much-branched habit, the dense canescence and by the fact that on plants with widely spreading pedicels the siliques are often attached at an angle to the pedicels and thus may be nearly parallel to or at only a slight angle from the axis of the raceme.

Var. *osmiarum* (Cockll.) Shinnars. Plants simple or branched from near the base, the foliage and lower stems more or less canescent; axes of the racemes and the pedicels subglabrous to canescent and usually glandular; lower leaves pinnate to bipinnate, the upper ones usually simply pinnate, the segments usually more or less linear and entire; sepals 1-2 mm. long, often with rose pigmentation, the petals slightly longer and whitish or yellow; pedicels spreading at about 65°-90°; siliques clavate; seeds biseriate. *Sophia andrenarum* var. *osmiarum* Cockll., *Descurainia halictorum* (Cockll.) Schulz, *D. andrenarum* (Cockll.) Cory, *D. pinnata* subsp. *halictorum* (Cockll.) Detl. According to Detling, in the n.w. half of Tex.

This variety is marked by the linear leaf segments, the horizontally spreading pedicels and the branching habit. Detling points out that the name *Sophia andrenarum* Cockll. refers to the nonglandular form of this group.

Var. *glabra* (Woot. & Standl.) Shinnars. Plant usually branching from near the base, the foliage and lower stems more or less canescent, the rest of the plant glabrous and not glandular; leaves bipinnate, the segments ovate to oblong, short; sepals 0.75-1.5 mm. long, the petals slightly longer and yellow; pedicels spreading at 60°-90°; siliques 5-8 mm. long, clavate; seeds biseriate. *Sophia glabra* Woot. & Standl., *D. pinnata* subsp. *glabra* (Woot. & Standl.) Detl. According to Detling, in the Trans-Pecos.

Var. *brachycarpa* (Richards.) Fern. Plants usually simple but sometimes branching, the leaves and stems more or less pubescent and glandular; leaves pinnate to bipinnate (the lower often again pinnatifid), the segments of the upper ones usually linear; sepals

1.5-2.5 mm. long; petals about 0.5 mm. longer and yellow; pedicels usually spreading at about 45°; siliques 5-12 mm. long, more nearly erect than the pedicels; seeds biseriate to sub-biseriate. *Sisymbrium brachycarpum* Richards., *Descurainia pinnata* subsp. *brachycarpa* (Richards.) Detl. Occasional in cen. Tex., according to Detling.

Cory and Parks, Cat. Flora Tex. (1938) include *Descurainia intermedia* (Rydb.) Daniels from the "Timber Belt," "Rio Grande Plains," "Blackland Prairies" and "Plains Country." However, Detling on his distribution map of the northern subspecies of *D. pinnata* shows *D. pinnata* subsp. *intermedia* (Rydb.) Detl. as occurring no further south than southern Colorado. He adds that all the specimens seen from the plains region should be assigned to *D. pinnata* subsp. *brachycarpa*.

11. HALIMOLOBOS TAUSCH

Fourteen species in North America and South America.

1. *Halimolobos diffusa* (Gray) Schulz. Perennial, usually woody at the base; stems with branches widely spreading, leafy, densely pubescent, 3-6 dm. high; leaves densely pubescent with dendritically branched trichomes, oblanceolate to nearly oblong, entire to sinuate, petiolate to cuneate at base; inflorescences numerous, terminating the many branches; sepals erect, densely pubescent; petals white, 2-3 mm. long; anthers small, nearly oval; pedicels slender, densely pubescent, widely spreading, 2-7 mm. long; siliques terete, widely spreading, densely pubescent, about 1 cm. long, 0.5 mm. in diameter; styles slender, 0.5-1 mm. long; seeds plump, wingless, about 1 mm. long; cotyledons incumbent. *Sisymbrium diffusum* Gray. Crevices of rocks, ledges and canyon slopes in the mts. of the Trans-Pecos, July-Sept.; also Mex., N.M. and Ariz.; var. *Jaegeri* (Munz) Roll. in Calif.

12. NERISYRENIA GREENE

Perennial herbs or subshrubs usually with a woody base; stems several to many; leaves petiolate to cuneate at base, entire to dentate, thickish, monomorphic; inflorescences terminating each branch, racemose; flowers showy; sepals spreading to slightly reflexed at anthesis, densely pubescent; petals broadly obovate to broadly spatulate, white to lavender; anthers sagittate, the lobes flaring; pedicels divaricate to ascending; siliques densely pubescent with branched trichomes, linear, nearly terete to somewhat flattened contrary to septum; style evident, glabrous; stigma decurrent on the style, elongated; seeds small, numerous.

Five species in southwestern United States and northeastern Mexico.

1. Leaves broadly spatulate to broadly oblanceolate, dentate, rarely entire, 5-20 mm. wide, flattened; siliques whitish-pubescent 1. *N. camporum*.

1. Leaves narrowly linear, entire, fleshy, nearly terete, less than 3 mm. wide; siliques greenish, pubescence not pannose 2. *N. linearifolia*.

1. *Nerisyrenia camporum* (Gray) Greene. Plants whitish-pubescent; caudex becoming woody and branched in older plants; stems few to several, 2-6 dm. tall; leaves monomorphic, broadly oblanceolate to somewhat narrower, usually dentate or repand, rarely entire, petiolate, 1-6 cm. long, 5-20 mm. wide, densely pubescent with branched trichomes on both surfaces; sepals oblong, nonsaccate, densely pubescent; petals broadly obovate to nearly spatulate, dilated toward base, white to light-lavender, infructescence narrow and elongated; pedicels divaricately ascending, usually straight, occasionally arching downward, densely pubescent, 6-12 mm. long; siliques sessile, straight to slightly curved inward, linear-oblong, obtuse above and below, compressed contrary to septum, whitish-pubescent, 1-3 cm. long, 2-3 mm. wide; styles slender, glabrous, 2-3 mm. long; stigmas cylindrical, prominent; seeds slightly oblong, wingless, small, less than 1 mm. broad. Limestone knolls and hills, gravelly and sandy soils on plains and outwashes, w. Tex., Feb.-Aug.; N.M. and Tex. to n.e. Mex.

2. *Nerisyrenia linearifolia* (Wats.) Greene. Plants greenish, intricately branched from a woody base, 1-3 dm. tall; leaves narrowly linear, thick and fleshy, nearly terete, densely

overlapping on the stems; inflorescences terminating the numerous branches, elongating in fruit; sepals pubescent, oblong, nonsaccate, spreading at anthesis; petals white, obovate; siliques pubescent, slightly compressed contrary to septum to nearly terete, 1-2 cm. long, 1.5-2 mm. wide; styles glabrous, 1.5-2 mm. long; stigmas cylindrical, decurrent on style; seeds oblong, wingless. Gypseous soils, open flats, knolls and bluffs, w. Tex., Apr.-Aug.; s.e. N.M., Tex. and n.e. Mex.

13. ARABIDOPSIS HEYNH.

About 10 species in Eurasia and East Africa; 1 species introduced into North America.

1. *Arabis thaliana* (L.) Heynh. MOUSE-EAR CRESS. Annual or winter annual; stems slender, one to several from the base, branched above, hirsute with simple trichomes toward base, 1-4 dm. tall; leaves in basal rosette, entire to shallowly dentate, oblanceolate, obtuse; petioles shorter than oblong blade, hirsute along margins; flowers minute; sepals sparsely hirsute to glabrous; petals white; pedicels slender, widely divaricate, to 1 cm. long; siliques linear, terete, strongly nerved, 1-1.5 cm. long, less than 1 mm. in diameter; styles less than 1 mm. long; seeds numerous, broadly oval to narrower, 0.3-0.4 mm. long; cotyledons incumbent. Open fields, yards and roadsides, e. Tex., Apr.-June; widely dispersed in U.S.; naturalized from Euras.

14. CARDAMINE L. BITTER-CRESS

Annual, biennial or perennial herbs, glabrous to sparsely hirsute with simple trichomes; leaves entire to pinnately compound, petiolate, alternate; flowers in racemes or panicles; petals white or purple, obovate to spatulate; siliques linear, straight, slightly compressed parallel to septum; valves opening elastically from silique base; replum margin extending partially over valvular area; seeds uniseriate, marginless, plump, longer than broad; cotyledons accumbent.

Between 150 to 175 species, cosmopolitan, mostly temperate. The variable species, *C. pennsylvanica* Muhl., has been reported, but not seen by us, from Texas. It resembles *C. parviflora* but differs from that species in having its stem hispid or hispidulous near the base and its terminal leaflet usually much broader than the lateral leaflets that are noticeably decurrent on the rachis.

- 1. Leaves entire or shallowly dentate; tuberous-based perennial 1. *C. bulbosa*.
- 1. Leaves pinnately lobed to compound; annuals with fibrous roots (2)
- 2(1). Siliques 1.5-2 mm. wide; petals greenish, strap-shaped 3. *C. macrocarpa* var. *texana*.
- 2. Siliques 1 mm. wide or less; petals white, spatulate (3)
- 3(2). Petioles and leaf bases glabrous; leaves mostly cauline; stems one or few from the base 2. *C. parviflora* var. *arenicola*.
- 3. Petioles and leaf bases hirsute; leaves mostly basal; stems several to many from the base 4. *C. hirsuta*.

1. *Cardamine bulbosa* (Schreb.) B.S.P. SPRING-CRESS. Stems erect from a short tuber, 2-6 dm. tall, simple or branched above, with fine pubescence on the lower part; leaves simple; basal leaves long-petioled and obovate to cordate-ovate, lower cauline leaves petioled, the upper sessile, entire to remotely dentate; petals white, 7-15 mm. long; siliques linear-lanceolate to linear, divaricate, 2-3 cm. long, on slender pedicels 2-3 cm. long; styles 2-3 mm. long; seeds variable, suborbicular to elongate-oval. Wet woods, creek bottoms and marshy meadows, e. Tex., Feb.-May; Tex. to Fla., Minn. and Que.

2. *Cardamine parviflora* L. var. *arenicola* (Britt.) Schulz. Glabrous annual; stems usually erect, simple or branched above, 1-3 dm. tall; leaves pinnatifid to pinnately lobed, petiolate; leaf lobes entire to shallowly dentate, cuneate at base or with a short petiolule; flowers small, crowded; petals white, spatulate, 2.5-3.5 mm. long; pedicels slender, ascend-

ing, 5-8 mm. long; siliques erect, 2-3 cm. long; styles less than 1 mm. long; seeds plump, oblong, 0.7-0.9 mm. long; cotyledons accumbent. Moist seeps, wet sandy soils and open wet places in wooded areas, ditches and stream banks, cen. and e. Tex., Feb.-Apr.; Fla. to e. Can., w. to Ore. and Wash.

3. *Cardamine macrocarpa* Brandeg. var. *texana* Roll. Herbaceous annual; stems several from base, 2-4 dm. long, glabrous, semierect to decumbent, highly branched, slightly angled with a narrow wing; leaves pinnatifid to simply pinnate, nonauriculate, the rachis minutely puberulent; leaflets usually petiolulate, dentate to shallowly lobed; infructescences with a gyrate rachis; petals greenish, strap-shaped, less than 1 mm. wide; pedicels straight, divaricate, minutely puberulent to glabrous, 5-8 mm. long; siliques straight, 2.5-4 cm. long, 1.5-2 mm. wide; styles 1-2 mm. long. Damp shady places in the mts., Big Bend region, Apr.-July; Tex. to Coah.

4. *Cardamine hirsuta* L. HAIRY BITTER-CRESS. Annual; stems erect to slightly decumbent, several to numerous from the base, simple or sparsely branched above, 1-2.5 (-3) dm. tall; leaves pinnately lobed, basal and lower cauline with entire to shallowly dentate suborbicular lobes and simple spreading trichomes on the petioles and leaf bases, upper cauline reduced and usually glabrous with oblong lobes; flowers small; petals white, spatulate, to 3 mm. long; siliques erect, straight, 15-25 mm. long, about 1 mm. wide, the valves elastic; styles 0.5 mm. long or less; seeds broadly oblong; cotyledons accumbent. Roadsides, open fields and other weedy situations, usually in damp or wet soil, rare in e. Tex. where recently found in Cass Co., spring; introd. from Eur. and found mostly in the s.e. U. S.

15. RORIPPA SCOP. YELLOW-CRESS

Annual to perennial herbs, mostly glabrous or sparingly pubescent; stems usually branched; leaves simple to pinnate or compound; flowers in terminal or axillary racemes; sepals spreading in anthesis; petals yellow or white, small or absent; siliques terete, narrowly cylindrical to globose, sessile; valves nerveless; seeds usually numerous, plump, small, marginless; cotyledons accumbent.

About 70 species in temperate and subtropical areas of the world.

- 1. Petals conspicuous, white; leaves pinnately compound .1. *R. Nasturtium-aquaticum*.
- 1. Petals yellow if present, minute or absent; leaves entire to pinnatifid but not compound (2)
- 2(1). Petals exceeding sepals, broadly oblong to obovate; plants perennial with underground rhizomes6. *R. sinuata*.
- 2. Petals shorter than sepals or absent, narrowly oblanceolate when present; plants with a taproot (3)
- 3(2). Siliques sessile or pedicels less than 2 mm. long; petals absent2. *R. sessiliflora*.
- 3. Siliques pedicellate; pedicels more than 3 mm. long; petals present (4)
- 4(3). Siliques short and thick, broadly oblong, obtuse; trichomes simple and pointed if present3. *R. islandica*.
- 4. Siliques elongated, terete; vesicular bulbous trichomes present on stems, foliage or siliques (5)
- 5(4). Leaf segments deeply dentate; lower leaves pinnatifid; cauline leaves petiolate4. *R. teres*.
- 5. Leaf segments entire; lower leaves merely lobed; cauline leaves sessile5. *R. ramosa*.

1. *Rorippa Nasturtium-aquaticum* (L.) Hayek. WATER-CRESS. Aquatic to semi-aquatic perennial, glabrous; stems floating, creeping or ascending, rooting at the nodes; leaflets ovate to oval, terminal larger than the lateral, somewhat fleshy; petals 3-4 mm. long; fruiting pedicels divaricate, 8-12 mm. long; fruit 1-2 cm. long, spreading or curved upward; style about 1 mm. long; seeds about 1 mm. long, plump, nearly orbicular.

Running streams and stream margins, cold springs, Mar.-May; widely dispersed as an introd. from Eur.

2. *Rorippa sessiliflora* (Nutt.) Hitchc. Annual or biennial with a taproot; stems erect, branched, 2-5 dm. tall, glabrous; leaves petiolate, oblanceolate, dentate; flowers in terminal and lateral racemes, small; sepals yellowish; petals absent or very rarely a petal may be seen in one or two flowers of a plant; pedicels less than 1 mm. long; siliques sessile or nearly so, terete to slightly compressed parallel to septum, oblong, 6-10 mm. long; styles less than 1 mm. long; seeds numerous, cordiform, plump, 0.4-0.6 mm. long. Wet land, river floodplains and along sluggish stream margins or around ponds, n. and e. Tex., Apr.-July; Tex. and La. to Va., Ind. and Minn.

3. *Rorippa islandica* (Oeder) Borbás. BOG MARSH-CRESS. Stems 3-8 dm. tall, branched above, glabrous to hirsute with simple pointed trichomes; lower leaves lobed only, dentate to almost entire, petiolate; upper leaves somewhat lobed to dentate, almost sessile; petals yellow, about 2 mm. long; pedicels slender, spreading; fruit 5-7 mm. long, linear to linear-oblong; seeds plump, cordiform, 0.5-0.8 mm. long. *R. palustris* and *R. obtusa* of Tex. auth. Along stream banks and margins of lakes or ponds, n.e. Tex., s.e. to Brazoria Co., Mar.-May; Tex. and La. to Greenl. and Eur. Several vars., but southwestern U.S. material appears to be var. *islandica*.

4. *Rorippa teres* (Michx.) Stuckey. Annual or biennial; stems 1-3 dm. long, erect to decumbent, branched; sparsely pubescent with vesicular trichomes, rarely glabrous; leaves oblong to oblanceolate, deeply pinnatifid and with the remote segments obtusely toothed, petiolate; racemes terminal and axillary, densely flowered; petals minute, about 1 mm. long, yellow; pedicels spreading, 2-5 mm. long; siliques linear-oblong, 1-1.5 cm. long, straight or slightly curved; styles evident, about 1 mm. long; seeds numerous, plump, slightly longer than broad, about 0.5 mm. long. *R. Walteri* (Ell.) Mohr. Wet fields, lakes, ponds and stream margins and swamp land, e. and s.w. Tex., Dec.-May; S.C. and Fla. to Okla. and C.A.

5. *Rorippa ramosa* Roll. Perennial; stems numerous, decumbent, highly branched, sparsely pubescent with vesicular trichomes, 3-6 dm. long; leaves numerous, sessile, auriculate, oblong to broadly lanceolate, pinnately lobed, 3-5 cm. long, 5-12 mm. wide; inflorescences short, mostly less than 5 cm. long; petals pale-yellow, 2.5-3 mm. long; pedicels widely spreading to ascending, 3-5 mm. long; siliques divaricately spreading to erect, oblong to lanceolate in outline, plump, 6-10 mm. long; valves densely covered with vesicular trichomes along their margins; styles 1.5-2.5 mm. long; seeds plump, cordiform, about 1.5 mm. in diameter. Flood-plains and intermittent stream beds, Big Bend region near the Rio Grande, Mar.-May; also Coah. to Dgo.

6. *Rorippa sinuata* (Nutt.) Hitchc. Perennial with creeping rhizomes; stems 2-4 dm. tall, glabrous, highly branched, erect to decumbent; leaves oblong to oblanceolate, deeply pinnatifid, the segments entire or nearly so; petals obovate, not differentiated into blade and claw, exceeding sepals; pedicels slender, 6-10 mm. long, spreading; siliques curved upward, 8-14 mm. long, about 2 mm. wide; seeds angular, plump, 0.7-0.8 mm. long. Loose soils, fields, roadsides and waste places as well as natural habitats, n. and w. Tex., Apr.-July; Ill. and cen. Can. to Wash., Nev. and N.M.

16. ERYSIMUM L.

WALL-FLOWER

Plants annual, biennial or perennial, rather coarse, with appressed branched trichomes; leaves simple, narrow, entire to dentate; flowers in racemes, mostly showy in native species; sepals erect, outer pair saccate at base; petals mostly large, clawed, yellow to orange or maroon; fruit linear, more or less 4-angled, elongated, erect to widely spreading; styles short, stigma 2-lobed; seeds numerous, uniseriate, wingless or with an abbreviated wing in distal end.

About 100 species in North America, the Mediterranean region, Europe and Asia.

1. Petals erect, greenish-yellow, 5-8 mm. long; pedicels 2-4 mm. long; persistent stigma smaller than style diameter; annual 1. *E. repandum*.
1. Petals unguiculate, yellow to orange, 15-30 mm. long; pedicels 5-10 mm. long; persistent stigma much larger than style diameter; biennial or perennial (2)

- 2(1). Siliques widely spreading; petals yellow; pedicels equaling diameter of mature siliques; branches widely spreading; plants mostly less than 3 dm. tall 2. *E. asperum*.
- 2. Siliques erect; petals yellow to orange or orange-red; pedicels more slender than mature silique diameter; branches ascending; plants mostly over 3 dm. tall 3. *E. capitatum*.

1. *Erysimum repandum* L. Annual, sparsely to densely pubescent with appressed bifurcate trichomes; single stem widely branched (especially above), 1-4 dm. tall; leaves linear to linear-oblongate, mostly repand-dentate, sometimes entire, lower short-petioled, upper cuneate at base; petals greenish-yellow, erect, 5-8 mm. long; pedicels spreading at right angles to rachis, not expanded below receptacle, 2-4 mm. long, about the same diameter as silique; siliques widely divergent, nearly terete, somewhat moniliform at maturity, 4-7 cm. long, about 1 mm. in diameter; seeds oblong, compressed, 1.1-1.4 mm. long; cotyledons incumbent. Weed of fields, roadsides and waste places, mainly n. and w. Tex., Mar.-May; widely scattered in U.S. and s. Can.; adv. from Euras.

2. *Erysimum asperum* (Nutt.) DC. Biennial or perennial, strigose from the presence of a dense covering of appressed bifurcate trichomes; stems usually single from the base, erect, 15-35 cm. tall, widely branched above; leaves numerous, crowded, linear to lanceolate, cuneate at base, remotely dentate to entire; flowers showy in dense racemes; petals yellow, strongly unguiculate, 15-25 mm. long; pedicels diverging at right angles to rachis, scarcely enlarged toward summit, 7-12 mm. long; siliques widely spreading, tetragonal, 8-12 cm. long, densely pubescent on four sides, keels evident as longitudinal lines with a less dense covering of trichomes; seeds plump, oblong, often angular, with a short distal wing, 1.7-2 mm. long; cotyledons incumbent. Grassland prairies, plains, low hills and bluffs in Panhandle, Apr.-June; grassland prairie region Tex. and Okla. to s. Can.

3. *Erysimum capitatum* (Dougl.) Greene. Coarse biennial or perennial herbs, densely pubescent with appressed bifurcate or trifurcate trichomes; stems erect, usually single from the base, branched above, 4-10 dm. tall; leaves numerous, linear-lanceolate, remotely dentate to entire, lower ones petiolate, gradually becoming cuneate upward on stem; inflorescences dense, elongating in fruit; petals strongly unguiculate, 15-25 mm. long, yellow to orange-red; pedicels widely spreading to divaricately ascending, 6-9 mm. long; siliques erect or less frequently divaricately ascending, 5-8 cm. long; styles 1-2 mm. long; persistent stigma large and deeply 2-lobed; seeds oblong, plump, 1.5-2 mm. long, wingless or with a short distal wing, *E. arkansanum* Nutt. Open rocky outcrops, road-cuts, banks, dry streambeds and open wooded hill or mt. slopes, n. and w. Tex., Apr.-July; O. to Ark., w. to Wash. and southw. in Mex.

17. MATTHIOLA R. BR.

Annual to perennial herbs with a dense grayish indument of branched trichomes; sepals erect, inner pair saccate at base; petals long-clawed, purple, white or yellowish; stigma strongly bilobed; siliques linear, terete to compressed; seeds mostly winged, 1 row in each loculus.

About 55 species in Europe and North Africa, extending eastward to Asia.

- 1. Siliques terminating in 2 distinct horns, terete; stems slender and diffuse 1. *M. bicornis*.
- 1. Siliques not horned at apex, compressed; stems rigid, stout and erect 2. *M. incana*.

1. *Matthiola bicornis* (Sibth. & Sm.) DC. EVENING STOCK. Plants much-branched, annual or biennial; leaves lanceolate or narrower, entire to somewhat dentate, acute, 4-8 cm. long; flowers sessile, clustered near ends of stems and branches, broadly opening at evening and closed by day, lilac or purple, fragrant; petals 1.5-2 cm. long; siliques 7-10 cm. long, spreading, forked at apex into two conspicuous horns. *M. longipetala* subsp. *bicornis* (Sibth. & Sm.) P. W. Ball. Occasionally escaped from cult., spring-summer.

2. *Matthiola incana* R. Br. **STOCK**. Biennial or perennial, 2-6 dm. tall, stiff, somewhat woody at base; leaves narrowly oblong to oblanceolate, 6-14 cm. long, obtuse, entire; flowers in terminal racemes, single or double-flowered; petals 2-3 cm. long, purple, pink or white; siliques 3-7 cm. long, erect, thick, terminated by the 2-lobed stigma, without conspicuous horns. Rarely escaped from cult., spring-summer.

18. CONRINGIA ADANS.

Seven species in the Mediterranean region and Europe to central Asia.

1. *Conringia orientalis* (L.) Dum. **TREACLE MUSTARD, HARE'S EAR**. Glaucous annual; stems erect, simple or branched above, leafy, 2-6 dm. tall; basal rosette of leaves wanting; cauline leaves oval to elliptical, entire or nearly so, cordate-clasping, 3-9 cm. long, 2-3.5 cm. broad; sepals saccate, erect; petals erect, yellowish, narrow, not differentiated into blade and claw; pedicels stout, widely spreading to divaricately ascending, scarcely expanded below receptacle; siliques linear, quadrangular in cross section, erect to slightly divergent, 8-11 cm. long; styles 1-2 mm. long; seeds oblong, wingless, plump, in 1 row in each loculus, 1.8-2.2 mm. long; cotyledons incumbent. Grainfields, cult. land, roadsides and open disturbed areas, Mar.-May; widely distributed as an introd. weed, nat. to cen. and e. Eur.

19. DIPLLOTAXIS DC.

About 25 species in the Mediterranean region and Europe.

1. *Diplotaxis muralis* (L.) DC. **STINKING WALL ROCKET, SAND ROCKET**. Annual or biennial herbs; stems usually several from the base, 2-4 dm. tall, branched, sparsely hispid below to glabrous; leaves mostly basal, sinuate, dentate to pinnatifid or lyrate lobed, rarely spatulate and nearly entire; cauline leaves few or none, cuneate at base when present; flowers few in elongated racemes; petals 5-7 mm. long, sulphur-yellow to lavender; pedicels slender, divaricately ascending, 1.5-2 cm. long; siliques remote, erect to slightly spreading, terete to slightly flattened, with prominent median vein, sessile, 2-3.5 cm. long; styles 1-2 mm. long; seeds oblong, about 1 mm. long, in 2 rows in each loculus; cotyledons conduplicate. Fields, roadsides and abandoned land, June-Aug.; widely scattered weed in U.S. and Can.; naturalized from Eur.

20. ERUCASTRUM PRESL

About 15 to 18 species in the Mediterranean region and central Europe.

1. *Erucastrum gallicum* (Willd.) Schulz. **ROCKET WEED, DOG MUSTARD**. Erect branching annual or biennial herb; stems pubescent with stiff retrorse simple trichomes, 2-8 dm. tall; leaves rough, oblong to obovate in outline, pinnatifid to nearly bipinnatifid, with deep rounded sinuses, reduced in size upwards; flowers in racemes; bracts of lower flowers pinnatifid; petals pale-yellow, 7-8 mm. long; siliques 4-angled, 2-4 cm. long, 1-2 mm. wide, ascending, slender, elongate, tapering to a conic beak, the valves keeled, more or less torulose; style about 4 mm. long; seeds oval-oblong, reddish-orange, about 1 mm. long, in 1 row. Weed of roadsides and open waste places, local in n. and n.e. Tex., Apr.-Sept.; widely distributed in U.S. and s. Can.; introd. from Eur.

21. BRASSICA L. MUSTARD

Coarse annual to perennial herbs; leaves sessile or petioled, the lower mostly lyrate-pinnatifid; sepals ascending or spreading; petals yellow to cream, long-clawed; siliques linear, often torulose, with an indehiscent and one-seeded or seedless beak; seeds globose, dark or yellowish.

About 25 species in Europe and Asia. Cultivars of cabbage, cauliflower, broccoli, brussels sprouts, etc. (*B. oleracea* L.) sometimes escape from cultivation. Other species, namely *B. nigra* (L.) Koch (black mustard), *B. hirta* Moench (white mustard) and *B. Rapa* L. (bird's rape) may occur as ruderals.

1. Upper cauline leaves auriculate, sagittate 1. *B. campestris*.
 1. Upper cauline leaves cuneate at base or petioled (2)
 2(1). Plants glabrous; sepals erect 2. *B. juncea*.
 2. Plant hirsute with spreading trichomes at least below; sepals spreading at anthesis ..
 3. *B. kaber*.

1. *Brassica campestris* L. BIRD RAPE, TURNIP RAPE. Annual or biennial; stems erect, 3-10 dm. tall, glabrous and glaucous or very slightly pubescent below; basal leaves lyrate-pinnatifid; upper leaves lanceolate to oblong, entire to shallowly dentate, auriculate and clasping the stem; petals yellow, 6-10 mm. long; pedicels divaricately ascending, 1-3 cm. long; siliques 4-7 cm. long, about 3 mm. thick, the beak 1-2 cm. long; seeds spheroidal or slightly compressed laterally, reddish-gray, 1.5-2 mm. in diameter; cotyledons conduplicate. Fields, waste land and roadsides, sporadic, Apr.-June; widely scattered in N.A.; introd. from Euras.

2. *Brassica juncea* (L.) Coss. INDIA MUSTARD, LEAF MUSTARD. Annual, 3-12 dm. tall, glabrate and somewhat glaucous, branched above; lower leaves 1-1.5 dm. long, lyrate-pinnatifid, long-petioled, with a large terminal lobe; upper leaves reduced, lanceolate to linear, mostly entire; petals yellow, 8-12 mm. long; siliques erect, 3-6 cm. long, the beak 4-8 mm. long; seeds spheroidal, brownish-red; cotyledons conduplicate. Weed of old fields, roadsides and waste places, Apr.-June; sporadic but common, temp. N.A.; naturalized from Euras.

3. *Brassica kaber* (DC.) Wheeler. CHARLOCK. Annual, 3-8 dm. tall, usually with a fleshy taproot; stems branched above, more or less hirsute; basal leaves lyrate-pinnatifid, with a rounded toothed terminal lobe; middle and upper leaves oblong to lanceolate, entire to dentate, sessile or nearly so; petals yellow, 6-8 mm. long; siliques 3-4 cm. long, cylindrical, the 1- or 2-seeded beak 1-1.5 cm. long; seeds spheroidal, red or black; cotyledons conduplicate. Common weed of cult. and waste land, Mar.-May; widely distributed in N.A.; naturalized from Euras.

22. ERUCA MILL.

Six species in Mediterranean Europe and northeast Africa.

1. *Eruca sativa* Mill. ROCKET SALAD, GARDEN ROCKET. Annual herb, 3-6 dm. high; stems erect, branching, hirsute below with simple spreading or retrorse trichomes, often glabrous above; lower leaves pinnatifid or lobed, the upper merely dentate; flowers in racemes; sepals erect; petals 1.5-2 cm. long, white to yellowish with brown or violet veins; pedicels stout, erect, 3-5 mm. long; siliques 15-25 mm. long, erect and appressed to the stem, thick, linear to linear-oblong, turgid, with a long sword-shaped beak; seeds in 2 rows, nearly globose, wingless. Weed of roadsides and waste places, mostly w. Tex., flowers any month; abundant in Mex., introd. from the Medit. region of Eur.

23. RAPHANUS L.

Eight species from Europe, Mediterranean area and Asia.

1. *Raphanus sativus* L. RADISH, RÁBANO. Erect annual or biennial, much-branched above, 3-6 dm. tall, from a fleshy taproot; leaves pinnatifid, the basal long-petioled, glabrous to hirsute; flowers in racemes; sepals erect, the lateral slightly saccate; petals white to purplish, not with dark veins, 15-20 mm. long, obcordate, long-clawed; body of indehiscent silique 2-4 cm. long, the beak 1-2 cm. long; style long, slender. Old fields, waste places and roadsides, spring-summer; probably both escaped from cult. and introd. from Eur. in weed form.

24. CAKILE MILL. SEA ROCKET

Annual herbs, fleshy, glabrous, caulescent, chiefly maritime; leaves alternate, entire or pinnatifid; flowers racemose, perfect; sepals erect, gibbous at the base; corolla cream to

white or light-lavender; ovary sessile, the style wanting and the stigma entire; fruit indehiscent, 2-jointed, the joints 1-chambered with each usually 1-seeded; seeds wingless; cotyledons accumbent, oblique or incumbent.

About 15 species bordering oceans and large lakes in temperate North America, Eurasia and Australia.

1. Upper joint of pod less than 1 cm. long, delicately 4-ridged; pedicels more slender than rachis; infructescence not geniculate 1. *C. fusiformis*.
1. Upper joint of the pod over 1 cm. long or more, coarsely 8-ridged; pedicels nearly same diameter as rachis; infructescence geniculate . . 2. *C. geniculata*.

1. *Cakile fusiformis* Greene. Stems erect or spreading, 3-7 dm. long, fleshy; leaves 5-15 cm. long, ovate in outline, lacinate-pinnatifid, obtuse, the segments linear; racemes greatly elongating, reaching 2-4 dm. long, rachis not geniculate; pedicels more slender than rachis, 3-5 mm. long; fruit slender, 15-25 mm. long, the lower joint turbinate, nearly terete, usually 1-seeded, the upper joint subulate or lance-linear (longer than the lower). Sandy areas near the ocean, mainland and off-shore islands, flowers any month; Fla. to Tex.

2. *Cakile geniculata* (Robins.) Millsp. Stout glabrous herbs; stem branching and more or less spreading, 1-4 dm. long; leaves 3-7 cm. long, oblanceolate to linear-oblanceolate, entire or with a few coarse rounded teeth; raceme 1-2 dm. long, strongly geniculate at maturity; pedicels very stout, 3-5 mm. long, spreading or ascending; fruit nearly terete, 2-3 cm. long, the lower joint with a prominent border at the summit, the upper joint lanceolate or oblong-lanceolate and usually curved, usually 1-seeded but occasionally 2-seeded (twice as long as the lower joint). Beaches and sandy places near ocean, mainland and offshore islands, flowers any month; n.w. Fla. to Tex.

25. SELENIA NUTT.

Low glabrous annuals with pinnately dissected leaves, caulescent or acaulescent; flowers odoriferous, in loose leafy-bracted racemes or on peduncles arising from the axils of a rosette of leaves; sepals spreading or erect, thickened with a low crest to markedly appendaged on exterior surface just below apex; petals obovate to spatulate, yellow; siliques subsessile to stipitate, flattened parallel to septum to inflated, broadly oblong to depressed globose; seeds biseriate in the silique, flattened, strongly margined or winged; cotyledons accumbent.

Five species, all from southwestern United States and adjacent Mexico.

1. Silique valves with vesicles present; siliques sessile; sepals persistent to fruit maturity 1. *S. grandis*.
1. Silique valves glabrous; siliques with at least a short stipe; sepals shed shortly after anthesis (persisting somewhat in *S. dissecta*) (2)
- 2(1). Leaves pinnate, mostly cauline and reduced; inflorescences terminal on well-developed stems 4. *S. aurea*.
2. Leaves bipinnate, mostly basal and well-developed; at least the earliest flowers borne on peduncles originating among basal leaves (3)
- 3(2). Siliques margined, tapered above and below, flattened parallel to septum; pedicels over 3 cm. long 2. *S. dissecta*.
3. Siliques not margined, rounded above and below, inflated and depressed subglobose; pedicels less than 3 cm. long 3. *S. Jonesii*.

1. *Selenia grandis* Martin. Winter annual, branched near base with the lateral decumbent branches equaling or exceeding the central erect stem; main stem or branches to 6 dm. long; leaves bipinnate, petiolate, glabrous or with vesicular trichomes along midvein or petiolule, to 2 dm. long; inflorescences very leafy with each pedicel subtended by a leaflike bract; sepals with a prominent hornlike appendage, persisting while fruits mature; petals yellowish, broadly obovate, notched at apex, barely exceeding the sepals; pedicels slender to stout, widely spreading, to 2 dm. long; mature siliques thick and fleshy, broadly oblong, sessile, to 15 mm. long and 1 cm. wide, valve exterior covered with, vesicular

trichomes; seed somewhat flattened, margined. Heavy soils and open flood-plain areas, from Dimmit and La Salle cos. southw. in the lower Rio Grande Valley, Feb.-Mar.; endemic.

2. *Selenia dissecta* T. & G. Mostly acaulescent, occasionally developing flowering stems, winter annual, often with a well-developed root; leaves bipinnate with acute lobes, glaucous, petiolate, to 1 dm. long; flowers mostly pedunculate as if on stems, then in an indefinite raceme; sepals widely spreading at anthesis, with a definite hornlike appendage; petals yellow, obovate to spatulate, exceeding the sepals; pedicels erect to spreading, to 8 cm. long; siliques at first inflated, becoming thick and fleshy at maturity, flattened parallel to septum, stipitate, to 3 cm. long, 1 cm. wide; style flaring broadly at base, to 5 mm. long; seeds margined, flattened. Low places and playa lake-margins, Big Bend region e. to Ector Co., Feb.-June; also N.M. and n.e. Mex.

3. *Selenia Jonesii* Cory. Winter annual, branching at crown; branches decumbent, to 3 dm. long; leaves bipinnate with small obtuse ultimate lobes, petiolate, to 1 dm. long; flowers both pedunculate and on stems in leafy-bracted racemes; sepals tawny, oblong, with a short pouchlike appendage to merely a thickened area below sepal apex; petals yellow, spatulate; pedicels widely spreading, to 3 cm. long; siliques inflated, subglobose, short-stipitate, rounded above and below, to 12 mm. in diameter; styles 2-3 mm. long; seeds widely winged; cotyledons accumbent. Moist swales and buffalo wallows on high prairies and plateaus of w.-cen. Tex., Mar.-Apr.; endemic.

4. *Selenia aurea* Nutt. Glabrous annual; stems erect or nearly so, single or several arising from the base, to 2 dm. tall; leaves pinnate, mostly cauline, petiolate, to 6 cm. long, the lobes entire or dentate; inflorescences terminal, congested; sepals without appendages; petals yellow, spatulate; pedicels divaricately ascending, slender, to 25 mm. long; siliques broadly oblong, stipitate, acute above and below, flattened parallel to septum, nonfleshy, to 25 mm. long, 5-10 mm. wide; styles flaring at base, 6-10 mm. long; seeds widely margined. Open glades and barrens, probably n.e. Tex., Apr.-May; Kan. and Mo. to extreme s.e. Okla.

26. LEAVENWORTHIA TORR.

Seven species in central and southern United States.

1. *Leavenworthia aurea* Torr. Winter annual; leaves rosette-forming, the early ones with only an orbicular entire and remote terminal blade portion, later leaves with few to several lateral lobes; early and mid-season flowers on scapes 3-9 cm. long, later flowers usually borne in a raceme on lateral decumbent branches; sepals 4-5 mm. long; petals narrowly lingulate, lemon-yellow to orange-yellow, shallowly emarginate, 7-10 mm. long; siliques strongly flattened parallel to septum, thickish, erect, 1.5-3 cm. long, 4-5.5 mm. wide; styles 2-3.5 mm. long; gynophore nearly 1 mm. long; seeds nearly orbicular, 3.5-4.5 mm. in diameter, strongly flattened, narrowly winged; radicle of embryo straight. Limestone cedar glades and fossil outcrops, local near San Augustine, Mar.-May; also s.e. Okla.

27. DRABA L. WHITLOW-CRASS

Annual, biennial or perennial herbs; stems leafy or scapose, usually pubescent with simple or branched trichomes; leaves entire or dentate; racemes short to elongate; petals white or yellow; silicles elliptic to linear, latiseptate, flat or sometimes twisted; seeds numerous, biseriate to irregularly seriate; cotyledons accumbent.

About 250 species in temperate and cold parts of North America, South America, Europe and Asia.

- 1. Perennial; petals 4-6 mm. long; silicles sometimes twisted 1. *D. Standleyi*.
- 1. Annuals or winter annuals; petals less than 5 mm. long or absent; silicles not twisted (2)

base, to 3 dm. high, usually foliose nearly to the inflorescences; basal leaves rosulate, obovate-cuneate, toothed in the distal half, shortly petiolate or sessile; cauline leaves oblong-ovate, sessile (sometimes nearly amplexicaul); infructescences elongated; sepals about 2 mm. long, elliptic to linear; petals white, 3-3.5 mm. long, shortly clawed and the blade obovate and emarginate or very much reduced or none; pedicels 2-7 mm. long, usually spreading, pubescent with simple trichomes; silicles 4-8 mm. long, obovate to elliptic, rounded at the tip and narrowed toward the base, hirsute with short simple trichomes; seeds 0.7-0.8 mm. long, elliptic to oblong, biseriata to several-rowed. *D. cuneifolia* var. *platycarpa* (T. & G.) Wats. Sandy and gravelly soils in cen. Tex., also Jeff Davis Co., early spring; Ark., Ariz., Ida. and Wash.

5. *Draba cuneifolia* T. & G. var. *cuneifolia*. Annual, hirsute with stipitate branched or a mixture of branched and simple trichomes; stems to 3 dm. tall, erect, usually branched from the base; basal leaves to 5 cm. long, usually obovate-cuneate, entire or more or less dentate (especially in the distal half), tapering into a short petiole or sessile; cauline leaves few, on the lower half of the stems, to about 35 mm. long, sessile (sometimes more or less amplexicaul), more or less obovate, entire or remotely dentate; infructescences rather dense and often congested; sepals 1-2.5 mm. long, oblong-ovate to linear; petals white, usually 3.5-5 mm. long, spatulate and emarginate, less often 1-2 mm. long and linear or absent; pedicels 2-7 mm. long, usually spreading; silicles 5-15 mm. long, elliptic to oblong, hispid with simple trichomes or glabrous; styles nearly obsolete; seeds about 0.7 mm. long, biseriata to several-rowed. Incl. var. *Helleri* (Small) Schulz and var. *leiocarpa* Schulz (applied to the form with glabrous silicles), *D. ammophila* Heller. In sandy and gravelly soils throughout Tex., except in the n. Panhandle and s. Rio Grande Plains, early spring; also in s. and cen. U.S.; n. Mex.

Var. *integrifolia* Wats. Differs from the typical variety in that the pubescence (including that of the silicles, these however, sometimes glabrous) is of branched trichomes only; in addition, the styles are usually developed (to 1 mm. long). Incl. var. *sonorae* (Greene) Parish (applied to those plants having pubescent silicles). In sandy soils and/or moist places in s. Tex. (Webb Co. to Starr Co.), early spring; also in s.w. Ut., w. Ariz., s. Calif. and n. Mex.

28. CAPSELLA MEDIC.

About 5 species native to Eurasia.

1. *Capsella Bursa-Pastoris* (L.) Medic. SHEPHERD'S PURSE, PANIQUESILLO. Stem 1-5 dm. tall, branching, pubescent below, glabrous above; basal leaves in a rosette, usually lyrate-pinnatifid; stem leaves auricled, dentate to entire; flowers in long racemes; petals white, 1.5-2 mm. long; pedicels slender, spreading at right angles or nearly so, 8-15 mm. long; siliques obcordate-triangular, 5-8 mm. long, strongly flattened contrary to the partition; styles less than 0.5 mm. long; seeds numerous, oblong, orange-yellow, wingless, about 1 mm. long; cotyledons incumbent. Waste land and street margins in cities and towns, roadsides and fields, Feb.-May; widespread weed occurring in most parts of the world; introd.

29. LEPIDIUM L. PEPPERWORT. PEPPERGRASS

Herbaceous annuals, biennials or perennials, glabrous to hispid; leaves entire to finely divided, sometimes amplexicaul; flowers small; petals 2-3 mm. long or rudimentary, white, pale-yellow or greenish, or absent; stamens 2, 4 or 6; silicles orbicular, elliptic or obovate, much-compressed and angustiseptate, often winged distally, the wings forming an apical notch; seeds one per loculus; cotyledons usually incumbent, rarely accumbent or oblique.

About 125 species throughout the world in temperate and warm regions.

1. Perennial, woody at the base (2)

1. Annual or biennial, not woody at the base (3)

2(1). Stems glabrous; inflorescences papillose 1. *L. montanum* var.

angustifolium.

2. Stems and inflorescences papillose 1. *L. montanum* var.

alyssoides.

- 3(1). Plants granular-puberulent with pustular or clavate trichomes; pedicels less than 3 mm. long2. *L. sordidum*.
- 3. Plants subglabrous to hispid or hirsute but not granular-puberulent (4)
- 4(3). Plants densely hispid to hirsute (5)
- 4. Plants subglabrous, papillose or pubescent, not hispid or hirsute (8)
- 5(4). Upper cauline leaves laciniate to pinnatifid; sepals usually persistent3. *L. oblongum*.
- 5. Upper cauline leaves only dentate to entire; sepals soon deciduous (6)
- 6(5). Pedicels terete or slightly flattened; silicles 2.5-3.5 mm. long, sparsely pubescent with the trichomes appressed4. *L. austrinum*.
- 6. Pedicels markedly flattened; silicles 3-4.5 mm. long, the trichomes not appressed or subglabrous except for marginal hairs (7)
- 7(6). Fruit densely hispid, usually broadly elliptic or obovate5. *L. lasiocarpum* var. *Wrightii*.
- 7. Fruit nearly glabrous, usually orbicular5. *L. lasiocarpum* var. *rotundum*.
- 8(4). Upper cauline leaves laciniate to pinnatifid; sepals usually persistent3. *L. oblongum*.
- 8. Upper cauline leaves dentate to entire; sepals soon deciduous (9)
- 9(8). Basal leaves usually bipinnatifid; petals none; plants fetid6. *L. ruderale*.
- 9. Basal leaves pinnatifid to serrate; rudimentary petals at least present; plants not fetid (10)
- 10(9). Silicles usually obovate, rarely suborbicular; pedicels shorter or about as long as the fruit; petals usually rudimentary or none7. *L. densiflorum*.
- 10. Silicles usually orbicular or elliptic; pedicels usually slightly longer than the fruit; petals usually at least twice as long as the sepals (11)
- 11(10). Cotyledons accumbent; inflorescences at least sparsely pubescent8. *L. virginicum* var. *virginicum*.
- 11. Cotyledons oblique to incumbent; inflorescences usually glabrous8. *L. virginicum* var. *medium*.

1. *Lepidium montanum* Nutt. var. *angustifolium* C. L. Hitchc. Biennial or perennial, woody at the base, glabrous (except on the flowering axes and pedicels); stems one to several, erect or sometimes decumbent, simple or much-branched, to 7 dm. high; basal leaves petiolate, to 15 cm. long, divided to bipinnatifid; cauline leaves exceptionally to 15 cm. long, usually less than 10 cm., 1-5 mm. wide, sessile, more or less linear and usually entire, rarely pinnately divided; sepals broadly elliptic, the outer ones slightly saccate, glabrous or slightly papillose; petals with blades more or less orbicular to broadly obovate, tapering to a narrow claw, white or cream; infructescences usually rather loose; pedicels to 1 cm. long, horizontally spreading, straight or slightly curved; silicles 2.5-5 mm. long, 2-3 mm. broad, sessile, elliptic to ovate, glabrous, narrowly winged distally, the notch shallow; style to 0.7 mm. long; seeds 1.5-2.5 mm. long, 0.9-1.3 mm. wide, elliptic to narrowly ovate, sometimes winged at the chalazal end; cotyledons incumbent. On sandy, saline or calcareous soils in s.w. Tex., Mar.-Aug.; also in s.e. N.M.

Var. *alyssoides* (Gray) M. E. Jones. Differs from var. *angustifolium* in that the entire plant is papillose. On sandy, saline or calcareous soils in s.w. and extreme n.w. Tex., Mar.-June; also in N.M., Colo. and e. Ariz.

2. *Lepidium sordidum* Gray. Annual or biennial, granular with conspicuous white pustular or shortly clavate trichomes; stems decumbent to erect, sometimes somewhat flattened, branched from near the base, to 2 dm. tall; basal leaves to about 8 cm. long,

petiolate, bipinnatifid to pinnatifid, the segments often toothed; cauline leaves to 3 cm. long, pinnatifid with the segments often toothed, the uppermost linear-lanceolate and entire or remotely toothed; sepals ovate with rather conspicuous white margins; petals rudimentary, linear and much shorter than the sepals; infructescences very dense and elongated; pedicels to 3 mm. long, suberect to spreading, straight or slightly curved, flattened on the adaxial side and sometimes narrowly winged; silicles 1.5-3 mm. long, 1-2.5 mm. wide, elliptic or sometimes ovate, flattened, glabrous, narrowly winged at the apex, the wings forming a shallow notch, the style about as long as the notch; seeds 0.8-1.2 mm. long, ovoid but slightly flattened; cotyledons incumbent. In dry grassy places in Trans-Pecos Tex., May-July; also n. Mex.

3. *Lepidium oblongum* Small. Annual or biennial, pubescent with weak spreading trichomes or hispid; stems prostrate to ascending, usually much-branched from near the base, to about 2 dm. long; basal leaves to 5 cm. long, bipinnatifid to pinnatifid, the segments usually dentate, often pubescent only on the vein; sepals ovate to deltate, often magenta with white margins, often persistent until the fruit is nearly fully developed; petals very much reduced and linear, or absent; stamens 2; infructescences dense and elongated; pedicels to 5 mm. long, ascending to spreading or recurved, straight or slightly curved, terete or slightly flattened and narrowly winged, usually pubescent on the adaxial side; silicles 2.5-3.5 mm. long, 2-3 mm. wide, usually elliptic to obovate or nearly orbicular, compressed, glabrous or minutely ciliate on the margins, narrowly winged at the distal end, the wings forming a small V-shaped notch; style obsolete or nearly so; seeds about 1.5 mm. long, 0.7-0.8 mm. wide, narrowly ovate and compressed; cotyledons incumbent. Roadsides and disturbed soils in n.w., n.-cen. and Trans-Pecos Tex., Feb.-Apr.; also in Ark., Kan., Okla., Ariz., Calif., Mex. and Guat.

4. *Lepidium austrinum* Small. Annual or biennial, the entire plant more or less hispid; stems usually single but branched, erect, often sulcate, to 6 dm. long; basal leaves to 9 cm. long, lyrate-pinnatifid with the segments dentate to serrate, tapering to a slender and often winged petiole; lower and middle cauline leaves to 6 cm. long, more or less lanceolate, rarely entire, usually dentate to serrate or somewhat pinnatisect; upper cauline leaves to about 2 cm. long, linear-lanceolate, remotely dentate to serrate; sepals narrowly elliptic, with white margins; petals narrowly spatulate and about twice as long as the sepals or rudimentary and much shorter than the sepals, white; stamens 2; infructescences densely fruited and elongated; pedicels to 5 mm. long, slender and terete or slightly flattened, often glabrescent on the abaxial side, spreading to slightly recurved; silicles 2.5-3.5 mm. long, 2-2.8 mm. wide, elliptic to ovate, compressed, winged on the distal half, the wings forming a shallow notch, sparsely pubescent with short appressed trichomes, often ciliate on the margins; seeds to about 1.6 mm. long and 1 mm. wide, ovoid but compressed, usually with a narrow wing; cotyledons incumbent. *L. lasiocarpum* var. *tenuipes* auct., non Wats. and var. *orbiculare* (Thell.) C. L. Hitchc. In sandy or loamy soils in n.-cen. to s. Tex., also in the Trans-Pecos, Feb.-May; also n. Mex.

5. *Lepidium lasiocarpum* var. *Wrightii* (Gray) C. L. Hitchc. Annual or biennial, densely hispid or hirsute with short acute trichomes; stems single to several, usually branched from the base, to about 3 dm. long; basal leaves to 5 cm. long, petiolate, pinnately lobed to pinnatifid, rarely only crenate; middle cauline leaves 1.5-3 cm. long, oblanceolate to obovate-oblong, rather coarsely toothed or nearly entire, the uppermost leaves linear-lanceolate and serrate to entire; sepals narrowly ovate, white-margined; petals rudimentary and somewhat linear, or absent; stamens 2; infructescences dense and elongated; pedicels to about 5 mm. long, conspicuously flattened, ascending to spreading, usually pubescent on the adaxial side; silicles 3-4.5 mm. long, 2-2.4 mm. wide, nearly orbicular or broadly elliptic to somewhat obovate, compressed, winged at the apex, the notch rather deep and narrow, hispid with spreading trichomes, the style very short; seeds 1.5-2 mm. long, 1-1.2 mm. wide, ovoid and compressed, narrowly winged; cotyledons incumbent. In sandy and/or disturbed soils in s.w. Tex., especially in the Trans-Pecos, to Rio Grande Plains, Feb.-May; also in s. and cen. N.M., s.e. Ariz. and n. Mex.

Var. *rotundum* C. L. Hitchc. Differs from var. *Wrightii* in that the silicles are usually nearly orbicular and are nearly glabrous except for trichomes on the margins. Sandy soils in the s. Rio Grande Plains, early spring; endemic?

6. *Lepidium ruderae* L. Fetid annual or biennial, glabrous or pubescent with very short simple trichomes; stems usually single, often branched especially near the top, to 3 dm. high; basal leaves petiolate, to 7 cm. long, usually bipinnatifid, rarely only pinnatifid; lower cauline leaves similar but less finely divided; upper cauline leaves to about 2 cm. long and 2 mm. wide, linear to narrowly spatulate, usually entire, rarely lobed or dentate near the base, the margins generally ciliate; sepals narrowly ovate-lanceolate; petals none; stamens 2; infructescences loose and elongated; pedicels to about 1 cm. long, spreading at about 45° to nearly horizontal; silicles 2-3.5 mm. long, 1-2.5 mm. wide, ovate to broadly elliptic, much-flattened, narrowly winged at the apex, the wings forming a broad shallow notch, the style very short and the stigma nearly sessile; seeds 1.2-1.8 mm. long, elliptic to narrowly ovate, compressed; cotyledons incumbent. Waste places and roadsides, disturbed soils in e. and s. Tex., Mar.-July; also in cen. and e. U.S., e. Can.; introd. from Eur.

7. *Lepidium densiflorum* Schrad. Annual or sometimes biennial, usually pubescent with short spreading trichomes, less often merely papillose or nearly glabrous; stem usually single from the base, somewhat erect, terete, usually branched above, to 5 dm. high; basal leaves to about 6 (-10) cm. long, petiolate, oblong to elliptic or lanceolate, deeply serrate-incised, rarely somewhat pinnatifid and then the segments often toothed; middle cauline leaves 2-3 cm. long, shortly petiolate and sometimes nearly amplexicaul, oblong-lanceolate to lanceolate, serrate; upper cauline leaves 1-2 cm. long, sessile, linear-lanceolate, usually remotely toothed, rarely nearly entire; sepals ovate, white-margined; petals rudimentary and more or less filiform, or none; stamens 2, rarely 4; infructescences dense, elongated; pedicels to 5 mm. long, spreading to suberect, terete or slightly flattened; silicles 2.5-3.5 mm. long, 2-3.3 mm. wide, obovate or rarely suborbicular, compressed, glabrous or minutely pubescent, narrowly winged on the distal third, the wings forming a narrow notch; seeds 1-1.3 mm. long, ovoid but compressed; cotyledons incumbent. *L. apetalum* Aschers., non Willd. In sandy and/or disturbed soils in e., cen. and n.w. Tex., Feb.-June; also in the cen. and e. U.S., occasionally in the Rocky Mts., Pac. States and Can.

8. *Lepidium virginicum* L. var. *virginicum*. LENTEJILLA. Annual or biennial, usually pubescent, rarely nearly glabrous; stem usually single from the base but often much-branched, somewhat erect, to 7 dm. high; basal leaves to about 15 cm. long, lyrate-pinnatifid, the segments often toothed; lower cauline leaves much as the basal but less divided; middle cauline leaves to 4 cm. long, shortly petiolate, oblong-lanceolate to lanceolate, usually serrate, rarely more deeply incised; uppermost cauline leaves to 2 cm. long, linear to linear-lanceolate, usually entire or nearly so; sepals white-margined, elliptic, usually caducous; petals usually obovate-spatulate and 2 to 3 times longer than the sepals, rarely somewhat linear and shorter than the sepals; stamens usually 2, rarely 4 or 6; infructescences dense and elongated; pedicels to 1 cm. long, slender and terete, spreading and often nearly horizontal; silicles 2.5-4.2 mm. long, 2.5-3 mm. wide, usually nearly orbicular, less often broadly elliptic or obovate, compressed, narrowly winged on the distal half, the wings forming a broad shallow notch, glabrous, the style very short; seeds to about 2 mm. long and 1 mm. wide, obovoid but much-compressed, narrowly winged; cotyledons accumbent. In sandy and/or disturbed soils in s., s.e. and cen. Tex., Feb.-July; throughout the U.S. except in the far w.

Var. *medium* (Greene) C. L. Hitchc. Differs from var. *virginicum* in that the infructescences are usually glabrous with the pedicels sometimes slightly flattened and the cotyledons are oblique to incumbent. *L. intermedium* Gray, non Rich., *L. medium* Greene. In disturbed soils and waste places throughout Tex., Feb.-July; also in Okla., Ariz., Colo. and the n.w. U.S.

30. CARDARIA DESV.

Two species known, the other, adventitious from Asia, in western and northern United States.

1. *Cardaria Draba* (L.) Desv. WHITE-TOP, HOARY CRESS. Perennial; stems arising from an underground rhizome, usually at least sparsely pubescent, erect, leafy, to about 5 dm. high; basal and lower cauline leaves petiolate, sinuate or lyrate (but usually lost by the

time of flowering); middle and upper cauline leaves sessile, elliptic to lanceolate, usually sinuate-toothed, somewhat amplexicaul and cordate or sagittate at the base; infructescences branched, the racemes corymbose; sepals elliptic; petals about twice as long as the sepals, clawed, white; pedicels to 1 cm. long, spreading; silicles 3.5-4.5 mm. long, the same in width, obcordate to ovate, often unequally inflated by the development of only one seed, indehiscent, often slightly emarginate; style to 1.5 mm. long, slender; seeds ovate to elliptic, much-compressed, not winged. In disturbed and agricultural ground, s.w. and w. Tex., Feb.-Aug.; introd. from Eur. and widely spread as a weed in U.S. and Can.

31. THLASPI L.

Annual or perennial herbs, glabrous and frequently glaucous; stems one to several from base, simple or branched above; leaves dimorphic, the basal petiolate, the cauline sessile and usually auriculate; inflorescence congested, elongating in fruit; siliques orbicular to obovate or broadly oblong, flattened contrary to septum, the valves winged or at least margined; seeds wingless.

About 60 species, mostly in Eurasia. A few species in temperate western North America and in South America.

1. Siliques nearly orbicular, widely winged and deeply notched at apex; styles obsolete; annual 1. *T. arvense*.
1. Siliques obovate, margined but scarcely winged, scarcely notched at apex; styles prominent; perennial 2. *T. Fendleri*.

1. *Thlaspi arvense* L. FANWEED, FRENCHWEED, PENNYCRESS. Annual weed; stems erect, branched above, 3-5 dm. tall; basal leaves petioled, oblanceolate, early-deciduous; cauline leaves sessile, oblong to lanceolate, the upper dentate, auriculate and clasping the stem; petals white, 2-4 mm. long; pedicels slender, divaricately ascending, 1-1.5 cm. long; silique deeply notched at apex, 8-15 mm. across; styles obsolete; seeds ovoid, compressed, 2-2.3 mm. long, with concentric ridges; cotyledons accumbent. Introd. weed, nat. to Euras., Apr.-June; most abundant in n.-cen. and w. U.S. and s.-cen. Can.

2. *Thlaspi Fendleri* Gray. Perennial caespitose herbs, glabrous and glaucous; stems unbranched above the base, 1-3 dm. tall; basal leaves with slender petioles, 2-4 cm. long, the blade 5-15 mm. long; cauline leaves sessile, auriculate and clasping; inflorescence very dense, only slightly elongated in fruit; petals spatulate, white to light-lavender, 5-8 mm. long; pedicels horizontal to slightly descending, 5-8 mm. long; siliques obovate to nearly elliptical, apex obtuse to truncate, 5-7 mm. long; styles 1.5-3 mm. long; seeds wingless, plump, 1 to 3 in each loculus. Mts. of the Trans-Pecos, Apr.-May; N.M. to Wyo., Ariz. and Mex.

32. SYNTHLIPSIS GRAY KEELPOD

Three species in western Texas and northeastern Mexico; a single species reaches Texas.

1. *Synthlipsis Greggii* Gray. Annual or biennial; stems numerous from a slender or thickened caudex, densely pubescent, weak, often decumbent or sprawling, 2-7 dm. long; leaves petiolate, densely pubescent with multiple-branched trichomes, deeply dentate to nearly entire, 2-14 cm. long; sepals narrowly oblong, nonsaccate, densely pubescent, 5-8 mm. long; petals white to lavender, broadly obovate, 9-12 mm. long; infructescence much-elongated, 1-4 dm. long; pedicels widely spreading to slightly descending, 5-15 mm. long, densely pubescent; siliques strongly flattened contrary to septum, margined, elliptical to broadly oblong, densely pubescent, 8-15 mm. long, 5-8 mm. wide; styles slender, glabrous, 2-5 mm. long; seeds slightly longer than broad, plump, 1.5-2 mm. long; cotyledons accumbent. Sandy to gravelly soils or limestone rubble in open areas or among desert shrubs, Rio Grande Plains and Trans-Pecos, Jan.-Nov.; also n.e. Mex.

33. MANCOA WEDD.

Eight species in southern North America and temperate South America.

1. Mancoa pubens (Gray) Roll. Annual or biennial, canescently pubescent throughout with intricately branched trichomes; stems erect, usually branched above, 3-9 dm. tall; basal leaves shortly petioled to sessile, pinnatifid to more deeply lobed, 3-6 cm. long; cauline leaves sessile, overlapping, oblong to oblanceolate, dentate to somewhat lobed, 1-6 cm. long; inflorescence racemose; sepals ovate to broadly oblong, densely pubescent, nonsaccate, erect at anthesis; petals white, narrowly spatulate, 2.5-3.5 mm. long; infructescence greatly elongated, 1-4 dm. long; pedicels spreading at right angles to slightly ascending, rigid, 6-15 mm. long; siliques densely pubescent, oblong to oval, not compressed or only slightly flattened parallel to septum, 5-8 mm. long, 3-4 mm. wide; styles slender, less than 1 mm. long; stigmas minute; seeds oblong, plump, wingless, less than 1 mm. long. Grassy banks and plains, often near springs or creeks, Trans-Pecos, Apr.-June; also n. e. Mex.

34. LESQUERELLA WATS. BLADDER-POD

Herbaceous annuals, biennials or perennials, more or less densely pubescent, the trichomes usually branched or stellate; basal leaves oblanceolate to suborbicular, pinnatifid to entire; cauline leaves more or less oblanceolate and shortly petiolate or sessile, in a few species auriculate; petals yellow or white; infructescences usually elongated but in a few species dense and subumbellate; siliques usually globose to obovoid (in a few species flattened), sessile or stipitate, glabrous or stellate-pubescent; style usually long and slender; seeds biseriata, usually somewhat flattened; cotyledons accumbent.

Eighteen species in Texas; about 75 species, for the most part in North America, several in temperate South America.

- 1. Stem leaves definitely auriculate; fruit glabrous (2)
- 1. Stem leaves not auriculate or only obscurely so (3)
- 2(1). Lower stems pubescent with appressed branched trichomes 1. *L. grandiflora*.
- 2. Lower stems pubescent with spreading simple trichomes 2. *L. auriculata*.
- 3(1). Plants annual (doubtful cases should be keyed under both alternatives) (4)
- 3. Plants biennial or perennial (15)
- 4(3). Siliques pubescent (5)
- 4. Siliques glabrous (6)
- 5(4). Siliques with both large simple and small branched trichomes 3. *L. lasiocarpa* var. *lasiocarpa*.
- 5. Siliques bearing small branched trichomes only 3. *L. lasiocarpa* var. *Berlandieri*.
- 6(4). Pedicels uniformly recurved and siliques therefore pendent (7)
- 6. Pedicels various but not uniformly recurved (8)
- 7(6). Petals yellow; siliques 3-4 mm. in diameter 4. *L. recurvata*.
- 7. Petals white; siliques 5-6 mm. in diameter 5. *L. pallida*.
- 8(6). Siliques sessile (9)
- 8. Siliques at least shortly stipitate (11)
- 9(8). Valves sparsely pubescent within 7. *L. sessilis*.
- 9. Valves glabrous on the inner surface (10)
- 10(9). Cauline leaves lyrate to narrowly obovate; ovules 2 per locule; plants of northeast Texas 6. *L. angustifolia*.
- 10. Cauline leaves elliptic to obovate; ovules 4 to 8 per locule; infructescences dense 11. *L. densiflora*.

- 11(8). Pedicels straight or simply curved (12)
 11. Pedicels sigmoid (14)
 12(11). Infructescences dense; rays of the trichomes arranged asymmetrically
 11. *L. densiflora*.
 12. Infructescences usually loose; rays of the trichomes arranged symmetrically (13)
 13(12). Siliques globose or ellipsoid 8. *L. gracilis* var. *gracilis*.
 13. Siliques obpyriform with a basal shoulder 8. *L. gracilis* var. *repanda*.
 14(11). Cauline leaves lyrate to narrowly elliptic; stipe usually less than 1 mm. long;
 plants of west Texas 9. *L. Gordonii*.
 14. Cauline leaves broadly elliptic to obovate; stipe usually more than 1 mm. long; plants
 of south Texas 10. *L. Lindheimeri*.
 15(3). Siliques pubescent 14. *L. valida*.
 15. Siliques glabrous (16)
 16(15). Infructescences dense and crowded at apex of stems (17)
 16. Infructescences elongated and loose (20)
 17(16). Trichomes with rays fused into peltate scales 15. *L. Mcvaughiana*.
 17. Trichomes with rays free or only partly fused (18)
 18(17). Plant biennial; trichomes nearly all with rays asymmetrically arranged; siliques
 to 5.5 mm. long; chiefly in south-central Texas 11. *L. densiflora*.
 18. Plant perennial from a woody caudex; trichomes often with symmetrical rays; siliques
 5.5 mm. long or more (19)
 19(18). Caudex usually unbranched; basal leaves with blades usually elliptic to obovate;
 stems usually 2-5 dm. high; plants of east-central Texas
 12. *L. Engelmannii*.
 19. Caudex usually branched; basal leaves with blades usually somewhat orbicular to
 rhombic; stems usually 1-2 dm. high; plants of northwest Texas
 13. *L. ovalifolia*.
 20(16). Pedicels usually sigmoid; styles usually fragile and early-deciduous
 18. *L. argyraea*.
 20. Pedicels recurved to ascending, not sigmoid; styles persistent (21)
 21(20). Pedicels ascending; trichome rays fused for half or more their length
 17. *L. Fendleri*.
 21. Pedicels ultimately recurved; rays free or fused only at the base
 16. *L. purpurea*.

1. *Lesquerella grandiflora* (Hook.) Wats. Annual or biennial (?), densely pubescent with branched usually 5-rayed trichomes; stems several to numerous, erect to decumbent, 2-7 dm. long, the rays of the trichomes usually appressed; basal leaves 5-15 cm. long, petiolate, oblanceolate, dentate to bipinnatifid, the rays of the trichomes often erect; cauline leaves 1-4 cm. long, sessile, the upper ones auriculate, those lower usually without auricles, oblong to lanceolate, dentate; sepals oblong, not saccate; petals obovate to orbicular, sometimes slightly emarginate, usually with a short claw, yellow; ovules 4 to 6 per locule; infructescences rather loose; pedicels 1-2 cm. long, ascending or divaricate, sometimes slightly curved; siliques 4-6 mm. long and broad, sessile or on a short gynophore, globose to slightly longer than broad, terete, glabrous; seeds 2.5-3 mm. in diameter, orbicular, flattened and margined. In loose sandy soils in s. and cen. Tex., also Borden Co., Mar.-Apr.; endemic.

2. *Lesquerella auriculata* (Engelm. & Gray) Wats. Annual, densely hirsute with long simple trichomes and an understory of smaller branched ones; stems several to numerous, erect or decumbent, to 2 dm. long; basal leaves 2-5 cm. long, 8-15 mm. wide, shortly petiolate, dentate to lyrate, sometimes nearly entire; cauline leaves 1-4 cm. long, 3-10 mm. broad, sessile and auriculate, oblong to sagittate, entire to dentate; sepals narrowly oblong, the outer pair slightly saccate; petals obovate, entire or slightly emarginate, yellow; ovules 6 to 8 per locule; infructescences often rather dense; pedicels 7-15 mm.

long, ascending to spreading at about 45°, densely hirsute; siliques 4-6 mm. long, 4-6 mm. broad, nearly sessile, globose to slightly longer than broad, terete, glabrous; seeds about 2 mm. in diameter, somewhat orbicular, flattened and margined. Prairies and disturbed soils in e.-cen. Tex., Mar.-May; also in w.-cen. and n.e. Okla.

3. *Lesquerella lasiocarpa* (Gray) Wats. var. *lasiocarpa*. Annual, biennial or perennial, hirsute with a mixture of branched and simple spreading trichomes; stems several, decumbent to procumbent, to 5 dm. long; basal leaves 3-10 cm. long, 1-3 cm. broad, petiolate, oblanceolate, sinuate to incised; cauline leaves 1-4 cm. long, 0.5-2 cm. broad, sessile, obovate to elliptic or oblong, sinuate to incised, nonauriculate to barely so or with definite auricles present; sepals linear-oblong; petals broadly obovate with a somewhat orbicular blade and a short claw, pale-yellow but often purplish when dry; ovules 8 to 14 per locule; infructescences lax; pedicels 15-25 mm. long, recurved; siliques 5-9 mm. long, 4-9 mm. broad, sessile, in outline orbicular to elliptic or cordate, strongly flattened contrary to septum to only slightly compressed; seeds about 1.5 mm. long, nearly orbicular, flattened and margined. In sandy, gravelly and/or disturbed soils in the Rio Grande Plains, Jan.-Apr.; also n.e. Mex.

Var. *Berlandieri* (Gray) Pays. As the typical variety but hirsute with branched trichomes only and more often bearing flattened rather than inflated siliques. In sandy to heavy and/or disturbed soils, s.e. Rio Grande Plains, Mar.-Apr.; also Tam.

4. *Lesquerella recurvata* (Gray) Wats. Annual, rather sparsely pubescent with granular-rough sessile or shortly stipitate stellate trichomes usually having forked rays; stems several, erect to decumbent and usually branched, 2-5 dm. long; basal leaves 3-5 cm. long, usually dentate to pinnatifid, rarely entire and the blade elliptic to rhombic; cauline leaves 1-3 cm. long, sessile or (the lower ones especially) shortly petiolate, obovate to elliptic or lanceolate, entire or finely dentate, often secund; sepals elliptic, not saccate; petals cuneate or somewhat obdeltate, tapering into a short broad claw, often slightly emarginate, yellow; ovules 4 to 8 per locule; infructescences rather loose; pedicels of the lowermost fruit 1-2 cm. long, recurved; siliques 3-4 mm. in diameter, sessile or on a very short gynophore, more or less globose, glabrous, the style as long as or slightly shorter than the fruit; seeds about 1.4-1.5 mm. \times 1.5-1.7 mm., somewhat orbicular to broadly ellipsoid (slightly broader than long), flattened and usually margined. Usually on calcareous soils, cen. Tex., Mar.-May; endemic.

5. *Lesquerella pallida* (T. & G.) Wats. Apparently annual, pubescent with small stellate trichomes, the rays simple or forked; stems slender and decumbent, much-branched, about 3 dm. long; basal leaves not known; cauline leaves to about 3 cm. long, rather coarsely toothed; sepals elliptic-oblong; petals white (*vide* Torrey & Gray); ovules 6 per locule; infructescences loose; pedicels recurved; siliques 5-6 mm. in diameter, on a short gynophore, somewhat globose, the style about as long or slightly shorter. San Augustine (San Augustine Co.), Tex. (only collection known.)

6. *Lesquerella angustifolia* (T. & G.) Wats. Annual, densely to sparsely pubescent with small several-rayed trichomes, the rays usually forked and often fused for part of their length; stems one to several, sometimes branched, to 4 dm. long; basal leaves to 7 cm. long, petiolate, entire or remotely dentate to pinnatifid; cauline leaves to 1 dm. long, sessile or (the lower ones) shortly petiolate, narrowly obovate or lorate, entire to remotely dentate; sepals somewhat ovate to elliptic, the outer ones usually slightly saccate; petals obovate or with an obovate to obdeltate blade tapering to a short broad claw, usually emarginate, yellow; ovules 2 per locule; infructescences rather lax to dense; pedicels 1-2 cm. long, usually spreading, sometimes nearly erect; siliques 4-5.5 mm. long, sessile or on a very short gynophore, somewhat globose, glabrous; style 2.5-3 mm. long; seeds 2.5-3 mm. \times 3-3.5 mm., somewhat orbicular to broadly ellipsoid (broader than long), much-flattened and margined. *L. longifolia* Cory. On limestone soils in extreme n.e. Tex., Apr.; also s.e. Okla.

7. *Lesquerella sessilis* (Wats.) Small. Annual, pubescent with sessile or very shortly stipitate stellate trichomes, the rays unfused but often forked; stems one to several, erect, sometimes branched, to 6 dm. high; basal leaves to 8 cm. long, petiolate but sometimes very shortly so, entire to lyrate, sometimes mucronulate, sparsely to densely pubescent; cauline leaves to 5 cm. long, sessile, linear to narrowly elliptic, acute, entire to repand or remotely dentate; sepals elliptic, the outer ones acute, the inner somewhat thickened

distally and slightly cucullate; petals with blades somewhat orbicular to broadly obovate or slightly broader than long, tapering to a short broad claw; ovules 4 to 6 per locule; infructescences usually loose; pedicels of the lowermost siliques 1-2 cm. long, usually spreading, sometimes horizontal to recurved or loosely sigmoid; siliques 3-5.5 mm. long, sessile, more or less globose or less commonly obovoid, the valves often papillose without but within sparsely pubescent with stipitate irregularly-rayed trichomes; styles 1.8-3.3 mm. long; mature seeds not seen. *L. gracilis* var. *sessilis* Wats. In s.-cen. Tex., Feb.-May; endemic.

8. *Lesquerella gracilis* (Hook.) Wats. var. *gracilis*. Annual, sparsely pubescent with stellate trichomes, the numerous rays free or somewhat fused; stems several, to 5 dm. long, erect or decumbent, usually branched; basal leaves petiolate, to 8 cm. long, the blade narrowly oblanceolate to obovate, entire to lyrate; cauline leaves usually sessile, 1-5 cm. long, somewhat linear to oblanceolate, entire to dentate; sepals somewhat elliptic to oblong, the outer ones saccate; petals spatulate to cuneate or obovate, yellow; ovules 8 to 10 per locule; pedicels 1-2 cm. long, ascending to spreading, straight; siliques 3-5 mm. in diameter, globose to ellipsoid, glabrous within and without, on a slender stipe 1-2 mm. long; styles slender, 2-4 mm. long; seeds flattened, not winged. In sandy and/or disturbed soils and waste places in cen. and s.-cen. Tex., Mar.-May; also Okla., Miss. and Ark.

Var. *repanda* (Nutt.) Pays. Differs from the typical variety in that the siliques are obpyriform, usually with a distinct basal shoulder. *L. repanda* (Nutt.) Wats., *L. Nuttallii* (T. & G.) Wats. In fields and on roadsides in n.e. Tex., Apr.-May; also s.e. Okla., Kan. and Ark.

9. *Lesquerella Gordonii* (Gray) Wats. Annual, densely pubescent with sessile or shortly stipitate stellate trichomes generally with 4 to 6 rays usually forked; stems few to many, to 4 dm. long, prostrate, decumbent or erect, usually branched; basal leaves petiolate, to 4 cm. long, the blade elliptic to obovate, often entire but may be dentate to pinnatisect; cauline leaves petiolate (the lower ones) or sessile, to 5 cm. long, lorate-falcate to narrowly elliptic, entire (usually) to repand or coarsely dentate; sepals somewhat elliptic to oblong, the outer ones slightly saccate, the inner ones more or less cucullate; petals cuneate or with an obdeltate to obovate blade tapering to a broad claw, sometimes expanded at the base, yellow; ovules 5 to 10 per locule; infructescences usually elongated; pedicels 1-1.5 cm. long, normally sigmoid but at times merely recurved or spreading; siliques 4-7 mm. long, or a short stipe (to 1 mm. long), somewhat globose to broadly ellipsoid, glabrous within and without; styles slender, 2-4 mm. long; seeds 1.7-1.8 mm. \times 1.7-1.8 mm., somewhat orbicular, flattened, not winged. In sandy and gravelly soils in w. Tex., Mar.-June; also w. Okla., N.M., Ariz. and n. Mex.

10. *Lesquerella Lindheimeri* (Gray) Wats. Annual, rather sparsely pubescent with sessile or shortly stipitate stellate trichomes, the several rays free (usually) or somewhat fused, usually forked; stems usually several, to 5 dm. long, erect or the laterals decumbent, often rather straggling; basal leaves petiolate, to 8 cm. long, oblanceolate to obovate, usually pinnatifid, sometimes only sinuate; cauline leaves to 4 cm. long, shortly petiolate (the lower ones) or sessile, elliptic or obovate, usually entire but sometimes dentate; sepals somewhat elliptic, the outer ones saccate, the inner cucullate; petals spatulate to cuneate or with a somewhat obovate blade tapering to a short broad claw, yellow; ovules 6 to 9 per locule; infructescences loose; pedicels 8-15 mm. long, spreading at 45°-90°, somewhat sigmoid; siliques 4-5 mm. in diameter, on a slender stipe (about 1 mm. long), somewhat globose, glabrous within and without; styles slender, 2-3 mm. long; mature seeds not seen. *Vesicaria Lindheimeri* Gray. Usually in heavy black soils along the coastal plain of s. Tex., Feb.-May; also in adj. coastal Mex.

11. *Lesquerella densiflora* (Gray) Wats. Annual or biennial, densely pubescent with sessile or shortly stipitate stellate trichomes, the rays unfused and often unforked but asymmetrically arranged forming on one side of the trichome a deep U-shaped notch; stems one to several, erect or decumbent (sometimes prostrate?), to 4 dm. long; basal leaves to 5 cm. long and to 1 cm. broad, petiolate, entire or with remote teeth or pinnatifid; cauline leaves to 6 cm. long and 2 cm. broad, sessile or on short petioles, narrowly obovate to elliptic, repand to remotely dentate; sepals elliptic, usually acute, the outer ones generally saccate; petals with blades obovate or obdeltate, tapering into

a rather short claw, yellow; ovules 4 to 8 per locule; infructescences dense, usually 5-10 cm. long, exceptionally to 20 cm.; pedicels 1-1.5 (-2.5) cm. long, spreading at about 45° to nearly horizontal; siliques 3.5-5.5 mm. long, sessile or on a short stipe (1 mm.), somewhat globose to broadly obovoid, glabrous; styles slender, 2.5-4.5 mm. long; seeds 1-1.6 mm. in diameter, somewhat orbicular, flattened, not margined. In sandy and calcareous soils, cen. Tex., Mar.-May; endemic.

12. *Lesquerella Engelmannii* (Gray) Wats. Perennial, densely pubescent with sessile or shortly stipitate stellate trichomes, often umbonate, granular-rough, the several rays free or fused at the base (usually not forked) and regularly disposed or asymmetrically arranged forming on one side of the trichome a deep notch; stems several, to 5 dm. high, erect and rather stout, arising from a woody caudex, usually not branched; basal leaves to 6 cm. long and 2 cm. broad, petiolate, usually elliptic or obovate, entire to coarsely dentate; cauline leaves usually 2-4 cm. long and 3-5 mm. broad, exceptionally to 10 cm. long and 1 cm. broad, sessile or (the lower ones especially) shortly petiolate; sepals narrowly ovate to elliptic, usually saccate; petals obovate to elliptic, sometimes slightly emarginate, often with a short claw, yellow; ovules 5 to 8 per locule; infructescences dense, sometimes subumbellate; pedicels of lowermost fruit to 25 mm. long, usually spreading at 45° but may be erect or nearly horizontal; siliques 5.5-8 mm. long, on a stipe about 1 mm. long, globose to broadly ellipsoid, glabrous; styles 5-8.5 mm. long, slender; seeds about 2.1-2.5 mm. \times 2.2-2.6 mm., somewhat orbicular to broadly ovate, flattened. Calcareous soils in e.-cen. Tex., Apr.-May; endemic.

13. *Lesquerella ovalifolia* Rydb. Perennial, pubescent with sessile or shortly stipitate stellate trichomes, usually umbonate and granular-rough, the numerous rays often forked and fused (at least at the base), and usually symmetrically disposed but occasionally forming a U-shaped notch on one side of the trichome; stems several, usually 1-2 dm. high, erect and rising from a heavy woody caudex, usually branched; basal leaves to 7 cm. long and 2 cm. broad, petiolate, somewhat orbicular to rhombic or narrowly elliptic, usually entire but sometimes coarsely dentate; cauline leaves usually less than 1 cm. long, to 4 mm. broad, sessile or the lower ones shortly petiolate, oblong to narrowly elliptic or obovate, entire; sepals more or less elliptic, usually saccate; petals with blades somewhat orbicular to obdeltate or obovate, sometimes emarginate, tapering to a rather broad claw, yellow; ovules 5 to 8 per locule; infructescences dense, often subumbellate; pedicels of lowermost fruit to 2 cm. long, usually spreading at about 45° but may be nearly erect to nearly horizontal; siliques 6-9 mm. long, on a stipe 0.5-0.8 mm. long, somewhat globose to broadly ellipsoid and then sometimes slightly angustiseptate, glabrous; styles 4.5-8 mm. long; seeds about 1.7-2 mm. \times 1.7-2.2 mm., somewhat orbicular to very broadly ovate, flattened. On sandy and/or calcareous soils in n.w. Tex., Apr.-May; also w. Kan., Okla., s.e. Colo. and n.e. N.M.

14. *Lesquerella valida* Greene. Biennial or perennial, pubescent with small sessile stellate several-rayed trichomes with the rays simple or forked and free or fused to about half their length; basal leaves to 8 cm. long, petiolate, broadly elliptic to lanceolate, entire or remotely dentate; cauline leaves to 15 mm. long, sessile or shortly petiolate, elliptic to obovate, entire; sepals elliptic or oblong, tapering distally and somewhat thickened and slightly cucullate, the outer ones slightly saccate; petals linear or with a broadly obovate blade tapering to a broad claw, the margins lacerate, yellow; ovules 6 to 9 per locule; infructescences dense; pedicels to 15 mm. long, rather thick, ascending or slightly spreading; siliques 5.5-7 mm. long, sessile, in outline round or broadly ovate, somewhat latiseptate, pubescent; styles 3-4 mm. long; mature seeds not known. *L. lepidota* Cory. In Texas known only by a single collection from Hudspeth Co., May; also N.M.

15. *Lesquerella Mcvaughiana* Roll. Perennial, usually densely silvery-pubescent with sessile usually umbonate stellate trichomes having numerous unforked rays fused for half or more their length; stems few to several, erect or decumbent, to 4 dm. long; basal leaves to 9 cm. long, petiolate, rhombic to obovate or lanceolate, entire, sometimes mucronulate; cauline leaves to 3 cm. long, lower ones shortly petiolate, upper ones sessile, obovate to narrowly elliptic, entire; sepals elliptic, the outer ones saccate; petals with blades broadly obovate to rhombic or obdeltate, sometimes emarginate, tapering to a slender claw about the same length as the blade, white to purplish; ovules 3 to 6 per locule; infructescences dense; pedicels of lowermost fruit 8-20 mm. long, ascending to spreading, the lower ones

sometime horizontal or loosely sigmoid; siliques 4-7 mm. long, sessile or on a very short stipe, usually ovoid and rather acute but sometimes globose, glabrous; styles 1.5-4 mm. long; seeds 1.4-1.6 mm. \times 1.2-1.3 mm., somewhat oblong to broadly ovate, flattened, not winged. Rocky limestone slopes and outcrops in Brewster and Pecos cos., spring-summer; endemic.

16. *Lesquerella purpurea* (Gray) Wats. Perennial, pubescent with sessile or shortly stipitate stellate trichomes with numerous unforked rays that are free or fused for a short distance; stems several, usually erect, but sometimes prostrate or decumbent, to 7 dm. long, arising from a caudex, sometimes branched; basal leaves 4-15 cm. long, petiolate, elliptic to obovate, entire to pinnatifid, sometimes panduriform; cauline leaves to 5 cm. long and 1 cm. broad, sessile or shortly petiolate, usually broadly elliptic to obovate or rhombic; sepals elliptic to ovate, the outer ones very saccate; petals obdeltate to narrowly obovate, unclawed or with blades obdeltate to obovate or somewhat orbicular (often emarginate) and tapering to a broad claw, white or purple; ovules 2 to 6 per locule; infructescences usually loose; pedicels 5-20 mm. long, finally recurved but earlier spreading to horizontal; siliques 4-8.5 mm. long, sessile or on a short stipe, globose to broadly ellipsoid, glabrous; styles 1.5-2.5 mm. long; seeds 2.2-2.6 mm. \times 2.6-2.8 mm., somewhat orbicular to broadly elliptic, flattened. Sandy or rocky (often calcareous) soils in mts. of Trans-Pecos Tex., Feb.-Sept.; also Ariz. and N.M.

17. *Lesquerella Fendleri* (Gray) Wats. Perennial, silvery-gray pubescent with sessile or shortly stipitate stellate trichomes with the rays numerous and unforked but fused for half or more their length; stems several, decumbent or erect, 3-40 cm. long, arising from a caudex, sometimes branched; basal leaves petiolate, more or less elliptic, entire or coarsely dentate; cauline leaves variable, to 8 cm. long and 12 mm. broad, sessile or shortly petiolate, usually somewhat lorate to narrowly elliptic, entire to coarsely dentate; sepals more or less elliptic to oblong and tapering distally, usually not saccate; petals obdeltate to obovate and unclawed or with the blade obdeltate to obovate and tapering to a short claw, yellow; ovules 10 to 16 per locule, infructescences usually loose but sometimes hardly extending beyond the foliage; pedicels 1-2.5 cm. long, usually spreading at 45° or less, sometimes nearly erect; siliques 4.5-8 mm. long, usually sessile but occasionally shortly stipitate, somewhat globose to broadly ellipsoid or ovoid, glabrous; styles 3-5 mm. long; seeds 1.3-1.6 \times 1.3-1.5 mm., more or less orbicular to broadly ovate or oblong, flattened. *L. foliacea* Greene, *L. stenophylla* (Gray) Rydb. In sandy or rocky soils, especially when calcareous, in s.w. and s.-cen. Tex., spring-summer; also N.M., Ariz., Colo., Ut. and n. Mex.

18. *Lesquerella argyrea* (Gray) Wats. Biennial or perennial, rather densely pubescent with sessile or shortly stipitate stellate trichomes with the rays usually unforked and free or fused near the base; stems usually several, the outer ones usually decumbent but sometimes prostrate or erect, to 7 dm. long; basal leaves to 9 cm. long, petiolate, more or less elliptic, entire to pinnatifid; cauline leaves to 4 cm. long, sessile or the lower ones shortly petiolate, elliptic to rhombic or obovate, usually acute, entire or repand to coarsely dentate; sepals somewhat elliptic, the outer ones sometimes slightly saccate; petals with blade obovate to obdeltate, sometimes emarginate, tapering to a short claw, yellow; ovules 8 to 18 per locule; infructescences loose; pedicels usually 1.5-2 (-3) cm. long, usually sigmoid, sometimes merely recurved, rarely spreading or ascending; siliques 4-8 mm. long; sessile or very shortly stipitate, globose to broadly ellipsoid, glabrous; styles 3-5 mm. long, fragile and usually early deciduous; seeds 1.3-1.9 \times 1.4-1.9 mm., more or less orbicular to broadly elliptic (slightly broader than long), flattened with a narrow rim. On sandy and calcareous soils in cen. and s. Tex., Feb.-Apr.; also n.e. Mex.

35. CAMELINA CRANTZ

About 10 species of the Mediterranean area, Europe and Asia.

1. *Camelina microcarpa* Andr. LITTLE POD, FALSE FLAX. Erect annual or biennial; stems simple or branched above, 3-6 dm. high, lower portion pubescent with long simple or forked trichomes and an understory of branched trichomes, glabrous above; basal rosette wanting; leaves sessile, auriculate or the lower nearly cuneate, entire or nearly so, oblong to lanceolate, pubescent; flowers small, in elongate racemes; sepals pubescent,

nonsaccate; petals yellowish-white, erect, not differentiated into blade and claw, 3-4 mm. long; pedicels slender, divaricate; siliques pyriform, indurate, slightly compressed parallel to septum, tapered below and abruptly beaked above, minutely mottled, the keel margined over replum; style about 1 mm. long atop the slender beak; seeds plump, oblong, wingless, several to many in each loculus; cotyledons incumbent. Fields, roadsides and waste places, Apr.-June; widely distributed as a weed in N.A.; nat. of Eur.

36. LOBULARIA DESV.

Five species in the Mediterranean area and southwestern Europe.

1. *Lobularia maritima* (L.) Desv. SWEET ALYSSUM. Short-lived perennial but grown in flower gardens as an annual, 6-20 cm. tall, much-branched, partly decumbent, gray-green from a covering of appressed bifurcate trichomes; leaves linear to narrowly oblanceolate, entire, tapering to the base; flowers small, fragrant, slender-pedicelled, numerous, in lengthening racemes; petals white or occasionally lavender or purple, entire; stamens with short filaments, 2 unequal-lengthed glands at the base; siliques obovate to suborbicular, sparsely pubescent, flattened parallel to septum; seeds 1 in each loculus, oval, compressed, 1-1.5 mm. long; cotyledons accumbent. Escaped from cult., adv. from Eur.

37. RAPISTRUM CRANTZ

Three species in central Europe, the Mediterranean region and western Asia.

1. *Rapistrum rugosum* (L.) All. Annual; stems 3-8 dm. tall, branched, usually glabrous above and sparsely hispid below; lower leaves 1-3 dm. long, petioled, lyrate-pinnatifid, the terminal lobe the largest; upper leaves subentire, slender-petioled; flowers small; petals yellow, with darker veins, short-clawed, 6-10 mm. long; pedicels short, thickened; upper segment of silique nearly globose, abruptly conspicuously beaked, 3 or 4 times the size of the lower cylindrical joint; seeds oblong, 1.5-1.8 mm. long; cotyledons conduplicate. Weed of fields, roadsides and waste places, cen. and e. Tex., Apr.-June; sporadic in N.A.; introd. from Euras.

38. MYAGRUM L.

One species in the Mediterranean region and Eurasia.

1. *Myagrum perfoliatum* L. Glaucous glabrous annual, 2-10 dm. tall; stems erect, branching above; basal leaves petiolate, oblanceolate, sinuate-dentate to pinnatifid; cauline leaves oblong to broadly lanceolate, entire to sparsely dentate, sessile, auriculate and clasping the stem; sepals erect, outer saccate, inner less so; petals yellow, 3-5 mm. long; siliques indehiscent, broadly clavate, somewhat compressed, abruptly contracted to a beak; seeds about 3 mm. in diameter. Fields and roadsides, n.-cen. Tex., Apr.-May; local at several locations in U.S.; adv. from Euras.

39. CORONOPUS ZINN

Ten species, cosmopolitan or nearly so.

1. *Coronopus didymus* (L.) Sm. SWINE WART CRESS. Sparingly pubescent annual or biennial herb with prostrate outer branches, 1-4 dm. long; trichomes simple; basal leaves oblong in outline, 3-10 cm. long, with margined petioles, deeply pinnatifid, the lobes dentate; stem leaves similar but shorter and sessile or on much shorter petioles; racemes axillary in leafy bracts; sepals spreading; petals white, about 1 mm. long; stamens 2; siliques didymous, 2-2.5 mm. broad, finely wrinkled, the valves indehiscent; styles wanting; seeds cochleate, 1-1.4 mm. long; cotyledons incumbent and transversely folded. Weed of old fields, roadsides and waste places in cities and towns, e. and s. Tex., Mar.-May; widespread weed of cen. and e. N.A. and in w. Coastal States.

40. DITHYREA HARV. SPECTACLE-POD

Densely pubescent biennials or perennials with numerous cauline leaves; petals white or purple; infructescences loose; pedicels horizontal or slightly recurved; siliques markedly angustiseptate, broader than long, somewhat oblong ("spectacle-shaped"), narrowly winged; styles short and stout; stigmas capitate to tectiform; seeds large, one per locule; cotyledons accumbent.

Five species in southwestern United States and northern Mexico.

1. Cauline leaves usually cuneate at the base, often dentate; stems not branched near the top 1. *D. Wislizenii*.
1. Cauline leaves usually truncate at the base, usually sinuate; stems often branched near the top 1. *D. Wislizenii* var. *Palmeri*.

1. *Dithyrea Wislizenii* Engelm. Biennial or perennial, hirsute with trichomes usually dichotomously or irregularly branched (sometimes stellate or rarely simple); stems one to several, erect, sometimes branched near the base, to 6 dm. tall, densely pubescent; basal leaves to 14 cm. long, 4 cm. wide, sessile on a cuneate base or shortly petiolate, oblong to elliptic, rounded to truncate, repand-sinuate, coarsely dentate or pinnatifid, densely pubescent; cauline leaves 2-12 cm. long, 8-30 mm. wide, sessile on a cuneate base or shortly petiolate, usually lanceolate, entire to repand or coarsely dentate, densely pubescent, often numerous and overlapping on the stem; sepals oblong to narrowly ovate, the outer usually slightly saccate, the inner slightly cucullate, densely pubescent; petals with blades obovate, the claw expanded at the base and occasionally toothed, white or purple; infructescences loose; pedicels 1-2 cm. long, usually horizontally spreading, sometimes recurved, straight or curving-ascending, densely pubescent; siliques 7-10 mm. long, 10-16 mm. wide, oblong and very much angustiseptate, the septum about 1 mm. wide, distally truncate, densely pubescent; styles very short, the stigma tectiform; ovules 1 per locule; seeds 2.5-3.5 mm. long, 2-3 mm. wide, broadly oblong to nearly orbicular, much-flattened with a narrow wing, cotyledons accumbent. Incl. var. *Griffithsii* (Woot. & Standl.) Pays., *D. Griffithsii* Woot. & Standl. In sandy soils of w. and s.w. Tex., Feb.-May, rarely to Aug.; also in N.M., Nev. and Ut.

Var. *Palmeri* Pays. Differs from the typical variety by having the stems often branched near the top, the cauline leaves usually truncate at the base and rarely toothed and often more or less appressed to the stem. In sandy soils, n.w. Tex., Apr.-June, rarely to Aug.; also in Okla.

FAM. 81. CAPPARIDACEAE JUSS.⁷² CAPER FAMILY

Herbs (ours), shrubs or trees often with rank odor; leaves alternate, palmately (1-) 3- to 11-foliolate; stipules minute or lacking; flowers single and axillary or in terminal bracteate or ebracteate many-flowered racemes, somewhat zygomorphic, perfect, 4-merous, polypetalous; sepals 4, free or partially fused; petals 4, free; stamens 6 to 27 or more, as long as or longer than petals; nectariferous disk or gland between corolla and stamens frequent; ovary 1, superior; fruit a 2-valved unilocular capsule, usually borne on a slender gynophore (stipe above receptacle) or sessile, with many free-falling seeds or a 2-valved schizocarp with 1- or 2-seeded closed achenelike mericarps (in *Wislizenia*); seed reniform, the seed coat deeply invaginated. Also spelled Capparaceae.

About 500 species in about 40 genera, mostly tropical America and Africa, often xerophytic, all Texas species of Subfamily Cleomoideae.

1. Stamens (6 to) 8 to 27; capsules erect, sessile or short-stipitate, apically dehiscent, the hirsute-glandular valves persistent; corolla open in bud, the stamens not enclosed; petals white or pink, notched to irregularly torn at apex; nectary gland prominent, strictly adaxial 1. *Polanisia*, p. 707.
1. Stamens 6; capsules or schizocarps divergent to deflexed on a short to long stalk (gynophore), the glabrous valves freely deciduous; corolla closed in bud, the stamens covered by the petals (except in *Cleome gynandra*) (2)

⁷² Contributed by Hugh H. Iltis.

- 2(1). Fruits 2-parted schizocarps, with each of the 2 valves (1-2 mm. long) closely and permanently enclosing its single seed and falling with it; racemes ebracteate (bracts minute), very dense; southwest Texas 4. *Wislizenia*, p. 711.
2. Fruits unilocular capsules with free-falling seeds; racemes bracteate or flowers singly in the axils of cauline leaves (3)
- 3(2). Capsules elongate, many-seeded, 1-8 cm. long; petals white, yellow, pink or purple 2. *Cleome*, p. 709.
3. Capsules rhomboidal, few-seeded, 4-8 mm. long, as wide as or wider than long, the valves laterally expanded cones; petals yellow 3. *Cleomella*, p. 711.

1. POLANISIA RAF. CLAMMY-WEED

Herbaceous viscid-pubescent annuals with strong rank odor; leaves petiolate, palmately 3-foliolate; flowers in bracteate racemes; sepals free nearly to base; corolla open in bud, zygomorphic; petals spatulate with long claw (ours) or obovate, emarginate to lacinate, white, yellowish, pink or purplish, the adaxial pair markedly longer; gland prominent between corolla and stamens, strictly adaxial, solid or tubular, yellow or orange; stamens 8 to 27, of unequal length (staggered maturation); anthers short; capsule elongate, erect, sessile or short-stipitate, glandular, the persistent valves dehiscing apically; seeds many, the deep invagination very narrow but not fused by a membrane at the mouth.

A genus of 5 species (8 taxa) endemic to North America, related to xerophytic African *Cleome* groups.

1. Leaflets lanceolate-elliptic to obovate, 10-30 mm. wide; petals 5-27 mm. long, entire to shallowly notched; nectary solid, concave, 2-3 mm. long and wide; style slender, 6-42 mm. long, withering in fruit; fruits 5-10 mm. wide; seed 2-3 mm. in diameter (Subg. *Polanisia*) (2)
1. Leaflets linear to filiform, 1-5 mm. wide; petals 4-11 mm. long, deeply lacinate; nectary a long hollow tube or (in *P. erosa* subsp. *breviglandulosa*) a shallow cup; style setaceous, short, persistent; fruits 2-4 mm. wide; seed 1-2 mm. in diameter (Subg. *Cristatella*) (4)
- 2(1). Petals 14-27 mm. long, white, often drying yellow; stamens about 20 to 30, 20-50 mm. long; seed coat very smooth, often with a coppery-iridescent sheen; Rio Grande and southwest Texas (Mexico) 1. *P. uniglandulosa*.
2. Petals 5-16 mm. long; stamens about 10 to 20, the longest 8-30 mm. long; seeds dull, more or less rough (3)
- 3(2). Petals white, (5-) 10-18 mm. long, the stamens long-exserted; capsules 5-10 mm. wide, inflated, glandular; seeds more or less roughened to smooth, dull; throughout Texas 2. *P. dodecandra* subsp. *trachysperma*.
3. Petals rose-color to purple, (6-) 10-12 (-17) mm. long, the stamens slightly longer; capsules slender, 4-7 cm. long, 4-6 mm. wide, subglabrous; seeds very prominently roughened; lower Rio Grande Valley 2. *P. dodecandra* subsp. *riograndensis*.
- 4(1). Flowers and gynophore 4-5 mm. long; fruiting style 1-2 mm. long; plants densely glandular-viscid; northwest half of Texas 3. *P. Jamesii*.
4. Flowers 6-11 mm. long; fruiting style 3-6 mm. long; plants slightly glandular to subglabrous; southeastern half of Texas, mainly on Coastal Plain (5)
- 5(4). Nectary 2.5-5.5 mm. long, hollow and tubular, prominent in fruit; gynophore 7-14 mm. long; larger petals 7-11 mm. long; widespread, east Texas 4. *P. erosa* subsp. *erosa*.
5. Nectary 1-2 mm. long, cup-shaped, inconspicuous; gynophore 3-6 mm. long; larger petals 6-9 mm. long; southernmost tip of Texas 4. *P. erosa* subsp. *breviglandulosa*.

1. *Polanisia uniglandulosa* (Cav.) DC. MEXICAN CLAMMY-WEED, HIERBA DEL COYOTE. Branched or unbranched annual (rarely perennial in Mexico), 4-8 dm. tall, glandular-viscid; leaflets 3, broadly elliptic to oblanceolate, 2-4 cm. long, 1-2 cm. wide, acute to

obtuse; racemes dense, many-flowered; bracts of raceme reduced, sessile, ovate, acute, about 1 cm. long; petals white (rarely reported as sulfur-yellow, probably due to drying?), narrowly spatulate, gradually attenuate to a slender claw, the longest 15-30 mm. long; stamens about 20 to 27, purple to pink, mostly 2-5 cm. long; style herbaceous, 2-4 cm. long, slender, equaling stamens; capsules erect, somewhat bladderly, 6-10 cm. long, 7-10 mm. wide, opening at top; seeds many, very smooth, frequently (under 10 \times) with a bronze somewhat iridescent sheen. Sandy washes, river-sides, arroyos, open pinyon-juniper-oak forest, rocky hillsides, roadsides and pastures in Trans-Pecos Tex., May-Oct.; Tex. and N.M. to Chis.

Very similar to *P. dodecandra* but with larger flowers, shinier and slightly smaller seeds.

2. *Polanisia dodecandra* (L.) DC. CLAMMY-WEED. Very similar to *P. uniglandulosa*; sparsely branched or unbranched annual (rarely perennial), 2-6 dm. tall, glandular-viscid; leaflets 3, oblanceolate, 2-4 cm. long, 5-20 mm. wide; petals 5-16 mm. long, white; stamens 6 to 20, 9-30 mm. long, pink to purple, not much longer to much-exceeding petals; seeds many, red- or dark-brown, wrinkled or tubercled, dull.

Extremely variable in flower- and fruit-size; divisible into three intergrading more or less geographic subspecies:

Subsp. *trachysperma* (T. & G.) Iltis. Petals white, (5-) 10-16 mm. long; longest stamens 12-30 mm. long, exerted; bracts lanceolate to ovate; capsules 2-7 cm. long, 5-10 mm. wide, generally wider and more pubescent than the following; seeds dull, more or less roughened on back but not as much as in the following. *Polanisia trachysperma* T. & G. In sandy, rocky or gravelly soil of plains and hills, river bottoms, sandbars and washes, volcanic ash slopes, oak thickets, pinyon-juniper forests, prairies, fields, roadsides and along railroad tracks, common throughout Tex., flowering intermittently from May to Oct.; from Mex. to s.w. Can., Minn., Mo. and Ark.

Subsp. *riograndensis* Iltis. Very similar to the above but leaves more often rounded; petals pink to rose or purple, smaller, mostly (6-) 8-14 (-17) mm. long; longest stamens 12-17 mm. long; style 3-5 (-8) mm. long; bracts ovate to often nearly orbicular; raceme often dense and flat-topped; capsules often narrower, (3-) 4-7.5 cm. long, (3-) 4-5 (-7) mm. wide, sparsely glandular; seeds prominently roughly tuberculate-rugose. In sandy, gravelly (sometimes limestone) or alluvial silty soil, near riverbanks, coastal dunes, open areas in coastal live oak forest, bottoms of washouts, in semidesert *Opuntia*-mesquite scrub and shrub thickets, often weedy on roadsides in chaparral pastures, fallow fields or other disturbed areas, both sides of lower Rio Grande Valley and adj. desert areas, Mar.-Nov.; endemic.

Appears to intergrade with subsp. *trachysperma* (Aransas, Llano and Hays cos. and vic.), but typical, pink-flowered, dense-racemed, rough-seeded plants are distinct enough and more southern.

Subsp. *dodecandra*. Petals white, very small, 5-7 mm. long; stamens (6 or) 7 to 10, short. From Mo. to Wisc., Que. and Me., with occasional Tex. plants (especially from near Dallas, introd.?) and cen. Tex. (San Saba, Hays and Llano cos.) that approach it closely but are not referred here.

3. *Polanisia Jamesii* (T. & G.) Iltis. Branched strict densely viscid-glandular annual 1-3 (-4) dm. tall; leaves short-petioled; leaflets 3, linear, 1-4 cm. long, to 5 mm. wide, often folded; racemes open, 3-15 cm. long, few-flowered, each with 5 to 9 open flowers and buds; bracts 3-foliolate; petals spatulate, slender-clawed, white to yellowish, strongly dimorphic, the larger pair 4-5 mm. long and emarginate to shallowly laciniate with 3 to 6 lobes, the smaller 2-3 mm. long, and deeply laciniate; stamens 6 to 9, pink, 3-5 mm. long; nectary yellow, tubular, 2-3.5 mm. long, yellow, drying pink-purple; capsules linear-fusiform, 1-3 cm. long, 3-4 mm. wide, dehiscing nearly to base; style 1-2 mm., persistent; gynophore 2-4.5 mm. long; pedicels 8-9 mm. long; seeds 4 to 18, bright-reddish-brown. *Cristatella Jamesii* T. & G. Loose sands, sand hill prairies, sand blow-outs, sand bars etc., n.w. and w. Tex., late May-Oct.; Wisc. and Ill., on the Great Plains to Colo., s. to Kan.

4. *Polanisia erosa* (Nutt.) Iltis. Branched annual 2-6 dm. tall, the divergent slender branches sparsely glandular to subglabrous; petioles to 2 cm. long; leaflets 3, linear to oblanceolate, 1-4 cm. long, 1-5 mm. wide, often folded; racemes to 25 cm. long, very open, each with 10 to 17 open flowers and buds; bracts 3-foliolate; petals broadly spatulate, white to pale-yellow, sometimes pink-tinged, with purplish-pink claw, very strongly

dimorphic, the larger pair 6-11 mm. long and to 7 mm. wide with 5 to 9 palmately lacinate lobes, the smaller 4-6 mm. long and much deeper cut into filiform segments; stamens 6 to 15, pink, 6-12 mm. long; nectary yellow, tubular or cup-shaped (s.e. Tex.); capsules erect, narrowly linear-fusiform, 2-6 cm. long, 1.5-3.5 (-5) mm. wide, dehiscent nearly to base; style 3-6 mm. long, persistent; gynophore 3-14 mm. long; pedicel 12-22 mm. long; seeds 6 to 36 per capsule, dark-reddish-brown.

Divisible into 2 geographic subspecies:

Subsp. *erosa*. Nectary gland tubular, prominent, (2.5-) 3-5.5 mm. long; larger petals 7-11 mm. long; gynophores (in fruit) 7-14 mm. long, the capsule stipitate. *Cristatella erosa* Nutt. Dry loose deep sandy soils, sandhills, sandy prairies, woods and fields, common in Tex. in the w. Gulf Coastal Plain from s. Tex. to the Red River, Okla. and into La. (rare), early Apr.-Oct.; essentially a Tex. endemic.

Subsp. *breviglandulosa* Iltis. Like subsp. *erosa* but plants bushier; leaves denser, the leaflets more oblong and shorter; nectary gland cup-shaped, small, 1-2 mm. long; larger petals 6-9 mm. long; gynophores (in fruit) 3-6 mm. long; capsule nearly sessile. Sand plains of Tex. from the Rio Grande to Aransas, Jim Hogg and Zapata cos., Apr.-Oct.; endemic.

2. CLEOME L. SPIDER FLOWER. CLEOME

Erect slender to robust annual (ours) or perennial herbs, shrubs or small "trees," glabrous or glandular-pubescent, often spiny; leaves palmately 1- to 11-foliolate; leaflets entire or serrulate, flat or conduplicate; stipules none or minute; racemes terminal, greatly elongating in fruit, bracteate or flowers singly in axils of cauline leaves; corolla open or closed in bud; sepals 4, free or fused at base; petals 4, subequal, free, white, yellow, pink or purple, spatulate, entire, acute to rounded; disk conic, the nectary inconspicuous, sometimes adaxially expanded; stamens 6; anthers elongate, longitudinally dehiscent; capsules elongate, pendent, deflexed or erect, sessile or borne on a stipe (gynophore); seeds many, the invagination open (if very narrow) or fused by a membrane.

About 150 species, mostly of tropical America and Africa, often of arid habitats.

1. Aestivation open, the petals not covering the stamens in bud; stamens on the gynophore 6-22 mm. above petals, the stamen scars visible on gynophore in fruit; petals white; leaves 5- to 7-foliolate; sporadic weed, east Texas (Sect. *Gymnogonia*) . . .
 1. *C. gynandra*.
1. Aestivation closed, the stamens covered by petals until anthesis; stamens inserted next to petals; petals white, pink or purple (2)
- 2(1). Plants armed with pairs of "stipular" thorns at base of petioles; disk conic-circular, not adaxially expanded (Sect. *Tarenaya*) (3)
2. Plant unarmed, glabrous; disk pronouncedly adaxially expanded; petals pinkish or purple; anthers coiled when dry; native species (Sect. *Peritoma*) (4)
- 3(2). Low diffusely branched slender 3-foliolate herb; petals white, 5-10 mm. long; siliques sessile or short-stiped, erect or ascending; rare, south Texas (Cameron Co.)
 2. *C. aculeata*.
3. Tall robust 5- to 9-foliolate herb; petals pink to purple (rarely white), 20-40 mm. long; siliques on gynophore 5-8 cm. long, deflexed; cultivated and escaped, scattered in east Texas 3. *C. Hassleriana*.
- 4(2). Leaflets narrowly elliptic, 5-15 mm. wide; plants tall, branched; flowers 8-13 mm. long, racemose in the axils of small 1-foliolate bracts; siliques 3-9 mm. wide; northeast corner of Texas Panhandle 4. *C. serrulata*.
4. Leaflets linear, 2 mm. wide or less; plants slender, simple or few-branched; flowers 4-7 mm. long, singly in axils of 3-foliolate cauline leaves; siliques 2-4 mm. wide; rare in Presidio Co., Texas 5. *C. multicaulis*.

1. *Cleome gynandra* L. SPIDER WISP. Erect annual herb, 5-15 dm. tall, more or less glandular-pubescent, unarmed; stems simple or sparsely branched; petioles 3-9 cm. long; leaflets 3 to 7, oblanceolate to rhomboidal, acute to acuminate or rounded-apiculate, to

7 cm. long and 4 cm. wide, glabrate, serrulate-denticulate to ciliate; racemes to 4 dm. long, few- to many-flowered; bracts small, 3-foliolate, sessile; sepals free, to 6 mm. long; petals 4, not covering the stamens in bud, white, 1-2 cm. long, spatulate with a long claw; stamens 6, inserted 6-22 mm. up on the slender gynophore, the filaments 8-22 mm. long; capsule linear-cylindric, to 10 cm. long, 5 mm. thick; gynophore 2-4 cm. long, with stamen scars visible even in fruit; seeds many, sharply tuberculate. *Gynandropsis gynandra* (L.) Merr. A pantropic weed of Afr. origin, sporadic in much of the warmer e. U.S. from N.C. to e. Tex.; May-Oct. (-Dec.).

2. *Cleome aculeata* L. Spreading open-branched or erect annual, 3-8 dm. tall, sparsely glandular-pubescent to subglabrous; stems slender, flexuous, armed with pairs of (often very) small recurved "stipular" prickles 1-3 mm. long; leaflets 3, thin, lance-elliptic to ovate, broadly acute, 2-6 cm. long, 1-3 cm. wide, entire; racemes open, with bracts 1-2 cm. long; sepals 2-6 mm. long, divergent to reflexed, deciduous; petals white, 5-10 mm. long; stamens 6, 1-2 cm. long; capsule erect or ascending, 2-6 cm. long, 3-5 mm. wide, more or less constricted, on a stipe 1-8 mm. long; seeds several, 2.4-2.8 mm. in diameter, transverse-rugose, with white aril attached to cleft. Weedy open places in Rio Grande Valley (Cameron Co.), June-Oct.; s. Tex. to n. Arg. and W.I.; sporadically introd. in the Old World.

3. *Cleome Hassleriana* Chod. SPIDER PLANT, SPIDER FLOWER, PINK QUEEN. Robust shrubby glandular-pubescent annual herb, 1-2 m. tall, prominently armed with pairs of stout "stipular" prickles 2-6 mm. long at base of petioles that are 4-13 cm. long; leaflets 5 or 7, oblanceolate-elliptic to narrowly elliptic, long-pointed at both ends, to 12 cm. long and 3 cm. wide, serrulate-denticulate, glandular; racemes dense, to 1 m. long; bract 1-foliolate, to 3 cm. long; petals large, showy, pink to purple (rarely white), 2-4 cm. long, long-clawed, in one row; stamens 6, 4-7 cm. long in "male" flowers that alternate cyclicly with essentially "female" ones; anthers 1 cm. long; capsules linear-cylindric, 4-10 cm. long, to 4 mm. thick, glabrous, more or less constricted; gynophore 5-8 cm. long; pedicel 2-4 cm. long, the fruit divergent to deflexed; seeds many, 1.8-2.3 mm. in diameter, with a shiny membrane covering the cleft. *C. spinosa* L. and of auth., not Jacq., *C. pungens* of auth., not Willd.? Often cult. and occasionally escaped in e. Tex., Apr.-Oct.; introd. from Latin Am.

4. *Cleome serrulata* Pursh. ROCKY MOUNTAIN BEE PLANT. Erect somewhat shrubby branched annual, 2-15 dm. tall, glabrous, glaucous, unarmed; leaflets 3, narrowly elliptic, 2-6 cm. long, 5-15 mm. wide, pointed at both ends; flowers in dense elongated many-flowered racemes; bracts narrow, simple; sepals united for one half to two thirds their length, persistent in fruit; petals bright-pink to purplish, rarely white (f. *albiflora* Cockll.), 8-12 mm. long; disk with nectariferous adaxial scale to 4 mm. long; stamens 13-20 mm. long; capsules variable, linear-cylindric to fusiform, pointed sharply at both ends, 2-8 cm. long, 3-9 mm. wide, deflexed; gynophore 11-23 mm. long; pedicel 14-20 mm. long; seeds several to many, ovoid, sharply pointed, 3-4 mm. long, black-brownish-mottled, blistered, the cleft fused. *Peritoma serrulatum* (Pursh) DC., *P. integrifolia* Nutt. Open woods and along railroads, restricted to n.e. corner of Tex. Panhandle, one station (introd.?) on Mustang Island, Corpus Christi Bay, May-Sept.; widespread throughout the Rocky Mts., Great Basin and Great Plains, from n.w. Calif. to s.w. Can., Ariz., n. Tex., Neb. and Minn.; adv. eastw.

5. *Cleome multicaulis* DC. Slender erect unbranched or sparingly branched glabrous annual, 2-7 dm. tall; leaflets 3, linear, strongly folded, 1-3 cm. long, 1-3 mm. wide; flowers in axils of cauline leaves, in very open elongate racemes; petals pinkish-purple, 4-7 mm. long; disk small, bulbous; capsule obovoid to linear, 9-18 mm. long, 2-4 mm. thick, deflexed; gynophore 3-10 mm. long, the pedicel 15-22 mm. long, both delicate; seeds subglobose, light-brown, 1.8-2.5 mm. long, smooth. *C. sonorae* Gray, *Peritoma sonorae* (Gray) Rydb. Presidio Co. (edge of cienega, volcanic ash soil, in thick growth of sacaton above Capote Falls, Sierra Vieja, 2000'); in alkaline sinks and old saline lake beds in *Larrea* belt in N.M., from s. Colo. to s.e. Ariz., s.w. N.M. to s.-cen. Mex. (D.F.), very sporadic and rare; June-Aug.

3. CLEOMELLA DC.

Erect slender to robust glabrous (rarely pubescent) annuals (ours) or perennial herbs; leaves alternate, palmately 3-foliolate; leaflets entire, mucronate, less than 4 cm. long; stipules minute, filiform; racemes terminal, bracteate; sepals minute, barely fused at base, tardily deciduous; corolla yellow, closed in bud, the petals subsessile; stamens 6, equal; anthers tightly coiled when dry; capsule an obdeltoid or rhomboidal silicle, often wider than long, the 2 valves deciduous, expanded contrary to the placenta into 2 obtuse to sharply pointed cones; gynophore elongate; style slender, persistent, indurate; seeds 3 to 20.

A small endemic North American genus of 10 xerophytic species, differing from *Cleome* (Sect. *Peritoma*) and *Wislizenia* in fruit characters.

1. Seeds 3 to 6 per capsule; fruiting gynophore 6-17 mm. long; style 0.5 mm. long; petals 4-6 mm. long; flowering portion of raceme short, flat or rounded, 1-2 cm. long; leaflets acute; eastern half of Texas 1. *C. angustifolia*.

1. Seeds 6 to 16 per capsule; fruiting gynophore 4-7 mm. long; style 1.5-2 mm. long; petals 6-9 mm. long; flowering portion of raceme oblongoid-elongate, 2-5 cm. long; leaflets often rounded to emarginate; Trans-Pecos Texas
..... 2. *C. longipes*.

1. *Cleomella angustifolia* Torr. Glabrous erect often very bushy annual, 6-26 dm. tall; leaflets 3, linear-elliptic, acute, 25-60 mm. long, 2-8 mm. wide; racemes to 4 dm. long, the flowering portion flat to rounded and 1-2 cm. long, bracteate (the lower 3-foliolate, the upper 1-foliolate); petals yellow, 4-6 mm. long; mature capsules oblongoid to rhomboidal or obdeltoid (cones acute to rounded), 5-10 mm. long, 5-9 mm. wide; style 0.5 mm. long or less; gynophore 4-7 mm. long, the androgynophore prominent and 1-1.5 mm. long; pedicel 7-12 (-17) mm. long; seeds 3 to 6 per capsule, dark-brown-mottled. Deep sands, gravels in river-bottoms, edge of ponds, roadsides, sandy prairies and bare sandstone shale in e. half of Texas (also Dawson Co.), June-Oct.; Tex. to e. Kan., w. Neb. and n.e. Colo.

2. *Cleomella longipes* Hook. Glabrous erect branched annual (or rarely perennial?) 3-8 dm. tall; leaflets 3, oblanceolate to oblong-oblanceolate, acute to rounded or emarginate, 15-30 mm. long, 4-10 mm. wide; racemes 1-5 dm. long, the flowering portion oblong-cylindric and 2-6 cm. long; bracts 1-foliolate or upper flowers ebracteate; petals yellow, 6-9 mm. long; mature capsule (silicle) obdeltoid or rhomboidal (the cones often sharply acuminate), 4-8 mm. long, 6-10 mm. wide; style 1-2 mm. long; gynophore 6-17 mm. long; pedicel 5-18 mm. long; seeds 6 to 16 per capsule, obovoid, when mature dark-brown. In saline or alkaline soils or sands of semideserts in the Trans-Pecos, May-Sept.; s.e. Ariz., s.w. N.M. and w. Tex. to cen. Mex.

4. WISLIZENIA ENGELM.

JACKASS CLOVER

About 3 species (or monotypic, with one highly polymorphic species?) in southwestern United States and northwest Mexico; very similar to *Cleomella*.

1. *Wislizenia refracta* Engelm. Robust glabrous annual, 4-7 dm. high (easily confused with *Cleomella* spp.), sparsely to densely branched; leaflets 3, oblanceolate to elliptic or ovate-oblong, 1-2 (-3) cm. long, 3-8 (-11) mm. wide, rounded at apex, attenuate at base into slender petiolules to 4 mm. long; stipules minute tufts of filiform hairs; racemes short, 1-8 cm. long, very dense, ebracteate; sepals minute, tardily deciduous; corolla closed in bud; petals yellow, subsessile, 2-4 mm. long; stamens 6, 6-7 mm. long, the anthers tightly coiled when dry; pistil long-exserted; style 4-6 mm. long in fruit, very slender; gynophore slender, 3-7 mm. long, strongly refracted against the slender pedicel (4-10 mm. long); fruit a 2-celled twin pod that separates into 2 divaricate or deflexed obovoid nutlets, each with 1 or 2 seeds permanently enclosed by the capsule-valve; nutlets 1.5-2.5 mm. long, smooth to veined, minutely to markedly tuberculate at distal end; seed smooth, yellow. In alkaline sandy or loamy soils of semideserts, on edges of playas, grasslands (*Hilaria* assoc.), riversides and roadsides, at 3,000 ft. elev. in the Trans-Pecos, mid-July-Sept.; Tex. and n. Mex. to Nev. and Baja Calif.

FAM. 82. RESEDACEAE S. F. GRAY

MIGNONETTE FAMILY

Annual (in ours) or perennial herbs with alternate leaves and glandlike stipules; racemes or spikes terminal, composed of small perfect bracteate flowers that are irregular and unsymmetrical; calyx 4- to 7-parted, persistent; petals small, clawed, as many as 7, sometimes laciniate; stamens as many as 40, not covered in bud; fruit a 1-celled capsule, 3- to 6-beaked; seeds many, subreniform.

About 6 genera comprising about 70 species that are mostly in the Mediterranean region.

1. OLIGOMERIS CAMB.

Characters of the family. About 9 species in both hemispheres.

1. *Oligomeris linifolia* (Vahl) Macbr. Rather succulent erect annual, glabrous, to 35 cm. tall, branching from base; leaves numerous, linear, often fascicled, to 25 mm. long; spike densely but often loosely flowered, to 15 cm. long; flowers sessile, about 2 mm. long; sepals 4, ovate-lanceolate, white-marginate; petals 2, white, cuneate-obovate, acuminate, with irregular apical margins; stamens 3, the slender filaments about 1 mm. long; capsule depressed-globose, to about 2.5 mm. long and 3-4 mm. thick, 4-beaked, opening at the summit, each lobe dorsally sulcate; seeds black, vernicose, about 0.5 mm. long. *O. subulata* Webb. On salt and clay flats, about boulders and on gravel bars along streams in the Rio Grande Valley and Trans-Pecos, Feb.-Aug.; from Tex. to Calif. and n. Mex.

FAM. 83. SARRACENIACEAE DUM.

PITCHER-PLANT FAMILY

Perennial rhizomatous and insectivorous plants with clustered tubiform leaves and solitary nodding flowers borne on a long naked erect scape; leaves rigidly erect, trumpet-shaped and partially filled with liquid, with a ridge on the adaxial side and terminated by an expanded hood; flowers regular, bisexual; sepals 5, with 3 appressed persistent bracts; petals 5, pendent, deciduous; stamens numerous; anthers 2-celled, dehiscing longitudinally; style simple below, expanded above into a large persistent 5-lobed umbrellalike structure, with a small stigma under each of the notched lobes; ovary 5-celled; fruit 5-valved; seeds keeled or winged on one side.

A small family of three genera comprising about 15 species.

1. SARRACENIA L.

PITCHER-PLANT. TRUMPET

Characters of the family. A genus of eight species, all of which are confined to the United States with the exception of *S. purpurea* L. which extends into Canada.

1. *Sarracenia alata* Wood. YELLOW TRUMPETS. Leaves yellow-green, trumpet-shaped, dilated upward, to 7 dm. long; hood ovate to suborbicular, with inconspicuous reddish veins, to 8 cm. long; scape about as long as the leaves; sepals broadly ovate to rhombic-ovate, bluntly obtuse at apex, curved, 4-5 cm. long, to 4 cm. wide; petals greenish-yellow, drooping, panduriform, 5-6 cm. long, to 4 cm. wide near the broadly rounded apex; style to 8 cm. wide, convex; capsule muricate; seeds tuberculate. *S. Sledgei* Macfarl. In wet acid bogs on slopes and flats in pinelands in e. and s.e. Tex., Mar.-Apr.; on the Gulf Coastal Plain from s. Ala. to e. Tex.

FAM. 84. DROSERACEAE SALISB.⁷³

SUNDEW FAMILY

Perennial or biennial (rarely annual) insectivorous herbs growing in wet or damp soil; leaves circinate in bud, expanding into a rosette or tuft at base of scape or rarely scattered

⁷³ Ref.: Frances E. Wynne in Bull. Torrey Club 71:166-174. 1944; Lloyd H. Shinnars in Sida 1:53-59. 1962; C. E. Wood, Jr. in Jour. Arnold Arb. 47:89-99. 1966.

in submersed plants, with or without prominent stipules, red or green, adorned with gland-tipped hairs that exude drops of a clear glittering glutinous fluid; scape with a simple or branched few-flowered secund inflorescence that nods at the undeveloped apex; flowers regular, shortly pedicellate, opening only in sunlight, hypogynous, usually 5-merous, soon withering but persistent; calyx imbricated; petals convolute; stamens 5, opposite the sepals, the anthers fixed by the middle; styles 3 or 5, bipartite to base; capsule 3- to 5-valved, with as many parietal placentas as valves; seeds numerous.

About 4 genera of more than 100 species of worldwide distribution.

1. DROSERA L. SUNDEW

Characters same as those of the family. More than 100 species primarily in the Southern Hemisphere.

- 1. Scape with gland-tipped hairs except toward base; stipules absent or vestigial; seeds crateriform, 0.3-0.4 mm. long 1. *D. annua*.
- 1. Scape glabrous or with inconspicuous sessile glands; stipules prominent, free (2)
- 2(1). Petioles with few to many long lax hairs lacking gland-tip; flowers pink, about 10 mm. in diameter; seeds 0.4-0.5 mm. long, papillose-corrugated with 14 to 16 ridges 2. *D. capillaris*.
- 2. Petioles glabrous or with inconspicuous sessile glands; flowers white, 7-8 mm. in diameter; seeds 0.7-1 mm. long, irregularly and densely covered with long papillae 3. *D. intermedia*.

1. *Drosera annua* E. L. Reed. Leaf blades suborbicular to cuneate-flabellate, to 8 mm. long and wide, about one-third as long as the glandular petiolar base; stipules lacking or rudimentary; scape erect, to 12 cm. tall, provided with gland-tipped hairs, supporting as many as 6 flowers; sepals ovate, subacute, to 4 mm. long, united at base; petals pink or roseate, obovate, to 9 mm. long; capsule obovoid, 3.5-4 mm. long; seeds black, obovoid, the pits in 10 to 12 rows. In damp sand in pinelands or mixed forests and in open bogs in e. and s.e. Tex., Feb.-June; Tenn., s. to Ala., Okla., La. and Tex.

Referred by some authors to *D. brevifolia* Pursh.

2. *Drosera capillaris* Poir. Leaf blades broadly spatulate to obovate, to 1 cm. long and 9 mm. wide, exceeded in length by the more or less pubescent petioles that are to 4 cm. long; stipules divided into numerous setaceous segments to 5 mm. long; scape erect, to 25 cm. tall, glabrous or inconspicuously glandular, supporting as many as 20 glabrous flowers in a strictly erect inflorescence; sepals oblong-elliptic, obtuse, to 4 mm. long and 2 mm. wide, united at base; petals pink, to 7 mm. long and 3 mm. wide; capsule ellipsoid-obovoid, to 5 mm. long; seeds ovate-oblong to elliptic, asymmetric, brown, coarsely papillose-corrugated. In wet sands and on seepage slopes and in bogs in e. Tex., Feb.-June; Va., Tenn. and Ark., s. to Fla. and Tex.; also W.I., Mex., C.A. and n. S.A.

3. *Drosera intermedia* Hayne. Leaves usually basal but sometimes extending up the stem when the plants grow in water or very wet places; leaf blades spatulate to oblong-obovate, to 2 cm. long and 5 mm. wide, with slender glabrous or inconspicuously glandular petioles to 5 cm. long; stipules divided into several setaceous segments to 5 mm. long; scape erect, to 2 dm. tall, glabrous or inconspicuously glandular, supporting as many as 20 flowers in an inflorescence that at first curves outward and often downward at the base before becoming erect; sepals oblong, to 4 mm. long and 1.5 mm. wide, united at base; petals white or sometimes pinkish, to 5 mm. long and wide; capsule ellipsoid, to 5 mm. long; seeds oblong, reddish-brown, blunt at the ends, densely and irregularly covered with long papillae. In wet sands and peaty areas in s.e. Tex., June-Aug.; Nfld. to Ont., w. to O., Ill. and Minn., s. to Fla. and Tex.

**FAM. 85. PODOSTEMACEAE AGARDH
RIVER-WEED FAMILY**

Aquatic herbs, attached to rocks in swift-flowing water by dislike processes, in habit resembling some species of algae and mosses; leaves alternate, 2-ranked, simple to lobed or decomposed; flowers naked, solitary, perfect, arising from a spathe-like involucre;

perianth wanting or composed of 3 to 5 scalelike or membranous sepals; stamens 1 to many; fruit a 2- or 3-celled many-seeded ribbed capsule.

About 130 species in more than 40 genera, mostly tropical.

1. PODOSTEMON MICHX. RIVER-WEED

Characters of the family. More than a dozen species of wide distribution.

1. *Podostemon Ceratophyllum* Michx. **THREAD-FOOT.** Plant olive-green, firm, glabrous; leaves long-petiolate, rigid, divided into linear or filamentous segments or sometimes simple, with dilated base sheathing the stem; stems abbreviated to very elongate, sometimes as much as 6 dm. long or more; flowers green, arising along the stems or in clusters at apex of stems, with slender pedicels; perianth obsolete; stamens 2, the more or less united filaments exceeding the ovary; ovary 2-celled; stigmas 2, subulate; capsule unequally 2-valved, with one 5-ribbed valve persistent, broadly ellipsoid, 2-3 mm. long. Attached to rocks in streams in (?) e. Tex., May-July; from Ga., along the Gulf Coast to Okla., n. to Ont. and N.B.

Although no specimens have been seen from Texas the species is included here because of the strong possibility of its occurrence in the state. It is extremely abundant in some sections of the Mountain Fork River in McCurtain Co., Oklahoma, less than 30 miles north of Bowie and Red River counties, Texas.

FAM. 86. CRASSULACEAE DC.⁷⁴ ORPINE FAMILY

Annual or perennial succulent exstipular herbs with perfect symmetrical flowers usually in a cyme; leaves simple or sometimes dentate; petals (free or somewhat united) and pistils the same number as the calyx segments and the stamens the same or double their number; fruit a 1-celled follicle that opens down the ventral suture, 1- to many-seeded.

About 1,500 species in 35 genera that are worldwide in distribution.

1. Plants minute, spreading or decumbent, annual; leaves opposite and connate at base, 7 mm. long or less; flowers solitary or in glomerules usually in axil of leaves, to 2 mm. long; stamens as many as calyx segments 1. *Tillaea*, p. 714.
1. Plants erect to suberect-ascending or sometimes procumbent, perennial or sometimes annual; leaves not opposite or (if so) not connate at base, sometimes in irregular whorls, longer than above; flowers in cymes, racemes or panicles, usually much more than 2 mm. long; stamens twice as many as the calyx segments (2)
- 2(1). Corolla with the parts free or essentially so; perennials or annuals 2. *Sedum*, p. 715.
2. Corolla united (at least at base) to form a tube; all perennials (3)
- 3(2). Leaves broad and flat, borne in a basal rosette, those of the scape reduced and often bractlike 3. *Echeveria*, p. 716.
3. Leaves terete to subcylindric and turgid, linear, borne on stem (4)
- 4(3). Plants small, in anthesis to 15 cm. tall; leaves less than 2 cm. long; flowers less than 5 mm. long 4. *Villadia*, p. 716.
4. Plants large, in anthesis well above 30 cm. tall; leaves much more than 2 cm. long; flowers about 25 mm. long 5. *Kalanchoë*, p. 717.

1. TILLAEA L. PIGMY-WEED

About 20 species of worldwide distribution.

1. *Tillaea aquatica* L. **WATER PIGMY-WEED.** Tufted or matted more or less aquatic annual, glabrous throughout; stems filiform, much-branched from base, spreading or

⁷⁴ Adapted partly from N. L. Britton and J. N. Rose in *N. Am. Fl.* (22)(1):7-74. 1905.

decumbent, to 10 cm. long; leaves opposite, connate-perfoliate, linear to linear-oblong, entire, to 7 mm. long; flowers minute, solitary, axillary, 4-merous, essentially sessile or with pedicels longer than the leaves; calyx 1 mm. long, about half as long as the greenish-white petals; follicles ovoid, 1.5-2 mm. long, 1- to several-seeded. *Crassula aquatica* (L.) Schoenl., *Tillaeastrum aquaticum* (L.) Britt. On dry mud flats about pools and along shores in e. and s.e. Tex., May-Aug.; from Nfld., w. to Wash., Ut., Wyo. and Tex., s. to Md. and La.; also Mex.

Plants with some of the pedicels exceeding the leaves have been segregated as var. *Drummondii* (T. & G.) Jeps. [*Tillaea Drummondii* T. & G., *Crassula Drummondii* (T. & G.) Fedde, *Tillaeastrum Drummondii* (T. & G.) Britt.].

2. SEDUM L. STONECROP. ORPINE

Smooth and fleshy-leaved perennials or occasionally annuals with mostly alternate (sometimes opposite or whorled) or imbricated simple leaves and flowers in broad to one-sided terminal or axillary cymes; sepals and petals 4 or 5, the usually narrow petals free or scarcely united at base; stamens 8 to 10, mostly perigynous; follicles several- to many-seeded, each subtended by a basal scale.

About 600 species, mainly in temperate and boreal regions of the Northern Hemisphere.

1. Leaves (at least the upper ones) densely imbricated, rarely to 5 mm. long (2)
1. Leaves not imbricated (excepting those of rosettes), alternate or rarely opposite or whorled, more than 5 mm. long (3)
 - 2(1). Stems covered with tubercles; follicles widespreading .1. *S. Havardii*.
 2. Stems not tuberculate; follicles erect2. *S. moranense*.
- 3(1). Annual or biennial species (4)
3. Perennial species (5)
 - 4(3). Follicles ascending; petals white or pinkish3. *S. pulchellum*.
 4. Follicles widely divergent; petals bright-yellow4. *S. Nuttallianum*.
- 5(3). Plants found in coastal area of south Texas; leaves opposite, 2-2.5 cm. long5. *S. texanum*.
5. Plants confined to mountains of Trans-Pecos Texas; leaves not opposite, to 1 cm. long (6)
 - 6(5). Petals narrowly lanceolate, about 4 mm. long; lower leaves ovate6. *S. Robertsianum*.
6. Petals spatulate to spatulate-obovate or elliptic, 6-8 mm. long; lower leaves obovate to elliptic-obovate7. *S. Wrightii*.

1. *Sedum Havardii* Rose. Low procumbent perennial, much-branched at base; stems reddish and covered with tubercles, to about 15 cm. long; leaves flattened but somewhat turgid, 2.5-5 mm. long, elliptic, obtuse, the upper ones distinctly imbricated; flowers few clustered at and near the apex of the branches, sessile or nearly so; calyx small, about 1 mm. long; petals creamy-white tipped with dark-red or reddish, narrowly lanceolate, acuminate, 4-5 mm. long; follicles widespreading. *S. Liebmannianum* of Coult. (Bot. W. Tex. 110. 1891), not Hemsl. At foot of cliffs and in crevices of rock ledges in Davis and Chisos Mts. in the Trans-Pecos; endemic.

2. *Sedum moranense* H.B.K. Perennial, procumbent, much-branched, rooting at the nodes; leaves glabrous, ovate, minute, scarious at base, 1-3 mm. long, thick, turgid, obtuse, densely appressed, imbricated; flowers in short secund racemes or only one or two at the tips of the branches; pedicels very short; sepals linear-oblong, somewhat unequal, fleshy, produced backward at base; petals reddish, 5 mm. long, lanceolate; follicles erect, at least at first. *S. Liebmannianum* Hemsl.

Reported from Trans-Pecos Texas but it is very dubious that this Mexican species occurs there.

3. *Sedum pulchellum* Michx. Glabrous annual (or biennial ?), ascending or trailing, branched, 1-3 dm. long; leaves crowded, terete, linear, sessile, obtuse, slightly auriculate at the base, 6-25 mm. long, about 2 mm. wide; cyme 4- to 7-forked, its branches

spreading or recurved in flower; flowers sessile, close together, 8-12 mm. broad; petals linear-lanceolate, acute, about twice the length of the lanceolate obtusish sepals; follicles 4-6 mm. long, tipped with slender styles. In seepage on and about calcareous rocks in e. Tex., Mar.-May; from w. Va., w. to s. Ill., Mo. and Kan., s. to Ga., Ala., Ark. and Tex.

4. *Sedum Nuttallianum* Raf. YELLOW STONECROP. Annual, pale-green, low, tufted, glabrous, 5-8 cm. tall; leaves alternate, linear-oblong, teretish, obtuse, sessile, entire, 4-15 mm. long; cyme 2- to 5-forked, its branches 1-5 cm. long; flowers sessile or very short-pedicelled, about 7 mm. broad; petals yellow, lanceolate, acute; follicles divergent, tipped with short subulate styles. *S. Torreyi* G. Don. On shallow soil, especially on and about sandstone and granite, also in pasturelands and clayey soils, mainly on the Edwards Plateau but n.e. to Hopkins Co., Apr.-July; in s.w. Mo., Ark., Okla. and Tex.

5. *Sedum texanum* J. G. Sm. Glabrous ascending herbaceous perennial, 1-2 dm. tall, cespitose, sparingly branching near base; leaves opposite, thick, fleshy, obovate to ovate-lanceolate, obtuse to acute, to 25 mm. long; inflorescence a spicate equilateral raceme or somewhat paniculate; flowers subsessile; sepals oblong to lanceolate, acute, 2-3 mm. long; petals free, rosy-yellow, 4-5 mm. long, oblong to oblanceolate, acute to subacuminate; follicles erect, long-acuminate. *Villadia texana* (J. G. Sm.) Rose, *Lenophyllum texanum* (J. G. Sm.) Rose. In chaparral and brushland along the coast in s. Tex., Oct.-Dec.; endemic.

6. *Sedum Robertsianum* Alex. Erect-sprawling succulent perennial; stems strongly red-streaked and -spotted, 8-12 cm. long; leaves ovate, turgid, elliptic in cross section, glabrous, yellow-green, heavily spotted with red, 5-8 mm. long, 3-4 mm. in diameter, obtusely apiculate at apex; inflorescence 2-branched or sometimes simple; flowers 6 to 12 on each branch of inflorescence, about 1 cm. across, equilaterally arranged, sessile or short-pedicelled; sepals lanceolate, the outer ones largest; petals narrowly lanceolate, about 4 mm. long, twice the length of the largest sepals, greenish at base, bright-yellow above, the channel on the upper surface deepening into a pit below the middle of petal. In shallow calcareous soils on mt. summits in the Trans-Pecos, spring-summer; endemic.

7. *Sedum Wrightii* Gray. Perennial, glabrous; stems weak, decumbent, 2-5 dm. long or less, often with long branches; basal and lower leaves obovate to elliptic-obovate, obtuse, 6-10 mm. long, those of the inflorescence oblong to spatulate-oblong, much smaller; cymes compact; flowers very short-pedicelled; calyx segments oblong, obtuse, half the length of the petals; petals spatulate to spatulate-obovate or sometimes elliptic, obtuse or obtusish, apiculate, white tinged with rose, 6-8 mm. long, their tips spreading; follicles erect, a little shorter than the petals, tipped with subulate styles. In crevices of ledges and on boulders, both igneous and limestone, in w. Edwards Plateau and the Trans-Pecos, July-Oct.; Tex., N.M. and n. Mex.

3. ECHEVERIA DC.

About 200 species mainly in the drier regions of the Western Hemisphere.

1. *Echeveria strictiflora* Gray. Scapose perennial plant with a rosette of broad flat succulent leaves; leaves oblanceolate to broadly spatulate, acuminate, glabrous, pale-green and slightly glaucous, to about 1 dm. long and 4 cm. wide, the upper surface with bright-red margins; flowering scape 2-4 dm. tall, simple or sometimes forked, provided with greatly reduced lanceolate leaves; racemes secund, to 15 cm. long; flowers shortly pedicelled, about 15 mm. long; sepals 5, oblong; corolla 5-angled and -lobed, twice the length of sepals, scarlet; stamens 10, the anthers oblong; scales large, thick, truncate; follicles free, oblong, erect, tapering into a slender style. *Cotyledon strictiflora* (Gray) Baker. On ledges and rocky slopes in mts. of the Trans-Pecos, June-Aug.; also n. Mex.

4. VILLADIA ROSE

Between 25 and 30 species, mostly Mexican and Andean.

1. *Villadia squamulosa* H.B.K. Perennial herb with fleshy or somewhat tuberous roots and terete turgid leaves, glabrous throughout; stems slender, branching at base, erect or ascending, 1-1.5 dm. long; leaves linear, 1-2 cm. long; flowers sessile or short-pedicelled,

either single and axillary or in small clusters; sepals 5, nearly equal; corolla segments rose-colored, ovate, acute, thin, 2-3 mm. long, about twice as long as the sepals, united into a short but distinct tube; appendages very large, yellow, 1 mm. long or more, thickened above; stamens 10; follicles erect. In the mts. of Trans-Pecos Tex. and Chih.; spring-summer.

5. KALANCHOË ADANS.

About 125 species mainly in Africa and Madagascar; containing many species grown for their ornamental value, including the following.

1. *Kalanchoë verticillata* Elliot. Glabrous perennial with simple erect stems to about 1 m. tall; leaves sessile, opposite or whorled, linear-subcylindric, mottled with violet-brown, 2.5-15 cm. long, producing plantlets at the tips; flowers in panicles, tubular, scarlet to salmon-color, pendulous, about 25 mm. long. *Bryophyllum tubiflorum* Harv. A nat. of S. Afr., cult. in s. Tex. where it has become naturalized, especially abundant in cactus-mesquite thickets at Loyola Beach, Kleberg County, as well as elsewhere in the Rio Grande Valley.

Quite a few species of succulents are cultivated in the Rio Grande Valley. Since some of these tend to persist around abandoned homesites and some even tend to migrate into the surrounding brush and chaparral growth, these will undoubtedly, in time, have to be treated as a part of our introduced and established flora.

FAM. 87. SAXIFRAGACEAE JUSS.

SAXIFRAGE FAMILY

Perennial herbs, woody vines, shrubs or rarely small trees with opposite or alternate usually exstipulate leaves; inflorescence variable; stamens mostly definite; carpels commonly fewer than the sepals, either separate or partly so or all combined into one compound pistil; floral cup either free or adherent to ovary, usually persistent or withering away; stamens and petals almost always inserted on rim of floral cup; ovary usually at least partly inferior; fruit a capsule or berry; ovules anatropous; seeds with copious endosperm.

Closely allied to Rosaceae and with some genera without clear relationships; sometimes split into several families. Estimated to be more than 1,000 species in nearly 100 genera in both hemispheres.

1. Plants herbaceous (2)

1. Plants woody (6)

2(1). Plants diminutive, forming prostrate patches less than 5 cm. across 1. *Lepuropetalon*, p. 718.

2. Plants with prominent erect stems (3)

3(2). Leaves scattered along the flowering stem; ovary 5- to 7-celled; follicles circumscissally dehiscent; ovary mostly superior 2. *Penthorum*, p. 718.

3. Leaves mostly basal and rosulate; ovary 1- or 2-celled; fruits not dehiscent as above; ovary about half-inferior (4)

4(3). Fertile stamens 10; ovary 3- or 4-celled; mature leaves usually less than 3 cm. long 3. *Saxifraga*, p. 718.

4. Fertile stamens 5; ovary 1-celled; mature leaves usually more than 3 cm. long (5)

5(4). Leaves lobulate or toothed; flowers in panicles, without staminodia 4. *Heuchera*, p. 719.

5. Leaves entire; flowers solitary on a scapose stem, with staminodia 5. *Parnassia*, p. 719.

6(1). Leaves alternate (7)

6. Leaves opposite (8)

- 7(6). Leaves pinnately veined, unlobed, at most with serrulate margins; ovary superior, free from the calyx; fruit a capsule 6. *Itea*, p. 720.
7. Leaves noticeably palmately veined and lobed; ovary inferior; fruit a berry
..... 7. *Ribes*, p. 720.
- 8(6). Stamens usually many more than 15; leaves characteristically ovate or elliptic (9)
8. Stamens 12 or less; leaves characteristically linear or linear-elliptic (10)
- 9(8). Erect or spreading shrubs; flowers 4- or 5-merous; calyx lobes well-developed ..
..... 8. *Philadelphus*, p. 722.
9. High-climbing vines; flowers 7- to 10-merous, calyx lobes toothlike
..... 9. *Decumaria*, p. 725.
- 10(8). Petals long-clawed; filaments terminated by 2 narrowly triangular appendages; capsules ovoid or conic, more than 8 mm. long 10. *Fendlera*, p. 725.
10. Petals without a claw; filaments without appendages; capsules ellipsoid, less than 6 mm. long 11. *Fendlerella*, p. 726.

1. LEPUROPETALON ELL.

A monotypic genus. Segregated by some authors as a monotypic family, Lepuropetalaceae.

1. *Lepuropetalon spathulatum* (Muhl.) Ell. Annual diminutive herbs, growing in small tufts, glabrous, mostly in hemispheric patches 1-1.5 cm. across; stems abbreviated, usually branched from the base, the branches angled; leaves alternate, simple, sessile, spatulate, 2-6 mm. long, obtuse, usually adorned with lines of reddish glands; entire; flowers inconspicuous but large for the plant, solitary near or at the ends of the stems and branches; hypanthium flattish, at maturity longer than the calyx; calyx 1.5-2 mm. wide; sepals 5, ovate, spreading, 1-2 mm. long at maturity; corolla white, minute, regular; petals 5, broad, scalelike, shorter than the sepals, reniform to ovate-reniform; stamens 5; filaments subulate, very short; ovary partly inferior, the 3 or 4 short carpels united; fruit about 2 mm. long, the folliclelike carpel apices erect, slightly spreading; fruit a capsule loculicidal at apex; seeds pitted. Sandy soil about sinks and on wet soil in the e. half of Tex., Feb.-Mar.; from S.C. and Ga. to Tex and Mex.; also Chile.

2. PENTHORUM L. DITCH-STONECROP

About 3 species, with 2 in Asia. Segregated by some authors as a monogeneric family, Penthoraceae.

1. *Penthorum sedoides* L. Upright or somewhat bushy-sprawling weedlike perennial herb, stoloniferous; stem decumbent at base, simple to widely branched, to about 8 dm. tall; leaves alternate, scattered, elliptic to broadly lanceolate, serrate, acute to acuminate at apex, narrowly cuneate at base, to 15 cm. long and 4 cm. wide; flowers yellowish-green, loosely spiked along the upper side of the naked scorpioid branches of the cyme; calyx lobes 5 or 7; petals usually absent; stamens 10; pistils 5 or 7, united below and slightly sunken in the receptacle, forming a 5-angled 5-horned and 5-celled capsule that opens by dehiscence of the caplike beaks, with numerous ellipsoid echinate seeds. Wet ground, usually along and on edge of water in streams in e. and s.e. Tex., June-July; from Fla. to Tex., n. to s. N.B., N.E., s.w. Que., s. Ont., Mich., Wisc., Minn. and Neb.

3. SAXIFRAGA L. SAXIFRAGE

About 370 species, mostly in the North Temperate Zone.

1. *Saxifraga texana* Buckl. Perennial herb from a bulbous base, to 15 cm. tall; leaves simple, in a basal rosette, spreading, broadly ovate to ovate-oblong, obtuse at apex, abruptly narrowed into a petiolate base, to 4 cm. long, usually much smaller, with undulate margins, essentially glabrous; scapes erect, usually solitary, green or rose-colored, coarsely white-pubescent (especially below the middle); cymules aggregated into tight

heads; sepals ovate to oblong, obtuse, 1.5-2 mm. long, commonly rose-colored; petals white, broadly elliptic to obovate, 2.5-3 mm. long, narrowed at base; stamens 10; follicle-like carpel tips 3 or 4, about 3 mm. long, the stout tips ascending or somewhat spreading. *S. Reevesii* Cory, *Micranthes texana* (Buckl.) Small. In seepage on rock outcrops in fields and on edge of woods in e. Tex., uncommon, Feb.-Mar.; in Mo., Kan., Ark., Okla. and Tex.

4. HEUCHERA L.⁷⁵ ALUMROOT

Perennial herbs with scapose stems from a stout caudex and long-petioled mostly basal simple leaves; petioles glabrous to densely pubescent, with dilated margins or adherent stipules at their base; leaf blades orbicular to broadly ovate or somewhat pentagonal or reniform, cordate to subtruncate at base, often somewhat lobulate and toothed; flowers in small clusters borne in a narrow often lax panicle, slightly irregular, greenish or purplish; calyx 5-cleft; petals 5, narrow; styles 2, slender; ovary half-inferior; capsule 1-celled, ovoid, with 2 parietal many-seeded placentae, 2-beaked, opening between the beaks; seeds oval, with a rough close seed coat.

About 50 species in North America.

1. Petals shorter than to only slightly exceeding the sepals; plants confined to northeast Texas1. *H. americana*.
1. Petals about twice as long as the sepals; plants confined to mountains of Trans-Pecos Texas (2)
- 2(1). Inferior part of ovary turbinate to broadly obconic at anthesis, about as broad as or broader than long2. *H. rubescens*.
2. Inferior part of ovary narrowly obconical, distinctly longer than broad3. *H. leptomeria*.

1. *Heuchera americana* L. Leaves to 15 cm. long, with 5 to 9 rounded lobules and numerous blunt teeth, glabrous to finely strigose on upper surface, more or less hirsute or strigose on veins of lower surface; flowering stems glabrous to short-hirsute, becoming glandular in the inflorescence, to 1 m. tall; flowers 3-5 mm. long; calyx nearly regular, the tube flaring from summit of the broadly campanulate hypanthium, about 1 mm. long; petals obovate to spatulate or oblanceolate, often purplish; stamens and style conspicuously exerted; capsule ovoid, 5-7 mm. long, with persistent styles nearly as long. Upland woods in n.e. Tex., Apr.-June; from Conn. to Ont. and Mich., s. to Ga., Ala., Tex. and Okla.

Our plants appear to be referable to var. *brevipetala* Rosend., Butt. & Lak., with the petals shorter than the sepals or linear-oblanceolate and slightly exceeding the sepals.

2. *Heuchera rubescens* Torr. Leaves to about 5 cm. long, glabrous to sparingly hirsute on upper surface (especially on the veins), often more or less hirsute on the veins of lower surface, rounded-lobulate and with rounded-ovate, ciliate and bristle-pointed teeth; flowering stems glabrous to more or less hirsute below, shining, becoming glandular in the inflorescence, to 4 dm. tall; hypanthium narrowly campanulate, pinkish, glandular-puberulent and (with the sepals) more or less white-hairy; sepals oblong, obtuse, green-tipped, 3-6 mm. long; petals linear-oblanceolate, about twice the length of the sepals; stamens as long as or slightly longer than the petals. Rocky places in the mts. of the Trans-Pecos, up to 8,000 ft. alt., July-Sept.; from Ut. to Calif. and s.e. Ore., e. to w. Tex.

3. *Heuchera leptomeria* Greene. The basis for separating *H. leptomeria* from *H. rubescens* is extremely tenuous. It is quite possible that they should be combined. *H. versicolor* Greene var. *leptomeria* (Greene) Kearn. & Peeb. On moist shaded rocks in conifer forests in mts. of the Trans-Pecos, July-Oct.; from w. Tex. and s. Ut. to Ariz., Calif. and n. Mex.

5. PARNASSIA L. GRASS-OF-PARNASSUS

Perennial glabrous herbs with short rootstocks and with a scapelike stem; leaves simple, entire, mostly basal and petioled, the single cauline leaf sessile; scape typically 1-flowered;

⁷⁵ Ref.: C. O. Rosendahl, F. K. Butters and Olga Lakela in Minn. Stud. Pl. Sci. 2:1-180. 1936.

hypanthium short and usually poorly developed; sepals 5, imbricated in bud; petals 5, imbricated in bud, white, conspicuously greenish- or yellowish-veined, deciduous; stamens 5, persistent and alternate with the petals and with 5 clusters of more or less united staminodia that are gland-bearing at the ends; ovary 1-celled, superior to half-inferior; style short or none; stigmas 4, sessile; capsule 1-celled, 4-valved.

About 50 species in the Northern Hemisphere. Segregated by some authors as a monogeneric family, Parnassiaceae.

1. Leaves reniform; petals with claw; staminodes 5-9 mm. long, equaling or shorter than the stamens1. *P. asarifolia*.

1. Leaves suborbicular-ovate; petals sessile; staminodes 12-15 mm. long, conspicuously longer than the stamens2. *P. grandifolia*.

1. *Parnassia asarifolia* Vent. Flowering stem 2-5 dm. high; basal leaves with petioles to 15 cm. long, broadly reniform, 3-4 cm. long, wider than long; cauline leaf about or below middle of stem, similar to but smaller than the basal leaves; petals oblong-elliptic, contracted at base into a claw, 12-18 mm. long, with 11 to 15 radiating veins; staminodia 3-pronged, usually slightly shorter than the stamens, 5-9 mm. long, united for one fifth to two fifths their length. In sphagnum moss of evergreen shrub bogs in e. Tex., rare, Sept.-Nov.; from Va. and W.Va., s. to Ga. and Tex.

2. *Parnassia grandifolia* DC. Flowering stems to 4 dm. tall; basal leaves with petioles to 15 cm. long, thick and firm, ovate to suborbicular, usually subcordate at base, to 1 dm. long and 8 cm. wide; cauline leaf ovate to suborbicular-ovate, usually borne below the middle of the scape; sepals elliptic, 4-5 mm. long, 3- to 7-veined; petals elliptic, 15-20 mm. long, with about 7 strong veins; filaments 7-8 mm. long, subulate; anthers ovate, acute, about 3 mm. long; staminodia nearly filiform, 12-15 mm. long, 3 to 5 in each set, united only at the base; capsule ovoid, about 15 mm. long. In moist meadows and wet marly situations in e. Tex., rare, Aug.; from Fla. to Tex., n. to Va., W.Va., Tenn. and Mo.

6. ITEA L. SWEET-SPIRE

About 15 species, mostly in southeast Asia. This genus, along with *Choristylis* Harv., is treated as a segregate family, Iteaceae, by some authors.

1. *Itea virginica* L. TASSEL-WHITE. Shrubs to 25 dm. tall; leaves simple, alternate, petioled, deciduous, broadly elliptic to oblong or obovate, acute to abruptly acuminate at apex, minutely serrate, at time of flowering to 8 cm. or more long; racemes simple, terminating the branchlets, to 2 dm. long and 2 cm. in diameter, loose and open, the rachis and pedicels evident; calyx 5-cleft, free from the ovary or nearly so; petals 5, white, lanceolate, much longer than the calyx and longer than the 5 stamens; capsule oblong, 2-grooved, 2-celled, tipped by the 2 united styles, 2-parted when mature, several-seeded. Swamps, about lakes and along wooded streams in e. Tex., Apr.-May; from Fla. to Tex., n. to N.J., e. Pa., Ky., s. Ill., Mo. and Okla.

7. RIBES L. CURRANT. GOOSEBERRY

Shrubs with arching or straggly branches, unarmed or sometimes spiny; leaves alternate or appearing to be fascicled, broadly rounded, mostly palmately lobed, with the lobes toothed or crenate; flowers solitary or in fascicles or abbreviated racemes; calyx 5-lobed, often colored, the tube adherent to the ovary; petals 5, small, inserted in the calyx tube; stamens 5, inserted on calyx tube alternately with the petals; ovary 1-celled; berry crowned by the shriveled remains of the flower.

About 150 species in cold or temperate regions in both hemispheres. A number of species are of economic importance because they are alternate hosts for the white pine blister rust, the fruits are eaten by birds, animals and man, and many are favorite browse plants of both domestic animals and deer. This genus, along with *Grossularia* Mill., is treated by some authors as a segregate family, Grossulariaceae.

1. Branchlets prickly with short nodal spines; pedicels not jointed (2)

1. Branchlets without spines; pedicels jointed (3)

- 2(1). Branches with 2 to 4 spines at a node; petioles sparsely pilose and typically with scattered long pectinate hairs below the middle; found only in east Texas 1. *R. curvatum*.
2. Branches with a solitary spine at a node; petioles uniformly densely pubescent; found only in mountains of west Texas 2. *R. leptanthum*.
- 3(1). Hypanthium and sepals densely pubescent; anthers with a conspicuous cup-shaped apical gland; fruit glandular-stipitate; inflorescences and petioles pubescent and with noticeably stipitate glands 3. *R. mescalegium*.
3. Hypanthium and sepals glabrous or essentially so; anthers at most with a callus at the apex; inflorescence and petioles without long-stipitate glands (4)
- 4(3). Hypanthium 12-15 mm. long; sepals at most about half as long as the tube, revolute or spreading in the faded flower; young branchlets reddish-brown 4. *R. odoratum*.
4. Hypanthium 6-10 mm. long; sepals more than half as long as the tube, upright and closed in the faded flower; young branchlets tan-color 5. *R. aureum*.

1. *Ribes curvatum* Small. GRANITE GOOSEBERRY. Shrub diffusely branched, to 1 m. tall; branchlets slender, reddish-brown, with reddish slender nodal spines 4-6 mm. long; leaves suborbicular, cuneate to subcordate at base, 1-3 cm. wide, 3- to 5-lobed, the lobes with few obtuse-rounded teeth, sparingly pubescent; petioles slender, as long as or shorter than blade; flowers 1 to 5 on slender peduncles, white; bracts often 3-lobed, ciliate; ovary glandular or pubescent; hypanthium broad-campanulate, glandular; sepals linear to linear-spatulate, 6-10 mm. long, revolute; petals prominently toothed near apex, 1.5-2 mm. long; stamens as long as sepals; filaments villous; fruit greenish, glabrous, globose, 6-8 mm. in diameter. *Grossularia texensis* Cov. & Berger. Rocky woods and slopes in e. Tex., Mar.-May; from Ga. to La. and Tex.

2. *Ribes leptanthum* Gray. Shrub slender, to 2 m. tall; branchlets arching, smooth or bristly, with stout nodal spines from a broad swollen base and to 12 mm. long; leaves suborbicular-reniform, truncate to open-cordate at base, 5-20 mm. wide, 3- to 5-cleft with dentate lobes, glabrous to pubescent and somewhat glandular; petioles as long as or shorter than blade; flowers greenish-white, 1 or 2 on a slender peduncle; pedicels short or wanting; ovary glabrous or sometimes glandular-pubescent; sepals oblong, greenish-white, about as long as the nearly cylindrical greenish hypanthium; petals white or pinkish, obovate, obtuse, about half as long as the sepals and as long as the stamens; style glabrous, exerted, bifid at apex; fruits black, lustrous, smooth or glandular-hispid. On talus slopes and about boulders and cliffs in mts. of the Trans-Pecos, up to 8,000 ft. alt., Mar.-May; from w. Tex. and Colo. to Ut. and Ariz.

3. *Ribes mescalegium* Cov. Shrub, much-branched and upright; leaves reniform to orbicular, cordate to broadly cuneate at base, 1-4 cm. wide, 3- to 5-lobed, with obtuse crenulate lobes, commonly pubescent; flowers greenish-white; bracts obovate, dentate at the obtuse apex; hypanthium about 7 mm. long, pubescent; sepals oblong-ovate, about half as long as the hypanthium; anthers with a conspicuous cup-shaped apical gland; style glabrous; fruit sparingly glandular-pubescent, black. Near summit of mts. in the Trans-Pecos, up to 8,000 ft. alt., July-Sept.; in w. Tex. and N.M.

This species is closely allied to the more western *R. inebrians* Lindl. and *R. cereum* Dougl.

4. *Ribes odoratum* Wendl. BUFFALO CURRANT. Shrub erect, to 2 m. tall, the young branchlets reddish-brown, pubescent; leaves ovate to orbicular-reniform, cuneate to truncate at base, 3-8 cm. wide, deeply 3- to 5-lobed, with coarsely dentate lobes, glabrate to puberulous on lower surface; flowers yellow, fragrant, 5 to 10 in a usually nodding raceme; bracts ovate to oval, foliaceous; rachis pubescent; hypanthium 12-15 mm. long and 2-2.5 mm. wide; sepals elliptic-obovate, scarcely half as long as tube, 5-6.5 mm. long, revolute or recurved, not upright and closed in the faded flower; petals 2.5-3.5 mm. long, erose at apex, reddish; fruit globose to ellipsoid, black or yellowish, 8-10 mm. long. On cliffs, rocky slopes and sandy bluffs in w. half of Tex., Feb.-May; from Minn. to Ark., Tex., Col. and S.D.

5. *Ribes aureum* Pursh. GOLDEN CURRANT. Shrub to 2 m. tall; young branchlets light-tan-color, glabrous or puberulous; leaves orbicular-reniform to obovate, cuneate to sub-

cordate at base, to 5 cm. wide, 3-lobed, the coarsely crenate-dentate lobes often with only 2 or 3 teeth, glabrous or sometimes puberulous on lower surface; petioles about as long as blade; flowers yellow, fragrant or slightly so, 5 to 15 in a raceme; bracts oblong to obovate; hypanthium slender, 6-10 mm. long, 1.5 mm. wide; sepals more than half as long as the tube, spreading, upright and closed in the faded flowers; petals changing to red; fruit globose, black or purplish-brown, 6-8 mm. in diameter. At lower elev. in the s. part of the Trans-Pecos, up to 6,000 ft. alt., Mar.-June; from S.D. to Assiniboia and Wash., s. to w. Tex., N.M., Ariz. and Calif.

8. PHILADELPHUS L.⁷⁶

MOCK-ORANGE

Shrubs with much-branched stems and exfoliating bark; leaves opposite, deciduous, exstipulate, entire or occasionally dentate, usually more or less pubescent and frequently white-sericeous on lower surface; axillary buds exposed or enclosed; flowers solitary or sometimes several in a cluster, mostly showy and fragrant; calyx turbinate or subcampanulate, adnate to ovary to form an hypanthium, glabrous to pubescent, the lobes 4 or 5; petals white to occasionally cream-color; stamens numerous, with subulate filaments and oblong anthers; ovary partly inferior; capsules ellipsoid to turbinate or subglobose.

About 75 species, mostly in temperate regions of both hemispheres, especially eastern Asia. Many species are grown as ornamentals.

1. Leaves broadly ovate to ovate-elliptic, 5-8 cm. long, 2.5-5 cm. wide; confined to river bluffs in northeast Texas 1. *P. pubescens*.
1. Leaves mostly elliptic, rarely more than 3 cm. long and 1.5 cm. wide; distribution on Edwards Plateau and the Trans-Pecos (2)
- 2(1). Axillary buds enclosed in nodal pouches at the ends of the petioles; branches determinate; inflorescence one- to few-flowered; stamens 25 to 75; stigmas linear; fruit ellipsoid, with subapical or circumferential persistent sepals; seeds more or less caudate, with rounded lobes on the crown (3)
2. Axillary buds exposed in axils of leaves; branches indeterminate; flowers solitary; stamens 13 to 35; stigmas columnar or subcapitate, 4-grooved; fruit turbinate or subglobose, with apical persistent sepals; seeds noncaudate (8)
- 3(2). Hypanthium and sepals glabrous or only sparsely pilose at the base 2. *P. microphyllus*.
3. Hypanthium and sepals uniformly pubescent (4)
- 4(3). Leaves glabrescent or sparsely villose on upper surface; hypanthium lanate 3. *P. argyrocalyx*.
4. Leaves definitely and permanently strigose, hispid or villose on upper surface; hypanthium incanous or slightly pilose (5)
- 5(4). Leaves pilose or villose on upper surface, the hairs appressed; densely long-villose on lower surface, the hairs erect; hypanthium incanous, the hairs long-villose, straight or slightly curly 7. *P. crinitus*.
5. Leaves strigose or hispid on upper surface; hypanthium incanous or slightly pilose, the hairs straight and appressed (6)
- 6(5). Hypanthium slightly pilose, the epidermal tissue visible 4. *P. occidentalis*.
6. Hypanthium thickly covered, the hairs incanous, the epidermal tissue obscured, the indumentum consisting of straight strigose hairs mixed with some weak crisp ones (7)
- 7(6). Leaves ovate-oblong; corolla disciform 4. *P. argenteus*.
7. Leaves ovate-lanceolate to lanceolate; corolla subcampanulate 6. *P. Palmeri*.

⁷⁶ Adapted from S. Y. Hu in Jour. Arnold Arb. 35:175-233; 36:52-109, 326-368; 37:15-90. 1954-1956.

- 8(2). Leaves strigose or strigose-villose, the hairs all straight; style 1 mm. long (9)
 8. Lower surface of leaves lanate and hirsute, the hairs dimorphous; style 1-2 mm. long
 (11)
- 9(8). Hypanthium glabrous; leaves strigose on both surfaces, the hairs appressed
 10. *P. Hitchcockianus*.
9. Hypanthium pubescent; upper surface of leaves pilose, the hairs appressed (10)
- 10(9). Corolla stellate, the petals oblong-lanceolate, 2-3 mm. wide; leaves oblong-lanceolate, 2-5 mm. wide 8. *P. Mearnsii*.
10. Corolla disciform, the petals suborbicular, 6-7 mm. wide; leaves ovate, 8-13 mm. wide 9. *P. Ernestii*.
- 11(8). Hypanthium villose and lanate; upper surface of leaves strigose with long appressed hairs and usually hirsute with scabridous erect ones; the persistent calyx apical on fruit 11. *P. serpyllifolius*.
11. Hypanthium glabrous or rarely sparsely pilose at the base; upper surface of leaves sparsely pilose, the hairs all appressed; the persistent calyx usually circumferential 12. *P. texensis*.

1. *Philadelphus pubescens* Lois. Shrub to about 3 m. tall; bark of young twigs gray, not exfoliating; leaves ovate to ovate-elliptic, 5-8 cm. long, 2.5-5 cm. wide, mostly rounded at base, acuminate at apex, sharply dentate to nearly entire, glabrous above, pubescent beneath; flowers with pubescent pedicels, in racemes of 5 or 7, about 25 mm. wide; sepals triangular-ovate, pubescent, about 5 mm. long; hypanthium pubescent. Rare on wooded bluffs in n.e. Tex. (Red River Co.), Apr.-June; from Tex. n. to Mo. and Ark., e. to Tenn. and Ala.

2. *Philadelphus microphyllus* Gray. Shrub erect, to about 2 m. tall; leaves with a petiole about 2 mm. long, ovate-elliptic to elliptic or sometimes elliptic-lanceolate, obtuse to acute at apex, 1-1.5 cm. long, 5-7 mm. wide, dark-green and villose-strigose to glabrous on upper surface, paler and more densely villose-strigose on lower surface, the hairs mostly appressed; flowers 1 or 2; sepals ovate-lanceolate, about 5 mm. long and 3 mm. wide at base; corolla cruciform; petals obovate-oblong, rounded and erose at apex, about 15 mm. long and 8 mm. wide above middle; stamens about 32, the filaments distinct; style 1 mm. long; capsules globose, 7 mm. in diameter. Incl. subsp. *typicus* C. L. Hitchc. In canyons at high elev. in the Chisos Mts., Brewster Co., June-Oct.; from Colo., Ut. and Nev. to w. Tex., N.M. and Ariz.

3. *Philadelphus argyrocalyx* Woot. Shrub erect, 1-2 m. tall; leaves with a petiole 1.5-2.5 mm. long, ovate to ovate-lanceolate or elliptic, obtuse to acute at apex, 1-3.5 cm. long, 4-15 mm. wide, sparsely strigose-villose on lower surface, the hairs more or less erect; flowers solitary; sepals ovate-lanceolate, 7-8 mm. long, 3.5-4.5 mm. wide at base; corolla cruciform; petals ovate-oblong, rounded and emarginate at apex, 15-17 mm. long, 10-14 mm. wide; stamens about 55, the filaments united into bundles; style 3 mm. long; capsules ellipsoid-subglobose, 10-12 mm. long, 7-9 mm. in diameter.

Although this species is considered to be endemic to mountains in south-central Mexico, it has been reported from Trans-Pecos Texas; June-Aug. No specimen, however, has been seen.

4. *Philadelphus occidentalis* A. Nels. Shrub low, the branches ochraceous; leaves ovate to ovate-elliptic, obtuse to acute at apex, 10-25 mm. long, 5-11 mm. wide, uniformly sparsely strigose-pilose on both surfaces, the hairs appressed; flowers solitary or ternate; sepals ovate, acuminate, 4-6 mm. long; corolla disciform; petals obovate, rounded at apex, 5-10 mm. long, 4-8 mm. wide; stamens about 35; style 1 mm. long; capsules subglobose-ellipsoid, 5 mm. long, 4.5 mm. in diameter. In canyons of mts. in the Trans-Pecos, June-Aug.; from Wyo. to Calif. and w. Tex., s. to n. Mex.

5. *Philadelphus argenteus* Rydb. Shrub to 2 m. tall; leaves with petioles 1-1.5 mm. long, ovate to oblong-elliptic, obtuse to acute at apex, 8-16 mm. long, 4-10 mm. wide, weak-strigose on upper surface, incanous on lower surface, the hairs largely strigose but mixed with some crisp weakly villose ones, all appressed; flowers solitary; sepals deltoid, acuminate, 5 mm. long, 4 mm. wide at base; corolla disciform; petals broadly ovate, 6-10 mm. long, 5-10 mm. wide; stamens about 46, the filaments separated; style 1 mm. long; capsules ellipsoid, 6 mm. long, 5 mm. in diameter. In canyons and on steep limestone

slopes in the Trans-Pecos, July-Aug.; from Calif., Nev., Ut. and Colo., s. to w. Tex. and n. Mex.

6. *Philadelphus Palmeri* Rydb. Small shrub with fibrous gray branchlets; leaves lanceolate, acute to acuminate at apex, 1-3 cm. long, 3-10 mm. wide, appressed sparse-pilose on upper surface, densely strigose-pilose on lower surface with the hairs largely straight and mixed with some weak and crisp ones, all appressed; flowers solitary; sepals ovate, acute, 5 mm. long, 3.5 mm. wide; corolla subcampanulate; petals oblong-obovate, 1 cm. long, 5-8 mm. wide; stamens about 23, the filaments united in 5 or more bundles; style 1.25 mm. long; capsules turbinate, 4-7 mm. long, 5-7 mm. in diameter. In high mts. of the Trans-Pecos, July; Ariz., w. Tex. and n. Mex.

7. *Philadelphus crinitus* (C. L. Hitchc.) Hu. Shrubs small, to 2 m. tall, with brownish-gray branchlets; leaves ovate to ovate-elliptic, acute at apex, 1-2 cm. long, 5-10 mm. wide, weakly villose on upper surface, moderately to densely villose or strigose-villose on lower surface, the hairs appressed; flowers solitary or rarely ternate, very fragrant; sepals ovate, acuminate, 6-8 mm. long, 3-4 mm. wide at base; corolla campanulate-disciform; petals suborbicular, 6 mm. in diameter; stamens 48 to 74, the filaments free; style 1-1.5 mm. long; capsules subglobose-ellipsoid, 7-9 mm. long, 6-7 mm. in diameter. *P. microphyllus* subsp. *crinitus* C. L. Hitchc. On talus slopes in the Davis Mts. of the Trans-Pecos, July-Aug.; also Ariz.

8. *Philadelphus Mearnsii* Evans. A spinescent low shrub with gray branches; leaves with a petiole 2 mm. long, oblong-lanceolate, obtuse to acute at apex, 5-15 mm. long, 2-5 mm. wide, strigose-pilose with appressed hairs on both surfaces; flowers solitary; sepals ovate-lanceolate, caudate at apex, 3 mm. long, 2 mm. wide; corolla stellate; petals oblong-lanceolate, acute or rarely notched at apex, 8 mm. long, 2.5 mm. wide; stamens 13 to 16; style 1 mm. long; capsule hemispherical, with a flat top, about 2 mm. in diameter. Rare in the mts. of the Trans-Pecos, June-July; N.M., w. Tex. and n. Mex.

9. *Philadelphus Ernestii* Hu. Small shrub with grayish branches; leaves ovate, obtuse at apex, 14-28 mm. long, 8-13 mm. wide, sparsely pilose on upper surface, villose on lower surface, the hairs more or less crisped at base; flowers solitary; sepals ovate, acuminate, 4 mm. long, 2 mm. wide; corolla disciform; petals suborbicular, 6-7 mm. in diameter; stamens about 20; style 1.5 mm. long; capsules subglobose, 4-5 mm. in diameter. Rare and apparently endemic on the Edwards Plateau.

10. *Philadelphus Hitchcockianus* Hu. A small subspinescent shrub; leaves ovate, obtuse at apex, 1-2.5 cm. long, 6-12 mm. wide, uniformly short-strigose on both surfaces, the hairs appressed; flowers solitary; sepals broadly ovate, acuminate, 3 mm. long, 2.5 mm. wide at base; corolla cruciform; petals oblong, rounded-emarginate at apex, 8 mm. long, 4.5 mm. wide; stamens about 23; style 1 mm. long; capsules turbinate, 4 mm. long, 5 mm. in diameter. About boulders and on walls of cliffs in canyons of the Guadalupe Mts. in the Trans-Pecos, May-June; Tex., N.M. and n. Mex.

11. *Philadelphus serpyllifolius* Gray. Subspinescent shrub, to 15 dm. tall, the branches cinereous; leaves ovate to ovate-oblong or ovate-lanceolate, obtuse to rarely rounded or acute at apex, 5-20 mm. long, 2-8 mm. wide, sparsely strigose and densely hirsute on upper surface, white with rather dense straight appressed hairs mixed with a close covering of very fine tangled tomentum; flowers solitary; sepals ovate, acuminate, 4 mm. long, 2.5 mm. wide, twice as long as the small hypanthium; corolla cruciform; petals oblong, 4-6 mm. long, 3-4 mm. wide; stamens about 20, the filaments distinct; style 1.5 mm. long; stigma columnar, 4-ridged, 1-1.5 mm. long; capsules subglobose, 4 mm. in diameter. On lower slopes of mts. in the Trans-Pecos, Apr.-May; Ariz., N.M., w. Tex. and n. Mex.

12. *Philadelphus texensis* Hu var. *texensis*. Small much-branched shrub; leaves ovate or rarely elliptic, acute at apex, prominently 3-nerved, 6-30 mm. long, 3-20 mm. wide, sparsely appressed-pilose on upper surface, white-villose and lanate on lower surface; flowers solitary; sepals deltoid, acuminate; corolla cruciform; petals oblong, 7-8 mm. long, 3 mm. wide; stamens about 16, the filaments dilated at base; style 1 mm. long; capsules subglobose, 4 mm. in diameter. On limestone bluffs and among boulders on the Edwards Plateau, Apr.-May; endemic.

Var. *Coryanus* Hu resembles *P. serpyllifolius* in that it has a pilose hypanthium and calyx, the latter being apical on the fruit. Bandera Co., Tex.

9. DECUMARIA L. CLIMBING HYDRANGEA

Two species, ours and one in China; sometimes placed in the segregate family, Hydrangeaceae.

1. *Decumaria barbara* L. WOOD-VAMP. Vines with aerial rootlets; leaves opposite, petiolate, ovate to ovate-elliptic, acute to subacuminate at apex, to 1 dm. long, dark-green and shining above, paler and sparingly pubescent on lower surface; flowers numerous, fragrant, white, mistlike, in compound terminal cymes, regular, all fertile; calyx tube turbinate, 7- to 10-toothed; sepals deltoid, less than 1 mm. long; petals linear-oblong to oblong, 3-4 mm. long; stamens 20 to 30; styles united into one, persistent; ovary inferior; stigma thick, 7- to 10-rayed; capsules numerous, 4-5 mm. long, with the persistent style and stigma urceolate, pendulous, 10- to 15-ribbed, 7- to 10-celled, many-seeded, bursting at the sides, the thin partitions at length separating into numerous chaffy scales. In rich woods and swamps of e. Tex., May-June; from Fla. to La. and (?) Tex., n. to s.e. Va. and Tenn.

No specimen has been seen from Texas, but it is included here on the distinct possibility that it occurs in the state.

10. FENDLERIA ENGELM. & GRAY

Deciduous to somewhat evergreen intricate shrubs with striate arching slender branches; leaves opposite or somewhat clustered on branchlets, 1- or 3-nerved, entire, sessile or nearly so; flowers solitary or 2 or 3 together, white, sometimes marked or tinged with red, pedicelled; hypanthium turbinate to broadly campanulate, 8-ribbed; sepals 4, valvate, deltoid to narrowly triangular-lanceolate, exceeding the hypanthium in length; petals 4, clawed, the blade rhombic-ovate to ovate-deltoid, erose to subentire; stamens 8; filaments flattened, with 2 narrowly triangular appendages at the top parallel with and often exceeding the apically elongated anthers; ovary partly inferior, about as wide as long during anthesis, 4-celled; styles 4, distinct, usually noticeably pubescent; capsule broad at the base, ovoid or conic, crustaceous, 4-valved, septicidal, less than half-inferior.

Four species from Colorado to Mexico. Favorite browse of deer, goats and sheep; also ornamental.

1. Leaves linear, often recurved, the margins revolute to the broad midrib, 1.5 mm. or less wide 1. *F. linearis*.

1. Leaves narrowly lanceolate to ovate-oblong, the margins (at most) only slightly revolute, usually 2 mm. wide or more (2)

2(1.) Leaves green and more or less coarsely strigose on both surfaces, the margins not noticeably revolute 2. *F. rupicola*.

2. Leaves grayish to whitish and tomentulose-strigose on lower surface, the margins distinctly revolute 3. *F. Wrightii*.

1. *Fendleria linearis* Rehd. Stiff erect shrubs to about 1 m. tall, the branches more or less strict; leaves linear, bluntly apiculate, coriaceous, about 15 mm. long and 1.5 mm. wide, sparsely strigillose, the margin strongly revolute to the broad midrib and enfolding a white tomentum, commonly recurved; flowers 3 to 5 clustered at end of branchlets; pedicels 2-5 mm. long; sepals triangular, about 4 mm. long; petals obovate, 7-8 mm. long and 5 mm. wide; anthers 2 mm. long, with a subulate appendage; capsule ovoid, about 8 mm. long. On rocky open slopes of mts. in the Big Bend National Park in w. Tex., rare, Apr.-May; also n. Mex.

2. *Fendleria rupicola* Gray. Shrubs much-branched, to 2 m. tall; leaves linear-elliptic to oblong-elliptic or sometimes elliptic-lanceolate, obtuse to acute, 1-4 cm. long, chartaceous to leathery; sepals 4-7 mm. long, more or less strigose on outer surface, softly lanate on inner surface; petals spreading, 1.5-2 cm. long, to 13 mm. wide; stamens erect, about half as long as the petals; capsules brown, to 15 mm. long. On ledges, slopes and among boulders in canyons of mts. in the Trans-Pecos, both igneous and limestone soils, Mar.-May, rarely as late as July; from Colo. through w. Tex., N. M. and Ariz. to n. Mex.

Plants with flowers often 4 cm. in diameter, and leaves 2-4 cm. long that are narrowly

elliptic to linear-lanceolate, usually subglabrous and often falcate, have been segregated as var. *falcata* (Thornb.) Rehd.

3. *Fendlera Wrightii* (Gray) Heller. Similar to *F. rupicola* except for the typically smaller leaves with their tomentulose lower surface and revolute margins, and the usually smaller flowers. *F. rupicola* var. *Wrightii* Gray, *F. tomentella* Thornb. Uncommon in the Trans-Pecos and on the w. edge of the Edwards Plateau, Mar.-May; from Colo. s. to n. Mex.

A specimen of this plant from Val Verde County (possibly deserving of varietal segregation) has more or less falcate leaves to 25 mm. long and large flowers that are 4 cm. in diameter. If it were not for the tomentulose, instead of solely strigose, lower surface of the leaves this plant, on the above characteristics, could be referred to *F. rupicola* var. *falcata*.

11. FENDLERELLA HELLER

Several species in western United States and Mexico.

1. *Fendlerella utahensis* (Wats.) Heller. YERBA DESIERTO. Shrubs upright, from a thick tough rootstock, much-branched, to about 1 m. tall, more or less strigose throughout; leaves thickish, opposite, shortly petioled, to 25 mm. long and 4 mm. wide, elliptic to linear-oblong or oblanceolate, entire, obtuse to acute; flowers inconspicuous, in few-flowered cymose clusters on a naked peduncle; petals and sepals 5 each; calyx tube adnate to the lower half of capsule, the linear lobes about 1 mm. long; petals white to cream-color, oblanceolate, about 4 mm. long; stamens 4 to 12; styles 3; capsules 2-4 mm. long, 3-celled. *Whipplea utahensis* Wats. On dry limestone ridges and in crevices of ledges and boulders in mts. of cen. and n. Trans-Pecos, June-Aug.; from s. Ut., n. Ariz. and s. Calif., w. to Tex. and n. Mex.

FAM. 88. HAMAMELIDACEAE R. BR.

WITCH-HAZEL FAMILY

Shrubs or trees with alternate simple leaves and deciduous stipules; flowers in heads or clusters, often polygamous or monoecious; calyx (when present) adherent to the base of the ovary; petals (when present) inserted on the calyx, narrow, valvate or imbricate in the bud; stamens numerous or twice as many as the petals and with half of them (those opposite the petals) sterile and changed into scales; ovary of 2 pistils united below and forming a 2-beaked 2-celled woody capsule that opens at the summit, usually with 1 or 2 anatropous seeds in each cell.

About 80 species in 22 genera in both hemispheres, chiefly tropical.

1. Shrubs with wavy-toothed pinnately-veined leaves; flowers with a definite calyx, perfect or polygamous, borne 2 or several on a short peduncle; capsule distinct, each cell with a single wingless bony seed; buds naked, stalked 1. *Hamamelis*, p. 726.
1. Trees monoecious, with palmately-veined and -lobed leaves; flowers with rudimentary calyx and no petals, in globular heads; capsules fused at base into a globular echinate head, each capsule with 1 or 2 winged seeds; buds scaly 2. *Liquidambar*, p. 727.

1. HAMAMELIS L.

WITCH-HAZEL

Tall shrubs or small trees with straight-veined deciduous short-petioled leaves and usually perfect flowers in small axillary pedunculate clusters or heads, the pubescence (when present) stellate; flowers usually surrounded by a scalelike 3-parted involucre; calyx 4-parted and with 2 or 3 bractlets at its base, the ovate obtuse lobes spreading and tomentose on outer surface; petals 4, liguliform, linear, spirally involute in the bud; stamens 4, very short, opposite the sepals, alternating with 4 scalelike staminodes; styles 2, short; capsule bivalvate, opening loculicidally from the top, elastically dehiscent; seed 1 in each cell, black, lustrous.

About 6 species in North America and Asia.

1. Flowering in autumn (Sept.-Dec.); calyx lobes yellowish to greenish on the smooth inner surface; petals mostly more than 15 mm. long 1. *H. virginiana*.
1. Flowering from midwinter to spring (Jan.-Apr.); calyx lobes reddish or orange-color on inner surface; petals mostly less than 12 mm. long 2. *H. vernalis*.

1. *Hamamelis virginiana* L. Coarse sparsely branched shrub or small tree to 5 m. tall, only occasionally sprouting from base; branchlets glabrous or sparsely pubescent and glabrate; leaves obovate to oval or suborbicular, rounded to cuneate or rarely subcordate at the oblique base, rounded to abruptly acute at apex, the margin undulate to crenate-dentate, prominently several-nerved, when mature to 15 cm. long and 75 mm. wide, glabrous to pubescent beneath or only sparsely pilose on the nerves; petals yellow; capsules obovoid, 1-1.5 cm. long, densely pubescent. *H. macrophylla* Pursh. Dry or moist woods in e. and cen. Tex., w. to Bandera Co. on the Edwards Plateau, Sept.-Dec.; from s. Que. to Minn., s. to Ga., Tex. and Mo.

2. *Hamamelis vernalis* Sarg. Similar in habit and appearance to *H. virginiana*. It differs from that species in its flowering season, the freely sprouting base of plants, more pubescent branchlets, the pale or glaucous lower surface of the essentially glabrous leaves, and the vividly colored inner surface of the calyx lobes. The yellow petals are also often reddish at base or sometimes throughout. Along streams in open woods in e. Tex., Jan.-Apr.; from s. Mo. and Okla. to Tex., La. and Ala.

2. LIQUIDAMBAR L.

Considered to be 3 species, one in America and 2 in Asia. Segregated by some authors into a separate family, Altingiaceae. The foliage is highly ornamental in the fall.

1. *Liquidambar styraciflua* L. SWEET-GUM, Tree to 40 m. tall or more, with grayish-brown furrowed bark and commonly with corky ridges on the branchlets, often exuding a gum said to be pleasant to chew; leaves deciduous, with slender petioles to 12 cm. long, rounded in outline, to 18 cm. long and 12 cm. wide, deeply 5- to 7-lobed to resemble a star, smooth and shining, fragrant when bruised, turning crimson in autumn, truncate to somewhat cordate at base, the triangular lobes acuminate and glandular-serrate; flowers unisexual, apetalous; *staminate flowers* intermixed with small scales in globose heads that are disposed in terminal racemes; *pistillate flowers* in slender-peduncled globose heads, consisting of more or less coherent 2-celled 2-beaked ovaries subtended by minute scales; styles 2, stigmatic along the inner surface; fruit globose, woody, to 3 cm. in diameter, on peduncles to 5 cm. long, the individual capsules opening between the persistent subulate rigid styles and producing 1 or 2 winged seeds, the capsules filled mostly with abortive seeds that resemble sawdust. In wet situations and in swampy woods in e. and s.-cen. (w. to Lee Co.) Tex., Mar.-May; from Fla. to Tex., Mex. and C. A., n. to s. Conn., s.e. N. Y., W. Va., s. O., s. Ind., s. Ill. and s.e. Mo.

FAM. 89. PLATANACEAE DUM.

PLANE-TREE FAMILY

Trees usually large, monoecious, with wide-spreading branches and mostly exfoliating bark; leaves deciduous, alternate, palmately lobed; petiole dilated and hollow at the base to envelope the axillary bud; stipules membranous, caducous, encircling the twig; flowers densely arranged in long-stemmed unisexual globose heads; calyx and corolla insignificant or sometimes wanting; *staminate flowers* with numerous sessile linear 2-celled anthers that are subtended by minute scales, the connective peltate at apex; *pistillate flowers* with numerous sessile carpels intermixed with scattered linear bracts; ovary tapered above, 1-celled, with a unilateral stigma extending for most of the length of the inner face of the linear-subulate style; fruit indehiscent, surrounded at the base by a tuft of long bristly tawny hairs that are directed upward parallel with and almost encompassing the fruit; seed orthotropous, one in each carpel, linear-fusiform.

Only one genus of uncertain relationship.

1. PLATANUS L.

SYCAMORE. PLANE-TREE. BUTTONWOOD

Characters of the family. About 10 species in the North Temperate Zone.

1. *Platanus occidentalis* L. Large tree to 50 m. tall and with a trunk to 4 m. in diameter; bark mottled brown and white or buff due to exfoliation; leaves broadly ovate to sub-orbicular or broadly reniform in outline, to about 2 dm. in diameter, truncate to cordate at base, essentially glabrous or with stellate pubescence on lower surface, 3- to 5-lobed, usually with broadly rounded shallow sinuses; leaf lobes mostly broadly triangular and acuminate, entire or with few long remote pointed teeth; fruiting heads 25 mm. or more in diameter, usually persistent on the tree during at least part of winter; fruit narrowly clavate, about 8 mm. long; seed brownish, about 6 mm. long. Incl. var. *glabrata* (Fern.) Sarg. and f. *attenuata* Sarg. Mostly along streams and in bottomlands throughout most of Tex. e. of Val Verde Co., Mar.-May; from Me., w. to Ont. and Neb., s. to n. Fla. and Tex.

FAM. 90. ROSACEAE JUSS.

ROSE FAMILY

Trees, shrubs or herbs; leaves alternate, simple or compound; stipules present, sometimes caducous to obsolete or wanting; flowers mostly perfect, regular or nearly so, having a floral cup ("hypanthium") formed by the fusion of the bases of sepals, petals and stamens (this appearing in some taxa with inferior ovaries to be merely the outer layer of the ovary wall); sepals usually 5, sometimes 3 to 8, rarely united at base, often appearing double by a row of outer bractlets; petals as many as the sepals, rarely wanting or numerous by "doubling," mostly imbricated in the bud and usually inserted with the stamens on the edge of the floral cup; stamens usually numerous, inserted near the edge of the floral cup; pistils one to many, distinct or united and sometimes adnate to the floral cup or hypanthium; ovules 1 to several in each carpel; endosperm scanty or absent; fruit a follicle, achene, pome or more or less aggregate drupelets or an achenelet.

This diverse family of plants perhaps comprise more than 2,000 species in about 100 genera. They are represented in most areas of the world but are most abundant in eastern Asia, North America and Europe. Its production of miscellaneous fruits edible to man is not surpassed by any other family of plants; among these are the apple, peach, pear, cherry, apricot, plum, almond, strawberry, raspberry and blackberry. Its contribution to ornamentals, epitomized by the rose, is of the highest importance. Many species provide food and forage for domestic and wild life.

1. Plants annual or perennial herbs above ground, unarmed, the caudex often somewhat woody (2)
1. Plants hardy or perennial shrubs or trees, if somewhat herbaceous then provided with prickles (9)
- 2(1). Fruit a dehiscent follicle, the superior ovary not enclosed in the calyx tube nor adherent to it 5. *Gillenia*, p. 731.
2. Fruit or carpels indehiscent (3)
- 3(2). Ovaries several to many, borne on a broad to elongate receptacle, not enclosed by the calyx (4)
3. Ovaries one to many, becoming achenes that are covered by the calyx (7)
- 4(3). Styles persistent and elongating after anthesis, plumose or jointed 12. *Geum*, p. 745.
4. Styles not elongate after anthesis, mostly deciduous (5)
- 5(4). Receptacle dry, not greatly enlarged in fruit 11. *Potentilla*, p. 744.
5. Receptacle pulpy and greatly enlarged in fruit (6)
- 6(5). Bractlets of calyx similar to the narrow calyx lobes; petals white or pinkish; receptacle becoming very juicy and edible 9. *Fragaria*, p. 743.
6. Bractlets much broader and longer than the calyx lobes; petals yellow; receptacle spongy, insipid and dryish 10. *Duchesnea*, p. 744.

- 7(3). Leaves palmate or palmately lobed; calyx with bractlets alternating with the 4 lobes; petals none14. *Alchemilla*, p. 750.
7. Leaves pinnate; calyx without bractlets; inflorescence spicate or spicate-racemose (8)
- 8(7). Calyx beset with hooked bristles, the 5-cleft limb closed after flowering and persistent; petals yellow18. *Agrimonia*, p. 751.
8. Calyx not bristly, the 4 petaloid lobes white or purple, deciduous in fruit; petals none19. *Sanguisorba*, p. 752.
- 9(1). Carpel solitary; fruit a dry or fleshy usually 1-seeded drupe (plumlike); leaves simple; flowers white or greenish, in racemes or corymbs, sometimes solitary in the leaf axils21. *Prunus*, p. 756.
9. Carpels more than one or (if solitary) the fruit an achene (10)
- 10(9). Ovary inferior, enclosed by and adnate to the calyx tube (hypanthium) which becomes more or less fleshy; fruit a pome (applelike or berrylike); calyx lobes more or less persistent at apex of fruit; petals white (11)
10. Ovary superior; calyx tube not fleshy and enclosing the pistils or (if so) not adnate to them (13)
- 11(10). Plants typically armed with strong woody spines; mature carpels hard and bony, 1 to 5, free or coherent in the pulpy fruit 8. *Crataegus*, p. 734.
11. Plant unarmed; mature carpels papery or soft-cartilaginous (12)
- 12(11). Carpels of the compound ovary as many as the styles, without false or partial partitions; fruit a pome or berrylike 6. *Pyrus*, p. 731.
12. Carpels of the compound ovary subdivided by partial (false) partitions projecting inward from the back; fruit berrylike 7. *Amelanchier*, p. 732.
- 13(10). Calyx tube enclosing the numerous carpels, becoming fleshy; fruit (hips) simulating a pome, crowned by the persistent calyx lobes20. *Rosa*, p. 752.
13. Calyx tube not enclosing the carpels or not becoming fleshy (14)
- 14(13). Fruits becoming juicy and more or less edible; stems usually armed with prickles13. *Rubus*, p. 746.
14. Fruits not becoming juicy; stems without prickles (15)
- 15(14). Carpels becoming dehiscent capsules or follicles that contain usually more than one seed (16)
15. Carpels becoming indehiscent 1-seeded achenes or sometimes tardily dehiscent in *Holodiscus* (18)
- 16(15). Seeds with a thin elongate terminal wing; leaves evergreen, simple 3. *Vauquelinia*, p. 730.
16. Seeds not winged; leaves deciduous (17)
- 17(16). Plants tall shrubs more than 100 cm. high, solitary or forming thickets; leaves large, rounded-cordate, usually shallowly 3-lobed; flowers in corymbs; fruits much-inflated 1. *Physocarpus*, p. 730.
17. Plants undershrubs less than 15 cm. high, forming mats over boulders and ledges; leaves small, spatulate, entire; flowers in dense spikelike inflorescences; fruits not inflated 2. *Petrophytum*, p. 730.
- 18(15). Flowers in panicles, very numerous and small; leaves simple, deeply cleft or coarsely toothed 4. *Holodiscus*, p. 731.
18. Flowers solitary or in few-flowered cymes or fascicles (19)
- 19(18). Petals normally none; leaves entire or merely dentate; pistil solitary 17. *Cercocarpus*, p. 751.
19. Petals present; leaves usually deeply cleft or pinnatifid (20)
- 20(19). Bark exfoliating; bractlets present, alternating with the sepals; achenes with purplish or lavender tails15. *Fallugia*, p. 750.
20. Bark not exfoliating or tardily so; bractlets none; achenes with white tails 16. *Cowania*, p. 750.

1. PHYSOCARPUS MAXIM.

About a dozen species; one in Manchuria, the others in North America.

1. *Physocarpus monogynus* (Torr.) Coult. MOUNTAIN NINEBARK. Shrub usually less than 1 m. high, with usually decumbent stems and exfoliating bark; branches brownish, glabrous to sparingly stellate-pubescent; leaves alternate, with petioles 15 mm. long or less, suborbicular-ovate to reniform, usually deeply palmately 3- or 5-lobed, incised, 1-4 cm. long, glabrous or nearly so and green on both sides; terminal corymbs few- to many-flowered; bracts lanceolate, caducous; pedicels 1-1.5 cm. long, usually sparingly stellate-pubescent; hypanthium hemispheric, about 3 mm. wide, stellate-pubescent; sepals 5, persistent, ovate-lanceolate to elliptic, usually obtuse, densely stellate-pubescent on both sides; petals 5, white, orbicular, spreading, about 3 mm. long; stamens 20 to 40, on a disk clothing the mouth of the hypanthium; filaments long, slender, filiform; anthers didymous; pistils 2 or 3, more or less united at the base; styles filiform, terminal; stigmas capitate; follicles 2 or 3, united to above the middle, densely stellate-pubescent, 3-5 mm. long, with ascending-spreading beaks, opening along both sutures; seeds over 1.5 mm. long, usually 2, obliquely pyriform, shining, with a bony coat. Rare on seepage ledges in canyons of the Guadalupe Mts. in the Trans-Pecos, Apr.-June; from Tex. to S. D., Wyo. and N. M.

2. PETROPHYTUM RYDB.

ROCK-SPIRAEA

About 4 species native to western North America.

1. *Petrophytum caespitosum* (Nutt.) Rydb. A densely caespitose undershrub with short stout branches, forming large flat mats that are appressed to the rock face; season's shoots very short; leaves persistent, crowded on the short branches, spatulate to narrowly oblanceolate, usually 5-12 mm. long and 2-4 mm. wide, sometimes to 4 cm. long, densely silky, 1-ribbed or very rarely 3-ribbed, somewhat coriaceous, obtuse or mucronate; peduncles 3-10 cm. high, silky, with subulate bractlike leaves; racemes short, 1-5 cm. long, dense, usually simple; pedicels 1-2 mm. long; flowers perfect; hypanthium 1 mm. deep, hemispheric, densely silky; sepals 5, valvate, triangular-ovate, acute, about 1.5 mm. long; petals 5, imbricate, white, linear to spatulate, obtuse, 2-2.5 mm. long; stamens about 20; filaments filiform, distinct, about twice as long as the sepals; disk evident, entire-margined; pistils 3 to 5; ovary and lower part of the style densely pubescent; style filiform, terminal; stigma minute, entire; ovules 2 to 4, pendulous; follicles 3 to 5, about 2 mm. long, dehiscent along both sutures; seeds linear. *Eriogynia caespitosa* (Nutt.) Wats., *Spiraea caespitosa* Nutt. On faces of boulders, cliffs, and ledges on the Edwards Plateau and in the mts. of the Trans-Pecos, July-Sept.; from Tex., n. to S. D. and Mont., w. to Calif.

3. VAUQUELINIA H. & B.

About 9 species in southwestern United States and Mexico.

1. *Vauquelinia angustifolia* Rydb. GUAUYUL, PALO PRIETO. Shrub 3-5 m. high, with a trunk 5-10 cm. in diameter; bark of the young ascending twigs glabrous and light greenish-brown, that of the old branches chestnut-brown and more or less fissured and cracked; stipules small, deciduous; petioles 1-2 cm. long, glabrous; leaf blades linear, 5-10 cm. long, 1 cm. wide or less, coriaceous, shining dark-green above, yellowish-green beneath, acute at each end, sharply dentate, strongly reticulate; corymbs rather small, glabrous; bracts subulate, 5-8 mm. long; flowers perfect, fragrant; hypanthium short-turbinate, glabrous without, villous at the base within; sepals 5, ovate, nearly 2 mm. long, glabrous without, villous on the margins within, persistent, coriaceous, valvate; petals 5, imbricate, deciduous, orbicular to broadly elliptic, 4-5 mm. long, usually notched at apex; stamens 15 to 25, slightly shorter than the petals, inserted on the margin of the disk, subequal; filaments subulate; anthers didymous, versatile; carpels 5, opposite the sepals, connate into a 5-celled ovoid densely tomentose capsule; styles 5, short, parallel, at last deciduous; stigmas capitate; fruit ovoid, woody, about 6 mm. long, densely pubescent.

On rocky slopes in chaparral and in canyons of Chisos Mts. in the Trans-Pecos, June-Aug.; also n. Mex.

4. HOLODISCUS MAXIM.

About 8 species that are native to the Western Hemisphere.

1. *Holodiscus discolor* (Pursh) Maxim. RUSH ROCK-SPIRES, BUSH ROCK-SPIRES. Shrubs to 4 m. high, usually much smaller, more or less branched from the base, with exfoliating bark, the young twigs villous; leaves alternate, 1-10 cm. long, broadly ovate to broadly oval or suborbicular, mostly broadly or narrowly cuneate but sometimes almost truncate at base and mostly somewhat decurrent on the petiole, rounded at apex, simply or somewhat doubly toothed on the margins above, bright-green and sparingly pubescent to glabrate on upper surface, sparsely long-pubescent to tomentose on lower surface; inflorescence racemose to paniculate, to 2 dm. long; hypanthium somewhat saucer-shaped; sepals ovate-lanceolate to oblong-lanceolate, about 1.5 mm. long; petals 5, broadly ovate to elliptic, 1.5-2 mm. long; disk more or less developed, bearing about 20 stamens; anthers didymous; pistils 5, alternate with the 5 sepals, pubescent; styles terminal; fruit indehiscent, one-seeded, stipitate, laterally flattened. *H. dumosus* (Nutt.) Heller and var. *australis* (Heller) Ley. Base of cliffs, rocky-bouldery open-forested slopes and high canyons in mts. of the Trans-Pecos, June-Sept.; from w. Tex. to Ore. and Calif.; n. Mex.

Some plants found on the summit of the Davis and Guadalupe mts. are referable to var. *discolor* while all others in Texas are referable to var. *dumosus* (Nutt.) Maxim. The Guadalupe Mt. plants have large leaves to 10 cm. long with the blade very little decurrent on the prominent petiole and its lower surface merely long-pubescent instead of being densely villous-tomentose.

5. GILLENIA MOENCH INDIAN-PHYSIC

Only two species, another in northeastern United States and Canada.

1. *Gillenia stipulata* (Muhl.) Baill. AMERICAN-IPECAC. Perennial herb with horizontal rootstock and almost sessile 3-foliolate leaves; stems to 1 m. long, more or less pubescent; stipules ovate to orbicular, double-toothed to lacinate, 1-3 cm. long; lower leaves incised or lacinate with acuminate teeth, the upper leaves deeply and sharply double-serrate; leaflets lanceolate, 5-8 cm. long, acuminate, thin, more or less pubescent on both sides; paniculate corymb lax, leafy; hypanthium 4-5 mm. long, 3-3.5 mm. thick; calyx slender, somewhat constricted at the throat; sepals 5, lance-ovate, acute or somewhat acuminate; petals 5, oblanceolate, clawed, white or pinkish, 12-15 mm. long; stamens 20, included, the outer 10 much longer; follicles 5, included, 6-8 mm. long, puberulent; seeds 2 to 4, oval, 3 mm. long, longitudinally rugulose. *Porteranthus stipulatus* (Muhl.) Britt. Woods, thickets and rocky slopes in n.e. Tex., Apr.-June; from Ga. and Ala. to Tex., n. to N.Y., O., Ind., Ill., Mo. and Kan.

6. PYRUS L. PEAR

Trees or shrubs with alternate simple often toothed or lobed leaves; flowers showy, in corymbed or umbel-like cymes; calyxlike receptacle (hypanthium) globose to obconic, urceolate, bearing 5 lobes; petals 5, orbicular to obovate; stamens numerous; styles 2 to 5; fruit a large fleshy pome or smaller and berrylike, the 2 to 5 cells imbedded in the flesh, papery or cartilaginous, mostly 2-seeded.

About 50 species mainly in the North Temperate Zone.

1. Shrubs with slender ascending to spreading branches; leaves glandular along the midrib on upper side; inflorescence simple to more or less compound; petals mostly less than 1 cm. long and 7 mm. wide; fruit small and berrylike, rarely as much as 10 mm. in diameter 1. *P. arbutifolia*.
1. Trees or coarse shrubs often with spinescent branchlets; leaves not glandular along midrib; cyme simple and umbelliform or simply racemose; petals large (1-2 cm. long, 8-15 mm. wide); fruit rarely less than 15 mm. in diameter (2)

- 2(1). Leaves involute in bud and before expanding, never lobed; petals white; anthers reddish; orifice of concave receptacle partly or nearly closed by a disklike cushion; styles free to base; flesh of fruit with grit-cells; introduced and commonly cultivated 2. *P. communis*.
2. Leaves convolute or folded lengthwise in bud and before expanding, often lobed; petals roseate to white; anthers yellow or red; orifice of receptacle open; styles united at very base; fruit (in ours) subglobose and without grit-cells; native species (3)
- 3(2). Calyx glabrous or sparsely pilose and glabrescent on outside; leaves glabrous at maturity 3. *P. angustifolia*.
3. Calyx densely and permanently pannose-tomentose on the outside; leaves permanently pubescent on lower surface 4. *P. ioensis*.

1. *Pyrus arbutifolia* (L.) L.f. **RED CHOKEBERRY**. Colonial shrub or small slender tree (spreading by subterranean offsets) to 7 m. high, usually much smaller; branches slender, loosely ascending, the new branchlets gray- or white-tomentose; leaves broadly oblanceolate to narrowly obovate or elliptic, to 9 cm. long, tapering to the base, acute to short-acuminate or apiculate, dark-green and glabrous (except for glandular midrib) above, densely pannose-tomentose and pale beneath to rarely glabrous, crenate-serrate, in maturity to 9 cm. long and 4 cm. wide; flower clusters terminal on the stem and short axillary branches, 1.5-6 cm. broad, as many as 25-flowered, the rachis and pedicels tomentulose; flowers about 1 cm. broad; hypanthium tomentose; sepals bearing stipitate glands; petals white or pink-tinged; fruit obovoid to subglobose, bright- or dull-red, 5-7 mm. in diameter. *Aronia arbutifolia* (L.) Ell. and f. *macrophylla* (Hook.) Rehd. Low woods, thickets, swamps, wet pine barrens and bogs in e. Tex., Mar.-May; from Fla. to Tex., n. to N. S., N. Y., Ont., Mich. and Mo.

2. *Pyrus communis* L. **COMMON PEAR, PEAR**. Small tree of pyramidal habit, to about 15 m. high, sometimes spiny; branchlets glabrous or glabrate; leaves involute in the bud and (on expanding) orbicular-ovate to elliptic, acuminate at apex, to 8 cm. long, glabrous or promptly glabrate, with crenate margins; petioles 2-5 cm. long; flowers in umbelliform raceme, 2.5-3 cm. across; pedicels 1.5-3 cm. long; petals white, broadly oblong; hypanthium nearly closed by a ring of tissue at the summit, surrounding the free style; fruit pyriform to obovoid, large, the flesh with abundant grit-cells. A nat. of Euras. that has escaped from cult. in e. Tex. to thickets, edge of woods and clearings, Apr.-May.

3. *Pyrus angustifolia* Ait. **WILD CRAB APPLE**. Trees to 8 m. high or colonial shrubs; slender flowering branchlets and leaves glabrous or promptly glabrate; leaves of fertile often spinescent branchlets oblong or narrowly elliptic, round-tipped, blunt or merely short-mucronate, tapering to the base, entire to crenate-dentate or serrate, firm, often evergreen, in maturity to 75 mm. long and 3 cm. broad; sprout leaves much larger, coarsely toothed or lobate, to 9 cm. long and 7 cm. broad; pedicels and hypanthium sparsely villous or glabrous; flowers about 25 mm. across; calyx glabrous outside, tomentose within; petals roseate, fading to white; fruit 2-3 cm. in diameter, yellowish-green, the sepals often deciduous. *Malus angustifolia* (Ait.) Michx. In woods, bottoms and thickets in s.e. Tex., spring-summer; from Fla. to Tex., n. to Md., Va., Ky. and Mo.

4. *Pyrus ioensis* (Wood) Bailey. **WILD CRAB**. Tall shrub or small tree of irregular habit, to 10 m. high; branchlets tomentose; leaves firm, ovate-oblong to broadly elliptic, to 1 dm. long, obtuse to short-acuminate, coarsely serrate and rarely also shallowly lobed, persistently pubescent on lower surface; pedicels stout, 2-3.5 cm. long, tomentose; flowers 3.5-4 cm. across; anthers pink or salmon-color; fruit subglobose, green, waxy, about 25 mm. in diameter. Incl. var. *texana* (Rehd.) Bailey, *Malus ioensis* (Wood) Britt. and var. *texana* Rehd., (?) *M. Soulardii* (Bailey) Britt. On limestone slopes, along creeks and at head of draws on the Edwards Plateau, spring-summer; from Wisc., Minn. and Neb., s. to Ark., Okla. and Tex.

7. AMELANCHIER MEDIC. JUNE-BERRY. SUGAR-PLUM.
SHAD-BUSH. SERVICE-BERRY. SARVICE-BERRY

Shrubs or small trees with simple deciduous leaves and unarmed branches; flowers racemose or rarely solitary; hypanthium campanulate, more or less adnate to the ovary;

sepals 5, narrow, persistent and usually reflexed; petals 5, white, ascending; stamens numerous; filaments subulate; styles 2 to 5, connate, pubescent at the base; ovary wholly or partly inferior, the cells becoming twice as many as the styles by false partitions intruding from the back; fruit a berrylike pome, 4- to 10-celled.

About 25 species that are natives of the North Temperate Zone. Some species are cultivated for their ornamental value or for their edible fruits.

1. Trees with thin-herbaceous leaves 40 mm. long or more that are finely serrulate to near the base; pedicels slender, with 2 or 3 bracteoles scattered about the middle; petals about 15 mm. long; in northeast Texas1. *A. arborea*.
1. Shrubs or small trees with subcoriaceous to coriaceous leaves mostly 35 mm. long or less that are coarsely toothed above the middle; pedicels stout, with a pair of bracteoles on or just beneath the hypanthium; petals 10 mm. long or less; in the mountains of Trans-Pecos Texas (2)
- 2(1). Leaves mostly about 30 mm. long, glabrous or essentially so, the margins with rounded apiculate teeth; petals oblanceolate, 8-10 mm. long; sepals narrowly triangular-lanceolate, 3-4 mm. long2. *A. utahensis*.
2. Leaves mostly 15 mm. long or less, permanently pubescent on the lower surface with contorted whitish hairs, the margins with sharp spreading teeth; petals suborbicular, about 4 mm. long; sepals suborbicular-ovate, 1.5-2 mm. long3. *A. denticulata*.

1. *Amelanchier arborea* (Michx. f.) Fern. Fastigate shrub or slender tree to 20 m. high and a trunk to 4 dm. in diameter; overwintering buds 6-13 mm. long; expanding leaves green above, densely white-tomentose on lower surface, small and folded at flowering time; mature leaf blades ovate to oblong-oval or slightly obovate, acuminate at apex, cordate or rounded at base, to 1 dm. long and 5 cm. wide, retaining some pilosity on lower surface and on the petioles, sharply and often doubly serrate, the long teeth usually 6 to 10 per cm.; racemes rather close, nodding, 3-5 cm. long; lower pedicels to 17 mm. long; hypanthium 2.5-3.5 mm. in diameter; sepals broadly oblong-triangular, obtuse or abruptly pointed, soon strongly reflexed from base; petals white, linear to narrowly oblong, 1-1.4 cm. long, sometimes roseate; fruit reddish-purple, dry, insipid. In rich woodlands along streams, in thickets and on open wooded slopes in n.e. Tex., Mar.-May; from Fla. to Tex. and Okla., n. to N. B., Que., Ont., Mich. and Minn.

2. *Amelanchier utahensis* Koehne. UTAH SERVICE-BERRY. Shrub or small trees to 5 m. high, with gray or brownish branches; leaves suborbicular to oval or sometimes obovate, rounded to somewhat acute at apex, rounded to subcordate at base, 1-4 cm. long, as wide as long, coarsely crenate-serrate to near the base, pale-green, finely tomentose and somewhat canescent; racemes 2-3 cm. long; flowers slightly ill-scented; sepals narrowly lanceolate, short-villous; petals white, elliptic, about 7 mm. long; fruit 7-8 mm. in diameter, yellow, reddish to purplish-black, insipid, puberulent. *A. alnifolia* of auth. In limestone soil on steep canyon slopes among boulders in the Guadalupe Mts. of the Trans-Pecos, fruiting Aug.-Sept.; from Tex. and N.M., w. to Wash., Ore. and Calif.

3. *Amelanchier denticulata* (H.B.K.) Koch. Shrubs 1-3 m. high; branchlets gray or brown when dry, grayish-tomentose when young, becoming glabrous; winter buds small, tomentose; leaves persistent, coriaceous, elliptic to obovate or orbicular, 5-15 mm. long, 3-10 mm. wide, truncate to rounded or acute and mucronulate at apex, shortly cuneate to rounded or truncate at base, the margins denticulate with 4 to 8 spreading acute teeth, glabrous and glossy above, closely grayish-tomentose beneath with the midvein prominent; petioles 2-4 mm. long, more or less tomentose; flowers somewhat fetid, about 1 cm. across, in short compact few-flowered corymbs; rachis and pedicels glabrous or pubescent, 3-6 mm. long; bracts persistent, carinate, lanceolate, green, ciliate, otherwise glabrous, about 2 mm. long; sepals suborbicular, about 2 mm. long and 2.5 mm. wide, rounded at the apex, ciliate, otherwise glabrous, green, soon reflexed; petals white, suborbicular to reniform, veiny, about 4 mm. long and 5 mm. wide, glabrous; stamens 20; filaments glabrous, minutely papillose; anthers 1-1.5 mm. long; hypanthium glabrous outside, campanulate, 3-4 mm. long and in diameter; styles 3, glabrous, free to the base, 2.5-3 mm. long; fruits in clusters of as many as 4, ellipsoid to subglobose, glabrous, purplish-black, 6-8 mm. thick. *Malacomeles denticulata* (H.B.K.) C. N. Jones. On talus slopes, about rimrock and in canyons in mts. of the s. Trans-Pecos, fruiting Aug.-Oct.; Tex., s. to Guat.

The Pacific service-berry, *A. florida* Lindl., has been reported from Texas, doubtlessly based upon a misdetermination of this species.

8. CRATAEGUS L.⁷⁷

HAWTHORN. RED HAW. THORN

Small trees or shrubs with usually crooked thorny branches and simple serrate or variously lobed deciduous leaves; leaves at the ends of vegetative shoots differently shaped, large and usually more deeply cut than those on the flowering branchlets; flowers solitary or commonly in corymbs; calyx tube campanulate or obconic, its limb 5-parted; petals normally 5, deciduous; stamens usually 5 to 20, in 1 to 3 series; filaments filiform; anthers oblong, white, yellow or some shade of red; styles 1 to 5, distinct; fruit a pome with 1 to 5 bony usually 1-seeded nutlets.

There are close to 1,000 specific proposals that have been made in this primarily North American genus. There is no way to estimate the number of valid species that might occur. Species comprising some Series, such as *Molles* and *Virides*, seem to intergrade imperceptibly into each other. Although we are inclined to combine even more of these than have been combined thus far, the conclusions of E. J. Palmer have been followed as closely as possible since our treatment is derived and adapted from his various published contributions regarding this genus. Palmer considered the primary taxonomic characters, in descending order of importance, to be color of anthers, number of stamens, the pubescent or non-pubescent condition of the corymb at time of flowering, and, lastly, general shape of the leaves. He was of the opinion that if these characteristics were used in combination species determinations could be made.

In regard to the three Series, *Crus-galli*, *Molles* and *Virides*, some authors, with apparent good reason, tend to unite most of the proposed segregates in each Series into one collective species or, at most, several entities. Hybrid incidence is high in this genus. Because of this an unusual degree of instability exists, and an entity that is described as a species may, in fact, be a hybrid.

The fruit of many species are edible and make fine jellies and preserves, and most have ornamental qualities.

1. Primary veins of the larger leaves running to the sinuses as well as to the points of the lobes (2)
1. Primary veins of the leaves running only to the points of the lobes, very rarely with some running to sinuses (3)
- 2(1). Leaves mostly broadly ovate in outline, often as broad as long, deeply incised and sharply serrate-laciniate, rounded to cordate at base; calyx densely woolly-pubescent outside; anthers red; fruit oblong 1. *C. Marshallii*.
2. Leaves mostly narrowly obovate to spatulate, unlobed or nearly so except at the ends of the branchlets, cuneate or attenuate at base; calyx glabrous or sparsely pubescent outside; anthers pale-yellow; fruit subglobose 2. *C. spathulata*.
- 3(1). Thorns short and stout, rarely slender or more than 2 cm. long; fruits blue or black at maturity (4)
3. Thorns usually long and slender, typically more than 4 cm. long, rarely absent; fruits red, yellow or remaining green at maturity (5)
- 4(3). Leaves mostly abruptly pointed or rounded at the apex, lustrous above; fruit blue and glaucous at maturity; in eastern Texas 3. *C. brachyacantha*.
4. Leaves mostly acute to acuminate at the apex, dull-green above; fruit grading from purple to black, lustrous but not glaucous; in northwestern Texas 4. *C. rivularis*.
- 5(3). Flowers single or 2 to 5 in simple clusters; stamens 20 to 25 (6)
5. Flowers usually more numerous, as many as 20 in simple or compound cymes or corymbs; stamens 5 to 20 (7)

⁷⁷ Adapted from various publications by E. J. Palmer, mainly in Robert A. Vines, *Trees, Shrubs, and Woody Vines of the Southwest*, pp. 329-387. 1960.

- 6(5). Leaves 35 mm. or more long, typically oblong-elliptic, the margins subentire and with minute glands; flowers usually 2 or several together 5. *C. opaca*.
6. Leaves mostly 30 mm. long or less, typically obovate-cuneate, the margins regularly crenate-serrate above the middle; flowers typically solitary 6. *C. uniflora*.
- 7(5). Flowers opening in April or May; nutlets pitted on ventral surface 7. *C. Calpodendron*.
7. Flowers opening in late March and April; nutlets plane on ventral surface (8)
- 8(7). Foliage and inflorescence glandular, usually conspicuously so 8. *C. Pearsonii*.
8. Foliage and inflorescence eglandular or (if slightly glandular) the glands small and soon deciduous (9)
- 9(8). Leaves mostly ovate or deltoid in outline, broadest below the middle, often obtusely rounded to truncate or subcordate at base (Ser. *Molles*: *C. mollis* and its variant entities) (10)
9. Leaves mostly narrowly obovate to cuneate or oblong-obovate, usually narrowed or somewhat attenuate to the base, unlobed or very obscurely lobed except those at the ends of branchlets (these are sometimes broadly obovate to oval or suborbicular) (17)
- 10(9). Leaves of flowering spurs mostly oval or ovate, rounded at base; leaves of terminal shoots broadly ovate, often truncate or subcordate at base (11)
10. Leaves of flowering spurs mostly elliptic or ovate-oblong, noticeably longer than broad, gradually or abruptly narrowed at base; leaves of terminal shoots broader, usually rounded or rarely truncate at base; sepals glandular-serrate; fruit red at maturity (15)
- 11(10). Fruit bright-yellow at maturity 9. *C. viburnifolia*.
11. Fruit bright-red at maturity (12)
- 12(11). Leaves often as broad as long, relatively small; leaves of terminal shoots sometimes broader than long 10. *C. brachyphylla*.
12. Leaves longer than broad (except rarely at the ends of shoots) (13)
- 13(12). Mature leaves thick or subcoriaceous; flowers 5 to 12 in a corymb 11. *C. Greggiana*.
13. Mature leaves firm but comparatively thin; flowers numerous, as many as 20 in a corymb (14)
- 14(13). Fruit ripening in August and September, the flesh succulent and edible; nutlets usually 5, occasionally 4 12. *C. mollis*.
14. Fruit ripening in October, the flesh dry and mealy; nutlets 3 to 5 13. *C. limaria*.
- 15(10). Mature leaves thick; sepals foliaceous, deeply glandular-serrate; anthers large, dark-red; fruit with thick mellow flesh, edible 14. *C. texana*.
15. Mature leaves relatively thin; sepals not foliaceous, more or less glandular-serrate; fruit with thin dry or mealy flesh, scarcely edible (16)
- 16(15). Anthers white or pale-yellow; sepals laciniately glandular-serrate; nutlets 3 to 5 15. *C. invisia*.
16. Anthers pink or rose-color; nutlets 5, occasionally 4 ... 16. *C. brazoria*.
- 17(9). Leaves of flowering branchlets mostly obovate or oblong-obovate, seldom over 2-3 cm. wide, mostly thick or firm, glossy above in most species; fruit remaining hard and often green at maturity; nutlets commonly 1 to 3, rarely as many as 5 (Ser. *Crus-galli*: *C. crus-galli* and its variant entities) (18)
17. Leaves of flowering branchlets usually rhombic to somewhat obovate or sometimes ovate, typically narrowed at base, relatively thin, dull-green above; fruit becoming soft or mellow with age; nutlets 3 to 5 (Ser. *Virides*: *C. viridis* and its variant entities) (28)

- 18(17). Foliage and inflorescence glabrous or essentially so (19)
18. Foliage and inflorescence pubescent while young and usually throughout the season. (26)
- 19(18). Mature leaves comparatively thin, not subcoriaceous, yellowish-green, slightly lustrous but not glossy above17. *C. sabineana*.
19. Mature leaves thick or subcoriaceous and glossy above (except in some shade forms) (20)
- 20(19). Leaves mostly obovate or spatulate, distinctly longer than broad, broadest above the middle (except sometimes at the ends of branchlets) (21)
20. Leaves broader, mostly broadly obovate to oblong-obovate or oval, only slightly longer than broad or often as broad as long at the ends of shoots. (23)
- 21(20). Serration of the leaves shallow or crenate; fruit 6-10 mm. thick; nutlets usually 218. *C. pyracanthoides*
21. Serration of the leaves sharp with acute teeth; fruit 8-12 mm. thick; nutlets 1 to 3, usually 1 or 2 (22)
- 22(21). Leaves of terminal shoot unlobed or rarely very obscurely lobed; flowers 1-1.5 cm. across; stamens about 1019. *C. crus-galli*.
22. Leaves of terminal shoot often slightly lobed; flowers about 2 cm. across; stamens about 2020. *C. Bushii*.
- 23(20). Young leaves quite glabrous; leaves of terminal shoot usually broadly ovate to suborbicular (24)
23. Young leaves sometimes slightly villous but soon glabrous (25)
- 24(23). Flowers 16-20 mm. across; fruit 11-13 mm. thick, subglobose; terminal leaves broadly oval to suborbicular, often with several small shallow lobes21. *C. Reverchonii*.
24. Flowers about 13 mm. across; fruit about 6 mm. thick, ellipsoidal; leaves oblong-obovate22. *C. cherokeeensis*.
- 25(23). Leaves of terminal shoot broadly obovate to elliptic, glabrous at maturity, unlobed but deeply and irregularly serrate; flowers mostly 5 or 6 in compact corymbs; stamens 20, the anthers pink23. *C. sublobulata*.
25. Leaves of terminal shoot ovate to oval or obovate, pale-villous below at maturity24. *C. Warneri*.
- 26(18). Leaves mostly broadly oval to suborbicular or rhombic, usually broadest about the middle25. *C. Tracyi*.
26. Leaves mostly obovate to oblong-obovate, typically broadest above the middle (27)
- 27(26). Flowers mostly 4 or 5 in compact corymbs; stamens about 20, the anthers pale-yellow or (in variants) rose-color26. *C. berberifolia*.
27. Flowers mostly 8 to 12 in loose corymbs; stamens about 10, the anthers usually pink or rarely white27. *C. Engelmannii*.
- 28(17). Mature leaves and inflorescences glabrous or essentially so (29)
28. Foliage and inflorescence conspicuously pubescent while young, the leaves more or less pubescent throughout the season (31)
- 29(28). Leaves thick or subcoriaceous at maturity, glossy above; nutlets 3 to 528. *C. glabriuscula*.
29. Leaves firm but comparatively thin at maturity, dull-green above; nutlets normally 5 (30)
- 30(29). Leaves variable in shape, mostly ovate-oblong or oblong-elliptic, glabrous; anthers pale-yellow or rarely pink29. *C. viridis*.
30. Leaves more uniform in shape, mostly ovate or ovate-oblong, pubescent above as they unfold, soon glabrous; anthers pink30. *C. sutherlandensis*.
- 31(28). Mature leaves comparatively thin; flowers mostly 8 to 15 in a corymb; fruit subglobose31. *C. anamesa*.
31. Mature leaves thick or coriaceous, pubescent while young, with age becoming glabrous and glossy above and slightly hairy along the veins beneath (32)

- 32(31). Flowers 2 cm. wide or more, mostly 10 to 20 in a corymb; sepals narrowly lanceolate, long-acuminate 32. *C. stenosepala*.
 32. Flowers less than 2 cm. wide, mostly 5 to 15 in a corymb; sepals lanceolate to deltoid-lanceolate, with a broad base 33. *C. poliophylla*.

1. *Crataegus Marshallii* Eggl. PARSLEY HAWTHORN. Shrub or small tree to 8 m. high, with slender thorny or sometimes thornless branchlets pubescent while young and thin scaly bark; leaves broadly ovate to deltoid-ovate, sharply serrate and deeply incised with 2 or 3 pairs of lateral lobes often coarsely toothed or again cleft at the ends, pubescent while young, thin, glabrous above, often slightly pubescent along the veins beneath; petioles slender, half to as long as or longer than the blades; flowers 1-1.5 cm. across, numerous in pubescent corymbs; stamens about 10; anthers red; calyx lobes lanceolate, entire or nearly so; fruit oblong to obovoid, 5-9 mm. long, 4-8 mm. thick, bright-red, with thin succulent flesh and 1 to 3 (usually 2) nutlets. *C. apiifolia* Michx. Sandy woods, hillsides, fencerows and pastures in e. Tex., fruiting Sept.-Oct.; from Va. to Fla., w. along the Coastal Plain to Tex., n. in the Miss. Valley to s.e. Mo.

2. *Crataegus spathulata* Michx. PASTURE HAW. Shrub or tree 5-7 m. high, with stoutish usually thorny horizontal branchlets and thin scaly or smooth gray bark; leaves of flowering branchlets narrowly obovate, mostly 1-2 cm. long and to 1 cm. wide, with several coarse rounded teeth or small lobes above the middle or near the apex, gradually narrowed to the entire base, firm, glabrous at maturity, glossy above, with strongly ascending or nearly parallel obscure veins; petioles one fourth to half as long as the blades; flowers 6-8 mm. across, numerous in compact glabrous corymbs; stamens about 20; anthers pale-yellow; calyx lobes deltoid, entire, persistent on fruit; fruit subglobose, 4-7 mm. thick, red, with thin mellow flesh and 3 or 4 nutlets. *C. microcarpa* Lindl. Sandy or sandy clay woods, fencerows and pastures in e. Tex., fruiting Oct.-Nov.; from Fla. to Tex., n. to Va. and s. Mo.

3. *Crataegus brachyacantha* Sarg. & Engelm. BLUEBERRY HAWTHORN. Tree to 15 m. high; branchlets light-green and slightly pubescent early in the season, soon becoming glabrous and ultimately ashy-gray in color, armed with numerous short stout somewhat curved spines that are rarely to 2 cm. long; leaves oblong-obovate to somewhat rhombic, abruptly pointed or rounded at the apex, gradually narrowed to the cuneate base, crenulate-serrate above with minute incurved glandular teeth, somewhat pubescent at first; mature leaves subcoriaceous, glabrous, lustrous, dark-green, to 5 cm. long and 25 mm. wide; flowers numerous in crowded glabrous corymbs, on slender pedicels, about 8 mm. wide; sepals short, triangular, narrowed to a gland-tipped apex; stamens 15 to 20; anthers yellow; fruit subglobose to obovoid, on erect pedicels, 8-13 mm. thick, bright-blue, covered with a glaucous bloom; nutlets 3 to 5. Borders of streams in rich soil in e. Tex., fruiting Aug.-Sept.; in Ark., La. and Tex.

4. *Crataegus rivularis* Nutt. Tree occasionally to 6 m. high; branchlets slender, reddish-brown, lustrous, unarmed or armed with straight slender spines usually about 25 mm. long; leaves lanceolate to oblong-obovate or elliptic, acute to acuminate at apex, gradually narrowed to a concave-cuneate base, very finely crenately serrate above with glandular teeth, about 5 cm. long and 18 mm. wide; petioles slender, slightly winged at apex, about 12 mm. long; flowers about 12 mm. wide, on long slender pedicels, in rather compact glabrous corymbs; sepals linear, entire or glandular, glabrous on outer surface, sparingly villous on inner surface; stamens 10 to 20; anthers pale rose-color; fruit short-oblong, full and rounded at the ends, dark-crimson becoming black and lustrous at maturity, 8-13 mm. long; flesh thin, yellow, dry and mealy; nutlets 3 to 5. On banks of streams in extreme n.w. Tex., fruiting Sept.-Oct.; from s.e. Ida. to s.w. Colo., n. N. M. and Tex.

5. *Crataegus opaca* H. & A. WESTERN MAYHAW, APPLE HAW. Tree to 9 m. high; branchlets slender, villous-pubescent when they appear but soon glabrous, armless or armed with straight chestnut-brown spines; leaves elliptic to oblong-elliptic or oblong-cuneiform, acutish at apex, cuneate at base, the margins essentially entire or with minute glandular teeth, densely pubescent when young, at maturity dull-green above and pubescent with rusty-brown hairs beneath, to 65 mm. long and 25 mm. wide; petioles slender, villous-pubescent, about 7 mm. long; flowers 2 to 5 in glabrous corymbs, about 25 mm. wide; sepals triangular and acute at gland-tipped apex, essentially entire; stamens 20; anthers large, deep rose-color; fruit depressed-globose, scarlet, lustrous, 12-15 mm. in diameter; nutlets 3 to 5. Commonly in depressions that are filled with water part of the

year, along streams and on border of swamps in e. Tex., fruiting May-July; from Ala. to Tex.

6. *Crataegus uniflora* Moench. Slender shrub to 15 dm. high, with slender often flexuous thorny branchlets, villous while young; leaves obovate-cuneate to oblong or elliptic, sharply or crenately serrate and sometimes obscurely lobed above the middle, usually about 3 cm. long and 15 mm. wide, pubescent while young, thick, the veins impressed above at maturity; petioles short, stout, wing-margined above; flowers 1-1.5 cm. wide, solitary or rarely 2 to 5, on short tomentose pedicels; stamens 20 or more; anthers small, white or pale-yellow; calyx lobes lanceolate, foliaceous, pectinate or deeply glandular-serrate, persistent on the fruit; fruit 1-1.3 cm. thick, subglobose or slightly pyriform, greenish-yellow or dull-red, with dry or mealy flesh and 3 to 5 (usually 5) nutlets. In flat woods and open sandy soils in e. Tex., fruiting Sept.-Nov.; from N. Y. and Pa. to Fla., w. to the Ozark region and Tex.

7. *Crataegus Calpodendron* (Ehrh.) Medic. Shrub or small tree to 6 m. high, with spreading branches, unarmed or with short slender spines; young branchlets pubescent; leaves elliptic to oblong-obovate, acute at apex, cuneate at base, 5-12 cm. long, serrate and often slightly lobed, dull-green and finally glabrous above, pubescent or sometimes glabrous on lower surface; flowers about 12 mm. across, in many-flowered pubescent corymbs 6-12 cm. across; sepals serrate; stamens 15 to 20; anthers pink; fruit ellipsoid to pyriform or somewhat globose, about 1 cm. long, dull-yellow or yellowish-red, pulpy; nutlets 2 or 3. Dryish open woods in e. Tex., fruiting Oct.-Nov.; from Tex. and Ark., northw. and eastw.

Var. *globosa* (Sarg.) E. J. Palm. is a plant with fruit more globose than in var. *Calpodendron*. Var. *hispidula* (Sarg.) E. J. Palm. has leaves more sharply serrate, with narrower acuminate teeth, spreading lateral lobes, and hispidulous beneath at maturity.

8. *Crataegus Pearsonii* Ashe. Small spreading tree to about 5 m. high and a trunk to about 1 dm. in diameter, with rough bark and crooked recurved branches; branchlets slender, light- to dark-gray or -brown, mostly glabrous; armed with slender chestnut-brown spines to 75 mm. long; leaves both spatulate to obovate or cuneate or ovate-flabellate to suborbicular, narrowly cuneate to truncate at base, obtuse to broadly rounded-subtruncate at apex, the margins singly or doubly serrate with the teeth commonly glandular, the glands extending down onto the petiole, frequently crenately lobed above the middle, the blade to 6 cm. long and about as wide or wider; flowers 15-25 mm. across, borne in simple or compound 3- to 6-flowered corymbs, with white-hairy to glabrous pedicels that are sometimes adorned with very glandular bracts; sepals oblong-linear, acuminate, serrulate and conspicuously glandular; petals white, oval to obovate, narrowed into a short claw; stamens 20; anthers yellow; fruit subglobose, bright-red, to 15 mm. in diameter, the flesh soft and juicy, acid. In mixed pine-hardwood forests in s.e. Tex., fruiting Oct.-Nov.; from Miss. to Tex.

9. *Crataegus viburnifolia* Sarg. Tree to 11 m. high, with a trunk to about 3 dm. in diameter, the gray bark scaly; branchlets unarmed, at first tomentose, eventually nearly glabrous and brownish; leaves ovate to elliptic or slightly obovate, 65-85 mm. long, 5-6.5 cm. wide, concave-cuneate to broadly rounded or even truncate at the entire base, coarsely often doubly serrate above with straight glandular teeth, sometimes shallowly lobed above, deep-green and lustrous on the scabrate upper surface, with pale hairs beneath; petiole glabrate, to 35 mm. long; flowers about 2 cm. across, prominently bracted, in wide lax 5- to 12-flowered corymbs; pedicels slender, tomentose; calyx tube and lobes villous; stamens about 20; anthers white; fruits subglobose, bright-canary-yellow, 1.5-2 cm. in diameter. Borders of woods and low ground in s.-cen. Tex., fruiting in Oct.; endemic.

10. *Crataegus brachyphylla* Sarg. Tree to 7 m. high, with a trunk to about 18 cm. in diameter; branchlets bright-red-brown, lustrous, armed or unarmed; leaves broadly ovate, rounded to acute at the apex, rounded to truncate at base, 5-7 cm. long, 5-6 cm. wide, coarsely often doubly serrate with straight acuminate teeth, thin, yellow-green and glabrous above, with long matted hairs beneath; petioles slender, pubescent but eventually glabrate, 2-3 cm. long; flowers about 15 mm. across, in small compact 5- to 8-flowered white-hairy corymbs; pedicels slender, they and the calyx tube with long white hairs; calyx lobes narrow, long-acuminate, laciniately glandular-serrate, thickly covered with white hairs; stamens 20; anthers deep-rose-color; fruit subglobose, dull-dark-red, 1-1.2

cm. thick. On dry gravelly ridges and in open woods in n.e. Tex., fruiting Sept.-Oct.; also Ark.

11. *Crataegus Greggiana* Eggl. Small tree to 6 m. high, with rough bark; branchlets tomentose, becoming glabrous; thorns numerous, straight, slender, chestnut-brown, 3-6 cm. long; leaves to 75 mm. long and 6 cm. wide, broadly ovate to ovate-elliptic, obtuse to acute at apex, broadly cuneate at base, subcoriaceous, dull, tomentose, becoming scabrous above, finely and doubly serrate, sometimes lobed towards the apex; petioles about 5 mm. long, tomentose; corymbs 5- to 12-flowered, along with the calyx densely white-tomentose; calyx-lobes lanceolate, acuminate, remotely and irregularly serrate, about 6 mm. long; stamens 10; anthers yellow; styles 3 to 5; fruit brick-red, 1-1.2 cm. thick, globose, tomentose, with the calyx lobes appressed and persistent against fruit. In rocky areas on the Edwards Plateau, s. into Mex., fruiting Oct.-Nov.

12. *Crataegus mollis* Scheele. DOWNY HAWTHORN, RED HAW. A tree 10-12 m. high, with stout sparingly thorny or nearly thornless branchlets villous while young and thick deeply fissured brownish-gray bark on the trunk; leaves relatively large, variable in shape, mostly ovate or deltoid, sharply or coarsely serrate, 7.5-10 cm. long and wide, usually with 4 or 5 pairs of lateral lobes or on vegetative shoots sometimes deeply lacinate, thickly coated with short appressed hairs on the upper surface and densely white-tomentose (especially along the veins beneath) while young, firm, yellow-green, glabrous above and often slightly pubescent beneath at maturity; flowers 2-2.3 cm. wide, many in tomentose corymbs; stamens about 20; anthers small, yellowish or rarely pink; calyx tube densely tomentose, the lobes glandular-serrate; fruit subglobose or rarely oblong or obovoid, 13-18 mm. thick, scarlet or bright-crimson, pubescent at least toward the ends, with a broad shallow calyx, thick mellow flesh and normally 5 nutlets. *C. Berlandieri* Sarg., *C. columbiana* Sarg., *C. quercina* Ashe, *C. indurata* Sarg. In stream bottoms, hillside woods and thickets in n.-cen. and s.-cen. Tex., fruiting Aug.-Oct.; from s. Ont. and Mich. to Ala., w. to Minn., Okla., Ark., Tex. and Miss.

13. *Crataegus limaria* Sarg. Tree to 9 m. high, with a trunk to 3 dm. in diameter, the dark bark scaly; branchlets with long white hairs at first, eventually lustrous and somewhat pubescent and spiny; leaves ovate, acute, concave-cuneate or rounded at base, 65-75 mm. long, 3.5-5 cm. wide, coarsely (often doubly) serrate with broad straight glandular teeth, sometimes shallowly and acutely lobed above, thin, light-green and scabrate above, pale and tomentose beneath; petioles slender, villous, about 3 cm. long; flowers to 25 mm. across, in compact 15- to 20-flowered villous corymbs, with slender pedicels covered with matted white hairs; calyx tube and lobes pubescent; stamens 15 to 18; anthers white; fruit ellipsoid to ovoid, crimson, lustrous, marked by large pale dots, 1-1.5 cm. in diameter, the flesh dry and mealy. *C. Mackensenii* Sarg. In dense woods of rich bottomlands in n.-cen. and s.-cen. Tex., fruiting Sept.-Oct.; also Ark.

14. *Crataegus texana* Buckl. Tree to 9 m. high, with a trunk to 3 dm. in diameter; branchlets armed or unarmed, at first reddish-brown, eventually grayish; leaves broadly ovate, acute to occasionally rounded at apex, broadly concave-cuneate at base, thickish, coarsely doubly glandular-serrate above, often with several broad acute lobes above, dark-green and lustrous above, pale and pubescent or tomentose beneath, 7.5-10 cm. long, 65-75 mm. wide; petioles stout, deeply grooved, to 2 cm. long, glabrous eventually; flowers about 2 cm. across, in broad open many-flowered tomentose corymbs, with slender densely villous pedicels; stamens 20; anthers red; calyx tube and lobes tomentose to villous, the sepals foliaceous and deeply glandular-serrate; fruits obovoid, 13-25 mm. thick, bright-scarlet, sweet and edible. Rich bottomlands of coastal Tex., fruiting in Oct.; endemic.

15. *Crataegus invisus* Sarg. Tree to 9 m. high, bark dark-brown and in platelike scales; branchlets stout, slightly zigzag, armed or unarmed; leaves ovate to oval, acute to acuminate at apex, cuneate or rounded at base, coarsely (often doubly) serrate with broad straight glandular teeth, occasionally with several short acuminate lobes above, 65-75 mm. long, 5-6.5 cm. wide, thin, dark-yellow-green and roughened on the upper surface by short hairs, coated beneath with long matted white hairs; petioles slender, glabrate, 3.5-5 cm. long; flowers about 2 cm. across, in broad mostly 7- to 12-flowered corymbs, with slender pedicels thickly coated with matted hairs; calyx tube and the laciniately glandular-serrate lobes more or less villous; stamens 20; anthers white or pale-yellow; fruit oblong, orange-red, marked by large pale dots, about 15 mm. in diameter, slightly

hairy at the ends. In dense woods of rich bottomlands mostly in e. Tex., fruiting Oct.-Nov.; also Ark. and Okla.

16. *Crataegus brazoria* Sarg. Tree to 75 dm. high, with a trunk to about 15 cm. in diameter, the bark pale; branches slender, somewhat zigzag, eventually lustrous and unarmed or armed with slender gray spines; leaves oval to oblong or obovate, rounded to acuminate at apex, rounded to concave-cuneate at the entire base, coarsely doubly serrate above with straight glandular teeth, usually slightly lobed above the middle, thin, dark-yellowish-green, glabrous and lustrous above, pale and pubescent beneath, 45-65 mm. long, 3-4 cm. wide; petioles slender, about 15 mm. long; flowers about 15 mm. across, in few- to many-flowered more or less villous corymbs, with slender hairy pedicels; stamens 20; anthers pink or rose-color; calyx tube and lobes with matted pale hairs; fruit subglobose, dull, dark-red, 8-15 mm. in diameter, sweet and edible. *C. dallasiana* Sarg. Stream bottoms or wooded hillsides and thickets in e. Tex. and the Blackland Prairies, Oct.-Nov.; endemic.

17. *Crataegus sabineana* Ashe. Tree to 9 m. high; branchlets stout, glabrous, tan to reddish; leaves broadly obovate to rhombic, acute at apex, cuneate at base, coarsely and sharply serrate, 25-35 mm. long; petioles about 4 mm. long; flowers in few-flowered corymbs; stamens 10 to 20; fruits oblong, 13-16 mm. long, greenish-yellow with a red cheek. In e. Tex. and w. La.

Closely allied to, if not conspecific with, *C. pyracanthoides*.

18. *Crataegus pyracanthoides* Beadle. Tree 8-10 m. high, with slender thorny or sometimes unarmed branchlets and dark-gray scaly bark; leaves obovate to oblanceolate, pointed or rarely rounded at the apex, shallowly serrate except near the base, glabrous, firm, dark-green and lustrous above; flowers 1-1.3 cm. wide, mostly 5 to 8 in lax glabrous corymbs; stamens 10 or 20; anthers white to pale-yellow or purplish; fruit subglobose or short-oblong, 6-10 mm. thick, red, with thin mellow flesh and 2 or 3 nutlets. Incl. var. *uniqua* (Sarg.) E. J. Palm. and var. *arborea* (Beadle) E. J. Palm., *C. uniqua* Sarg., *C. arborea* Beadle. In low rich woods and moist ground along streams in e. Tex., fruiting Oct.; from Ind. to Mo., s. to Fla. and Tex.

19. *Crataegus crus-galli* L. COCKSPUR HAWTHORN. Shrub or tree 6-8 m. high, with widespreading branches and dark slightly scaly bark; branchlets thorny, flexuous; leaves of flowering branchlets mostly obovate, sharply serrate except towards the cuneate base, at maturity thick, shining above; shoot leaves often oblong-elliptic, sometimes twice as large and coarsely serrate or dentate; flowers 1-1.5 cm. wide, numerous in glabrous corymbs; stamens about 10; anthers pink or pale-yellow; calyx lobes linear-lanceolate, entire or nearly so; fruit short-oblong to slightly obovoid or rarely subglobose, 8-10 mm. thick, often slightly 5-angled, greenish or dull-red, with thin dry flesh and 1 to 3 (usually 1 or 2) nutlets. Incl. var. *bellica* (Sarg.) E. J. Palm. On limestone bluffs and hilltops, woods, thickets and fence-rows in e. and n.-cen. Tex., fruiting Oct.-Nov.; from s.e. Can. to S. C., w. to Minn., Kan. and Tex.

20. *Crataegus Bushii* Sarg. Tree to 6 m. high, with a trunk to 25 cm. in diameter with dark scaly bark; branchlets sparingly armed or unarmed; leaves elliptic to obovate, broadly rounded to acute at apex, gradually narrowed from near the middle to the cuneate base, coarsely serrate above, coriaceous, 3-4 cm. long, 13-25 mm. wide, lustrous, glabrous; petioles villous, soon glabrous, about 15 mm. long; flowers 2-2.5 cm. across, in broad many-flowered glabrous corymbs; calyx tube and the linear-lanceolate lobes glabrous; stamens 20; anthers large and pink; fruit short-oblong, green tinged with dull-red, about 1 cm. long. In rich upland woods in n.e. Tex., fruiting Oct.-Nov., also Ark. and La.

21. *Crataegus Reverchonii* Sarg. Shrub or small bushy tree to about 6 m. high; leaves oval to obovate, to 35 mm. long and 25 mm. wide, leathery, glabrous, dark-green and lustrous above, pale beneath; petioles stout, about 8 mm. long; flowers 1-1.5 cm. across, with slender pedicels, in few-flowered compact glabrous corymbs; calyx tube and slender acuminate lobes glabrous; stamens 10 to 15; anthers (?) pinkish-red; fruit subglobose, light-scarlet, about 12 mm. thick. In thickets and open woods in n.-cen. Tex., fruiting Sept.-Oct.; also n. to Ark., Mo. and Kan.

22. *Crataegus cherokeensis* Sarg. Small tree with dark slightly scaly bark; branchlets slender, glabrous, zigzag, red-brown to orange-brown, armed with numerous straight slender spines; leaves oblong-obovate, rounded to acute at apex, cuneate at base, finely

(often doubly) serrate above the middle with acute teeth thickened at apex, thin, glabrous to thinly pubescent, dark-green and lustrous above, paler beneath, 3.5-4 cm. long, 1.5-2 cm. wide, often acutely lobed above the middle; petioles slender, glabrous, to 12 mm. long; flowers about 13 mm. across, with slender pedicels, in 5- to 7-flowered globose glabrous corymbs; calyx tube glabrous; calyx lobes slender, long-acuminate, entire to slightly and irregularly toothed above middle, glabrous; stamens 10, the anthers red; fruit ellipsoidal, dull-orange-red, about 1 cm. long and 6 mm. thick. Upland thickets and lowland woods in e. Tex., fruiting Sept.-Oct.; endemic.

Closely allied to *C. Engelmannii*, if not conspecific with it.

23. *Crataegus sublobulata* Sarg. Tree to 10 m. high, with a short trunk covered with soft corky slightly ridged gray-brown bark; branchlets zigzag, light reddish-brown, glabrous, armed with numerous slender straight chestnut-brown lustrous spines; leaves broadly obovate to elliptic, rounded or acute at apex, cuneate at base, coarsely and deeply irregularly serrate with acuminate teeth, often sublobulate with acuminate lobules, thick, glabrous, dark-green and lustrous above, paler beneath, 3.5-4 cm. long, 2.5-3 cm. wide; petioles stout, about 1 cm. long, villous-pubescent on upper side; flowers about 15 mm. across, with slender pedicels, in 5- or 6-flowered compact glabrous corymbs; calyx tube glabrous; calyx lobes slender, acuminate, entire or with a few teeth above the middle, glabrous on outer surface, sparingly villous-pubescent on inner surface; stamens 20; anthers pink; fruit short-oblong to subglobose or rarely obovoid, orange-red, 8-10 mm. long, 6-7 mm. thick. Edge of upland woods in e. Tex., fruiting Aug.-Sept.; endemic.

This is closely allied to, if not conspecific with, *C. Engelmannii*.

24. *Crataegus Warneri* Sarg. Tree to 8 m. high, with a slender trunk covered by dark scaly bark near the base; branchlets slender, red-brown, with pale hairs but eventually glabrate; leaves ovate to oval or obovate, rounded to acute and short-pointed at the apex, cuneate at base, 3.5-5 cm. long, 25-35 mm. wide, coarsely serrate above the middle with straight gland-tipped teeth, thin, dark-green and glabrous or occasionally villous on the midrib above, pale and villous along the midrib and primary veins beneath; petioles stout, densely villous, 5-7 mm. long; flowers 1-1.2 cm. across, with stout villous pedicels, in compact many-flowered villous corymbs; calyx tube thickly covered with matted pale hairs; calyx lobes slender, acuminate, glandular-serrate, slightly villous on the outer surface, puberulous on the inner surface; stamens 10; anthers red-purple; fruit ellipsoid to subglobose, orange-red, 6-9 mm. long. In sandy woods and on dry banks in e. Tex., fruiting Sept.-Oct.; endemic.

25. *Crataegus Tracyi* Ashe. MOUNTAIN HAWTHORN. Bushy tree to 45 dm. high, with a trunk about 3 dm. in diameter; branchlets slender, straight, dull-reddish-brown and glabrous; leaves obovate to oval or rhombic to suborbicular, rounded to acuminate at apex, often abruptly pointed, concave-cuneate at base, sharply coarsely serrate usually to below the middle with straight acuminate glandular teeth, dark-green, lustrous and scabrate above, pale-yellow-green below, 25-35 mm. long, 2-2.5 cm. wide; petiole about 8 mm. long; flowers about 13 mm. across, in compact mostly 7- to 10-flowered villous corymbs, with villous pedicels 8-13 mm. long; calyx tube glabrous or with occasional hairs at base; calyx lobes glandular-serrate, glabrous on outer surface, villous on inner surface; stamens 10 to 15; anthers pinks; fruit ellipsoid, about 1 cm. long, orange-red. *C. montivaga* Sarg. Rocky banks of streams on the Edwards Plateau and in the Trans-Pecos, fruiting Sept.-Oct.; endemic.

26. *Crataegus berberifolia* T. & G. BIGTREE HAWTHORN. Tree to 12 m. high, with a trunk about 3 dm. in diameter and branchless for about 6 m. above ground, the dark bark scaly and fissured; branchlets slender, dull-red-brown and slightly villous, armed with stout straight spines; leaves oblong-obovate to oval, acute to acuminate at the gradually narrowed apex, cuneate at base, coarsely and often doubly serrate above with glandular teeth, coriaceous-lustrous and slightly roughened on the upper surface, pale-green and scabrate on the lower surface, 3.5-5 cm. long, to 25 mm wide; flowers 1-2 cm. across, in slightly villous 4- or 5-flowered slender-branched compact narrow corymbs; calyx tube glabrous or slightly villous below; calyx lobes linear-lanceolate, entire, obscurely glandular-serrate, reflexed after anthesis; stamens about 20; anthers yellow to rose-color; fruit short-oblong, slightly pruinose, dull-green tinged with red, 8-15 mm. long. In low wet woods and on dryish hills in e. Tex., fruiting Sept.-Oct.; endemic.

Our plant has been referred to var. *edita* (Sarg.) E. J. Palm. (*C. edita* Sarg.) whose anthers are rose-color instead of being yellow as in var. *berberifolia*.

27. *Crataegus Engelmannii* Sarg. A stout shrub or small tree to 7 m. high, with a broad flat-topped crown of stiff spreading branches and gray-brown scaly or fissured bark; branchlets slender, flexuous, thorny, villous while young; leaves mostly obovate to oblong-obovate or sometimes elliptic on vegetative shoots usually slightly pilose above or on the veins beneath while young, subcoriaceous, reticulately veined at maturity; petioles stout, 3-8 mm. long, villous, wing-margined nearly to the base; flowers 12-15 mm. wide, 8 to 12 in slightly villous loose corymbs; stamens about 10; anthers pink or rarely white; fruit subglobose or short-oblong, 6-8 mm. thick, dull-crimson, with thin dry flesh and 1 to 3 nutlets. Sandy upland or lowland woods, thickets and open dry soils in e. and n.-cen. Tex., fruiting Oct.-Nov.; from Ill. to Okla. and Tex.

28. *Crataegus glabriuscula* Sarg. Tree to 75 dm. high, with a trunk about 3 dm. in diameter, with thin dark-brown scaly bark; branchlets slender, unarmed or armed; leaves ovate-oblong to suborbicular, acute to short-pointed or rounded at apex, gradually narrowed from below the middle to the slender entire base, coarsely and often doubly serrate usually only above the middle with broad straight gland-tipped teeth, sometimes divided toward apex into several short acute lobes, subcoriaceous, 3.5-5 cm. long, 2-2.5 cm. wide, glabrous, dark-green and lustrous on the upper surface, pale on the lower surface; petioles slender, about 1 cm. long; flowers about 13 mm. across, in few-flowered rather compact glabrous corymbs; pedicels slender, long; stamens 20; anthers pale-yellow; fruit oblong to obovoid or nearly globose, dull-orange-color, marked by minute dark dots, about 8 mm. long. Incl. f. *desertorum* Sarg. In dry creek beds and bottomlands along rivers in n.-cen. and s. Tex., fruiting Sept.; endemic.

29. *Crataegus viridis* L. GREEN HAWTHORN. Tree sometimes to 12 m. high, with slender unarmed or sometimes thorny branchlets and thin scaly pale-gray bark over orange-brown inner bark; leaves variable and often asymmetrical, thin, glabrous at maturity except for tufts of tomentum in the axils of the veins beneath, on flowering branchlets mostly rhombic or oblong-elliptic, 2.5-5 cm. long, 13-25 mm. wide, finely serrate above the middle or nearly to the base, on vegetative shoots often ovate and sharply serrate and sharply lobed or deeply cut toward the base; petioles slender, 1.2-5 cm. long; flowers 12-15 mm. wide, numerous in glabrous or rarely pubescent corymbs; stamens about 20; anthers small, pale-yellow or rarely red; fruit subglobose, 5-8 mm. thick, red or orange-red, with thin juicy flesh and usually 5 nutlets. *C. Davisii* Sarg. In low wet or alluvial woods, and fields in sandy soils and clays in e. and s.-cen. Tex., fruiting Sept.-Nov.; from Va. and Fla., w. to Ill., Mo. and Tex.

Those plants with somewhat villous-pubescent corymbs and branchlets are segregated as var. *velutina* (Sarg.) E. J. Palm. (*C. velutina* Sarg.). Those plants with leaves shorter than typical have been segregated as f. *abbreviata* (Sarg.) E. J. Palm. (*C. abbreviata* Sarg.), a possible hybrid of this species with *C. mollis*.

30. *Crataegus sutherlandensis* Sarg. Shrub or slender tree to 5 m. high, often forming thickets, the bark dark-gray; branchlets red-brown and glabrous, noticeably armed or unarmed; leaves ovate, acute at apex, concave-cuneate at base, 3-4 cm. long, 2-2.5 cm. wide, thin, dull yellow-green, slightly scabrate on the upper surface; petioles slender, 8-15 mm. long, sparingly villous at first but soon glabrous; flowers about 2 cm. across, with long slender glabrous pedicels, in lax usually 7- to 10-flowered corymbs; calyx tube glabrous; calyx lobes often laciniately divided near the base into glandular teeth, villous-pubescent on inner surface; stamens 20; anthers faintly tinged with pink; fruit subglobose, orange-red, 7-8 mm. thick. Incl. var. *spinescens* Sarg. In low or rich woods in s. Tex., fruiting Sept.-Oct.; endemic.

31. *Crataegus anamesa* Sarg. Shrub or small tree to 5 m. high, with a slender trunk covered by close or scaly gray bark; branchlets glabrous and dull reddish-brown, usually armed; leaves suborbicular-ovate to elliptic or somewhat obovate, acute at apex, cuneate at base, 3-5 cm. long and about as wide, finely serrate with short broad teeth and sometimes with rounded lobes above the middle, subcoriaceous, nearly glabrous, dark-green and lustrous above, pale beneath; petioles slender, 1.5-2 cm. long, densely villous at first but soon glabrous; flowers 2-2.5 cm. across, in compact 8- to 15-flowered densely villous corymbs crowded on the branches; calyx tube glabrous except for occasional short white hairs; calyx lobes rarely minutely dentate, glabrous on outer surface; stamens 20; anthers pale-yellow; fruit subglobose to slightly obovoid, dark-red, 9-10 mm. thick. *C. antiplasta* Sarg. Prairies in s.-cen. Tex., fruiting in Oct.; endemic.

32. *Crataegus stenosepala* Sarg. Shrub or small tree to 45 dm. high, with dark slightly scaly bark; branchlets slender, slightly fractiflex, glabrous, reddish-brown but eventually grayish, armed with numerous straight spines; leaves elliptic to oblong-elliptic or obovate, acute to acuminate at apex, cuneate at base, sharply and coarsely serrate above the middle with straight teeth, with short lobes near apex, glabrous, yellowish-green and lustrous above, paler beneath, 3.5-6 cm. long, to 35 mm. wide; petioles about 1 cm. long; flowers about 2 cm. across, in rather open 10- to 20-flowered slightly villous corymbs; calyx tube with few long white hairs; calyx lobes slender, long-acuminate, glabrous outside; stamens 20; anthers pale-yellow; fruit ellipsoid to somewhat obovoid, orange-red, about 8 mm. long. *C. antimima* Sarg. In s.-cen. Tex., fruiting Oct.-Nov.; endemic.

33. *Crataegus poliophylla* Sarg. Tree to 5 m. high, with a trunk to 25 cm. in diameter, with dark rough bark; leaves oblong-obovate to elliptic, acute to acuminate at apex, cuneate at base, 3-4 cm. long, 2.5-3 cm. wide, rarely larger, finely doubly serrate above the middle with straight teeth and usually irregularly divided toward the apex into short acute lobes, subcoriaceous, at first villous, soon glabrous, yellow-green and lustrous above, pale beneath; petioles slender, 1.5-2 cm. long, at first pubescent, becoming glabrous; flowers about 15 mm. across, in wide lax 5- to 15-flowered densely villous corymbs; calyx tube villous like the slender pedicels; calyx lobes short, lanceolate to deltoid-lanceolate, glandular-serrate or nearly entire, glabrous on outer surface; stamens 20; anthers yellow; fruit globose to ovoid, orange-red, 6-7 mm. thick. In thickets in well-drained soil in s.-cen. Tex., fruiting Sept.-Oct.; endemic.

9. FRAGARIA L.

STRAWBERRY

Rosulate perennials, usually with stolons and forming colonies; flowers white to pink, in cymes on scapes; leaves radical; leaflets 3, obovate-cuneate, coarsely serrate; stipules cohering with the base of the petioles which (with the scapes) are usually hairy; flowers similar to those in *Potentilla* but in varying degrees polygamo-dioecious; styles deeply lateral; receptacle in fruit much-enlarged and conical, becoming pulpy and usually scarlet, bearing the minute dry achenes scattered over or slightly imbedded in its surface.

About 15 species of the North Temperate Zone and the Andean region of South America.

1. Leaflets usually petiolulate; achenes set in usually deep pits; distribution in east Texas1. *F. virginiana*.
1. Leaflets sessile or subsessile; achenes superficial; distribution in mountains of Trans-Pecos Texas2. *F. bracteata*.

1. *Fragaria virginiana* Duchn. VIRGINIA STRAWBERRY, WILD STRAWBERRY. Leaves, scapes and runners from a subsimple caudex at the end of a simple thickish rhizome; old leaves firm or coriaceous, the new ones thinner, plane or hardly rugose; leaflets short-petiolulate, the terminal one cuneate-obovate, the lateral with rounded outer margins, sharply toothed; flowers unisexual or polygamous, the strictly pistillate flowers much smaller than the staminate, to 25 mm. broad, 2 to many in umbelliform cymes; calyx lobes to 1 cm. long; fruits 5-20 mm. in diameter, red, subglobose to ovoid; achenes 1.3-1.6 mm. long, in deep pits; pulp juicy. Fields, prairies, open slopes and borders of woods in the e. fourth of Tex., Mar.-Apr.; from Nfld. to Alta., s. to Ga., Tenn. and Tex.

Besides var. *virginiana*, the var. *illinoensis* (Prince) Gray is found in our region. It is a coarser plant throughout with denser pubescence on scape and petiole.

2. *Fragaria bracteata* Heller. Rootstock very short and rather thick; leaves very thin, somewhat glaucous, silky when young, glabrate in age (especially on the upper surface); petioles slender, 3-10 cm. long, silky with long white spreading or reflexed hairs; leaflets broadly rhombic-obovate, acute, coarsely toothed, 2-5 cm. long, the lateral ones very oblique; runners very slender, rather few; scape often over 1 dm. high, often exceeding the leaves, silky with long spreading or reflexed hairs, often with a unifoliate leafy bract, 2- to 8-flowered; flowers 1.5-2 cm. across; sepals and bracts lanceolate, acute; petals rounded-obovate, often nearly twice the length of the sepals; fruit somewhat elongate, ovoid to semi-ellipsoid, red, about 1 cm. long and 7.5 mm. in diameter; achenes superficial. *F. vesca* L. subsp. *bracteata* (Heller) Staudt. In Guadalupe Mts. in the Trans-Pecos, from Tex. to Mont., B. C. and Calif.

10. DUCHESNEA SM. INDIAN STRAWBERRY

About 6 species native to Asia.

1. *Duchesnea indica* (Andrz.) Focke. Perennial herb from a short rhizome, with leafy stolons and 3-foliolate leaves similar to those of the true strawberries; leaflets ovate to elliptic, 2-4 cm. long, crenately toothed, sparsely strigose on lower surface; peduncles 3-10 cm. long; flowers solitary, 15-18 mm. wide; calyx 5-parted, the lobes alternating with much larger foliaceous spreading 3-toothed appendages; petals 5, yellow; receptacle in fruit spongy but not very juicy; fruit bright-red, resembling a strawberry, insipid, about 1 cm. in diameter. Edge of low woods and thickets, seepage areas and marshes, along roadsides and in old fields in e. Tex., Mar.-Aug.; nat. of Asia that is established in many parts of the world.

11. POTENTILLA L.⁷⁸ CINQUEFOIL. FIVE-FINGER

Herbs or rarely shrubs with compound leaves and solitary or cymose flowers whose parts are rarely in fours; calyx flat, deeply 5-cleft, with as many bractlets at the sinuses so as to appear 10-cleft; petals 5, usually roundish; stamens few to many; achenes numerous, collected in a head on the dry mostly pubescent or hairy receptacle, often partly enclosed by the persistent accrescent calyx; styles slender, lateral or terminal, deciduous.

About 500 species chiefly throughout the North Temperate Zone.

- 1. Pedicel 5 to 12 times longer than the calyx; flowers axillary, solitary 1. *P. simplex*.
- 1. Pedicel shorter than or equaling the calyx in flower, to 3 times as long in fruit; flowers mostly in terminal corymbs (2)
- 2(1). Stem leaves pinnate (3)
- 2. Stem leaves palmate (4)
- 3(2). Principal leaves below inflorescence typically 3-foliolate; achenes smooth and without ventral protuberance 2. *P. rivalis*.
- 3. Principal leaves below inflorescence with 5 to several leaflets; achenes longitudinally ribbed and with a corky protuberance on ventral suture 3. *P. paradoxa*.
- 4(2). Leaflets 3, elliptic to oblong-lanceolate 4. *P. norvegica*.
- 4. Leaflets 5 or 7, oblanceolate 5. *P. recta*.

1. *Potentilla simplex* Michx. OLD-FIELD CINQUEFOIL. Stems and basal leaves from an irregularly enlarged rhizome that is often nodose or moniliform-thickened and to 8 cm. long and 2 cm. thick; stem hirsute to villous-hirsute with spreading hairs, at first erect or ascending, to 5 dm. high but soon greatly prolonging and arching, forking and rooting at tip (producing tubers that become young rhizomes of following years); cauline leaves (during anthesis) mostly to 1 dm. long; leaflets green and more or less strigose-pubescent or barely whitened beneath, narrowly obovate to narrowly elliptic or oblanceolate; middle leaflets of larger leaves to 75 mm. long, 9- to 27-toothed for three fourths their length; stipules of basal leaves with linear-lanceolate usually inrolling auricles, those of mature primary cauline leaves to 3 cm. long; first flower usually from node above second well-developed internode. *P. canadensis* of auth. In woodlands mainly in n.e. Tex., Mar.-June; from N. S. and N. B. to s. Ont. and Minn., s. to N. C., Tenn., Mo., Okla. and Tex.

2. *Potentilla rivalis* Nutt. BROOK CINQUEFOIL. Annual or biennial, rather slender, freely branched, ascending to erect, to 5 dm. high, softly villous, with paniculate-cymose very leafy flowering summit and branches; lower leaves pinnate, with 2 or 3 closely approximate pairs of leaflets or a single pair with the terminal leaflet 3-parted; cauline leaves with 3 or 5 leaflets; leaflets cuneate-obovate to -oblong, 2-5 cm. long, usually blunt, strongly toothed; flowers 4-8 mm. broad; mature calyx 5-8 mm. high, pilose; petals tiny, cuneate; stamens 5 to 20; achenes smooth. In wet situations about lakes and along streams

⁷⁸ Ref.: Lloyd H. Shinnars in *Field & Lab.* 23:19-21. 1955.

and ditches in the Panhandle, May-July; from Man. to B. C., s. to Mo., Kan., Tex., Mex. and Calif.

3. *Potentilla paradoxa* Nutt. Annual, biennial or short-lived perennial, superficially resembling *P. rivalis*, somewhat villous, to about 4 dm. high; stems diffusely branched, decumbent or ascending, slender or stout, leafy; leaves all pinnate, oblong to oblong-obovate; leaflets in 2 to 5 distant pairs, oblong to cuneate-obovate, sparsely crenate-dentate, to about 3 cm. long, usually much smaller; cyme open-paniculate, leafy; flowers yellow, on erect stalks, 5-7 mm. wide, the segments and bractlets subequal; stamens about 20; achenes longitudinally ribbed, with a prominent corky protuberance along the ventral suture. Moist or wet soil on river banks and lake margins in the Panhandle, May-July; from Ont. to B. C., s. to La., Tex. and N. M.

4. *Potentilla norvegica* L. Stout leafy annual or short-lived perennial, to 9 dm. high; stem erect or ascending, much-branched, hirsute with stiff mostly spreading hairs, often with shorter pubescence intermixed; lower leaves long-petioled, 3-foliolate; leaflets obovate to oblanceolate, to 8 cm. long, coarsely serrate, usually more or less hirsute, otherwise green; upper leaves sessile, often with narrow leaflets; inflorescence a leafy cyme; calyx in fruit enlarging to 17 mm. high, its bracteoles acutish; petals yellow, obovate, mostly shorter than calyx lobes; stamens 15 to 20; style slenderly conical at base, subterminal, about equaling the mature carpel; achenes longitudinally ribbed, to 1.3 mm. long. Incl. var. *hirsuta* (Michx.) Lehm., *P. monspeliensis* L. In damp or disturbed soils, thickets, clearings, roadsides and waste places in the Trans-Pecos, June-July; from Greenl. and Lab. to Alas., s. to Tex.

5. *Potentilla recta* L. SULPHUR CINQUEFOIL. Stem erect, very leafy, to 7 dm. high, from a perennial base, loosely hirsute; basal leaves with long hirsute petioles, digitately 5- or 7-foliolate; leaflets oblanceolate, to 14 cm. long, with few to many prolonged narrowly deltoid teeth, more or less hirsute on both surfaces, paler beneath; cyme stiffly erect, standing above the principal foliage; flowers on erect stalks, 15-25 mm. across; calyx hirsute, becoming 15 mm. high; petals obcordate, deeply emarginate, usually pale-yellow, equaling or exceeding the calyx lobes; stamens 25 to 30; style shorter than the mature carpel. In Tarrant and Cass cos., May-June; Eur. weed that has become naturalized in fields and along roadsides throughout much of n.e. U. S.

12. GEUM L. AVENS

Perennial rhizomatous herbs with pinnate or lyrate leaves; flowers few, solitary (in ours); calyx campanulate or deeply 5-cleft, usually with 5 small bractlets at the sinuses; petals 5; stamens numerous; achenes numerous, crowded on a conical or cylindrical dry receptacle, the long-persistent styles forming hairy or naked and straight or jointed tails; seed erect.

About 40 species, mostly in the North Temperate Zone.

1. Heads of achenes conspicuously stipitate above the calyx; achenes minutely appressed-puberulent; bractlets none; corolla yellow .. 1. *G. vernum*.
1. Heads of achenes sessile; achenes hirsute toward the summit or completely glabrous; bractlets commonly present; corolla white 2. *G. canadense*.

1. *Geum vernum* (Raf.) T. & G. Perennial, with a very short rootstock; stem 3-6 dm. high, erect or ascending, slightly pubescent; basal leaves long-petioled, pinnately 3- to 9-foliolate (on the new shoots simple and reniform); divisions with oval to obovate lobes that are 1-3 cm. long and 3-6 cm. wide, crenate or serrate, pilose; lower stem leaves pinnate with doubly serrate divisions, the upper leaves ternate; inflorescence open; bractlets none or rudimentary; sepals triangular, 1.5-2 mm. long, glabrous without, puberulent within, reflexed; petals oblong, yellow or ochroleucous, about equaling the sepals; receptacle stalked, glabrous; fruiting head about 1 cm. in diameter, on a stipe 1-2 mm. long; body of achenes 2-2.5 mm. long, minutely appressed-puberulent; lower segment of the style 2-2.5 mm. long, glabrous, the upper segment less than 1 mm. long and glabrous. In rich woods in n.e. Tex., Mar.-May; from Ont. to Ia. and Kan., s. to Tenn., Ark. and Tex.

2. *Geum canadense* Jacq. WHITE AVENS. Stem rather slender, to 12 dm. high, glabrous to sparingly hirsute, often minutely pubescent or glandular-puberulent at summit; leaves of basal tufts long-petioled, the petioles smooth or sparsely hairy, simple and undivided or with 3 to 5 (rarely 7) rhombic serrate leaflets; lower stem leaves similar to the basal leaves but short-petioled to sessile, mostly with 3 leaflets; upper stem leaves ternately cleft or simple, sharply serrate and acute; stipules ovate-oblong, 1-2 cm. long, subentire or cleft; peduncles filiform, minutely pilose to glandular-puberulent; pedicels velvety-puberulent; calyx lobes lanceolate to ovate-lanceolate, acuminate, 4-10 mm. long; petals white, oblong to obovate, 5-9 mm. long, 2-4.5 mm. broad, about equaling to longer than calyx lobes; fruiting head spherical, with numerous achenes, 1.2-2 cm. in diameter; the upper segment of the style ascending or spreading, only tardily reflexed; denuded receptacle densely white-villous. In rich woods in the e. third of Tex., w. to Real Co., Apr.-June; from N. S. to S. D., s. to Ga. and Tex.

We have two variants of this species in the state that may be segregated as follows:

1. Terminal segment of median cauline leaves usually acute; carpels 3-4 mm. long, broadly ovate (*G. camporum* Rydb.) var. *camporum* (Rydb.) Fern.
1. Terminal segment of median cauline leaves usually obtuse; carpels 2-3 mm. long, narrowly obovate to cuneate. var. *texanum* Fern.

13. RUBUS L.⁷⁹

BRAMBLE. DEWBERRY. BLACKBERRY

Perennial shrubs or less often herbs, very often prickly, with simple or more commonly compound serrate or lobed leaves and small to large perfect or unisexual white to pink or reddish flowers; hypanthium small, flat to hemispheric; sepals usually 5, valvate, spreading to reflexed, commonly ending in a short caudate appendage; bractlets none; petals as many as the sepals, erect or spreading, spatulate to obovate or elliptic; stamens numerous; pistils numerous, inserted on a convex receptacle that often elongates in fruit; style filiform or clavate; fruit a cluster of drupelets that fall together or sometimes separately, the receptacle falling with the drupelets or remaining attached to the pedicel.

In the shrubby species, the plant sends up from a perennial base a series of biennial stems, during their first year these are termed "primocanes" that normally do not branch nor flower, during their second year they are known as "floricanes" at which time they emit a number of short lateral branches with a few leaves and usually with a terminal flower or inflorescence; leaves of the primocanes compound; leaves of the floricanes often partly simple, regularly smaller and often of a different shape than those of primocanes.

The taxonomy of *Rubus* is complicated by hybridization, polyploidy and apomixis. More than 1,000 entities have been proposed in this genus. At present, there exists no infallible method for properly categorizing these proposals. The Gleason (1952) and Gleason and Cronquist (1963) collective species system is perhaps the best method yet devised to handle this task. We have adapted their lead in our treatment.

1. Leaflets whitened beneath with dense closely matted pubescence; flowers in open panicles; pedicels armed with small stout thorns 1. *R. bifrons*.
1. Leaflets green to gray beneath, glabrous or rather densely spreading-pubescent; flowers solitary, corymbose, racemose or in compact panicles; pedicels unarmed or with small prickles (2)
- 2(1). Plant upright and highbush, its canes not truly trailing but sometimes over-arching and the tips sometimes reaching the ground but not rooting; flowers nearly always in cymes or racemes (3)
2. Plant with its canes habitually trailing or lying on the ground surface by growing from the end in that position and taking root at tips of primocanes or branches; flowering shoots arising more or less perpendicular from the grounded canes; pedicels mostly of the ascendent type, the clusters mostly not distinctly of the racemiform type; frequently the primocanes are at first erect, sometimes the plants make distinct mounds but trailing canes issue from them (6)

⁷⁹ Ref.: Various papers by L. H. Bailey in *Gent. Herb.*, vol. 5. 1941-1945; L. H. Shinnars in *Field & Lab.* 22:27-30. 1954.

- 3(2). Main leaflets of mature primocane leaves long and narrow, attenuate at apex, the length usually twice or more the width, narrowed to the tip mostly in concave or sunken curves; floricanes leaflets usually also narrow (4)
3. Main leaflets of mature primocane leaves typically ovate to elliptic, the width distinctly more than one half the length, the sides often convex toward the apex (5)
- 4(3). Lower surface of leaves (especially those of primocanes) decidedly soft-pubescent to the touch 2. *R. louisianus*.
4. Lower surface of leaves (especially those of primocanes) not velvety or soft-pubescent to the touch 3. *R. persistens*.
- 5(3). Clusters of flowers manifestly exceeding the associated leaves and not buried in them, broadly corymbiform; southeast Texas 4. *R. saepescandens*.
5. Clusters of flowers and fruits prevailingly about equaled or often exceeded by the accompanying floral foliage, mostly few-flowered; north-central Texas 5. *R. oklahomus*.
- 6(2). Plants with glandular bristles occurring with the prickles (7)
6. Plants without glandular bristles (8)
- 7(6). Leaflets glabrous beneath or pubescent only on main veins, the margins without glands 6. *R. trivialis*.
7. Leaflets soft-pubescent over the lower surface, the margins with scattered reddish stipitate glands 7. *R. duplaris*.
- 8(6). Lower surface of primocane leaves usually decidedly soft-pubescent or even velutinous to the touch (9)
8. Lower surface of leaves on primocanes not soft-pubescent or velutinous to the touch (10)
- 9(8). Flowers 1 to 3 or occasionally 5, borne from terminal and sometimes middle portion of flowering branchlets on erect to ascending pedicels 8. *R. aboriginum*.
9. Flowers 4 to 9 (5 or more on most branches), borne from terminal middle and usually lower portion of flowering branchlet on ascending to widely spreading pedicels 9. *R. apogaeus*.
- 10(8). Primocane leaflets or the odd or terminal one sharply turned or abrupt toward its apex, or somewhat shouldered 10. *R. flagellaris*.
10. Primocane leaflets or at least the odd or central one gradually tapered to the summit 11. *R. Nessianus*.

1. *Rubus bifrons* Vest. Strong low-arching glandless bramble making canes 2-3 m. long or more with their apices lying or creeping on the ground and sometimes tip-rooting, the clump or colony to 15 dm. high; canes somewhat angled to almost terete, striate, scantily pilose to pubescent; prickles irregularly scattered and of differing lengths, 4-7 mm. long, moderately broad-based, flattened, straight to somewhat hooked; *primocane* leaflets 5, persistent, ovate-elliptic to oblong-elliptic or somewhat rhombic, 8-9 cm. long, 5-6 cm. wide, glabrous above, grayish to brownish-canescenscent or tomentose beneath, gradually or abruptly narrowed at apex, cuneate to subcordate at base, the margins finely and somewhat irregularly serrate; petiole and petiolules armed with short strong hooks; *floricane* leaves mostly 3-foliolate, the leaflets similar to those of the primocanes; inflorescence narrow and long with a few branches in the lower axils; peduncles and pedicels grayish-tomentose and bearing straight conspicuous prickles; flowers 2-2.5 cm. across; calyx lobes long-pointed, becoming reflexed; petals white or rose-color, narrow; fruit not large, about 15 mm. thick, black, the drupelets not numerous and loosely placed. A nat. Eur. plant that has become naturalized along sandy roadsides, in waste places and about old homesites in e. Tex., May-June; from Fla. to Tex., n. to R. I., Tenn. and Mo.

2. *Rubus louisianus* Berger. Erect high-arching and stiffish glandless bramble to 5 m. high; canes sharply angled and deeply furrowed, downy when young, eventually glabrous, green or greenish-brown, adorned along the angles with scattered straight or curved prickles; stipules subulate, ciliate; *primocane* leaflets 5, narrowly lanceolate to oblanceolate, rather long-pointed at apex and somewhat narrowed toward the base, bright dull-green above, paler and sparsely soft-pubescent beneath, rather regularly and sharply simply or doubly serrate; petiole rather stout, like the petiolules pubescent or villous

and with scattered curved prickles that extend to the midveins; *floricane* leaves in threes or with the upper one simple and ovate-deltoid, similar to but smaller than those of the primocanes, the terminal leaflet 2 to 3 times as long as wide; fruiting racemes pubescent, with 4 to 15 erect pedicels that are pubescent and provided with a few curved prickles; flowers rather large; calyx pubescent, the ovate-deltoid lobes tomentose inside; petals white, oblong-elliptic to obtusely oblanceolate or obovate, 6-15 mm. long, 3.5-10 mm. wide; fruit oblong-oval, with numerous small drupelets, whitish, sweet. *R. texanus* Bailey, *R. ramifer* Bailey, *R. arvensis* Bailey, *R. abundiflorus* Bailey, *R. argutus* of auth. In damp and sandy thickets, pastures and lowland areas, and along fencerows in e. Tex., Apr.; from Tex. to S. C., n. to Md. and Va.

3. *Rubus persistens* Rydb. Upright much-branched and intertangled glandless bramble to 2 m. high, not trailing nor root-tipping, sometimes forming close clumps; stems angled but the branches essentially terete; prickles rather abundant, prominent, becoming curved, broad-based and about 3 mm. long on floricanes; *primocane* leaflets 3 or 5, ovate-lanceolate to broadly lanceolate, at first somewhat pilose above but soon glabrous, the mature terminal leaflet 7-9 cm. long and 3-4 cm. wide, with some leaflets persistent over winter; *floricane* leaflets 3 or with some simple, mostly smaller and obtusish; flowers as many as 8 in short racemiform clusters that scarcely if at all exceeds the foliage, with short naked or few-prickly pedicels; flowers 2.5-3 cm. across; calyx lobes oblong, not attenuate but with a brief point; petals obovate, obtuse, soon more or less reflexed; fruit oblong. In sandy soils in open areas in s.e. Tex.; from Fla. to Tex.

4. *Rubus saepescandens* Bailey. A rampant long-branching bramble that produces canes sometimes to 16 m. long which run over shrubs and ascend to and recline against branches of trees; *primocanes* very thin for the great length, usually less than 1 cm. thick, commonly with one or two strong ridges, conspicuously glabrous, bearing a few nearly straight flat-based prickles 2-3 cm. or more apart and 2-3 mm. long; *primocane* leaves mostly 5-foliolate; leaflets oblong-lanceolate to elliptic, acuminate, the central leaflet broad at base, 7-9 cm. long, 4-5 cm. wide, nearly or quite glabrous above, soft-pubescent beneath, the margins finely irregularly serrate; petiole armed; *floricane* leaves 3-foliolate or the upper floral ones simple, the blades oblong to ovate-oblong or obovate and short-pointed, 4-7 cm. long, 1-4 cm. wide; flowers 6 to 10 in a broad corymbiform cluster that usually exceeds the accompanying foliage, borne on short lateral spurs; pedicels slender, ascending or divaricate, about 2 cm. long in anthesis, pilose, weakly armed, glandless, sometimes forked; corolla about 2 cm. across; petals narrow, obtuse. In sandy open areas in e. Tex.; also s. La.

5. *Rubus oklahomus* Bailey. Upright but arching very prickly glandless bramble to 2 m. high, with long weak horizontal or depressed branches some of which tip-root; canes terete but sometimes angular; prickles straight or curved, 3-6 mm. long, broad-based; *primocane* leaflets 3 or 5, broadly oval or the lower lateral pair rhombic, essentially obtuse at apex, rounded or expanded at base, about 7 cm. long and 4 cm. wide or more, thinly pubescent above, somewhat grayish and densely to sparsely soft-pubescent beneath, the margins dentate with obtuse-apiculate teeth; *floricane* leaflets much smaller but otherwise similar to those of the primocanes, the upper ones in the flower cluster sometimes simple; flowers 3 to 5, large, showy, projecting on short laterals that are leafy at base, the ascending pedicels pubescent and armed; calyx lobes very broad, apiculate or sometimes with foliaceous tips, becoming reflexed; corolla about 3 cm. across, the petals very broad and rounded. *R. largus* Bailey, *R. putus* Bailey, *R. valentulus* Bailey. In thickets, edge of woods, on slopes, in stream bottoms and along fencerows in n.-cen. Tex., Apr.; also Okla. and Ark.

6. *Rubus trivialis* Michx. SOUTHERN DEWBERRY, ZARZAMORA. Trailing or low-arching and soon depressed, with slender tough terete canes, tip-rooting; primocanes and usually the floricanes bearing glandular bristles among the hard curved prickles; *primocane* leaves somewhat coriaceous and semievergreen; leaflets usually 5, glabrous, oblong to lanceolate, coarsely toothed, to 1 dm. long and 3 cm. wide; *floricane* leaflets smaller; flowers 1 to few; pedicels erect, filiform, bristly or glandular; calyx glabrous or glabrescent on the back or glandular; petals obovate, 7-10 mm. wide; fruit subglobose to elongate, black, 1-3 cm. long. *R. riograndis* Bailey, *R. seorsus* Bailey, *R. Mcvaughii* Bailey. Rather ubiquitous, commonly a weedy plant along roadsides, fencerows and in thickets in various soils in e. Tex., w. to Grand Prairie, Mar.-Apr.; from Fla. to Tex., n. to Md., Mo. and Okla.

7. *Rubus duplaris* Shinn. Similar to but usually smaller than *R. trivialis*; primocanes low-spreading; floricanes trailing; both old and new canes adorned with a mixture of red gland-tipped bristles and soft pubescence among the prickles; leaves soft-pubescent on the lower surface, commonly provided with reddish stipitate glands along the main veins beneath and on the marginal teeth; flowers solitary. In open sandy oak woods in e.-cen. Tex., Apr.-May; endemic.

8. *Rubus aboriginum* Rydb. Canes running and tip-rooting, glandless, often nearly erect on hard soil, nearly or quite terete, lightly pilose when young but becoming glabrous the second year, bearing few scattered short hooked broad-based prickles that are 2-3 mm. long; primocane leaves 5-foliolate but on younger parts 3-foliolate; leaflets ovate to elliptic or oval, briefly pointed, softly but thinly pubescent on both surfaces and on the lower surface even until winter, sharply double-serrate, the lateral leaflets tapered to base, the terminal or central one 7-9 cm. long and three fourths as broad, mostly rather broad and subcordate at base; petiole and strong terminal petiolule stoutly armed and sparsely soft-pubescent; flowers 2-2.5 cm. across, 1 to 4 on short floral shoots that are provided with small 3-foliolate or sometimes simple cuneate leaves that are sharply serrate and mostly narrowed to base; pedicels slender, short-pilose, scantily if at all armed; calyx small, the pubescent lobes soon reflexed; petals obtuse and contiguous; fruit oblong, seedy, 15 mm. long or more. *R. austrinus* Bailey, *R. velox* Bailey, *R. Bollianus* Bailey, *R. almus* Bailey, *R. neonefrens* Bailey, (?) *R. nefrens* Bailey. In sandy open woods, along roadsides and in fencerows in e. Tex., w. to West Cross Timbers, April.; ? endemic.

9. *Rubus apogaeus* Bailey. Low tangled glandless bramble with downward-bending primocanes and long running tip-rooting floricanes, forming loose mounds to about 6 dm. thick, with few erect shoots but the general direction of all the growth is bending toward the ground, the branches 2-3 m. long and lying flat and tip-rooting; primocanes glabrous except at tip where they are somewhat pubescent, provided with weak essentially straight flat-based prickles 3-5 mm. long and spaced 5-10 mm. apart; primocane leaves 5-foliolate, the petioles long and armed; leaflets narrow, various, those near the top of cane oblong-lanceolate and long-acuminate (about 6 cm. long 3 cm. wide), the main ones broader and short-pointed and at least the central or odd one broad or subcordate at base, practically glabrous and somewhat lucid above, soft-pubescent to the touch or glabrous except on the veins beneath, not persistent, the margins sharply and unequally serrate; floricanes retaining the straight armature that becomes stouter with age; floricane leaflets 3, small, elliptic or narrower, acute to obtuse at apex, soft-pubescent beneath, 2 cm. long or less, obtusely serrate; flowers 7 or fewer on short floral shoots, often 25 mm. across at expansion but sometimes only one half that size; pedicels not elongated (2 cm. or less), pubescent, nude or provided with a few small hooks; petals rounded or obtuse and more or less contiguous; fruit small, oblong, seedy, about 1 cm. long. *R. uncius* Bailey, *R. lassus* Bailey, *R. Lundelliorum* Bailey. In damp thickets, on road shoulders and edge of forests in e. Tex., Apr.; ? endemic.

10. *Rubus flagellaris* Willd. NORTHERN DEWBERRY. Long-creeping and prostrate, the canes eventually flat-trailing and usually tip-rooting; primocanes to 6 mm. thick at base, at first ascending, later depressed, becoming to 5 m. long, glabrous, the angles with firm subulate but thick-based scattered and slightly recurved prickles to 4 mm. long; leaves on slender subglabrous or merely puberulent or appressed-pilose prickleless or sparsely prickly petioles; leaflets 3 or 5, serrate or dentate, glabrous or with the veins beneath appressed-pilose; terminal leaflet with elongate petiolules, ovate to subelliptic, rounded at base, rather abruptly contracted to an acuminate tip to 2 cm. long; lateral leaflets sessile and often asymmetrical; floricanes trailing, woody and tough, often reddish or purplish; flowering branchlets erect, those near the base producing corymbs of up to 9 or sometimes more flowers on nearly erect filiform glabrous to merely puberulent or appressed-pilose (rarely remotely villous) prickleless or sparsely setose-prickly pedicels about 1 cm. long; bracteal leaves 3-foliolate or simple, with glabrescent petioles, glabrous or nearly so beneath, the terminal leaflet or the simple blade ovate to obovate or lanceolate and longer than broad; calyx pubescent; petals white, oblong to elliptic-oval or obovate, 1-1.5 cm. long, 5-10 mm. wide; fruit relatively large, globose to slightly elongate, mostly 1-1.5 cm. in diameter, usually of rich flavor. *R. occidualis* (Bailey) Bailey. In dry fields, opening and borders of thickets in the e. third of Tex., May-June; from Me. and Que. to Ont. and Minn., s. to Tex.

11. *Rubus* *Nessianus* Bailey. Stout much-branched clambering glandless bramble, probably at length tip-rooting, the diffuse more or less prostrate canes sometimes to 6 m. long and 4-5 mm. thick, nearly or quite terete, glabrous, closely provided with stout hard curved broad-based prickles 3-4 mm. long; *primocane* leaves 3-foliolate or probably sometimes 5-foliolate, coriaceous and sometimes persistent, the margins unevenly sharply serrate, essentially glabrous on both surfaces; petiole abundantly hooked and more or less thinly pilose-pubescent; leaflets elliptic, shortly or abruptly acuminate at apex, the odd one 7-8 cm. long and 3-4 cm. wide or more, narrowed to the base; *floricane* leaflets elliptic or the upper ones simple and ovate, 4-6 cm. long, short-acute to almost obtuse or the odd leaflet to 8 cm. long, glabrous above, more or less thinly pubescent on the veins beneath; flowers 2 to 5, about 4 cm. across, showy, with long ascending very prickly pubescent separate pedicels; calyx pubescent, the broad lobes short-acuminate; petals very broad and rounded. In red sands in pinelands and bottomlands in s.-cen. and s.e. Tex., spring; ? endemic.

14. *ALCHEMILLA* L. LADY'S-MANTLE

About 250 species mainly in the mountains of Latin America with several in the Old World.

1. *Alchemilla microcarpa* Boiss. & Reut. PARSLEY PIERT. Annual to 1 dm. high; stem simple or diffusely branched from base, appressed-pubescent; stipules foliaceous, 3-4 mm. long, 3- or 5-lobed to about their middle; leaves shortly petiolate, flabelliform, deeply 3-cleft, pilose, 2-6 cm. wide; flowers small, greenish, several in fascicles opposite the leaves and partly enclosed by the stipule; calyx tube inversely conical, contracted at the throat; calyx limb 4-parted, with as many alternate accessory lobes or bractlets; petals none; stamens 1 to 4, alternate with the sepals; pistils 1 to 4, the slender style arising from near the base; hypanthium ellipsoid, minutely pubescent, to 1 mm. long in fruit, with connivent pubescent calyx lobes. In sandy open places, old fields and along roads in e. Tex., Apr.-June; a nat. of Eur. that has become naturalized from Del. and D. C., s. to Ga., Ala. and Tex.

15. *FALLUGIA* ENDL.

A monotypic genus.

1. *Fallugia paradoxa* (D. Don) Endl. APACHE-PLUME. Slender upright deciduous or semievergreen much-branched shrub, to 2 m. high; branchlets slender, grayish-white-tomentulose; stipulate; leaves alternate, cuneate, with 3 to 7 narrowly oblong lobes that are decurrent into the linear petiole, 8-15 mm. long, revolute, white-tomentulose on the lower surface, partly fascicled; flowers terminal, 1 to 3, perfect or polygamous, conspicuous, 25-35 mm. across; calyx tube cupular; sepals 5, ovate, imbricate, with 5 alternate narrow bracts at base; petals 5, white, suborbicular, spreading; stamens numerous; pistils many on a conical torus, pubescent; style slender; achenes with purplish feathery tails 2-5 cm. long, the heads of achenes attractive. In dry, sunny, well-drained situations in gravelly or rocky-bouldery soils in the w. Edwards Plateau and Trans-Pecos, May-Dec.; from Tex. to Calif. and n. Mex.

16. *COWANIA* D. DON

About 5 species in southwestern United States and Mexico.

1. *Cowania ericaefolia* Torr. HEATH CLIFFROSE. A straggling intricate bush 3-10 dm. high; bark dark-brown and fissured; young twigs very short, more or less tomentose when young; leaves alternate, linear-subulate, entire, coriaceous, glandular-dotted, 4-6 mm. long, with strongly revolute margins and spinulose tips, more or less fascicled at the ends of the branches; flowers solitary, terminal on short branches; pedicels about 5 mm. long, sparingly glandular; hypanthium campanulate-funnelform, persistent, 3 mm. long; sepals 5, elliptic, 4 mm. long, obtuse, imbricate, persistent, slightly tomentose and with stalked glands; petals 5, white or yellowish, obovate, spreading, 6-8 mm. long; stamens numerous in two series, inserted in the throat of the hypanthium; pistils about 8, sessile,

distinct; styles terminal, plumose, in fruit 15-25 mm. long, the naked tips 1 mm. long; achenes oblong or lanceolate, striate, villous-hirsute; seeds linear. On limestone boulders and crevices of cliffs in mts. of the Trans-Pecos, July-Oct.; also Coah.

17. CERCOCARPUS H.B.K.⁸⁰ Mountain Mahogany

Shrubs and small trees with dark-colored hard wood and smooth bark; leaves simple, alternate, fascicled, thick-herbaceous to coriaceous, evergreen, entire or dentate, linear to suborbicular-obovate, stipulate, often conspicuously veined on lower surface; flowers solitary or in small fascicles, with 5 small inconspicuous yellowish sepals and no petals; stamens numerous, inserted in 2 or 3 rows on the limb of the hypanthium; pistil 1, the ovary superior; hypanthium sheathlike in fruit, enclosing the slender villous achene; style long, persistent, plumose, twisted, much-exserted.

About 20 species confined to western United States and Mexico. Several species are considered to be good browse.

1. Leaves mostly 2 cm. long or less, entire or with only a few short teeth at the apex 1. *C. montanus* var. *paucidentatus*.
1. Leaves mostly more than 2 cm. long, usually coarsely toothed on the upper half (2)
- 2(1). Leaves (at maturity) densely pubescent (woolly); mostly in the Panhandle and northern Trans-Pecos 1. *C. montanus* var. *argenteus*.
2. Leaves (at maturity) glabrous or with only a few appressed silky hairs (not woolly); mostly on the Edwards Plateau and in the southern Trans-Pecos 1. *C. montanus* var. *glaber*.

1. *Cercocarpus montanus* Raf. Shrubs or small trees 1-6 m. high, rarely higher, strict or spreading; bark gray to brown, smooth on the branches, checkered and fissured on the older trunks; leaves thin to somewhat thick and firm in texture, rarely subcoriaceous and never resinous, green or gray-green above, lighter below, lanceolate to oblanceolate or elliptic, sometimes subrotund to ovate or obovate, acute or round at apex, usually cuneate at base, entire to serrate or dentate, 7-60 mm. long, to 35 mm. wide, rarely larger; lateral veins 3 to 10, parallel and straight or somewhat deflected toward the apex near the outer ends, evident to prominent beneath, slightly depressed above; petiole to 8 mm. long; stipules lanceolate to ovate, to 8 mm. long; flowers solitary or in fascicles of 2 or 3, the fascicles sometimes crowded on the short spur-branchlets into groups of 5 to 15 flowers; floral tube 3-9 mm. long, in fruit 7-16 mm. long, appressed-silky-strigose to spreading-villous or tomentose, sometimes glabrate; stamens 22 to 44, the anthers hairy; achene about one-third exserted from floral tube at maturity, the tail 2-8 cm. long, densely silky-plumose. In chaparral, canyons, on rimrock, breaks, rocky slopes and in open woodlands on the Edwards Plateau and in the Panhandle and Trans-Pecos, Mar.-June; throughout most of w. U. S. and n. Mex.

We have several variants distinguished in the key in this highly variable species.

Var. *argenteus* (Rydb.) F. L. Martin. Leaves densely pubescent.

Var. *glaber* (Wats.) F. L. Martin (*C. betuloides* Nutt.). Leaves essentially glabrous.

Var. *paucidentatus* (Wats.) F. L. Martin (*C. breviflorus* Gray). Some plants in Brewster and El Paso counties have their leaves and young branches densely covered with short spreading-erect hairs instead of having only the typically appressed hairs.

18. AGRIMONIA L. AGRIMONY. COCKLEBUR. HARVEST-LICE

Perennial herbs from stout rhizomes; leaves pinnate with crenate-serrate leaflets, interspersed with smaller leaflets; stipules foliaceous; flowers yellow, small, spicate-racemose; floral bracts 3-cleft; calyx tube (hypanthium) turbinate or hemispherical, the throat beset with hooked bristles, indurated in fruit and enclosing 2 achenes, the 5-cleft limb closed after flowering; petals 5; stamens 5 to 15; styles terminal; fruit an achene.

About 15 species mostly in the North Temperate Zone.

⁸⁰ Adapted from Floyd L. Martin in *Brittonia* 7:91-111. 1950.

1. Axis of the inflorescence and lower leaflet surfaces without glands, finely to densely pubescent with short crooked or ascending hairs . . . 1. *A. microcarpa*.
1. Axis of the inflorescence and lower leaflet surfaces conspicuously glandular; hypanthium without minute strigose hairs in the furrows (2)
- 2(1). Leaves glabrous on lower surface or with scattered long hairs on the veins; axis without short crooked or incurved hairs; leaflets less than 10, elliptic to obovate . . . 2. *A. rostellata*.
2. Leaves finely to softly pubescent on the lower surface; axis finely and densely pubescent; leaflets 10 or more, of a lanceolate type . . . 3. *A. parviflora*.

1. *Agrimonia microcarpa* Wallr. Plant slender, with fusiform roots, to 12 dm. high; stem divergently long-villous below; leaves mostly clustered near base, the petioles and rachises of principal leaves horizontally long-villous; larger leaflets 3 to 7, narrowly obovate to elliptic, rounded at summit, coarsely dentate, thin, sparsely strigose above and pilose beneath; rachises of inflorescences filiform, to 4 dm. long, minutely pilose, without glands, remotely flowered; hypanthium of mature fruit obconic to short-campanulate, about as broad as long, 1.5-3 mm. long, the bristles ascending or the outer slightly spreading. *A. pumila* Muhl. In low rich woods in e. Tex., July-Oct.; from Fla. to Tex., n. to N. J., Pa., W Va. and Ky.

2. *Agrimonia rostellata* Wallr. Plant slender, with fibrous or sometimes fusiform roots; stem nearly glabrous or with scattered hairs, to 1 m. high, with ascending slender branches; leaflets of principal leaves 5 to 9, broadly elliptic to obovate, with coarse blunt teeth, thin, glabrous or with scattered short hairs on veins of resin-dotted lower surface; intermediate small leaflets 1 to 3; axis of inflorescence with glands; fruits 3.5-4.5 mm. long, the bristles ascending or the outer spreading, the longer bristles overtopped by the domelike beak of calyx lobes; hypanthium round-based, hemispherical, grooveless or only shallowly grooved, smooth or glandular-granulose. In moist rich open woods in n.e. Tex., July-Sept.; from Ga. to Tex. and Okla., n. to Mass., Conn., N.Y., O., Ind., Ill., Mo. and e. Kan.

3. *Agrimonia parviflora* Ait. Plant stout and tall, to 2 m. high, from long fibrous roots; stem densely and divergently long-hirsute or villous; larger leaflets of middle and upper leaves 11 to 15, lanceolate-acuminate, sharply serrate, firm, veiny, copiously glandular-dotted beneath; smaller interspersed leaflets very unequal, often 3 to 5 pairs on the intervals of the hirsute rachis; axis of inflorescence glandular and finely pubescent; fruits 4-5 mm. long, the hooked bristles borne on a horizontal flange and spreading to ascending, the outer bristles strongly spreading; hypanthium turbinate, with deep rounded grooves. In damp thickets and meadows and in marshy areas in the n. Panhandle and in n. e. Tex., July-Oct.; from Fla. to Tex., n. to Conn., N. Y., Ont., O., Ind., Ill. and Neb.

19. SANGUISORBA L.

Several species in the Northern Hemisphere.

1. *Sanguisorba annua* Nutt. PRAIRIE BURNET. Glabrous annual from a slender taproot; stems freely branched, to 4 dm. high; leaves pinnately compound; leaflets 7 to 15, obovate in outline, 7-15 mm. long, pectinately divided almost to the midrib into narrow blunt lobes; stipules similar to leaflets, adherent to the petiole; flower heads dense, subglobose to cylindrical, to 3 cm. long, on a naked peduncle; flowers 4-merous, small, often polygamous or unisexual, each bracteate and 2-bracteolate; calyx with a turbinate tube, constricted at the throat, persistent, the 4 broad greenish petaloid spreading lobes with scarious margins and imbricated in the bud, deciduous; petals none; stamens 4 to 12 or more, with flaccid filaments and short anthers; pistils 1 to 3, the slender terminal style tipped by a tufted or brushlike stigma; achene usually solitary, enclosed in the 4-angled dry and thickish calyx tube. *Poteridium annuum* (Nutt.) Spach. In sandy or gravelly soils in prairies, pastures, open oak woods and along roadsides mainly in n.-cen. Tex., Mar.-June; from Tex. to Ark. and Kan., sometimes adv. elsewhere.

20. ROSA L. Rose

Woody perennials, upright or trailing, usually with prickly stems; leaves alternate, compound or rarely simple, typically with adnate stipules or these rarely absent; leaflets

3 to 15, serrate or biserrate, often pubescent and glandular; flowers perfect, solitary, corymbose or paniculate; sepals 5, rarely 4; petals 5, rarely 4 or (by transformation of the stamens) numerous, obovate to obcordate; stamens numerous, inserted on a disk at the margin of the hypanthium; ovaries numerous within the hypanthium; styles connate or free, included or exserted; stigmas thickened; hypanthium urceolate or globose, contracted at the mouth, becoming fleshy at maturity (the hip); fruit an achene.

Probably a little more than 200 valid cosmopolitan species that are native mainly in the Northern Hemisphere. Contrary to popular belief, there is no yellow rose of Texas except in a song that extols the charms of a sepia-complexioned lady.

1. Receptacle prickly-armed, cup-shaped; achenes only at bottom on a conical torus; leaflets not exceeding 25 mm. in length 1. *R. stellata*.
1. Receptacle smooth or only bristly, urn-shaped; achenes on wall and/or bottom (2)
- 2(1). Stipules free or nearly so, caducous (3)
2. Stipules adnate about one half or more, persistent (4)
- 3(2). Branchlets glabrous; leaflets 3 or 5; stipules denticulate 2. *R. laevigata*.
3. Branchlets tomentose or pubescent; leaflets 7 or 9; stipules pectinate 3. *R. bracteata*.
- 4(2). Styles exserted or at least not forming a head (5)
4. Styles little or not exserted, forming a head closing the mouth of the receptacle (6)
- 5(4). Stipules pectinate; prickles usually infrastipular; style glabrous; leaves usually 5 4. *R. multiflora*.
5. Stipules entire or denticulate; prickles scattered; leaves usually 3 5. *R. setigera*.
- 6(4). Leafles resin-dotted or glandular-pubescent beneath (with or without glandless pubescence in addition); stems with usually stout hooked prickles, sometimes mixed with glandular bristles; outer sepals usually pinnate (7)
6. Leaflets glabrous beneath or pubescent with glandless hairs; stems (at least at base) with usually straight prickles and bristles; sepals usually entire (9)
- 7(6). Prickles slender, straight or slightly curved; leaflets tomentose 6. *R. tomentosa*.
7. Prickles hooked; leaflets glabrous or pubescent beneath (8)
- 8(7). Leaflets suborbicular or broadly oval, usually obtuse, glandular on both surfaces; style pubescent; sepals spreading or erect, long-persistent 7. *R. Eglanteria*.
8. Leaflets ovate to oval, acute or short-acuminate, without glands above; style glabrous or nearly so; sepals reflexed, soon deciduous 8. *R. micrantha*.
- 9(6). Sepals (after flowering) spreading, deciduous; achenes inserted only at the bottom of the receptacle (10)
9. Sepals (after flowering) upright, usually persistent; achenes inserted on wall and bottom (12)
- 10(9). Leaflets typically 9 or 11, rather narrow 9. *R. foliolosa*.
10. Leaflets 7 or fewer, obovate to oblong-lanceolate (11)
- 11(10). Terminal leaflet more than 2.5 times as long as wide; in Johnson County 10. *R. ignota*.
11. Terminal leaflet less than 2.5 times as long as wide; east Texas 11. *R. carolina*.
- 12(9). Infrastipular prickles present; in Trans-Pecos Texas 12. *R. Woodsii*.
12. Infrastipular prickles not present; east of Trans-Pecos Texas (13)
- 13(12). Leaflets glabrous, acute 13. *R. arkansana*.
13. Leaflets pubescent (at least beneath), usually obtuse .. 14. *R. suffulta*.

1. *Rosa stellata* Woot. var. *stellata*. DESERT ROSE. Shrub to 6 dm. high; branches with numerous slender yellowish white prickles and closely stellate-pubescent when young;

leaflets 3, sometimes 5, broadly cuneate-obovate, 5-10 mm. long, incisely dentate, pubescent on both sides; flowers solitary, deep-rose-purple, 3.5-6 cm. across; fruit broadly turbinate, 1-1.5 cm. thick, dull-reddish. In mt. canyons in the Trans-Pecos, summer; from Tex. to Ariz.

Subsp. *mirifica* (Greene) W. H. Lewis (*R. mirifica* Greene) is usually a more vigorous plant with branches without the conspicuous stellate pubescence of var. *stellata*.

Var. *Erlansoniae* W. H. Lewis differs from the typical variety by having floral branches angled at the nodes, pale-green, devoid of internodal bristles and prickles or sometimes sparsely bristly and prickly, or glabrous. In canyons of the Guadalupe Mts.

2. *Rosa laevigata* Michx. CHEROKEE ROSE. Plant to 5 m. high; leaflets 3, rarely 5, elliptic-ovate to ovate-lanceolate, 3-6 cm. long, acute or acuminate, sharply and finely serrate, glabrous and lustrous, reticulate beneath; flowers white, rarely rose-colored, 6-8 cm. across, fragrant; fruit pyriform, bristly, 3.5-4 cm. long. A nat. of China that occasionally escapes from cult.

3. *Rosa bracteata* Wendl. MACARTNEY ROSE. Depressed evergreen with very broad-based paired infrastipular prickles; branchlets densely tomentose and slenderly prickly and stipitate-glandular; stipules about 5 mm. long, cleft essentially to base into slender segments; leaflets 5 to 9, hard and coriaceous, lustrous above, narrowly obovate, obtuse or acutish at apex, finely crenate-dentate, glabrous or pubescent on midrib beneath, 13-35 mm. long; flowers 1 to few, short-stalked, closely subtended by large dissected pubescent bracts, 5-7 cm. across, white; receptacle tomentose; fruit globose, 3-3.5 cm. across, orange-red, woolly. A nat. of China that is often planted as a living fence and which readily escapes from cult., especially in the e. third of Tex., summer-fall; from Fla. to Tex., n. to Va.

4. *Rosa multiflora* Thunb. JAPANESE ROSE. Plant noticeably trailing or arching in habit; leaflets obovate to oblong, mostly 7 or 9, 2-4 cm. long, serrate, pubescent, obtuse to acute; stipules fimbriate-pectinate; flowers abundant in pyramidal inflorescences, 2-4 cm. broad, mostly white; sepals ovate, abruptly acuminate, 5-8 mm. long; style glabrous; fruit small, globular. An Asian species that occasionally escapes from cult. in clearings, along roadsides and borders of woods in e. Tex., May-June.

5. *Rosa setigera* Michx. PRAIRIE ROSE, CLIMBING ROSE. Shrub climbing, leaning or trailing, the canes prolonging to at least 5 m. and bearing remote broad-based prickles; leaflets of flowering branchlets 3 or 5, ovate to ovate-oblong, acuminate, sharply serrate, to 1 dm. long, usually much less, lustrous above, glabrous or merely pilose on nerves beneath; stipules with entire or merely ciliate margins; flowers several in a corymb, roseate, fading to whitish, 4-8 cm. across; pedicels and receptacle glandular-hispid; sepals reflexed in anthesis, lance-attenuate, 12-16 mm. long, deciduous; styles glabrous, united into a column about equaling the stamens; fruit red, subglobose, 8-12 mm. long. Open woods, thickets, clearings and banks in e. Tex., Apr.-July; from Fla. to Tex., n. to N. Y., W. Va., O., Ind., Ill., Mo. and Kan.

Var. *tomentosa* T. & G. has leaves tomentose on the lower surface, dull above, and smaller, more numerous flowers than in var. *setigera*.

6. *Rosa tomentosa* Sm. Shrub to 2 m. high; branchlets often zigzag; young branchlets often bloomy; prickles stout, curved or straight; leaflets 5 or 7, elliptic to ovate, acute to short-acuminate, 2-4 cm. long, doubly serrate, finely pubescent above, tomentose and glandular beneath; stipules with short triangular spreading auricles; flowers pale-pink or nearly white, about 4 cm. across; pedicels often glandular-hispid; sepals lobed, usually deciduous before maturity; fruit subglobose, 1-2 cm. thick, stipitate-glandular. A Eur. species that occasionally escapes from cult., summer-fall.

7. *Rosa Eglanteria* L. SWEET-BRIER. Much-branched shrub to 2 m. high; prickles strong, hooked, sometimes mixed with bristles; leaflets 5 or 7, orbicular to oval, 1-3 cm. long, obtuse or acutish, dark-green and glabrous above, pubescent beneath, glandular on both sides, fragrant; flowers 1 to 3, bright-pink, 3-5 cm. across, with short glandular-hispid pedicels; receptacle glandular-hispid; fruit subglobose to ovoid, orange to scarlet, with more or less spreading tardily deciduous sepals. A Eur. species that occasionally escapes from cult., summer-fall.

8. *Rosa micrantha* Sm. Much-branched shrub to 2 m. high, with arching branches, armed with uniform curved prickles, without bristles; leaflets 5 or 7, broadly ovate, 1.5-3 cm. long, short-acuminate, doubly glandular-serrate, glabrous or pubescent above,

pubescent and glandular beneath; flowers 1 to 4, pink to white, about 3 cm. across; styles glabrous, somewhat exserted; pedicels glandular-hispid; fruit ovoid to subglobose, with spreading or reflexed deciduous sepals. A Eur.-Medit. species that occasionally escapes from cult., summer-fall.

9. *Rosa foliolosa* Nutt. LEAFY ROSE, WHITE PRAIRIE ROSE. Low shrub to 5 dm. high; stem with short straight slightly reflexed prickles or nearly unarmed, rarely bristly; leaflets 7 or 9, rarely 11, narrowly- to linear-oblong, 1-3 cm. long, acute, finely serrate, glabrous and lustrous above, glabrous or pubescent on the veins beneath; stipules usually narrow; flowers solitary or few, white to rose-color, about 4 cm. across; calyx glandular-hispid; pedicels and receptacle sparingly glandular-hispid or the latter sometimes smooth; fruit subglobose, somewhat hispid, about 8 mm. across. Prairies, sandy oak woods, thickets and along fences, roadsides and railroad tracks in n.-cen. and cen. Tex., s.w. to Kerr Co., Apr.-June; also Okla. and Ark.

10. *Rosa ignota* Shinn. Plant woody, otherwise not well-known; leaflets 3 or 5, rarely reduced to one, oblong-lanceolate to narrowly elliptic, serrulate, glabrous; stipules adnate to petioles, glandular-denticulate and puberulent, a little shorter than the petioles; flowers 1 or 2, shortly pedicellate; calyx glabrous towards base, glandular-hispid on outside toward the apex of the tube, the lobes narrowly ovate-attenuate and deflexed; petals pink, obovate, 1-1.2 cm long, smaller than or subequal to the calyx lobes. A poorly known plant from thickets on limestone in Johnson Co.

This plant is considered to be referable to *R. foliolosa* by some recent authors.

11. *Rosa carolina* L. CAROLINA ROSE. Low and slender shrub to 1 m. high; canes usually borne singly from stolons, 2-6 mm. thick at base, these often bearing short acicular scattered prickles; middle and upper internodes with few or no prickles; infrastipular prickles acicular, firm, straight or nearly so, horizontally divergent or slightly reflexed, 4-9 mm. long, rarely wanting; stipules narrow, the halves of the adnate pair spreading, to 15 mm. long and 2 mm. broad; leaflets 5 to 9, elliptic to narrowly ovate-lanceolate or narrowly obovate, acute to obtuse, 1.5-4 cm. long, submembranaceous to firm, dull or barely sublustrous above, coarsely serrate on margins above the middle; rachis glabrous or [in f. *glandulosa* (Crép.) Fern.] stipitate-glandular and the leaflets more or less glandular-toothed; flowers mostly solitary, 35-55 mm. across; calyx stipitate-glandular or smooth; fruit red, subglobose; achenes castaneous, obovoid or semiobovoid (straight on one side), 4-5 mm. long. *R. serrulata* Raf., *R. subserrulata* Rydb., *R. texarkana* Rydb., *R. Treleasei* Rydb. In dry sandy, rocky or open habitats or thin woods in e. Tex., May-July; from Fla. to Tex., n. to N. S., N. E., Ont., Mich., Wisc., Minn., and Neb.

12. *Rosa Woodsii* Lindl. Small shrub to 1 m. high or more, with reddish-brown or later grayish bark; infrastipular prickles acicular or subulate, straight or arching from base; stipules glandular and pubescent on back, often glandular-serrulate, the pair 4-7 mm. broad; leaflets 5 to 9, elliptic-obovate, coarsely serrate, thin, pubescent beneath, 1-3 cm. long; flowers pink, solitary or several-corymbed, about 3 cm. across; sepals 1-1.5 cm. long, often glandular, erect or spreading in fruit; receptacle smooth; fruit subglobose, red, about 8 mm. in diameter. Incl. var. *Fendleri* (Crép.) Rydb., *R. Demareei* E. J. Palm. On plateaus and dry slopes in the Trans-Pecos, May-July; from Ont. and Minn. to B.C., s. to Mo., Neb., Tex. and n. Mex.

13. *Rosa arkansana* Porter. PRAIRIE ROSE. Shrub to 5 dm. high; stems very prickly and bristly; leaflets 9 or 11, elliptic, 2-6 cm. long, obtuse to acute, coarsely and sharply serrate, glabrous and lustrous above, glabrous or sparingly pilose on the veins beneath; stipules dilated, glandular-dentate; flowers few to many in corymbs, pink, about 4 cm. across; pedicels glabrous; fruit subglobose, 1-1.5 cm. thick, beaked by sepals 1-1.5 cm. long; achenes plump-ellipsoid, about 5 mm. long. On rocky slopes, in thickets and dry prairies in e. Panhandle, May-Aug.; from Wisc. and Minn., s. to Kan., Colo. and Tex.

14. *Rosa suffulta* Greene. SUNSHINE ROSE. Low shrub to 5 dm. high; stems densely prickly and bristly, usually green; leaflets 7 to 11, broadly elliptic to obovate-oblong, 1.5-4 cm. long, usually obtuse, cuneate, simply serrate, finely pubescent on both sides or finally glabrous above; stipules dilated, glandular-dentate; petiole and rachis finely pubescent; flowers corymbose, pink, about 3 cm. across; pedicels and receptacles glabrous; sepals sometimes lobed; fruit globose, about 1 cm. thick. *R. arkansana* var. *suffulta* (Greene) Cockl. In dry thickets, on rocky slopes and sands in n.-cen. Tex., May-Aug.; from Alta. and Man., s. to Ill. and Tex.

21. PRUNUS L. PLUM. CHERRY. PEACH

Deciduous or evergreen trees or shrubs; winter-buds with many imbricate scales; leaves alternate, serrate to serrulate or dentate, rarely entire, stipulate; flowers perfect, solitary or in fascicles or racemes; calyx 5-cleft; calyx tube campanulate, urceolate or tubular-obconical, deciduous after flowering; petals 5, spreading, white, pink or red; stamens numerous, perigynous; pistil 1, with elongated style, 2-ovuled; fruit a drupe, usually 1-seeded.

More than 400 species mainly in the temperate zones of the world. Many species are cultivated for their edible fruits or seeds or for their ornamental value.

1. Flowers in racemes (2)
1. Flowers solitary or in corymbs or umbels (4)
- 2(1). Flowers in axillary racemes about 3 cm. long; drupe with a dry exocarp; leaves persistent, evergreen 1. *P. caroliniana*.
2. Flowers in racemes more than 3 cm. long that terminate branches of the year; leaves deciduous (3)
- 3(2). Sepals deciduous; leaf blades mostly serrulate with very slender teeth 2. *P. virginiana*.
3. Sepals persistent; leaf blades mostly serrate with relatively coarse teeth 3. *P. serotina*.
- 4(1). Flowers sessile or rarely with pedicels to 7 mm. long (in *P. texana*); leaves usually small, mostly less than 3 cm. long (except in *P. persica*); fruits pubescent to puberulent or rarely glabrate (5)
4. Flowers distinctly pedicellate; leaves usually more than 3 cm. long; fruits glabrous (8)
- 5(4). Petioles 10-15 mm. long; leaves more than 5 cm. long; flowers 25 mm. or more across; fruit fleshy, not splitting 4. *P. persica*.
5. Petioles less than 5 mm. long; leaves much less than 5 cm. long; flowers less than 20 mm. across; fruits dry, commonly splitting (6)
- 6(5). Leaves cuneate to orbicular-obovate, coarsely toothed with glandless teeth on the rounded apical margin, invested with short silvery hairs; in mountains of Trans-Pecos Texas 5. *P. Havardii*.
6. Leaves elliptic to oblanceolate; on the Edwards Plateau and Rio Grande Plains (7)
- 7(6). Leaves glabrous, green on both surfaces, with entire margins or with several remote glandless teeth 6. *P. minutiflora*.
7. Leaves pubescent, the lower surface cottony-white, the upper surface deep-green, the margins with numerous glandular teeth. 7. *P. texana*.
- 8(4). Plant with mature leaves, with or without flowers or fruits (9)
8. Plant without mature leaves but with flowers (15)
- 9(8). Leaves with acute or acuminate teeth (the leaf tissue, not glands, usually forming the main tip), dull above, usually more or less pubescent; fruits dark purple to red or yellow (10)
9. Leaves with obtuse or rounded-obtusish teeth, the teeth often gland-tipped; calyx lobes usually glandular; fruit red or yellow (11)
- 10(9). Leaves rarely more than 7 cm. long, acute or gradually acuminate, usually sparsely short-pubescent on the lower surface; calyx lobes without glands; fruit subglobose, 1-2 cm. in diameter 8. *P. umbellata*.
10. Leaves usually more than 7 cm. long, abruptly acuminate, densely pubescent on the lower surface; calyx lobes slightly glandular; fruit ellipsoid to globose, 2-3 cm. long 9. *P. mexicana*.
- 11(9). In mountains of Trans-Pecos Texas; pedicels and young branchlets densely short-pubescent 10. *P. Murrayana*.
11. East of the Trans-Pecos region; pedicels and young branchlets glabrous or very rarely with one or both pubescent (12)

- 12(11). Leaves mostly more than 7 cm. long, pubescent along the midrib beneath; fruit 2-3 cm. in diameter11. *P. Munsoniana*.
12. Leaves rarely more than 7 cm. long; fruit smaller than above (13)
- 13(12). Leaves ovate to oval, obtuse to acutish at apex, pubescent on lower surface, plane; young branchlets pubescent; pedicels short-pubescent12. *P. gracilis*.
13. Leaves ovate-lanceolate to elliptic-lanceolate or lanceolate, acute to acuminate at apex, glabrous or sparsely pubescent on lower surface, usually somewhat conduplicate; young branchlets glabrous or rarely somewhat pubescent; pedicels glabrous or essentially so (14)
- 14(13). Calyx lobes glandular, usually pubescent within; leaves usually ovate-lanceolate and acuminate, the teeth without or with a minute often caducous gland13. *P. rivularis*.
14. Calyx lobes without glands, glabrous within except at the base or sparsely pubescent; leaves usually elliptic-lanceolate and acute, the teeth capped with a large permanent gland14. *P. angustifolia*.
- 15(8). In mountains of Trans-Pecos Texas; pedicels and calyx noticeably short-pubescent10. *P. Murrayana*.
15. East of the Trans-Pecos region; pedicels and calyx glabrous to densely pubescent (16)
- 16(15). Petals 3-7 mm. long; calyx lobes usually subglabrous to pubescent below middle on inner surface; leaves with gland-tipped obtusish teeth; rhizomatous shrubs or trees (17)
16. Petals 7.5-11 mm. long; calyx lobes densely pubescent on inner surface; leaves with sharp glandless teeth; nonrhizomatous trees (20)
- 17(16). Calyx lobes entire; pedicels 2-6 mm. long14. *P. angustifolia*.
17. Calyx lobes glandular-toothed; pedicels 5-15 mm. long (18)
- 18(17). Calyx tube and pedicel densely short-pubescent ..12. *P. gracilis*.
18. Calyx tube glabrous or pubescent only at summit; pedicels glabrous (19)
- 19(18). Shrub mostly less than 3 m. high; calyx lobes oblong-lanceolate to ovate-lanceolate13. *P. rivularis*.
19. Tree to 10 m. high; calyx lobes ovate to ovate-oblong11. *P. Munsoniana*.
- 20(16). Pedicels of fully expanded flowers 6-10 mm. long; calyx tube sparsely to densely pubescent; calyx lobes usually sparsely pubescent on outer surface9. *P. mexicana*.
20. Pedicels of fully expanded flowers 9-15 mm. long; calyx tube glabrous to sparsely pubescent; calyx lobes usually densely pubescent on both surfaces8. *P. umbellata*.

1. *Prunus caroliniana* (Mill.) Ait. LAUREL CHERRY. Tree to 12 m. high with a trunk to 25 cm. in diameter; branchlets slender, glabrous; leaves evergreen, oblong-elliptic to elliptic-lanceolate, acute to acuminate at apex, mucronate, coriaceous, glabrous, 5-12 cm. long, to 35 mm. wide, the margins entire or very rarely remotely spinulose-serrate, dark-green and lustrous on upper surface, paler or lower surface; petioles stout, broad, glabrous; flowers in dense racemes that are much shorter than the leaves, 3-5 mm. across; pedicels 3-4 mm. long; calyx tube obconic, the small thin lobes rounded; petals minute, cymbiform, cream-colored; stamens exerted, orange-colored; fruit ovoid to subglobose, short-pointed, black, lustrous, 1-1.3 cm. long, with a thick skin, ripening in the fall but remaining on the branches until after the flowering period of the following year. *Lauro-cerasus caroliniana* (Mill.) Roem. In and on the edge of forests, lowland areas, fields and thickets in e. Tex., flowering in Feb.-Apr., fruiting Apr.-Oct.; from Fla. to Tex., n. to N. C.

A popular ornamental in the eastern third of Texas.

2. *Prunus virginiana* L. COMMON CHOKECHERRY. Shrub or tree to 10 m. high; bark non-aromatic; branchlets glabrous; leaves ovate to broadly elliptic or obovate, 4-12 cm. long,

abruptly acuminate, broadly cuneate to rounded at base, thin, closely and sharply serrulate, dark-green and somewhat lustrous above, glaucescent or grayish-green beneath and glabrous except for axillary tufts of hairs; petioles 1-2 cm. long, glandular; flowers white, 8-10 mm. across, in dense glabrous racemes 7-15 cm. long; calyx limb deciduous in fruit; fruits globose, about 8 mm. in diameter, acid and astringent, dark-purple; stone smooth. Open woods, rocky slopes, bluffs, rimrock, breaks and seepage areas in e. Tex., the Panhandle and Trans-Pecos, fruiting June-Aug.; from Nfld. to Sask., s. to N. C., Tenn., Mo., Kan. and Tex.

3. *Prunus serotina* Ehrh.⁶⁴ BLACK CHERRY, WILD BLACK CHERRY. Tree to 30 m. high, rarely shrubby, with dark bark, the branches reddish-brown, the inner bark aromatic; leaves short-petiolate, oblong-lanceolate to ovate-oblong, acuminate to taper-pointed or acute at apex, firm to coriaceous, crenate-serrate with blunt incurved callous teeth, 3.5-15 cm. long, dark-green and lustrous above, pale-green beneath, the broad midrib prominent beneath and often villous; petioles 6-25 mm. long, usually glandular; racemes slender and elongate, 6-15 cm. long, the divergent pedicels 3-10 mm. long; flowers 7-10 mm. broad; calyx with narrow acute often toothed lobes, persistent in fruit; fruit globose, 7-10 mm. in diameter, dark-red, becoming purple-black, sweetish or bitter. *Padus serotina* (Ehrh.) Agardh. Throughout most of e. and s. U. S., Can. and Latin Am.

A tree valued for its timber and ornamental foliage. The several variants of this species in Texas are segregated as follows:

1. Plants from the region of the Edwards Plateau in south-central Texas; branchlets and often foliage entirely glabrous; leaves coarsely toothed (2nd floral leaf with about 5 teeth per cm. of margin), long-petiolate (petiole of 2nd floral leaf about 15 mm. long); in woodlands, floodplains, canyons, draws and on mountain slopes (*P. eximia* Small) subsp. *eximia* (Small) McVaugh.
1. Plants mostly in east and extreme west Texas; branchlets glabrous to hirsutulous; leaves usually rufous-tufted beneath near base of midrib; floral leaves often with about 7 teeth per cm. of margin and petioles 10 mm. long or less (2)
- 2(1). Plants with small leaves and scant growth, of a xerophytic type; foliage leaves mostly 5-7 (-9) cm. long; fertile branches averaging 10 cm. in length; in canyons and breaks of mountains of Trans-Pecos Texas with an isolated locality (designated as *P. Parksii* Cory) near the Bexar-Wilson counties line [*P. virens* (Woot. & Standl.) Shreve] subsp. *virens* (Woot. & Standl.) McVaugh.
2. Plants with relatively large leaves and luxuriant growth, of a mesophytic type; foliage leaves mostly 6-9 (-15) cm. long; petioles often about 15 cm. long in foliage leaves, 1 cm. long in second floral leaf; fertile branches averaging 12 cm. long; branchlets usually glabrous; in eastern Texas in woodlands, thickets, fence-rows and along roadsides subsp. *serotina*.

4. *Prunus persica* (L.) Batsch. PEACH, DURAZNO. Tree to 8 m. high; branchlets glabrous; buds pubescent; leaves elliptic-lanceolate to oblong-lanceolate, 8-15 cm. long, broadest about or slightly above the middle, long-acuminate and attenuate at apex, broadly cuneate at base, serrate or serrulate, glabrous; petioles 1-1.5 cm. long, glandular; flowers usually solitary, appearing before leaves, pink, 25-35 mm. across, very short-stalked; sepals pubescent on outer surface; fruit subglobose, 5-7 cm. in diameter, fleshy; stone deeply pitted and furrowed, very hard. A nat. of China, widely cult. for its luscious fruit, that occurs as waifs or escapes in waste places, dumps, thickets, along roadsides and edge of woods, mostly in e. Tex.

5. *Prunus Havardii* (W. Wight) W. Wight. HAVARD PLUM. A shrub with rather rigid branches, stout spinescent branchlets and light-gray bark; leaves obovate to oblong-obovate or sometimes flabelliform on young growth, 7-20 mm. long, 3-10 mm. wide, glabrous or sometimes finely pubescent on both surfaces, usually somewhat pale beneath and rather prominently reticulate-veined, the margin conspicuously dentate toward the apex, very rarely toothed below the middle, the teeth usually acute and glandless; flowers appearing with the leaves, sessile; calyx petaloid, slightly pubescent, the tube 2-2.5 mm.

⁶⁴ Adapted from Rogers McVaugh in *Brittonia* 7:279-315. 1951.

long, the entire and obtuse to acute lobes scarcely more than 1 mm. long; petals not evident; fruit sessile, nearly globular, the pubescent exocarp dehiscent along one edge, when dry about 1 cm. long and 7.5 mm. broad and thick; stone about 8 mm. long, rounded at the base and slightly pointed toward the apex, the surface smooth except for indistinct grooves near the ventral edge. *Amygdalus Havardii* W. Wight. On rocky slopes and canyons in the Trans-Pecos, fruiting in July; endemic.

6. *Prunus minutiflora* Engelm. TEXAS ALMOND. A low shrub with irregular often zigzag scarcely spinescent branches and grayish bark, often forming dense masses; leaves oblong-elliptic, narrowed at base, rounded at apex, 7-20 mm. long, 5-8 mm. wide, pale below and glabrous on both surfaces, often glaucous or bluish-gray, the margins sometimes slightly revolute, entire or occasionally irregularly toothed, glandless; petioles 2-3 mm. long; flowers appearing with the leaves on short lateral spurs, sessile or very nearly so, 1 to 4 on each spur; calyx tube campanulate with broadly ovate lobes about 1 mm. long; petals white, obovate, about 3.5 mm. long; fruit globose, about 12 mm. long and 1 cm. broad and thick when dry, the exocarp thin and dehiscent along the ventral edge; stone turgid and with a smooth surface, grooved along the dorsal edge, the ventral edge rather thick with an inconspicuous groove a short distance from the margin. *Amygdalus minutiflora* (Engelm.) W. Wight. Apparently rare on limestone slopes, sandy brushy plains, ledges and in canyon on the Edwards Plateau and Rio Grande Plains, fruiting in June; endemic.

7. *Prunus texana* Dietr. PEACH BUSH. A dwarf bushy shrub with very irregular branches and grayish bark; young branchlets light-gray and strongly pubescent; leaves oval to oblong-elliptic, 1.5-3 cm. long and 6-15 mm. wide on young succulent shoots, slightly narrowed toward the base, mostly obtuse at apex, green and pubescent above, grayish to tomentose below, the margins conspicuously glandular-serrulate; petioles 1-4 mm. long, pubescent; stipules linear, glandular; flowers appearing with or slightly before the leaves, solitary or in twos, 1-1.2 cm. broad; pedicels 3-4 mm. long, grayish-pubescent; calyx pubescent, the tube about 2 mm. long, the ovate-oblong lobes as long as tube and glandular-serrulate; petals white, oblong, 4.5-6 mm. long, obtuse at apex and abruptly narrowed to a very short claw; fruit rather densely velvety-hairy; stone ovoid, 13-15 mm. long, about 1 cm. broad and 9 mm. thick, usually rounded at the base, pointed at the apex and slightly flattened toward the ventral edge but rounded on the dorsal side, the surface smooth. *P. glandulosa* (Hook.) T. & G., *Amygdalus texana* (Dietr.) W. Wight. In the Edwards Plateau and Rio Grande Plains, fruiting in June; endemic.

8. *Prunus umbellata* Ell. FLATWOOD PLUM. Small tree to 6 m. high, with compact head and slender branches; bark light reddish-brown; branchlets glabrous or slightly pubescent at first; leaves elliptic-oblong to sometimes obovate, acute to short-acuminate, finely pubescent or glabrous above, 4-7 cm. long, rounded at base or broadly cuneate, finely serrate with acute teeth, usually pubescent beneath along the midrib, rather thin but firm at maturity; petioles 5-8 mm. long, tomentose; flowers 2 to 4, white, 1-1.8 cm. across, the slender pedicels glabrous; sepals ovate to ovate-oblong, obtuse, shorter than tube, sometimes slightly hairy without, densely pubescent within; fruit subglobose, 1-2 cm. across, red to yellow or dark-purple and with a bloom; stone oval to subglobose, obtuse, smooth or reticulate. Incl. var. *tarda* (Sarg.) W. Wight, *P. tarda* Sarg. In and on edge of forests, on slopes and along creeks, in pastures and fencerows, mostly in e. Tex., w. to Coleman Co., fruiting July-Aug.; from Miss. to Tex. and s. Ark.

9. *Prunus mexicana* Wats. BIG-TREE PLUM, MEXICAN PLUM. Tree to 12 m. high, not sprouting from the root; branchlets pubescent or glabrous; leaves obovate to oblong-obovate, 6-12 cm. long, abruptly acuminate, usually somewhat subcordate, sharply and often doubly serrate, short-pubescent above (at least when young) and rugose, pubescent and somewhat reticulate beneath, thickish at maturity; petioles glandular; flowers 2 to 4, white, 1.5-2 cm. across, the pedicels usually glabrous; calyx lobes dentate at apex or sometimes entire, slightly glandular, pubescent within; fruit globose, sometimes ellipsoid, 2-3 cm. long, purplish-red, bloomy; stone obovoid to subglobose, turgid. *P. arkansana* Sarg., *P. Palmeri* Sarg., *P. reticulata* Sarg., *P. tenuifolia* Sarg., *P. americana* var. *lanta* and *P. lanata* of auth. River bottoms, lake shores, hardwood slopes and prairies mostly n. e. and n.-cen. Tex. and the e. Edwards Plateau, fruiting July-Sept.; also n. Mex.

10. *Prunus Murrayana* E. J. Palm. MURRAY PLUM. Shrub 1-2 m. tall, probably becoming larger in protected situations, intricately branched or sometimes growing with erect stems

and few ascending branches; branchlets slender, rarely spiny, greenish-brown and densely pubescent the first season, becoming gray and glabrous or retaining some of the pubescence the second season; stipules linear, 6-10 mm. long, glandular-serrate; leaves ovate to ovate-lanceolate, 3-5 cm. long, 15-25 mm. wide, rounded at the base, acute or acuminate at apex, finely and evenly serrate with shallow obtuse teeth (12 to 14 per cm.), thin but firm at maturity, scabrate above and pilose-pubescent beneath with short stiff hairs; petioles 5-10 mm. long, densely pubescent, glandless; flowers in simple 1- to 5-flowered umbels, 8-12 mm. in diameter when fully expanded; pedicels slender, 8-12 mm. long, densely pubescent; calyx pubescent, the oblong-lanceolate lobes obtuse, glabrous within and densely hispid-pubescent on the outer surface; petals obovate, short-clawed, 4-5 mm. long, exceeding the short stamens; mature fruit unknown. On steep rocky slopes of canyons in the Davis Mts. of the Trans-Pecos; endemic.

11. *Prunus Munsoniana* Wight & Hedr. WILD-GOOSE PLUM. Shrubs or trees to 8 m. high; branchlets glabrous, soon chestnut-brown; leaves oblong-lanceolate to lanceolate, rarely obovate-oblong, 6-10 cm. long, acute or acuminate, rounded at base, finely glandular-serrate, bright-green and lustrous above, paler beneath and rather sparingly pubescent along the midrib and veins, sometimes pubescent all over when young, rarely quite glabrous, commonly conduplicate, rather thin at maturity; petioles 1.5-2 cm. long, usually biglandular, pubescent above; flowers 2 to 4, borne chiefly on short lateral spurs, 12-15 mm. across; pedicels slender, glabrous; calyx lobes ovate-oblong, as long as the glabrous tube, glandular-ciliate, glabrous or slightly pubescent outside, pubescent inside near base; petals obovate to oblong-obovate; fruit globose to short-ellipsoid, 15-25 mm. long, red or rarely yellow, slightly bloomy; stone oval, usually obliquely truncate at base. On limestone ledges and slopes and grassy thickets centered on the Edwards Plateau but s. to Calhoun Co. and n. to Rockwall Co., fruiting in summer; from Ky. and Tenn., s. to Kan. and Tex.

12. *Prunus gracilis* Engelm. & Gray. OKLAHOMA PLUM. Straggling shrub to 15 dm. high, forming thickets; young branchlets pubescent, later reddish-brown; leaves elliptic to ovate, 2.5-5 cm. long, obtuse to acute or short-acuminate, rounded at base, finely serrate with obtuse or acute teeth, finely and slightly pubescent above, reticulate and densely pubescent below; petioles pubescent, glandless; flowers 2 to 4, about 1 cm. across; pedicels and calyx finely pubescent to rarely subglabrous; calyx lobes ovate, acute, entire or denticulate, pubescent on both sides; fruit subglobose to ellipsoid, about 15 mm. thick, usually red, slightly bloomy; stone oval, obtusish at both ends. *P. normalis* (T. & G.) Small. In sandy or dryish soils on open hills and thin woods, fencerows and fields mostly in e. Tex. and the Panhandle, fruiting June-Aug.; also Okla. and Ark.

13. *Prunus rivularis* Scheele. CREEK PLUM, HOG PLUM. Shrub to 2 m. high, forming dense thickets; bark gray; young branchlets glabrous or rarely pubescent, chestnut-brown; leaves lanceolate to ovate-lanceolate, 5-7 cm. long, acuminate, cuneate or rounded at base, crenately glandular-serrate, usually strongly trough-shaped or conduplicate, green and glabrous above, paler beneath and slightly pubescent (rarely densely so while young); petioles 7-12 mm. long, with 2 to 4 glands at apex, more or less pubescent (especially above); flowers 2 to 4, about 1 cm. across; pedicels glabrous or very sparsely pubescent, 6-10 mm. long; calyx sparingly hairy outside; calyx lobes oblong to ovate-oblong, glandular-ciliate, shorter than tube, pubescent within (especially near base), erect or spreading to finally reflexed; petals obovate to oblong-obovate; fruit globose to subglobose, 1.5-2 cm. across, usually yellow with crimson cheek, rarely red; stone oblong, pointed at the ends, smooth or slightly reticulate. (?) *P. venulosa* Sarg., *P. texana* Scheele, *P. Reverchonii* Sarg. Along creeks, edge of woods, roadsides, canyons, breaks on limestone ravines and slopes, mainly on the Edwards Plateau and n.-cen. Tex., fruiting July-Sept.; also Okla.

This species is quite variable. The plant described as *P. venulosa*, though placed here, had some characteristics of *P. gracilis*.

14. *Prunus angustifolia* Marsh. CHICKASAW PLUM. Twiggy shrub forming thickets or small trees to 4 m. high; branchlets slender, zigzag, sometimes spinulose, glabrous, reddish; leaves lanceolate to oblong-lanceolate, strongly trough-shaped or conduplicate, 2-8 cm. long, to 2 cm. wide, acute or short-acuminate, broadly cuneate or rounded at base, the appressed teeth prominently gland-tipped, glabrous and lustrous above, paler beneath and glabrous or pubescent along the midrib toward the base; petioles reddish, glandular or glandless; flowers 2 to 4, expanding with the leaves, creamy-white, 8-9 mm. across;

pedicels 3-6 mm. long, glabrous; calyx glabrous; calyx lobes ovate, shorter than the tube, glandless, glabrous inside except near base; fruit subglobose to ellipsoid, to 25 mm. long, 1-2 cm. across, red or yellow, with thin skin; stone plump, oval, obtuse at the ends or acute at apex. Forming thickets in old fields, edge of woods, along roadsides and fencerows throughout most of the e. two thirds of Tex., fruiting May-July; from Md. and Del., s. to Fla., w. to Ark. and Tex.

Some plants in the Panhandle have ellipsoid fruits to 25 mm. long. They are here referred to subsp. *varians* Wight & Hedr. which typically has larger foliage and stones that are oval to obovoid. The fruits are ripe in late June and early July.

FAM. 91. LEGUMINOSAE JUSS.⁸² LEGUME FAMILY

Trees, shrubs, vines or herbs; leaves and branches alternate; stipules usually well-developed and persistent; leaves usually compound (when simple then so through reduction or fusion), the leaflets often with stipels; flowers rarely solitary, usually in terminal or axillary panicles, racemes, spikes, heads or glomerules, usually perfect and complete, perigynous (but the floral cup sometimes evanescently short and the flowers essentially hypogynous), bilaterally symmetrical (in the Mimosoideae, genera 1 through 10, appearing radially symmetrical except for the gynoeceium) and often markedly zygomorphic (especially in the Papilionoideae, genera 20 through 69); calyx valvate at a very early stage of development or variously imbricate; sepals 5, these in most genera fused at least partly and in some genera only 4 in number through fusion; corolla basically of 5 petals attached at the rim of the floral cup, rarely fewer through reduction (and in the Papilionoideae, genera 20 through 69, often appearing to be only 4 because of fusion of the lower 2), in some genera of the Mimosa group the petals neotenually connate; aestivation valvate or variously imbricate; stamens 1 to numerous, separate or variously coalescent in groups or in some flowers of some genera modified into staminodia; gynoeceium of a single superior simple pistil with a ventral placentary suture oriented upward in most flowers, the ovules 1 to numerous and attached in 2 alternating rows to the coalescent margins of the placentary suture; style simple; fruit a "pod" or folliclelike usually dry structure, either indehiscent or breaking up into 1-seeded sealed units or most commonly splitting lengthwise both along the ventral suture and the dorsal "midrib" (when thus dehiscent the fruit is said to be a "legume"); seeds 1 to numerous, with 2 thin integuments, essentially none or very little endosperm and large well-developed embryos. *Fabaceae*; *Papilionaceae*.

The Leguminosae comprise over 500 genera and well over 10,000 species and are distributed in all parts of the world inhabitable by seed plants. They include some of the extremely important economic plants such as beans, peas, alfalfa and clovers.

The Leguminosae fall into three well-marked subfamilies, as follows: (1) Subfamily Mimosoideae: genera 1 through 10; leaves pinnately twice-compound; flowers radially symmetrical (except for the gynoeceium), small and mostly in spikes, heads or congested racemes; sepals united nearly their full length; petals 5, separate or coalescent, valvate in bud; stamens 4 to numerous, usually greatly exceeding the petals in length; (2) Subfamily Caesalpinoideae: genera 11 through 19; leaves pinnately once- or twice-compound or simple; flowers bilaterally symmetrical but not strongly so, often large and showy; sepals often separate to the top of the floral cup; petals 5, about equal in length, never valvate in bud, the uppermost petal internal in the bud; stamens 5 to 10 (functional stamens only 1 in 1 genus), usually shorter than the petals or only about twice as long; (3) Subfamily Papilionoideae: genera 20 through 69; leaves pinnately once-compound or simple, never pinnately twice-compound; flowers bilaterally symmetrical, usually strongly so, often showy; sepals united, forming a distinct calyx tube prolonged beyond the floral cup; petals (or most of them) usually separate, imbricate in bud with the banner (uppermost petal) external, the 2 lateral petals (wings) (absent in *Amorpha*) clawed and the 2 lower petals modified and partly coalescent into a boat-shaped structure ("keel") (the keel absent in *Petalostemon*, *Eysenhardtia*, *Amorpha* and certain other genera); stamens 10 or fewer, usually some or all of them coalescent by the filaments.

⁸² Much of the information has been adapted, with permission, from the work of B. L. Turner, "The Legumes of Texas," University of Texas Press, Austin, xii, 284 p., 1959.

1. Leaves (all of them) simpleKey A, p. 762.
1. Leaves compound, with 2 or more leaflets (2)
- 2(1). Leaves pinnately twice-compoundKey B, p. 762.
2. Leaves pinnately once-compound or palmateKey C, p. 763.

KEY A

1. Trees or thorny shrubs (2)
1. Herbs or unarmed shrubs (3)
- 2(1). Leaves cordate or reniform11. *Cercis*, p. 784.
2. Leaves linear or linear-lanceolate46. *Alhagi*, p. 853.
- 3(1). Glabrous shrubs with glossy cordate or reniform leaves11. *Cercis*, p. 784.
3. Herbs, or if shrubs then leaves narrower (4)
- 4(3). Shrubs; leaves narrow, 3 mm. wide or narrower; stems gland-dotted33. *Dalea*, p. 819.
4. Annual or perennial herbs; leaves 8 mm. broad or broader; stems not gland-dotted (5)
- 5(4). Leaves cordate or reniform, about as long as broad or shorter66. *Rhynchosia*, p. 884.
5. Leaves linear, lanceolate, ovate, obovate or spatulate, 3 to 8 times as long as broad (6)
- 6(5). Leaves sessile or nearly so, without conspicuous reticulate veins, glabrous to pubescent22. *Crotalaria*, p. 800.
6. Leaves with petioles 4-20 mm. long, obviously reticulate-veined, glabrous (7)
- 7(6). Flowers in terminal racemes; fruit a loment, constricted between the seeds ..52. *Desmodium*, p. 855.
7. Flowers sessile in the leaf axils; fruit a legume, not constricted between the seeds62. *Galactia*, p. 880.

KEY B

1. Flowers in open racemes or solitary, never in congested heads or spikes; petals 4 mm. broad or broader (2)
1. Flowers in dense or loose globose heads or spikes or glomerules; petals 2 mm. broad or narrower (6)
- 2(1). Pinnae of well-developed leaves 10 cm. long or longer; trees or shrubs 24 dm. tall or taller (3)
2. Pinnae 8 cm. long or shorter; shrubs 24 dm. tall or shorter (4)
- 3(2). Leaves with 3 to 7 pairs of pinnae; flowers greenish-white; unarmed trees to 20 m. tall15. *Gymnocladus*, p. 793.
3. Leaves with only 1 pair of pinnae; flowers yellow; small spinescent trees or shrubs16. *Parkinsonia*, p. 793.
- 4(2). Plants thorny17. *Cercidium*, p. 794.
4. Thorns absent (5)
- 5(4). Trees, shrublets or herbs with a woody base, when herbs with orange sessile glands on the lower leaf surface (black glands on dried specimens) except in *C. oxycarpa*18. *Caesalpinia*, p. 794.
5. Herbs without orange sessile glands on the lower leaf surface (dried specimens not black-dotted)19. *Hoffmanseggia*, p. 797.
- 6(1). Stamens numerous or at least more than 10 per flower (7)
6. Stamens 10 per flower or fewer (10)
- 7(6). Unarmed herbs or small shrubs 1 m. high or shorter; stipules membranous, not spinescent; flower heads loose, each with 2 to 15 flowers3. *Calliandra*, p. 769.
7. Spinescent or prickly shrubs or trees (rarely spines absent); flower heads congested, each with (10 to) 15 to many flowers (8)

- 8(7). Stamens free to the top of the floral cup or nearly so 4. *Acacia*, p. 770.
8. Stamens united above the floral cup forming a tube 2-5 mm. long (9)
- 9(8). Plants armed with paired spines (often much-reduced;) flower heads greenish-white, 1-3 cm. across; native plants of south Texas . 1. *Pithecellobium*, p. 768.
9. Plants unarmed; flower heads reddish to pink, 3-5 cm. across; introduced or cultivated plants (rarely escaped), widespread 2. *Albizia*, p. 769.
- 10(6). Flowers in spikes (3-) 4-8 cm. long; trees or shrubs usually armed with straight stout spines (11)
10. Flowers in globose heads or in short spikes 1-3 cm. long (12)
- 11(10). Fruit flattened, 15 mm. broad or more; larger spines often branched; leaves once-pinnate and twice-pinnate on the same tree ... 14. *Gleditsia*, p. 793.
11. Fruit terete or tightly coiled, 12 mm. broad or narrower; spines unbranched; leaves all twice-pinnate 10. *Prosopis*, p. 783.
- 12(10). Trees or shrubs (brier-vines in *Schrankia*) with spines, thorns or recurved prickles (13)
12. Unarmed trees, shrubs or herbs (15)
- 13(12). Plant a weak-stemmed wide-spreading brier; stems, leaves and peduncles armed with numerous recurved prickles 6. *Schrankia*, p. 775.
13. Trees or shrubs with usually erect stems (straggling and brierlike in *Mimosa malacophylla*); plant variously spiny or prickly but at least the peduncles without numerous recurved prickles (14)
- 14(13). Pod twisted, springlike; anthers with apical glands; leaves with 1 pair of pinnae 10. *Prosopis*, p. 783.
14. Pod straight or nearly so (rarely contorted but never springlike); anthers without glands 7. *Mimosa*, p. 777.
- 15(12). Trees (2-) 3-15 m. tall 5. *Leucaena*, p. 774.
15. Prostrate herbs or low shrubs (16)
- 16(15). Flower heads bright-yellow; roots orange; fruits abruptly narrowed at the base, forming a distinct stipe 9. *Neptunia*, p. 782.
16. Flower heads pink or pinkish to white, never bright-yellow; roots not orange; fruits without a distinct stipe (17)
- 17(16). Flowers bright-pink, in dense heads or short spikes; stems prostrate; fruit with valves separating from the margin at maturity 7. *Mimosa*, p. 777.
17. Flowers whitish or greenish-white; stems erect to prostrate; fruit splitting along the margin at maturity, the valves not separating from the margin 8. *Desmanthus*, p. 779.

KEY C

1. Sepals separate, not forming a calyx tube beyond the short floral cup; flowers only slightly bilaterally symmetrical; stamens separate (2)
1. Sepals united into a calyx tube prolonged beyond the short floral cup; flowers usually strongly bilaterally symmetrical OR if appearing nearly radially symmetrical then the petals 3 mm. wide or narrower (3)
- 2(1). Flowers white or pinkish-red; leaflets 2; woody shrubs or small trees 12. *Bauhinia*, p. 784.
2. Flowers yellow; if leaflets 2 then the plant herbaceous . 13. *Cassia*, p. 785.
- 3(1). Leaves or most of them on the plant with 4 or more leaflets (4)
3. Leaves with only 2 or 3 leaflets (40)
- 4(3). Perennial or annual herbs or herbaceous vines, the aerial stems dying back each winter, any new stems arising from the previous year's root or underground stem (5)
4. Shrubs, trees or woody vines, the stems of most of them persisting to produce new growth each year (31)

- 5(4). Leaves palmate or digitate (the central leaflet stalked in *Galactia Grayi*) (6)
5. Leaves (or most of them) pinnate, the leaflets arranged alternately or opposite on the rachis (9)
- 6(5). Plants with prostrate stems 1-2 m. long; leaves (at least some of them) with a leaflet having a distinct stalk 5-10 mm. long 62. *Galactia*, p. 880.
6. Plants erect to semierect or acaulescent (rarely with stems short and prostrate); leaflets all sessile or equally short-stalked (7)
- 7(6). Leaves with 2 to 4 leaflets, never more; flowers yellow 51. *Zornia*, p. 855.
7. Leaves with 4 to 8 leaflets; flowers lavender to blue, never yellow (8)
- 8(7). Leaves not gland-dotted; fruit several-seeded, 20-60 mm. long 23. *Lupinus*, p. 802.
8. Leaves gland-dotted; fruit 1-seeded, 2-6 mm. long 30. *Psoralea*, p. 811.
- 9(5). Leaves gland-dotted (these often hidden beneath a dense pubescence but readily seen when the hair is scraped off) (10)
9. Leaves not gland-dotted (12)
- 10(9). Rachis of mature leaves 60-150 mm. long; fruit a prickly pod 10-20 mm. long .. 45. *Glycyrrhiza*, p. 853.
10. Rachis of mature leaves mostly 5-60 mm. long; fruit included within the calyx, not prickly, 5 mm. long or less (11)
- 11(10). Flowers strongly bilaterally symmetrical with well-developed banner, wings and keel; stamens 8 to 10 33. *Dalea*, p. 819.
11. Flowers not as strongly bilaterally symmetrical, at least 4 of the petals essentially alike, not differentiated into wings and keel; stamens 5 34. *Petalostemum*, p. 827.
- 12(9). Leaves with an even number of leaflets or bearing tendrils toward the end of the leaves; leaf rachis not terminated by a leaflet (13)
12. Leaves not bearing tendrils and having an odd number of leaflets; leaf rachis terminated by a leaflet (15)
- 13(12). Stems stiffly erect, 4-20 dm. tall; leaves without tendrils; leaflets 20 to numerous; flowers yellow, red or orange 40. *Sesbania*, p. 835.
13. Stems weak, climbing by tendrils or if erect and without tendrils then the stem 4 dm. tall or shorter; leaflets 4 to 20; flowers blue, violet or purplish (14)
- 14(13). Style with a dense ring of hairs just below the stigma 54. *Vicia*, p. 872.
14. Style flattened, with a line of hairs down the inner surface 55. *Lathyrus*, p. 876.
- 15(12). Stamens (all of them!) separate; flowers white; leaves densely pubescent; fruit indehiscent, torulose 20. *Sophora*, p. 798.
15. Stamens (at least 5 of them) coalescent by their filaments (16)
- 16(15). Rachis of leaf 2-15 (-20) mm. long; flowers 1 to 3 (or 4), terminal on slender peduncles, never racemose along a central axis; leaflets 3 to 9 (17)
16. Rachis of leaf 15-150 mm. long or if shorter then the flowers in several-flowered racemes; leaflets 5 to numerous (18)
- 17(16). Stems and leaves appressed-pubescent or glabrate; plants of Trans-Pecos Texas 28. *Lotus*, p. 810.
17. Stems and leaves densely pubescent with widespreading glandular hairs; plants of eastern half of Texas 47. *Aeschynomene*, p. 853.
- 18(16). Stipules rigid, spinescent; flowers white; plants of Trans-Pecos Texas 38. *Peteria*, p. 835.
18. Stipules membranous or herbaceous or absent, not at all spinescent (19)

- 19(18). Fruit a loment, indehiscent, breaking into 1-seeded segments at maturity; stems stiffly erect or trailing or twining, 3-20 dm. long; flowers 1 to 4 in axillary fasciculate clusters, short racemes or solitary (20)
19. Fruits dehiscent or indehiscent but not breaking into 1-seeded segments at maturity; stems mostly 4 dm. long or shorter, but if longer AND stiffly erect then the flowers numerous in each raceme (22)
- 20(19). Leaves with 3 to 5 (to 7) leaflets; plants of Trans-Pecos mountains 49. *Nissolia*, p. 854.
20. Leaves with 5 or more leaflets; plants east of Trans-Pecos Texas (21)
- 21(20). Flowers yellow; eastern half of Texas 47. *Aeschynomene*, p. 853.
21. Flowers purple; Panhandle of Texas 48. *Hedysarum*, p. 854.
- 22(19). Plants perennial; stems erect or high-twining, 3-20 dm. long; legume 6 to 20 times as long as broad, not inflated; plants of central and eastern Texas (23)
22. Plants annual or perennial; stems prostrate to weakly ascending (often acaulescent), if stiffly erect and more than 3 dm. tall then the legume inflated and less than 6 times as long as broad (25)
- 23(22). Stems, leaves and legume densely long-pubescent with spreading hairs 36. *Tephrosia*, p. 832.
23. Stems, leaves and legume appressed short-pubescent to nearly glabrate (24)
- 24(23). Grayish-pubescent; erect subshrubs, not climbing .29. *Indigofera*, p. 810.
24. Not grayish-pubescent; high-climbing vines 60. *Apios*, p. 879.
- 25(22). Peduncle of mature flowering racemes 8-30 cm. long; legume flattened (26)
25. Peduncle of flowering racemes 1-8 (-9) cm. long (27)
- 26(25). Flowers pink or reddish-tinged 36. *Tephrosia*, p. 832.
26. Flowers white or cream-colored 43. *Astragalus*, p. 838.
- 27(25). Flowers of various colors but not brick-red or reddish; annuals or perennials (28)
27. Flowers when fresh brick-red or reddish (often fading to a lavender-color in dried specimens); perennials (29)
- 28(27). Keel petals acute, blunt or rounded apically 43. *Astragalus*, p. 838.
28. Keel petals with the apex extending into a sharp erect point; plants acaulescent; flowers purple 44. *Oxytropis*, p. 852.
- 29(27). Fruit inflated, bladderlike; leaflets opposite along the leaf rachis, without raised reticulate veins 42. *Sphaerophysa*, p. 837.
29. Fruit flattened to somewhat turgid but not inflated or bladderlike; leaflets with raised reticulate veins OR if without reticulate veins then the leaflets arranged alternately along the rachis (30)
- 30(29). Leaflets mostly alternate along the leaf rachis, without raised reticulate veins; leaf petioles 1 cm. long or shorter 29. *Indigofera*, p. 810.
30. Leaflets mostly opposite along the leaf rachis, reticulate-veined; leaf petioles mostly 1 cm. long or longer 36. *Tephrosia*, p. 832.
- 31(4). Leaves gland-dotted (best seen with lens on undersurface) (32)
31. Leaves not gland-dotted (34)
- 32(31). Flowers with only 1 petal present (the banner); leaves (most of them) 8 cm. long or longer OR if shorter then the leaflets densely pubescent; leaflets (4-) 5-30 mm. broad 31. *Amorpha*, p. 817.
32. Flowers with 4 or 5 petals; leaves (most of them) 8 cm. long or shorter OR if more than the leaflets glabrate or nearly so; leaflets 1-5 mm. broad (33)
- 33(32). Rachis of leaf on well-developed leaves 30-90 mm. long; fruit 3 to 6 times as long as the calyx; flowers white 32. *Eysenhardtia*, p. 818.
33. Rachis of leaf 5-25 mm. long; fruit not exceeding the calyx; flowers rose, reddish or purplish (rarely white) 33. *Dalea*, p. 819.

- 34(31). Leaflets 2 mm. broad or narrower 35. *Brongniartia*, p. 832.
34. Leaflets 4 mm. broad or broader (35)
- 35(34). Stamens (all of them!) separate to the top of the floral cup; fruit indehiscent, narrowly fusiform, torulose, 6-25 mm. thick 20. *Sophora*, p. 798.
35. Stamens united by their filaments into a tube; fruit flattened, or if nearly terete then not as in *Sophora* (36)
- 36(35). Rachis of leaf 1-8 cm. long; legume 15-35 mm. long; flowers 5-10 mm. long (37)
36. Rachis of leaf 8 cm. long or longer; legume 30 mm. long or longer; flowers 10 mm. long or longer (38)
- 37(36). Suffruticose herbs, appearing shrublike, 2 m. tall or shorter; rachis of leaf mostly 3-8 cm. long 29. *Indigofera*, p. 810.
37. Shrubs, intricately branched and 1-3 m. tall; rachis of leaf 1-3 cm. long 39. *Coursetia*, p. 835.
- 38(36). Herbs or if somewhat shrubby in the lower part of the plant then most of the plant with annual green easily broken stems; flowers 8-20 mm. long, pale-yellow, orange or reddish 40. *Sesbania*, p. 835.
38. Woody vines, shrubs or trees, the main stem developing a tough brown bark; flowers 15 mm. long or longer, white, lavender or rose-purple, never yellow, orange or red (39)
- 39(38). Shrubs or woody vines, never prickly or spiny, the ultimate stems twining 37. *Wisteria*, p. 834.
39. Erect trees or shrubs, often prickly or spiny, the ultimate stems never twining 41. *Robinia*, p. 837.
- 40(3). Leaves with tendrils 55. *Lathyrus*, p. 876.
40. Leaves without tendrils (41)
- 41(40). Leaflets 2 (42)
41. Leaflets 3 (43)
- 42(41). Leaflets 15-30 mm. broad, obtuse or rounded apically 21. *Baptisia*, p. 799.
42. Leaflets 4-15 mm. broad, acute apically, pubescent 51. *Zornia*, p. 855.
- 43(41). Twining vines (often trailing when support is lacking) (44)
43. Herbs or shrubs with erect or trailing stems, never twining (54)
- 44(43). Woody or semiwoody high-climbing vines; well-developed leaves 2 dm. long or longer (45)
44. Perennial or herbaceous vines, not at all woody; leaves mostly 2 dm. long or shorter (46)
- 45(44). Stipules inconspicuous, 6 mm. long or less; flowering racemes 2-5 cm. long .. 63. *Dioclea*, p. 882.
45. Stipules conspicuous, 8-15 mm. long; flowering racemes 7-40 cm. long 64. *Pueraria*, p. 883.
- 46(44). Flowers solitary or in clusters of 2 or 3 in the axils of leaves, seemingly without a common peduncle, never 1 to several on terminal peduncles or in racemes (47)
46. Flowers 1 to numerous on terminal peduncles or in short or elongate racemes (49)
- 47(46). Flowers yellow, 4-7 mm. long; legume 14-30 mm. long 66. *Rhynchosia*, p. 884.
47. Flowers not yellow, 10-30 mm. long; legume 40-100 mm. long (48)
- 48(47). Flowers subtended by conspicuous membranous bracts 3-5 mm. broad; legume tapering into a slender beak 1-3 cm. long; plants of central and east Texas 57. *Centrosema*, p. 878.
48. Flowers subtended by small subulate bracteoles 1 mm. broad or less; legume beakless or nearly so; plants of Trans-Pecos Texas 59. *Cologania*, p. 879.
- 49(46). Flowers of various colors but never yellow (50)
49. Flowers yellow (53)

- 50(49). Flowers 1 to several at the apex of an elongate peduncle, not at all racemose; leaves with petioles 1-4 cm. long67. *Strophostyles*, p. 885.
50. Flowers several along the sides of a central axis, or if the flowers 1 or 2 at the apex of a peduncle then the leaves sessile or nearly so (51)
- 51(50). Flower pedicels subtended by persistent bracts about as long as broad (2-4 mm. long); calyx lobes 4 (the uppermost occasionally shortly cleft); plants of east Texas58. *Amphicarpaea*, p. 878.
51. Flower pedicels without conspicuous bracts or bracts deciduous, if bracts persistent then these 2 or 3 times as long as broad and acute apically (52)
- 52(51). Calyx lobes 4, subulate, as long as the tube or longer; peduncles 1-6 (-7) cm. long62. *Galactia*, p. 880.
52. Calyx lobes 5, obtuse or broadly acute, scarcely longer than broad, shorter than the tube; peduncles of mature racemes (4-) 7-25 cm. long68. *Phaseolus*, p. 886.
- 53(49). Peduncles of mature racemes 1-8 cm. long; legume 15-25 mm. long66. *Rhynchosia*, p. 884.
53. Peduncles 8-30 cm. long; legume 30-60 mm. long69. *Vigna*, p. 888.
- 54(43). Banner not dark-red or if reddish then much shorter than 3 cm. (55)
54. Banner narrow, dark-red, 3-5 cm. long; plant a shrub or subshrub 1-3 m. tall61. *Erythrina*, p. 880.
- 55(54). Leaves and/or calyx gland-dotted (glands often hidden beneath a dense pubescence but readily seen when the hair is scraped off) (56)
55. Neither leaves nor calyx gland-dotted (57)
- 56(55). Flowers lavender or brick-red, never yellow30. *Psoralea*, p. 811.
56. Flowers yellow33. *Dalea*, p. 819.
- 57(55). Leaflets toothed or denticulate, at least near the apex (sometimes minutely so) (58)
57. Leaflets entire, not at all toothed (60)
- 58(57). Flowers in slender elongate racemes, at least 4 to 8 times as long as thick26. *Melilotus*, p. 806.
58. Flowers in short thick racemes or umbels, 3 times as long as thick or shorter (59)
- 59(58). Fruit coiled or curved, longer than the calyx; leaves trifoliate, not palmate ..25. *Medicago*, p. 804.
59. Fruit not coiled or curved, shorter than the calyx27. *Trifolium*, p. 806.
- 60(57). Flowers 4-6 cm. long56. *Clitoria*, p. 878.
60. Flowers 3 cm. long or shorter (61)
- 61(60). Leaves (or at least some of them) with petioles 15 mm. long or longer (62)
61. Leaves with petioles 14 mm. long or shorter (72)
- 62(61). Perennials; stems stiffly erect, 1-2 m. tall (63)
62. Annual or perennial herbs much less than 1 m. tall, or if the stems as much as 1 m. long then trailing and not stiffly erect (65)
- 63(62). Flowers yellow; fruit a several-seeded pod, not breaking at maturity into 1-seeded segments; known only from southern Brewster Co. in the Trans-Pecos ..24. *Genistidium*, p. 804.
63. Flowers of various colors but mostly violet or rose-tinged; fruit a 1- to several-seeded loment that breaks at maturity into 1-seeded segments (64)
- 64(63). Leaflets subtended by stipels; fruit a several-seeded loment52. *Desmodium*, p. 855.
64. Leaflets without subtending stipels; fruit 1-seeded53. *Lespedeza*, p. 869.
- 65(62). Leaves palmate, the terminal leaflet sessile or essentially so (66)
65. Leaves trifoliate, the terminal leaflet with a stalk 5-40 mm. long (67)

- 66(65). Flowers yellow; petioles pubescent with long hairs; pod inflated
.....22. *Crotalaria*, p. 800.
66. Flowers white; petioles glabrate; pod flattened62. *Galactia*, p. 880.
- 67(65). Stems prostrate, not at all erect, bearing subterranean fruit near the lower part;
leaflets leathery, elliptic to orbicular, with raised reticulate veins beneath
.....62. *Galactia*, p. 880.
67. Stems erect, ascending or trailing but never bearing subterranean fruit; leaflets various
(68)
- 68(67). Fruit 20-25 mm. broad; seeds 12-16 mm. broad; trailing plants on open beach-
sand65. *Canavalia*, p. 883.
68. Fruit 15 mm. broad or narrower; seeds 10 mm. broad or narrower (69)
- 69(68). Flowers yellow, never rose or purplish66. *Rhynchosia*, p. 884.
69. Flowers rose, violet or purplish, never completely yellow (70)
- 70(69). Leaflets not subtended by stipels; fruit 1-seeded .53. *Lespedeza*, p. 869.
70. Leaflets subtended by stipels; fruit several-seeded (71)
- 71(70). Fruit a loment, breaking at maturity into 2 to 6 1-seeded segments
.....52. *Desmodium*, p. 855.
71. Fruit a several-seeded pod, not breaking into 1-seeded segments; large trailing vines
of Trans-Pecos Texas68. *Phaseolus*, p. 886.
- 72(61). Stipules fused to the petiole, often forming a tube around the stem; flowers
small, yellowish-orange50. *Stylosanthes*, p. 854.
72. Stipules not or but slightly fused to the petiole, never forming a tube; flowers vari-
ously colored (73)
- 73(72). Stamens (all of them!) separate; fruit an inflated or globose pod
.....21. *Baptisia*, p. 799.
73. Stamens united, forming a tube; fruit a flattened 1- to several-seeded pod or loment,
never inflated or globose (74)
- 74(73). Stipels present, subtending each leaflet; fruit a 2- to several-seeded loment,
breaking at maturity into 1-seeded segments52. *Desmodium*, p. 855.
74. Stipels absent; fruit 1-seeded or several-seeded but not breaking into segments at
maturity (75)
- 75(74). Stipules minute, reduced to glands; fruit several-seeded
.....28. *Lotus*, p. 810.
75. Stipules not reduced to glands; fruit 1-seeded53. *Lespedeza*, p. 869.

1. PITHECELLOBIUM MART.

Trees or shrubs with spinescent stipules; leaves twice pinnately compound with 2 to several pinnae; leaflets numerous, smooth or with raised venation; a gland present on the adaxial side of the petiole or where the petiole and leaf rachis join (between the lowest pair of pinnae); flowers in heads or spikes, whitish, yellowish or cream-colored; stamens more than 10 per flower (usually 20 to 30) and basally united into a tube prolonged well beyond the floral cup; fruit a legume with 6 to 15 seeds, usually 5-15 cm. long, sometimes promptly (sometimes tardily) dehiscent.

A large genus with about 150 species widely distributed in the warmer parts of the Americas, the name is sometimes misspelled *Pithecollobium*.

1. Dense trees with dark-green foliage and short often forked or zigzag branches (less commonly of shrubby stature, usually in the north extreme of range); leaflets 3 to 6 pairs per pinna; petiolar gland elevated between the lowest pair of pinnae; flowers in spikes; fruit a thick woody tardily dehiscent legume
.....1. *P. flexicaule*.
1. Usually diffuse not dense-foliaged shrubs, rarely small trees, with relatively long straight branches; leaflets (6 or) 7 to 20 pairs per pinna; petiolar gland depressed, usually below the lowest pair of pinnae; flowers in heads or glomerules; fruit a thin-walled promptly deciduous legume2. *P. pallens*.

1. *Pithecellobium flexicaule* (Benth.) Coult. ÉBANO, TEXAS EBONY. Shrubs or usually small trees (to 15 m. in s. part of range) with rounded very dense dark crown and dark bark; trunk to 6 dm. thick but usually only about 1 dm. thick; branches stout and short, divaricate, usually formidably armed with valid stipular spines, the bark pale-gray on the younger branches; leaflets 3 to 6 pairs per pinna; petiolar gland elevated between the lowest pair of pinnae; flowers in dense spikes usually 2-3 cm. long and about 2 cm. thick; fruit thick, heavy-walled, woody, usually oblong or elliptic in transection, about 2 cm. broad and 1-2 dm. long, not or scarcely constricted between the seeds which are tightly held in nearly sealed compartments within the pods until the long-delayed dehiscence; seeds about 1 cm. long, red. *Ebenopsis flexicaulis* (Benth.) Britt. & Rose. Frequent in low woods in the coastal part of Rio Grande Plains, rare n. to just s. of Laredo and to the vic. of Sinton, San Patricio Co., Apr.-July (rarely to Nov.); Ver., S.L.P., Tam., N.L., and Tex.

Highly prized as an ornamental and shade tree, and also for the very dense red heartwood, which is used to make art objects and small furniture; the red seeds are used to make jewelry.

2. *Pithecellobium pallens* (Benth.) Standl. TENAZA. Shrubs usually 1-2 m. tall, rarely small trees to 6 m., diffuse and not at all dense-foliaged, the herbage pale-green; bark pale-brownish-gray and rather smooth; branches with pale epidermis or bark, often striate, often nearly straight with few branchlets; leaflets usually 7 to 20 per pinna; petiolar gland depressed, situated below the lowest pair of pinnae; flowers in heads or glomerules usually about 1 cm. long and broad; fruit thin-walled, linear in transection, about 1 cm. broad and 1 dm. long, thickest where each of the small blackish seeds bulges the pod (at each seed the pod about 3-4 mm. thick), the margins thin and rounded, the dehiscence prompt. *P. brevifolium* Benth., *Havardia brevifolia* (Benth.) Small. Locally abundant in brush, coastal part of Rio Grande Plains, n. to San Patricio Co., May-Aug.; also adj. Mex.

2. ALBIZIA DURAZZ.

SILK-TREE. MIMOSA-TREE

A genus of about 70 species of the warmer parts of the Old World. The generic name is often misspelled *Albizzia*.

1. *Albizia Julibrissin* Durazz. MIMOSA-TREE. Essentially unarmed shrubs or low weak-stemmed (brittle-stemmed) short-lived trees to 4 or 5 m. high; leaves twice pinnately compound with a number of pinnae and very numerous small pale-green leaflets; flowers borne in heads and the heads borne in clusters toward the ends of the branches, the clusters of heads very conspicuous and showy because of the masses of red or pink stamens; heads often 3-5 cm. thick; stamens more than 10 (usually 20 to 40), far-exceeding the other parts of the flower and red or pink in color; fruit a thin-walled legume about 1 cm. broad and about 1 dm. long, linear in transection except where each of the small seeds bulges the pod to about 4 mm. thickness; margins of pods smooth, rounded; dehiscence prompt. Frequently cult. and rarely escaped in the e. half of Tex., spring; introd. from Asia.

3. CALLIANDRA BENTH.

Shrublets, subshrubs or rhizomatous perennial herbs usually not more than 2-3 dm. tall, rarely to 6-7 (-10) dm. in some species, unarmed (the stipules membranous, not spinescent); leaves pinnately twice-compound, usually with only 1 or a few pairs of pinnae and crowded small leaflets; flowers small and inconspicuous, aggregated into 2- to 15-flowered glomerules or heads about 1 cm. long, usually whitish or cream-colored; stamens more than 10 (usually about 20) and the filaments coalescent basally into a tube prolonged above the top of the floral cup; fruit an elastically dehiscent persistent flattish legume usually only a few cm. long and tapered toward the base, with only (1 or) 2 to 6 seeds, linear in transection except for the slightly thicker margins and the slight bulges over the seeds; dehiscence prompt; seeds small and flattish; valves of pods sharply recurved after dehiscence, persistent. *Anneslia* Salisb.

A genus of about 130 species of the warmer parts of the Americas.

1. Leaves predominantly with 2 to 7 pairs of pinnae; stems herbaceous (2)
1. Leaves predominantly with 1 pair of pinnae (very rarely 2 pairs but these few on each plant); stems woody (3)
- 2(1). Flowers terminal on peduncles 1-5 cm. long or more (flowers in bud often sessile but the peduncle becoming pronounced at maturity); leaves copiously pubescent; pinnae 3 to 7 pairs1. *C. herbacea*.
2. Flowering heads axillary, not on a conspicuous peduncle; leaves moderately puberulent to nearly glabrate; pinnae 2 to 4 pairs2. *C. humilis*.
- 3(1). Flowers 2 on each peduncle, never more; legume 8-10 mm. wide3. *C. biflora*.
3. Flowers 3 to 15 on each peduncle; legume 5-7 mm. wide4. *C. conferta*.

1. *Calliandra herbacea* Gray. Most of the aboveground portion herbaceous and only 1-2 dm. long; the woody underground portion very strongly developed and with deep roots; petioles 1-3 cm. long; leaves rather copiously pilosulous; pinnae 3 to 7 pairs; flower heads at the ends of long peduncles (1-5 cm. long) emerging from uppermost axils, the peduncle often elongating as the flowers mature; heads several-flowered; stamens about twice as long as the corolla; legume 4-7 cm. long, about 7 mm. broad, pubescent when young, later glabrate. *Anneslia herbacea* (Engelm.) Britt. & Rose. Locally abundant in the Davis Mts. and Chisos Mts. of the Trans-Pecos at elev. above 4,000 ft., June-Aug.; Zac. and Jal., n. to N.M. and Ariz.

2. *Calliandra humilis* (Schlecht.) L. Benson. Most of the aboveground portion herbaceous and only 1-2 dm. long; the woody underground portion very strongly developed and with deep roots; petioles 1-3 cm. long; leaves sparingly puberulent to glabrate; pinnae 2 to 4 pairs; flower heads on axillary abbreviated peduncles; heads few- to several-flowered; stamens pinkish, 7-10 mm. long, mostly glabrate. *Anneslia humilis* (Schlecht.) Britt. & Rose. Rare in grasslands above 4,000 ft. elev. in Brewster and Presidio cos. in the Trans-Pecos, June-Aug.; Hgo. and Jal., n. and n.w. to Ariz. and N. M.

3. *Calliandra biflora* Tharp. Subshrubs from slender woody rhizomes; aerial stems usually 4-6 dm. tall, erect and sparingly branched; leaf rachises 1-4 cm. long; pinnae 1 pair, rarely 2 or 3 pairs; leaflets about 16 per pinna, oblong-lanceolate, sessile, 5-9 mm. long, 1-1.8 mm. broad; stipules subulate; peduncles solitary in the axils of reduced mid-stem leaves, 8-10 mm. long, each bearing at its summit 2 flowers; pods usually solitary, 8 cm. long or less, 8-10 mm. broad. A very few populations, grassland in DeWitt and Goliad cos. in the s. Tex. Coastal Plain, May-July; also Tam.

4. *Calliandra conferta* Gray. Shrublets usually only 1-3 dm. tall, usually much-gnarled from browsing and divaricately short-branched; leaves small, each with 1 pair of pinnae (very rarely 2 pairs in some leaves on some plants) and few small leaflets; peduncles 1 cm. long or less (longer in Trans-Pecos Texas); flowers several per peduncle, small and very inconspicuous; pod 5-7 mm. broad. Our plants have been mistaken for *C. eriophylla* Benth. (of n.w. Mex., N.M. and Ariz.) by some authors. Locally abundant on caliche and limestone, Rio Grande Plains, s. parts of Edwards Plateau and the Trans-Pecos, rare n. to Travis Co., Apr.-July and rarely again in fall; Tex., Coah., N.L. and Tam.

4. ACACIA MILL.*

Shrubs or small trees or rarely (*A. hirta*) subshrubs or even perennial herbs, variously with stipular spines or recurved prickles or unarmed; leaves twice pinnately compound with 1 to several pairs of pinnae and usually numerous leaflets; flowers very small, white to yellow, in usually short-pedunculate many-flowered heads or spikes; stamens numerous (20 to 100) per flower, all quite separate above the top of the floral cup; fruit a promptly to very tardily dehiscent thick- to thin-walled legume. *Vachellia* Wight & Arn.; *Poponax* Raf.; *Acaciopsis* Britt. & Rose; *Acaciella* Britt. & Rose; *Senegalia* Raf.

A genus of about 600 species widely distributed in the warmer parts of the world. Ours have some value as browse, and several, especially guajillo, are excellent honey plants.

* See Appendix.

1. Flowers (when open) in definite spikes, 2 to 6 times as long as broad (2)
1. Flowers (when open) in globose heads or very short spikes one and one half times as long as wide or less (4)
- 2(1). Legume somewhat woody, 7 mm. wide or less; spines straight, paired at each node 6. *A. rigidula*.
2. Legume fleshy, 12 mm. wide or more; spines recurved or absent, infrastipular, not paired at the nodes (3)
- 3(2). Leaflets mostly 6-12 mm. long; pods not contorting (twisting); seeds narrowly obovate to ovate 8. *A. Wrightii*.
3. Leaflets mostly 3-6 mm. long; mature pods often contorting; seeds nearly orbicular 7. *A. Greggii*.
- 4(1). Stipules not spinose; spines (prickles) recurved, infrastipular (not paired at the nodes) or absent (9)
4. Stipules spinose, straight, usually long (rarely absent or much-reduced) (5)
- 5(4). Bracts borne at summit of peduncle; plants of central and southern Texas (*A. Farnesiana* often introduced elsewhere) (6)
5. Bracts borne near middle of peduncle; plants of western Texas (7)
- 6(5). Fruit glabrous, less than 7 cm. long; petiolar gland borne near middle of petiole or absent 2. *A. Farnesiana*.
6. Fruit densely pubescent, 7 cm. long or more; petiolar gland borne between the two lowest pinnae 1. *A. tortuosa*.
- 7(5). Pinnae 4 to 7 pairs 3. *A. constricta*.
7. Pinnae 1 to 3 (or 4) pairs (8)
- 8(7). Leaflets linear, almost filiform, alternate, spaced 1 mm. or more apart; legume conspicuously brown or black glandular-dotted 5. *A. Schottii*.
8. Leaflets ovate, flattened, inconspicuously alternate, spaced 0.8 mm. apart or less; legume not conspicuously black-glandular 4. *A. neovernicosa*.
- 9(4). Low suffrutescent plants, rarely more than 1 m. tall; flowers white, pedicellate; petiolar gland absent (10)
9. Shrubs or trees, usually more than 1 m. tall or more; flowers yellow or whitish; petiolar gland present (11)
- 10(9). Pinnae 3 to 8 (to 10) pairs; stem glabrous; plants of southern and western Texas 12. *A. texensis*.
10. Pinnae 7 to many pairs; stem glabrous or with widespreading hairs 11. *A. hirta*.
- 11(9). Leaflets numerous (20 to 50 pairs); pinnae 3 to many pairs 10. *A. Berlandieri*.
11. Leaflets 4 to 15 pairs; pinnae 1 to 4 (or 5) pairs (12)
- 12(11). Leaflets 3 mm. long or less 3. *A. constricta*.
12. Leaflets 3-10 mm. long 9. *A. Roemeriana*.

1. *Acacia tortuosa* (L.) Willd. HUISACHILLO. Usually low rounded shrubs 5-15 (-20) dm. tall, often with several stems at the base, much-branched and armed with numerous paired pallid or blackish pinlike stipular spines; petiolar gland borne between the 2 lowest pinnae; leaves very similar to those of huisache; peduncles slender, pubescent, 1-4 cm. long, with a pair of bractlets at the very top usually hidden by the flowers; flowers in bright-yellow fragrant globes about 1 cm. thick; pods (3-) 4-13 cm. long, nearly terete in transection or (when immature) somewhat oblong in transection, velvety-pubescent or very commonly merely densely strigose, blackish, the valves (leathery when fresh) flexible, very tardily dehiscent; seeds in 1 row, nearly spherical, black. *Poponax tortuosa* (L.) Raf. Local in Rio Grande Plains, spring (later following rains in droughty years); W.I., Mex., n. to Tex. (See Appendix.)

Our plants have been mistaken for *A. Schaffneri* (Wats.) Herm. which is a very closely related species (or race of *A. tortuosa*) of the Mexican highlands. One population found

by R. O. Albert near Alice, Texas, combines characters of huisache and of *A. tortuosa* and doubtless represents evidence of hybridization between them.

2. *Acacia Farnesiana* (L.) Willd. HUISACHE. Shrubs or usually small trees 2-4 m. tall, often with several trunks and flaring upward, obconical in overall shape, with a densely branched crown and numerous slender branches armed with numerous paired (stipular) straight pallid pinlike spines; petiolar gland borne near middle of petiole or absent; leaves 3-8 cm. long, with a small gland on the petiole; pinnae 2 to 6 pairs; leaflets gray-green, numerous, linear-oblong, 3-5 mm. long; peduncles slender, 1-4 cm. long, pubescent, with a pair of bractlets at the very top usually hidden by the flower head; flowers in bright-yellow globes about 1 cm. thick, very fragrant; pods (2-) 3-8 cm. long, nearly terete, tapered to both ends, blackish, smooth, pulpy within, the valves coriaceous, very tardily dehiscent; seeds in 2 rows. *Vachellia Farnesiana* (L.) Wight & Arn. Abundant in much of s. Tex. n. to Travis Co. and n.w. to s.e. Brewster Co., cult. farther n., spring, occasionally again following rains in droughty years; very widespread in trop. Am., nearly ubiquitous, with several unnamed races; also widely cult. in the Old World, formerly the source of the fragrant oils of many "French" perfumes. (See Appendix.)

3. *Acacia constricta* Gray. MESCOT ACACIA. Shrubs 1-3 m. tall, diffuse to dense, with numerous slender pallid branches armed with slender paired pinlike stipular spines; petiole with a gland near the end; pinnae 4 to 7 pairs; leaflets several pairs, oblong or linear, 2-4 mm. long, glabrous or pubescent but viscid-verniceous; peduncles slender, 1-3 cm. long, pubescent, near the middle with a pair of minute bractlets; flowers borne in fragrant yellow globes about 1 cm. thick; legumes 5-10 cm. long, 3-5 mm. broad, about as thick as broad, much-constricted between the seeds, pallid-brown, the valves (2) thin-walled, separating into 2 layers when dry. *Acaciopsis constricta* (Gray) Britt. & Rose. Abundant in Trans-Pecos and s. part of Plains Country n.e. to Howard Co., rare in subdesertic areas near the Rio Grande in s. Tex. (Starr and Zapata cos.), spring or later following rains in droughty years; s.w. U.S., s.e. to cen. Mex. and isolated farther s.e. in s. Pue.

Probably has hybridized to some extent with *A. neovernicosa* but *A. constricta* flowers about 1 or 2 weeks earlier than does the former where the 2 species occur together.

4. *Acacia neovernicosa* Isely. Openly branched shrubs 1-2 m. tall, rather diffuse with several main branches from the base, the slender pale glabrous verniceous branchlets armed with slender paired pinlike stipular spines; petiole 3-7 mm. long, with a cup-shaped gland near the tip; entire leaf viscid-verniceous; pinnae 1 to 2 (or 3) pairs; leaflets 7 to 9 pairs per pinna, ovate, nearly touching one another (crowded); peduncles slender, 1-3 cm. long, viscid, usually pubescent and near the middle with a pair of minute bractlets; flowers borne in fragrant yellow globes about 1 cm. thick; legumes 4-7 cm. long, 3-5 mm. broad, nearly as thick as broad, thin-walled, 2-valved, the valves separating into 2 layers when dry, the whole much-constricted between the seeds. *Acaciopsis vernicosa* (Standl.) Britt. & Rose, *Acacia constricta* var. *vernica* (Standl.) L. Benson. Frequent throughout the Trans-Pecos in deserts, Apr.-July; N.M. n. to Ariz. and Tex. See remark under *A. constricta*.

5. *Acacia Schottii* Torr. Desert shrubs 1-2 m. tall, rather diffuse with several main branches from the base, the slender pale glabrous branchlets armed with slender paired pinlike stipular spines; petiole and rachis of leaf puberulent; pinnae usually only 1 pair each with 3 to 5 pairs of filiforms or at least linear-subterete leaflets about 4 mm. long and spaced out at about 1 mm. intervals on the pinna; peduncles slender, 2-3 cm. long, each near the middle with a pair of minute bractlets; flowers borne in fragrant yellow globes about 1 cm. thick; legumes 5-8 cm. long, very narrow (almost as thick as broad), thin-walled, 2-valved, the valves separating into 2 layers when dry, the whole much constricted between the seeds, glabrous, dotted with glands (these dark in dry specimens). *Acaciopsis Schottii* (Torr.) Britt. & Rose. Local in deserts, s.w. Brewster Co. in the Trans-Pecos, spring or rarely later; also Chih.

6. *Acacia rigidula* Benth. CHAPARRO PRIETO, BLACK BRUSH. Shrubs 1-3 m. tall with whitish bark on most branches; branches numerous and short, divaricate, very rigid with whitish needlelike straight stipules or spines; leaves green, usually with only 1 pair of pinnae and a few pairs of leaflets on each; leaflets 6-15 mm. long, glabrous, dark-green, glossy, blunt, inequilaterally obovate; flowers whitish, in spikes about 1 cm. thick and 2 to 6 times as long as thick; legumes almost as thick as broad, 6-8 cm. long, less than 7 mm. broad, not or only very slightly constricted between the seeds. This was long mistakenly

known as *A. amentacea* DC., a species of southwestern Mexico. Abundant in Rio Grande Plains, rare w. along the Rio Grande to Brewster Co., Feb.-July; S.L.P., Ver., Tam., N.L., Coah. and Tex.

7. *Acacia Greggii* Gray. CATCLAW. Shrubs usually not more than 1-2 m. tall, rounded and much-branched; branches usually rather formidably armed with recurved catclaw-like prickles which are situated usually on the internodes or only fortuitously associated with nodes; pinnae 1 to 3 pairs; leaflets 3 to 7 pairs, mostly 3-6 mm. long, obovate to narrowly oblong, usually pallid-green, obtuse; flowers creamy-white, in spikes about 1 cm. thick and 2 to 6 times as long as thick; pods flat, thin, usually falcate and markedly contorted, 5-8 cm. long, 15-20 mm. broad, only very tardily becoming rigid (usually somewhat flexible and elastic), brownish; seeds small and flat, not causing the pod to bulge, nearly orbicular in outline. *Senegalia Greggii* (Gray) Britt. & Rose. Locally frequent in brushy vegetation, Trans-Pecos and Rio Grande Plains, n.e. as far as Taylor and Coleman cos., spring (later, following rains in droughty years); s. U.S. and n. Mex. See remark under *A. Wrightii*. (See Appendix.)

8. *Acacia Wrightii* Benth. CATCLAW, UÑA DE GATO. Shrubs or small trees (1-) 2-3 m. tall; branches with catclawlike prickles which are situated on the stems below the nodes (not usually near leaves); leaves often fascicled; petioles 4-12 mm. long, bearing a small gland at the tip; pinnae 1 or 2 pairs; leaflets 2 to 6 pairs per pinna, mostly 6-12 mm. long; flowers creamy-white, in spikes about 1 cm. thick and 2 to 6 times as long as thick; pods flat, thin, occasionally somewhat falcate but usually not much contorted, 5-8 cm. long, about 2 cm. broad, only very tardily becoming rigid (usually somewhat flexible and elastic), reddish-brown; seeds small, not much bulging the pod, narrowly obovate to ovate. *A. Greggii* var. *Wrightii* (Benth.) Isely, *Senegalia Wrightii* (Benth.) Britt. & Rose. Locally frequent in brush and woodland along creeks and in canyons, Rio Grande Plains, Edwards Plateau and plateau outliers rarely as far n. as Shackelford Co. and n.w. to Crane and Terrell cos., spring (rarely later following rains); s. U.S. and n. Mex.

Closely related to *A. Greggii*; occasional specimens are difficult to assign to one or the other species except arbitrarily.

9. *Acacia Roemeriana* Scheele. CATCLAW. Diffuse straggling or even half-scandent shrubs 1-2 (-3) m. tall; stems weak and slender, nearly glabrous to pubescent, armed along the internodes with recurved catclawlike prickles; leaves glabrous to rarely softly pubescent, with 1 to 3 pairs of pinnae; leaflets 4 to 8 pairs per pinna, 3-10 (-15) mm. long, obtuse, usually somewhat anisilateral, strongly veined; peduncles slender, 2-3 cm. long; flowers creamy-white, in fragrant globes about 1 cm. thick; legume flat, thin, occasionally somewhat falcate or contorted, 5-10 cm. long, 15-30 mm. broad, reddish-brown, usually flexible and elastic and only very tardily becoming rigid after the prompt dehiscence; seeds small, thin, not much bulging the pod, narrowly obovate to ovate. *A. malacophylla* Gray, *Senegalia Roemeriana* (Scheele) Britt. & Rose. Frequent in brush in the s. part of the Trans-Pecos, infrequent throughout the Edwards Plateau, n. to Jones Co. and on caliche cuevas s. to Maverick Co. and e. to Travis Co., spring or later following rains in droughty years; also Chih., Coah. and N.L.

10. *Acacia Berlandieri* Benth. GUAJILLO. Shrubs 1-2 (-4) m. tall, usually with several main stems near the base, ascending and flaring out widely near the top, sparingly branched, the relatively thick striate internodes usually armed with scattered nearly straight prickles 1-3 mm. long; petiole bearing a sessile gland on top; stipules not spinescent, small and caducous or in some rare luxuriant specimens well-developed and anisilaterally cordate, to 1 cm. long; pinnae 10 to 12 pairs, more or less; leaflets numerous, 30 to 50 pairs per pinna, crowded, linear, 4 mm. long, tomentose to nearly glabrous; peduncles axillary, pubescent, 2-5 cm. long; flowers creamy-white, borne in heads (rarely these slightly elongated and about twice as long as thick) about 1 cm. thick, the heads sometimes collected into vaguely paniculate leafy aggregations; ovary densely whitish-tomentose when young; legume heavy and thick-walled, elliptic-oblong in transection when fully mature, somewhat linear in transection when immature, 8-15 cm. long, 15-25 mm. broad, usually retaining a good deal of velvety-pubescence when ripe but eventually glabrate, tardily dehiscent, the valves thick-walled. *Senegalia Berlandieri* (Benth.) Britt. & Rose. Exceedingly abundant on limestones ridges and caliche cuevas in the Rio Grande Plains and n.w. to e. Brewster Co. in the Trans-Pecos and s. part of Edwards Plateau, rare in deeper soils of Rio Grande Valley and delta, spring (often later following rains in droughty years); Tex. to Qro., S.L.P. and Hgo.

The occasional shrubs with elongate instead of globular heads have been given the name *A. Emoryana* Benth. but they seem not to be specifically distinct. *A. Berlandieri* is an important honey-plant.

11. *Acacia hirta* T.&G. FERN ACACIA. Rounded subshrubs or often forming colonies by means of woody rhizomes; aerial stems unarmed, (5-) 6-12 dm. tall, woody and persistent in the lower part, sparingly or not branched, usually graceful and wandlike where not damaged by browsing; petiole and rachis usually hirsutulous (glabrous forms exist), the herbage often taking on a slight brownish cast from the pubescence; pinnae 7 to many pairs (usually 10 to 13); leaflets very numerous (often 24 to 30 pairs per pinna) and crowded, linear; peduncles short; flowers in small (about 1 cm. thick) whitish or rufescent-white or creamy heads, the heads often assembled in vaguely paniculate somewhat leafy arrangements; fruit brownish, very flat, about 5-7 cm. long, 6-10 mm. broad, stipitate, promptly dehiscent, the valves very thin and papery and not separating into 2 layers; seeds nearly orbicular in outline, quite flat. *Acaciella hirta* (T.&G.) Britt. & Rose, *Acacia angustissima* (Mill.) O. Ktze. var. *hirta* (T.&G.) Robins. Frequent in grasslands and in open shrubby vegetation throughout the e. two thirds of Tex., rarely w. to the Plains Country and even to Brewster Co. in the Trans-Pecos, May-Sept.; Tex., Coah., Okla., Ark., Mo. and Fla.

12. *Acacia texensis* T.&G. Rounded subshrubs or shrublets (usually woody and persistent only in the lowest few cm. of height) forming colonies by means of woody rhizomes; aerial stems unarmed, only 1-3 (-5) dm. tall and sparingly or not branched, usually glabrous, wandlike or somewhat zigzag with striate internodes; petiole and rachis with scanty appressed pubescence; pinnae 3 to 8 (to 10) pairs; leaflets 6 to 20 pairs, linear, obtuse nearly glabrous or appressed-pubescent; peduncles short; flowers in small (about 1 cm. thick) whitish or cream-colored heads, the heads often assembled in vague leafy panicles; fruit brownish, very flat, about 4-6 cm. long, 4-8 mm. broad, acuminate at the very tip, long-stipitate, sparingly appressed-pubescent or glabrous, promptly dehiscent, the valves very thin and papery and not separating into 2 layers; seeds nearly orbicular in outline, quite flat. *Acaciella texensis* (T. & G.) Britt. & Rose. Abundant locally in the Trans-Pecos, especially in grasslands at moderate elev., May-Aug.; Dgo., Zac. and Chih. n. to Tex. and Ariz.

Plants intermediate between *A. texensis* and *A. hirta* occur in the Edwards Plateau and Rio Grande Plains; the name *A. texensis* is based on such plants, and the propriety of applying it to the populations of far western Texas is dubious. (See Appendix.)

5. LEUCAENA BENTH.

LEAD-TREE

Shrubs or usually trees 2-10 (-13) m. tall, weak- or brittle-stemmed, unarmed; leaves pinnately twice-compound, 8-30 cm. long; petioles elongate, with a gland on the upper side; pinnae (2 or) 3 to 25 pairs; leaflets numerous; flowers borne in whitish or yellowish globes 1-2 cm. thick, the heads often most abundant near the branch tips and in vaguely paniculate leafy aggregations; calyx valvate in bud; stamens 10 per flower, distinct to the top of the floral cup; legume linear, broad or narrow, flat with usually 10 or more seeds, often stipitate, the thin valves of two layers but remaining intact, promptly dehiscent; seeds usually obovate in outline, thin, brown, lying transversely in the pod or somewhat obliquely.

A genus of about 20 species in tropical and subtropical areas, only several venturing into the warm-temperature area of North America.

1. Pinnae (2 or) 3 (or 4) pairs per leaf; leaflets 4 to 9 pairs per pinna; flower heads bright-yellow1. *L. retusa*.
1. Pinnae 4 or more pairs per leaf; leaflets 10 to many pairs per pinna; flower heads creamy-white (2)
- 2(1). Leaflets mostly 8-12 mm. long, 1.5-4 mm. broad ..2. *L. leucocephala*.
2. Leaflets mostly 8 mm. long or shorter and mostly about 1 mm. broad
.....3. *L. pulverulenta*.

1. *Leucaena retusa* Gray. Tree 2-4 (-8) m. tall, the younger parts minutely pubescent, mostly glabrate; leaves with (2 or) 3 or 4 pairs of pinnae; leaflets 4 to 9 pairs per pinna, oblong to elliptic or obovate, 7-25 mm. long, reticulate-veined; glands present

usually between each pair of pinnae and often smaller ones between each pair of leaflets, slightly elevated; heads about 2 cm. thick, bright-yellow; pod narrowly to broadly linear, (10-) 15-25 (-35) cm. long, 8-12 mm. broad, acute at both ends. *Caudoleucaena retusa* (Gray) Britt. & Rose. Scattered in dry canyons, w. part of Edwards Plateau and w. to the Davis Mts. and Chisos Mts. of the Trans-Pecos, Apr.-July; also Coah.

2. *Leucaena leucocephala* (Lam.) de Wit. POPINAC. Tree 2-4 (-8) m. tall, the youngest twigs puberulent; leaves with 4 to 9 pairs of pinnae; leaflets 11 to 17 pairs per pinna, oblong to lanceolate, slightly anisolateral, apically acute, 7-12 mm. long; 2-3.5 mm. broad; heads about 15-20 mm. thick, creamy-white; pod strap-shaped, to 20 (usually 8-15) cm. long, 1-2 cm. broad, stipitate, usually denticulate apically, with 18 to 25 seeds. Scattered and infrequent in s. Tex., where introd. and commonly planted, May-June; trop. Am., now widely adv. around the world.

Used in plantings and as green manure. Where *L. leucocephala* and *L. pulverulenta* have been planted together, some hybridization has occurred. Our plants have for more than a century, through error, been called *L. glauca*.

3. *Leucaena pulverulenta* (Schlecht.) Benth. TEPEGUAJE. Tree 3-10 (-13) m. tall, with trunk to 7 dm. thick, the wood very soft and often brittle; leaves with 10 to 25 pairs of pinnae; leaflets 15 to 40 pairs per pinna, linear, 3-6 mm. long, about 1 mm. broad; heads about 1-2 cm. thick, creamy-white; pod strap-shaped, 8-22 cm. long, 3-19 mm. broad, shortly acute apically, long-stipitate. Locally abundant in extreme s. Tex. (Brownsville region), in Cameron and Hidalgo cos., planted but not persistent farther n., Mar.-June; Tex., N. L., Tam., S.L.P. and Ver.

6. SCHRANKIA WILLD.

SENSITIVE BRIER

Perennial herbs; taproots napiform or irregular, to 2 cm. thick; stems 1-20 cm. long, weak, sprawling, dying back each year, armed with numerous recurved prickles (or very rarely the prickles absent); stipules subulate; leaves pinnately twice-compound, 3-15 cm. long, 2-10 cm. broad, with (2 or) 3 to 10 pairs of pinnae, the rachis and rachillas usually with recurved prickles; leaflets 4 to numerous, glabrous; flowers in pink globes 1-2 cm. thick; peduncles axillary, (2-) 3-11 cm. long, with recurved prickles; stamens usually 8 to 12, separate above the floral cup; legume linear, in transection nearly linear to narrowly elliptic to rhombic, 2-12 cm. long, 4-6 mm. broad or broader, sometimes nearly as thick as broad, usually with numerous recurved prickles (prickles rarely absent), promptly dehiscent into 2 valves or often each valve splitting tardily into 2 merivalves; seeds several to numerous. *Leptoglottis* DC.; *Morongia* Britt.

A small warm-American genus, sometimes submerged in *Mimosa* but adequately distinct. The species in Texas intergrade somewhat where they grow together and might be treated as varieties of a single species, but this treatment is not particularly more rewarding than the present one.

1. Leaflets with raised reticulate veins beneath (2)

1. Leaflets smooth or the midvein prominent only (3)

2(1). Legume 1-4 cm. long, rounded at apex; peduncles 4-12 cm. long; flower heads in early bud with protruding bracts1. *S. hystericina*.

2. Legume 4-12 cm. long, acute or beaked at apex; peduncles 2-7 (-10) cm. long; flower heads in early bud with bracts completely hidden2. *S. uncinata*.

3(1). Lower portion of stem distinctly 4- or 5-sided, glabrous; stipules small, 1-3 (-4) mm. long; pod 4-sided, scarcely flattened at maturity; plants of southern Texas3. *S. latidens*.

3. Lower portion of stem rounded, not distinctly 4- or 5-sided; stipules 3-6 mm. long; pod various (4)

4(3). Mature legume 4-7 (-8) cm. long, flattened, the valves 3 to 6 times as wide as the thickened margin; pinnae 2 to 5 (or 6) pairs; leaflets mostly obtuse at apex; plants of central and north-central Texas.4. *S. Roemeriana*.

4. Mature legume 6-12 cm. long, tetragonal, not conspicuously flattened or if so the valves less than twice as wide as the margin; pinnae (3 or) 4 to 8 pairs; leaflets mostly acute at apex (rarely obtuse throughout); plants of easternmost or westernmost Texas (5)

- 5(4). Stems, ovary and pod puberulent; plants of western Texas
5. *S. occidentalis*.
 5. Stems, ovary and pod completely glabrous; plants of east Texas
6. *S. microphylla*.

1. *Schrankia hystericina* (Britt. & Rose) Standl. Essentially glabrous, the stems often very coarse and 2-4 m. long; pinnae usually 4 or 5 pairs; leaflets usually 10 to 15 pairs, with raised reticulate veins beneath, 4-7 mm. long, obtuse or acutish, apiculate; stipules 4-6 mm. long; flower heads in early bud with protruding bracts; peduncles 4-12 cm. long; legume 1-4 cm. long, apically rounded, subterete, very densely prickly. *Leptoglottis hystericina* Britt. & Rose, *Mimosa quadrivalvis* L. var. *Nuttallii* (Britt. & Rose) Beard subvar. *hystericina* (Britt. & Rose) Beard. Sandy forested areas, e. and s.e. Tex., Feb.-May; also La.

2. *Schrankia uncinata* Willd. Stems usually 6-12 dm. long; pinnae usually 4 to 8 pairs; leaflets 8 to 15 pairs, elliptic, firm, 4-8 mm. long, apically cuspidate, with raised reticulate veins beneath; stipules 4-6 mm. long; flower heads in early bud with bracts completely hidden; peduncles 3-9 cm. long; legume compressed to nearly terete, 5-10 cm. long, 3-4 mm. thick, densely or sparingly prickly. *S. Nuttallii* (DC.) Standl., *Leptoglottis mimosoides* Small, *Mimosa quadrivalvis* L. var. *Nuttallii* (DC.) Beard. Locally abundant in e., s.e. and n.-cen. Tex. and the Plains Country, usually in sandy soils, Apr.-June; cen. U.S., sparingly s.e. to S. C. and Ala., s.w. to Tex.

3. *Schrankia latidens* (Small) K. Schum. Lower portion of stems distinctly 4- or 5-sided; pinnae usually (1 or) 2 or 3 pairs; leaflets 4 to 12 pairs per pinna, smooth beneath or the midvein only prominent, oblong, 3-8 mm. long, about 2 mm. broad, obtuse, minutely apiculate; stipules 1-3 (-4) mm. long; fruiting peduncles about 4 cm. long; legume 4-sided to subterete, scarcely at all flattened (at maturity!) *Leptoglottis Berlandieri* Britt. Possibly not distinguishable from the *S. quadrivalvis* (L.) Britt. & Rose (that is, *Mimosa quadrivalvis*) described from the Coastal Plain of Ver. Frequent in sandy loam, Rio Grande Plains sparingly n.e. to Grimes Co., Apr.-Sept.; also Tam. (possibly much farther s. if inseparable from *S. quadrivalvis*).

4. *Schrankia Roemeriana* (Scheele) Blank. Lower portion of stem terete, not distinctly 4- or 5-sided, the stem usually 3-10 dm. long; occasionally with stems and pod pubescent as in *S. occidentalis*; pinnae 2 to 5 (or 6) pairs; leaflets 6 to 13 pairs per pinna, smooth beneath or only the midvein prominent, apically obtuse; stipules 3-6 mm. long, subulate; peduncles 2-6 cm. long; mature legumes (3-) 4-7 (-8) cm. long, flattened, the valves 3 to 6 times wide as the thickened margin. *S. platycarpa* Gray, *Leptoglottis Reverchonii* Britt. & Rose, *Mimosa quadrivalvis* L. var. *Roemeriana* (Scheele) Beard. Frequent in calcareous soil, n.-cen. Tex. and scattered in Edwards Plateau, Apr.-July; also Okla.

5. *Schrankia occidentalis* (Woot. & Standl.) Standl. Lower portion of stem terete, not distinctly 4- or 5-sided; stems, ovary and pod puberulent; pinnae 3 or 4 (to 8) pairs; leaflets usually about 12 to 16 pairs per pinna, smooth beneath or only the midvein prominent, mostly acute or rarely obtuse apically; stipules 3-6 mm. long; mature legume 6-12 cm. long, tetragonal, not conspicuously flattened or if so the valves less than twice as broad as the margin. *Mimosa quadrivalvis* L. var. *occidentalis* (Woot. & Standl.) Beard. Infrequent or locally abundant, in loose sand, s. part of Plains Country, May-July; also N.M.

6. *Schrankia microphylla* (Sm.) Macbr. Lower portion of stem terete, not distinctly 4- or 5-sided; stems, ovary and pod quite glabrous; pinnae 3 or 4 (to 8) pairs; leaflets 10 to 17 pairs per pinna, smooth beneath or only the midvein prominent, mostly acute or rarely obtuse apically; stipules 3-6 mm. long; mature legume 6-12 cm. long, tetragonal, not conspicuously flattened or if so the valves less than twice as broad as the margin; beak of legume 6-10 m. long. *Morongia angustata* (T. & G.) Britt., *S. Halliana* (Britt. & Rose) Small. Scattered in s.e. Tex., rare in s. part of e. Tex. where it intergrades with *S. latidens*, Aug.-Sept.; Coastal States, Va. to Tex.

According to L. S. Beard, this taxon is in reality not distinguishable from the true *Mimosa quadrivalvis*, i.e., what we here call *S. latidens*.

7. MIMOSA L. MIMOSA. CATCLAW

Shrubs or lianes or (in 1 species) prostrate perennial herbs, in most species the herbage and even the legumes armed with scattered recurved prickles; leaves pinnately twice-compound with 1 to 14 pairs of pinnae; leaflets few to numerous; stipules usually small and subulate, never spinescent; flowers small and aggregated into white, pink to reddish globes or rarely short spikes; stamens 8 to 10 (usually exactly twice as many as petals), usually colored, free above the floral cup; fruit a flattened (sometimes contorted) pod usually a few cm. long, with a unique mode of dehiscence, the margins remaining more or less intact and more or less persistent while the valves separate from them and often break up into 1-seeded sections somewhat like loment. *Mimosopsis* Britt. & Rose.

A large genus of about 400 species in tropical and subtropical regions, principally in North America and South America.

1. Plants with herbaceous prostrate stems 1. *M. strigillosa*.
1. Plants with woody erect or clambering stems, never prostrate (2)
 - 2(1). Stems clambering or straggling, briarlike; leaflets (the larger ones) ovate, 10 mm. long or more 2. *M. malacophylla*.
 2. Stems stiffly erect, ascending or recurved but never straggling and briarlike; leaflets linear to nearly orbicular, 2-8 mm. long (3)
 - 3(2). Leaves (at least some of them) with 8 to 14 pairs of pinnae; flower heads cylindric, spikelike 3. *M. dysocarpa*.
 3. Leaves with 1 to 8 pairs of pinnae (rarely more in *M. pigra*); flower heads globose (4)
 - 4(3). Pinnae (at least some of them) with 20 or more pairs of leaflets; prickles flattened, white at base, scarcely if at all recurved; valves of pod breaking at maturity into 8 or more transverse segments 4. *M. pigra*.
 4. Pinnae with 3 to 20 pairs of leaflets; prickles (when present) flattened to nearly conical, brown to white at base, usually recurved; valves of pod breaking at maturity into 7 or fewer segments, or remaining intact (5)
 - 5(4). Leaves (at least some of them) with 4 to 8 pairs of pinnae; valves of legume straight, separating entire from the margin at maturity (6)
 5. Leaves with 1 to 3 pairs of pinnae; pod valves remaining intact or breaking into joints (7)
 - 6(5). Prickles conical, not conspicuously flattened near base, only slightly recurved; pods short-villous, with straight prickles along the margin; leaflets very small, not exceeding 1.5 mm. in length; branches flexuous 7. *M. Warnockii*.
 6. Prickles not conical, flattened near the base, usually recurved; pods glabrate, not at all villous, the margins with short recurved prickles or these lacking; leaflets 2 mm. long or more; branches straight to somewhat flexuous 8. *M. biuncifera*.
 - 7(5). Valves of the pod densely covered with short yellow prickles; leaflets densely sericeous 5. *M. Emoryana*.
 7. Valves of the pod glabrous or merely scattered-puberulent; leaflets glabrous to sparsely pubescent (8)
 - 8(7). Leaves with 1 or 2 pairs of pinnae; leaflets 1 or 2 pairs to each pinna; petioles conspicuously flattened, broadened at the apex 10. *M. zygothylla*.
 8. Leaves with (1 or) 2 or 3 pairs of pinnae; leaflets (2 or) 3 to 8 pairs to each pinna; petioles not flattened or rarely flattened (9)
 - 9(8). Petals separate to the base or nearly so; pod often shiny and light-colored (yellowish), constricting and twisting between the seeds at maturity or the valves contorting and breaking into 1-seeded segments; stems essentially straight, not zigzag 6. *M. borealis*.
 9. Petals united for one half their length or more; pod dark-brown, straight with nearly parallel valves, not contorting or breaking into segments at maturity; stems usually slightly zigzag (10)

- 10(9). Flower heads in bud 4-5 mm. wide; leaflets 1.5-3 mm. long; plants of southern-most Texas 9. *M. Wherryana*.
 10. Flower heads in bud 5-8 mm. wide; leaflets 3-6 mm. long; plants of central and west Texas 8. *M. biuncifera*.

1. *Mimosa strigillosa* T.&G. POWDERPUFF, VERGONZOSA. Perennial herb with sprawling annual stems 1-2 (-4) m. long, usually copiously furnished with stiff spreading bristle-like emergences, but these not noxious; pinnae 4 to 6 pairs, more or less; leaflets usually 10 to 15 pairs per pinna, linear, usually 3-6 mm. long, 0.5-1 mm. broad; flowers in pink or purple globes; pod oblong, 15-20 mm. long, 10-12 mm. broad, setulose, with 1 to few joints. Frequent in grasslands and openings in forests on sandy loam, e. and s.e. Tex. and coastal parts of Rio Grande Plains, May-Oct.; s.e. U.S. w. to Okla. and Tex.; Tam., Parag. and Arg.

2. *Mimosa malacophylla* Gray. RASPILLA. Liane climbing in trees or forming a tangle, usually 3-4 m. high, less commonly a weak-stemmed shrub, the stems armed with recurved prickles; petioles and rachises with prickles also; pinnae 3 to 5 pairs; leaflets 3 to 6 pairs per pinna, pubescent or glabrous, ovate to oblong or obovate, the larger ones on any plant 10 mm. long or longer; flowers whitish, in heads about 1-2 cm. thick; legume broadly linear to oblong, 40-75 mm. long, 8-10 mm. broad, stipitate, several-jointed. Incl. var. *glabrata* Benth., *M. Wootonii* Standl. Rare in woodlands along streams, Rio Grande Plains, June-July; also Tam. and N.L.

3. *Mimosa dysocarpa* Benth. GATUÑO. Shrub 1-2 m. tall; branches short and numerous, divaricate, very prickly, the youngest twigs villosulous; pinnae on larger leaves 8 to 14 pairs; leaflets 7 to 16 per pinna, oblong-linear, acute, usually pubescent on both sides; flowers in pinkish cylindrical spikes 1-2 cm. long or longer, very showy; pod 25-50 mm. long, about 6 mm. broad, tomentose, usually slightly constricted between the seeds, the margins usually prickly. Locally abundant on brushy hillsides, Davis Mts. and Chisos Mts. in the Trans-Pecos, June-July; Tex., N.M., and Ariz. s. to Dgo.

4. *Mimosa pigra* L. var. *Berlandieri* (Gray) B. L. Turner. ZARZA, COATANTE. Shrub 1-2 (-3) m. tall, much-branched, the branches and leaves very noxiously armed with slightly recurved prickles, forming impenetrable thickets; pinnae 4 to 6 (to 12) pairs; leaflets (on at least some of the larger leaves of any plant) 20 or more pairs per pinna; prickles flattened, whitish basally; flowers in pinkish globes about 1 cm. thick; pod 4-5 cm. long; 8-10 mm. broad, the valves breaking into 8 or more joints. *M. Berlandieri* Gray. Locally abundant in dry lake beds and resacas and other seasonally inundated areas of clay soil. Cameron and Hidalgo cos. in extreme s. Tex., rare farther n. along the coast, Mar.-Nov.; var. *pigra* widespread in the tropics (probably originally nat. to Am.); var. *Berlandieri* in Tex., e. Mex. and scattered elsewhere.

5. *Mimosa Emoryana* Benth. Shrub about 1 m. tall with numerous short prickles that are recurved and basally somewhat flattened; pinnae 1 to 3 pairs per leaf; leaflets 3 to 5 pairs per pinna, oblong, 2-3 mm. long, obtuse, sericeous-villosulous above and below; flowers in small pink heads; pods 30-35 mm. long, 4-6 mm. broad, more or less constricted between the seeds, densely covered with short yellow prickles, the valves separating from the margins and breaking up into 3 to 5 joints. Locally abundant, deserts of s. Brewster and Presidio cos. in the Trans-Pecos, May-July; also Chih.

6. *Mimosa borealis* Gray. PINK MIMOSA. Rounded much-branched shrub about 1 m. tall (rarely to 25 dm.); branches only slightly zigzag, the prickles usually remote and strongly recurved and basally flattened; pinnae (1 or) 2 or 3 pairs per leaf; leaflets 3 to 8 pairs per pinna, oblong to ovate, 2-6 mm. long; petioles not or rarely flattened; flowers in pink globes; petals separate nearly to the top of the floral cup; pods linear-oblong, 25-50 mm. long, 6-8 mm. broad, glabrous, with 4 to 7 seeds, more or less constricted between the seeds, pallid (yellowish), the margins with or without recurved prickles, the valves contorting, breaking away from the margins and breaking into 4 to 7 1-seeded joints. *M. fragrans* Gray, *M. texana* (Gray) Small. Frequent in brushy vegetation in Trans-Pecos and Edwards Plateau, infrequent into the Plains Country, Apr.-July; Okla., N.M. and Tex.

7. *Mimosa Warnockii* B. L. Turner. Low rounded shrub, usually less than 1 m. tall; branches usually markedly zigzag, the numerous prickles conical, not conspicuously flattened near the base and only slightly recurved near the tip; pinnae 3 to 7 (or 8) pairs;

leaflets very small, about 7 to 12 pairs per pinna, usually not more than 1.5 mm. long, oblong to linear-oblong, obtuse; flowers in pinkish globes; pod linear, 2-5 cm. long, 2-3 mm. broad, short-villous, with straight prickles marginally, more or less constricted between the seeds, the valves separating at maturity from the margins but remaining intact, not breaking up into joints. *M. flexuosa* Benth. (not Poir.), *Mimosopsis flexuosa* (Benth.) Britt. & Rose. Local in the Davis Mts. at about 4,500-5,500 ft. elev. on soils derived from volcanic rock, May-Aug.; Tex., N.M., Ariz. and Son.

8. *Mimosa biuncifera* Benth. CAT'S-CLAW MIMOSA. Rounded shrub about 1 m. tall; branches numerous, only slightly zigzag, the numerous vicious prickles not conical but somewhat flattened basally and apically markedly recurved; pinnae on at least some of the larger leaves of the plant 4 to 8 pairs (rarely to 10 pairs); leaflets 5 to 12 pairs per pinna, 2 mm. or more long, linear-oblong; flowers in pinkish globes; petals united half their length or more; pod linear, curved or nearly straight, 20-35 mm. long, 3-4 mm. broad, the valves separating at maturity from the margins but remaining intact, not breaking up into joints, glabrate, the margins with short recurved prickles or these absent. Incl. var. *Lindheimeri* (Gray) Robins., *M. Lindheimeri* Gray, *Mimosopsis biuncifera* (Benth.) Britt. & Rose. Frequent in Trans-Pecos, infrequent and scattered in Plains Country and Edwards Plateau, Apr.-Sept.; N. M. and Ariz., s.e. to Son., Chih. and Coah.

9. *Mimosa Wherryana* (Britt. & Rose) Standl. Rounded much-branched shrub 5-15 (-20) dm. tall, the rather remote prickles somewhat flattened at the base and recurved; pinnae 1 to 3 pairs; leaflets 3 to 6 pairs per pinna, (1-) 2-3 mm. long, oblong, obtuse or rounded; flowers in heads which in bud are very small (only 4-5 mm. thick) and in flower are white; pod narrowly oblong, glabrate, 2-3 cm. long, about 5 mm. broad, with recurved prickles on both margins, the valves separating from the margins but remaining intact and not breaking up into 1-seeded joints, not much if any contorted; seeds few, small, oriented longitudinally in the pod. *Mimosopsis Wherryana* Britt. & Rose. Local on caliche and gravel hills near the Rio Grande in Starr and Zapata cos., spring-fall; also Tam.

10. *Mimosa zygophylla* Gray. Straggling diffuse shrub 1-2 (-3) m. tall, appearing leafless from a distance, with numerous basally flattened recurved prickles; pinnae only 1 or 2 pairs; leaflets only 1 or 2 pairs per pinna; flowers in pink globes; pods 1-3 cm. long, 6-7 mm. broad, the valves separating from the margins but remaining intact, not breaking into 1-seeded joints. Local in deserts, s. Brewster Co. and s. Hudspeth Co. in the Trans-Pecos, spring-fall; Zac., Chih., Coah. and Tex.

8. DESMANTHUS WILLD.

Perennial unarmed herbs (perhaps subshrubby in *D. Cooleyi*); roots often napiform, somewhat woody; stems several from the crown, annual (rarely with short woody extensions at the extreme base), (1-) 2-10 dm. long, erect or spreading; leaves pinnately twice-compound, usually 2-10 cm. long, with 2 to 10 long pairs of pinnae, the leaflets very small and numerous; stipules usually subulate, rarely evanescently small; peduncles axillary, long or short, each bearing terminally a head or partial head (glomerule) of few to several very small flowers; flowers usually white or whitish; sepals 5, free to the top of the floral cup; petals 5, essentially separate also; stamens 10 (or only 5 in *D. leptolobus* and *D. illinoensis*), separate to the top of the floral cup; some of the flowers in each head with sterile stamens; fruit a dry flattened 1- to several-seeded promptly dehiscent legume. *Acuan* Medic.

A genus of about 40 species of the warmer parts of the Americas; a few species also in the Old World tropics.

1. Legume falcate, 2 to 5 times as long as broad; stems erect; stamens 5 1. *D. illinoensis*.
1. Legume linear, at least 7 times longer than wide; stems decumbent to erect; stamens 5 or 10 (2)
- 2(1). Leaflets with raised somewhat reticulate veins (upper surface sometimes smooth); infructescence at maturity on peduncles 30-150 mm. long (3)
2. Leaflets without raised reticulate veins; infructescence on peduncle 4-60 mm. long (4)

- 3(2). Mature fruiting peduncles 8-15 cm. long; legume tapering to a point; the larger leaves with petioles 10 mm. long or more; leaflets glabrous or sparsely pubescent along the margins only2. *D. reticulatus*.
- 3. Mature fruiting peduncles 3-8 cm. long; legumes obtuse or abruptly mucronate, never tapering to a point; leaves with petioles 10 (rarely 15) mm. long or less; leaflets pubescent over the lower surface3. *D. obtusus*.
- 4(2). Stem densely short-villous throughout (rarely glabrate); petiolar glands orbicular, minute, 0.4 mm. long or less4. *D. velutinus*.
- 4. Stems glabrous or sparingly pubescent along the angles, never evenly pubescent throughout; petiolar glands 0.3-3 mm. long (5)
- 5(4). Stipules small or wanting, less than 2 mm. in length; peduncles 2 cm. long or less (exceptionally, 3 cm.)5. *D. Cooleyi*.
- 5. Stipules longer, setiform, 2-8 mm. long (sometimes appearing less when the tips are broken off); peduncles 0.4-6 cm. long (6)
- 6(5). Seeds placed lengthwise in pod, elliptic, 4.5-5 mm. long; legumes somewhat constricted along the margin between the seeds; pinnae 4 to 10 pairs; stamens 56. *D. leptolobus*.
- 6. Seeds placed obliquely in pod (most noticeable in immature fruit), variously shaped but less than 3 mm. long; legume margins straight; pinnae 1 to 7 pairs; stamens 10 (7)
- 7(6). Stipules conspicuously pubescent; stems prostrate, arising from a deep tuberous taproot; petiolar gland 0.7-1.5 mm. long7. *D. acuminatus*.
- 7. Stipules glabrous (rarely, with 5 or 6 scattered hairs); petiolar gland 0.7 mm. long or less if the stems are prostrate, OR 0.7-3 mm. long if the stems are erect (8)
- 8(7). Fruiting peduncles 2-6 mm. long; pinnae 1 to 2 pairs only8. *D. brevipes*.
- 8. Fruiting peduncles 10 mm. long or more; pinnae 2 to 7 pairs9. *D. virgatus*.

1. *Desmanthus illinoensis* (Michx.) MacM. Stems erect, 3-10 dm. long; stipules filiform, 6-8 mm. long; leaves 6-10 cm. long; pinnae 6 to 14 pairs, with a small oblong or suborbicular gland between them or between the lower pair of pinnae only; leaflets linear, acute, glabrous or ciliate, 2-3 mm. long; heads several-flowered; peduncles in fruit 3-7 cm. long; stamens 5 only; legumes flat, strongly falcate, in dense heads, 15-25 mm. long, 2 to 5 times as long as broad, about 5 mm. broad, glabrous. *Acuan illinoense* (Michx.) O. Ktze. Frequent in clay soils in n.-cen. Tex., infrequent or rare in Edwards Plateau and Plains Country, rare in s.e. Tex. and the Trans-Pecos, June-Sept.; Ala. to Tex. and n. to Ill., O., Minn., S.D. and Colo.

2. *Desmanthus reticulatus* Benth. Much-branched from the base; stems weak and at least in the basal part sprawling, 2-16 dm. long; pinnae 1 to 4 pairs; leaflets 4 to 10 pairs per pinna, with raised somewhat reticulate veins at least on the lower surface, glabrous or sparsely pubescent along the margins only, oblong to elliptic or the upper pair elliptic-obovate, 3-5 mm. long, apically rounded to mucronulate; petioles of the larger leaves 1 cm. long or more, the gland minute and orbicular or absent; stamens 10; fruiting peduncles 8-15 cm. long; legume linear, tapering to a point, 25-50 mm. long, at least 7 times longer than broad, about 3 mm. broad. *Acuan reticulatum* (Benth.) O. Ktze. Infrequent in s.-cen. Tex., w. to Edwards Co., n.e. to Travis Co. and s.e. to San Patricio Co., on limestone and caliche uplands, spring; endemic.

3. *Desmanthus obtusus* Wats. Much-branched from the base; stems weak and at least in the basal part usually sprawling, 1-6 dm. long; pinnae 1 to 4 pairs per leaf; leaflets 8 to 14 pairs per pinna, with raised somewhat reticulate veins at least on the lower surface, pubescent over the lower surface, oblong, obtuse, 3-5 mm. long; petioles of the larger leaves 10 (rarely 15) mm. long or less, the small gland orbicular and borne between the lower ' pinnae; stamens 10; fruiting peduncles 3-8 cm. long; legume linear, 15-35 mm. long, at least 7 times longer than broad, about 2 mm. broad, straight, never tapering to a point though sometimes abruptly mucronate. *Acuan obtusum* (Wats.) Heller, *A. fallax* Small. Infrequent in calcareous soils over limestone or caliche uplands, Edwards Plateau,

s. part of Plains Country, e. part of the Trans-Pecos and Rio Grande Plains, Apr.-Aug.; also N.M. and Coah.

4. *Desmanthus velutinus* Scheele. Much-branched from the base; stems usually diffuse and spreading, 2-5 dm. long, the herbage (except leaflets) densely short-villous (very rarely glabrate); pinnae 3 to 6 pairs; petiole about 1 cm. long, the gland between the lowest pair of pinnae orbicular and 0.4 mm. or less in diameter; leaflets not having raised reticulate venation, the midvein often prominent, 2.5-4 mm. long, linear-oblong, acute or obtuse; stamens 10; fruiting peduncles 3-6 cm. long; legume straight or nearly so, linear, 3-7 cm. long, at least 7 times longer than broad, about 3 mm. broad, subulate-tipped. *Acuan velutinum* (Scheele) O. Ktze. Abundant on limestone hills, e. part of Edwards Plateau and parts of n.-cen. Tex., less common w. to e. part of Plains Country, parts of the Trans-Pecos and on caliche cuestas in the Rio Grande Plains, Apr.-June; also N.M. and Coah.

5. *Desmanthus Cooleyi* (Eat.) Trel. Bushy-branched, decumbent or ascending, 2-5 dm. long, the angled stems and branches glabrous or merely puberulent; stipules less than 2 mm. long; pinnae 2 to 7 pairs, with an orbicular gland 0.3-3 mm. long between the lower pair; leaflets without raised reticulate venation, 8 to 15 pairs per pinna, oblong or linear-oblong, 3-4 mm. long, acutish or mucronulate, ciliate at least when young; peduncles 2 cm. long or less (exceptionally 3 cm.); stamens 10; legume straight or nearly so, linear, 3-7 cm. long, at least 7 times as long as broad, about 3 mm. broad, pointed. *Acuan Cooleyi* (Eat.) Britt. & Rose, *Desmanthus Jamesii* T. & G. Locally frequent in Plains Country and higher grasslands of Trans-Pecos, June-Aug.; Nebr. to Ariz. and s. to Dgo.

6. *Desmanthus leptolobus* T. & G. Stems several from the base, ascending, 6-10 dm. long, the stem and branches rough-angled; stipules setiform, 4-6 mm. long; pinnae 4 to 10 pairs, the small gland orbicular and borne between the lowest pair of pinnae or absent; leaflets 10 to 24 pairs, not reticulate-veined, linear-lanceolate, acute, ciliate or glabrous; peduncles 10-25 mm. long; stamens 5; legume straight or nearly so, linear, at least 7 times as long as broad, acuminate-tipped, glabrous, slightly constricted between the seeds; seeds usually 6 to 8, elongate, 4.5-5 mm. long, with the long axis oriented parallel to the long axis of the legume. *Acuan leptolobum* (T. & G.) O. Ktze. Local in n.-cen. Tex. and adj. cos., rare w. on Edwards Plateau and Plains Country (w. to Lipscomb Co.), May-Sept.; Kan., Mo., Ark. and Tex.

7. *Desmanthus acuminatus* Benth. Roots linear-cylindric (slenderly fusiform), deep, tuberous; stems several from the base, decumbent, (1-) 2-6 dm. long; pinnae 1 to 4 pairs, the gland between the lowest pair orbicular and 0.7-1.5 mm. broad; leaflets not reticulate-veined, 6 to 12 pairs per pinna, linear-oblong, mucronate, ciliate, 2.5-4 mm. long; stipules 3-7 mm. long, setiform, conspicuously pubescent; peduncle 1-4 cm. long; stamens 10; legume linear, straight or somewhat curved, 3-5 cm. long, at least 7 times as long as broad, about 3 mm. broad; seeds less than 3 mm. long, placed obliquely in the pod. *Acuan acuminatum* (Benth.) O. Ktze. S.-cen. Tex., n. to McLennan Co., s. to Goliad and Calhoun cos., w. to Llano Co. and e. to Waller Co, spring; endemic.

8. *Desmanthus brevipes* B. L. Turner. Stems somewhat erect, 3 dm. or more long, sparingly branched above, brittle, glabrous, with 5 reddish ridges; leaves glabrous; petiole 2-6 mm. long; rachis and petiole 6-18 mm. long; pinnae only 1 or 2 pairs, 2-5 cm. long, with a large elliptic gland 1.5-3 mm. long and 1-2 mm. broad between the lower pair of pinnae; leaflets 15 to 24 pairs per pinna, not reticulate-veiny, linear to linear-oblong, glabrous, 2-7 mm. long, obtuse to apiculate; stipules subulate, 2-4 mm. long; peduncle only 2-6 mm. long; stamens 10; pods straight or slightly curved, 25-50 mm. long, about 3 mm. broad, at least 7 times as long as broad, linear, glabrous, acute; seeds 12 to 18, oblong, about 2.5 mm. long, placed obliquely in the pod. Known from only 5 collections in Texas, all in scattered coastal cos. from Willacy Co. to Galveston Co., various times of the year; also Arg.

9. *Desmanthus virgatus* (L.) Willd. Rather variable, the stems usually several to numerous and sprawling to decumbent or ascending, glabrous to sparingly puberulent; stipules setiform, essentially glabrous, 2-8 mm. long; pinnae 2 to 7 pairs; gland between the lowest pair of pinnae or between several pairs of pinnae 0.3-2.5 mm. in diameter; leaflets not reticulate-veiny, often about 10 to 15 pairs per pinna, linear, 2-6 mm. long; stamens 10; peduncles 1-6 cm. long; legume linear, 3-6 cm. long, at least 7 times as long

as broad, not constricted between the seeds when mature; seeds placed obliquely in the pod. *Acuan virgatum* (L.) Medic. Widespread in the s. half of Tex. including the Trans-Pecos. Represented with us by 2 varieties as follows:

Var. *depressus* (Willd.) B. L. Turner. Stipules with a conspicuous auricle; petiolar gland at base of lower pair of pinnae only, 0.7 mm. long or shorter; stems prostrate, rarely ascending. *Acuan Tracyi* Britt. & Rose, *A. texanum* Britt. & Rose. Frequent in Rio Grande Plains and n. to Harris, Travis and Tom Green cos., Apr.-Nov.; widespread in warmer parts of Am., as also is the var. *virgatus*, not known from Tex.

Var. *glandulosus* B. L. Turner. Stipules not conspicuously auricled; glands 1 to 4 between at least some of the pinnae (not just the lowest pair), 0.7-2.5 mm. long; stems erect or ascending. Frequent in the Trans-Pecos, especially in the mts., e. to Val Verde Co., Apr.-Nov.; also N. M. and Coah.

9. NEPTUNIA LOUR.⁸³

Perennial unarmed herbs with somewhat thickened woody orangish-colored taproots and few to several sprawling prostrate or decumbent annual stems (rarely floating); leaves pinnately twice-compound; pinnae 2 to 11 pairs, with or without a gland between the lowest pair of pinnae; leaflets 8 to 43 pairs per pinna, usually linear to oblong or somewhat tapered toward the apex; stipules well-developed, lanceolate or lance-acuminate; peduncles axillary, several cm. long, often conspicuously bracteolate; flowers small, densely crowded in round or slightly elongated heads, yellow or yellow-green, often the lower flowers of the head lacking functional genitalia or at least functional gynoecia, the upper flowers perfect; sepals and petals 5 each, free above the floral cup; stamens 10 (at least in the upper flowers of the head), free above the floral cup, the anthers with a small gland apically between the 2 cells; fruit a thin legume, definitely stipitate, 1-5 cm. long, 6-17 mm. broad, flat, promptly dehiscent; seeds few to several, elongate, oriented transversely in the pod.

A genus of 11 species, scattered in warm-temperature parts of the Americas, Africa, Asia and Australia.

1. Petiole glandular; flowering peduncles bearing 2 large cordate bracts 4-8 mm. long and 3-5 mm. wide; leaflets without raised reticulate veins; plants semiaquatic or terrestrial3. *N. plena*.
1. Petiole eglandular; flowering peduncles bearing 1 or 2 subulate bracts 1-3 mm. long and 1-2 mm. wide, or bracts absent; leaflets with raised reticulate veins; plants terrestrial (2)
- 2(1). Flowers in head with stamens all alike, anther-bearing; flower heads (when in bud) with 30 to 60 flowers, subcylindric; stipe of pod 4-15 mm. long; leaflets 8 to 18 pairs; calyx 1-2 mm. long (including lobes) ..1. *N. lutea*.
2. Flowers in upper part of head with anther-bearing stamens, those in lower part smaller and with yellow (drying orange) petaloid staminodes; flower heads (in bud) with 20 to 30 flowers, ovoid; stipe of pod 0-4 mm. long (rarely 5 mm.); leaflets 14 to 43 pairs; calyx 2-2.7 mm. long (including lobes)2. *N. pubescens*.

1. *Neptunia lutea* (Leavenw.) Benth. YELLOW-PUFF. Plant of dry sandy areas; pinnae 2 to 11 pairs; petioles and rachises glandless; leaflets 8 to 18 pairs per pinna, with raised reticulate venation beneath; floral cup (plus sepals) 1-2 mm. long; flowering peduncles with 1 or 2 subulate bracts 1-3 mm. long and 1-2 mm. broad, or these absent; flower heads with 30 to 60 flowers, slightly elongate; stipe of pod (4-) 5-15 mm. long. Incl. var. *multipinnatifida* B. L. Turner. Scattered or locally frequent over the e. half of Tex. s. to Aransas and Goliad cos., w. to n.-cen. Tex. (one record for Runnels Co.), Apr.-Oct.; Ala., Miss., Ark., La., Okla. and Tex.

2. *Neptunia pubescens* Benth. Plant of dry sandy or grassland areas; pinnae 2 to 5 (or 6) pairs; petioles and rachises glandless; leaflets 14 to 43 pairs per pinna, with raised

⁸³ Partly adapted from D. R. Windler in Austral. Jour. Bot. 14:379-420. 1966.

reticulate venation beneath; flower cup (plus sepals) 2-2.7 mm. long; flowering peduncles with 1 or 2 subulate bracts 1-3 mm. long and 1-2 mm. broad, or these absent; flower heads with 20 to 30 flowers, essentially round or ovoid; stipe of pod 0-4 mm. long (rarely to 5 mm.). Frequent near the coast and inland to Val Verde Co. Represented with us by 2 varieties as follows:

Var. *pubescens*. Stipe of legume longer than the persistent calyx; legume usually tapering to the stipe; leaves with 3 to 6 pairs of pinnae. *N. floridana* Small, *N. Lindheimeri* Robins. Coastal Plain of Tex. inland to Anderson, Leon and Gonzales cos., May-Oct.; Gulf Coastal States; W.I., Mex., C.A., Col., Peru, Parag. and Arg.

Var. *microcarpa* (Rose) Windler. Stipe of legume usually shorter than the persistent calyx (shorter than 2 mm.); legume usually rounded to the stipe; leaves usually with 2 to 3 pairs of pinnae. *N. Palmeri* Britt. & Rose. N. part of Rio Grande Plains from McMullen and Atascosa cos. w. to Val Verde Co., May-July; Tex., Coah., N.L. and Jal.

3. *Neptunia plena* (L.) Benth. Terrestrial to semiaquatic; stems when in watery environment producing a thick spongy indument; pinnae 2 to 5 pairs; petioles with a gland just below the lowest pair of pinnae; leaflets 9 to 38 pairs per pinna, without raised reticulate veins; flowering peduncles bearing 2 large cordate bracts about 4-8 mm. long and 3-8 mm. broad; flower head ovoid; stipe of pod 3-9 mm. long, longer than the persistent calyx. Known from a single collection from a temporary lake just s. of Armstrong, Kenedy Co. in s. Texas, Oct. 17, 1938, probably not a persistent member of our flora; Braz. and Peru, n. to W. I. and Mex.; adv. in India.

10. PROSOPIS L. MESQUITE

Shrublets to medium-sized trees, often armed with straight needlelike solitary or paired stipular (?) spines; leaves pinnately twice-compound; petiolar or rachillar gland present; pinnae 1 to several pairs; leaflets 4 to 30 per pinna, usually linear and glabrous; flowers in spikes or heads, usually yellowish or creamy-white; sepals coalescent well above the top of the floral cup; petals 5, either free or coalescent above the floral cup; stamens 10, each anther bearing a short gland apically between the 2 locules; fruit a leathery often rather solid tough indehiscent several-seeded pod several cm. long; seeds partitioned from each other and often essentially embedded in fleshy parenchyma. *Neltuma* Raf.; *Algarobia* Benth.; *Strombocarpa* Engelm. & Gray.

A genus with about 40 species in the drier, warmer areas of the world.

- 1. Flowers in yellowish globose heads; pinnae 25 mm. long or shorter; pod in a tight spiral of uniform diameter; plants usually short (rarely as much as 6 dm. tall) and forming colonies by root budding 4. *P. reptans* var. *cinerascens*.
- I. Flowers in spikes, usually creamy-white to pale-yellow; pinnae usually longer than 25 mm.; pod coiled or straight; plants usually taller and not forming colonies by root budding (2)
- 2(1). Pod tightly coiled in a spiral of uniform diameter; leaflets 4 to 8 pairs per pinna; plants of Trans-Pecos Texas 3. *P. pubescens*.
- 2. Pods not coiled; leaflets usually 10 to many pairs per pinna (3)
- 3(2). Leaflets 20 to 30 pairs per pinna, 5-10 (-15) mm. long, 2 to 7 times as long as broad, approximate; pinnae (1 or) 2 (or 3) pairs .. 1. *P. laevigata*.
- 3. Leaflets usually fewer than 17 pairs per pinna or if that many then usually averaging longer than in *P. laevigata*, usually 5 to 15 times as long as broad, relatively remote; pinnae 1 (less commonly 2) pairs 2. *P. glandulosa*.

1. *Prosopis laevigata* (Willd.) M. C. Johnst. MESQUITE. Small tree; pinnae usually 2 pairs per leaf; leaflets 20 to 27 pairs per pinna, closely set, 4-6 (-9) mm. long, the foliage minutely and abundantly hispidulous; pods essentially straight, nearly as thick as broad, (5-) 7-15 cm. long. Rare, known in Tex. from one genetically dilute population 3 miles s.e. of Calallen, Nueces Co., Coastal Bend region, spring and other times; widespread in Mex. n. to Tam., N. L. and Dgo.; adv. in Tex.

2. *Prosopis glandulosa* Torr. HONEY MESQUITE. Shrub or tree; pinnae usually 1 pair per leaf, less commonly 2 pairs; leaflets relatively remote, usually 6 to 15 (to 20) pairs per pinna, (10-) 15-62 mm. long, the foliage usually glabrous; pods essentially straight, nearly

as thick as broad, (5-) 7-20 cm. long. Probably the commonest "legume" in Texas, and represented with us by 2 varieties as follows:

Var. *glandulosa*. Leaflets (25-) 30-45 (-62) mm. long, 8 to 15 times as long as broad, 6 to 13 (to 15) pairs per pinna. Abundant in Rio Grande Plains, parts of n.-cen. and s.e. Tex. and Plains Country, scattered in the Trans-Pecos, e. Tex. and Edwards Plateau, spring and later; Kan., Okla. and e. N.M., s. to Tam., N.L. and Coah.

Var. *Torreyana* (L. Benson) M. C. Johnst. Leaflets (10-) 15-25 (-30) mm. long, 5 to 8 times as long as broad, (8 to) 10 to 15 (to 20) pairs per pinna. Common in the Trans-Pecos, spring and later; Tex., N. L., Coah., Chih., N. M., Ariz., Son., Baja Calif. and Calif.

This plant has been known, through error, as *P. "juliflora"* or *P. "chilensis"* in many publications, and is the famous one that furnishes important fodder (the pods) for horses, cattle, goats, men, etc., and which has increased greatly in abundance (though it has not much extended its total overall geographic range) in the last 120 years, becoming especially abundant on disturbed grasslands.

3. *Prosopis pubescens* Benth. SCREWBEAN, TORNILLO. Large shrub or small tree 2-10 m. tall; pinnae 1 pair (less commonly 2 pairs); leaflets 5 to 8 pairs per leaf, 7-11 mm. long, 2.5-4 mm. broad; flowers in a spike 40-55 mm. long, pale-yellowish; pod 25-50 mm. long overall but tightly spirally coiled, the coil about 4-5 mm. thick, the turns about 1.5-3 mm. high, markedly pubescent. Alluvial soil, desert washes, near the Rio Grande in the Trans-Pecos, spring and later; Calif. and Baja Calif. e. to Tex.

4. *Prosopis reptans* Benth. var. *cinerascens* (Gray) Burk. TORNILLO. Shrublet (rarely clambering up through shrubbery to 15 dm. tall) usually about 2-4 dm. tall and forming colonies by means of root budding; pinnae 1 pair; leaflets 7 to 13 pairs, 2.5-4 mm. long, 0.8-1.2 mm. broad; flowers in a globose dark-yellow head; pod 15-37 mm. long overall, tightly spirally coiled, the coil about 4-6 mm. thick, the turns about 2-3 mm. high, pubescent or glabrate. Clay soils, Rio Grande Plains and s. coastal Tex., spring and later; Tex., N.L., Tam. and S.L.P. The typical variety occurs in Arg.

11. CERCIS L. REDBUD

A genus of half a dozen species of temperate areas of North America, Asia and Europe.

1. *Cercis canadensis* L. Deciduous unarmed small tree; leaves alternate, simple, cordate to somewhat reniform; stipules not persistent; petioles well-developed; flowers appearing in spring before or as the leaves expand, rose or pink-purplish, in sessile umbel-like aggregations along the preceding year's growth; floral tube and essentially gamosepalous calyx purplish, persistent, basally oblique, broadly and irregularly campanulate, enlarged on the lower side, the 5 minute calyx lobes short and broadly triangular; corolla appearing papilionaceous, markedly bilaterally symmetrical; petals 5, the uppermost bannerlike one internal in bud; stamens 10, filaments free to the top of the floral cup, the anthers all functional; fruit a slightly stipitate dark-brown oblong to broadly linear thin-walled legume, blunt or acutish; seeds several too many. Widespread in e. U. S. and the mts. of e. Mex. Represented with us by three varieties as follows:

Var. *canadensis*. Mature leaves thinnish, dull green on both surfaces, generally cordate in outline, generally acute. Forested sandy areas of e. and n.-cen. Tex., in the latter area intergrading with the next, Mar.-May; e. U. S.

Var. *texensis* (Wats.) Rose. Mature leaves coriaceous, rich deep-green, shiny, distinctly glaucous above, reniform to cordate-reniform in outline, obtuse to emarginate or often merely rounded at apex; petioles and young branchlets quite glabrous or nearly so. *C. reniformis* Engelm. Edwards Plateau and calcareous soils of n.-cen. Tex. and e. parts of Plains Country, spring; also Okla.

Var. *mexicana* (Rose) M. Hopk. Leaves as in var. *texensis* but petioles and young branchlets densely woolly-tomentose both in youth and maturity. In mts. of the Trans-Pecos and e. to Crockett and Val Verde cos., spring; Tex. and mts. of n. Mex.

12. BAUHINIA L.

A large genus with about 250 species in the warmer parts of the world, of which we have only one.

1. *Bauhinia congesta* (Britt. & Rose) Lundell. Shrub or small tree 2-4 m. tall, unarmed, deciduous; leaves alternate, petiolate, consisting of 2 leaflets 15-30 mm. long and almost as broad; stipules present; flowers in sessile umbel-like aggregations among the leafy twigs; calyx of 5 free sepals; petals 5, white or light-pink, at least some of them clawed, the uppermost internal in bud; stamens 9 or 10 but only one of them functional, the rest staminodia, all free to the top of the floral cup; fruit a flattened promptly dehiscent several-seeded legume several cm. long. *Casparea jermiana* Britt. Rare, known only from canyons and arroyos in limestone hills ("Anacacho Mountains") in Kinney Co.; reported (apparently erroneously) from Presidio Co. and Gillespie or Llano Co., Mar.-May; also n.e. Mex.

Now becoming rather common in the nursery trade, especially in the Houston area. This attractive shrub deserves wider cultivation.

13. CASSIA L.⁸⁴

SENNA

Annual and perennial herbs, shrubs or rarely small trees (and large trees and woody vines in tropics); leaves paripinnate, spiral or distichous, the leaflets in 2 to 20 (to 60) pairs, the petiole bearing 1 or more glands between or below leaflets, or glandless; flowers mostly in axillary racemes, sometimes solitary or in terminal racemes or panicles; sepals obtuse to acuminate, subequal to very unequal; petals yellow (very rarely white), subequal or one larger; stamens 10, loculicidally dehiscent and trimorphic (3-4-3) (the uppermost set reduced, the lowest with longer anthers and/or longer filaments), or stamens 10 or 5, equal and porose; gynoecium often enantiostylous; pod flat, turgid or terete, erect to pendent, indehiscent or dehiscent by both sutures or elastically dehiscent by twisting valves; seeds few to many, transverse or oblique or longitudinal.

About 400 species, mostly in tropical America, but nearly cosmopolitan in tropics and subtropics. Various species are used as ornamentals, for plantation shade (coffee, cacao, etc.), soil improvement, pharmaceuticals and timber. Some authors follow Rafinesque and Britton in distributing the species among 28 segregate genera (9 in Texas). The genus is treated conservatively here.

- 1. Leaflets one pair, more or less gray-green (2)
- 1. Leaflets two or more pairs, yellow-green or medium-green (gray-green in *C. Lindheimeriana* and *C. Orcuttii*) (5)
- 2(1). Flowers solitary on long peduncles in the leaf axils; fruit ovoid, indehiscent; low perennial herb from knobby tuberous roots1. *C. pumilio*.
- 2. Flowers in axillary or terminal corymbiform racemes or panicles; fruit linear, flattened, apically dehiscent; erect or ascending perennial herbs from deep branching roots (3)
- 3(2). Leaflets lanceolate2. *C. Roemeriana*.
- 3. Leaflets ovate-lanceolate to ovate (4)
- 4(3). Leaflets 2 or 3 times longer than wide, densely short-pubescent, the hairs not more than 2 mm. long; pod 2-3 cm. long, curved, ascending3. *C. bauhinioides*.
- 4. Leaflets less than 2 times longer than wide, silvery-pubescent, the hairs 3-5 mm. long; pod 3-4 cm. long, straight or little-curved, mostly erect4. *C. durangensts*.
- 5(1). Plant shrubby, the stems definitely woody below (*C. alata* usually grown as an herb in Texas) (6)
- 5. Plant herbaceous, dying at least to the ground in fall (9)
- 6(5). Leaflets less than 1 cm. long; pod flat (7)
- 6. Leaflets 2 cm. long or longer; pod terete or bearing a conspicuous longitudinal wing on each valve face (8)
- 7(6). Shrub with spreading or ascending stems, less than 5 dm. tall; petiole with a sessile turbinate gland near base; pod 3-4 cm. long ..5. *C. Greggii*.
- 7. Shrub with erect or ascending stems to 30 dm. tall or taller; petiole without glands; pod 6-10 cm. long6. *C. Wislizenii*.

⁸⁴ Contributed by Howard S. Irwin.

- 8(6). Leaflets 2 or 3(5) pairs, oblanceolate, the rachis bearing a gland between at least the lower pair of leaflets or commonly between all pairs; bracts small, not petal-like; pedicels longer than the flowers; fruit pendent, terete, light-green, maturing light-brown 7. *C. corymbosa*.
8. Leaflets 6 to 12 pairs, broadly oblong, the rachis eglandular; bracts 1.5-2.5 mm. long, petal-like; pedicels much shorter than the flowers; fruit more or less horizontal, the valves each with a conspicuous scalloped longitudinal wing, dark-green, maturing black 8. *C. alata*.
- 9(5). Herbs with distichous leaves; inflorescences axillary or supra-axillary, short, few-flowered; pod elastically dehiscent (10)
9. Herbs with spiral phyllotaxy; inflorescences terminal or (if axillary) either the pedicels shorter than the peduncle or the plants malodorous; pods indehiscent or latently but not elastically dehiscent (18)
- 10(9). Procumbent perennials with deeply penetrating swollen roots (11)
10. Erect or ascending annuals (*C. fasciculata* var. *Ferrisiae* occasionally a short-lived perennial in extreme southern Texas) with shallow unthickened roots (12)
- 11(10). Leaflets 12 or more pairs, not more than 1 mm. wide; pedicels 2.5-5 cm. long; sepals with indistinct venation; petals yellow-orange; pod glabrescent, mostly 6- to 8-seeded, the septa oblique 9. *C. texana*.
11. Leaflets 10 pairs or fewer, about 1.5 mm. wide; pedicels to 1.5 cm. long; sepals finely striate; petals 7-10 mm. long, pale-yellow; pod spreading-pubescent, mostly 12- or more-seeded, the septa nearly transverse 10. *C. aristellata*.
- 12(10). Pedicels 1-5 mm. long; petals less than 8 mm. long; stamens 5 (13)
12. Pedicels 5-10 mm. long; petals 10 mm. long or longer; stamens 10 (14)
- 13(12). Stipules 3-8 mm. long; leaflets ciliate, the hairs 0.6-1 mm. long 11. *C. leptadenia*.
13. Stipules 5-10 mm. long; leaflets eciliate 12. *C. nictitans*.
- 14(12). Stems stiffly erect, mostly unbranched below, the upper branches pubescent with spreading hairs 2-3 mm. long; leaflets glabrate .13b. *C. fasciculata* var. *robusta*.
14. Stems erect to prostrate, simple to diffusely branched; pubescence (when present) short or appressed, never spreading and 2-3 mm. long (15)
- 15(14). Leaflets glabrate on face (16)
15. Leaflets densely pubescent with incurved hairs (17)
- 16(15). Plant mostly less than 5 dm. tall; petiolar gland less than 0.5 mm. wide; leaves mostly with 6 to 10 pairs of leaflets; anthers purple .13c. *C. fasciculata* var. *rostrata*.
16. Plant commonly 10 dm. tall or taller; petiolar gland 0.5-1.5 mm. wide; leaves with 9 to 15 pairs of leaflets; anthers yellow (purple or mottled in introgressants) .. 13a. *C. fasciculata* var. *fasciculata*.
- 17(15). Stems erect, branched above; petiolar gland sessile or nearly so; pods 5-6 mm. wide 13e. *C. fasciculata* var. *puberula*.
17. Stem branched from base, widespreading; petiolar gland distinctly stipitate; pod 3-5 mm. wide 13d. *C. fasciculata* var. *Ferrisiae*.
- 18(9). Petiolar glands occurring between 1 or more pairs of leaflets (19)
18. Petiolar glands solitary, below lowest pair of leaflets (21)
- 19(18). Annual, glabrous, yellow-green to medium-green, malodorous; petiolar gland appressed to rachis; leaflets 2 or 3 pairs, obovate; peduncle nearly obsolete (but pedicels to 2 cm. long); pod 12-20 cm. long, 3.5-5 mm. wide, scarcely flattened, the seeds longitudinal 14. *C. obtusifolia*.
19. Perennials, gray-pubescent to -puberulent or glabrate, odorless; petiolar glands erect; leaflets 4 or more pairs; pod not more than 10 cm. long, flattened, the seeds transverse or oblique (20)

- 20(19). Stems angulate; rachis glands between (2-) most pairs of leaflets; leaflets 4 to 8 pairs, densely soft-pubescent, oblong to elliptic; petals 12-15 mm. long; pod 4-6 cm. long, 7-8 mm. wide15. *C. Lindheimeriana*.
20. Stems terete; rachis gland between only the lowest pair of leaflets; leaflets 4 to 6 pairs, puberulent or glabrate, lanceolate; petals 8-10 mm. long; pod 8-10 (-12) cm. long, 3-4 mm. wide16. *C. Orcuttii*.
- 21(18). Malodorous annual, the stem simple or branched from ordinary root; flowers 2 to 5 per raceme, usually wilting by mid-day, borne on peduncles less than 2 cm. long; pods brown and turgid at maturity, somewhat raised over the seeds but without distinct septations; seeds ovoid, brown17. *C. occidentalis*.
21. Odorless perennial, commonly with few to several simple stems from a yellowish woody root; flowers numerous, remaining open for several days, borne on peduncles 3-8 cm. long; pods flat, pendent, maturing black, the cross septations clearly impressed; seeds flat, black or dark-brown ..18. *C. marilandica*.

1. *Cassia pumilio* Gray. DWARF SENNA. Small tufted strigulose subcaulescent perennial herb to 2 dm. tall, usually much lower, arising from a deep few-branched tuberous root; leaves spirally arranged; leaflets 1 pair, linear or narrowly lanceolate (the first of the season commonly much shorter and broader), glabrate or ciliate, cuspidate, (1-) 2-5 cm. long, 1-2 (-3) mm. wide, the rachis about as long as the leaflets and tipped with a setaceous bristle; stipules setaceous-subulate, 4-10 mm. long, persistent; flowers exceeding the leaves, solitary, the buds nodding; pedicels 10-15 cm. long, with a pair of bracts one fifth of the distance below the flower; sepals 7-10 mm. long, rounded or obtuse, few-nerved, persistent, the margins pale; petals a little longer than the sepals, pale-yellow, with conspicuous brown venation when dry; stamens 10, the 3 uppermost much-reduced; pod inflated, subglobose, membranous, indehiscent, 10-15 mm. long, 7-10 mm. wide, puberulent; seeds few. Rocky or sandy ground, mostly on limestone soils, locally abundant and sometimes showy on roadsides, Throckmorton Co. s. through Edwards Plateau to Zapata Co., w. to Dawson and Presidio cos., Apr.-June, intermittently to Aug.; also in s. N. M. and s. in Mex. to Coah. and S.L.P.

This, the smallest of all *Cassias*, is sometimes placed alone in the segregate genus *Tharpia* Britt. & Rose. The grasslike foliage, thick pod and diminutive stature clearly distinguish this species from all others.

2. *Cassia Roemeriana* Scheele. TWO-LEAVED SENNA. Erect or ascending gray-pubescent perennial herb with few to many stems 3-6 dm. tall from a thickened root; leaves spirally arranged; leaflets 1 pair, more or less parallel, longer than the petiole, lanceolate or lance-linear, 3-6 cm. long, 7-12 mm. wide, straight or slightly falcate, the base inequilateral, more or less appressed-pubescent on both sides; petiole without a terminal bristle but bearing a slender erect dark-brown gland between the leaflets; stipules setaceous, 7-10 mm. long, more or less persistent; flowers exceeding the leaves, 2 to 5 on axillary peduncles or at the branch ends forming terminal panicles; sepals ovate, membranous, 6-7 mm. long, sparingly pubescent, not persisting to fruit; petals about twice as long as the sepals, yellow, prominently nerved when dry; stamens straw-colored to light-brown, the 3 uppermost much-reduced; ovary pubescent; pod straight or slightly falcate, turgid, compressed, 2-3 cm. long, 5-7 mm. wide, sparingly strigose, dehiscent part way down both sutures; seeds numerous, transverse. *Earleocassia Roemeriana* (Scheele) Britt. Common in fields and open woods on limestone soils in cen. and w. Tex. from Ellis and Navarro cos. s. to the Rio Grande and w. to Bailey, Gaines, Culberson and Presidio cos., Apr.-May and again in Sept., sparingly from June through Aug.; also in N. M. and s. in Mex. to N. L. and Coah.

This species is easily grown from seed and makes a good garden perennial on limestone and black clay soils. It and *C. Lindheimeriana* are the commonest *Cassias* of central and west Texas.

3. *Cassia bauhinioides* Gray. TWO-LEAVED SENNA. Spreading or ascending perennial herb or shrub, the gray-tomentose stems 1-4 dm. long and usually branched, from a thick woody root; leaves spirally arranged; leaflets 1 pair, slightly divergent, oblong or oblong-ovate, rounded at both ends, the base very asymmetric, 2-4.5 cm. long, 1-1.5 cm. wide, softly pubescent on both sides; petiole bearing a slender erect gland between the leaflets; stipules linear-setaceous, 3-6 mm. long, more or less persistent; flowers 1 or 2 (or 3) on peduncles as long as or longer than the leaves, forming corymbs at branch ends; sepals thin, elliptic or oblong, pubescent, 6-8 mm. long; petals about 1.5 times longer than the

sepals, yellow, conspicuously veiny when dry; stamens 10, brown, the 3 uppermost much-reduced; ovary pubescent, the style glabrous; pod subfalcate, turgid, compressed, oblique, 2-4 cm. long, 5-8 mm. wide, villous, dehiscing along both sutures; seeds 8 to 15, transverse. Hills, flats and gulches in various soils, Loving Co., w. and s. through the Trans-Pecos and in scattered localities eastw. along the Rio Grande to Hidalgo Co., May-June; also N. M. and Ariz., s. to Zac. and Hgo.

Sometimes placed in the segregate genus *Earleocassia* Britt. The specific name, *bauhinoides*, suggests the superficial resemblance of the leaves to those of *Bauhinia*, especially to the Texas species, *B. congesta*.

4. *Cassia durangensis* Rose. TWO-LEAVED SENNA. Erect or ascending perennial herb with few to several densely grayish- or yellowish-pubescent stems 2-5 dm. tall; leaves spirally arranged; leaflets 1 pair, broadly oblong to nearly orbicular, 3-5 cm. long, 2-3.5 cm. wide, densely and softly grayish-pubescent, the incompletely expanded leaflets varying from silvery to olive or yellowish; petiole generally longer than the leaflets, bearing a slender erect brownish gland between the leaflets; flowers 1 to 6 on axillary peduncles that exceed the leaves; sepals about 7 mm. long, pilose; petals 12-15 mm. long, pale-yellow, conspicuously veined when dry; stamens yellow-brown, the 3 uppermost much-reduced; ovary pilose; pod usually erect, straight or slightly falcate, compressed, 3-4 cm. long, 6-8 mm. wide, densely pubescent; seeds numerous, glossy, transverse. Dry areas at 1,500-3,500 ft. elev., principally on limestone soils, in Brewster and Presidio cos., May-July and sparingly on to Oct.; also s. to Dgo.

This species is quite variable in hairiness, the hairs ranging from about 1 mm. to nearly 3 mm. long. The much broader leaflets and straighter, more erect pods of *C. durangensis* readily distinguish it from the preceding. *C. durangensis* is sometimes included, along with several other Texas Cassias, in the segregate genus *Earleocassia*.

5. *Cassia Greggii* Gray. Shrub to 1 m. tall with tortuous spreading stems bearing numerous short whitish-puberulent branchlets, the more vigorous branchlets flexuous; leaves distichous (more or less fasciculate on slow-growing spurs); leaflets 2 to 5 pairs, oblanceolate to obovate, 5-15 mm. long, 3-5 mm. wide, glabrous, coriaceous, somewhat nitid, the veins prominent; petiole bearing a minute sessile or short-stipitate gland below the lowest pair of leaflets; rachis bristle-tipped; stipules linear, subulate, persistent for the season or falling earlier; flowers commonly few, solitary on slender axillary pedicels 1-2 cm. long, the buds spherical or ovoid; sepals ovate, obtuse or broadly acute, 5-7 mm. long, puberulent; petals obovate, the fifth cupped and incurved, 10-14 mm. long, yellow; stamens yellow to straw-colored; ovary puberulent; pod linear or linear-lanceolate, 3-4 cm. long, 4-6 mm. wide, glabrate, elastically dehiscent; seeds black, glossy. Caliche hills near Orange Grove, Jim Wells Co., May-July; also Coah., N.L. and Tam.

C. Greggii is sometimes included in the segregate genus *Chamaecrista* Moench, but it is readily separated from other Texas *Chamaecristas* by its shrubby habit and the rounded or blunt (not pointed) buds. Although Bentham, in his 1871 revision of the genus, gave Texas as the provenance of the species, the first authentic collection for the state was made in 1959 by Fred B. Jones.

6. *Cassia Wislizenii* Gray. Shrub 15-30 dm. tall, with many short rigid leafy branches, the young branchlets appressed-pubescent to glabrate; leaves spirally arranged on spurs, often apparently fasciculate; leaflets 3 to 7 pairs, thickish, obovate or cuneate-obovate, rounded or retuse, apiculate, 4-9 mm. long, 2-4 mm. wide, glabrous; stipules 2-5 mm. long, long-persistent; flowers in crowded panicles, becoming corymbose at branch ends; sepals oblong or suborbiculate, 6-10 mm. long; petals 2-2.5 mm. long, yellow; stamens 10, the 3 uppermost much-reduced; ovary puberulent, soon glabrous; pod pendent, 6-15 cm. long, 5-6 mm. wide, flat but raised over the numerous seeds, glabrous, somewhat nitid; seeds ovoid, dark-brown, 4-5 mm. long. *Palmerocassia Wislizenii* (Gray) Britt. Igneous soils, mostly between 3,000 and 4,000 ft. elev., Presidio Co., May-July; also in s. N. M. and s.e. Ariz., s. to Son. and Chih.

This species, the largest of the Texas Cassias, is also the most conspicuous in flower, the masses of large yellow flowers contrasting sharply with the small leaflets and dark branches.

7. *Cassia corymbosa* Lam. ARGENTINE SENNA. Glabrous shrub or occasionally a small short-trunked tree to 35 dm. tall, the widespreading crown supported by 1 to several smooth lenticellate stems; leaves spirally arranged, evergreen or in severe winters only

partially evergreen; leaflets 2 or 3 pairs, oblanceolate to lanceolate or lance-elliptic, acute to acuminate at the apex, obliquely rounded at the base, 2-5 cm. long, 4-10 mm. wide, the terminal pair largest; petiolar gland erect, between the lower pair of leaflets or occasionally between all pairs; stipules caducous; flowers in corymbs in the upper axils, surpassing the leaves; sepals very unequal, narrowly elliptic or ovate; petals oblong or obovate, subequal, 10-12 mm. long, bright-yellow; stamens 10, the 3 uppermost much-reduced, the 3 lowest with long arching filaments; ovary white-puberulent; pod pendent, terete, obtuse, 6-8 cm. long, 7-9 mm. thick, light-green, maturing brown, indehiscent; seeds numerous, buried in a gummy pulp, obovoid, shining, about 4 mm. long. Nat. of Arg. and Urug., cult. in cen. and s. Tex. and occasionally escaped; Aug.-Sept.

Increasingly popular as a garden shrub, Argentine senna withstands temperatures as low as 15° F. The closely related but less hardy *C. bicapsularis* L. (obovate leaflets rounded at apex) and *C. laevigata* Willd. (lanceolate leaflets to 8 cm. long) are tropical American shrubs occasionally cultivated in the Rio Grande Valley and lower Gulf Coast region; rarely occurring as escapes.

8. *Cassia alata* L. EMPEROR'S CANDLESTICKS. Shrub (usually dying back to the ground in Texas) to 2 or 3 m. tall, the few thick branches and immature leaves puberulent; leaves spirally arranged, 30-75 cm. long; leaflets 6 to 12 pairs, broadly oblong or obovate, 6-17 cm. long, 3-7 cm. wide, the terminal pair largest, obliquely rounded or truncate at base, obtuse or somewhat retuse at apex; petiole marginate, eglandular; stipules lanceolate, acuminate, 1-2 cm. long, often greenish-orange or yellowish, firm, more or less persistent; flowers in dense elongate spikelike simple or few-branched racemes 1-3 dm. long, borne terminally or in the upper axils; bracts petal-like, ovate-orbicular, imbricate, 15-25 mm. long, deciduous; pedicels very short; sepals straw-colored or light-yellow, about 1 cm. long; petals nearly equal, obovate, clawed, 1.5-2 cm. long, yellow, drying with conspicuous venation; stamens 10, the 3 uppermost much-reduced, the 3 lowest with larger anthers; ovary pubescent; pod held horizontally, linear-oblong, straight, 1-2 dm. long, with a scalloped longitudinal medial wing on each valve face, membranaceous, glabrous, maturing black, indehiscent or tardily dehiscent; seeds many, brown, 4-angled, about 4 mm. long. Nat. of Am. trop., cult. as a perennial herb in s. and cen. Tex., sometimes as a shrub in the lower Rio Grande Valley; Aug.-Oct.

A comparative newcomer to the garden scene in Texas, *C. alata* is especially common in the Gulf Coast area but the roots survive inland where temperatures do not fall much below 15° F. The only *Cassia* with winged pods, this species is sometimes placed alone in the segregate genus *Herpetica* Raf. The purgative properties of leaf extracts of *C. alata* have been found to equal those of commercial senna, *C. acutifolia* Delile.

9. *Cassia texana* Buckl. TEXAS SENNA. Prostrate perennial herb with numerous stems 2-6 dm. long radiating from the crown of a deep taproot; stems slender, more or less flexuous, the youngest portions whitish-puberulent and ascending; leaves distichous; leaflets 10 to 16 pairs, narrowly oblong or lanceolate, acute, 6-8 mm. long, about 1 mm. wide, puberulent beneath, 3- or 4-veined, the costa very excentric; petiolar glands below lowest pair of leaflets, sessile, indistinct; stipules triangular-ovate, cordate, acuminate, 2-4 mm. long; flowers axillary, mostly solitary, the slender pedicels exceeding the leaves and sometimes to 5 cm. long; sepals ovate, acute, 7-8 mm. long, puberulent; petals broadly ovate, 10-13 mm. long, the fifth one large and turned inward, yellow, the upper 4 with a red spot at base, wilting by midday and then turning pinkish-orange; stamens 10, equal, yellow or straw-colored; ovary whitish-puberulent; pod erect or ascending, 2.5-4 cm. long, puberulent or glabrate; seeds shining, black-brown, 4-6 mm. long. Open places in sandy soil, DeWitt and Maverick cos. s. to the Rio Grande and farther s. in Mex. to Tam.

Apparently a northerly variant in the *C. chamaecristoides* Collad. complex, the status of this species is as yet uncertain. It is sometimes cited as *Chamaecrista texana* (Buckl.) Penn.

10. *Cassia aristellata* (Penn.) Cory & Parks. Perennial herb with several slender decumbent stems to 5 dm. long from a deep swollen root; stems puberulent and sparsely pilose; leaves distichous; leaflets 6 to 8 (to 12) pairs, linear to oblanceolate, obliquely acuminate, 10-15 mm. long, about 2 mm. wide, ciliate but otherwise glabrous, strongly several-nerved; petiolar gland arising near pulvinus, stipitate, disciform; stipules lanceolate, acuminate, several-nerved, 4-6 mm. long, scabrous-persistent; flowers solitary, axillary, on slender pedicels 8-12 mm. long; sepals lanceolate, finely striate, puberulent,

about 10 mm. long; petals about as long as sepals, pale-yellow, wilting at midday; stamens 10, yellow; ovary hirsute; pod linear, slightly falcate, 3-4 cm. long, 3-5 mm. wide, loosely strigose, opening suddenly by the elastic twisting valves; seeds trapezoidal, light-brown. *Chamaecrista aristellata* Penn. Sandy fields and open woods, Bexar Co., s. to lower Rio Grande Valley, July-Aug.; endemic.

Aside from its frost-tolerance and reduced pubescence, this species, known only from Texas, is scarcely distinct from *C. calycioides* DC. of the American tropics.

11. *Cassia leptadenia* Greenm. Slender annual, commonly very small and unbranched but under favorable conditions branching and reaching 4 dm.; stems puberulent; leaves distichous; leaflets 12 to 16 pairs, linear-oblong, acute, mucronate, 8-12 mm. long, 1-2 mm. wide, ciliolate, obscurely veined except for the subcentral costa; rachis strongly ciliate; petiolar gland discoid, stipitate; stipules narrowly lanceolate, long-acuminate, ciliate, 5-7 mm. long, persistent; flowers borne in supra-axillary condensed few-flowered clusters; sepals lanceolate, acuminate, 4-5 mm. long, hirsute; petals very unequal, in a single flower ranging from 2.5 to 7 mm. long, yellow, wilting by midday; stamens 5 to 8, yellow or stramineous; ovary pubescent; pod linear, erect, somewhat arcuate, 3-4 cm. long, 3-4 mm. wide, puberulent, elastically dehiscent; seeds 8 to 12, dark-brown, nitid. *Chamaecrista leptadenia* (Greenm.) Cockill. Mountainous areas, mainly in igneous soils, 3,000-6,000 ft., Jeff Davis, Brewster and Presidio cos., July-Sept., especially after late summer rains; also in s. N. M. and Ariz., s. to Qro. and Sin.

This species differs from *C. nictitans* of east Texas chiefly by its pubescence.

12. *Cassia nictitans* L. SENSITIVE PEA. Small annual herb 1-4 dm. tall, commonly branched and spreading; stems slender, puberulent; leaves distichous, somewhat touch-sensitive; leaflets mostly 10 to 20 pairs, linear-oblong, obtuse or rounded and mucronate at apex, 7-15 mm. long, 2-3.5 mm. wide, glabrous, finely ciliate, the costa subcentral; petiolar gland discoid or cupulate, stipitate or subsessile; stipules linear-lanceolate, acuminate, ciliate, 5-8 mm. long, persistent; flowers 1 to 3 together in supra-axillary clusters, inconspicuous, on puberulent pedicels 1-3 mm. long; sepals lanceolate, acuminate, puberulent; petals unequal, varying in a single flower from 3 to 8 mm. long, yellow, wilting by midday; stamens 5, the anthers pinkish to rose; ovary pubescent; pod erect, linear-oblong, flat, 2.5-5 cm. long, 3.5-5.5 mm. wide, lightly appressed-pubescent; seeds mostly 5 to 10, oblique, black, nitid. *Chamaecrista nictitans* (L.) Moench. In sandy open woods and fields, abundant in disturbed places, n.e. Tex., w. to Grayson and Tarrant cos., s. to Bastrop and Jefferson cos., Sept.-Oct.; also throughout most of the e. half of the U.S.

Several varieties are recognized, that in Texas being var. *nictitans*.

13a. *Cassia fasciculata* Michx. var. *fasciculata*. PARTRIDGE PEA. Erect glabrate annual to 1.25 m. tall, commonly slender and few-branched in dense stands but (with adequate room) lower and diffusely branched; leaves distichous; leaflets mostly 8 to 15 pairs, linear-oblong, mucronate, 1-2 cm. long, 2-4 mm. wide, glabrous, ciliolate; petiole bearing a single sessile or short-stipitate truncate gland (about 1.5 mm. across) below lowest pair of leaflets; stipules linear, attenuate, ciliolate, 5-10 mm. long; flowers borne in abbreviated 2- to 7-flowered supra-axillary racemes, one flower opening at a time; pedicels puberulent, 1-2 cm. long; sepals lanceolate, acuminate, 10-15 mm. long; petals obovate, yellow (rarely white), wilting by midday, the 4 upper each with a red spot at base, the lowest larger and incurved, 10-17 mm. long; stamens 10, subequal, yellow; ovary conspicuously enantiostylous, short-pubescent, 6-8 mm. long; pod linear, usually somewhat falcate, obtuse, mucronate, 5-7 cm. long, 4-6 mm. wide, glabrous or sparingly puberulent; seeds 10 to 20, flattened, oval or more or less triangular, 3-5 mm. long, dark-brown. Fields and open woods, mainly on sandy soils, e. and cen. Tex., w. to Wichita, Callahan, Hays and Karnes cos., July-Oct.; in much of the e. half of the U.S.

The partridge pea is occasionally grown as an ornamental and, as the roots bear nodules, is sometimes included in soil-improving cover crops. However, it has been reported to be toxic to stock when green, in hay or by seeds. Besides the typical variety, 4 additional ones occur in Texas. Introgression occurs among some of them in the south-eastern part of the state.

13b. *Cassia fasciculata* var. *robusta* (Pollard) Macbr., also erect and sometimes taller, has younger stems conspicuously hirsute with spreading yellowish or whitish hairs 2-3 mm. long, hirsute sepals, petals to 2 cm. long, and hirsute pods. In fields and cleared woodlands in extreme e. Tex., w. only to Rusk and Polk cos.; e. to Fla. and n. to O.

13c. *Cassia fasciculata* var. *rostrata* (Woot. & Standl.) B. L. Turner is lower, commonly 2-6 dm. tall, often ramose, with 5 to 10 pairs of leaflets 7-12 mm. long and 2-3 mm. wide, a short-stipitate petiolar gland not more than 0.5 mm. across, smaller flowers with purple anthers on pedicels not more than 1 cm. long, and pods not more than 45 mm. long. The most westerly variety, ranging from Frio and LaSalle cos. to the Rio Grande, n. to Wichita, Wheeler and Winkler cos.; n. to Kan.

Locally abundant, but apparently in widely scattered stations, this variety is found in open places mainly on calcareous soils. It was originally published as *Chamaecrista rostrata* Woot. & Standl. Introgression with var. *fasciculata* occurs along the eastern margin of the Edwards Plateau, especially in the vicinity of Austin.

13d. *Cassia fasciculata* var. *Ferrisiae* (Britt.) B. L. Turner is strikingly different with decumbent much-branched reddish stems forming a mat often 1 m. across, the leaflets pubescent on both sides, the petiolar gland stipitate and not more than 0.5 mm. across, the anthers purple and the pod pubescent. Primarily a plant of the coastal dunes from Brazoria Co. to the Rio Grande, but it is found in sandy places inland to Robertson, Hays, Atascosa and Zapata cos.

Introgression with var. *fasciculata* occurs in south-central Texas, mainly from Lee to Jackson cos. west to Guadalupe and Karnes cos., and with var. *puberula* in Jackson and Victoria cos.

13e. *Cassia fasciculata* var. *puberula* (Greene) Macbr. is an eastern taxon, having the habit and general proportions of var. *fasciculata* but the peculiar incurved pubescence of var. *Ferrisiae*; the anthers are purple. Found mainly on the littoral prairies of the Galveston-Houston-Beaumont area but extends inland in the sandy oak-hickory and pine woodlands n. to Shelby Co., and w. to DeWitt Co.

To the north it intergrades with var. *fasciculata*, to the west with var. *Ferrisiae*. This variety was originally treated at specific rank and named *Chamaecrista puberula* Greene.

14. *Cassia obtusifolia* L. SICKLE-POD. Erect malodorous herb to 1.5 m. tall, usually lower and widespreading with numerous ascending essentially glabrous branches; leaves spirally arranged; leaflets mostly 3 pairs, symmetrically obovate, the apex rounded and apiculate, the base cuneate, 2.5-5 cm. long, 1-3 cm. wide, the terminal pair largest, glabrous or the undersurface puberulent; petiolar gland usually 1, slender, between the lowest pair of leaflets, appressed to the rachis; stipules linear-subulate, falcate, 1-1.5 cm. long; flowers 1 to 3 on a short axillary peduncle, the pedicels to 2 cm. long (to 35 mm. in fruit); sepals oblong or oval, obtuse, 5-10 mm. long, membranaceous; petals 8-15 mm. long, nearly equal, yellow, wilting by midday; stamens 10, the 3 uppermost much-reduced, the 3 lowest with very large anthers; ovary glabrous or puberulent; pod linear, usually arcuate downward, more or less tetragonal, 16-20 cm. long, 4-5.5 mm. wide; seeds numerous, longitudinal, 5 mm. long, dark-brown, shining, with a linear areole 0.3-0.5 mm. long. Disturbed ground on sandy soils, e. Tex. w. to Dallas and Gonzales cos., July-Sept.; e. and n. to Pa., Ind. and Mo., s. through the Am. trop. and in the Old World.

This species has been much confused with the very similar Old World species *C. Tora* L., from which it differs by the longer pedicels (not over 10 mm. in flowers of *C. Tora*, to 15 mm. in fruit) and the linear areole (1.5-2 mm. wide in *C. Tora*). *Cassia obtusifolia* is commercially important as the alternate host of the tobacco etch virus disease. The seeds, known to contain antibiotic substances, have been reported fatal to quail but, in a feeding experiment, were not toxic to poultry.

15. *Cassia Lindheimeriana* Scheele. Erect perennial herb 1-2 m. tall, with 1 to several velvety-pubescent shallowly sulcate stems arising from a deep woody root; leaves spirally arranged; leaflets 5 to 8 pairs, oblong to elliptic, acute or obtuse, mucronate, the base asymmetric, 2.5-5 cm. long, 1-2 cm. wide, sericeous on both sides; petiolar glands setaceous, 1 between each pair of leaflets; stipules linear-subulate, 8-15 mm. long, deciduous; flowers in racemes about as long as the leaves, borne in upper axils; sepals ovate to elliptic, 6-8 mm. long, pubescent; petals elliptic, 12-15 mm. long, light-golden-yellow; stamens straw-colored to light-brown, the 3 uppermost much-reduced; ovary densely pubescent; pod broadly linear, compressed, straight or curved, 4-6 cm. long, 6-8 mm. wide, apiculate, sparsely pubescent; seeds numerous, irregularly ovoid, margined or rugose, dark-brown. *Earleocassia Lindheimeriana* (Scheele) Britt. Limestone soils of Edwards Plateau from Travis, Bexar and Dimmit cos. w. through the Trans-Pecos, Aug.-Oct.; N. M. and s.e. Ariz., s. in Chih. and Tam.

This species is especially suitable as an ornamental on limestone and black clay. In a feeding experiment, the leaves were found toxic (but not fatal) to sheep.

16. *Cassia Orcuttii* (Britt. & Rose) B. L. Turner. Perennial herb 3-6 dm. tall; stems few to several, erect or ascending, striate, glabrate or puberulent and sparingly hirsute (at least when young), arising from a thick woody root; leaves spirally arranged; leaflets 4 to 6 pairs, lanceolate, acute or acuminate, apiculate, 15-25 mm. long, 5-8 mm. wide, finely appressed-pubescent, becoming glabrate above with age; petiolar glands setaceous, one between each of the 3 to 5 lower leaflet pairs; stipules linear-subulate, 6-10 mm. long, deciduous; flowers in racemes borne in the upper axils, equaling or surpassing the subtending leaves, the buds nodding; pedicels slender, 1-1.5 cm. long; sepals oblong, about 6 mm. long, obtuse; petals orbicular, 5-8 mm. long, light-yellow; stamens 10, the 3 uppermost much-reduced; ovary puberulent; pod narrowly linear, acuminate, compressed, 8-11 cm. long, 3-4 mm. wide, glabrous, raised over the obliquely arranged seeds; seeds numerous, slightly flattened, dark-brown. Limestone slopes at 3,000 to 5,000 ft. in the Del Norte Mts., farther s. near Sanderson, apparently only in Brewster Co., July-Aug.; also in adj. Mex.

This species, sometimes placed in the segregate genus *Peirantsia* Raf., has been likened to *C. Lindheimeriana* but, beside its much lower stature, it differs strikingly with its lightly hirsute young stems, pendent buds, small flowers and very different pod.

17. *Cassia occidentalis* L. COFFEE SENNA, BRICHO. Erect glabrous malodorous annual 1-2 m. tall; stem sulcate, usually with few to several strongly ascending branches; leaves spirally arranged; leaflets 4 to 6 pairs, lanceolate to ovate, acute or acuminate, the base only slightly asymmetric, terminal pair largest, 3-6 cm. long, 1-2.5 cm. wide, somewhat glaucous beneath; petiolar gland borne on the pulvinus in the axil, sessile, globose or conical; stipules linear-lanceolate, acuminate, 4-6 mm. long, caducous; flowers few together in short bracteate axillary racemes; sepals oblong, obtuse, 6-9 mm. long; petals broadly ovate or elliptic, yellow or yellow-orange, wilting by mid-day, 10-18 mm. long; stamens 10, the 3 uppermost much-reduced, the 3 lowest with elongate filaments; ovary pubescent on faces; pod linear, obtuse, mucronate, erect, more or less arcuate, at first flat, maturing turgid, 8-12 cm. long, 7-10 mm. wide, medially dark-brown and elevated over the seeds, the margins paler; seeds many, ovoid, compressed, dull-brown, 4-5 mm. long, transverse. Roadsides, waste ground and other disturbed places, Gulf Coast and inland n. and n.w. to Cherokee, Robertson, Travis and Comal cos., Aug.-Nov.; in the s.e. U.S. and in the trop. and subtrop. of the New World and Old World.

A pantropic weed, probably of American origin, coffee senna is sometimes placed in the segregate genus *Ditremexa* Raf. The seeds are still used in some regions as a coffee substitute and in various folk medicines. Increased soil fertility is ascribed to this species in Africa. In this country the plant occurs commonly in old pastures. It is known to be weakly toxic to various stock animals which, however, ordinarily avoid it. A number of experiments have demonstrated the antibiotic activity of seed extracts.

18. *Cassia marilandica* L. MARYLAND SENNA. Perennial herb from woody root, few to several erect mostly simple glabrous or very sparingly pubescent stems 1-2 m. tall; leaves spirally arranged; leaflets mostly 6 to 10 pairs, oblong to elliptic, broadly acute to obtuse, mucronate, slightly asymmetric at base, glabrous, glaucous beneath, 3-6 cm. long, 1-2 cm. wide, subequal; petiolar gland ovoid-conic, sessile or short-stipitate, borne upon or just distal to the pulvinus; stipules linear-lanceolate, caducous; flowers in dense short multiflorate racemes in the upper axils or in terminal panicles, the filiform bracts caducous; sepals ovate, obtuse, light-yellow, 4-6 mm. long; petals obovate or elliptic, yellow, 9-11 mm. long; stamens 10, the 3 uppermost much-reduced, the 3 lowest with somewhat longer anthers; anthers brown; ovary pubescent; pod linear, usually arcuate downward, flat, the margin undulate, 7-11 cm. long, 8-11 mm. wide, glabrous or sparsely pubescent, maturing black, impressed and septate between the seeds, the segments about half as long as wide; seeds transverse, flat, ovate, 4-5 mm. long, black, nitid. Moist sandy fields, open woods and creek borders, e. Tex., w. to Johnson and Washington cos., Aug.-Sept.; also in e. U.S.

An attractive plant occasionally cultivated as a garden subject and of some value as a nectar plant in apiaries. It is commonly confused with *C. hebecarpa* Fern., an extra-Texas species with fewer pod segments, each about as long as wide. The Texas species is sometimes cited as *Ditremexa marilandica* (L.) Britt. & Rose.

14. GLEDITSIA L.

Trees or tall shrubs often armed with stout straight or branched thorns; leaves alternate, deciduous, pinnately once- or twice-compound (both kinds of leaves often on the same plant); stipules minute, caducous; leaflets crenulate, usually ovate-oblong to oblong-lanceolate, numbering 9 to 18 pairs on once-pinnate leaves or on individual pinnae; pinnae (on twice-pinnate leaves) several (up to 8) pairs; flowers in spikelike axillary racemes (3-) 4-8 cm. long, polygamous, only slightly bilaterally symmetrical; floral cup campanulate; sepals equal or subequal, free; petals 3 to 5, subequal, 4-5 mm. long, very narrow, yellowish or greenish-yellow, the uppermost internal in bud; stamens 3 to 10, the filaments free, the anthers of the pistillate flowers abortive; fruit several-seeded, dehiscent or indehiscent, flattened, 15 mm. broad or broader.

A genus of 11 species of North America, South America, Asia and Africa. The name is sometimes spelled "Gleditschia."

- 1. Pods linear-oblong, elongate, many-seeded, indehiscent; ovary pubescent 1. *G. triacanthos*.
- 1. Pods oval, oblique, 1- to 3-seeded, tardily dehiscent; ovary glabrous 2. *G. aquatica*.

1. *Gleditsia triacanthos* L. HONEY LOCUST. Trees or shrubs; leaflets usually appressed-pubescent at least along the midvein; ovary densely pubescent along both margins, sessile or nearly so; fruit broadly linear, 7-40 cm. long, indehiscent, with many seeds embedded in packing tissue. Scattered in e. half of Tex., s.w. to Bexar and Karnes cos., rare as far w. as Tom Green Co., spring; e. U. S.

2. *Gleditsia aquatica* Marsh. WATER LOCUST. Trees or shrubs; leaflets glabrous at maturity even along the midvein; ovary glabrous laterally, long-stalked; fruit a legume, ovate to elliptic, 5 cm. long or less, tardily dehiscent; seeds 1 to 3, not embedded in packing tissue. Scattered in swamps, along rivers and low bottomland forests, e. and s.e. Tex., May-June; cen. U. S. to Fla.

15. GYMNOCLADUS LAM.

A genus of 2 species, of United States and China.

1. *Gymnocladus dioica* (L.) K. Koch. KENTUCKY COFFEE-TREE. Unarmed trees; leaves deciduous, alternate, pinnately twice-compound, very large, 3-9 dm. long, 3-6 dm. broad, with 3 to 7 pairs of pinnae, each pinna more than 1 dm. long and with 4 to 7 pairs of leaflets plus a terminal leaflet (!), sometimes the lowest pair of pinnae replaced by a pair of large leaflets; leaflets 4-7 cm. long, 2-3 cm. broad; flowers in terminal spikelike racemes, only slightly bilateral; sepals 5, separate above the floral cup; petals 5, subequal, broad, white, separate, the uppermost one internal in bud; stamens 10, the filaments free above the floral cup; ovary sessile; fruit oblong, (5-) 10-20 (-25) cm. long, about 3-5 cm. broad, persistent and indehiscent over-winter but tardily dehiscent the second year; seeds 15-20 mm. long, embedded in packing tissue. Reported to occur in the Panhandle but we have not seen Tex. collections; perhaps the report is based on a cult. specimen; n.e. U.S. s.w. to Okla.

16. PARKINSONIA L.

A genus of 3 or 4 species in the warmer parts of America and in South Africa.

1. *Parkinsonia aculeata* L. RETAMA. Small diffuse trees to 10 m. tall, with green branches very formidably armed with needle-sharp slightly recurved spines that represent the modified rachises of the leaves; foliage feathery; leaves alternate, pinnately twice-compound, nearly sessile; pinnae 1 (or 2) pairs, elongate, to 5 dm. long (usually 1-3 dm.), with flattened green rachis; leaflets very numerous and small (only 2-4 mm. long); flowers in short racemes, sometimes appearing solitary in the axils, about 1 cm. across, only slightly bilaterally symmetrical; sepals 5, separate; petals 5, subequal, bright-yellow, broad, the uppermost enclosed by the others in bud; legumes torulose, (3-) 5-10 cm.

long, only slightly flattened, brown, deciduous, thin-valved; seeds few to several, oriented longitudinally in the pod, almost as thick as broad. Frequent weed in Rio Grande Plains, especially in low poorly drained areas, perhaps adv., n. at least to Williamson Co., spring-fall; widespread in Am., perhaps nat. in S. A.

17. CERCIDIUM TUL. PALOVERDE. RETAMA CHINA

Green-limbed deciduous shrubs or small trees, much-branched; branches green, zigzag and some of them thornlike terminally, armed at each node with a short (2-7 mm.) nearly straight needlelike spine or thorn; leaves alternate, twice-pinnately-compound; pinnae 1 to 3 pairs, only 1-3 (-4) cm. long; leaflets few pairs, rotundly oblong, 4-6 mm. long, pallid or glaucous-green; flowers in very short axillary (1-3 cm. long) racemes or corymbs, or sometimes appearing solitary, about 1 cm. across, bright-yellow; sepals 5, valvate or induplicate-valvate in bud, free above the floral cup; petals 5, broad, subequal, yellow, clawed, the uppermost enclosed by the others in bud; stamens 10, the filaments free above the floral cup, all alike; fruit a flattish oblong or linear firm-valved legume (1-) 2-6 cm. long, with 1 to few seeds, apically acute.

A genus of 9 species of the warmer Americas; we have 2 taxa which intergrade and which no doubt are merely geographic races of 1 species.

- 1. Ovary glabrous or nearly so; base of pod glabrous; pinnae mostly (1 or) 2 or 3 pairs 1. *C. macrum*.
- 1. Ovary densely pubescent; base of pod appressed-pubescent; pinnae mostly 1 or rarely 2 pairs 2. *C. texanum*.

1. *Cercidium macrum* I. M. Johnst. Small tree (2-) 3-4 m. tall, with a rather dense crown; pinnae usually 2 or 3 pairs; ovary and base of pod glabrous or nearly so. Locally frequent in brush on clay loam, Rio Grande Plains inland to McMullen, Duval and Starr cos., spring-summer; Tex., N.L., s. to 22°30' N. in Tam. with one record in extreme s.e. S.L.P.

2. *Cercidium texanum* Gray. Shrubs, often several-stemmed from the base, flat-topped; pinnae usually 1 pair, less commonly 2 pairs; ovary and base of pod appressed-pubescent. Locally abundant in semidesert scrub, Rio Grande Plains n.w. to Val Verde Co., s.e. to Starr Co.; spring-summer; also Coah. and N.L.

18. CAESALPINIA L.⁸⁵

Unarmed trees, shrubs or shrublets; leaves bipinnate; pinnae 3 to 30; leaflets 2 to 10 pairs, oblong or orbicular to ovate or obovate; stipules small, entire or lacinate; inflorescence terminal, in some species overtopped by the lateral branches, therefore seemingly lateral; bracts ovate, caducous; bracteoles absent; pedicels 2-30 mm. long; calyx tube short; calyx teeth 5, oblong to ovate, their margin entire or fimbriate; petals 5, yellow, the uppermost dissimilar; stamens 10; filaments free, pubescent or glandular at base; anthers uniform, longitudinally dehiscent; ovary sessile or stipitate; ovules few to several; fruit falcate, ovate or lunate, acute, compressed, dehiscent; seeds few to several.

A very large, heterogenous genus with about 150 species, distributed all over the world, especially abundant in the warmer parts of the Americas. *Erythrostemon* Kl.; *Poinctanella* Britt. & Rose; *Pomaria* Cav.; *Schrammia* Britt. & Rose. The genus *Hoffmanseggia* is included by some authors in *Caesalpinia*.

- 1. Leaflets without orange sessile glands on the lower surface (2)
- 1. Leaflets with orange sessile glands (black on dried specimens) (7)
- 2(1). Pinnae 14 to 30; leaflets 7 to 10 pairs on each pinna, oblong; stamens bright-red, 70-90 mm. long; introduced species of central and west Texas 1. *C. Gilliesii*.
- 2. Pinnae 3 to 11; leaflets 2 to 8 pairs on each pinna; stamens 5-20 mm. long; native species (3)

⁸⁵ Contributed by Imre J. Eifert.

- 3(2). Leaflets 10-25 mm. long; shrubs or small trees, 15 dm. tall or more 2. *C. mexicana*.
3. Leaflets 3-7 mm. long; small shrublets, 5 dm. tall or less (4)
- 4(3). Leaflets ovate to orbicular, 2 to 3 pairs on each pinna 3. *C. phyllanthoides*.
4. Leaflets oblong, 3 to 8 pairs on each pinna (5)
- 5(4). Mature leaves with 5 to 11 pinnae; petiole 3-10 cm. long; inflorescence 10- to 20-flowered; stems woody only at base; plants of southwestern Texas 4. *C. oxycarpa*.
5. Mature leaves with 3 pinnae; petiole 1-2 cm. long; intricately branched low shrublets (6)
- 6(5). Plants 15-30 cm. high; stem and leaves glabrous or somewhat puberulent, glandless or with a few stalked glands; peduncle and calyx with a few scattered stalked glands, glabrous or the calyx ciliate 5. *C. Drummondii*.
6. Plants 10-20 cm. high, densely short-pubescent and densely covered by stalked glands 6. *C. texensis*.
- 7(1). Leaflets with conspicuous raised reticulate veins beneath, broadly ovate, subcordate, acute; terminal pinna much longer than the lateral ones 7. *C. caudata*.
7. Leaflets smooth, without raised veins beneath (except for the midvein), elliptic to obovate; terminal and lateral pinnae of about equal length (8)
- 8(7). Leaflets 5 to 10 pairs on each pinna 8. *C. Jamesii*.
8. Leaflets 2 to 5 pairs on each pinna (9)
- 9(8). Plant glabrous or sparingly pubescent; pod elliptic, 20 mm. long or less 9. *C. brachycarpa*.
9. Plants conspicuously pubescent; pod lunate or obliquely oblong, 23 mm. long or more (10)
- 10(9). Pinnae 5 to 7; leaflets 3 to 5 pairs, pubescent; inflorescence 10-15 cm. long, 10- to 15-flowered; pod lunate, broadest in the upper half 10. *C. atropunctata*.
10. Pinnae 3 to 5; leaflets 2 to 3 pairs, very densely villous; inflorescence 15-30 cm. long, 15- to 25-flowered; pod obliquely oblong, its sides parallel 11. *C. Parryi*.

1. *Caesalpinia Gilliesii* (Hook.) Benth. BIRD-OF-PARADISE. Shrub or tree to 5 m. high or less; leaves 1-3 dm. long; pinnae 7 to 15; leaflets 7 to 10 pairs, oblong, glabrous; stipules ovate, fimbriate, 4-8 mm. long; inflorescence 1-3 dm. long, densely covered with stalked yellow glands; pedicels 2-3 cm. long; calyx 25-30 mm. long; petals obovate, yellow, 25-30 mm. long; filaments bright-red, short-pubescent at base, 7-9 cm. long; ovary densely covered with stalked yellow glands; fruit obliquely oblong-lanceolate, pubescent, 6-9 cm. long; seeds 6 to 8. *Poinciana Gilliesii* Hook., *Erythrostemon Gilliesii* (Hook.) Link, Kl. & Otto. Widely cult. for its showy flowers, more commonly found as an escape in cen. and w. Tex. in dry habitats, May-Sept.; nat. of S. A.

2. *Caesalpinia mexicana* Gray. MEXICAN CAESALPINIA. Small tree; branches, leaves and inflorescence glabrous; stipules small, ovate, caducous; pinnae 5 to 9; leaflets 4 to 5 pairs, submembranous, ovate or oblong, 10-25 mm. long, reticulate-veined; inflorescence 10- to 30-flowered, 1-3 dm. long; pedicels 10-22 mm. long, jointed near the top; calyx segments oblong, pubescent, 6-10 mm. long; petals obovate, 9-13 mm. long, with stalked glands on their claws; stamens about as long as the petals; ovary pubescent, with stalked glands; pod oblong, acute, 5-6 cm. long, pubescent or glabrous, usually with glands (at least below the middle). Only in southernmost Tex. (Cameron and Hidalgo cos.) where it is frequently grown as an ornamental, Feb.-July; also Tam. to Sin. and s. to Gro.

3. *Caesalpinia phyllanthoides* Standl. Low slender shrub with glabrous branches; leaves 5-9 cm. long; pinnae 5 to 9, long-stalked; leaflets 2 to 3 pairs, 3-7 mm. long, 3-4.5 mm. wide, orbicular to ovate, subcoriaceous, with rather prominent veins beneath, glandless;

inflorescence few-flowered; pedicels finely puberulent, with scattered stalked glands; sepals 6-7 mm. long, puberulent, glandular or glandular-ciliate; petals obovate, 1 cm. long; stamens densely covered with thick hairs at base; fruit 25 mm. long, glabrous, with a few scattered dark glands; seeds 1 or 2. Rare, Live Oak and Jim Wells cos. in s. Tex., Mar.-Apr.; also Tam.

4. *Caesalpinia oxycarpa* (Gray) Fisher. Low suffrutescent plant 1-3 dm. high; branches rather densely pubescent, with stalked glands; stipules ovate, glandular; petiole and rachis pubescent and glandular; pinnae 5 to 11; leaflets 5 to 9 pairs, oblong, glabrous or puberulent at the margin, 3-5 mm. long; inflorescence 10-15 cm. long, 10- to 20-flowered, rather densely covered with stalked red glands; bracts ovate, pubescent, glandular, caducous; pedicels 1-3 mm. long; calyx lobes ovate, glandular; petals obovate, glandless or with a few glands; filaments pubescent below the middle; ovary densely covered with long-stalked red glands; pod falcate, acute, 2-3 cm. long, 6-8 mm. broad, pubescent, glandular; seeds 4 to 6. *Hoffmanseggia oxycarpa* Gray, *Larrea oxycarpa* (Gray) Britt. In rocky limestone habitats in s.w. Tex. (Maverick, Terrell and Val Verde cos.), Mar.-May; also Coah. and N. L. (Subsequent study reveals that this should be retained in *Hoffmanseggia*.)

5. *Caesalpinia Drummondii* (T. & G.) Fisher. Intricately branched shrublet 15-30 cm. high; the slender branches glabrous or somewhat puberulent, with a few scattered stalked glands; stipules ovate, entire or denticulate; pinnae 3; leaflets 4 or 5 pairs, oblong to obovate, 4 mm. long, 1 mm. broad, glabrous or somewhat puberulent, glandless or with a few stalked glands on the lower surface; calyx persistent; calyx lobes ovate, glabrous or long-ciliate, 3-4 mm. long, 1 mm. broad; inflorescence 10- to 20-flowered; pedicels 4-5 mm. long; petals broadly obovate, exerted, glandular at base; fruit lunate, broadest in the upper half, glabrous, glandular, 2 cm. long; seeds 1 or 2. *Hoffmanseggia Drummondii* T. & G., *Larrea Drummondii* (T. & G.) Britt. Rare in sandy-clay soil in s. Tex. (Atascosa, Bee, Goliad, Karnes and San Patricio cos.), Apr.-Sept.; also Tam.

6. *Caesalpinia texensis* (Fisher) Fisher. Intricately branched shrublet 1-2 dm. high; branches gray, finely pubescent, with many stalked glands; stipules ovate, entire or denticulate; pinnae 3; leaflets 4 or 5 pairs, oblong, 2 mm. long, less than 1 mm. broad, finely pubescent; calyx glandular, finely pubescent, persistent; calyx lobes linear, 3 mm. long, 1 mm. broad or less, with many stalked glands; inflorescence 2- to 10-flowered; pedicels 3-4 mm. long; petals 3-4 mm. long, enclosed in the calyx or slightly exerted, glandular at base; filaments short-pilose at base; pod lunate, broadest in the upper half, glabrous, glandular, 10-15 mm. long; seed 1. *Hoffmanseggia texensis* Fisher, *Larrea texensis* (Fisher) Britt. Rare in s. Tex. (collected once in 1829 "on the Nueces river," probably in McMullen Co.), May-July; also Tam. (Subsequent study places this in *C. Drummondii*.)

7. *Caesalpinia caudata* (Gray) Fisher. Low branched shrub 3-5 dm. high; pinnae 3 to 11, the lateral ones 2-4 cm. long and with 3 to 5 pairs of leaflets, the terminal one 4-10 cm. long and with 9 to 11 pairs of leaflets; leaflets broadly ovate, subcordate, acute, 2.5-12 mm. long, with conspicuous raised reticulate veins beneath; sepals 8-10 mm. long, imbricate, glandular, pubescent, deciduous; petals about twice as long as the sepals, densely covered with large yellow sessile glands on the outer surface; pod lunate, broadest in the upper half, short-tipped, with sessile and stalked glands, elastically dehiscent, 2-4 cm. long, 10-17 mm. broad; seeds 2 to 4. *Hoffmanseggia caudata* Gray, *Schrammia caudata* (Gray) Britt. & Rose. In loose sandy soil in s. Tex., Mar.-June; also N. L. and Tam.

8. *Caesalpinia Jamesii* (T. & G.) Fisher. Herbaceous from a suffrutescent base, with a 1-4 dm. long woody spindle-shaped root; stems 2-4 dm. high, appressed-pubescent, glandular; pinnae 5 to 7; leaflets 5 to 10 pairs, ovate to short-oblong, 4-5 mm. long, glabrous or puberulent above, pubescent and glandular beneath; inflorescence 5-10 cm. long, 5- to 15-flowered; calyx lobes linear-lanceolate, acute, pubescent, glandular, 5-6 mm. long; petals glandular, somewhat longer than the calyx; stamens shorter than the petals; pod lunate, broadest in the upper half, acute, with hairy emergences and sessile glands, 20-25 mm. long, about 8 mm. broad; seeds 2 or 3. *Hoffmanseggia Jamesii* T. & G., *Larrea Jamesii* (T. & G.) Britt. In dry sandy or alluvial soils in the Trans-Pecos and Plains Country, May-Sept.; widespread species in cen. and s.w. U. S. and Mex.

9. *Caesalpinia brachycarpa* (Gray) Fisher. Strongly branched shrublet with woody rootstock, 1-4 dm. high; branches glabrous or sparingly pubescent, with scattered stalked glands; stipules obovate, denticulate; pinnae 5 to 7; leaflets 3 to 6 pairs, elliptic, 3-6 mm.

long, glabrous or puberulent, with large sessile glands beneath; inflorescences 5-10 cm. long, 6- to 12-flowered; bracts obovate-oblong, 3-4 mm. long, lacerate, caducous; pedicels 3-5 mm. long; calyx 5-6 mm. long, pubescent, the lobes linear-lanceolate, glandular; petals somewhat longer than the calyx lobes; stamens shorter than the petals; pod ovate to short-oblong, acute, puberulent or short-pubescent, sparingly glandular, the margin with short hairy emergences; seeds 1 or 2. *Hoffmanseggia brachycarpa* Gray, *Larrea brachycarpa* (Gray) Britt. In gravelly or rocky limestone soil, restricted to Edwards Plateau (Crockett, Edwards and Kinney cos.), May-June; endemic.

10. *Caesalpinia atropunctata* Eifert. CAMOTE DEL RATON. Shrub 4-6 dm. high, much-branched; branches villous, glandular; stipules pinnatifid, 6-8 mm. long, purplish; pinnae 5 to 7; leaflets 3 to 5 pairs, elliptic to obovate, pubescent on both sides, with many orange sessile glands beneath; inflorescence 10-15 cm. long, pubescent, 10- to 15-flowered; bracts pinnatifid, purplish, caducous; pedicels 2-4 mm. long; calyx 5-6 mm. long, the lobes oblong, densely pubescent, glandular; petals somewhat longer than the sepals, dark-yellow; pod 20-25 mm. long, lunate, acute, broadest in the upper half, glandular, with hairy emergences; seeds 2 to 4. *Pomaria melanosticta* Schauer, *Hoffmanseggia melanosticta* (Schauer) Gray, *Caesalpinia melanosticta* (Schauer) Fisher, non Spreng. Rare, Rio Grande Plains, in sandy or rocky soil, Mar.-June; Tex. and Coah. to Hgo. and Qro.

A widespread variable species.

11. *Caesalpinia Parryi* (Fisher) Eifert. Shrub, 4-5 dm. high, densely villous; stipules pinnatifid, 2-3 mm. long; pinnae 3 to 5; leaflets 2 or 3 pairs, obovate, 4-10 mm. long, pubescent on both sides, glandular beneath; inflorescence 15-30 cm. long; 15- to 25-flowered; pedicels 3-4 mm. long; calyx about 8 mm. long, densely pubescent, glandular; petals somewhat longer than the sepals; pod with hairy emergences, glandular, obliquely oblong, 25 mm. long, about 1 cm. broad; seeds 3 or 4. *Hoffmanseggia melanosticta* var. *Parryi* Fisher, *Caesalpinia melanosticta* var. *Parryi* (Fisher) Fisher, *Hoffmanseggia Parryi* (Fisher) B. L. Turner. In rocky limestone soil, known in w. Tex. only from s. Brewster Co.; also in adj. Mex.

19. HOFFMANSEGGIA CAV.⁸⁶

RUSH-PEA

Unarmed perennial herbs, often very glandular; leaves oddly bipinnate; pinnae 5 to 11; leaflets 4 to 11 pairs, small; inflorescence a terminal raceme; bracts caducous; bracteoles absent; pedicels short, not jointed; calyx tube very short, its 5 segments valvate; petals 5, yellow, the uppermost dissimilar, with orange spots and stripes; stamens 10, free; filaments often glandular at the base; anthers uniform, longitudinally dehiscent; ovary sessile; ovules few to several; fruit flat, straight or falcate, often glandular, usually tardily dehiscent, its valves chartaceous; seeds 2 to 8, ovate, with little endosperm. *Larrea* Ort. The genus is sometimes included in *Caesalpinia*.

- 1. Peduncle and calyx with stalked glands; petals conspicuously clawed (the claw 4-6 mm. long), densely glandular1. *H. glauca*.
- 1. Peduncle and calyx without stalked glands (2)
- 2(1). Pinnae 7 to 11; inflorescence 5- to 10-flowered; pod 25-40 mm. long, strongly falcate2. *H. drepanocarpa*.
- 2. Pinnae 3 to 7; inflorescence 3- or 4-flowered; pod 12-15 mm. long, straight3. *H. tenella*.

1. *Hoffmanseggia glauca* (Ort.) Eifert. Stem 1-3 dm. high, glabrous or puberulent; stipules ovate; petiole and rachis glandular; pinnae 5 to 11; leaflets 5 to 11 pairs, oblong to obovate, glabrous or puberulent, 3-8 mm. long; inflorescence terminal, glandular, pubescent, 1-2 dm. long, 5- to 15-flowered; bracts ovate, caducous; pedicels 2-5 mm. long; calyx pubescent and glandular, its oblong lobes 6-7 mm. long; petals 10-12 mm. long, with long glandular claws; stamens shorter than the petals, glandular and pubescent; pod falcate, 2-4 cm. long, 5-8 mm. broad, glandular, glabrous or puberulent, reticulate-veined; seeds 4 to 8. *Hoffmanseggia falcata* Cav., *H. densiflora* Gray, *Larrea densiflora* (Gray) Britt. Common along roadsides in w. Tex., Mar.-Sept.; cen. and s.w. U. S. to Mex. and w. S. A. A highly variable species.

⁸⁶ Contributed by Imre J. Eifert. See Appendix.

2. *Hoffmanseggia drepanocarpa* Gray. SICKLEPOD RUSH-PEA. Stems 1-2 dm. high, glandless, finely pubescent; stipules ovate, acute; petiole and rachis finely pubescent; pinnae 7 to 11; leaflets 4 to 10 pairs, oblong, pubescent, glandless; inflorescence about 1 cm. long, 5- to 10-flowered; pedicels 2-5 mm. long; calyx lobes oblong, pubescent, persistent, 5-8 mm. long; petals somewhat longer than the calyx, short-clawed; pod puberulent, reticulate-veined, 2-4 cm. long, strongly falcate, curved into part of a circle, rounded at both ends; seeds 6 to 11. *Caesalpinia drepanocarpa* (Gray) Fisher, *Larrea drepanocarpa* (Gray) Britt. In sandy or limestone soils in w. Tex., Apr.-July; s.w. U. S. and n.-cen. Mex.

3. *Hoffmanseggia tenella* Tharp & L. O. Wms. Stem 8-15 cm. high, terminated by a 3- to 5-flowered raceme; pinnae 3 to 7, sparingly soft-pubescent; petiole 5-13 cm. long; stipules small, 1-2 mm. long; leaflets 5 or 6 pairs, oblong, 2-4 mm. long, 1-2 mm. broad, glabrous above, sparingly pubescent beneath; calyx 4 mm. long, its lobes linear-oblong, finely but densely pubescent; petals obovate, with a very short claw, 3-4 mm. long, 1.5-2 mm. broad; filaments with a few short hairs; pod 12-15 mm. long, 4-6 mm. broad, straight, finely and rather densely pubescent, glandless; seeds 2 to 4. Known only from Nueces and Kleberg cos., Apr.-Nov.; endemic.

20. SOPHORA L.

Perennial herbs or unarmed deciduous or evergreen shrubs or small trees; leaves alternate, once-imparipinnately-compound; stipules minute, deciduous; flowers in terminal or axillary usually densely flowered racemes several cm. long; calyx of 5 sepals united above the floral cup; corolla white, yellow, bluish-purple or rosy-pink, strongly bilaterally symmetrical and papilionaceous, the banner external in bud; stamens 10, the filaments free above the top of the floral cup; fruit a 1- to several-seeded indehiscent or very tardily dehiscent woody or fleshy pod which is usually strongly constricted between the seeds and essentially as thick as broad.

A very heterogeneous genus of about 70 species in the warmer parts of the world.

1. Plants herbaceous, 6 dm. tall or lower1. *S. Nuttalliana*.
1. Plants woody shrubs or small trees (2)
- 2(1). Leaves densely and conspicuously pubescent; flowers bright-yellow; plants of coastal southernmost Texas5. *S. tomentosa*.
2. Leaves glabrous or slightly pubescent at maturity; flowers white to rosy to purplish (3)
- 3(2). Leaves (well-developed ones) with 13 to 17 leaflets; flowers white to rosy-pink; fruit black at maturity, 8 mm. thick or less; leaves deciduous4. *S. affinis*.
3. Leaves with 5 to 11 (13) leaflets; flowers violet-blue to purplish; leaflets coriaceous, thickened; fruit grayish to brown, 11 mm. thick or more; leaves persisting through the winter (evergreen); flowers bluish-purple (4)
- 4(3). Leaflets 17 mm. broad or broader, glabrous above; inflorescence 5-15 cm. long2. *S. secundiflora*.
4. Leaflets 10-15 mm. broad, the upper surface somewhat pubescent; only in Guadalupe Mts. in Trans-Pecos Texas3. *S. formosa*.

1. *Sophora Nuttalliana* B. L. Turner. WHITE LOCO. Perennial herb usually only 3-5 dm. tall, the aerial shoots forming colonies by means of rhizomes; herbage grayish-silky-pubescent; flowers in slender racemes, pure-white. *S. sericea* Nutt., an illegit. name. Frequent in grama grasslands in the higher parts of the Plains Country and the Trans-Pecos mts. and High Plains, spring; S. D. to Ariz., N.M. and Tex.

The plants are often mistaken for species of *Astragalus* but can readily be excluded from that genus by the separate stamens.

2. *Sophora secundiflora* (Ort.) DC. TEXAS MOUNTAIN LAUREL, MESCAL BEAN, FRIJOLILLO. Evergreen shrub 5-35 dm. tall, with usually dense dark-green glossy foliage; leaflets very firm, 5 to 11 (to 13) per leaf, often 17 mm. broad or broader and glabrous above; racemes 5-15 cm. long, 5-10 cm. broad, bluish-purple and very showy, the individual flowers 1-2 cm. long, the banner external to the others in bud; fruit woody, 2-12 cm. long, 11 mm. thick or thicker, only moderately constricted between the seeds; seeds red. Fre-

quent in brushy vegetation, s. edge of Edwards Plateau (n. to Travis Co.) and caliche cuestas in Rio Grande Plains, scattered in w. part of Edwards Plateau and Trans-Pecos mts., isolated records from Cameron Co., spring; Tex. and N.M. s. in the mts. to S.L.P.

Cultivated for the beautiful evergreen foliage and showy flowers. The red seeds are made into jewelry. The flowers and seeds are said to contain poisonous compound(s).

3. *Sophora formosa* Kear. & Peeb. Shrub 1-2 m. tall, much like *S. secundiflora* but the leaflets narrower and the upper surfaces somewhat pubescent and not glossy. Rare in scattered mts. of Ariz., N.M. and known from one record from the Guadalupe Mts. in Trans-Pecos Tex. Probably only a western race of *S. secundiflora*.

4. *Sophora affinis* T. & G. EVE'S NECKLACE. Shrub 2-5 m. tall or occasionally a tree to 10 m. high; foliage deciduous, at least when young sericeous-pubescent; leaflets 13 to 17 per leaf; flowers in racemes 3-10 cm. long, whitish or rosy-pink; fruit 3-15 cm. long, black, leathery, 8 mm. thick or narrower, strongly torulose. Limestone soils, Edwards Plateau and n.-cen. Tex. spring; Okla., Ark., La. and Tex. The seeds are said to contain poisonous substance(s).

5. *Sophora tomentosa* L. YELLOW SOPHORA. Rounded shrub about 1 m. tall (in our latitudes often freezing back in winter time and behaving as subshrubs); foliage densely pubescent, grayish; flowers in terminal racemes, bright-yellow. Infrequent near and along the coast in s. Tex. as far n. as Aransas Co., Mar.-Oct.; widely distributed along warm coastal areas of the world.

21. BAPTISIA VENT.⁸⁷

WILD INDIGO

Perennial herbs from deeply buried large rootstocks; stems stout (often 4-8 mm. thick at base), usually solitary at ground level, bushy-branched higher up; leaves alternate, palmately 3-foliolate, either sessile or petiolate, with large to obsolescent persistent or caducous stipules; leaflets usually narrowly obovate to oblanceolate, usually cuneate at base and rounded (rarely acute) at apex, entire, firm; flowers in terminal or axillary few-to many-flowered racemes; calyx campanulate, often somewhat bilabiate, 5-lobed (or by fusion of upper 2 lobes becoming 4-lobed), the lobes usually shorter than the tube; corolla papilionaceous, usually about 2 cm. long, white or yellow (rarely bluish); stamens free; fruit usually a 2- to many-seeded very tardily dehiscent (or perhaps in some cases indehiscent) beaked pod.

A genus of perhaps 25 species of eastern United States. Taxonomic difficulties in the genus arise because of past and perhaps continuing hybridization and introgression; the descriptions below are intended in the main to reflect the more or less genetically "pure" species, but many plants will be found which exhibit combinations of the characters of 2 or more species. Some species of the genus have been reported to be toxic to livestock.

- 1. Flower pedicels at maturity 15-35 mm. long; bracts of the racemes persisting 2. *B. leucophaea*.
- 1. Flower pedicels 10 mm. long or shorter; bracts of the raceme early deciduous (2)
- 2(1). Flowers blue; stipules broad and conspicuous, most of them persisting, 10 mm. long or longer 5. *B. australis*.
- 2. Flowers yellow or white; stipules lanceolate, deciduous or much-reduced, 0.5-5 mm. long (3)
- 3(2). Petioles of mature lower leaves slender, (3-) 5-12 mm. long; flowers white 3. *B. leucantha*.
- 3. Petioles short and broad, 0.5-5 (-10) mm. long; flowers yellow (4)
- 4(3). Stems glabrous to occasionally pubescent; flowers in terminal racemes 4. *B. sphaerocarpa*.
- 4. Stems densely short-pubescent; flowers either all axillary or both axillary and terminal 1. *B. Nuttalliana*.

1. *Baptisia Nuttalliana* Small. Stems 4-12 dm. tall, densely short-pubescent at least on the younger parts; petioles absent or to 1 mm. long; leaflets 25-35 mm. long, 13-20 mm. broad; stipules deltoid to setaceous, usually caducous, very small; flowers solitary in upper

⁸⁷ This treatment is based in part on unpublished monographic work of B. L. Turner.

axils or forming short terminal racemes; bracts of raceme 2-4 mm. long, caducous; pedicels 2-5 mm. long; calyx tube 7-9 mm. long; corolla yellow, the banner 8-15 mm. long; pod villous to glabrate, subglobose to ovoid, 4-13 mm. long, 2-11 mm. thick, the short beak recurved. Frequent in woodlands on sandy loam, e. and n.-cen. Tex., spring; Miss., La., Ark., Mo., Okla. and Tex. Occasionally hybridizes with *B. leucophaea*.

2. *Baptisia leucophaea* Nutt. PLAINS WILD INDIGO. Stems 3-8 dm. tall; petioles 2-4 mm. long or less; leaflets 3-10 cm. long; stipules large, 1-4 cm. long, ovate-lanceolate, persistent; racemes 10-25 cm. long, many-flowered, secund, declined; floral bracts ovate- to cordate-lanceolate, 1-3 cm. long, persistent; pedicels about 15-35 mm. long at maturity; calyx tube 1 cm. long, the lobes 3-5 mm. long; corolla white or yellow, the banner about 20-22 mm. long; pod 3-5 cm. long, 15-25 mm. thick, with a slender beak. E. half of state in sandy soils, spring; represented with us by 2 intergrading varieties as follows:

Var. *leucophaea*. Leaflets predominantly narrow-spatulate, obtuse, rounded or gradually narrowed into an acute apex, mostly 10-35 mm. broad. N.e. and n. part of n.-cen. Tex.; Ark., Okla. and Tex., n.e. to N. E. and Wisc.

Var. *laevicaulis* Canby. Leaflets predominantly ovate-rhombic to obovate-cuneate, broadly acute or abruptly obtuse at apex, mostly 20-25 mm. broad. *B. laevicaulis* (Canby) Small. S. parts of e. and s.e. Tex. and s. along the coast to Willacy and Cameron cos.; also La.

3. *Baptisia leucantha* T. & G. Stems 15-20 dm. tall; petioles (3-) 5-12 mm. long or upper (miniature) leaves often nearly sessile; leaflets 25-65 mm. long, 15-30 mm. broad; stipules lanceolate, usually about 5 mm. long or less, mostly caducous; racemes 2-6 dm. long; pedicels 3-10 mm. long; floral bracts caducous; calyx tube 7-9 mm. long, the lobes a third to half as long as tube; corolla white, the banner 13-15 mm. long and white with purple splotches; pod 25-40 mm. long, short-beaked. Rare in pine and oak woodlands on sandy soil, e. and s.e. Tex., Apr.-June; most of e. U. S.

4. *Baptisia sphaerocarpa* Nutt. Plant 1 m. high or less; stems usually glabrate; petioles 0.5-10 mm. long; stipules minute, to 5 mm. long, caducous; leaflets 3 on lower leaves, often reduced to 2 or 1 on upper leaves, broadly oblanceolate to obovate or often broadly elliptic, 25-80 mm. long; racemes terminal and 2-3 dm. long or lateral and 15-25 cm. long; flowers numerous; pedicels 2-10 mm. long; floral bracts caducous; calyx tube 4-10 mm. long; corolla yellow, the banner 10-18 mm. long; pod 12-18 mm. long, with beak 3-13 mm. long. *B. viridis* Larisey. Frequent in loamy soils, e., s.e. and n.-cen. Tex., Apr.-May; Mo., Ark., Okla., La. and Tex.

5. *Baptisia australis* (L.) R. Br. WILD BLUE INDIGO. Stems 6-12 dm. tall, glabrous, more or less glaucous; petioles 2-4 mm. long; leaflets obovate to obovate-lanceolate, 4-8 cm. long, 15-30 mm. broad; stipules lanceolate, 10-15 mm. long, usually persistent; racemes terminal, 2-5 cm. long; bracts 7-9 mm. long, caducous; pedicels 5-8 mm. long; calyx tube 9-10 mm. long; corolla blue, the banner about 22 mm. long; pod 3-6 cm. long. *B. minor* Lehm. Infrequent, n.-cen. Tex., with an outlying station in Childress Co. in the Plains Country, Apr.-May; the species as a whole in n.e. and cen. U. S.

22. CROTALARIA L. RATTLEPOD

Annual or perennial herbs with taproots; leaves simple or trifoliate, alternate; stipules usually small; flowers in terminal or axillary racemes; each pedicel with a small or large bract at the base and with a pair of bractlets near the upper end; calyx gamosepalous, the tube often obliquely campanulate, the lobes often free and often subequal; corolla usually somewhat exceeding the calyx, papilionaceous, yellow (the banner often with red diffused in the yellow); banner orbicular to ovate, longer than the wings or keel, external in bud; wings oblong; keel often scythe-shaped, sometimes beaked; stamens 10, monadelphous; ovary nearly sessile, less commonly short-stiped; legume greatly inflated, typically several to many-seeded, a few cm. long, globose to oblong or cylindrical.

A genus of perhaps 300 species of the warmer parts of the world, most numerous in Africa.

1. Leaves trifoliate (2)
1. Leaves simple (3)

- 2(1). Legume densely tomentose with spreading hairs; petioles with wide-spreading hairs 1-3 mm. long1. *C. incana*.
2. Legume appressed-pubescent to nearly glabrate; petioles glabrate or with appressed hairs 1 mm. long or less2. *C. pumila*.
- 3(1). Leaves (the larger ones) 20 mm. wide or more; cultivated species (4)
3. Leaves 15 mm. wide or less; native species (5)
- 4(3). Stipules minute, setaceous or absent; inflorescence without bracts or the small bracts subulate3. *C. retusa*.
4. Stipules broad, ovate, conspicuous; inflorescence with conspicuous ovate bracts
.....4. *C. spectabilis*.
- 5(3). Pubescence on calyx and stem mostly of spreading hairs 1-2 mm. long
.....5. *C. sagittalis*.
5. Pubescence of appressed hairs 0.3-1 mm. long6. *C. Purshii*.

1. *Crotalaria incana* L. CHIFLÍN. Taprooted annual (occasionally overwintering!) 3-10 dm. tall; stipules small, setaceous, caducous; leaflets uniformly 3, ovate to obovate or orbicular, 15-40 cm. long, 10-25 mm. broad, pubescent beneath or glabrescent; petiole longer than the terminal leaflet, with wide-spreading hairs 1-3 mm. long; inflorescence long, terminal or subterminal or lateral, 5- to many-flowered; bracts setaceous; calyx very deeply lobed, the tube almost lacking; calyx lobes almost linear, acuminate, about 1 cm. long; corolla yellow to brownish-yellow (the banner often slightly reddish); legume densely tomentose with spreading brownish hairs, not attenuate basally, sessile, pendulous, 25-35 mm. long. Sandy soils, coastal s. Tex., very local, Mar.-Sept.; trop. Am., H.I., Phil., Java, India, Afr.; probably originally nat. to Am.

2. *Crotalaria pumila* Ort. Annual or perennial, erect or decumbent, 4-30 cm. tall; stipules minute, setaceous, caducous; petioles glabrate or with appressed hairs 1 mm. long or shorter; leaflets uniformly 3 per leaf, narrowly obovate to oblong, 7-35 mm. long; inflorescence longish, terminal or subterminal or lateral, usually 1- to 5-flowered; calyx lobes shorter than to about as long as the tube, the lobes about half as long as the corolla; corolla yellow; keel bent at a sharp right angle, its beak attenuate, 6-11 mm. long; back of the banner pubescent apically; legume 12-15 mm. long, puberulent, almost sessile, yellowish. Infrequent in high grama grasslands, Trans-Pecos mts., Aug.-Sept.; Fla., s.w. U.S., Mex., Guat., Br. Hond., W.I. and S. A.

3. *Crotalaria retusa* L. Erect annual herb 3-9 dm. tall, the stems not flexuous; leaves uniformly simple, obovate, 3-8 cm. long, 10-15 (-20) mm. broad, glabrous above, short-pubescent beneath, not margined or recurved; stipules minute, setaceous or absent; bracts minute, linear to subulate or nearly absent, caducous; inflorescence a simple terminal raceme 1-2 (-3) dm. long; calyx lobes broadly ovate, slightly pubescent; calyx tube campanulate, broadly truncate basally; corolla yellow or yellowish-red; banner 20-25 mm. long, its back glabrous (or pubescent only on the midvein); keel rounded, about half as long as banner; legume elongate, stipitate, many-seeded, not enclosed by the calyx, more or less cylindrical, 2.5-4 (-5) cm. long and 1 cm. thick, glabrous. Probably not a persistent member of our flora, occasionally escaped from cult. (one report from Tarrant Co.); Afr., Asia, Austral., C.A., W.I., rarely s.e. U. S.

4. *Crotalaria spectabilis* Roth. SHOWY CROTALARIA. Erect taprooted annual; stems not flexuous, 5-10 (-20) dm. tall, puberulent to glabrous; leaves uniformly simple, obovate, basally cuneate, 5-15 (-20) cm. long or the upper ones smaller; stipules broad, ovate, conspicuous, persistent; bracts conspicuous, ovate; racemes clustered near the top of the stem, terminal or axillary, 15-50 cm. long; pedicels (5-) 10-20 mm. long; calyx essentially glabrous, glaucous; corolla yellow; banner 15-25 mm. long, its back glabrous or pubescent only along the primary vein; keel much shorter than banner, densely pubescent along the suture; legume elongate, stipitate, many-seeded, 3-5 cm. long, oblong but broadening apically, wide-spreading or drooping. Probably not a persistent member of our flora, escaping from cult. at scattered places, e. half of Tex., spring-fall; Old World trop., scattered in New World trop.

5. *Crotalaria sagittalis* L. Annual or short-lived perennial, the pubescence spreading-hirsute; stems ascending, 1-5 dm. tall; leaves all simple, lanceolate or linear to elliptic,

3-8 cm. long; 8-15 mm. broad; stipules usually present, triangular, very narrowly decurrent on the stems for about half the length of the internode; racemes 2- to 4-flowered; bracts ovate-lanceolate, slender-stalked; floral cup about 2 mm. long; calyx with spreading hairs, 1-2 mm. long, the unequal lobes lanceolate to linear; corolla about as long as the calyx, yellow; pod oblong, glabrous, 20-35 (-40) mm. long, about 1 cm. thick. *C. fruticosa* Mill. Sandy soils, e. half of Tex., w. to Parker, Bastrop and Wilson cos., Apr.-Sept.; e. and cen. U.S., Mex., C. A., W.I. and S. A.

6. *Crotalaria Purshii* DC. Erect perennial herb; taproot woody; stems 2-4 (-5) dm. tall; pubescence appressed, sericeous, the hairs 0.3-1 mm. long; leaves all simple, lanceolate to linear, 3-6 (-8) cm. long, usually 4-10 mm. broad, tapering to the base; stipules usually present, decurrent narrowly on the stem, often at least half the length of the internode; racemes usually with (2 to) 4 to 6 flowers; floral cup about 2 mm. high; calyx above the floral cup 7-9 mm. long, strigose; corolla yellow; pod glabrous, oblong, 25-40 cm. long, about 1 cm. thick. Reported to occur in scattered localities, e. half of Tex., but probably on the basis of misdetermined specimens of *C. sagittalis*; s.e. U.S., Mex. and Guat.

23. LUPINUS L. BLUEBONNET

Biennials or winter annuals (or perennial herbs in *L. plattensis*), forming rosettes in the fall, flowering the next spring; taproots slender; leaves alternate, palmately compound with 3 to 10 leaflets; leaflets mostly narrowly obovate to oblanceolate, long-tapered to the base, apically rounded or truncate to acute at apex, often with rather dense sericeous pubescence (at least on the lower surface); petioles well-developed; stipules adnate to the base of the petiole; flowers in conspicuous terminal racemes, papilionaceous, each flower mostly blue or lavender but with some areas of white and maroon on some of the petals, never yellow; calyx 2-lipped, the lips nearly entire and the lower 1 longer; banner external to the other petals in bud; stamens 10, monadelphous, dimorphic, the longer with more or less globose versatile anthers, the shorter with linear basifixed anthers; ovary sessile; legume oblong or broadly linear, flattened, 2- to 12-seeded, usually sericeous-pubescent; seeds pebblelike.

A genus of perhaps 200 species in the temperate regions of both hemispheres (not Africa or Australia).

1. Pubescence of stem and petioles spreading at right angles; leaflets long-hairy on both surfaces; plants mostly 15 cm. high or less, rarely to 25 cm.; in Trans-Pecos Texas1. *L. concinnus*.
1. Pubescence of stem and petioles predominantly ascending or appressed; leaflets sparsely hairy or glabrous on upper surface (2)
- 2(1). Racemes (including peduncle) 18-45 cm. long; wing petals 10-12 mm. long, 5-7 mm. wide; banner with creamy or yellowish eye; in Trans-Pecos Texas 2. *L. Hvardii*.
2. Racemes 6-25 cm. long; wing petals 7-10 mm. long (often 12 mm. in *L. plattensis*); banner with bright white eye; in Panhandle, central and east Texas (except *L. texensis* cultivated or occasionally introduced along roadsides in Trans-Pecos Texas and *L. plattensis* in Panhandle) (3)
- 3(2). Leaves with predominately 7 to 10 (very rarely 6 or 5) leaflets; perennial herb to about 5 dm. high 5. *L. plattensis*.
3. Leaves with predominately 5 or 6 (very rarely 7) leaflets; winter annual herbs (4)
- 4(3). Wing petals on fresh flowers inflated, cheeklike in front view, light blue; pubescence of flower buds and mature pod yellowish-gray or brown; tip of incompletely expanded raceme rounded, not very conspicuous from a distance; leaflets mostly obtuse or broadly rounded at apex, usually some truncate at apex and cuneate below; plants occurring in sandy or sandy-clay soils of oak and pine areas 3. *L. subcarnosus*.
4. Wing petals on fresh flowers not inflated, nearly straight in front view, dark blue (except for occasional albinos); pubescence of flower buds and mature pod silvery or white; tip of incompletely expanded raceme white, pointed or acute, conspicuous from a distance; leaflets mostly acute to obtuse at apex, not truncate nor cuneate;

plants occurring in calcareous, gravelly or sandy-clay soils but often growing in sand along roadways 4. *L. texensis*.

1. *Lupinus concinnus* Agardh. ANNUAL LUPINE. Winter annual, simple or much-branched from the base, 4-15 (-25) cm. tall, densely villous, the spreading hairs 1-3 mm. long; leaves numerous, very villous, the petioles 2 to 4 times as long as the longest leaflets; leaflets 5 to 8, oblanceolate with obtuse apices, 1-2 cm. long, 2-5 mm. broad, with a pubescence of long spreading hairs on both surfaces; racemes nearly sessile, 3-6 cm. long, surpassed by the leaves; flowers 7-9 mm. long, usually well-scattered; pedicels about 1 mm. long; calyx upper lip bifid, about 4 mm. long, the lower lip 3-toothed and somewhat longer; petals edged with rich reddish-purple; banner 7-9 mm. long, 4-5 mm. broad, rounded or emarginate apically, white centrally, the lateral portions lavender; wings 7-8 mm. long, about 3 mm. broad, lavender-tipped; keel usually straight, 6-7 mm. long, about 2 mm. broad, naked, often red-tipped; pods oblong, 10-15 mm. long; seeds 2 to 4, 2-3 mm. long, angled, nearly square, mostly dull-spotted on a pale background. Infrequent in local populations, grama grasslands in the Trans-Pecos above 4,500 ft. elev., spring; s.w. U.S. and n.w. Mex.

2. *Lupinus Havardii* Wats. CHISOS BLUEBONNET. Erect winter annual, (2-) 3-8 dm. tall, averaging much taller than most of our other bluebonnets, with more vigorous ascending branches; herbage with silky appressed or ascending (not spreading) pubescence; leaflets usually 7, oblanceolate, glabrous on the upper surface, 8-20 mm. long or larger; raceme (including peduncle) 18-45 cm. long, the pedicels equaling or exceeding their calyxes at anthesis; calyx narrow, slightly gibbous; petals about 12 mm. long, purple-blue with a pale spot on the banner; banner with a creamy-white center-spot, becoming yellow and finally red with age; legume narrowly linear, 24-36 mm. long, about 4 mm. broad; seeds 6 to 8, nearly square, the maximum diameter 3-3.5 mm. Frequent in deserts, usually in alluvium or fine talus, s. parts of Hudspeth, Presidio and Brewster cos. in the Trans-Pecos, spring; also Chih.

3. *Lupinus subcarnosus* Hook. TEXAS BLUEBONNET. Winter annual, mostly branched at the base, the branches more or less decumbent, entire plant 15-40 cm. tall, subappressed-silky-pubescent, often with some spreading hairs; leaves several, very silky below and on the margins, glabrous or nearly so above; petioles fully twice as long as their longest leaflets; leaflets usually 5 (or 6), very rarely 7, oblanceolate, apically rounded to occasionally truncate or obtuse, the lower leaves sometimes with more fleshy obovate leaflets, 12-25 mm. long, 6-12 mm. broad; peduncles 3-8 cm. long, erect; racemes 6-12 cm. long, several-flowered; tip of the bracts 5-6 mm. long, lanceolate, deciduous; incompletely expanded raceme rounded, not very conspicuous from a distance; flowers 10-13 mm. long, crowded; pubescence of flower-buds and mature pod yellowish-gray or faintly brownish-gray; pedicels 3-6 mm. long; calyx 5-6 mm. long, its upper lip bifid and 4-5 mm. long, its lower lip entire or acutely 3-toothed and about 5-6 mm. long; petals broad, bright-blue; banner with white center that may turn purplish with age, suborbicular, 11-13 mm. long, 9-13 mm. broad; wings 10-11 mm. long, 6-7 mm. broad, in fresh flowers inflated and cheeklike in front view; keel nonciliate, the usually slender point sharply upturned; pods silky, 25-35 mm. long, 6-8 mm. broad, stout and at maturity somewhat constricted between the large seeds; seeds 4 or 5, gray or tawny, unmarked or obscurely spotted, about 5 mm. broad. Locally abundant in loose deep fine sandy loam or podsol, s.-cen. Tex. from Leon Co. s.w. to LaSalle Co. and in scattered populations to n. Hidalgo Co., scattered in some areas by humans but rarely persisting (e.g., in Orange Co.), spring; endemic.

This species is named by law as the State Flower of Texas.

4. *Lupinus texensis* Hook. TEXAS BLUEBONNET. Very similar to *L. subcarnosus* but from a distance the half-mature raceme appearing slightly thicker and more crowded, the tip portion silvery white (owing to bud-pubescence) and pointed or acute, conspicuous and showy; leaflets usually more acute apically; calyx slightly larger on the average (6-8 mm.); wing petals on fresh flowers not inflated, nearly straight in front view, dark-blue (except for occasional albinos). Widespread in usually calcareous soils, in a N.-S zone through Tex., w. to Taylor, Tom Green and Val Verde cos., e. to Fannin, Kaufman, Leon and Washington cos., spring; endemic.

This is the species that is widely spread by our highway department, garden clubs and

other such organizations. Because of its apparent unpalatability to grazing animals and the prevalent practice of abusive overstocking of ranges where it grows, the species is greatly increasing in numbers and distribution.

5. *Lupinus plattensis* Wats. Perennial erect herb to about 5 dm. tall; leaflets usually more than 6 per leaf. Rare in dunes of higher parts of the Plains Country (Hartley Co.), Apr.-May; w.-cen. U.S., s. to Okla. and Tex.

24. GENISTIDIUM I. M. JOHNST.

A monotypic genus of the Chihuahuan Desert.

1. *Genistidium dumosum* I. M. Johnst. Shrub 25-50 cm. or more tall, erect, rounded, much-branched, unarmed; branchlets rigid, slender, strigose; leaves alternate, pinnately trifoliolate, densely strigose; leaflets oblanceolate, 5-18 mm. long, firm, apically acute, the terminal one petiolulate and larger than the 2 lateral ones, petioles 1-4 mm. long; stipules subulate, 1-1.5 mm. long; flowers in axillary racemes; pedicels 2-3 mm. long; calyx campanulate, basally more or less oblique, with a tube 2.5-3 mm. long, sparsely strigose, more or less 2-lipped, the lips about 3 mm. long and longer than the tube, the upper one connate high up; banner yellow or reddish, with a greenish eyespot, the blade suborbicular and about 8 mm. broad, the claw about 3 mm. long; wings yellow or reddish, lunate-oblong, the curved claw 4 mm. long and to 0.8 mm. broad, the blade 6 mm. long and near the middle 2.5 mm. broad, 1-2 mm. longer than the keel; keel whitish, the claws 3.8 mm. long and blade 4.5 mm. long and 2.8 mm. broad; stamens 10, 9 with filaments coalescent and the tenth (upper) one free; anthers all alike; ovules 4 to 6; pod straight, when immature 20-25 mm. long, about 4 mm. broad, coriaceous, dry and dehiscent. Exceedingly rare, known only from 1 or 2 plants on very dry limestone hills between Terlingua and Lajitas, s. Brewster Co. in the Trans-Pecos, June-Sept.; also 1 locality in Coah.

25. MEDICAGO L.

BUR-CLOVER. MEDICK

Annual, biennial or perennial herbs, taprooted, 3-10 cm. tall; leaves alternate, pinnately trifoliolate; leaflets cuneate to obovate or nearly orbicular, the distal margin serrulate; stipules partially fused to the base of the petiole; flowers papilionaceous, solitary or in very short few-flowered axillary clusters, or in crowded spikelike racemes in the upper axils; calyx campanulate, the lobes almost equal; corolla yellow or in one species violet-blue, 2-12 mm. long; banner obovate to oblong; wings oblong; keel obtuse; stamens 10, diadelphous, 9 filaments coalescent, the tenth (upper) free from the rest; fruit arching or slightly curved to strongly spirally coiled, usually indehiscent, smooth or prickly; seeds 1 to several.

A genus of about 120 species of temperate regions of the Old World, some of the species widely cultivated and introduced in America.

1. Flowers (6-) 7-12 mm. long, violet-blue (rarely white); plant perennial 1. *M. sativa*.
1. Flowers 2-5 mm. long, yellow; plant annual or biennial (2)
- 2(1). Stipules acuminate, slightly dentate to entire along the margin; leaves, stems, stipules and calyxes more or less pubescent (3)
2. Stipules deeply divided, very conspicuously lacerate; plant essentially glabrous except for occasional stem pubescence (4)
- 3(2). Fruit a prickleless or nearly prickleless black or dark-brown pod at maturity; flowers 1.5-2 mm. long 2. *M. lupulina*.
3. Fruit a prickly coiled pod (bur) at maturity; flowers 2.5-4 mm. long 3. *M. minima*.
- 4(2). Fruit a tightly coiled prickleless flattened pod, 10-15 mm. in diameter at maturity; flower pedicels 2-3 mm. long; stipules divided to the midrib 4. *M. orbicularis*.
4. Fruit a loosely curled barrel-shaped pod, 4-7 mm. in diameter; flower pedicels 0.5-2 mm. long; stipules deeply divided but arising from a distinct membranous base (5)

5(4). Stipules mostly divided deeply beyond the middle (individual stipule lacerations mostly 2-6 mm. long); leaflets mostly longer than wide, without a central spot5. *M. polymorpha* var.

vulgaris.

5. Stipules not divided beyond the middle (individual stipule lacerations mostly 0.5-2 mm. long); leaflets as broad as long or broader, usually with a central purple spot6. *M. arabica*.

1. *Medicago sativa* L. ALFALFA. Perennial herb 3-10 dm. tall; leaflets 1-3 cm. long, 3-8 mm. broad, obovate to oblong or oblanceolate; stipules (5-) 8-15 (-20) mm. long, usually fused to the petiole for the basal 2-5 mm.; peduncles 1-3 cm. long in the upper axils; racemes crowded, 1-4 cm. long, 1-2 cm. thick, with 10 to 20 (to 30) flowers; petals 7-12 mm. long, violet-blue; pod loosely and spirally coiled in 1 or 2 turns, the coils about 4-5 mm. in diameter, prickleless. Widespread as an escape along roadsides and in abandoned fields (apparently absent only from Rio Grande Plains and Coastal Bend region), Apr.-July; nat. of Eur., now very widely distributed as a forage crop and a weed.

2. *Medicago lupulina* L. BLACK MEDICK. Annual; stems and branches usually decumbent, 1-4 (-6) dm. long, usually pubescent; leaflets broadly obovate or nearly orbicular to almost elliptical, pubescent, 1-2 cm. long, 3-10 mm. broad; stipules lanceolate to ovate-lanceolate, 5-10 mm. long, adnate to the petiole for about 2-3 mm.; peduncles 5-40 mm. long, axillary, slender; racemes very compact, 10- to 50-flowered, about 7-10 mm. long; petals 1.5-2 mm. long, yellow; pod dark-brown or nearly black at maturity, making one partial revolution, vaguely reniform, prickleless, 2-3 mm. in diameter; seed solitary. Scattered and weedy in the e. half of Tex., spring; nat. of Euras., now widely introd.

3. *Medicago minima* (L.) L. SMALL BUR-CLOVER. Annual; stems decumbent to erect, softly and densely spreading-pubescent, 1-3 (-5) dm. long; leaflets obovate to cuneate-oblong, mostly 5-10 (-15) mm. long; stipules ovate-lanceolate, entire or short-toothed, 4-7 mm. long; peduncles 10-25 mm. long, axillary, slender; racemes capitate, with (1 to) 3 to 5 (to 8) flowers; petals 2.5-4 mm. long, yellow; pod almost globose, coiled, with nearly straight flexible prickles 2-3 mm. long (each prickle hooked at the very tip), including the prickles 5-12 mm. in diameter. Frequent in n.-cen. Tex. and e. edge of Edwards Plateau, rare farther e., spring; nat. of Euras., now widely introd.

4. *Medicago orbicularis* (L.) Bartal. BURTON CLOVER. Annual; stems decumbent to ascending, 1-5 dm. long, essentially glabrous or with occasional pubescence; leaflets obovate to obcordate or rhombic, 8-18 mm. long, 5-10 mm. broad; stipules deeply divided nearly to the midrib, conspicuously lacerate, mostly less than 1 cm. long; peduncles mostly 1-2 cm. long, arcuate; pedicels 2-3 mm. long; flowers 1 to 5 per peduncle; petals about 3 mm. long, yellow; pod prickleless, flattened and tightly coiled into 4 to 6 spirals, the coils 1-2 cm. in diameter, glabrous, strongly reticulate. Infrequent, scattered in n.-cen. Tex. and e. part of Plains Country, spring; nat. of Medit. area, now widely introd.

5. *Medicago polymorpha* L. var. *vulgaris* (Benth.) Shinn. BUR-CLOVER. Annual; stems 5-50 dm. long, decumbent to ascending, puberulent or usually essentially glabrate; leaflets cuneate-obovate to obcordate, 6-15 mm. long, mostly longer than broad; stipules 6-10 mm. long, at least those of the distal leaves deeply incised, the individual lobes 2-6 mm. long; peduncles 1-3 cm. long; pedicels 0.5-1 mm. long; flowers (1 to) 3 to 5 (to 8) per head; petals 2.5-4 mm. long, yellow; pod with 2 rows of flexible prickles (2-3 mm. long) which are straight except for the hooked tip, spirally coiled 2 to 5 times, the coils 4-6 mm. in diameter (excluding prickles). *M. hispida* Gaertn. Widespread in the e. half of Tex. rare in w. half, a common lawn weed, spring; nat. to Old World, now widely introd.

6. *Medicago arabica* (L.) Huds. SPOTTED BUR-CLOVER. Annual; stems 1-6 dm. long, ascending to decumbent, usually essentially glabrous; leaflets obovate to obcordate, about as broad as long or broader, usually with a purplish central spot, 10-25 mm. long; stipules ovate-lanceolate, mostly 5-10 mm. long, incised but the lobes less than half the total length (about 0.5-2 mm. long); peduncles mostly 10-25 mm. long; pedicels 0.2-0.5 (-1) mm. long; flowers 1 to 5 per head; petals about 4-5 mm. long, yellow; pod with 2 rows of flexible recurved prickles about 2-3 mm. long, spirally coiled with 4 to 7 coils, the coils 5-6 mm. in diameter (excluding the prickles). Scattered in e. half of Tex., spring; nat. of Old World, now widely introd.

26. MELILOTUS MILL.

SWEET CLOVER

Biennial or annual herbs, taprooted, 3-30 dm. tall, the stems erect and usually nearly glabrous; leaves alternate, pinnately trifoliolate; leaflets usually oblanceolate to obovate, serrulate on the distal margin, the terminal leaflet petiolulate; stipules partially fused to the base of the petiole, obliquely ovate; peduncles axillary, usually several cm. long; flowers usually only a few mm. long, papilionaceous, white or yellow, in lax to crowded usually many-flowered spikelike racemes; calyx campanulate, minute, with nearly equal subulate to lanceolate acute to acuminate lobes; petals white or yellow, only a few mm. long, deciduous after anthesis; stamens 10, diadelphous, 9 of the filaments coalescent, the tenth (upper) one free; fruit ovoid to globose, straight or nearly so, usually 1-seeded and minute, commonly reticulate, indehiscent or essentially so.

A genus of about 20 species native to the Old World, widely introduced in the New World, valuable as forage crops. The genus is only very weakly distinguished from *Medicago*, and probably should be merged with it.

1. Flowers white; pod reticulate-veined, dark-brown to black at maturity 1. *M. albus*.
1. Flowers yellow; pod appearing cross-ribbed or smooth, gray or light-brown to tan at maturity (2)
- 2(1). Flowers 1-3 mm. long; pod globose; stipules widened below with scarios margins; annual 2. *M. indicus*.
2. Flowers 3-5 mm. long; pod ovoid (longer than broad); stipules not widened below with scarios margins; biennial 3. *M. officinalis*.

1. *Melilotus albus* Lam. WHITE SWEET CLOVER, HUEAM. Annual or biennial 3-15 (-30) dm. tall; racemes with 30 to 80 flowers; petals white; banner about 3-5 mm. long, somewhat exceeding the wing and keel in length; pod 2-3.5 mm. long, 2-2.5 mm. broad, about 1.5-2 mm. thick, glabrous, very short-stalked, usually dark-brown to blackish at maturity, reticulate-veined. Scattered as a weed over Tex. (seemingly rare on Edwards Plateau and in far e. Tex.), spring; nat. of Euras., now widely introd.

2. *Melilotus indicus* (L.) All. SOUR CLOVER, ALFALFILLA. Annual 1-5 dm. tall; stipules lanceolate, those of the lower leaves widened below the middle, scarios and partially encircling the stem and with a small free basal lobe; racemes with 10 to 60 flowers; flowers 1-3 mm. long; petals yellow; banner about 3 mm. long; pod flattened, nearly orbicular, 1.5-2.5 mm. long, yellowish or reddish at maturity, very short-stalked, not reticulate-veined. Scattered over Tex. (rare in Rio Grande Plains and higher parts of Plains Country, infrequent in Trans-Pecos and Edwards Plateau), spring; nat. of Medit. area, now widely introd.

3. *Melilotus officinalis* (L.) Lam. YELLOW SWEET CLOVER. Biennial or rarely annual, 4-10 (-20) dm. tall; stipules lanceolate, acute, mostly 5-8 mm. long, entire, not widened below nor with scarios margins; racemes with 30 to 70 flowers; flowers 3-5 mm. long; petals yellow; banner about 5 mm. long; pod ovoid, 2.5-4 mm. long, 2-2.5 mm. broad, about 1.5 mm. thick, distinctly short-stalked, glabrous, usually light-brown to tan at maturity, the transverse ridges more prominent than the longitudinal ones. Frequent in n.-cen. Tex. and scattered elsewhere, spring; nat. of Euras., now widely introd.

27. TRIFOLIUM L.

CLOVER

Annual, biennial or perennial herbs; stems usually weak and with some of them at least partially decumbent; leaves alternate, trifoliolate (either palmately so or the terminal leaflet longer-stalked in 2 species), typically obovate to nearly orbicular, serrulate on the distal margin, rarely more than 3 cm. long; petioles well-developed; stipules conspicuous, persistent and usually at least partially adnate to the base of the petiole; inflorescence axillary and/or terminal, sessile or peduncled capitate or spikelike racemes or umbel-like aggregations (flowers rarely solitary, as in *T. amphianthum*); flowers sessile or pedicellate; calyx persistent, the tube campanulate or cylindrical and with 5 to 10 (to 20) nerves, the lobes linear to deltoid and equal or unequal; corolla papilionaceous,

never blue nor purple (except in *T. carolinianum*); petals united below with the filament tube in some species; stamens 10, diadelphous, 9 filaments coalescent into a tube, the tenth (uppermost) one free; pod often enclosed within the calyx tube and typically enveloped by the persisting petals, obovoid to oblong-linear, usually membranous, indehiscent or opening by a suture, or more rarely circumscissile; seeds 1 to 4.

A large genus of 300 species of temperate regions of the world.

1. Leaves pinnately trifoliolate (the terminal leaflet with a longer stalk than the lateral ones); flowers yellow (2)
1. Leaves palmately trifoliolate (all the leaflets sessile or nearly so); flowers not yellow (3)
- 2(1). Banner 2-4 mm. wide; flowers 20 to 40 in each head 1. *T. campestre*.
2. Banner 1-2 mm. wide; flowers 5 to 18 in each head 2. *T. dubium*.
- 3(1). Leaflets more than 3 times as long as wide 3. *T. Willdenovii*.
3. Leaflets rarely more than twice as long as wide, usually one to one and one half times as long as wide (4)
- 4(3). Flower heads sessile or nearly so at the ends of main branches (peduncles less than 5 mm. long) 4. *T. pratense*.
4. Flower heads on peduncles 10 mm. long or more (5)
- 5(4). Flower heads at least twice as long as wide (3 cm. long or more), spikelike 5. *T. incarnatum*.
5. Flower heads globose (umbellate or capitate), about as long as wide (6)
- 6(5). Flowers sessile in the heads or nearly so (pedicels 1 mm. long or less); cultivated or rare introduced species 6. *T. resupinatum*.
6. Flowers distinctly pedicelled (mature pedicels 1-8 mm. long); native or common introduced species (7)
- 7(6). Mature flowering heads 25-40 mm. across; stems erect or ascending, not creeping 7. *T. reflexum*.
7. Mature flowering heads 25 (rarely 30) mm. across or less, if somewhat more than the stems prostrate and creeping (8)
- 8(7). Flower heads short-racemose; pedicels arising along a distance of 2-5 mm. at the end of the peduncle; calyx lobes shorter than the tube; stems creeping; flowers white 8. *T. repens*.
8. Flower heads umbellate; pedicels all arising at the end of the peduncle; calyx lobes (at least some of them) as long as the tube; stems erect or ascending, if creeping then fruits developing below the ground; flowers deep-rose-red to yellowish-white (9)
- 9(8). Peduncles arising from creeping stolons; stems rooting at the nodes; petals (at maturity) 2 to 4 times as long as the calyx 9. *T. amphianthum*.
9. Peduncles arising from erect or ascending stems; stems not rooting at the nodes; petals one to two times as long as the calyx (10)
- 10(9). Calyx lobes (some of them) about as long as wide ..10. *T. bejariense*.
10. Calyx lobes (all of them) 2 to 3 times as long as wide ..11. *T. carolinianum*.

1. ***Trifolium campestre* Sturm.** LOW HOP CLOVER. Annual or biennial; stems decumbent or commonly ascending, usually densely appressed-short-pubescent at least on the younger parts, the older ones often glabrate; leaves pinnately trifoliolate; terminal leaflet with a longer stalk (1-3 mm.) than the lateral ones; leaflets mostly (6-) 8-12 (-15) mm. long and usually about twice as long as broad but very variable, oblong-obovate to cuneate-obovate or obovate-lanceolate; peduncles mostly 1-3 cm. long; pedicels 0.2-0.8 mm. long; flowers 2.5-5.5 mm. long, 20 to 40 per head; heads globose to ovoid or very short-cylindrical, 5-15 mm. long, 8-12 mm. thick; calyx glabrous, the 5-nerved tube campanulate and 0.5-0.8 mm. long, the lobes very unequal; corolla yellow, turning brownish when dry; banner 2-4 mm. broad, conspicuously longer than the wing or keel; pod oblong, about 3 mm. long including the stipe. Sandy soils along roads, wooded areas of e. and s.e. Tex., spring; nat. of Eur., now widely introd.

2. *Trifolium dubium* Sibth. SHAMROCK, SMALL HOP CLOVER. Annual; stems erect or decumbent, to 35 cm. long, appressed-pubescent; leaves pinnately trifoliolate; petiole 3-8 (-10) mm. long; stipules 4-8 mm. long; terminal leaflet with a longer stalk (1-3 mm. long) than the lateral ones; leaflets largely glabrous, cuneate-obovate, 6-12 mm. long, about half as broad as long to as broad as long; heads hemispherical to spherical, 5-8 mm. thick; peduncles 5-25 mm. long; flowers 5 to 18 per head, 2.5-3 mm. long; pedicels 0.2 mm. long; calyx 5-nerved, the tube about 1 mm. long, the lobes very unequal; corolla yellow; petals grooved and ribbed lengthwise, inconspicuously so at first, markedly so in age; banner 1-2 mm. broad, longer than the wing and keel, only inconspicuously veined; legume oblong, about 2.5-3 mm. long including the stipe which is about 1 mm. long. Nat. of n. Eur., introd. and found in grassy places.

3. *Trifolium Willdenovii* Spreng. MOUNTAIN CLOVER. Short-lived perennial or biennial, 1-2 (-8) dm. tall, the stems shortly decumbent basally; leaves palmately trifoliolate; petioles several cm. long; stipules connate to petiole practically their entire length; leaflets all sessile or nearly so, 1-3 cm. long, 3 to 7 times as long as broad, serrulate nearly the entire length, mostly oblanceolate; peduncles 3-11 cm. long; heads nearly globose, 15-25 mm. thick, immediately subtended by about half a dozen deeply lobed bracts about as long as the flowers; flowers about 20 to 40 per head, 8-15 mm. long; corolla partly white but mostly purplish. *T. fistulosum* Vaughan, *T. Ortegae* Greene. Rare in creek-beds, Davis Mts. at about 4,000-6,000 ft. elev., summer; Rocky Mts. and s. in the mts. to Mexico City.

This is sometimes united with the allegedly pan-boreal species *T. Wormskjoldii* Lehm.; perhaps our plants should go under the latter name.

4. *Trifolium pratense* L. RED CLOVER. Perennial or sometimes biennial; stems usually decumbent at least basally, 2-7 dm. long, commonly with spreading pubescence; leaves palmately trifoliolate; petioles 10-25 mm. long; stipules adnate nearly the total length to the petiole; leaflets all sessile or nearly so, less than 3 times (usually twice) as long as broad, ovate to elliptic or cuneate-obovate, 1-3 (-5) cm. long, nearly entire; peduncle very short or absent; heads subglobose to ovoid, 1-3 cm. long, (1-) 2 (-3) cm. thick; flowers 30 to 90 per head, 12-18 mm. long; calyx tube campanulate, basally narrowed, 10-nerved, 3-4 cm. long; calyx lobes subulate; corolla reddish to reddish-purple (rarely white); banner longer than wing or keel; pod about 3 mm. long and 2 mm. thick. Scattered escape in e. half of Tex., May-July; nat. of Eur., now widely introd. and cult.

5. *Trifolium incarnatum* L. CRIMSON CLOVER. Winter annual or annual; stems ascending, 2-4 (-8) dm. tall; leaves palmately trifoliolate; petioles of the lowest leaves much-elongated, 5-20 cm. long; stipules mostly 1-2 cm. long and adnate to the petiole base more than half the length; leaflets all sessile or nearly so, less than 3 (usually 1 to 2) times as long as broad, broadly obovate and somewhat cuneate to nearly orbicular, mostly 1-3 (-4) cm. long; peduncle 4-12 cm. long, terminal; heads spikelike, at least twice as long as thick, (2-) 3-7 cm. long; flowers nearly sessile and very numerous, 8-12 mm. long; calyx tube cylindrical to campanulate, 3.5-5 mm. long, 10-nerved, the lobes subulate; banner much longer than wing or keel, scarlet or red (rarely white); legume sessile, ovoid. Scattered as a roadside escape, e. half of Tex., spring; nat. of s. Eur., now widely introd.

6. *Trifolium resupinatum* L. PERSIAN CLOVER. Annual or winter annual; stems largely glabrous, to 45 cm. long, decumbent to ascendent; leaves palmately trifoliolate; petioles 3-80 mm. long; stipules long-adnate to petiole base; leaflets all sessile or nearly so, less than 3 (usually 1 to 2) times as long as broad, mostly 1-2 cm. long and 7-10 mm. broad, mostly obovate to oblanceolate; peduncle 2-6 cm. long; heads about as long as thick, hemispherical, burlike in age, 5-10 mm. thick, with about 6 to 18 flowers; pedicels 1 mm. long or less; flowers 4-6 mm. long; calyx pilose, inflated at one side, strongly bilabiate, the tube 1.5-2 mm. long; corolla lavender-pink, basally twisted so the banner appears to be the lowest petal; banner conspicuously longer than the wing or keel; pod oblong to ovoid, 1- or 2-seeded, completely enclosed by the bladderly calyx. Rare roadside escapee in e. Tex., spring; nat. of Old World, now widely introd.

7. *Trifolium reflexum* L. BUFFALO CLOVER. Annual; stems pilose to nearly glabrous, spreading or erect, to 3 dm. long; leaves palmately trifoliolate; petioles 5-150 mm. long; stipules adnate to the petiole for about a fourth their length; leaflets all sessile or nearly so, 2 to 3 times as long as broad, mostly 10-35 mm. long, ovate or elliptic to oblong or

cuneate-obovate; peduncle 1 cm. long or longer, half to twice as long as the thickness of the head; heads about as long as thick, the mature ones 25-40 mm. thick, umbel-like; pedicels 2-5 mm. long at anthesis, later elongating to 10 mm. long in fruit; flowers 8-10 (-12) mm. long; calyx tube campanulate to cuplike, 1.5-2 mm. long, 10-nerved; corolla deep-red, or at least the banner red (keel and wing petals sometimes whitish); banner exceeding wing and keel; pod oblong, 4-6 mm. long including the stipe which is about 1.5 mm. long; seeds often 4. Sandy forested areas, n.e. Tex., s.w. to Robertson Co., May-July; most of e. U.S.

8. *Trifolium repens* L. WHITE CLOVER. Perennial, mat-forming; stems creeping, glabrous or nearly so, rooting at the nodes; leaves palmately trifoliolate; petioles 5-20 cm. long; stipules mostly 8-15 mm. long; leaflets all sessile or nearly so, less than 3 times as long as broad, broadly elliptic-obovate to cuneate-obcordate, mostly 1-2 (-3) cm. long; peduncle 10-25 cm. long; heads about as long as thick, mature ones less than 25 (rarely 30) mm. thick, somewhat racemose, the axis of the raceme 2-5 mm. long; pedicels at anthesis about 1.5 mm. long, afterwards elongating to as much as 3-5 mm. long; calyx lobes shorter than calyx tube, the cylindrical tube 10-nerved and 2-3 mm. long; corolla white (some petals sometimes pinkish), (6-) 8-10 (-12) mm. long, the banner conspicuously longer than the wings; pod oblong-linear, 4-5 mm. long, 3- or 4-seeded. Scattered escape in e. half of Tex., spring and fall; nat. of Eur., now widely introd.

A species somewhat resembling white clover but not having the creeping stems is alsike clover, *T. hybridum* L., widely cultivated and present as a lawn weed in adjacent states; it will probably eventually be found in Texas.

9. *Trifolium amphianthum* T. & G. PEANUT CLOVER. Perennial; stems glabrous or nearly so, creeping, stoloniferous, rooting at the nodes; leaves palmately trifoliolate; leaflets all sessile or nearly so, less than 3 times as long as broad; flowers of 2 sorts; *cleistogamous flowers* solitary, short-peduncled, borne just above the ground, after anthesis thrusting down into the sand and producing underground fruit; *chasmogamous flowers* with peduncle 1 cm. long or longer, arising from the creeping stolon; heads about as long as thick, mature ones less than 25 (rarely 30) mm. thick, umbellate; pedicels (1-8 mm. long) all arising at the end of the peduncle; corolla deep-red, 2 to 4 times as long as the calyx; some fruit borne underground. Frequent in wooded sandy areas, e., s.e. and n.-cen. Tex., s. to Caldwell, DeWitt and Victoria cos., spring; also La.

10. *Trifolium bejariense* Moric. Annual or winter annual; stems glabrous or nearly so, ascending or decumbent, 1-2 dm. long; leaves palmately trifoliolate; leaflets all sessile or nearly so, less than 3 times as long as broad, mostly 5-10 mm. long; peduncle 1 cm. long or longer, 2 to 6 times as long as the head is thick, several times longer than the subtending leaves; heads about as long as thick (15-20 mm. thick), mature ones less than 25 (rarely 30) mm. thick, umbel-like; pedicels 1-8 mm. long, all arising at the end of the peduncle; flowers numerous; calyx reticulate-veined, 2-lipped, the tube campanulate, the lobes (at least some of them) about as long as broad and very unequal; corolla slightly longer than the calyx, white or yellowish-white, turning brown on drying; banner and wings toothed, the banner much longer. Sandy or sandy clay soils of prairies and open woods, e. and n.-cen. Tex., s. to Wilson, DeWitt and Victoria cos., spring; endemic.

11. *Trifolium carolinianum* Michx. Annual (*vide* some authors) or perennial (*vide* others); stems glabrous or sparsely pubescent, erect or decumbent, to 3 dm. long; leaves palmately trifoliolate; petioles commonly 1-5 cm. long; stipules adnate to petioles about a third to half their length; leaflets all sessile or nearly so, only about 1 to 1.5 times as long as broad, obovate to obcordate, basally cuneate, 4-10 (-15) mm. long, 3-10 mm. broad; peduncle 3-10 (-12) cm. long or longer, 2 to 6 times as long as the head is thick; heads about as long as thick, mature ones 15-25 (-30) mm. thick, umbel-like; pedicels all arising at the end of the peduncle, 1-3 mm. long at anthesis but elongating to 3-4 mm. in fruit; flowers 4-6 (-7) mm. long; calyx villosulous, the campanulate tube about 1 mm. long and 10-nerved, the lobes (all of them) 2 to 3 times as long as broad; corolla 1 to 2 times as long as the calyx; petals longitudinally lined or ribbed, yellowish-white changing to brown (purplish according to some authors); pod oblong, 2.5-3.5 mm. long, 2- to 4-seeded. E. and s.e. Tex., s.w. to Travis, Caldwell and Wharton cos., spring; s.e. U.S. n.w. to Kan. and Okla., n. to Mo. and Va.

28. LOTUS L. DEER VETCH. TREFOIL

Annual or perennial erect herbs, usually 1-5 dm. tall; leaves alternate, once-pinnately 3- to 5-foliolate or by reduction palmately trifoliolate; petioles short, often shorter than the rachis or not much longer; stipules in one species well-developed and in the others nearly obsolescent and glandlike; leaflets small, rarely more than 1 cm. long, linear to nearly orbicular, usually with appressed pubescence, usually entire; stipules absent; peduncles usually several cm. long, emerging from the upper axils and longer than the leaves; flowers about 1 cm. long, solitary or paired or in umbel-like groups at the end of the peduncle; calyx cylindric to campanulate with more or less equal lobes at the end of the tube; corolla papilionaceous, the petals usually basically yellowish or whitish but with red, rose or purple areas; banner external to the rest in bud, ovate to obovate; wings obovate or oblong and adhering to the incurved keel of usually fused petals; stamens 10, diadelphous, 9 with filaments coalescent and the tenth (uppermost) free, the filaments (all or part of them) expanded just below the anthers; ovary sessile; legume linear, usually 1-3 (-4) cm. long, nearly straight, dark-brown, thin-walled, promptly dehiscent, acute; seeds numerous.

A genus with about 120 species in temperate areas of the Old World and New World.

- 1. Stipules well-developed, leafletlike; each peduncle with 4 to 10 flowers and later with several legumes 3. *L. corniculatus*.
- 1. Stipules glandlike or obsolete; each peduncle with 1 or 2 (rarely 3) flowers and later usually only 1 pod (2)
- 2(1). Perennial of Trans-Pecos Texas; leaflets usually 5; style pubescent just below the stigma 2. *L. oroboides*.
- 2. Annual east of Trans-Pecos Texas; leaflets 3; style glabrous 1. *L. Purshianus*.

1. *Lotus Purshianus* (Benth.) Clem. & Clem. DEER VETCH. Annual, bushy-branched; leaflets 3, lance-elliptic, mostly 1-2 cm. long; stipules glandlike; bract at the top of the peduncle usually leafletlike; petals whitish with pink veins or pinkish with darker veins, rarely yellowish with pink-tinge. *L. americanus* (Nutt.) Bisch., not Vell. Abundant in n.-cen. Tex., infrequent in Llano region and e. and s.e. Tex., usually on sandy soils, Apr.-Jan.; most of U.S. w. of Miss. River; also n.w. Mex.

2. *Lotus oroboides* (H.B.K.) Kearn. & Peeb. Perennial from woody taproots; stems very numerous from the base, usually 1-2 dm. long; leaflets usually 5, oblanceolate to linear (those of the lowest earliest leaves broader), (3-) 5-12 mm. long; stipules glandlike; bract at the top of the peduncle usually linear; petals yellow or the banner more or less red dorsally. *L. rigidus* of Tex. ref. Abundant in parts of the Trans-Pecos, especially in soil derived from basaltic rock, above 4,000 ft. elev., Mar.-Sept.; s.w. U.S. and n.w. Mex.

The closely allied *L. Wrightii* (Gray) Greene, native to the mountains in adjacent New Mexico and Mexico, has been reported, without verification, from west Texas. It may be superficially distinguished by its much-abbreviated or obsolete leaf rachis that usually results in a pedate appearance to the leaf.

3. *Lotus corniculatus* L. BIRD'S FOOT TREFOIL. Perennial from woody taproots; stems very numerous from the base, usually 2-5 dm. tall; leaflets usually 3 (but sometimes appearing to be 5 because the stipules are leafletlike), obovate to rhombic-obovate or rarely nearly oblanceolate, about 1 cm. long; petals golden-yellow, varying in part to orange or brick-red. A cult. species, rarely escaping, summer; nat. of Old World, now widely introd. as forage and hay crops.

29. INDIGOFERA L. INDIGO

Perennial herbs, usually gray-pubescent all over, the pubescence appressed with the hairs often medifixed (with 2 ends free); leaves alternate, once-imparipinnately-compound; petioles short; stipules herbaceous, subulate to setaceous; leaflets 5 to 15, usually oblanceolate to obovate or elliptic, rarely linear, either or not opposite on the rachis; flowers in axillary sometimes spikelike racemes; calyx teeth 5; corolla papilionaceous, brick-red (less often pinkish or purplish); banner orbicular or obovate, short-clawed; wings oblanceolate

or oblong or linear, short-clawed, slightly adherent to the keel, the blade forming a basal auricle; keel petals united distally, the claws separate, the blades spurred or pouched; stamens 10, diadelphous, 9 with coalescent filaments, the tenth (uppermost) free, the anther connective glanduliferous; pod not much if at all compressed, promptly dehiscent, several-seeded, straight or falcate, linear or curvilinear; seeds usually separated in the pod by partitions, not stipitate.

A genus of about 400 species of warm regions.

1. Stems procumbent or prostrate to somewhat ascending; leaflets 5 to 9, never more, arranged alternately along the rachis; well-developed racemes much-surpassing the subtending leaf 1. *I. miniata*.
1. Stems stiffly erect; leaflets 7 to 15, opposite or nearly so along the rachis; racemes as long as or but slightly exceeding the subtending leaf (2)
- 2(1). Mature pods with a small swollen reddish glabrous knob at the base; leaves densely strigose on both surfaces 2. *I. Lindheimeriana*.
2. Mature pod acute at base, without a swollen reddish knob; leaves sparsely strigose, the upper surface less densely so to glabrous 3. *I. suffruticosa*.

1. *Indigofera miniata* Ort. SCARLET PEA. Stems several from the somewhat woody tap-root, procumbent or decumbent; leaflets 5 to 9, alternate on the rachis; well-developed racemes much-surpassing the subtending leaf; calyx teeth subulate, twice as long as the calyx tube; pod 1-3 cm. long, 2-3 mm. thick. A very abundant legume of open areas of the e. two thirds of Tex., represented with us by 3 varieties as follows:

Var. *miniata*. Stem hairs appressed; petals 5-8 mm. long; stipules 3-5 mm. long. *I. argentata* Rydb. Rio Grande Plains, rare n. to Lavaca and Wilson cos., intergrading with the next, Apr.-Sept.; Tex., Cuba, Fla. and Mex.

Var. *leptosepala* (Nutt.) B. L. Turner. Nearly all stem hairs appressed; petals 8-20 mm. long. E. two thirds of Tex. except extreme s. part and Llano region, rare w. to e. part of Panhandle and to Terrell Co.

Var. *texana* (Buckl.) B. L. Turner. With predominately curled or nonappressed hairs on the stems and long stipules (5-8 mm. long). Abundant in sandy soils derived from granite, gneiss and sandstone in the Llano region (Llano, Gillespie, Mason and San Saba cos.)

2. *Indigofera Lindheimeriana* Scheele. Erect stems 5-10 dm. tall; leaflets 7 to 15, opposite or nearly so on the rachis, densely strigose on both surfaces; racemes in flower somewhat shorter than the leaves but in fruit slightly longer; calyx less than half as long as the corolla, the teeth lanceolate or deltoid and not or only slightly exceeding the calyx tube; pod 20-25 mm. long, basally with a small swollen reddish glabrous knob. Local in alluvial soil of creeks in limestone hill areas, s. margin of Edwards Plateau from Crockett and Terrell cos. to Comal Co., May-Aug.; also N. L. and Coah.

3. *Indigofera suffruticosa* Mill. INDIGO. Erect stems 5-20 dm. tall; leaflets 9 to 15, opposite or nearly so on the rachis, sparsely strigose; racemes shorter than the leaves; calyx less than half as long as the corolla, the teeth lanceolate or deltoid and not or only slightly exceeding the calyx tube; pods (when mature) 15-20 mm. long, acute basally. Local, Coastal Plains, Hardin Co. to Cameron Co. and inland to Brazos, Gonzales and Wilson cos., July-Nov.; nat. to trop. Am., now widely introd.

This species and *I. tinctoria* L. are the sources of the substances which are the chemical precursors of the blue dye indigo, formerly important in commerce.

30. PSORALEA L.⁸⁸

Caulесcent or acaulescent perennial herbs, the herbage and calyx glandular-punctate (rarely not); leaves alternate, palmately or once impari- or pinnately compound; petioles well-developed, stipules well-developed, usually persistent and entire; leaflets variously shaped, usually widest in the distal half, marginally entire; stipels present; flowers in dense to loose axillary or terminal spikelike racemes, usually with 2 or 3 flowers associated with each bract; calyx with a tube (basally often gibbous and becoming inflated in fruit) and

⁸⁸ Partly adapted from L. H. Shinnors in Field & Lab. 19:14-25. 1951 and partly from David J. Ockendon in Southw. Nat. 1:81-124. 1965.

5 lobes, the 4 upper lobes equal, the lower usually longer and broader than the upper; corolla papilionaceous, whitish, bluish, purplish, lavender or reddish-brown (never yellow), often fading and becoming discolored in age; banner tapering into a short claw, the blade obovate; wings short-clawed, the blades oblong or oblanceolate with a distinct basal lobe; keel petals rounded and apically united, each attached to the base of the adjacent wing petal; stamens 10, diadelphous, 9 of the filaments coalescent into a tube, the tenth (uppermost) free (occasionally absent); pod with globose to ovoid body slightly if at all compressed and a flat narrow tapering beak, thin, papery, pubescent or glandular, indehiscent or rupturing irregularly or tardily circumscissile; seeds ovoid to ellipsoid with tapering margins, usually rather thin and smooth but occasionally thicker and with reticulate margins.

About 130 species, mainly in the tropics and subtropics throughout the world. The northern plains species, *P. esculenta* Pursh, with edible tuberous roots, has been reported (but not seen by us) from Texas.

1. Leaves pinnately 3-foliolate (2)
1. Leaves palmately 3- to 7-foliolate or the uppermost only 1- or 2-foliolate (the middle leaflets rarely stalked in aberrant forms of *P. scaposa*) (5)
 - 2(1). Leaflets lanceolate to oblong-lanceolate, 3 to 7 times as long as wide; flowers in elongate spikelike racemes (3)
 2. Leaflets rhombic-lanceolate to ovate or orbicular, about one to two (or three) times as long as wide; flowers few, in heads or very short spikes (4)
 - 3(2). Corolla deep-purple, 7-10 mm. long; calyx 3.2-4 mm. long 1. *P. simplex*.
 3. Corolla lilac or lavender, 4-7 mm. long; calyx 2-3 mm. long 2. *P. psoralioides* var. *eglandulosa*.
 - 4(2). Plant with elongate prostrate leafy stems; leaves membranous, upper and lower not markedly different, variously pubescent to nearly glabrous, without white veins 15. *P. rhombifolia*.
 4. Plant scapose (stem not evident); leaves leathery, the lower surface densely appressed-pubescent, the upper glabrous or nearly so except for the prominent white veins 13. *P. Rydbergii*.
 - 5(1). Inflorescence a slender loose raceme or slender interrupted spike less than 15 mm. thick; bracts of inflorescence 4 mm. or less long; calyx 2-7 mm. long (enlarging in fruit) (6)
 5. Inflorescence a dense spikelike raceme 20-40 mm. thick; bracts of inflorescence 4-15 mm. or more long; calyx 8-17 mm. or more long (9)
 - 6(5). Branches and under surface of leaflets glabrous and prominently resin-dotted; calyx lobes 1 mm. long or less 3. *P. lanceolata*.
 6. Branches and under surface of leaflets minutely or conspicuously pubescent, not prominently resin-dotted; calyx lobes (1-) 1.5-6 mm. long (7)
 - 7(6). Pedicels of many or all the flowers longer than the calyxes; calyxes 2-4 mm. long (slightly enlarged in fruit) (8)
 7. Pedicels absent or shorter than the calyxes; calyxes 5-7 mm. long (conspicuously enlarged in fruit) 6. *P. digitata*.
 - 8(7). Leaflets linear to lanceolate, 7 to 16 times as long as wide 4. *P. linearifolia*.
 8. Leaflets oblanceolate to obovate, 2 to 6 times as long as wide 5. *P. tenuiflora*.
 - 9(5). Plant with a well-developed mainstem at least 1 dm. long (10)
 9. Plant acaulescent or with a short mainstem less than 1 dm. long or with several lateral stems to 3 dm. long (13)
 - 10(9). Flowers in terminal groups of 3 to 7; bracts conspicuous, broadly ovate, enclosing the calyx 7. *P. Reverchonii*.
 10. Flowers in dense many-flowered racemes; bracts rather inconspicuous and not enclosing the calyx (11)

- 11(10). Leaflets narrow, linear, the longest at least 5 cm. long 8. *P. cyphocalyx*.
11. Leaflets broader, elliptic or obovate, seldom reaching 4 cm. long (12)
- 12(11). Stems 3-6 dm. long, procumbent to ascending, with many well-developed erect branches; stipules of middle and upper leaves linear-lanceolate 9. *P. cuspidata*.
12. Stem less than 3 dm. tall, erect, unbranched or with 1 or 2 short lateral branches; stipules of middle and upper leaves ovate 10. *P. latestipulata*.
- 13(9). Leaflets narrow, 3 or 4 times as long as broad 14. *P. hypogaea*.
13. Leaflets broader, up to twice as long as broad (14)
- 14(13). Leaflets elliptic or rhomboid, eglandular; hairs spreading, at least 2 mm. long; beak of fruit very narrow, less than 1 mm. broad ... 11. *P. subulata*.
14. Leaflets obovate, glandular; hairs appressed or if spreading then less than 2 mm. long; beak of fruit usually more than 2 mm. broad .. 12. *P. trinervata*.

1. *Psoralea simplex* T.&G. Perennial with fusiform tuberous roots; stems erect, simple, 3-9 dm. tall, more or less strigose throughout; stipules subulate, about 1 cm. long; leaves pinnately trifoliolate, the lower petioled, the upper subsessile; petioles 5 cm. long or shorter; leaflets 2-7 cm. long, 5-15 mm. broad, linear-lanceolate, acute or mucronate, gland-dotted above, strigose beneath; peduncles 4-10 cm. long; racemes 2-5 cm. long, dense, spikelike; calyx sparingly strigose, purple, the tube 3.2-4 mm. long; calyx lobes lanceolate, acute, a little longer than the tube, the lowest one a little longer than the rest; corolla deep-purple, 7-10 mm. long; pod obliquely orbicular, flat, transversely wrinkled, with a short incurved beak; seed brown, 2.5 mm. long. *Orbexilum simplex* (T.&G.) Rydb. Infrequent in sandy soils, e. and s.e. Tex., spring; s.e. U.S.

2. *Psoralea psoralioides* (Walt.) Cory var. *eglandulosa* (Ell.) F. L. Freeman. **SAMPSON'S SNAKEROOT**. Perennial with fusiform tuberous roots; stems several from the base, 3-8 dm. tall, glabrous or sparingly strigose; stipules 4-5 mm. long, subulate; petioles 1-6 cm. long or the upper ones much shorter; leaves pinnately trifoliolate; leaflets 4-7 cm. long, 1-2 cm. broad, lanceolate (or those of the lower leaves elliptic), 4 to 7 times as long as broad, sparingly dotted with minute glands; peduncles 8-15 cm. long; racemes 4-10 cm. long, dense, spikelike; calyx strigose, 2-3 mm. long (3-6 mm. including the lobes) its lanceolate lobes slightly longer than the tube with the lowest one slightly longer than the rest; corolla lilac or lavender, 4-7 mm. long; pod obliquely orbicular, flat 4 mm. long, transversely wrinkled, with a short incurved beak; seed dark-brown, 3 mm. long. *Orbexilum pedunculatum* (Mill.) Rydb. Sandy wooded areas, e. and s.e. Tex., frequent, spring; s.e. U.S. n. to Va. and Ill. (The var. *psoralioides* from Va. to Fla., not in Tex.).

3. *Psoralea lanceolata* Pursh. Perennial with creeping branched rootstocks, stem 15-40 cm. tall, glandular-punctate throughout, sparingly strigose; leaves palmately 3-foliolate; stipules linear-lanceolate to subulate, 3-10 mm. long; petioles 1-2 cm. long; leaflets 1-4 cm. long, narrowly linear to oblanceolate, beneath nearly glabrous and prominently gland-dotted; peduncles 2-5 cm. long; racemes slender, loose, 10-25 mm. long and less than 15 mm. thick; bracts minute; calyx campanulate, sparingly strigose, the tube 2 mm. long, the nearly equal lobes obtuse and gland-dotted; corolla white or slightly purple-tinged, 5-6 mm. long; banner almost orbicular; blades of the wings obliquely oblong-oblanceolate; keel petals scarcely lobed at the base and usually purple-tipped; pod globose, 5 mm. long, conspicuously glandular-warty, sparingly strigose or glabrate, the short beak erect. *P. micrantha* Gray, *Psoralidium lanceolatum* (Pursh) Rydb. Sandy soils, higher parts of the Plains Country, June; Great Plains s. to Tex. and s.w. to Ariz.

4. *Psoralea linearifolia* T. & G. Perennial with creeping rootstock; stem 3-8 dm. tall, sparingly gland-dotted, sparingly strigose or glabrate, striate, with long slender branches; leaves palmately trifoliolate (those of the branches often 1-foliolate); stipules lanceolate or subulate, 3-7 mm. long; petioles 1-5 mm. long; leaflets linear to lanceolate, 7 to 16 times as long as broad, 2-6 cm. long, 1-3 mm. broad, with numerous small glands, glabrous above, sparingly strigose beneath, acute at both ends; peduncles 4-8 cm. long; racemes loose, few-flowered, 3-6 cm. long, less than 15 mm. thick; flowers 1 to 4 at each node; bracts lanceolate, acuminate, less than 4 mm. long; pedicels 4-8 mm. long, often longer than the calyxes; calyx tube 3-4 mm. long, conspicuously punctate, sparingly strigose, only slightly enlarging after anthesis; calyx lobes lanceolate, acute, as long as the tube; corolla blue, 7-8 mm. long; banner rounded-obovate; pod about 8 mm. long, ovoid, flattened, gradually tapering into a straight beak; seed dark-brown, broadly obliquely

reniform. *Psoralidium linearifolium* (T. & G.) Rydb. Rocky calcareous soils, frequent in n.-cen. Tex., rare in Plains Country, May-June; Neb. and Wyo., s. to Tex.

5. *Psoralea tenuiflora* Pursh. SCURFY PEA. Perennial with long rootstocks; stem 2-6 dm. tall, more or less strigose, glandular-dotted, much-branched; leaves digitately trifoliolate or the lower rarely 5-foliolate; stipules lanceolate, 2-3 mm. long; petioles 3-12 mm. long; leaflets 1-5 cm. long, 5-12 mm. broad, 2 to 6 times as long as broad, oblong-ob lanceolate to linear, rarely even obovate, obtuse, mucronate, gland-dotted on both sides, glabrate above, strigose beneath; peduncles 2-3 cm. long; racemes 15-40 mm. long; bracts minute, ovate or lanceolate, acuminate; flowers solitary or two at each node; pedicels often longer than the calyxes; calyx tube 2-2.5 mm. long, sparingly strigose, densely gland-dotted; calyx lobes nearly equal, lanceolate, acute, nearly equaling the calyx tube; corolla blue, about 5-7 mm. long; banner rounded-obovate, nearly orbicular; pod ovoid, 7-8 mm. long, glabrous, densely gland-dotted, with a short straight beak; seed brown, reniform, shiny. *Psoralea Bigelovii* (Rydb.) Tidestr., *P. floribunda* T.&G., *P. obtusiloba* T.&G., *Psoralidium tenuiflorum* (Pursh) Rydb. Frequent in n.-cen. Tex. and local in Trans-Pecos and parts of the Plains Country, scattered in Edwards Plateau and e. and s.e. Tex., May-July; cen. U.S. from Ill. to Mont. and s. to Tex. and Ariz.

6. *Psoralea digitata* T.&G. Perennial with rootstocks; stems erect, simple below, with ascending-spreading branches, 3-8 dm. tall, appressed-canescens throughout; leaves mostly palmately 5-foliolate or some of those on the branches 3-foliolate; stipules lanceolate, 5-10 mm. long; petioles 2-5 cm. long; leaflets linear or linear-ob lanceolate, 2-5 cm. long, 3-5 mm. broad, glabrous above except the midvein, densely silky beneath; peduncles 10-15 mm. long; racemes spikelike, interrupted, 3-6 cm. long; bracts broadly obovate, 5 mm. long, nearly as broad, sparingly gland-dotted, abruptly short-acuminate; flowers 2 to 4 at each node, subsessile; calyx 5-7 mm. long, accrescent after anthesis, conspicuously enlarged in fruit; calyx lobes ovate-lanceolate, abruptly short-acuminate, the lowest somewhat longer; banner obovate; pod ovoid, 7-8 mm. long, with a flat straight beak; seed ellipsoid, brown, 4-5 mm. long. Usually in sandy soils; represented with us by 2 varieties:

Var. *digitata*. Leaflets narrowly oblong-lanceolate, those of the middle leaves 4-8 mm. broad. *Psoralidium digitatum* (T.&G.) Rydb. Locally abundant in n.-cen. Tex., w. to Erath Co., reported from Wheeler Co. in the Panhandle, May-July; S. D. to Colo., Tex. and Ark.

Var. *parvifolia* Shinn. Leaflets linear, those of the middle leaves 2-4 mm. broad. Oak and pine woodlands, e. Tex., spring; endemic.

7. *Psoralea Reverchonii* Wats. Erect herb 5-12 dm. tall; rootstock large, fusiform or elongate; mainstem unbranched below, much-branched above with many lateral ascending slender branches; pubescence sparse, appressed, inconspicuous except for that on the margins of the bracts and calyxes which appear silky; leaves palmately 3- (to 5-) foliolate, the lower leaves caducous; stipules subulate, to 6 mm. long; petioles short, 2-8 (-28) mm. long; upper leaves almost sessile; leaflets elliptic or broadly elliptic with an acute often mucronate apex, 15-30 (-45) mm. long, 5-9 (-14) mm. broad, glabrous and punctate above, pubescent beneath; racemes short, congested, turbinate or subcapitate, each with 3 to 7 flowers; branches bearing the flowers much-branched, giving the appearance of a panicle; peduncles to 2 cm. long; flowers partly enclosed by the large persistent ovate-caudate bracts which are 11-20 mm. long and 8-12 mm. broad; bracts and calyxes conspicuously glandular-punctate; flowers 10-15 mm. long, on pedicels to 7 mm. long; calyx lobes 5-12 mm. long; petals bluish-lavender; fruit enclosed by the calyx, 6-8 mm. long, with a beak 2-3 mm. long, densely glandular-punctate. Rocky calcareous soils or rarely on sandy soils, rare in n.-cen. Tex. (Cooke, Hood and Johnson cos.), June-July; also Okla.

8. *Psoralea cyphocalyx* Gray. Tall erect slender herb with a small globose or short-fusiform rootstock which is 12-25 mm. long and 10-18 mm. thick; stem 3-7 (-9) dm. tall, unbranched except near its apex; branches very slender; leaves palmately 3- to 5-foliolate, rather sparse, often only 5 to 10 per plant, distributed almost all the way up the stem but lower leaves often caducous; petioles (8-) 12-35 (-50) mm. long; leaflets elongate, narrowly lanceolate or elliptic to linear, 35-85 mm. long, 3-9 (-13) mm. broad, upper surfaces glabrate and glandular-punctate, lower surface with an inconspicuous sparse appressed pubescence which covers most of the plant; stipules lanceolate below, linear or subulate above, to 1 cm. long; racemes dense, subglobose or somewhat elongate, 3-7

(-9) cm. long; peduncles 3-8 cm. long, about as long as or longer than the petioles; pedicels short, 1-3 mm. long; bracts ovate or lanceolate, shortly acuminate, 5-7 mm. long; flowers as in *P. cuspidata*, lavender, purple or bluish; fruit about 8 mm. long, completely enclosed within the expanded calyx, the beak about 3 mm. long. *Pediomelum cyphocalyx* (Gray) Rydb. Barren limestone hills, e. edge of Edwards Plateau and w. part of n.-cen. Tex. from Bandera and Medina cos. n. to Wise Co., May-June; endemic.

9. *Psoralea cuspidata* Pursh. Procumbent to ascending or erect herb with fusiform or elongate thickened rootstocks 1-2 cm. thick and 5-25 cm. long; stems (25-) 30-60 (-80) cm. long, unbranched below, with ascending branches above; pubescence appressed, somewhat sparse; lowest stipules broadly ovate, about 13 mm. long and 6 mm. broad, tending to clasp the stem and usually not associated with leaves or branches; stipules becoming progressively narrower toward the top but remaining about the same length; upper stipules lanceolate to linear-lanceolate or linear-subulate, 8-13 mm. long, 0.5-1.5 mm. broad; leaves digitately 3- to 5-foliolate; petioles shorter than the peduncles, 1-3 (-4) cm. long; leaflets broadly to narrowly elliptic or obovate, apically acute to obtuse or even rounded, more or less apiculate, 10-20 (-24) mm. broad, 25-50 mm. long, lower surfaces pubescent, upper glabrate and gland-dotted; inflorescence a dense or interrupted conical or elongate raceme 4-7 (-9) cm. long; bracts broadly to narrowly ovate or elliptic, long-acuminate or cuspidate, becoming narrower and more elongate in age, 7-14 mm. long, 2-5 mm. broad; bracts and calyx conspicuously gland-dotted; flowers 12-20 mm. long, the calyx a little more than half this length; calyx gibbous basally, becoming inflated in fruit; calyx lobes lanceolate or ovate, acute or sometimes long-acuminate; lower calyx lobe 7-12 (-15) mm. long, the upper 4 lobes 3-7 (-10) mm. long; petals light- or deep-blue, purplish-blue or violet; fruit completely enclosed in the expanded calyx, 6-8 mm. long, with a small curved beak about 2 mm. long. *P. caudata* (Rydb.) Cory, *Pediomelum Parksii* Tharp & Barkl. Frequent, usually in calcareous soils, n.-cen. Tex., Plains Country and Edwards Plateau, infrequently s. to DeWitt and Lavaca cos., spring; Great Plains, S. D. to Tex.

10. *Psoralea latestipulata* Shinnars. Erect herbs 1-3 dm. tall, with a globose turnip-shaped or rarely narrowly elongate tuberous rootstock 25-45 mm. long and 15-30 mm. thick, typically with no lateral branches except for a few short ones near the apex; leaves usually fewer than 12, clustered with the inflorescences along the upper half or third of the length; stem with dense spreading pubescence or less dense appressed pubescence; leaves palmately 5- to 7-foliolate; stipules broadly ovate to lanceolate, 7-14 mm. long, 3-7 mm. broad, yellowish below, greenish above, the upper stipules not much narrower than the lower ones; petioles to 7 cm. long, generally a little longer than the peduncles; leaflets narrowly elliptic or obovate, 20-45 mm. long, 6-15 mm. broad, gland-dotted; racemes dense, globose, to 35 mm. long; bracts similar to the stipules; flowers similar to those of *P. cuspidata*; pod 10-12 mm. long, with a narrow beak 5-6 mm. long, inconspicuously gland-dotted. Represented with us by two varieties as follows:

Var. *latestipulata*. Pubescence rather dense, spreading; plants often only 5-10 cm. tall but occasionally reaching 3 dm.; leaflets less than 10 mm. broad. Rocky or sandy calcareous soil or on bare limestone, n.-cen. Tex., s. part of Plains Country and n. part of Edwards Plateau, s.w. to McCulloch and Tom Green cos., Apr.-May; endemic.

Var. *appressa* Ockendon. Pubescence sparse, appressed; plants 15-35 cm. tall; leaflets 6-15 mm. broad. Frequent, hillsides, Travis to Kerr cos., s.e. to Gonzales Co., Mar.-Apr.; endemic.

11. *Psoralea subulata* Bush. Rootstocks 20-45 (-60) mm. long, 10-25 (-40) mm. thick, globose or fusiform; stem absent or rarely to 8 cm. long, with densely crowded nodes; pubescence of dense spreading hairs 2-3 mm. long; leaves palmately (3- to) 5-foliolate; stipules scarious, lanceolate, 10-15 mm. long; petioles 5-15 (-18) cm. long; leaflets elliptic to rhomboid or obovate, with an acute to obtuse or rounded apex, densely pubescent below; sparsely so above, 25-55 (-73) mm. long, 13-26 (-37) mm. broad; racemes dense, (1-) 3-6 cm. long; peduncles about as long as or somewhat shorter than the petioles; calyx lobes of roughly equal length, 6-10 mm. long, the upper 4 linear-subulate, the lower lanceolate, to 2 mm. broad; petals purplish or lavender, the banner paler, often cream-colored below; pod 15-20 mm. long, with a subulate beak 10-15 mm. long, densely pubescent, projecting well beyond the expanded calyx. Incl. var. *minor* Shinnars, *Pediomelum subulatum* (Bush) Rydb. Local in openings in woods on loose sandy soil, e., s.e. and

n.-cen. Tex., s. to Bexar, Wilson and Goliad cos., Mar.-May; endemic as far as known, but probably La., too.

12. *Psoralea trinervata* (Rydb.) Standl. Short erect herbs with enlarged fusiform rootstocks 40-55 mm. long and 12-20 mm. thick; stems absent or less commonly to 12 cm. long; pubescence conspicuous, appressed or somewhat spreading; leaves palmately 5-foliolate; petioles 6-15 cm. long; leaflets cuneate-obovate or elliptic, with an obtuse mucronate apex and crinkly margins, 25-40 mm. long, 15-23 mm. broad, gland-dotted and less densely pubescent above; stipules scarious, lanceolate to linear, to 15 mm. long; racemes dense, globose or more elongate, to 6 cm. long; peduncles 3-9 cm. long, shorter than the petioles; pedicels short, to 2 mm. long; flowers 12-18 mm. long; corolla not projecting far beyond the calyx lobes; calyx tube (in flower) 4-5 mm. long; calyx lobes 10-12 mm. long, enlarging considerably in fruit, very unequal, the upper 4 linear-subulate, the lower 1 elliptic, about 3 mm. broad in flower and to 7 mm. broad in fruit; lower calyx lobe (in fruit glabrate) sparsely punctate, with 3 prominent veins; beak of fruit stout, flat, broad, 10-15 mm. long, projecting somewhat beyond the calyx lobes; seed large, rather thick and of uniform thickness, markedly reticulate. *Pediomelum trinervatum* Rydb. Very rare and perhaps not a persistent member of our flora, collected once in August, about 1853, in "fields near the Presidio del Norte," Presidio Co. in the Trans-Pecos. Otherwise known from Grant Co., N. M. and near Chihuahua, Chih.

13. *Psoralea Rydbergii* Cory. Root tuberous, often expanded above and elongate below, 4-11 cm. long, 18-27 mm. thick; stem absent; pubescence appressed or tending to become spreading; leaves pinnately 3-foliolate; stipules scarious, lanceolate or broadly lanceolate, to 12 mm. long; petioles 30-95 mm. long; petiolule of middle leaflet 5-12 mm. long; leaflets broadly elliptic or obovate, acute, obtuse or becoming rounded apically, 15-23 (-32) mm. long, 10-19 (-24) mm. broad, gland-dotted, densely pubescent below, more sparsely so above with hairs more or less restricted to the veins; raceme dense, globose, to 3 cm. long; peduncle 20-65 mm. long, generally shorter than the petioles; pedicels to 3 mm. long; bracts inconspicuous, scarious, lanceolate, to 8 mm. long, similar to the stipules; flowers 12-20 mm. long; corolla projecting well beyond the calyx; calyx 10-17 mm. long; calyx lobes about as long as the tube and linear or narrowly lanceolate, subequal, the lower 1 slightly broader than the upper 4; calyx expanding and elongating in fruit; pod to 15 mm. long with a tapering beak almost as long as the body of the pod, the beak barely projecting beyond the calyx lobes. *Pediomelum humile* Rydb. Rare in calcareous soil, in Val Verde Co., s.w. Tex., Apr.-May; also Coah.

14. *Psoralea hypogaea* T.&G. Rootstock globose or fusiform; stem absent; whole plant covered with dense whitish appressed pubescence; upper surfaces of leaflets becoming glabrate; leaves palmately 3- to 7-foliolate, mostly 5-foliolate; stipules lanceolate or ovate, scarious, to 2 cm. long; petioles 4-9 (-12) cm. long; leaflets narrowly obovate to linear-elliptic or linear-ob lanceolate, (15-) 25-50 mm. long, 4-9 (-13) mm. broad; spike dense, globose, to 25 mm. long; peduncle from very short to about as long as the petioles, 5-70 (-100) mm. long; bracts inconspicuous, scarious, ovate; flowers 8-12 mm. long, almost sessile; upper 4 calyx lobes subulate, lower 1 lanceolate or elliptic, in fruit to 4 mm. broad and often with 3 conspicuous veins; banner whitish to pale-lavender or lavender; wings and keel dark-lavender or purple; fruit 13-18 mm. long, with a narrow beak 7-12 mm. long which projects well beyond the calyx. Represented with us by 2 varieties as follows:

Var. *hypogaea*. Root fusiform or elongate, 2-4 cm. long, (4-) 8-20 mm. thick; leaflets mostly rather narrowly elliptic, up to 8 times as long as broad; peduncles markedly shorter than the petioles, 5-30 mm. long. *Pediomelum hypogaeum* (T.&G.) Rydb. Higher parts of the Plains Country, s. to Lubbock Co., May-June; Mont. and Wyo., s. to Tex. and N.M.

Var. *scaposa* Gray. Rootstocks usually globose, 12-25 mm. long, 11-25 mm. thick; leaflets often broader and shorter than in var. *hypogaea*; peduncles (2-) 3-7 (-10) cm. long, about the same length as the petioles or just a little shorter. *P. scaposa* (Gray) Macbr. and var. *breviscapa* Shinnery, *Pediomelum Goughae* Tharp & Barkl. Calcareous hillsides, n.-cen. Tex. and e. edge of Edwards Plateau, locally w. to Martin and Mitchell cos., Apr.-May; endemic.

15. *Psoralea rhombifolia* T. & G. Rootstock deep, about 25 mm. long and 1 cm. thick; 1 or more long slender trailing shoots to 1 m. long, branching from the crown, these stems occasionally ascending near the ends; pubescence usually short-appressed and rather sparse but occasionally longer, denser and spreading; leaves pinnately trifoliolate; stipules small,

linear or lanceolate, 2-6 cm. long; petioles slender, 3-7 (-11) cm. long; petiolule of middle leaflet to 15 mm. long; leaflet shape variable; basal leaves commonly with orbicular leaflets that are rounded or emarginate apically; leaflets of midstem ovate to rhomboid or broadly lanceolate to broadly elliptic, 10-35 mm. long, 1-3 cm. broad; spikes short, dense, capitate, commonly with only 3 to 8 flowers, in some plants the inflorescence elongate and forming distinct internodes; peduncles slender, (2-) 3-7 (-10) cm. long; bracts similar to the stipules, small, linear, inconspicuous; flowers small, 5-8 (-10) mm. long; calyx 4-6 mm. long, the lobes subequal and slightly longer than the tube; petals brick-red or orange-brown, the banner somewhat paler than the wings and keel; fruit 8-11 mm. long, body enclosed by the calyx, the linear beak 4-6 mm. long and projecting well beyond the calyx. Usually sandy soil, Grayson Co., w.-s.w. to Andrews Co. and s. to Rio Grande Plains, infrequent in e. and s.e. Tex., Mar.-July; Tex., La., Okla., Tam., N.L., Ver., Hgo., Pue., Oax., Mor., Jal., Son. and Baja Calif.

31. AMORPHA L.

Unarmed erect shrubs, often rhizomatous, the herbage and calyx often gland-dotted; leaves alternate, deciduous, usually 8 cm. or more long, once-imparipinnate with 7 or more leaflets; leaflets (4-) 5-30 mm. broad; stipules setaceous, caducous; stipels present; flowers in dense spikelike racemes; calyx obconoid, 5-toothed, persistent; corolla very irregular, reduced to 1 petal (the uppermost one, banner), the rest absent, this banner purplish, bluish or whitish; stamens 10, exserted; filaments all united briefly at the base, free for most of their length; fruit 4-8 mm. long, gland-dotted, not much if at all compressed, slightly exserted from the calyx, 1- or 2-seeded, very tardily dehiscent or seemingly indehiscent.

A genus of about 20 species in the temperate regions of North America.

- 1. Leaflets (15-) 20-30 mm. wide; calyx uniformly pubescent (2)
- 1. Leaflets 8-18 (-22) mm. wide; calyx glabrous to variously pubescent (3)
- 2(1). Leaflets with conspicuous raised veins beneath; spikes of inflorescence (mature ones) (15-) 20-40 cm. long3. *A. paniculata*.
- 2. Leaflets inconspicuously veined beneath; spikes of inflorescence 10-20 cm. long
.....4. *A. texana*.
- 3(1). Leaves sessile or subsessile, the petioles 8 mm. long or less
.....1. *A. canescens*.
- 3. Leaves distinctly petiolate, the petioles 10 mm. long or more (4)
- 4(3). Stalk of the leaflet conspicuously warty with raised glands; calyx conspicuously glandular; mature flowering racemes 15-30 cm. long ..2. *A. laevigata*.
- 4. Stalk of the leaflet inconspicuously glandular, if at all; calyx indistinctly glandular; flowering racemes 10-15 (-20) cm. long5. *A. fruticosa*.

1. *Amorpha canescens* Pursh. LEAD PLANT. Rhizomatous, usually canescent or less commonly glabrous; shrub 3-10 dm. tall; leaves 3-15 cm. long, sessile or subsessile, the petiole (0.5-) 1-3 (-5) mm. long; leaflets (11 to) 27 to 41 (to 47), usually (3-) 10-18 (-25) mm. long, (2-) 4-7 (-12) mm. broad, ovate-oblong to oblong-elliptic or oblong to elliptic or even ovate, the venation usually obscured by the pubescence or inconspicuous even when the pubescence is absent; racemes usually numerous in the axils of the uppermost leaves and often forming a dense compound cluster, (2-) 7-15 (-25) cm. long, 10-15 mm. thick; calyx tube 1.5-2.5 mm. long; calyx lobes narrowly triangular-lanceolate, unequal, 0.6-2.5 mm. long; banner 4.5-6 mm. long, bright-violet. Incl. var. *glabrata* Gray. Infrequent or rare and local and with a very peculiar disjunct distribution, occurring in sandy prairies, e. Panhandle and again scattered in s.e. and s.-cen. Tex., s. to Aransas Co., May-July; s.-cen. Can. s. to N.M. and Tex.

2. *Amorpha laevigata* T.&G. Glabrous shrub, 10-25 dm. tall; leaves 1-2 dm. long; petioles slender, 2-3 cm. long; leaflets 7 to 21, oblong or obovate, 2-3 cm. long, 1-2 cm. broad, rounded at both ends or cuneate basally and sometimes emarginate apically, thin, conspicuously gland-dotted beneath; petiolules conspicuously warty-glandular; flowering racemes usually 2 or 3 (sometimes more), slender, 15-30 cm. long; calyx glabrous, gland-

dotted; calyx lobes short, the upper 2 rounded, the lower 3 lanceolate, acute; banner blue or purple; pod about 5 mm. long, conspicuously gland-dotted, nearly straight dorsally. Rare in n.e. Tex. (Cass and Van Zandt cos.), June; also Okla. Perhaps only a form of *A. texana*.

3. *Amorpha paniculata* T.&G. Stout shrub 2-3 m. tall; branchlets sulcate, tomentose; leaves 20-35 cm. long; petioles 4-5 cm. long; leaflets 15 to 19, ovate or oblong, 3-8 cm. long, (15-) 20-30 mm. broad, rounded at both ends or rarely emarginate apically, when young finely short-pilose above and densely tomentose beneath, at maturity glabrous and glossy above and still tomentose on lower surface, with prominent venation beneath; spikes of inflorescence (15-) 20-40 cm. long; calyx oblique, narrowly campanulate, pubescent, the lobes lanceolate and about half as long as the tube; banner purple; pod 6-8 mm. long, more or less curved dorsally, pubescent and with large resinous gland-dots. Deep acid woodlands and bogs, e. Tex., May-June; Ark., La. and Tex.

4. *Amorpha texana* Buckl. Shrub 1-3 m. tall, with spreading branches; branches, foliage and inflorescence more or less pubescent to glabrous; leaves 10-15 cm. long; petioles 1-2 cm. long; leaflets 7 to 15, broad-oblong or ovate, 15-40 mm. long, 15-30 mm. broad, rounded at both ends or emarginate apically, firm, dark-green and glossy above, paler and pubescent beneath at least along the inconspicuous veins; petiolules 3-5 mm. long, usually pubescent and conspicuously glandular; spikes of inflorescence solitary or few, (5-) 10-15 (-20) cm. long, rather loosely flowered at least near the base; rachis puberulent; calyx narrow-campanulate, 4-5 mm. long, uniformly pubescent or glabrous, gland-dotted; calyx lobes all much shorter than the tube, the 2 upper ones blunt or round, the 3 lower short-lanceolate and acute; banner blue or violet; pod 6-7 mm. long, nearly straight dorsally, conspicuously gland-dotted. Incl. var. *glabrescens* E. J. Palm. Scarce along Edwards Plateau creeks and rivers in Bandera, Blanco, Comal, Gillespie, Kendall and Kerr cos., spring; endemic.

5. *Amorpha fruticosa* L. BASTARD INDIGO. Shrub 2-3 m. tall; branches and foliage more or less pubescent with short-appressed hairs; leaves 1-2 dm. long; petioles (1-) 2-3 cm. long; leaflets 11 to 27 (to 35), oblong or elliptic, rounded or narrowed at base, rounded or rarely abruptly pointed apically, 15-30 mm. long, 7-15 (-20) mm. broad, firm but thin at maturity, dark-green and slightly reticulate-veined above, paler and sparingly gland-dotted and more or less pubescent at least along veins beneath, not crowded on rachis; petiolules short, not glandular-warty; spikes solitary or several, 8-15 (-20) cm. long, peduncled; calyx 3-4 mm. long, nearly glabrous or pubescent; calyx lobes all much shorter than the tube, the upper 2 broad and obtuse, the lower 3 triangular and acute, villous or ciliate along the margins; banner dark-blue; pod 6-7 mm. long, slightly curved dorsally, glabrous and conspicuously gland-dotted. Widespread, Apr.-June; represented with us by 4 subtaxa:

Var. *fruticosa*. Leaflets broad, elliptic. Rare in e. Tex.; e. U. S.

Var. *angustifolia* Pursh. Leaflets narrower. Widespread in Tex. except absent in Rio Grande Plains and rare in e. and far w. Tex.; widely scattered in U. S.

Var. *croceolanata* (P. W. Wats.) Mouillef. With densely pubescent leaves and calyxes. Rare in s.e. Tex.; s.e. U. S.

Var. *occidentalis* (Abrams) Kearn. & Peeb. With oval or oblong glabrate leaflets and mostly solitary spikes. Scattered in w. half of Tex.; Wyo., Calif., Tex., N.M., Ariz., Son., etc.

32. EYSENHARDTIA H.B.K.

KIDNEY WOOD

Shrubs unarmed, much-branched, 5-35 dm. tall, the branches slender; all the herbage and many flower parts gland-dotted and aromatic; leaves alternate, deciduous, once-imparipinnate, 1-6 (-9) cm. long; petioles short; stipules subulate; leaflets 13 to 47, 3-12 mm. long, oblong or oblong-lanceolate; stipels subulate, 0.3-0.5 mm. long, about equaling or shorter than the petiolules; flowers in axillary or subterminal spikelike racemes 1-11 cm. long, slender, sometimes somewhat interrupted; calyx unequally lobed, the anterior (uppermost) lobe longest, the tube split more deeply between the posterior lobes; corolla nearly regular but vaguely papilionaceous; petals white to pale-yellow, nearly equal, 4-5 mm. long, with oblanceolate to obovate blades and narrow claws; stamens 10, diadelphous,

9 with filaments coalescent about half their length, the tenth (uppermost) free; pod indehiscent or very tardily dehiscent, 5-10 mm. long, 1.7-2.5 mm. broad, laterally flattened, with only 1 mature seed, gland-dotted.

More than a dozen species from southwestern United States to Guatemala.

- 1. Shrub usually 2-3 m. tall; leaves 3-9 cm. long; leaflets 15 to 47, mostly 5-12 mm. long; racemes 3-11 cm. long1. *E. texana*.
- 1. Shrub usually not more than 1 m. tall; leaves 1-3 cm. long; leaflets 13 to 17, 3-4 mm. long; racemes usually not more than about 3 cm. long; rare species in mountains in Presidio Co.2. *E. spinosa*.

1. *Eysenhardtia texana* Scheele. VARA DULCE. Shrub, usually 2-3 m. tall, rarely small trees; leaves 3-9 cm. long; leaflets 15-47 per leaf, mostly 5-12 mm. long; racemes 3-11 cm. long. *E. angustifolia* Penn. Frequent in brushy vegetation, usually on highly calcareous soils, s. Tex., n. to Bell, San Saba, Crockett and Brewster cos., Apr.-Sept.; Tex. s. to Qro. and Ver.

2. *Eysenhardtia spinosa* Gray. Shrub, usually not more than 1 m. tall; leaves 1-3 cm. long; leaflets 13 to 17, 3-4 mm. long; racemes usually about 3 cm. long. Rare, known from one population on Capote Peak in w. Presidio Co., Trans-Pecos Tex., Aug.; also Chih.

33. DALEA L.⁸⁹

Annual or perennial herbs or low shrubs, unarmed; leaves alternate, once-imparipinnately-compound or in *D. scoparia* simple, or rarely palmately trifoliolate, gland-dotted; stipules and stipels present, the latter sometimes reduced to glands; flowers in terminal heads, racemes or spikes, of various colors; calyx usually gland-dotted, usually obconoid or campanuloid, its cup often ribbed, the 5 lobes often as long as the cup or longer and often subulate; corolla papilionaceous or in a few species very obscurely so, the banner (uppermost) petal attached near the rim of the floral cup, the other 4 petals attached either near the rim of the floral cup or else seemingly attached at various levels on the "stamen tube" (this may represent in part an extension of the floral cup tissue) but never at the terminal rim of that "stamen tube;" stamens 5, 6, 7, 8, 9 or 10, the filaments monadelphous, coalescent for most of their lengths; fruit a dry indehiscent slightly if at all flattened 1- or 2-seeded pod mostly included in the persistent calyx or but very slightly exceeding it. *Parosela* Cav.

A genus of perhaps 250 to 300 species in the warmer parts of the Americas, not well-delimited from *Petalostemum* Michx. but technically distinguished by the placement of the petals on the "stamen tube."

- 1. Leaves simple (rarely, 3-foliolate) 1. *D. scoparia*.
- 1. Most leaves on any one specimen compound (2)
- 2(1). Plants more or less shrubby or suffrutescent, the stems persisting to produce new branchlets each year (straggling and stoloniferous in *D. Greggii*) (3)
- 2. Plants annual or perennial, the stems not persisting (the very lowest portions of the stem sometimes persisting in *D. Wrightii*) (7)
- 3(2). Branches and leaves glabrous (4)
- 3. Branches and leaves villous to puberulent (5)
- 4(3). Calyx lobes as long as the tube or longer22. *D. formosa*.
- 4. Calyx lobes much shorter than the tube 8. *D. frutescens*.
- 5(3). Plants straggling, the stems decumbent and rooting at the nodes; calyx lobes lanceolate, 1-3 mm. long; leaves densely sericeous ..21. *D. Greggii*.
- 5. Plants with stiffly erect stems; calyx lobes triangular, 0.5-1 mm. long or (if longer) subulate and some of them recurved at tip; leaves variously pubescent but not densely sericeous (6)

⁸⁹ We are grateful to Rupert C. Barneby for reading and making some additions and corrections to the manuscript.

- 6(5). Calyx lobes subulate, at least some of them recurved at the tip; plants of extreme southern Texas23. *D. thyrsiflora*.
6. Calyx lobes deltoid, 0.5-1 mm. long, not recurved at tip; plants of western Texas
..... 9. *D. argyraea*.
- 7(2). Flowers short-pedicel (best seen on old spikes after the flowers fall), spreading at right angles or reflexed at maturity; racemes densely covered with long brown or tawny hairs (8)
7. Flowers sessile or nearly so, ascending, never reflexed; spikes variously pubescent (10)
- 8(7). Bracts ovate, 10-15 mm. long; stems stiffly erect, sparsely pubescent, conspicuously glandular-pustulate 2. *D. lachnostachys*.
8. Bracts lanceolate, 8 mm. long or less; stems straggling, densely soft-pubescent, with scattered glands but not pustulate (9)
- 9(8). Leaflets cuneate-obovate, truncate or retuse at apex, with conspicuous crenulate margins, the glands nearly all marginal 4. *D. neomexicana*.
9. Leaflets mostly elliptic, rounded at apex (rarely retuse), without crenulate margins, the glands scattered and not conspicuously marginal
..... 3. *D. longipila*.
- 10(7). Leaflets completely glabrous (11)
10. Leaflets variously pubescent (17)
- 11(10). Plants annuals (Doubtful cases should be keyed under both alternatives) (12)
11. Plants perennials (15)
- 12(11). Stamens 5; 4 of the petals inserted slightly below the end of the "stamen tube," the fifth near the base of the "stamen tube"24. *D. emarginata*.
12. Stamens more numerous; all 5 petals inserted near the top of the floral cup, not on the "stamen tube" (13)
- 13(12). Stems 3-10 dm. tall; bractlets caducous 7. *D. leporina*.
13. Stems 1-3 dm. tall; bractlets not caducous (14)
- 14(13). Flowering peduncles mostly 3-9 cm. long at maturity
..... 5. *D. polygonoides*.
14. Flowering peduncles mostly 1-3 cm. long at maturity .. 6. *D. brachystachys*.
- 15(11). Spikes very lax; corolla white; stems mostly single .14. *D. enneandra*.
15. Spikes not very lax; corolla purplish; plants with several stems from the base (16)
- 16(15). Calyx lobes subulate, 6 to 40 times as long as broad, usually as long as the calyx tube or longer13. *D. pogonathera*.
16. Calyx lobes acute to acuminate, 6 times as long as broad or less, shorter than the calyx tube12. *D. lasiathera*.
- 17(10). Stems prostrate, widely spreading; flowers red to pink (18)
17. Stems erect to suberect or decumbent but not prostrate and spreading; flowers yellow (sometimes fading to a pinkish color when dry) (19)
- 18(17). Calyx tube and lobes densely villous10. *D. lanata*.
18. Calyx tube glabrous, the lobes villous11. *D. terminalis*.
- 19(17). Main stem leaves 5- or 7- (9-) foliolate, the majority always 5-foliate (20)
19. Main stem leaves 3-foliate (the uppermost sometimes simple) (22)
- 20(19). Stipules setiform, over 4 mm. long; bracts 6-12 mm. long; calyx teeth mostly 6-9 mm. long19. *D. Wrightii*.
20. Stipules subulate, sometimes up to but exceptionally over 3 mm. long; bracts 2.5-5.5 mm. long; calyx teeth mostly 3.5-5 mm. long (21)
- 21(20). Stems coarser, erect, 30-75 cm. long, if branched distally commonly over 40 cm. long; spikes mostly 14-21 mm. thick; petals permanently yellow (unchanged in age or in drying), the keel blades 5-7 mm. long ...15. *D. aurea*.
21. Stems slender, commonly both diffuse and branched distally, 5-35 cm. long; spikes 7-13 (15) mm. thick; petals yellow fading pink or brown, the keel blades 3-5 mm. long16. *D. nana*.

- 22(19). Leaflets linear to linear-elliptic; pubescence of stems appressed; north-central Texas17. *D. Hallii*.
22. Leaflets obovate or elliptic-obovate, if narrowly so then the stems loosely pilose; Plains and Trans-Pecos (23)
- 23(22). Spikes relatively loose, not conelike; bracts subhomomorphic, deciduous; blade of banner 3-4 mm. long, over half as long as its claw; keel blades 5-6 mm. long18. *D. Jamesii*.
23. Spikes dense and conelike; bracts dimorphic, those at base of spike broadly ovate-acuminate, those between the flowers narrower; blade of banner about 2 mm. long, 2 or 3 times shorter than its claw; keel blades 3-4 mm. long20. *D. laniceps*.

1. *Dalea scoparia* Gray. BROOM PEA. Shrub 5 dm. tall or taller, with ascending canescent and conspicuously gland-dotted branches; leaves simple, spatulate-linear or oblanceolate, 1 cm. long or shorter, canescent and gland-dotted; peduncles 2-7 cm. long; spikes subglobose or oblong, 12-15 mm. broad, dense; bracts lanceolate, 2 mm. long; calyx tube turbinate, strongly 10-ribbed, with a row of 2 to 4 glands in each interval, 2.5 mm. long, white-villous; calyx lobes deltoid, 1 mm. long; corolla dark-blue; blade of the banner broadly ovate, subcordate basally and retuse apically, usually with a single gland near the apex, the claw 2.5 mm. long; blades of the wings oblong, with a rounded basal lobe, 5 mm. long, those of the keel petals broadly obliquely obovate, 5 mm. long, the claws of the wings and keel petals 2 mm. long; pod obliquely obovate, pubescent and gland-dotted, glabrous only at the very base; body about equaling the calyx. *Psorothamnus scoparius* (Gray) Rydb. Dunes and coppice mounds along the Rio Grande in El Paso and Hudspeth cos. (downstream to Ft. Hancock), (May) Aug.-Sept.; Ariz., N. M., Tex., Chih. and Coah.

2. *Dalea lachnostachys* Gray. Perennial herb with deep roots; stems erect, branched, 1-3 dm. tall, straw-colored, conspicuously gland-dotted and -pustulate and finely villous; leaves spreading, 4-8 cm. long; stipules subulate, 3-5 mm. long; petioles 1-3 cm. long; rachis gland-dotted and villous; stipules glandlike; leaflets 9 to 11, ovate or obovate, silky-villous on both sides, conspicuously gland-dotted along the margins beneath, 8-15 mm. long; peduncles opposite the leaves and terminal, 3-6 cm. long; racemes long-hairy, dense, cylindrical, 4-8 cm. long, fully 15 mm. thick; bracts ovate, concave, scarious-margined, often tinged with lilac, pubescent, long-acuminate, 10-15 mm. long, longer than the buds, deciduous; pedicels present; calyx tube turbinate, 3 mm. long, silky-pilose, strongly 10-ribbed, the calyx lobes twice as long as the tube; corolla bright-blue; blade of the banner broadly ovate, cordate basally, 4 mm. long, the claw 3 mm. long; blades of the wings and keel petals obliquely ovate, with a rounded basal lobe, about 4 mm. long, the claws 3 mm. long; pod very villous. *Parosela lachnostachys* (Gray) Heller. Locally abundant in the Trans-Pecos (Brewster, Hudspeth, Jeff Davis and Presidio cos.), 3,500-5,500 ft. elev., June-Oct.; Tex., N. M., Ariz. and Chih.

3. *Dalea longipila* (Rydb.) Cory. Perennial herb with slender roots; stem straggling, branched at the base, decumbent or spreading, 1-2 dm. long, densely and softly long-villous; leaves 3-5 cm. long, spreading; stipules small, subulate; leaflets 9 to 13, elliptic, rounded apically, rather sparingly silky-villous with long hairs, conspicuously gland-dotted, 6-12 mm. long; peduncles opposite the leaves, 3-7 cm. long; racemes long-hairy, rather dense, 2-3 cm. long; bracts narrowly lanceolate, 8 mm. long or shorter, gradually attenuate, not exceeding the calyxes; pedicels present; calyx long-silky; calyx tube about 3 mm. long, the lobes 4 mm. long; blade of the banner acutish-cordate, 3.5 mm. long, yellowish-white, gland-dotted near the base; wings yellowish-white, the blades obliquely obtusate, slightly retuse apically, with a rounded basal lobe, 4 mm. long, the claws 2 mm. long; keel petals with a purple tip, the blades obliquely obovate, with a rather large rounded basal lobe, with small glands at the base, 5 mm. long, the claw 3 mm. long; pods glabrous. *Parosela longipila* Rydb. Very dry limestone hills, Brewster, Val Verde and Terrell cos. of s.w. Tex., June-Oct.; also Coah., Tam. and N.L.

4. *Dalea neomexicana* (Gray) Cory. Perennial herb with slender roots; stems branched from the base, straggling, decumbent or prostrate, 1-2 dm. long, densely short-villous, almost velutinous; leaves 15-30 mm. long; stipules subulate, minute; petioles 3-6 mm. long; rachis densely short-villous; leaflets 7 to 11, cuneate-obovate, retuse, densely villous, gland-dotted near the margins, 3-8 mm. long, marginally crenulate; peduncles opposite the leaves, 2-3 mm. long; racemes long-hairy, dense, 1-2 cm. long;

bracts narrowly lanceolate, acuminate, 8 mm. long or shorter, scarcely longer than the calyx, long-villous; pedicels present; calyx tube turbinate, strongly 10-ribbed, densely silky-villous, 3 mm. long, the lobes about 5 mm. long; corolla mostly yellowish with purple- or rose-tinged keel, rarely rose-colored; blade of the banner broadly cordate, 3.5 mm. long, acute, conspicuously gland-dotted toward the base, equaling the claw; blades of the wings obliquely obcuneate-ovate, acutish, with a rounded basal lobe, 3.5-4 mm. long, those of the keel petals broadly obovate, with a rounded basal lobe, 4 mm. long, the claws of both 2-3 mm. long; pod villous. *Parosela neomexicana* (Gray) Heller. Deserts and desert-grasslands of the Trans-Pecos, frequent, Mar.-Nov.; s. Ariz., N. M., Tex., Chih., Son., Coah. and Tam.

5. *Dalea polygonoides* Gray. Slender taprooted annual 1-2 dm. tall, erect, branched, glabrous; leaves 2-3 cm. long; stipules subulate, 2 mm. long; petiole 5-10 mm. long; rachis glabrous, slightly gland-dotted; leaflets 3 to 9, broadly linear or linear-oblong, 6-15 mm. long, glabrous on both sides, sparingly gland-dotted beneath; peduncles terminating the branches, 3-9 cm. long; spikes dense, 1-2 cm. long; bracts ovate or obovate, acuminate, equaling the calyx, rather persistent, dark-colored with a few large glands, ciliate; flowers sessile or nearly so; calyx tube narrowly turbinate, somewhat extended by the fruit, silky-villous, 1.5 mm. long, 10-ribbed; calyx lobes subulate, acuminate, about equaling the tube; corolla bluish, pinkish or white; blade of the banner about 1 mm. long, rounded-ovate, truncate or subcordate basally, slightly longer than the claw; wings and keel petals inserted at the middle of the staminal tube, the blades obliquely ovate, with a rounded basal lobe, about 1 mm. long, those of the keel petals united along the lower edge, the claws 1 mm. long; pod villous, obliquely obovate, equaling the calyx. *Parosela polygonoides* (Gray) Heller. Rare on the higher parts of the Davis Mts., Jeff Davis Co. in the Trans-Pecos, Sept.; Tex., N. M., Ariz., Dgo. and Chih.

6. *Dalea brachystachys* Gray. Slender taprooted annual; stems 1-3 dm. tall, glabrous, much-branched, sparingly gland-dotted; leaves 1-3 cm. long; stipules minute, subulate; petiole 4-8 mm. long; rachis glabrous, margined, sparingly gland-dotted; stipels represented by glands; leaflets 5 to 11, cuneate-oblong to linear, glabrous, gland-dotted and glaucous beneath, 5-15 mm. long; peduncles terminating the branches or opposite the leaves, 1-3 cm. long at anthesis; spikes subglobose; bracts ovate, acute or acuminate, green to dark-brown, conspicuously gland-dotted, glabrous, tardily deciduous; flowers sessile or nearly so; calyx tube turbinate, 10-ribbed, silky-hirsute, 2 mm. long; calyx lobes with a deltoid base, subulate-filiform, longer than the tube; corolla yellowish, tinged with rose; blade of the banner subcordate, 2 mm. long and fully as broad; wings and keel petals inserted far below the middle of the "staminal tube," blades of the wings 2-2.5 mm. long, those of the keel petals broader and with a smaller basal lobe, 3 mm. long, the claws of both nearly 2 mm. long; pod silky-villous. *Parosela brachystachys* (Gray) Heller. Davis Mts. in the Trans-Pecos, at elev. of 4,000-6,000 ft., Aug.-Sept.; N. M., Ariz., Tex. and Son., s. to. Aguasc. and Pue.

7. *Dalea leporina* (Ait.) Bullock. FOXTAIL DALEA. Slender taprooted annual; stem striate, glabrous, gland-dotted, somewhat tubercled, with ascending branches, 3-10 dm. tall; leaves ascending, 4-8 cm. long; stipules subulate, 2-3 mm. long; petiole 5-8 mm. long; rachis glabrous, margined, sparingly gland-dotted; stipels glandlike; leaflets 21 to 41, 4-10 mm. long, glabrous, rather oblong, gland-dotted beneath; peduncles at the ends of the branches and opposite the leaves, 3-10 cm. long; spikes dense, 2-8 cm. long, about 8 mm. thick; bracts lanceolate or lance-ovate, acuminate, caducous, membranous, mostly pale, ciliate marginally and pilose dorsally; flowers sessile or nearly so; calyx tube turbinate, silky-pilose, 3 mm. long; calyx lobes lanceolate, subulate-acuminate, about equaling the tube; corolla white or tinged with rose or lilac; blade of the banner hastately obovate, with a truncate base and acute basal lobes, 2.5-3 mm. long; blades of the wings obliquely oblong, 2 mm. long, with a rounded basal lobe, those of the keel petals more obovate, with a less distinct basal lobe, soon distinct; stamens more than 5; pod pilose apically. *D. alopecuroides* Willd., *D. oreophila* (Cory) Cory, *D. leporina* var. *alba* (Michx.) Harrington, *Parosela alopecuroides* (Willd.) Rydb., *Petalostemum oreophilum* Cory. Scattered in Trans-Pecos mts., Sept.-Oct.; widespread in cen. N. A. and s. to C. R. and the Arg.-Bol. Andes.

8. *Dalea frutescens* Gray. BLACK DALEA. Rounded or often spreading shrub 2-10 dm. tall; branches striate, glabrous, very sparingly gland-dotted; leaves spreading, 10-25 mm.

long; stipules setaceous-subulate, 2 mm. long; petiole 5 mm. long; rachis glabrous, slightly margined; leaflets 13 to 17, glaucous-verdigris, glabrous, minutely gland-dotted beneath, obovate, retuse, 3-8 mm. long; peduncles terminating the branches, 1-5 cm. long, glabrous; spikes at first subcapitate, dense, about 1 cm. long or in some populations loose and to 6 cm. long; bracts ovate, acute, conspicuously gland-dotted; calyx tube turbinate, 3 mm. long, with conspicuous orange gland-dots between the 10 strong ribs; calyx lobes deltoid, with short subulate tips, villous-ciliate marginally, much shorter than the calyx tube; corolla purple; blade of the banner cordate, nearly 5 mm. long, the claw 3 mm. long; blades of the other petals 6 mm. long, the claws 1.5 mm. long; pod broadly obliquely obovate, glabrous, conspicuously gland-dotted. Incl. var. *laxa* (Rydb.) B. L. Turner, *Parosela frutescens* (Gray) Vail, *P. laxa* Rydb. Cen. and Trans-Pecos Tex. e. to Montague, Dallas, Bell, Williamson and Travis cos., usually on dry limestone hills in brushy vegetation, absent from higher parts of Plains Country and from Rio Grande Plains, July-Oct.; s.e. Okla., Tex., N.M., Chih., Coah. and N.L.

Formerly an important browse but quickly eliminated from browsed ranges, thus absent from much of its former range. In the western part of the distribution, these shrubs are hosts of *Pilostyles Thurberi*.

9. *Dalea argyrea* Gray. SILVER DALEA. Erect shrub 3-10 dm. tall, corymbosely branched above; branches canescent-tomentose and gland-dotted or glandular-tuberculate, leafy; leaves spreading, 1-2 cm. long; stipules subulate, about 2 mm. long; petiole 3-5 mm. long; rachis canescent-tomentose; stipels glandlike; leaflets 7 to 13, obovate or obovate-oblong, closely sericeous on both sides, gland-dotted beneath, 5-8 mm. long; peduncles terminating the branches, 1-2 cm. long; spikes dense, short, 10-25 mm. long; bracts lance-ovate, acuminate, about equaling the calyx, canescent; calyx tube broadly campanulate, silky-villous, 2.5 mm. long; calyx lobes deltoid, acute, 0.5-1 mm. long, not recurved, shorter than the tube; banner yellowish, fading purplish, the blade orbicular, 3-4 mm. long, equaling the claw; wings and keel petals purple, the blades of the keel petals united along the lower edge; pod silky-villous. *Parosela argyrea* (Gray) Heller. Scattered on limestone hills and mts. in the Trans-Pecos e. to Val Verde Co., July-Sept.; N. M., Tex., Chih., Coah. and N. L.

This plant is reputedly poisonous to stock.

10. *Dalea lanata* Spreng. WOOLLY DALEA. Perennial with long woody roots; stems several, essentially prostrate, 3-5 dm. long, densely and shortly villous-tomentose; leaves spreading, 2-3 cm. long; stipules subulate, 3-5 mm. long; rachis villous-tomentose; stipels represented by glands; leaflets 9 to 13, obovate to cuneate or rarely oblong, usually emarginate, 4-12 mm. long, densely short-villous; peduncles opposite leaves, 1-3 cm. long; spikes elongate, in fruit lax, 3-8 cm. long; bracts broadly obovate, abruptly acuminate, equaling the calyx, persistent, villous and with a few conspicuous glands on the back; flowers sessile or nearly so; calyx all densely villous externally; calyx tube turbinate, membranous, 2.5 mm. long; calyx lobes lanceolate, acuminate, shorter than the tube; corolla blood-red to purple, rarely white; blades of the banner rounded-cordate, with a deep sinus, more or less cucullate, 3 mm. long, the claw 2 mm. long; blades of the wings ovate and with a rounded basal lobe, 3 mm. long, those of the keel petals broadly obliquely obovate, with a smaller basal lobe, 3 mm. long, the claws of both 1 mm. long; pod half-reniform, finely villous. *Parosela lanata* (Spreng.) Britt. Local in deep loose sand, usually in dune areas, higher parts of the Plains Country and along the Red River e. to Grayson Co.; also isolated in extreme s. Tex. (Kenedy, Brooks, Jim Hogg and Starr cos.), June-Oct.; Kan. and Colo. to Tex.

11. *Dalea terminalis* M. E. Jones. Essentially identical to *D. lanata* but the calyx tube glabrous (lobes villous). *Parosela terminalis* (M. E. Jones) Heller. Local in deep loose sand in the Trans-Pecos near the Rio Grande, June-Sept.; Tex. to Ut., Ariz. and Chih.

12. *Dalea lasiathera* Gray. PURPLE DALEA. Perennial with woody roots and short caudexes; stems several from the base, 1-3 dm. tall, slender, glabrous, almost glandless; leaves 20-35 mm. long; stipules subulate, 1-2 mm. long; rachis margined, glabrous, slightly gland-dotted; leaflets 7 to 13, glabrous, linear-oblong or oblanceolate, rounded or retuse apically, 5-15 mm. long, glabrous, minutely gland-dotted beneath; peduncles 3-5 cm. long; spikes moderately dense, 3-6 cm. long; bracts broadly ovate, short-acuminate, bluish-green and conspicuously gland-dotted dorsally, somewhat scarious-margined; flowers sessile or nearly so; calyx tube broadly turbinate, 3 mm. long, silky-villous and gland-dotted; calyx lobes 6

times as long as broad or shorter, plumose, with a deltoid base and a short subulate tip, 2 mm. long; corolla purple; blade of banner round-reniform, 4 mm. long, 5 mm. broad; wings and keel petals inserted a little below the middle of the "stamen tube," the blades strongly curved, those of the former 5 mm. long, of the latter 6 mm. long; pod densely villous above. *Parosela lasiathera* (Gray) Heller. Limestone hills and cuestas, Trans-Pecos (Jeff Davis Co.), Edwards Plateau and Rio Grande Plains s. to Duval Co., Mar.-June; Tex., Coah., N. L. and Tam.

13. *Dalea pogonathera* Gray. **HIERBA DEL CORAZÓN, BEARDED DALEA.** Perennial herb with woody roots and short caudexes; stems many, ascending or erect to decumbent, 1-2 dm. long, seldom 3 dm. long, glabrous, slender; leaves spreading, 1-2 cm. long; stipules subulate-setaceous, 2-3 mm. long; rachis slightly margined, glabrous, gland-dotted; stipels glandlike; leaflets 5 or 7, linear-oblong or linear-cuneate, truncate or retuse apically, glabrous, gland-dotted beneath, bluish-green; peduncles opposite the leaves, 10-25 mm. long; spikes 2-6 cm. long, moderately to very dense; bracts broadly ovate, abruptly short-acuminate, glabrous, scarious-margined, bluish-green and gland-dotted dorsally, persistent; flowers sessile or nearly so; calyx tube broadly turbinate, 3 mm. long, 10-ribbed, silky, not conspicuously gland-dotted; calyx lobes filiform from a deltoid base, 6 to 40 times as long as broad, silky-plumose, 4 mm. long; corolla purple to nearly flesh-colored; blade of the banner rounded-reniform, 2 mm. long, 3 mm. broad, the claw 3 mm. long; wings inserted near the middle of the "stamen tube," the keel petals higher up, the blades of the former 2.5-3 mm. long, the claws 1 mm. long; blades of the keel petals similar but with a comparatively smaller basal lobe, 4-4.5 mm. long; pod densely villous above. *Parosela pogonathera* (Gray) Vail, *P. Walkerae* Tharp & Barkl. Frequent in the Trans-Pecos and Rio Grande Plains, scattered n.e. to Wichita Co., Mar.-Sept.; Tex. to Ariz. s. to Zac. and S. L. P.

Plants of Trans-Pecos and westward that have calyx teeth over 4 mm. long and relatively large flowers (keel blades mostly 4.5-6 mm.) are var. *pogonathera*; south and east from Uvalde Co. the species is represented by the smaller flowered var. *Walkerae* (Tharp & Barkl.) B. L. Turner, with calyx teeth mostly less than 4 mm. and keel blades, often paler purple, only 3.5-4.5 mm. long. Intergrades occur on the lower Rio Grande.

14. *Dalea enneandra* Nutt. Perennial with woody roots; stems mostly solitary at base, 3-10 dm. tall, glabrous, branched above; leaves 2-3 cm. long; stipules subulate; rachis margined, gland-dotted; leaflets 5 to 9, linear or narrowly oblong, conspicuously gland-dotted beneath, 5-12 mm. long, glabrous and bluish-green; peduncles slender, 2-4 cm. long; spikes very lax, 5-12 cm. long; bracts broadly ovate, short-acuminate, densely gland-dotted dorsally, conspicuously scarious-margined; flowers sessile or nearly so; calyx tube turbinate, 3 mm. long, densely silky; calyx lobes filiform with a deltoid base, 4 mm. long, plumose; corolla white; blade of the banner rounded-cordate, gland-dotted below, 3 mm. long, the claw 3 mm. long; wings inserted near the middle of the "stamen tube," the keel petals higher up, the blades of the former 4 mm. long, those of the latter 5 mm. long, the claws of both 1.5-2 mm. long; pod densely villous above, glabrous below. *D. laxiflora* Pursh, *Parosela enneandra* (Nutt.) Britt. Frequent, mostly in alluvial soils, n.-cen. Tex. w. to Plains Country, rare s.e. to Austin Co., May-Oct.; Ia. to N. D., N. M., Tex. and Miss.

15. *Dalea aurea* Nutt. **GOLDEN DALEA.** Perennial herb, slightly woody at the extreme base; stems 1 to several, erect, 3-5 dm. tall, silky-canescens, leafy but the upper leaves reduced and scattered; leaves pinnately 5- or rarely 7-foliolate, ascending, 2-5 cm. long; stipules subulate, (1-) 2-3 mm. long; petiole about 1 cm. long; rachis sericeous, obscurely if at all dotted; leaflets oblong-oblongate to narrowly obovate, sparingly silky above, densely so and minutely gland-dotted beneath, 1-2 cm. long; peduncles terminating the stems, 1-10 cm. long; spikes dense, 2-5 cm. long, 15-25 mm. thick; bracts ovate, short-acuminate, densely silky, equaling the calyx; flowers sessile or nearly so; corolla yellow; blade of the banner flabelliform-cordate, about 4 mm. long and broad, the claw 4-5 mm. long; wings and keel petals inserted slightly above the middle of the "stamen tube," blades obliquely ovate, with a large rounded basal lobe, those of the wings about 5 mm. long, those of the keel petals 6-7 mm. long, the claws of both 1 mm. long; pods silky-villous. *Parosela aurea* (Nutt.) Britt. Widespread and locally common in w. two thirds of Tex. e. to n.-cen. Tex., occasional on Gulf Coastal Plain (Bee and Brooks cos.), May-July; S. D. to Wyo. and s. to Coah.

16. *Dalea nana* Torr. DWARF DALEA. Perennial herb, branched at the base; stems 1-2 (-3) dm. tall, decumbent at the base or usually ascending, silky-canescens; leaves numerous, spreading, 2-3 cm. long; stipules subulate-setaceous, 1-3 (-4) mm. long; petioles 4-8 mm. long; rachis silky-canescens; leaflets 5 to 9 (rarely 3), obovate, 5-15 mm. long, sericeous on both sides; peduncles opposite the leaves and at the ends of the branches, 5-20 mm. long; spikes oblong, dense, 1-3 cm. long, 8-13 mm. thick; bracts ovate or lance-ovate, short-acuminate, pubescent, about equaling the calyx; flowers sessile or nearly so; calyx tube turbinate, 10-angled, 3 mm. long, sericeous; calyx lobes filiform from a broad base, longer than the tube; corolla yellow, fading rose-colored; blade of the banner reniform, 2 mm. long, 3.5 mm. broad, the claw 3 mm. long; blades of the other petals 3-3.5 mm. long, those of the keel petals slightly larger than those of the wings, the claws 1 mm. long; pod villous.

The var. *nana* [*Parosela nana* (Gray) Heller], characterized by relatively loose spikes and broadly ovate bracts 2-4 mm. wide, is calcifuge and found usually in sandy soil throughout the Rio Grande Plains and, disjunctly, in a relatively large-flowered form in the Trans-Pecos and Northern Plains; the strongly calciphile var. *carnescens* (Rydb.) Kearn. & Peeb. (*Parosela rubescens* Wats., *P. carnescens* Rydb., *P. Whitehouseae* and *P. Lesueurii* Tharp & Barkl.), distinguished by dense conelike spikes and lanceolate bracts mostly less than 2 mm. wide, is the common form from the Edwards Plateau westward through the Trans-Pecos. Occasional intergrades occur along the Rio Grande. The var. *nana* to w. Kan., Colo., s.e. Ariz., Chih., N. L.; the var. *carnescens* to s. Ariz., Tam. and Dgo., flowers both in spring and fall.

17. *Dalea Hallii* Gray. Perennial herb with woody caudexes; stems slender, decumbent (ascending toward the ends), 1-2 dm. tall, strigose-canescens; leaves digitately ternate, 2-4 cm. long; stipules subulate, 1-3 mm. long; petiole 10-15 mm. long, strigose; leaflets 3, linear, acute or even minutely cuspidate, 10-25 mm. long, glabrous above, strigose-canescens beneath, obsolete gland-dotted; peduncles terminal, 1-2 cm. long; spikes at first dense, in age laxer, 1-4 cm. long; bracts ovate-lanceolate, acuminate, villous-canescens, equaling the calyx; flowers sessile or nearly so; calyx tube turbinate, 2 mm. long, silky-canescens; calyx lobes filiform from a broad base, silky-plumose, nearly twice as long as the tube; corolla yellow, fading rose-colored; blade of the banner flabelliform-reniform, 2 mm. long, shorter than the claw; wings and keel petals inserted below the middle of the "stamen tube;" blades of the wings 3.5-4 mm. long, those of the keel petals 5 mm. long; pods villous. *Parosela Hallii* (Gray) Heller. N.-cen. Tex., n. and n.e. to Parker, Dallas, Tarrant and Fannin cos., s. to Hays and Kerr cos., May-June; endemic.

18. *Dalea Jamesii* (Torr.) T. & G. Perennial herb with thick woody caudexes; stems numerous, ascending, usually about 1 dm. high, densely silky; leaves palmately 3-foliolate, 10-25 mm. long; stipules subulate-setaceous, indurate, 5-9 mm. long; petioles about 1 cm. long, densely silky; leaflets obovate or cuneate, rounded or acutish apically, 8-15 mm. long, densely silky-canescens on both sides; peduncles terminal, very short, sometimes obsolete; spikes dense, 15-60 mm. long, 15-18 mm. thick; bracts deciduous, membranous, ovate or broadly lanceolate, acuminate, equaling the calyx, often purple-tinged; flowers sessile or nearly so; calyx tube turbinate, 25-30 mm. long, densely silky, the lobes filiform from a broad base, plumose, and longer than the tube; corolla yellow, fading purplish; blade of the banner cordate, 3 mm. long, equaling the claw; wings and keel petals inserted below the middle of the "stamen tube;" blades of the wings 4-4.5 mm. long, those of the keel petals 7-8 mm. long; pod villous. *Parosela Jamesii* (Torr.) Vail. Local in Trans-Pecos mts. and very rare in Plains Country and one record for Crockett Co., Apr.-July; s. to n. Dgo.

19. *Dalea Wrightii* Gray. Low perennial herb with woody roots and short caudexes; stems several, ascending or erect, rarely more than 1 dm. long, densely silky-canescens, leafy; leaves pinnately 5- to 7-foliolate, 2-4 cm. long; stipules setiform, (4-) 5-9 mm. long, indurate; petioles about 1 cm. long; rachis sericeous, not gland-dotted; leaves oblanceolate to obovate or elliptic, 5-20 mm. long, silky-canescens on both sides; spikes subsessile at the ends of the stems, 2-6 cm. long, nearly 2 cm. thick; bracts lanceolate, acuminate, longer than the calyx; flowers sessile or nearly so; calyx tube turbinate, 3 mm. long, densely silky, 10-ribbed; calyx lobes filiform from a broad base, plumose, almost twice as long as the tube; corolla yellow, fading rose-colored or purplish; blade of the banner cordate-flabelliform, nearly 3 mm. long and broad, the claw 6 mm. long; wings and keel

petals inserted a little above the middle of the "stamen tube;" blades of wings 3.5 mm. long, those of keel petals 4 mm. long; pod villous. *Parosela Wrightii* (Gray) Vail, *P. Warnockii* Tharp & Barkl. Frequent in the Trans-Pecos, Apr.-Sept.; Tex. to s. Ariz., n. Chih., Son. and Coah.

20. *Dalea laniceps* Barneby. Dwarf perennial herb, silvery-pilose throughout, not visibly glandular but aromatic; stems usually 1 to 3, rarely several, including the solitary terminal disproportionately large heads 2.5-8 cm. long; leaves 1-3.5 cm. long, pedately 3-foliolate the leaflets rhombic-ovate to elliptic-oblong and 5-18 mm. long, the terminal one largest; stipules linear-setiform, (3-) 4-8 mm. long; spikes sessile among the upper leaves, densely many-flowered, plumply ovoid-oblong to subglobose, 1-3 (-3.5) cm. long, 1.5-2 cm. thick; bracts dimorphic, the outermost broadly ovate-acuminate, 6-9 long, 3.5-5 mm. wide, the inner ones about as long but narrower, elliptic, acuminate; flowers sessile; calyx tube densely pilose, 2.5-3 mm. long, the triangular-aristate teeth 5-6 mm. long, in age plumose; petals clear-yellow drying orange- or pinkish-brown; blade of the banner reniform, about 2 mm. long, the claw 5-6 mm. long; wings and keel petals inserted well above the middle of the "stamen tube;" blades of wings 3 mm. long, those of keel petals 3-4 mm. long; pod barbate above the middle. Rare and scattered, dry stony hillsides, often on limestone, in Tex. known only from s. Pecos Co., Apr.-May, again in fall; Trans-Pecos Tex. to N.L., Zac. and e. Chih.

21. *Dalea Greggii* Gray. Subshrub with thick caudex; branches several, decumbent or prostrate, grayish-tomentose, gland-dotted, usually several dm. long, woody near the base, rooting at the nodes and often forming tight colonies 1 m. or more across; leaves 5-20 mm. long, densely sericeous-grayish-tomentose; stipules subulate, 1-2 mm. long; petiole not more than twice as long as the lowest internode of the rachis; rachis 1-2 cm. long; leaflets 5 or 7 (rarely up to 11), often crowded, obovate, 3-6 mm. long; heads erect, terminal, dense, usually 1-2 cm. long and 1 cm. or less thick (not including protruding corollas), sessile or short-peduncled; flowers sessile; bracts ovate-lanceolate, densely silky-villous, shorter than the calyx, early-deciduous, the upper ones 4-5 mm. long and broadly lanceolate; calyx 5-6 mm. long; calyx tube broadly turbinate, weakly 10-ribbed, 2.5 mm. long, densely silky-villous, inconspicuously gland-dotted between the ribs; calyx lobes subulate, pilose, 1-3 mm. long, about equaling the tube; corolla reddish-lavender to purple (rarely the banner and claws yellowish); petals often with a gland near the tip; banner blade rhombic-ovate, longer than broad, the claw 2 mm. long; wing blades 4 mm. long, the wings shorter than the keel petals; keel petals 5-7 mm. long, their blades 5 mm. long, claws about 1.5 mm. long; pod densely villous and minutely gland-dotted above, glabrate below. *Parosela Greggii* (Gray) Heller. Scattered in limestone hills, s.e. part of the Trans-Pecos, Mar.-Aug.; Tex., Chih., Coah., Tam., N. L., Hgo., Dgo., Zac., S.L.P., Pue, and Oax.

22. *Dalea formosa* Torr. FEATHER PLUME. Shrub 3-10 dm. tall, divaricately branched; branches glabrous and sparingly gland-dotted; leaves usually less than 1 cm. long; stipules subulate, persistent; rachis glabrous; stipels conic, thick; leaflets 7 or 9, oblong-spatulate, 1.5-2 mm. long, involute, glabrous, gland-dotted beneath; spikes headlike, few-flowered, short-peduncled, terminal; bracts broadly ovate, glabrous, conspicuously gland-dotted, short-acuminate, deciduous; calyx tube deeply campanulate, pilose, 10-ribbed, with a row of glands in each interval; calyx lobes filiform from the deltoid base, plumose, 6 mm. long, longer than the tube; corolla rose-colored with the banner usually yellowish; blade of the banner cordate, 4 mm. long, the claw nearly as long; blades of the wings 5 mm. long, those of the keel petals 6-7 mm. long, the claws of both 4 mm. long; pod pilose and gland-dotted above, glabrate below. *Parosela formosa* (Torr.) Vail. Frequent in dry scrubby vegetation in the Trans-Pecos, infrequent in Plains Country and e. to Taylor, Kimble and Webb cos., June-Sept.; Okla. and Colo., s. to Son., Chih. and Coah.

This is reputedly a good browse; it is a host-species of *Pilostyles Thurberi*.

23. *Dalea thyrsoflora* Gray. Erect subshrub 5-12 dm. tall, with many thick short grayish-brown villous branches; leaves 2-5 cm. long; stipules subulate, 3-5 mm. long; rachis short-villous; stipels glandlike; leaflets 3 to 9, obovate or ovate, often retuse, 6-18 mm. long, short-villous on both sides, gland-dotted beneath; spikes short, dense, usually oblong and subsessile in the axils of the leaves; bracts ovate, about equaling the calyx tube; calyx tube pubescent, strongly 10-ribbed, conspicuously gland-dotted in the intervals, 2.5-3 mm. long; calyx lobes filiform, plumose, the lowest 5 mm. long and recurved at the tips, the

rest 4 mm. long; corolla yellowish, turning brownish-purple. *D. domingensis* var. *paucifolia* Coult., *Parosela humilis* (Mill.) Rydb. Local in open brushlands in the Brownsville region, Cameron Co., extreme s. Tex., Sept.-Dec.; lowlands in Tex., Mex., Guat.

24. *Dalea emarginata* (T. & G.) Shinn. Slenderly taprooted annual, often with several spreading nearly simple branches from the base, 2-5 dm. long or longer; leaves 2-5 cm. long, spreading; stipules subulate; leaflets 13 to 17, glabrous, cuneate or oblong-cuneate, 2-7 mm. long, emarginate apically, glabrous, verdigris-green above; minutely gland-dotted beneath; spikes oblong or cylindric, long-peduncled, in fruit 1-3 cm. long, about 1 cm. thick; bracts about as long as the calyxes, obovate, abruptly acuminate, villous dorsally, with glabrate tips; flowers sessile or nearly so; calyx villous, 3 mm. long, oblique; calyx lobes lanceolate, acuminate, fully equaling the tube; corolla rose-purple; blade of the banner broadly rectangular-oblong, retuse or truncate apically, truncate basally, 2.5 mm. long, shorter than the claw; other 4 petals inserted not far below the end of the stamen tube, their blades oblong, rounded apically, 2.5 mm. long, the claws short; stamens 5; pod obliquely obovate, somewhat lunate, villous above. *Petalostemum emarginatum* T. & G. Sandy soils of s. Tex., often abundant, n. to Real, Llano and Brazos cos., Mar.-Dec.; Tex. s. to Ver.

34. PETALOSTEMUM MICHX.

PRAIRIE CLOVER

Unarmed perennial herbs, the herbage and/or the flowers gland-dotted; leaves alternate, once-imparipinnately-compound with 3 to numerous leaflets; stipules linear or subulate, persistent; flowers in dense terminal heads or spikes, each flower subtended by a bract; calyx comprising an obconoid or campanuloid often longitudinally ribbed tube and 5 usually narrow lobes; corolla subpapilionaceous, of 5 separate and similar petals usually attached in different places, the uppermost petal (banner, though not much if any larger than the rest) inserted near the rim of the floral cup, the other 4 inserted at the terminus of a structure which appears to be formed by the coalescence of the lower portions of the stamens and is thus called a stamen tube (though it may be formed partly of floral cup tissue); petals white, yellowish, pink or purplish; stamens 5, monadelphous in that the lower parts of the filaments are coalescent with only the most distal portion free; fruit a short obovate or semiorbicular 1- or 2-seeded usually indehiscent dry pod, enclosed in or but slightly exerted from the persistent calyx.

A wholly North American genus with about 35 species, not at all well-delimited from *Dalea* but technically keyed out on the basis of the insertion of 4 of the petals at the rim of the "stamen tube" instead of along the length of it. According to some authors, on etymological grounds the name should be spelled "Petalostemon," and is masculine instead of neuter as here treated.

1. Leaflets (on well-developed leaves) 25 to 41; flowers white; calyx tube pubescent 6. *P. microphyllum*.
1. Leaflets 3 to 25 (2)
- 2(1). Calyx glabrous or ciliate on the margins of the lobes only; flowers white (3)
2. Calyx or at least the calyx lobes densely pubescent; flowers yellowish, rose or purplish (6)
- 3(2). Flower heads (spikes) globose or subglobose, 12 mm. long or shorter 1. *P. multiflorum*.
3. Flower heads elongate, cylindric, 15-100 mm. long (rarely less on late-flowering branches) (4)
- 4(3). Calyx tube with a ring of small glands at the top (rarely glandless); calyx not noticeably oblique 2. *P. candidum*.
4. Calyx tube covered with large scattered glands; calyx strongly oblique (5)
- 5(4). Leaflets 13 to 25; tips of bracts glabrous 4. *P. glandulosum*.
5. Leaflets 9 to 13 (to 17); tips of bracts pubescent 5. *P. phleoides*.
- 6(2). Leaves and stem both glabrous (rarely sparingly pilose) or the stems short-pubescent and the leaves glabrous (7)
6. Leaves and stems densely short-pubescent to long-hirsute (see also *P. purpureum*) or the stems rarely sparsely pilose (14)

- 7(6). Petals pale-yellowish; bracts narrowly lanceolate, brownish-pubescent throughout 7. *P. compactum*.
7. Petals rose or purplish; bracts ovate, often abruptly acuminate, if narrowly lanceolate then the upper portion glabrate (8)
- 8(7). Bracts narrowly lanceolate; stems decumbent or weakly ascending; plants of the Gulf Coast grassland (and Oklahoma) 16. *P. decumbens*.
8. Bracts ovate to broadly lanceolate; stems stiffly erect or ascending; plants of central and northern Texas (9)
- 9(8). Spikes slender, 1 cm. thick or less (10)
9. Spikes 1 cm. thick or more (12)
- 10(9). Calyx tube and lobes covered with a dense spreading usually tawny pubescence; plants of Panhandle and northwest areas of Texas .. 12. *P. tenuifolium*.
10. Calyx tube and lobes unevenly pubescent with a short white appressed pubescence, or else the calyx glabrate; plants of central Texas (11)
- 11(10). Calyx lobes completely glabrate or merely ciliate along the margin; south-central Texas (intergrading with the species below) 3. *P. sabinale*.
11. Calyx lobes conspicuously pubescent 13. *P. tenue*.
- 12(9). Calyx densely villous throughout with spreading hairs 11. *P. purpureum*.
12. Calyx with a dense appressed pubescence, the tube or lobes often with some degree of glabrousness (13)
- 13(12). Mature plants 3-6 dm. high; peduncles 4-12 cm. long; widespread plants of central and north-central Texas 15. *P. pulcherrimum*.
13. Mature plants 1-2 dm. high; peduncles 3 cm. long or less; rare restricted endemic of north-central Texas 14. *P. Reverchonii*.
- 14(6). Flowers pale-yellow; spikes 15-30 mm. thick 8. *P. obovatum*.
14. Flowers pink; spikes 8-13 mm. thick (15)
- 15(14). Calyx (including lobes) 4-5 mm. long; spikes 10-13 mm. thick; stems densely villous; Panhandle area of Texas 10. *P. villosum*.
15. Calyx 3-4 mm. long; spikes 10 mm. thick or less; stem sparsely pubescent; eastern Texas 9. *P. griseum*.

1. *Petalostemum multiflorum* Nutt. Perennial herb with woody caudex; stems several, 3-6 dm. tall, glabrous, grooved, much-branched, the upper branches short and with few reduced leaves; leaves numerous, 2-4 cm. long, spreading; stipules lance-subulate; leaflets 3 to 9, linear, linear-oblong or linear-oblancheolate, obtuse or mucronate, often involute, conspicuously gland-dotted beneath, glabrous, 6-12 mm. long; spikes usually numerous, subglobose, in fruit 8 mm. thick and about 1 cm. long; bracts rhombic-lanceolate, with subulate tips, shorter than the calyxes, deciduous; calyx 3 mm. long; calyx tube glabrous, strongly 10-ribbed; calyx lobes deltoid-lanceolate, 1 mm. long, marginally ciliolate but otherwise glabrous; corolla white; blade of the banner reniform, 2-2.5 mm. long, 3 mm. broad, the claw 3 mm. long; blades of the other petals elliptic, 3 mm. long, the claws 1.5 mm. long; pod obliquely obovoid, 3.5 mm. long, the beak at right angles to the long axis. *Dalea multiflora* (Nutt.) Shinnery. Locally abundant in cen. Texas, e. to Harris and Grimes cos., s. to Maverick and Nueces cos., w. to Taylor and Crockett cos., (reported by Rowell from Hemphill Co. in the Panhandle), June-July; Mo. to Kan. and s. to Tex.

2. *Petalostemum candidum* (Willd.) Michx. Perennial with woody base; stems 3-10 dm. long, glabrous, striate, with ascending or spreading branches; leaves scattered, ascending, 3-5 cm. long; stipules subulate; leaflets 5 to 9, oblong or linear-oblancheolate to linear, 1-3 cm. long, acute or mucronate, minutely gland-dotted beneath, acute basally; spikes dense (or in some populations the internodes elongating after anthesis), oblong to cylindrical, in fruit about 8 mm. thick and 15-100 mm. long; bracts lanceolate with a long subulate tip, longer than the calyxes or the buds; calyx 3 mm. long; calyx tube glabrous, 10-angled or -ribbed, with a ring of small glands near the top or rarely glandless,

not noticeably oblique; calyx lobes deltoid-lanceolate, villous-ciliolate, acute, 1 mm. long; corolla white; blade of the banner reniform, cordate, 2 mm. long, 3 mm. broad, the claw 2.5 mm. long; blades of the other petals ovate to oblanceolate, cuneate basally, 2.5 mm. long, about equaling the claws; pod obliquely obovoid, 3 mm. long. Represented with us by 2 intergrading varieties as follows:

Var. *candidum*. Leaflets relatively broad, most of them more than 2 mm. broad; spikes remaining dense even after anthesis; bracts not completely dehiscent, a minute "heel" remaining on the rachis after abscission; calyx glabrous and with low rounded bony ridges after anthesis. *Dalea candida* Willd. Scattered in e., s.e. and n.-cen. Tex., rarely w. into the Plains Country where intergrading with the next.

Var. *oligophyllum* (Torr.) Herm. Leaflets relatively narrow, most of them less than 2 mm. broad; after anthesis the dense spikes becoming looser by the elongation of internodes; bract completely dehiscent; calyx puberulent and after anthesis with sharp wing-like prominent ridges. *P. oligophyllum* (Torr.) Rydb. (illegit. name), *P. truncatum* Rydb., *P. occidentale* (Heller) Fern. Scattered populations in higher parts of Plains Country and Trans-Pecos, May-Sept.; N.D. and Mont. s. to Chih. and Dgo.

3. *Petalostemum sabinale* Wats. Perennial, woody only at the base; stems ascending, 2-4 dm. tall, glabrous, somewhat striate; leaves yellowish-green, about 3 cm. long; leaflets 11 to 15, linear or linear-oblanceolate, 10-15 mm. long, flat, gland-dotted beneath, blunt, glabrous; spikes cylindric, in age 4-6 cm. long and 1 cm. thick or less; bracts broadly lanceolate, acuminate, glabrous, deciduous, about equaling the calyxes; calyx 3 mm. long; calyx tube glabrous, 10-ribbed, with conspicuous yellow glands; calyx lobes short, triangular, ciliolate (but otherwise glabrous), acute; corolla rose-colored; blade of the banner broadly cordate, notched at the apex, 2 mm. long, 3 mm. broad, the claw 2 mm. long; blades of the other petals oblong-oblanceolate, obtuse apically, 2.5 mm. long; pod glabrous, obliquely obovoid. *Dalea sabinale* (Wats.) Shinn. Known only from Bandera Co., s. part of Edwards Plateau, at the entrance to Sabinal Canyon, May-July; endemic.

Closely related to *P. tenue* and perhaps only a form of that species, seeming to intergrade with it.

4. *Petalostemum glandulosum* Coult. & Fish. Perennial with woody base; stems striate, leafy, glabrous, 2-6 dm. tall, branched; leaves 2-4 cm. long, ascending; stipules subulate-setaceous; leaflets 13 to 25, oblong or oblong-obovate, 5-8 mm. long, obtuse or retuse, conspicuously gland-dotted beneath, dark-green above, paler beneath, glabrous or sparingly pilose above; spikes dense, cylindric, in fruit 8 mm. thick and 2-9 cm. long; bracts linear-lanceolate, caudate-attenuate, longer than the calyxes and buds, glabrous; calyx rose-tinged, 3-4 mm. long; calyx tube strongly oblique, gibbous on the upper side, glabrous, conspicuously gland-dotted, not ribbed; calyx lobes small, all near the lower side, ciliolate on the margins, the lower 3 lance-subulate, the upper 2 broadly deltoid, with a subulate tip; corolla white; blade of the banner cordate, 3-4 mm. long, 4 mm. broad, the claw fully 3 mm. long; blades of the other petals linear, 3 mm. long, the claws 1.5 mm. long; pod obliquely obovoid, 3 mm. long, pubescent. *Dalea glandulosa* (Coult. & Fish.) Shinn. Scattered on the Tex. Coastal Plain from Hardin and Trinity cos. s.w. to Aransas and Dimmit cos., rare inland to Val Verde Co., May-July; endemic.

Apparently closely related to *P. microphyllum* and *P. phleoides*.

5. *Petalostemum phleoides* T.&G. Perennial, branched at the base; stems 3-7 dm. tall, simple or branched, striate, glabrous or nearly so; leaves 3-5 cm. long, ascending; stipules subulate-setaceous; leaflets 9 to 13 (to 17), oblong or cuneate-oblong, 5-10 mm. long, usually rounded apically, conspicuously gland-dotted beneath, sparingly pilose on both sides; spikes cylindric, dense, in fruit 15-60 mm. long and about 8 mm. thick; bracts lanceolate, with long subulate-filiform long-ciliate tips, much-exceeding the calyxes of the buds; calyx 3 mm. long; calyx tube turbinate, strongly oblique, glabrous, 10-nerved, covered with large scattered glands; calyx lobes near the lower side, similar to those of *P. glandulosum*, ciliolate marginally; corolla white; blade of the banner cordate, 3 mm. long, 3-4 mm. broad, the claw 3 mm. long; blades of the other petals linear or linear-oblanceolate, 3 mm. long, the claws 2 mm. long; pod obliquely obovoid. *Dalea phleoides* (T.&G.) Shinn. Rare in sandy woodlands of e. Tex., June; also Ark.

6. *Petalostemum microphyllum* (T.&G.) Heller. Perennial, branched at the woody base; stems erect or ascending, 2-6 dm. tall, grooved or striate, more or less pilose, often

branched; leaves numerous, 3-5 cm. long, spreading or ascending; stipules subulate; leaflets 25 to 41, oblong or oblong-cuneate, 4-6 mm. long, emarginate, conspicuously gland-dotted beneath, more or less pilose or in age glabrate; spikes dense, cylindrical, in fruit 8 mm. thick and 2-5 cm. long; bracts linear-lanceolate, densely pubescent, with long-subulate persistent tips, longer than the calyxes; calyx 2.5-3 mm. long; calyx tube oblique, gibbous above, densely pubescent; calyx lobes very short, the lower 3 triangular-ovate; corolla white; blade of the banner cordate, 2 mm. long, 3 mm. broad, the claw 3 mm. long; blades of the other petals linear-oblong, 3 mm. long, the claws 2 mm. long; pod 2-2.5 mm. long, obliquely and very broadly obovoid, pubescent, the beak at right angles to the axis. *Dalea Drummondiana* Shinn. Frequent in e., s.e. and n.-cen. Tex., w. to Young, Gonzales, Goliad and Nueces cos., June-July; endemic.

7. *Petalostemum compactum* (Spreng.) Swezey. Perennial with woody taproot; stems several, 4-8 dm. tall, glabrous, striate, leafy; leaves numerous, ascending, 5-8 cm. long; stipules subulate; leaflets 5 to 7, oblong to oblong-lanceolate or linear-oblong, acute or obtuse, short-petiolate, glabrous, pale-green above, gland-dotted and paler beneath, 15-25 mm. long; spikes cylindrical, dense, in fruit 10-12 mm. thick and 2-15 cm. long; bracts narrowly lanceolate, attenuate, densely pubescent with long brownish silky hairs; calyx 4.5 mm. long, densely silky-villous with brown hairs; calyx lobes narrowly lanceolate and equaling the tube; corolla pale-yellowish; blade of the banner cordate, 2 mm. long, the claw 4 mm. long; blades of the other petals lanceolate or oblanceolate, 2 mm. long, the claws about 1 mm. long; pod broadly obliquely obovate, almost half-round, 2 mm. long, sparingly pubescent. *Dalea compacta* Spreng. Infrequent or rare in w. Tex. (Mitchell, Martin, Presidio and Hudspeth cos.), June-July; Wyo. and Neb. to Tex.

8. *Petalostemum obovatum* T.&G. Pussyfoot. Perennial; stems decumbent or ascending, 3-5 dm. long, densely silky-villous; leaves numerous, 3-5 cm. long; stipules subulate; leaflets obovate or ovate, 8-10 mm. long, truncate, rounded or acutish apically, densely silky-villous on both sides; spikes cylindrical, in fruit 15-30 mm. thick and 5-11 cm. long; bracts broadly elliptic to ovate, acuminate, silky-villous, longer than the calyxes; calyx 6 mm. long, silky-villous; calyx lobes lanceolate, caudate-attenuate, twice as long as the tube; corolla pale-yellow; banner blade cordate, 2 mm. long, the claw 2 mm. long; blades of the other petals oblong, 3 mm. long, the claws less than 1 mm. long; pod broadly obliquely obovate, nearly orbicular, villous. *Dalea obovata* (T.&G.) Shinn. Sandy prairies of s. Tex., n. to Travis and Colorado cos., Apr.-July; endemic.

9. *Petalostemum griseum* T.&G. Perennial; stems 2-7 dm. tall, usually erect, often reddish, striate, sparsely pilose, branched above; leaves numerous, 3-4 cm. long, spreading; stipules subulate; leaflets 9 to 17, oblong to oblanceolate or linear-oblong, 6-12 mm. long, mucronate, finely long-pilose, conspicuously gland-dotted beneath; spikes many, very short-peduncled, cylindrical, in fruit 25-60 mm. long and 6-7 mm. thick; bracts deciduous, linear-lanceolate, caudate-attenuate, longer than the calyxes, pubescent; calyx 10-ribbed, densely pubescent, 3 mm. long; calyx lobes lanceolate or deltoid-lanceolate, acute, a little longer than the tube; corolla pink or pink-purple; blade of the banner cordate, 2 mm. long and as broad, equaling the claw; blades of the other petals oblong, 2 mm. long, the claws scarcely 0.5 mm. long; pod 2 mm. long, obliquely obovoid, pubescent. *Dalea grisea* (T. & G.) Shinn. Sandy woodlands, e. and s.e. Tex., spring-summer; endemic.

Closely related to *P. villosum*.

10. *Petalostemum villosum* Nutt. Perennial with woody taproot and caudex, branched at the base, bushy; stems ascending or decumbent, 3-6 dm. tall, densely villous; leaves very numerous and crowded, 3-5 cm. long, often with fasciculate ones in their axils; stipules subulate; leaflets 9 to 17, close, oblong or oblanceolate, acute or obtuse, 5-10 mm. long, 2-4 mm. broad, densely villous; spikes terminating the branches, usually sessile, sometimes clustered, cylindrical, in fruit 8 mm. thick and 2-10 cm. long, dense; bracts lanceolate, caudate-attenuate, longer than the calyxes, deciduous, villous; calyx (including lobes) 4-5 mm. long, densely villous, 10-ribbed, the lanceolate lobes acute and shorter than the tube; corollas pale-rose-purple, rarely white; blade of the banner cordate, 2 mm. long and broad, the claw 2.5 mm. long; blades of the other petals elliptic, 2.5 mm. long, the claws 0.5 mm. long; pod obliquely obovate, somewhat lunate, 3 mm. long, villous. *Dalea villosa* (Nutt.) Spreng. Scattered or rare in the Plains Country, in sandy soil, June-Aug.; Mich. to Mo., Tex., Mont. and Sask.

11. *Petalostemum purpureum* (Vent.) Rydb. Perennial, branched at the woody base; stems 2-9 dm. tall, striate, glabrous to villous, more or less branched; leaves numerous, 3-5 cm. long, often with fasciculate ones in their axils; stipules subulate; leaflets often 5, linear, glabrous or villous, 8-20 mm. long, 1-3 mm. broad, involute; spikes short-peduncled, oblong or cylindric, dense, in fruit 15-50 mm. long and about 1 cm. thick or more; bracts broadly oblanceolate, abruptly acuminate, densely pubescent, with a dark almost glabrous subulate tip; calyx silky-villous, 3-4 mm. long, the lanceolate lobes acute and shorter than the tube; corolla rose-purple; blade of the banner cordate, obtuse, 2 mm. long, the claw about 3 mm. long; blades of the other petals oblong, rounded apically, 3 mm. long, the claws 1 mm. long; pod obliquely obovate, 3 mm. long, pubescent. *Dalea purpurea* Vent., *P. molle* Rydb. Rare and scattered in n. Tex. in cos. bordering the Red River, isolated in Guadalupe Mts. in the Trans-Pecos, June-July; Ind. to Sask., N.M. and Tex.

Some populations seem to show the effect of introgression of this species with *P. tenuifolium* and *P. pulcherrimum*.

12. *Petalostemum tenuifolium* Gray. Perennial with woody base; stems ascending or erect, slender, 15-30 cm. tall, pale, glabrous, striate, branched; leaves ascending, 3-4 cm. long; stipules subulate-setaceous; leaflets 3 to 5, linear or narrowly linear-oblanceolate, 8-18 mm. long, involute, blunt, glabrous or nearly so, sparingly glandular; spikes cylindric, in fruit 2-5 cm. long and about 8 mm. thick; bracts silky-villous throughout, ovate, abruptly contracted into a subulate tip, slightly exceeding the buds; calyx 4 mm. long, externally with a dense spreading usually tawny pubescence all over, the deltoid-lanceolate lobes about as long as the tube; corolla rose-purple; blade of the banner cordate, 3 mm. long and as broad, nearly equaling the claw; blades of the other petals oblanceolate, 3 mm. long; pod pubescent. *P. Porterianum* Small, *Dalea tenuifolia* (Gray) Shinn. Frequent in higher parts of Plains Country, along the Red River e. to Wichita Co., May-Sept.; Kan. to Ark. and Tex.

The population in Wichita Co. seems to indicate intergradation between this species and *P. pulcherrimum*.

13. *Petalostemum tenue* (Coul.) Heller. Perennial with woody base; stems much-branched, glabrous, slender, terete, about 3 dm. tall; leaves numerous, spreading, 2-3 cm. long; stipules subulate-setaceous; leaflets 3 to 5, linear, strongly revolute, 5-12 mm. long, acute, glabrous or nearly so, strongly punctate; spikes usually long-peduncled, subglobose to cylindric, 10-30 mm. long and 7-10 cm. thick in fruit; bracts ovate-lanceolate, pubescent, much shorter than the calyxes, apically often glabrous; calyx 4 mm. long, appressed-silky; calyx lobes deltoid-ovate, shorter than the tube, conspicuously pubescent; corolla pink-purple; blade of the banner broadly cordate, 2 mm. long, shorter than the claw; blades of the other petals elliptic, 3 mm. long; pod obliquely obovate, finely pubescent. *Dalea Stanfieldii* (Small) Shinn. Edwards Plateau s.w. to Tom Green and Medina cos. and n. to Wise and Denton cos., in rocky limestone areas, May-July; endemic.

14. *Petalostemum Reverchonii* Wats. Perennial, branched at the woody base; stems diffuse, 1-2 dm. long, glabrous or finely pubescent; leaves 2-3 cm. long; stipules subulate; leaflets 5 to 11, linear or linear-oblanceolate, glabrous, 5-10 mm. long, acutish, somewhat involute; peduncles 3 cm. long or less; spikes subglobose or oblong, in fruit 1-7 cm. long and about 1 cm. thick or thicker; bracts shorter than the calyxes, deciduous, silky throughout, broadly lanceolate, acuminate; calyx about 4 mm. long, with appressed silky pubescence; calyx lobes deltoid, acute or acuminate, about equaling the tube; corolla deep-pink or rose; pods silky, obliquely obovate, 3 mm. long. *Dalea Reverchonii* (Wats.) Shinn. Known only from the limestone summit of Comanche Peak, Hood Co., Tex., where collected once in June, about 1880; endemic.

15. *Petalostemum pulcherrimum* (Heller) Heller. Perennial with woody taproot, branched at the base; stems simple, erect, striate, glabrous or sparingly pubescent, 3-7 dm. tall; leaves 4-6 cm. long, numerous; stipules subulate-filiform; leaflets 3 to 7, linear, 2-4 cm. long, 1-3 mm. broad, acute at both ends, often somewhat involute, yellowish-green above, somewhat glaucous, sparingly pubescent or glabrous, gland-dotted beneath; peduncles 4-12 cm. long; spikes oblong, in fruit 2-4 cm. long and 12-15 mm. thick; bracts broadly ovate, short-acuminate, pubescent, with a dark almost glabrous subulate tip; calyx 4 mm. long; calyx tube glaucous, silvery-pubescent; calyx lobes much shorter

than the tube, the 3 lower deltoid-lanceolate, the upper 2 triangular-ovate; corolla deep-rose-purple; blade of the banner 2.5 mm. long, cordate, rounded or retuse apically, the claw 3 mm. long; blades of the other petals oblong or elliptic, rounded apically, 3 mm. long, the claws 1 mm. long; pod broadly obliquely obovoid, slightly pubescent, 3 mm. long. *Dalea Helleri* Shinners. Frequent in calcareous soils, n.-cen. Tex., infrequent s.e. to Goliad, Jackson and Montgomery cos., w. to Irion Co., rare in the Trans-Pecos (Hudspeth Co.), May-July; Mo. and Ark. to Tex. and N.M.

Apparently intergrading with *P. purpureum* and other species in parts of its range.

16. *Petalostemum decumbens* Nutt. Perennial; stems solitary or several, decumbent or weakly ascending, glabrous or sparingly pubescent, striate; leaves numerous, 3-5 cm. long, ascending; stipules subulate; leaflets 5 to 7, linear or linear-oblong, 8-20 mm. long, acute or mucronate, slightly involute marginally, sparingly pilose, gland-dotted beneath; spikes ovoid or short-oblong, 1-2 cm. long and fully 1 cm. thick in fruit; bracts lanceolate, attenuate, much longer than the calyxes and buds, the tips glabrous; calyx with short silky-appressed pubescence, 4 mm. long; calyx lobes lanceolate or ovate-lanceolate, shorter than the tube, acute; corolla pink or rose-purple; blades of the banner oblong-ovate, cordate basally, 3 mm. long, equaling the claw; blades of the other petals linear-oblong, fully 3 mm. long, the claws less than 1 mm. long; pod broadly and obliquely obovate, strigillose. Black clay soils of s.e. Tex. and n. to Polk and Tyler cos. in local prairies or gumbo glades, Apr.-June; also Okla.

35. BRONGNIARTIA H.B.K.

A genus with about 40 species in the drier parts of tropical America, of which we have one:

1. *Brongniartia minutifolia* Wats. Unarmed shrub 3-13 dm. tall, much-branched; branches somewhat zigzag, glaucous-green, nearly glabrous; leaves alternate, approximate, once-imparipinnately-compound, 3-7 cm. long, glabrous; stipules herbaceous, lanceolate, 2-3 mm. long, rather persistent; petioles 3-8 mm. long; leaflets 19 to 41, linear, revolute, 2-5 mm. long; stipels essentially absent; flowers solitary in the axils; pedicels 6-15 mm. long, near the top with 2 minute bractlets less than 1 mm. long; calyx 7-9 mm. long, with an obliquely obconoid or campanuloid tube, puberulent internally; calyx lobes lanceolate, acute, the lower 3 free from each other nearly to the top of the floral cup, the upper 2 united much higher up; corolla papilionaceous, pale-purplish to cream-colored or yellow-white; banner with a nearly orbicular blade about 8 mm. long and a claw about 3 mm. long; wings obovate, somewhat falcate, with an auricle at the base of the blade on the upper side; keel petals broadly lunate, coalescent near the apex; stamens 10, monadelphous, the filaments coalescent about half their length; pod dry, dehiscent, much-flattened, glabrous, obovate, 18-25 mm. long, attenuate below, the stipe equaling the calyx tube. Rare in the Chisos Mts. of s. Brewster Co. in the Trans-Pecos, 2,500-3,500 ft. elev., June-Aug.; also Chih.

36. TEPHROSIA PERS.⁹⁰

HOARY PEA

Perennial usually pubescent herbs from woody taproots; leaves alternate, once-imparipinnately-compound with (3 to) 5 to 31 leaflets; stipules mostly slender, herbaceous, persistent or deciduous; stipels absent; flowers in terminal or axillary racemes; calyx with an obconoid or campanuloid tube and 5 usually lanceolate lobes; corolla papilionaceous, white, pink, red or purple, the banner broad and dorsally silky-pubescent and clawed; wings usually broadly oblong, clawed, the blade with an auricle near the base on the upper side, coalescent near the tip; stamens monadelphous in a special way, the uppermost filament free near the base but coalescent with the rest near the middle of its length then free the rest of the length, the other 9 filaments coalescent variously for a third to two-thirds their lengths; anthers all alike; ovary surrounded at the very base

⁹⁰ The characters, except those of *T. tenella*, are adapted from the work of Carroll E. Wood, Jr. in *Rhodora* 51:193-231, 233-302, 305-364, 369-384. 1949.

by a collarlike disk attached to the floral cup; fruit a linear straight or somewhat curved flattened often obliquely striate dehiscent legume 2-6 cm. long; seeds several. *Cracca* L., a rejected name.

A large genus of about 300 species in the warmer parts of the world. Some species are the sources of fish-poisons.

1. Style glabrous; plants of Trans-Pecos Texas1. *T. tenella*.
1. Style minutely barbate on the ventral (upper) side; plants of Panhandle, central, and eastern areas of Texas (2)
- 2(1). Leaflets broadly to narrowly linear, 3 to 6 times as long as wide (3)
2. Leaflets obovate to nearly orbicular, 1 to 2 times as long as wide (4)
- 3(2). Racemes short, broad, 3-10 cm. long; stems stiff and erect; leaflets acute apically2. *T. virginiana*.
3. Racemes narrow, elongate, 10-40 cm. long; stems reclining, not stiffly erect; leaflets apically obtuse to truncate3. *T. onobrychoides*.
- 4(2). Leaflets 5 to 19, mostly 9 or 11, densely hirsutulous to nearly glabrous above but with at least a few appressed hairs near the margins, the margins conspicuously bordered with white hairs; calyx and back of banner with whitish hairs; ovules and seeds 5 or 64. *T. Lindheimeri*.
4. Leaflets 3 to 9, mostly 5 or 7, completely glabrous above, the margins not conspicuously bordered; indument of calyx and banner golden; ovules and seeds 4 to 8 ...
.....5. *T. potosina*.

1. *Tephrosia tenella* Gray. Perennial with deep woody rootstock; stems slender, branched, sparingly strigose or glabrate, angled; leaves 6-10 cm. long; stipules subulate-filiform, 3-5 mm. long; petiole 1-3 cm. long; rachis sparingly strigose; leaflets 7 or 9, rarely 11, or on the lower leaves 3 or 5, linear or oblong, acute; racemes opposite the leaves, lax, few-flowered, including the peduncle 1-2 dm. long; flowers solitary or 2 together at each node; bracts subulate; calyx sparingly strigose, the tube 2 mm. long, the lance-subulate lobes 2 mm. long; corolla about 8 mm. long, reddish; style not barbate ventrally; pod nearly straight, 30-45 mm. long, 2-4 mm. broad, short-strigose, 6- to 8-seeded. *Cracca tenella* (Gray) Rose. Rare in the Trans-Pecos, Chinati Mts., Presidio Co., summer; Tex. to Ariz., s. to Baja Calif., Son. and Chih.

2. *Tephrosia virginiana* (L.) Pers. DEVIL'S SHOESTRING, CATGUT, GOAT'S-RUE. Pubescent herb with woody crown and woody roots; stems stiff and erect, (2-) 3-7 dm. tall, not or sparingly branched; leaves 5-14 cm. long; petioles mostly shorter than the lowermost leaflets; leaflets 9 to 31, usually 15 to 25, elliptic to linear-oblong, acute, 11-31 (-33) mm. long, (2-) 4-8 (-10) mm. broad, 2 to 7 times as long as broad; racemes 3-10 cm. long, short-peduncled; pedicels 4-17 (20) mm. long; flowers 14-21 mm. long; corolla usually bicolored, the banner lemon-yellow to cream-colored dorsally and cream to white ventrally, the wings and keel rose or rarely white, the petals often brown in dried specimens; style barbate; legume straight to slightly downwardly falcate, (25-) 35-55 mm. long, (3.5-) 4-5.5 mm. broad; seeds 6 to 11. *T. leucosericea* (Rydb.) Cory, *Cracca virginiana* L. Frequent in sandy soils, n. Tex. s. to Lubbock, Callahan, Guadalupe, DeWitt and Jefferson cos., Apr.-June; N.H. to Fla., w. to Wis., Kan. and Tex.

3. *Tephrosia onobrychoides* Nutt. Perennial herb with woody crown and taproot; stems stout, terete, 1 to several, decumbent or reclining (never stiffly erect), to 6 or 7 dm. long; stems, petioles, rachises and petiolules pubescent; principal leaves 8-22 cm. long; petioles shorter than the lowermost leaflets; leaflets mostly (11 or) 13 to 25 (to 29), linear-oblongate or narrowly elliptic to oblong-elliptic or elliptic-cuneate, the apex obtuse to rounded or truncate, 17-55 (-60) mm. long, 4-16 (-20) mm. broad, 2.5 to 6 times as long as broad; racemes 1-4 dm. long; pedicels ascending, 4-10 mm. long; flowers 15-20 mm. long; corolla white becoming purple or crimson in age, pink or purple on drying; style barbate; legume straight or the proximal half slightly curved downward, 35-85 mm. long, (3.5-) 4.5-5 mm. broad, ascending or spreading, pubescent; seeds 3 to 10. *T. angustifolia* Featherm., *T. texana* (Rydb.) Cory. *Cracca onobrychoides* (Nutt.) O. Ktze. Sandy soils of e. and s.e. Tex., s.w. to Wilson, Goliad and Aransas cos., Apr.-June; Ala. to Tex. and Okla.

4. *Tephrosia Lindheimeri* Gray. Decumbent-stemmed perennial herb with woody crown and taproot; stems several, to 1 m. long; herbage densely pubescent; leaves 5-15 (-20) cm. long, ascending; petioles shorter or often longer than the lowermost leaflets; leaflets mostly (5 or) 7 to 15 (to 19), obovate to broadly ovate-cuneate or nearly orbicular or elliptic, apically obtuse or retuse, (11-) 18-33 (-37) mm. long, (7-) 12-21 (-27) mm. broad; racemes 7-30 cm. long; pedicels (4-) 5-9 mm. long, ascending; flowers 13-15 mm. long; corolla rose-purple, the banner with a white spot near the base of the blade; style barbate; legume roughly parallelogramiform, somewhat curved and narrowed near the base, (25-) 40-50 mm. long, 7-8.5 mm. broad, pubescent; seeds usually 4 to 6. Mostly sandy soils of Rio Grande Plains, n. to Llano region, Apr.-Sept.; endemic.

5. *Tephrosia potosina* Brandeg. Rather similar to *T. Lindheimeri*; stems to 5 dm. long; leaves 7-22 cm. long; petioles longer than the lowest leaflets; leaflets 3 to 9 (usually 5 or 7), obovate to broadly obovate-cuneate or orbicular, apically obtuse or retuse, 1-5 cm. long, 7-40 (-45) mm. broad; racemes to 27 cm. long; flowers 13-20 mm. long; corolla rose-purple with a green spot at the base of the blade of the banner; pedicels, calyx and back of banner usually hirsutulous with golden or rusty hairs; legume 20-55 mm. long, 6-8 mm. broad; seeds usually 4 to 8. Rare in calcareous soils, s. edge of Edwards Plateau in Hays and Uvalde cos., Apr.-Aug.; Tex., Coah., N.L., S.L.P. and Tam.

37. WISTERIA NUTT.

WISTERIA

Unarmed woody vines or lianes, twining and high-climbing, nearly glabrous; leaves alternate, once-imparipinnately-compound; petioles developed; stipules present; leaflets 5 to 15, usually 2-7 cm. long, thin; stipels present; flowers in large terminal and axillary drooping racemes, very showy; peduncles short; pedicels 5-25 mm. long; calyx more or less 2-lipped, the upper lip with 2 broad teeth united to near the apex, the lower lip with 3 longer and narrower teeth; corolla papilionaceous, 15-20 mm. long, purple to lilac and bluish-purple (rarely nearly white); petals subequal in length; banner with suborbicular blade and short claw, reflexed, the blade with 2 callosities or appendages; wings free, clawed, the blades obliquely obovate, falcate, with a prominent basal auricle on the upper margin; keel petals clawed, coalescent apically, the blade lunate with a salient basal lobe; stamens diadelphous, 9 filaments coalescent into a tube, the uppermost free or peculiarly nonadelphous with the uppermost filament shortly coalescent to the rest near the middle of its length, free above and below; fruit a linear flattened dehiscent legume 7-20 cm. long, 2-valved, the valves slightly convex; seeds several to numerous. *Kraunhia* Raf.

A genus with 7 species in the temperate region of North America, China and Japan, some of the species being widely cultivated. L. H. Bailey noted that, horticulturally, these plants are "the noblest of the woody vines for temperate regions." They are frequently trained as large shrubs.

1. Legume and ovary glabrous; pedicels 5-10 mm. long; native species
.....1. *W. macrostachya*.
1. Legume and ovary pubescent; pedicels 10-25 mm. long; introduced species
.....2. *W. sinensis*.

1. *Wisteria macrostachya* T.&G. Leaves 1-3 dm. long; leaflets mostly 9, ovate to elliptic-lanceolate, 3-7 cm. long, acuminate apically, rounded or cordate basally, racemes 2-3 dm. long; pedicels 5-10 mm. long; legume and ovary glabrous. *W. frutescens* (L.) Poir. var. *macrostachya* (T.&G.) T.&G. Moist woods and along river banks, e. and s.e. Tex., Apr.-Aug.; Ind. and Ill. s. to La. and Tex.

This should probably be treated as only a variety of the *W. frutescens* of southeastern United States.

2. *Wisteria sinensis* (Sims) Sweet. CHINESE WISTERIA. Leaflets 7 to 13; legume and ovary pubescent; pedicels 10-25 mm. long. Widely cult. in Tex., occasionally found as an escape.

Wisteria floribunda (Willd.) DC., the JAPANESE WISTERIA, with 15 to 19 leaflets and puberulent peduncles, is also occasionally cultivated.

38. PETERIA GRAY⁹¹

A genus of 4 species; Utah and Nevada, southeast to central Mexico.

1. *Peteria scoparia* Gray. CAMOTE DEL MONTE. Bushy perennial herb 5-10 dm. tall, the numerous slender rather stiff glabrous stems ascending or somewhat divaricate, pale-green and striate; leaves alternate, once-imparipinnately-compound, 5-10 cm. long; rachis slender, persistent, with internodes 3-5 mm. long; stipules spinescent, a pair of divaricate setose spines (2-) 3-5 (-6) mm. long; leaflets 9 to 15, narrowly elliptic to oblong, (2-) 3-6 (-11) mm. long, 1-2 mm. broad, usually deciduous in the dry season, glabrous except on margin above, strigose beneath, acutish and mucronate apically; flowers several in loose pedunculate racemes 1-2 dm. long; pedicels slightly glandular-puberulent; calyx with a campanuloid tube about 5 mm. long and 5 lobes 2-3 mm. long, the tube slightly gibbous at the base above, the 2 uppermost lobes united slightly higher up than the 3 lower ones; corolla papilionaceous, 13-16 mm. long, white; petals clawed; banner strongly folded lengthwise and laterally reflexed; wings smaller than the banner and with blades slightly auricled on the upper side; keel petals a little shorter than the wings, their blades auricled; stamens diadelphous, 9 of the filaments coalescent, the uppermost (tenth) one free; style barbate; fruit a narrow linear dehiscent legume 35-60 mm. long and 4-5 mm. broad. Infrequent in Trans-Pecos mts. at elev. of 4,000-5,000 ft., July-Aug.; Tex., Ariz., Chih. and N.M.

The Spanish name attributed to this plant implies that the roots are tuberous, rather like sweet potatoes, and edible; related species are known to have such roots but the root system of the Texas plants is thus far unknown to science.

39. COURSETIA DC.

A genus of about 15 species in the warmer, drier regions of America.

1. *Coursetia axillaris* Coult. & Rose. BABY-BONNETS. Rounded shrub 5-15 dm. tall, unarmed; branches cinereous-strigose when young, with ashen bark, numerous, short, divaricate; leaves alternate, once even-pinnately compound, 1-3 cm. long; rachis strigose, terete; petiole very short; leaflets 6 to 10, reticulate, broadly elliptic or obovate, 3-8 mm. long, 2-5 mm. broad, rounded at both ends, glabrous or nearly so, sparingly strigose beneath; stipels small or obsolescent; flowers in short inconspicuous terminal and axillary racemes usually not much (if any) longer than the foliage, 1 to 4 per raceme; pedicels 5-8 mm. long; bracts linear-lanceolate; calyx strigose; calyx tube 2 mm. long, campanuloid; calyx lobes 5, 3 mm. long, deltoid-lanceolate, acute; corolla mostly pale-pink, about 1 cm. long, papilionaceous; petals subequal; banner blade broadly obovate, retuse, the claw short; wing blades broadly and obliquely oblanceolate, with a rounded basal auricle on the upper side; keel petal blades nearly semiorbicular, with a small basal auricle; stamens 10, diadelphous, 9 filaments coalescent to about the middle, the tenth (uppermost) filament free, bent near the base; style barbate on upper side; fruit a dry 4- to 8-seeded linear torulose glabrate legume 35-40 mm. long and 5 mm. broad. Infrequent or rare in scrubby vegetation, caliche ridges of Rio Grande Plains (San Patricio, Duval, Jim Hogg and Hidalgo cos.), spring-fall; also Tam. and S.L.P.

40. SESBANIA SCOP.

Annual or perennial herbs or subshrubs or weak deciduous shrubs, unarmed, with long green glabrous rarely branched branches and stems; leaves alternate, remote, once even-pinnately compound, often 2-3 dm. long; petioles short; stipules herbaceous, caducous; leaflets numerous, usually linear or narrowly oblong, often 2-3 cm. long, glabrous, green; stipels absent; flowers in axillary racemes usually shorter than the foliage; peduncle 1-12 cm. long; each flower subtended by a caducous bract; calyx closely subtended by a pair of caducous bractlets, the broadly campanulate tube usually broader than high and regular or nearly so; calyx lobes much shorter than the tube, nearly equal, deltoid, acute;

⁹¹ Adapted from C. L. Porter in *Rhodora* 58:344-354. 1956.

corolla papilionaceous, yellowish, red to orange, 6-20 mm. long; banner reflexed, longer than the other petals, the blade suborbicular, the claw short; wing blades oblanceolate to oblong, the claws a fourth to a third as long as the blade; keel petals auriculate, strongly arching, with elongate claws about as long as the blades; stamens diadelphous, 9 of the filaments coalescent basally, the tenth (uppermost) one free; fruit a dry elongate linear 2-valved or 4-sided or 4-winged dehiscent or indehiscent pod. *Daubentonia* DC.; *Glottidium* Desv.

A genus with about 40 species in the tropical and subtropical regions of both hemispheres, usually growing in seasonally wet places. The native species are troublesome weeds in the Texas Gulf Coastal Plain rice fields.

1. Peduncle 5-12 cm. long; flowers 6-9 mm. long; pods with 2 seeds 1. *S. vesicaria*.
1. Peduncle 1-5 cm. long; flowers 10-20 mm. long; pods with several to many seeds (rarely 2 by abortion) (2)
- 2(1). Racemes of 2 to 6 flowers; pods elongate, linear, not winged 2. *S. macrocarpa*.
2. Raceme of 10 to 30 flowers; pods short, thickened, 4-winged (3)
- 3(2). Banner yellow, 12-15 mm. long; native species common in east and southern Texas 3. *S. Drummondii*.
3. Banner orange-red or rose-colored, 15-20 mm. long; introduced species of eastern Texas, rarely escaping cultivation 4. *S. punicea*.

1. *Sesbania vesicaria* (Jacq.) Ell. BAG-POD, BLADDER POD. Annual herb; leaves 10-15 cm. long; leaflets 20 to 40 (52), 1-4 cm. long, 3-6 mm. broad; peduncle 5-12 cm. long; flowers 6-9 mm. long; corolla yellowish or tinged with pink or red; stipe of legume 1-2 cm. long, 1-1.5 mm. thick; legume body oblong to ellipsoid, 25-80 mm. long, 15-20 mm. thick, the valves separating at maturity into 2 layers (the outer thicker, the inner thin and papery-membranous); legume beak about 5-7 mm. long. *Glottidium vesicarium* (Jacq.) Harper. Frequent, e. third of Tex. w. to Palo Pinto, Erath, Bastrop, Gonzales, Karnes and San Patricio cos., Aug.-Sept.; Coastal States, N.C. to Tex.; also W.I. Perhaps adv. on the continent from the W.I.

2. *Sesbania macrocarpa* Muhl. BEQUILLA. Robust annual 7-40 dm. tall, rather gracefully ascending with few or no branches or occasionally with some wide-spreading branches; leaves 1-3 dm. long; leaflets up to 70, mostly 1-3 cm. long and 2-6 mm. broad; peduncle 2-4 cm. long; flowers 11-16 mm. long, yellow; legume linear, glabrous, 1-2 dm. long, 3-4 mm. broad, 1 mm. thick, with much-thickened sutures and a beak 5-10 mm. long; seeds 30 to 40. *Sesbania exaltata* (Raf.) A. W. Hill. Infrequent or locally abundant, e. third of Tex., w. to Denton, Tarrant, Travis, Hays, Comal, San Patricio and Cameron cos., Aug.-Oct.; Fla. to Tex. and n. to Mo.; locally waived in n.e. U.S.

3. *Sesbania Drummondii* (Rydb.) Cory. RATTLEBUSH, POISON BEAN, COFFEE BEAN. Shrub (in the north extremity of distribution the branches often die back during the winter, only the lowest part of the plant remaining alive and becoming woody) 4-30 dm. tall; leaves mostly 1-2 dm. long; leaflets 20 to 50, mostly 15-35 mm. long and 4-7 mm. broad; peduncle 1-5 cm. long; flowers 13-16 mm. long, yellow (often with red lines); pod often 5-6 cm. long, about 1 cm. broad, short-stiped and short-beaked, the body 4-winged the full length, the wings about 3 mm. broad. *Daubentonia Drummondii* Rydb. Coastal Plain inland to Denton, Williamson, Travis, Comal, Wilson, McMullen and Starr cos., locally very abundant, June-Sept.; Coastal States, Fla. to Ver. and inland to S.L.P.

The seeds are loose in the mature pods which rattle when the bush is in motion, hence the common name. The seeds, if eaten, are known to be poisonous to sheep and goats.

4. *Sesbania punicea* (Cav.) Benth. Shrub 1-2 m. tall; leaves 1-2 dm. long; leaflets 12 to 40, mostly 1-3 cm. long and 4-7 mm. broad; peduncle 1-3 cm. long; flowers about 15-20 mm. long, at least the banner red, rose-red or orange-red; pod 5-8 cm. long, about 12-15 mm. thick, strongly 4-winged, the stipe 5-15 mm. long. *Daubentonia punicea* (Cav.) DC. Infrequent or rare in e. and s.e. Tex. (Nacogdoches, Tyler and Hardin cos.), spring; nat. of S.A., widely adv. in the warmer parts of s.e. U.S.

41. ROBINIA L.

Shrubs or trees to 10 m. high, often forming colonies by means of root sprouts; stipules spinescent, paired, nearly straight, to 1 cm. long; leaves alternate, 5-15 (-30) cm. long, once-imparipinnately-compound, deciduous in fall; petioles short; leaflets 7 to 19, usually obovate-elliptic, glabrous or pubescent; stipels present but early deciduous; flowers in conspicuous axillary usually nutant short-peduncled racemes that are usually shorter than the foliage; calyx campanulate, more or less 2-lipped, the upper 2 lobes shortest and coalescent for part of their length, the lower 3 lobes longer and more deeply divided and about equal; corolla papilionaceous, white or red or reddish-purple; petals clawed, 1-3 cm. long; banner blade obcordate or suborbicular or nearly so, more or less reflexed; wing blade obliquely oblong to obovate, free, with a basal auricle on the upper side; keel petal blades incurved, coalescent near the tip, basally auriculate; stamens 10, monadelphous, the uppermost filament coalescent to the filament tube for about two-thirds its length but free at both ends; ovary somewhat stipitate; style barbate on the upper side; fruit a legume, broadly linear, compressed, short-stipitate and with 2 thin valves; seeds few to several.

A genus of perhaps 10 species of the temperate parts of the United States and Mexico; difficult taxonomically because of widespread hybridization.

1. Ultimate stems and leaves densely hispid 1. *R. hispida*.
1. Ultimate stems and leaves glabrous, only the axis of raceme hispid, if at all (2)
- 2(1). Pod and axis of raceme densely hispid 2. *R. neomexicana*.
2. Pods and axis of raceme glabrous 3. *R. Pseudo-Acacia*.

1. *Robinia hispida* L. BRISTLY LOCUST. Shrub 3-30 dm. tall, much-branched, with densely hispid and usually somewhat pilose branches; petals purple to reddish-purple or rosy; legume densely glandular-hispid. Rare in e. Tex., where probably introd., spring; mts. from Va. to Ky., s. to Ga. and Ala.; cult. over a wider area.

2. *Robinia neomexicana* Gray. Shrub 3-30 dm. tall, much-branched, the numerous branches gray-puberulent or in age reddish or purplish, occasionally glandular-hispid; petals rose-pink or so pale as to be almost white; legume glandular-hispid as well as hirsutulous. Rare in the Trans-Pecos, known only from the Guadalupe Mts. and Franklin Mts., spring; N.M., Col., Ariz., Nev., Son. and Tex.

Probably our only native species of *Robinia*.

3. *Robinia Pseudo-Acacia* L. BLACK LOCUST. Tree to 15 m. tall, nearly glabrous; petals white (the banner with a yellowish center-lozenge); legume glabrous. Scattered localities in e., n.-cen. and s.e. Tex., where probably introd. through cult., spring and occasionally later; probably nat. to parts of s.e. U.S., now very widely cult. in temp. climates.

Black locusts are weedy, "dirty" trees and root-sprout perniciously, therefore they are to be avoided in cultivation, although they are widely touted by unscrupulous nursery-dealers as "million-dollar shade trees."

42. SPHAEROPHYSA DC.

A genus with about 30 species in Australia, New Zealand and northern Asia.

1. *Sphaerophysa salsula* (Pall.) DC. Perennial herb spreading into colonies by means of rhizomes; leaves alternate, once-imparipinnately-compound, 3-10 cm. long, sessile or shortly petioled; leaflets (15 or) 17 to 25, oblong-obovate to narrowly oblong or in some upper leaves narrowly elliptic, 3-18 mm. long; flowers in loose axillary racemes; peduncles 3-9 cm. long; calyx 5-6 mm. long, white-strigulose, the tube campanuloid and 3.8-4.6 mm. long, the deltoid teeth 1.2-2 mm. long, the whole becoming papery, persistent; corolla papilionaceous, brick-red (drying lavender or brownish); banner recurved, 12-14 mm. long, suborbicular-cuneate, 11.5-14 mm. broad; wings 10-12 mm. long (including claws 2.8-3.4 mm. long); keel 11.3-12.5 mm. long (including claws 4.5-5 mm. long); stamens 10, diadelphous, 9 filaments coalescent, the uppermost (tenth) one free; fruit an inflated nearly globose bladderlike pod with thin papery walls; pod stipe 4.5-7 mm. long, the body 13-24 mm. long and 9-20 mm. thick. *Swainsona salsula* (Pall.) Taub. Scattered

near roads in El Paso Co., extreme w. Trans-Pecos, May-July; nat. to n. Asia, but occasionally introd. in w. Am.

43. ASTRAGALUS L.⁹²

MILK-VETCH. LOCO WEED

Unarmed perennial or annual herbs, caulescent or not, leaves once-imparipinnately-compound, petioled; stipules present, often well-developed and forming sheaths or other structures but never spinescent in our species, leaflets several to many; stipels absent; flowers in axillary racemes (rarely single), often these nearly spikelike; calyx with a campanuloid to cylindric tube and 5 equal to unequal deltoid to setaceous lobes; corolla papilionaceous, white, yellow to purplish or lavender, never red; banner reflexed, the blade oblanceolate to broadly cuneate, claw present; wings clawed, the blade auricled at the base on the upper side and with a depression; keel petals coalescent distally, the blades auricled basally and with a low prominence which fits into the wing's socket; keel petals obtuse to acute; stamens diadelphous, 9 of the filaments coalescent, the tenth (uppermost) one free; fruit a linear to globose dry to fleshy (often very tardily) dehiscent legume exerted from the calyx; dehiscence sometimes occurs after the fruit has fallen to the ground; seeds 1 to several.

A very large, difficult genus with about 1,500 species occurring throughout the subtropical and temperate parts of the world except Australia. Many plants of this genus accumulate selenium ions in toxic concentrations, and when ingested in sufficient quantity by stock cause the symptoms known as "loco disease;" other species which do not accumulate selenium are useful forage.

1. Pubescence of the herbage dolabriform, the hairs attached laterally above their bases with one ascending and a shorter descending arm (2)
1. Pubescence basifixed, the simple hairs attached at base (6)
- 2(1). Tall erect leafy plants, more or less rhizomatous, the stems 4.5-10 dm. long; racemes densely many-flowered, the flowers nodding; pods erect, bilocular; stipules connate 7. *A. canadensis*.
2. Low tufted or loosely matted and prostrate plants, the stems arising together from the root crown or shortly forking caudex; racemes relatively few-flowered, the flowers ascending or spreading; pods 1-locular (3)
- 3(2). Flowers large, the deeply campanulate or cylindric calyx tube 6.5-10.5 mm. long, the keel 12-19 mm. long (4)
3. Flowers smaller, the campanulate calyx tube 3-4.5 mm. long, the keel 4-10 mm. long (5)
- 4(3). Pod straight or nearly so, a little laterally compressed its whole length, carinate by the sutures, persistent on the receptacle until after dehiscence; a widespread plains species, extending south to the Panhandle, Trans-Pecos, and north-central areas of Texas 10. *A. missouriensis*.
4. Pod crescent-shaped, laterally compressed at both ends, dorsiventrally compressed at the middle, readily disjoining from the receptacle and dehiscent on the ground; a western species just entering Texas in El Paso County 9. *A. amphioxys*.
- 5(3). Stipules connate; slender prostrate caulescent plants of the Davis Mountains, the stems 1-6 dm. long 4. *A. humistratus*.
5. Stipules free; tufted acaulescent or shortly caulescent plants, the stems 0-1 dm. long; peduncles and racemes often dimorphic, the early peduncles well-developed and bearing chasmogamous flowers, the later ones very short (often subradical) and bearing cleistogamous flowers, sometimes the inflorescences all of either one sort or the other 20. *A. lotiflorus*.

⁹² Adapted from Rupert C. Barneby in Mem. N.Y. Bot. Gard. 13:1188 pp. 1964. We are grateful to Mr. Barneby for having read the manuscript.

- 6(1). Plants perennial (doubtful cases should be keyed under both alternatives) (7)
 6. Plants annual (22)
- 7(6). Flowers large; calyx tube 5-11.5 mm. long; banner 12-25 mm. long, the keel 10.5-19 mm. long (keel as little as 9 mm. in densely villous-tomentose *A. mollissimus* var. *Earlei* of Trans-Pecos Texas) (8)
7. Flowers small; calyx tube 1.5-4.5 mm. long; banner mostly 4.5-10 mm. long but to 15.5 mm. in *A. distortus* of east Texas, the keel 3.5-10 mm. long (17)
- 8(7). Stipules near the base of the stem connate (9)
 8. Stipules all free; pod sessile, spreading or erect (10)
- 9(8). Pedicels in anthesis 1-1.8 mm. long, in fruit 1.5-2.9 mm. long; pod horizontal or declined, sessile, turgid or inflated, subterete (except at the beak); ovules 25 to 36 3. *A. puniceus*.
9. Pedicels in anthesis 2-3.5 mm. long, in fruit 3-8 mm. long; pod pendulous, stipitate (the stipe 3.5-7 mm. long), triquetrously compressed; ovules 12 to 22 5. *A. racemosus*.
- 10(8). Herbage densely silky-villous or villous-tomentose with shorter, curly and longer, straight, spirally twisted hairs to 1-3 mm. long (the vesture becoming tawny after a short period in the herbarium); stipules silky-pilose dorsally (11)
10. Herbage variously pubescent to nearly glabrous but (if the hairs over 1 mm. long) then all of one sort (not twisted) and the stipules then glabrous or nearly so dorsally (12)
- 11(10). Stems few, erect, 2-6 dm. long; peduncles stiffly erect; flowers nodding; pedicels becoming 4-9 mm. long in fruit; pod persistent on the receptacle until after dehiscence; Davis Mountains; flowering after summer rain 12. *A. giganteus*.
11. Stems usually numerous, decumbent or closely tufted, 0-1.5 (-2) dm. long; peduncles humistrate in age; flowers ascending; fruiting pedicels to 3 mm. long; pod readily deciduous, dehiscent on the ground; widespread, Edwards Plateau north and west; flowering in the spring 11. *A. mollissimus*.
- 12(10). Flowers ochroleucous; calyx very sparsely strigulose; pod subunilocular, the septum very narrow and incomplete; coarse ill-scented (seleniferous) plants entering northwestern Texas in Bailey, Martin and Midland counties 6. *A. praelongus*.
12. Flowers mostly purple, if ochroleucous then the calyx densely tomentulose and of east Texas; pod fully 2-locular, the septum broad (13)
- 13(12). Pod plumply ovoid, subglobose or if oblong-cylindroid then 10-20 mm. in diameter; valves of the pod very thick and succulent when first formed, 1-5 mm. thick when dry; widespread (14)
13. Pod narrowly oblong-ellipsoid, 17-38 mm. long, 5-8 mm. thick, obtusely triquetrous, grooved dorsally, the valves stiffly papery, less than 0.5 mm. thick; Tran-Pecos Texas, (Hudspeth, Culberson, El Paso cos. and apparently isolated in Reagan and Terrell cos.) 8. *A. Waterfallii*.
- 14(13). Ovary and pod glabrous; calyx early-circumscissile, leaving the pod naked (15)
 14. Ovary and pod pubescent (16)
- 15(14). Pod broadly oblong-ellipsoid or subglobose, seven eighths to one and one half times as long as its diameter; stipules glabrous or nearly so dorsally; leaflets commonly glabrous or medially glabrescent on the upper surface; widespread 13. *A. crassicaarpus*.
15. Pod cylindroid, three to four times longer than wide; stipules strigulose dorsally, at least above the middle; leaflets subequally cinereous or silvery-strigulose on both sides; confined to gypseous soils of the Pecos Valley in Reeves and Culberson counties and adjoining New Mexico 14. *A. gypsodes*.

- 16(14). Stems arising singly or few together from loosely forking subterranean caudex branches or oblique rootstocks; walls of the ripe pod 1-1.5 mm. thick; calyx persistent about the base of the fruit; widespread and common over the prairies east of the Pecos 15. *A. plattensis*.
16. Stems arising in a clump together from the root crown; pod walls 2-5 mm. thick; calyx early-circumscissile, leaving the fruit naked; a rare taxon, (Irion and Brewster counties) 13. *A. crassicarpus*.
- 17(7). Stipules (at least those at base of the stems) connate; stems partly subterranean, arising from a buried root crown and emerging singly from the ground (18)
17. Stipules all free; stems arising together from the root crown at soil level (19)
- 18(17). Pod small, 4-8 mm. long, 2.5-3.5 mm. in diameter, solid or nearly so; Panhandle southeast to Knox and Fisher counties 2. *A. gracilis*.
18. Pod larger, 9-17 mm. long, 4.5-6 mm. in diameter, a little inflated; Trans-Pecos Texas 1. *A. pictiformis*.
- 19(17). Plants of Trans-Pecos Texas; pod globose, ovoid or half-ovoid, bladderly-inflated, the papery-diaphanous valves strigulose (20)
19. Plants of east Texas; pod narrowly lunate-ellipsoid or half-obovoid, the firmly papery or leathery valves glabrous (21)
- 20(19). Pod subsymmetrically ovoid or globose, both sutures about equally convex; very common in Trans-Pecos Texas 17. *A. Wootonii*.
20. Pod strongly asymmetric, half-ovoid or -ellipsoid, the ventral suture nearly straight, the dorsal one strongly convex; just entering Texas in El Paso County 16. *A. allochrous*.
- 21(19). Calyx 3-5.5 mm. long, the teeth not over 2 mm. long; petals (in Texas) purplish; keel 5.5-9.3 mm. long 18. *A. distortus*.
21. Calyx 6.3-8.9 mm. long, the teeth 2.5-4 mm. long; petals cream-colored or greenish-white; keel 9.4-10.2 mm. long 19. *A. Soxmaniorum*.
- 22(6). Pod papery, bladderly-inflated, unilocular; Trans-Pecos Texas (return to couplet no. 20)
22. Pod variable but never much-inflated, bilocular except in *A. Soxmaniorum* of east Texas (23)
- 23(22). Petals uniformly cream-colored or greenish-white; keel 9.4-10.2 mm. long; pod unilocular; potentially perennial but flowering the first season 19. *A. Soxmaniorum*.
23. Petals purple, lilac or at least lilac-tipped, if appearing whitish when dried then the keel shorter; pod bilocular; oblique annuals (*A. Emoryanus* exceptionally biennial) (24)
- 24(23). Plant thinly hirsute with widely spreading hairs 1-1.3 mm. long; petals irregularly graduated, the white wings much shorter than the violet banner and keel; keel blades lunately lanceolate, gradually tapering into a narrow beaklike apex; pod sessile, abruptly deflexed, triangular-ovate in dorsal view, 5.5-9 mm. long ... 25. *A. reflexus*.
24. Plant variously pubescent but if hirsute then densely so and the pod otherwise; petals regularly graduated, even if only slightly so, the banner longest and keel shortest (25)
- 25(24). Pod densely pilose-hirsute, narrowly oblong, straight, 7-13 mm. long, 2.5-3.5 mm. in diameter; racemes capitate 3- to 7-flowered, the flowers and pods erect or nearly so on stiff erect peduncles 27. *A. Wrightii*.
25. Pod glabrous, strigulose or thinly hirsutulous but if pubescent either narrower or spreading or incurved (26)
- 26(25). Racemes 7- to 25-flowered; pod deflexed, elevated on and readily deciduous from a stipelike gynophore 1.5-2.5 mm. long, the body peltate, subcircular or broader than long in dorsiventral view; ovules 4 26. *A. brazoensis*.
26. Racemes mostly fewer-flowered but if over 7-flowered the ovules at least 8; pod sessile or truly stipitate (the stipe continuous with the body), linear to oblong in outline, grooved dorsally (27)

- 27(26). Flowers both large and few (2 to 6), the banner (12-) 13-18.5 mm. long; keel 9.5-13 mm. long, its broad blades 7-9.5 mm. long; pod stipitate, the stipe 1-2.5 (-3) mm. long and the narrowly oblong body 3.5-6 mm. thick; style minutely barbellulate below the stigma24. *A. Lindheimeri*.
27. Flowers smaller, the banner not over 12 mm.; keel mostly less than 8 mm. long, its blades 2.3-5 mm. long (but if the keel up to 9.3 mm. or its blades up to 7 mm. long then the flowers 9 or more to the raceme); style glabrous; pod sessile or nearly so, the stipe less than 1 mm. long and the body 1.8-3.5 mm. in diameter (28)
- 28(27). Pod (sessile, uniformly glabrous) readily deciduous from the receptacle and dehiscent at both ends on the ground; keel tip broadly rounded, blunt; leaflets of all leaves truncate-emarginate or retuse21. *A. Emoryanus*.
28. Pod (sessile or substipitate, glabrous or pubescent) firmly attached to the receptacle and dehiscent (unless broken off accidentally or in pressing) apically on the raceme; if all leaflets truncate-emarginate or retuse and the keel tip obtuse the pod cuneately contracted at base into a short stipe (29)
- 29(28). Herbage more densely pubescent with longer hairs or if the hairs no longer than the leaflets pubescent above, or the ovary and pod pubescent, or the leaflets elliptic and acute in at least some upper leaves, or the keel-tip broadly rounded
.....22. *A. Nuttallianus*.
29. Herbage full, deep-green, the margins and lower midrib of the leaflets sparsely strigulose with appressed hairs 0.3-0.65 mm. long; leaflets of all leaves retuse; calyx sparsely strigulose with hairs 0.25-0.5 mm. long; keel-tip sharply deltoid or triangular-acute (30)
- 30(29). Banner mostly 8-12 mm. long; keel mostly 6-7.8 mm. long; pod 20-35 mm. long, straight or very gently and evenly incurved its whole length
.....23. *A. leptocarpus*.
30. Banner 5-7.5 mm. long; keel 4.5-5.8 mm. long; pod 12-26 mm. long, usually incurved near the base and straight or nearly so thereafter ...22. *A. Nuttallianus*.

1. *Astragalus pictiformis* Barneby. Perennial, low and slender, with an initial taproot and deeply buried root crown; herbage densely strigulose-villosulous with subappressed and ascending sinuous hairs, greenish-cinereous or canescent; stipules 1.5-5 (-6.5) mm. long, those at the buried nodes connate around the stem, the upper ones connate through about one third to one half their length; leaves (10-) 15-55 mm. long, shortly petioled; leaflets 9 to 17, mostly crowded, oblong-obovate to -oblanceolate or (especially in some lower leaves) suborbicular, obtuse or commonly retuse, flat or marginally involute, 2-8 (-10) mm. long; calyx 4-6.3 mm. long; petals flesh-pink tinged with lilac, the banner purple-striate, the keel tipped with dull-purple; banner (8.5-) 9-11 mm. long; keel 7-8.9 mm. long; pod deflexed, sessile, oblong or plumply oblong-elliptic in outline, 9-17 mm. long, 4-6 mm. in diameter, straight or commonly a trifle decurved, abruptly contracted at base into an obscure stipelike neck no longer than wide and at apex into a short deltoid-acuminate slightly declined beak, elsewhere obscurely and obtusely triquetrous, keeled ventrally by the prominent thick convexly arched suture, shallowly and openly grooved dorsally, the lateral angles obtuse, the thinly fleshy green or purplish ultimately stiffly papery and brownish valves strigulose, finely coarse-reticulate. Rare in desert grassland, calcareous soil, Hueco Mts., Hudspeth Co., and Davis Mts., Jeff Davis Co., in the Trans-Pecos, Apr.-June and later; also N.M.

2. *Astragalus gracilis* Nutt. Perennial, slender, sparsely leafy, strigulose nearly throughout with fine straight appressed or a few narrowly ascending hairs 0.3-0.5 mm. long; stems 15-40 cm. long; stipules amplexicaul and connate, progressively less united upward, the uppermost free or united by a stipular line; leaves 25-70 mm. long, all shortly petioled or the uppermost sessile; leaflets 9 to 17, linear, linear-oblong, narrowly oblong, oblanceolate or cuneate-oblong, commonly retuse but when narrow-truncate to obtuse, flat or involute, (3-) 5-20 (-25) mm. long; calyx 2.1-3.3 mm. long; petals pale-lilac or purplish; banner often purple-veined, 5.3-8.4 mm. long; keel 3.7-6.1 mm. long; pod declined or deflexed, or from decumbent branches horizontally spreading, sessile, obliquely suborbicular to plumply ovate or ovate-elliptic in dorsal view, (4-) 4.3-8 (-9) mm. long, 2.2-3.6 mm. thick, obtuse at base, abruptly cuspidate at apex, obcompressed,

the dorsal face either flattened or openly and shallowly sulcate, the ventral face convex, carinate by the prominent thickened suture, the somewhat fleshy densely strigulose or minutely villosulous valves becoming brown or stramineous, stiffly leathery and rigid, transversely rugulose-reticulate. *A. microphacos* Cory. Scattered in calcareous soils, higher parts of the Plains Country, Apr.-June; Sask., S.D. and Mont. s. to Tex.

3. *Astragalus puniceus* Osterh. Perennial; herbage canescent with basifixed often curly hairs 0.4-0.9 (-1.2) mm. long; stems several, 1-3 (-5) dm. long; stipules 2-6 mm. long, the lowest small and connate, in the upper nodes becoming nearly free; leaves (2-) 3-11 cm. long; leaflets (7 to) 13 to 27, (3-) 5-16 mm. long; racemes with 5 to 19 (to 27) flowers; pedicels at anthesis 1-1.8 mm. long, in fruit arcuate-recurved, somewhat thickened; calyx 6-10.5 mm. long, the tube 4.9-8 mm. long; petals pink-purple or pallid; banner 13.4-21 mm. long; wings 13.5-18 mm. long; keel 10.4-14 mm. long; pod horizontally spreading or declined, sessile, oblong or ovoid-ellipsoid, 15-24 mm. long, 5-9.5 mm. thick, turgid or somewhat inflated except in the cuspidate beak; ovules 25 to 36. Rare, reported recently in higher parts of Plains Country in Deaf Smith Co. (we have not seen the specimens), spring (?); Panhandle of Okla., s.e. Colo., n.e. N.M. and Tex.

4. *Astragalus humistratus* Gray. Perennial, prostrate to diffuse or weakly assurgent, sometimes matted, the several or many stems radiating from the root crown or caudex, slender and wiry or rather coarse, (4-) 17-60 (-30) cm. long, dolabriform-pubescent; stipules all fully amplexicaul and connate, the smaller lowest ones into a subtruncate or bidentate sheath, the upper progressively longer ones with narrowly triangular or lance-acuminate free blades as long as or longer than the sheathing base; leaves 10-60 (-75) mm. long, all subsessile or the lowest shortly petioled; leaflets (5 to) 9 to 17 (or 19), elliptic to oblong-elliptic or oblanceolate, acute to obtuse and mucronulate or (in some lower leaves) obovate and obtuse, flat, loosely folded or involute, crowded or well-spaced, (2-) 3-17 (-19) mm. long; racemes 7- to 30-flowered; pedicels ascending or a trifle arched outward; calyx 3.2-7.6 (-8.8) mm. long; petals varying from greenish- or pinkish-white to ochroleucous and to lurid or magenta-purple; banner 5.9-11.8 mm. long; wings 5.8-10.7 mm. long; keel 5.1-10 mm. long; pod ascending, spreading, rarely a little declined, commonly humistrate, varying from plumply half-ovoid to narrowly oblong-ellipsoid, 6-20 mm. long, contracted distally into a deltoid or triangular-acuminate laterally compressed beak. Rare in Davis Mts., elev. 6,500-7,000 ft., in the Trans-Pecos, May-Sept.; Colo., Ut., Nev., N.M., Ariz., Tex., Son. and Chih. Our plants belong to the typical variety which occurs only in Tex., Chih., N.M., Ariz. and Colo.

5. *Astragalus racemosus* Pursh. Perennial, coarse leafy herb of stout or moderate stature, with a woody taproot and knotty multicipital root crown at or just below soil-level, thinly to quite densely strigulose with filiform or flattened appressed hairs; stipules scarious or nearly becoming so, 3-12 mm. long, the lowest amplexicaul and connate into a short subtruncate or bidentate often early-ruptured sheath, the median ones progressively less united upward along the stem, the uppermost free or nearly so; leaves (4-) 5-15 cm. long, the lowest shortly petioled, the rest subsessile; leaflets (9 or) 11 to 29 (or 31), lance-elliptic to ovate, mostly obtuse and mucronulate, sometimes (in upper leaves, rarely all) linear-lanceolate or elliptic and acute or acuminate, flat or loosely folded, (5-) 10-35 mm. long; petals white or ochroleucous or whitish with keel tip, wings or base and tip of banner blade tinged or veined with pale-lilac or pink-purple; banner 14-20.5 mm. long; wings 12.5-19 mm. long; keel 10.8-15.2 mm. long; pod pendulous, stipitate, the slender straight stipe, 3.5-7 mm. long, the linear-oblong to lance-oblong or oblong-ellipsoid body 1-3 cm. long and 3-8 mm. in diameter, triquetrously compressed with acute ventral and narrow but blunt lateral angles. Local in Plains Country, Mar.-June; Sask., N.D. to Tex. and w. to Wyo., Ut., Colo. and N.M.

6. *Astragalus praelongus* Sheld. Ill-scented perennial, coarse and ordinarily tall, either nearly glabrous or the upper stems, lower surface of the leaflets and the inflorescence thinly strigulose with straight appressed hairs 0.3-0.65 (-1) mm. long; stipules all free, thinly herbaceous, becoming papery-scarious, 2.5-7 (-9) mm. long; leaves 4-18 (-22) cm. long, all petioled or the uppermost subsessile; leaflets (7 to) 11 to 27 (to 33), obovate or oblong-obovate to lanceolate or oblanceolate, obtuse or retuse, or in some upper (all) leaves elliptic and acute, (3-) 8-35 (-50) mm. long; racemes 10- to 25- (to 33)-flowered; pedicels in fruit ascending, straight; calyx 5.8-13 (-14) mm. long, glabrous

or thinly strigulose with black or white hairs; petals orchroleucous with faintly maculate keel tip, exceptionally pink-tinged; banner 15-23.5 mm. long; wings 15-22 mm. long, the claws 5.3-8.4 mm.; pod subunilocular, erect or horizontally spreading, sessile, the turgid or decidedly inflated body varying from narrowly ellipsoid to broadly ovoid or obovoid to subglobose, 18-38 (-42) mm. long, 5-15 mm. thick. *Jonesiella Ellistiae* Rydb. Rare in Plains Country, spring; Nev., Ut., Colo., Ariz., N.M. and Tex.

7. *Astragalus canadensis* L. Usually robust, more rarely quite slender caulescent perennial; stems arising singly and few together from oblique or horizontally spreading at length woody rhizomes, more or less densely strigulose with straight or largely straight appressed and subappressed dolabriform hair; stipules deltoid-acuminate or lanceolate, 3-18 mm. long, membranous, at least the lowest ones connate into a bidentate sheath; leaves (3-) 5-35 cm. long, shortly petioled or the upper ones subsessile; leaflets (7 to) 13 to 35, broadly lanceolate or lance-oblong to ovate-oblong or elliptic, rarely obcordate, obtuse and mucronulate to obtuse or shallowly emarginate, flat, (0.5-) 1-4.5 (-5) mm. long; pedicels ascending or a little arched outward; calyx (4.6-) 5.5-10.5 (-11) mm. long; petals greenish-white, cream-color, dull-straw-yellow or greenish tinged with dull- or lurid-purple; banner (11.3-) 13.2-17 (-17.5) mm. long; pod erect, sessile on the slightly elevated receptacle, oblong-cylindroid or -ellipsoid, (9-) 10-20 mm. long, 2.9-5.2 mm. thick. Scattered in n. part of n.-cen. Tex. and parts of e. and s.e. Tex., May-June; much of temp. N.A.

Without much doubt merely a variety of the Old World *A. uliginosus* L.

8. *Astragalus Waterfallii* Barneby. Perennial, low, tufted, subcaulescent or shortly caulescent, with a thick woody taproot, strigulose nearly throughout with straight or nearly straight appressed and often a few narrowly ascending hairs; stipules ovate-triangular or triangular-lanceolate, 2.5-8 mm. long; leaves appearing subradical, 30-100 (-125) mm. long, with slender petiole; leaflets 9 to 25, elliptic or oval-elliptic to ovate-oblong or oblanceolate, obtuse or subacute, loosely folded or finally flat, 3-16 mm. long; petals purple with paler claws, the banner with a large pallid lozenge in the fold; banner 18.5-23 mm. long; wings 17.2-22.7 mm. long; keel 14.5-19 mm. long; pod ascending (humistrate), narrowly oblong-ellipsoid or somewhat clavately ellipsoid, a trifle incurved, (17-) 20-38 mm. long, 5-8 mm. in diameter, cuneate or cuneately tapering at base, abruptly acute and cuspidate at apex, obtusely trigonous and at the same time a little compressed, carinate ventrally by the suture, the lateral angles rounded, the dorsal face shallowly sulcate, the fleshy purple-mottled strigulose valves becoming stiffly papery or leathery, in age brownish, finely reticulate and also wrinkled lengthwise, inflexed below the beak as a complete or subcomplete septum 2.3-4.3 mm. wide. Limestone areas in the Trans-Pecos, scattered, with one locality in Reagan Co., Mar.; N.M., Tex., Chih. and probably Coah.

9. *Astragalus amphioxys* Gray. Low, tufted or loosely matted, subcaulescent or shortly caulescent, winter annual or perennial of short duration, densely strigose-strigulose throughout with stiff straight appressed usually subcontiguous dolabriform hairs, the herbage silvery-white; stipules ovate or deltoid to triangular or triangular-acuminate or -caudate, semi- (the lowest sometimes fully) amplexicaul; leaves 2-10 (-13) cm. long, all petioled; leaflets (7 to) 11 to 21, elliptic or rhombic-elliptic to oblanceolate or obovate, sharply acute to obtuse and mucronulate, exceptionally emarginate, distant or crowded, flat or loosely folded, 3-13 (-20) mm. long; calyx 9.3-14.2 mm. long; petals bright-pink-purple; banner with a large striate lozenge in the fold, exceptionally pure-white, 16-25 mm. long, the wings a little shorter; keel 13-20 mm. long; pod ascending (humistrate), variable in length and curvature, (15-) 20-40 (-50) mm. long, 5-10 mm. thick, most commonly (1) crescentic in profile, gently and evenly arched through one fourth to a complete circle, laterally compressed and acute to long-acuminate at both ends, obcompressed at the middle; or (2) straight but otherwise as above; or (3) obcompressed throughout below the beak; or (4) when short then obtuse and dorsiventrally compressed at base, acuminate and laterally compressed distally; in all cases both sutures prominent their whole length, the dorsal one often sinuous, commonly depressed at the middle of the pod and lying in a double groove, the green or sometimes mottled more or less fleshy strigulose valves becoming stiffly leathery or subligneous, rarely a trifle spongy in age, reticulate and sometimes also wrinkled lengthwise, often rugulose on the obtuse trans-

versely dilated angles, either not inflexed or if so the septum present only near the middle of the pod and very narrow, not over 1.1 mm. wide; dehiscence apical, through the gaping beak and also basal through the dorsal or both sutures. Rare near El Paso, extreme w. Trans-Pecos, Mar.-June; Nev., Ut., Colo., Ariz., N.M., Tex. and Chih.

10. *Astragalus missouriensis* Nutt. Low, loosely tufted or prostrate, shortly caulescent or sometimes subcaulescent, with a taproot and at length loosely forking, with a scarcely suffruticulose caudex, densely strigulose or strigose throughout with straight parallel often contiguous lustrous dolabriform hairs 0.7-1.25 mm. long; herbage silvery-white to greenish-gray; stipules (2-) 3-9 mm. long, ovate or triangular-acuminate, fully or semi-amplexicaul-decurrent, free (or the lowest exceptionally shortly connate); leaves (2-) 4-14 cm. long, with a flaccid, deciduous or weakly persistent petiole; leaflets (5 to) 11 to 17 (to 21), elliptic to narrowly obovate, acute or mucronulate, sometimes mostly obovate and obtuse, flat, 3.5-13 (-17) mm. long; calyx 5-12 mm. long, strigulose, purple-tinged; petals (except in rare albinos) pink-purple, with a pale lozenge in the fold of the banner, drying dull-bluish; banner 9.5-22 (-24) mm. long, the wings nearly as long to considerably shorter; keel 8.9-17.3 (-18.5) mm. long; pod ascending (humistrate), sometimes through accidental twisting of the pedicel apparently spreading or declined, sessile and (commonly) persistent on the receptacle, subsymmetrically oblong or oblong-elliptic in outline, 14-27 (-30) mm. long, (4-) 5-9 (-10) mm. thick, obtuse or sometimes cuneate at base, abruptly contracted distally into a subulate, pungent or triangular-acuminate and laterally compressed beak, variably compressed, the green fleshy strigulose valves becoming stiffly leathery or subligneous, 0.3-0.5 mm. thick when dry, transversely reticulate and wrinkled lengthwise, brownish and ultimately black, either not inflexed or often so far as to form a distinct septum to 1.1 mm. wide. Rare in Plains Country and Trans-Pecos, in desert grama grasslands, Mar.-June; Alta., Sask. and Man. s. to Tex.

11. *Astragalus mollissimus* Torr. CRAZY WEED, TEXAS LOCO, WOOLLY LOCO, PURPLE LOCO WEED. Low, often relatively robust and leafy, densely or quite loosely tufted, perennial but of only a few years' duration, the taproot early becoming woody and the rootcrown in old plants sometimes developing into a shortly forking caudex, the stems and foliage villous-tomentose (pilose) throughout; leaves canescent, silvery or rarely greenish, the vestiture usually composed of two sorts of extremely fine hairs, one shorter, curly and entangled, the other longer, spreading-ascending or rarely retrorse or forwardly appressed, straight or sinuous, spirally twisted, both turning rufous or tawny when dry; stipules free; leaves (3-) 6-26 cm. long, all petioled; leaflets 11 to 35, suborbicular or ovate to obovate or rhombic-elliptic, often thick-textured, 3-45 mm. long, commonly diminishing upward along the rachis; pedicels 0.5-1.5 mm. long, in fruit thickened and 1-3 mm. long; calyx (7-) 8-14 mm. long; petals pink-purple to dull-pinkish-lavender or yellowish suffused with sordid-lilac, or creamy-white drying stramineous, often tending to persist about the forming pod; banner 12-24.5 mm. long, the wings as long or somewhat shorter; keel shorter than the wings; pod spreading or ascending, commonly humistrate, obliquely ovate or lance-elliptic to lunate or linear-oblong in outline, 9-25 mm. long, 4-13 mm. in diameter, solid or more or less turgid, sometimes decidedly inflated but never bladderly, rounded or (when broad) subtruncate or a trifle umbilicate at base, contracted distally into a short conical or laterally flattened deltoid beak, terete when narrow, obcompressed and shallowly sulcate along both sutures when broad, nearly straight to incurved through 90° or slightly more, the fleshy valves becoming stiffly papery, leathery or subligneous, rugulose-reticulate, glabrous, strigose or villous-tomentose, inflexed as a complete septum extending up to the base or into the apex of the beak.

According to some authorities, this was the first loco weed to be recognized. When eaten, it is especially fatal to horses.

Ranging from Nebr., Wyo. and Ut. s. and s.e. to Pue.; represented in w. Tex. by 5 varieties.

Var. *mollissimus*. Calyx tube 3.4-4.5 mm. in diameter; petals purple or marginally suffused with purple, the keel 14-18 mm. long; pod glabrous or with hairs much less than 1 mm. long. Plains Country, with one record from Culberson Co. in the Trans-Pecos; intergrading extensively with var. *Earlei*.

Var. *Earlei* (Rydb.) Tidestr. Like var. *mollissimus* but flowers smaller; calyx tube 0.8-3

mm. in diameter; keel 9-13 mm. long. Abundant in the Trans-Pecos, Mar.-June, etc.; Tex., Chih. and Coah.

Var. *Coryi* Tidestr. Petals cream-colored, immaculate; pod glabrous or distally with hairs less than 1 mm. long. *A. argillophilus* Cory. Abundant on w. part of Edwards Plateau from Crockett Co. n. to Martin Co., Mar.-May, etc.; endemic.

Var. *Bigelovii* (Gray) B. L. Turner. Calyx 10 mm. or more long; banner 16-25 mm. long; pod 10-15 mm. long, densely villous-tomentulose, the longest hairs 1-1.6 mm. long; ovules 20 to 30. Local in Trans-Pecos deserts (El Paso, Hudspeth and Presidio cos.), Feb.-June; N.M., Ariz. and Tex.

Var. *marcidus* (Rydb.) B. L. Turner. Calyx 7-9.5 mm. long; banner 12-16 mm. long; pod 6-10 mm. long, villous-hirsute with hairs more than 1 mm. long; ovules 12 to 16. Rare in Jeff Davis and Presidio cos. in the Trans-Pecos, Apr.-July; endemic.

12. *Astragalus giganteus* Wats. Robust, amply leafy, with a thick woody taproot, densely tomentulose and pilose throughout with shorter curly or sinuous and longer nearly straight spirally twisted loosely ascending hairs 1.3-2.5 mm. long; herbage silky-canescens or greenish in age, the vestiture tending to turn rufous or rusty when dry; stipules free; leaves (9-) 13-35 cm. long, with stout rather short petioles; leaflets 17 to 35, broadly to narrowly elliptic or ovate to oblong or rhombic-elliptic, acute or abruptly short-acuminate, often callous-mucronulate, flat, (7-) 10-55 mm. long, all carinate dorsally by the prominent pale densely pilose midrib; pedicels at first ascending, becoming arched outward or recurved and then again erect in fruit, at anthesis (1.2-) 1.5-4 mm. long, in fruit (3-) 4-9 mm. long; calyx (7.8-) 10-14.7 mm. long; petals pale-yellow; banner (14.4-) 15.5-21.5 mm. long; wings (12.4-) 14.3-19.5 mm. long; keel (11.5-) 12-15.1 mm. long; pod stiffly erect, sessile, plumply ovoid- or ellipsoid-acuminate, 15-25 mm. long, 8-13 mm. in diameter, slightly incurved, rounded or subtruncate at base, contracted distally into a short triangular-acuminate laterally compressed unilocular beak, otherwise turgid but a little dorsiventrally compressed, flattened or shallowly sulcate dorsally (but the sinuous suture prominent), more deeply open-sulcate ventrally toward the middle, the green fleshy glabrous valves becoming stiffly leathery, brownish-stramineous and ultimately blackish, faintly cross-reticulate and sometimes also wrinkled lengthwise, inflexed below the beak as a complete or subcomplete septum (1.5-) 2-5 mm. wide. Davis Mts. and Chinati Mts. in the Trans-Pecos, 6-7,000 ft. elev., June-Aug.; N.M., Tex. and Chih.

13. *Astragalus crassicaarpus* Nutt. GROUND PLUM. Perennial of medium or robust stature, with a woody taproot and several decumbent, ascending or sometimes suberect stems arising from a determinate root crown or (in one var.) from slender subterranean caudex branches; herbage variably pubescent, green or cinereous, the leaflets glabrous or medially glabrescent above; stipules free; leaves (20-) 35-150 mm. long, the upper ones shortly petioled or subsessile; leaflets (11 to) 15 to 33, broadly to narrowly elliptic, obtuse or acute, or (in some lower leaves) truncate-emarginate, mostly flat, 3-24 mm. long; pedicels ascending or a little arched outward, at anthesis slender and 1-2.7 mm. long, in fruit thickened (often clavate) and (2-) 2.7-7.5 mm. long; petals purple, lilac, cream-colored or greenish-white, the keel in any case purple- or pink-tipped; banner (16-) 16.5-25 (-27) mm. long, the wings shorter; keel (10.7-) 12-20.7 mm. long; pod spreading or ascending (humistrate except sometimes in var. *trichocalyx*), sessile, globose, broadly and plumply oblong-ellipsoid-ovoid or -obovoid, 15-40 mm. long, seven eighths to one and a half times as long as wide, abruptly obtuse or truncate at both ends, or a trifle retuse or umbilicate at apex and there abruptly contracted into a conic subulate cusplike beak 1-3 mm. long, the body a little obcompressed, shallowly sulcate or merely depressed along the sutures, the fleshy glabrous valves at first firm and succulent (and if dried at this stage collapsing inward and becoming irregularly and coarsely wrinkled, leaving the sutures salient), composed of 3 layers: a thin outer coat and a similar inner one of small cells, these becoming leathery, the outer one eventually brown or blackish and nearly smooth, and a much thicker intervening layer of large cells filled with a sweet juice, this ultimately drying out to a pale alveolate-spongy or pithy texture, the whole valve wall 1.2-5 mm. thick (at least near the sutures), the endocarp inflexed across the pulpy-filamentous cavity as a papery septum 8-15 mm. wide, this produced through the valve wall to unite with or at least to meet the immersed ventral suture; dehiscence very

tardy, either occurring on the ground by gradual weathering and decay over winter (the exocarp then sometimes separating as a papery shell, the beak splitting but not gaping to release the seeds) or the whole pod splitting through both sutures and the septum and separating into two false carpels. Alta., Sask. and Man. s. to Ariz., N.M., Tex. and Ark.; represented with us by 3 varieties as follows:

Var. *crassicaarpus*. Calyx pilose with mixed black and white or largely black hairs 0.5-1.5 mm. long; petals purple or purple-tinged; peduncles mostly 20-65 mm. long; stems arising together from the crown of the taproot or very shortly forming from the root at or just below the soil level. *A. caryocarpus* Ker. Locally frequent in prairies of n. Tex. s. to Limestone, Tom Green and Irion cos., and in the Trans-Pecos, Mar.-July; Alta., Sask. and Man. s. to N.M., Tex. and Ark.

Var. *Berlandieri* Barneby. Like var. *crassicaarpus* but the stems arising singly or few together from slender widely forking underground stem branches, forming loose mats. *A. mexicanus* DC. Cen. Tex., Williamson Co. s.w. to Uvalde Co., scattered s.e. to Victoria Co., in prairies, spring, etc.; endemic.

Var. *trichocalyx* (T.&G.) Gl. Calyx and pedicels densely villosulous (hairs 0.5-1 mm. long) with short entangled and some longer ascending cream-colored or brownish hairs; petals greenish-white or cream colored; peduncles mostly 6-15 cm. long. Open woodlands, e. Tex. and rare w. to n.-cen. Tex., Mar.-June; Ill., Mo., Okla., Ark. and Tex.

14. *Astragalus gypsodes* Barneby. GYP GROUND PLUM. Perennial, low, robust, commonly quite coarse, strigulose throughout (except the fruit) with fine sometimes flattened stiff straight appressed hairs 0.25-0.5 (-0.7) mm. long; herbage silvery or greenish-canescens, the leaflets pubescent on both sides, often a little more densely so above than beneath; stipules free; leaves (4-) 6-18 cm. long, with short stiff petiole; leaflets (11 to) 15 to 25 (to 29), elliptic to narrowly ovate-lanceolate or rhombic-elliptic and obtuse or subacute, or (in some leaves) oblong-obovate and retuse, flat, 5-20 mm. long; pedicels at anthesis ascending, 1.3-2.3 mm. long, in fruit a little thickened, usually arched outward, (1.6-) 2-3.4 mm. long; petals bright pink-purple above the pale claws, drying bluish, the keel tip deeply maculate; pod loosely ascending or spreading (nearly always humistrate), broadly and plumply oblong-cylindroid to oblong-ellipsoid or more narrowly cylindroid or clavate-ellipsoid, 25-45 (-50) mm. long, (8-) 10-21 mm. thick, straight or rarely a little incurved, subtruncately rounded to broadly turbinate at base, abruptly contracted at apex into a minute conic-subulate beak, terete or a trifle compressed either laterally, dorsiventrally or (especially when incurved) shallowly sulcate dorsally at maturity, the extremely thick succulent smooth and shining glabrous pale-green but brightly purple-checked valves becoming alveolate-spongy and 1.7-2.3 mm. thick when ripe, the exocarp becoming stramineous or more or less brownish-purple and finely reticulate-wrinkled, the endocarp inflexed as a complete septum nearly as wide as the pod's diameter; dehiscence tardy, after falling, primarily basal and upward through the ventral suture, the seeds apparently discharged basally. Rare and local in gypsum soils, n. Culberson and Reeves cos. in the Trans-Pecos, May; also N.M.

15. *Astragalus plattensis* T.&G. Perennial, low, diffuse or decumbent, with an often deeply buried woody taproot giving rise to slender branched and often widely creeping subterranean caudex branches, the whole plant including ovary and pod thinly to densely pilose with widely to narrowly ascending or spreading rarely subappressed straight or subsinuous lustrous hairs (0.9-) 1-1.5 (-1.9) mm. long; herbage green or grayish-green; stipules at the lowest leafless nodes connate into a bidentate or truncate sheath, the median and upper ones free or connate for a short space; leaves 25-115 mm. long, shortly petioled or the uppermost sessile, leaflets (11 to) 15 to 27, broadly to narrowly elliptic or ovate to oblong, obtuse or acute, or in some lower or rarely all leaves oblong-obovate and truncate-emarginate, flat or loosely folded, (2-) 4-13 (-17) mm. long; pedicels in fruit 2.4-3.8 mm. long; calyx 7.8-12.2 (-13.7) mm. long; petals pink- or lilac-purple, the color fugacious in drying, the banner sometimes largely pallid but keel and wings at least purple-tipped; banner (14.3-) 16.5-20 (-21.5) mm. long; wings (13-) 14.5-17 (-18.4) mm. long; keel (11.5-) 12-15.5 (-16) mm. long; pod ascending or spreading (humistrate), sessile, long-persisting on but finally disjointing from the receptacle (this sometimes produced as a thick glabrous stipelike neck to 1.3 mm. long), the body obliquely ovoid-oblong or subglobose, 10-17 mm. long, 10-13 mm. thick, truncate or

shallowly cordate at base, abruptly contracted distally into a narrowly conic-subulate rigid beak 1-3.5 mm. long, a trifle obcompressed, sulcate both dorsally and ventrally, the sutures both thick but embedded in the valves and not salient, the ventral suture nearly straight or at least much less strongly convex than the dorsal one, the thick fleshy valves strigulose or pilosulous with appressed or narrowly ascending hairs 0.5-0.8 mm. long, stiffly leathery, transversely rugulose and 0.9-1.3 mm. thick at maturity, inflexed as a complete septum 3.6-6 mm. wide. Common in Plains Country, Edwards Plateau and n.-cen. Tex., scattered s. to Victoria and Karnes cos., spring; N.D. and Wyo. s. to Tex.

16. *Astragalus allochrous* Gray. Low, commonly coarse biennial or short-lived perennial, usually flowering and often perishing the first summer, strigulose nearly throughout with straight or mostly straight appressed or subappressed hairs 0.45-0.7 mm. long; herbage green or when young cinereous; stipules ordinarily free, rarely very shortly and obscurely connate; leaves 4-10 mm. long, the uppermost either shortly petioled or subsessile; leaflets (9 or) 11 to 21, oblong-obovate to oblanceolate and obtuse or retuse, or (especially in some upper leaves) elliptic or narrowly oblong-elliptic and either obtuse and mucronulate or acute, flat or loosely folded, (4-) 6-21 mm. long; pedicels in fruit arched outward, a trifle thickened, 2-4 mm. long, persistent; calyx (3.6-) 4.1-5.7 mm. long; petals pink- or reddish-purple, drying violet; banner 7.2-9.4 mm. long; wings 6.6-8.3 mm. long; keel 6.2-7.5 mm. long; pod loosely spreading or declined, those of some outer stems often humistrate and ascending, sessile on the slightly elevated receptacle and readily deciduous, very obliquely ellipsoid or half-ellipsoid, bladderly-inflated, (20-) 25-40 (-45) mm. long, 10-17 (or when pressed apparently to 20) mm. thick, obconic at base, contracted about 3-6 mm. below the apex into a deltoid compressed slightly incurved beak, the ventral suture straight or nearly so, the dorsal one strongly convex, the thin pale-green or purple-cheeked finely strigulose valves becoming papery-diaphanous, stramineous, lustrous, delicately cross-reticulate, not inflexed, the funicular flange 0.4-0.8 mm. wide; dehiscence apical, after falling. Rare in deserts, El Paso Co., extreme w. Trans-Pecos, Apr.; Ariz., N.M. and Tex.

17. *Astragalus Wootonii* Sheld. **GARBANCILLO.** Low but often coarse and leafy, winter annual or biennial, thinly or when young rather densely strigulose, villosulous or pilosulous with hairs 0.4-0.8 mm. long; herbage pale-green, yellowish-green or greenish-cinereous; stipules free, rarely very shortly and obscurely connate; leaves (2-) 4-10 (-12) cm. long, all shortly petioled or the uppermost subsessile; leaflets (7 to) 11 to 23, narrowly oblanceolate to linear-oblong or oblong-obovate, retuse-truncate or obtuse, often callous-mucronulate, folded or rarely flat, 5-20 mm. long; pedicels in fruit arched, a trifle thickened, 1.5-3.5 mm. long, persistent, calyx 4.3-6.4 mm. long; petals whitish, sometimes tinged with pink or lavender, or pale to vivid reddish-lilac; banner 4.6-7.5 mm. long, the wings a trifle shorter or rarely a trifle longer; keel (4.1-) 4.4-6.4 mm. long; pod loosely spreading or declined, commonly humistrate (and then often apparently ascending), sessile on the conical receptacle and readily disjointing, broadly and subsymmetrically or sometimes somewhat obliquely ovoid or ovoid-ellipsoid to ellipsoid or subglobose, bladderly-inflated, (10-) 15-37 (-43) mm. long, (8-) 12-20 (or when pressed apparently to 24) mm. thick, broadly cuneate or rounded at base, contracted just below the apex into a short and obscurely differentiated deltoid laterally flattened beak, otherwise subterete or openly and shallowly sulcate along one or both sutures, the sutures filiform, subequally convex or the dorsal one more strongly so, the thin green or purplish-tinged very rarely lightly mottled thinly strigulose to subvillosulous or glabrate valves becoming papery, stramineous, lustrous, delicately reticulate, not inflexed, the funicular flange none or to 0.7 (-1) mm. broad; dehiscence apical, after falling. *A. Tracyi* (Rydb.) Cory. Frequent in the Trans-Pecos, reported also to be rare near the Canadian River in the Panhandle, spring; Calif., Ariz. and N.M. s.e. to Michoac., Mex. and Pue.

This is considered to be one of the most poisonous of all loco weeds. Although especially poisonous to horses it is also known to have some effect on cattle and sheep.

18. *Astragalus distortus* T.&G. Short-lived perennial, low, diffuse, with a taproot and knotty root crown or shortly forking caudex, sparsely strigulose with fine straight appressed or subappressed hairs 0.2-0.45 mm. long; herbage green; stipules free; leaves of the principal stems (20-) 40-100 (-135) mm. long (those of the subbasal branchlets often smaller and with smaller leaflets), with slender but sometimes short petiole; leaflets

(9 to) 13 to 25 (to 27), oval or obovate to elliptic-oblancheolate or suborbicular, truncate or retuse, flat, (2-) 3-11 mm. long; pedicels in fruit somewhat thickened, 1.5-2.4 mm. long; calyx 3.1-6.3 mm. long, the triangular-subulate or subulate teeth one third to one half as long as the campanulate tube; petals pink-purple with pale wing tips and pale striate eye in the banner, all lilac-tinged or all whitish with lavender keel tip, rarely all white; banner 8.2-15.3 mm. long, the wings shorter; keel 5.5-9.3 mm. long; pod normally ascending and humistrate, rarely declined of its own weight from ascending peduncles, sessile on an incipient or short gynophore 0.4-1.4 mm. long, varying in profile from narrowly lunate-elliptic to obliquely oblong-, ovate-, or obovate-elliptic, 13-25 mm. long, 3.5-7 mm. in diameter, shallowly sulcate only dorsally or more deeply sulcate along both sutures, the green thinly fleshy glabrous valves becoming leathery, brownish and ultimately almost black, not inflexed or inflexed as an incipient septum to 1 mm. wide; dehiscence apparently apical, very tardy, after falling and weathering on the ground. Ia. and Ill., s. to Tex., La. and Miss.; W.Va. and Va.; represented with us by 2 varieties as follows:

Var. *distortus*. Pod deeply sulcate on both ventral and dorsal surfaces, didymous in cross section; ovules mostly 28 to 37; banner 11-15.5 mm. long; keel 7.5-9.5 mm. long. Not collected as yet in Tex., but known just north of the border in Okla.

Var. *Engelmannii* (Sheld.) M. E. Jones. Pod shallowly sulcate dorsally but not or obscurely so ventrally, obcordate to nearly round in cross section; ovules 15 to 28; banner mostly 6.5-11.5 mm. long; keel 5.5-7 mm. long. Abundant in n.-cen., e. and s.e. Tex. s.w. to Wilson and Goliad cos., spring; also La.

19. *Astragalus Soxmaniorum* Lundell. Perennial but probably of short duration, diffuse, thinly strigulose-hirsutulous with fine mostly straight loosely ascending and subappressed hairs 0.5-0.7 mm. long; herbage green; stipules free; leaves (25-) 35-90 (-115) mm. long, shortly petioled; leaflets (9 to) 13 to 19 (or 21), obovate to obovate-cuneate or oblong-obovate, deeply notched, flat, (2-) 4-15 mm. long; pedicels in fruit straight and ascending or divaricate, or strongly arched outward, a little thickened, 1.2-2.6 mm. long, persistent; calyx 6.1-9 mm. long, the lanceolate or lance-caudate teeth (2-) 2.4-4 mm. long; petals greenish-white or cream-colored, immaculate; banner 11.4-17.4 mm. long; wings 9.8-13 mm. long; keel 8.6-12.7 mm. long; pod ascending (humistrate) or (when pressed) apparently spreading or declined, sessile on a stout gynophore 0.6-1.6 mm. long, the body half-obovate or lunately oblanceolate in profile, with straight or gently concave ventral and strongly convex dorsal sutures, 15-21 mm. long, 5-8 mm. thick, broadest above the middle and tapering downward into the cuneate base, abruptly contracted distally into a rigid cusp 1.5-2.5 mm. long, the whole a trifle compressed laterally and obscurely trigonous, with rounded lateral and flattened or shallowly grooved dorsal faces, the green somewhat fleshy glabrous valves becoming leathery, reticulate, stramineous or blackish-brown, inflexed (especially toward the base) as a very narrow and incomplete septum 0.4-1.3 mm. wide; dehiscence apical, basal, and ultimately through the ventral suture, the dorsal suture also splitting to reveal the septum's outer walls. Rare and local, forests of e. Tex. and s. to Hardin Co., spring; endemic.

20. *Astragalus lotiflorus* Hook. Short-lived perennial, low, with a taproot, at first very slender becoming stouter, woody and ultimately producing a shortly forking caudex; herbage pubescent, usually densely so, with fine dolabriform hairs; stipules free; leaves 25-110 (-140) mm. long, with slender petiole; leaflets (3 to) 7 to 17, cinereous or canescent, narrowly to broadly elliptic or oblanceolate to oval or obovate-cuneate, flat or loosely folded, 4-20 (-26) mm. long, the terminal one commonly longer than the last pair; inflorescence dimorphic, (a) chasmogamous and (b) cleistogamous, these found commonly on different plants or if on the same plant at different seasons of the year, most often in discrete colonies of like plants but sometimes separately on different individuals in a colony, in seedling plants cleistogamous only; (a) *chasmogamous racemes* borne on slender peduncles (3-) 4-12 cm. long, these ascending at anthesis, procumbent in fruit, either longer or shorter than the leaf; pedicels in fruit thickened, sometimes arched outward, 1.2-2.4 mm. long, persistent; calyx 5-9.7 mm. long; petals greenish-white to ochroleucous or tinged or veined with lavender, sometimes brightly tipped or margined with purple or bluish-purple; banner 8.5-14 mm. long; wings 7.8-11.8 mm. long; keel 6.6-9.8 mm. long; *cleistogamous flowers* with calyx at anthesis commonly shorter but accrescent and as large in fruit; petals whitish (drying yellowish);

banner 4.3-7.2 mm. long; wings 4.2-6.5 mm. long; keel 4.2-6 mm. long; pod (alike on both types of inflorescence) ascending or loosely spreading (humistrate), ovoid-acuminate, ovoid-, lance- or narrowly oblong-ellipsoid, 12-37 mm. long, 5-8 mm. in diameter, straight, lunately incurved or rarely a little decurved, rounded or narrowly to broadly cuneate at base, either abruptly contracted or gradually tapering distally into a triangular- or lance-acuminate somewhat compressed beak, dorsally flattened or openly depressed-sulcate (when obscurely trigonous) in the lower one-third to two-thirds, carinate ventrally by the prominent thick suture, the dorsal suture also prominent but thinner and commonly undulate, the green somewhat fleshy strigulose or villosulous valves becoming stramineous or purplish-brown, leathery or stiffly papery, cross-reticulate and often wrinkled lengthwise, not inflexed. Incl. var. *nebraskensis* Bates, *A. Reverchonii* Gray. Local, n.-cen. Tex. w. to Plains Country with an isolated station in n. Brewster Co. in the Trans-Pecos, spring; Alta., Sask. and Man. s. to N.M., Tex. and Coah.

21. *Astragalus Emoryanus* (Rydb.) Cory. Annual or winter annual, exceptionally persisting into a second year, diffuse or prostrate, densely to quite thinly strigulose, hirsutulous or subvillosulous with appressed incurved-ascending or more rarely rather stiffly spreading hairs; herbage silvery-cinereous or sometimes greenish; stipules free; leaves 10-45 (-80) mm. long, all shortly petioled or the uppermost sessile; leaflets (7 to) 11 to 19 (or 21), often rather crowded, oval-obovate or obcordate to broadly cuneate-oblancheolate or sometimes mostly elliptic-oblancheolate, obtuse or retuse, loosely folded or flat, 2-10 (-14) mm. long; calyx 3.6-6 mm. long; petals pink-purple, the banner with a large pallid striate eye in the fold; banner (6-) 7.3-11.2 mm. long; wings (5.1-) 6.2-8.8 (-10) mm. long; keel (4.5-) 4.8-6.6 mm. long; pod spreading, declined or (when humistrate) ascending, linear-oblong or narrowly lance-oblong in profile, incurved gently and evenly through a one fourth to one half circle or (when short) lunately incurved to almost straight, 8-22 mm. long, (2-) 2.2-4.3 mm. in diameter, obtuse at base, shortly cuspidate at apex, triquetrously compressed with low-convex lateral and openly sulcate dorsal faces, the green or purple-tinged glabrous valves becoming papery, pale-brown or stramineous, delicately reticulate, inflexed as a complete or nearly complete septum 1.2-2 mm. wide. A species with 2 varieties as follows:

Var. *Emoryanus*. Pod linear-oblong, very gently to strongly but then evenly incurved, 12-22 mm. long, (2-) 2.2-3.3 mm. in diameter, five to six and one half times as long as its diameter. Frequent in the Trans-Pecos and near the Rio Grande in Rio Grande Plains, with isolated stations in s.-cen. Tex., spring; Ariz., N.M., Tex., Chih. and N.L.

Var. *terlinguensis* (Cory) Barneby. Pod more broadly and plumply lance-oblong, nearly straight or very slightly incurved, 8-14 mm. long, (2.5-) 3-3.7 mm. thick, three to four and one third times as long as thick. Known in Tex. only from Brewster, Presidio, Culberson and Hudspeth cos. in the Trans-Pecos, spring; also Coah.

22. *Astragalus Nuttallianus* A. DC. Annual and winter annual, mostly of 3 or 4 months duration, nearly always quite slender, sometimes diminutive and fugitive, varying from nearly glabrous below the thinly strigulose inflorescence to densely strigulose, villosulous or pilose with appressed incurved or partly (rarely all) spreading often lustrous hairs 0.4-1.35 mm. long; herbage green, cinereous or canescent; stipules free; leaves 10-65 (-90) mm. long, all slender-petioled or the upper ones often sessile; leaflets (5 or) 7 to 19 (to 23), varying from linear-elliptic and acute to obcordate, 2-14 (-17) mm. long, nearly always flat, all of the same type throughout the plant or dimorphic, those of the lower leaves broader; pedicels in fruit 0.5-1.6 mm. long; calyx 2.5-5.7 mm. long; petals whitish, pinkish-lilac, pinkish- or amethystine-purple, when brightly colored the banner with a large pale eye, the color turning bluish or violet on drying; banner 3.7-10 (-13) mm. long; wings 3.7-8.6 (-10.7) mm. long; keel 3.7-6.8 (-9.3) mm. long; pod ascending, spreading or declined, sessile or contracted at base into a short stipe or obscure stipelike neck 0.5-0.9 mm. long, linear or linear-oblancheolate in profile, nearly straight, incurved near the base and straight or nearly so thereafter, or less often evenly and gently incurved its whole length through about a one third or even one half circle, when first formed triquetrously and a trifle laterally compressed, with nearly plane lateral and narrower shallowly sulcate dorsal faces, the faces becoming flat or slightly convex as the ovules swell, subequally 3-sided or somewhat tetragonal when ripe, the thin green or purple-tinged glabrous, strigulose or villous valves becoming papery, stramineous or brownish and ultimately black or nearly so, delicately cross-reticulate, inflexed as a

complete septum to about 2 mm. wide or the septum sometimes incomplete or sub-obsolete; dehiscence apical and downward through the ventral and part way through the dorsal suture. A species with at least 9 "varieties" occurring from Calif., Nev., Ut., Colo. and Okla. s. to Dgo. and Pue.; represented with us by 6 varieties separable by the following key:

1. Leaflets of all leaves retuse or truncate-emarginate (2)
 1. Leaflets not all retuse or truncate-emarginate, elliptic or ovate and obtuse to subacute in at least some upper (often all) leaves (4)
 - 2(1). Ovary and pod pubescent; pod loosely strigulose and the herbage hirsutulous; flowers very small, the banner about 5-6 mm. long .. var. *zapatanus*.
 2. Ovary and pod glabrous or if pubescent only minutely strigulose; flowers variable in size but if very small with banner less than 6.5 mm. long, then the herbage minutely strigulose or subglabrous (3)
 - 3(2). Flowers small, the banner 4.3-7.3 (-7.6) mm. long, the keel tip deltoid-acute or sharply deltoid; raceme axis not elongating or scarcely so, not more than 8 (or 10) mm. long in fruit var. *Nuttallianus*.
 3. Flowers larger, the banner 8.5-13 mm. long, the keel tip obtusely rounded; raceme axis mostly elongating and 10-30 mm. long in fruit .. var. *macilentus*.
 - 4(1). Keel obtusely rounded at tip; racemes elongating, the axis mostly 5-30 mm. long in fruit; pod commonly glabrous var. *macilentus*.
 4. Keel deltoid or narrowly so at tip, acute or subacute, commonly porrect; racemes not or scarcely elongating, to 8 (rarely to 12) mm. long in fruit; pod glabrous, strigulose or villosulous (5)
 - 5(4). Flowers relatively large, the banner mostly 7-9 mm. long; racemes mostly 4- to 10-flowered; pod consistently glabrous var. *pleianthus*.
 5. Flowers small, the banner mostly 5-7 mm. long; racemes mostly 1- to 5- (or 6-) flowered (6)
 - 6(5). Pod hirsutulous, the hairs 0.5-1 mm. long; leaflets commonly 11 to 13 var. *trichocarpus*.
 6. Pod glabrous or strigulose, if pubescent the shorter hairs appressed and 0.5 mm. long or less; leaflets commonly 7 to 11 var. *austrinus*.

Var. *Nuttallianus*. N.-cen. Tex. and e. part of Plains Country, s. to Edwards Plateau and Rio Grande Plains, spring; also Okla.

Var. *macilentus* (Small) B. L. Turner. Edwards Plateau and Trans-Pecos, spring; endemic.

Var. *pleianthus* (Shinners) Barneby. *A. austrinus* var. *pleianthus* Shinners. Cen. Tex., w. to Sutton Co., s. to Refugio Co., n. nearly to Red River, spring; endemic.

Var. *trichocarpus* T. & G. Almost same range as preceding; passing into var. *austrinus* to the w.

Var. *austrinus* (Small) Shreve & Wiggins. *Hamosa Davisiana* Rydb. W. two-thirds of Tex., e. to n.-cen. Tex. and Rio Grande Plains, spring; Ariz., N.M. and Okla. s. to Son., Dgo., Coah. and N.L.

Var. *zapatanus* Barneby. Webb, Zapata and Jim Hogg cos. of Rio Grande Plains, Feb.-Mar.; also Tam.

23. *Astragalus leptocarpus* T.&G. Precocious annual with slender taproot, variable in stature but commonly low and delicate, the stems, leaf rachises and peduncles thinly (or when young somewhat densely) strigulose with straight appressed or subappressed hairs; stipules free; leaves 15-70 mm. long, the lowest shortly petioled, the rest sessile; leaflets (7 to) 11 to 17 (or 19), oblong-, obovate- or oblanceolate-cuneate, retuse or emarginate or in some lower leaves broadly cuneate-obcordate, flat, rather thick-textured, green, glabrous, 2-10 (-12) mm. long; pedicels in fruit 0.8-1.7 mm. long, persistent; calyx (3-) 3.6-4.5 (-5.3) mm. long; petals magenta- or amethystine-purple, drying violet, the banner with a large white striate eye, the wings often white-spotted distally near the inner margin; banner (5.2-) 8.3-12 (-13.2) mm. long; wings (5-) 7.2-9.8 (-11.3) mm. long; keel (4.5-) 6-7.8 (-9) mm. long; pod horizontally spreading or ascending at a wide angle, sessile but cuneately tapering at base into a thick sometimes stipelike neck to 0.5 mm.

long, narrowly linear or linear-oblongate in profile, straight or rarely slightly and evenly incurved, narrowly cuneate and shortly cuspidate at apex, 17-37 mm. long, 2.2-3.1 (-3.5) mm. in diameter, triquetrously compressed with at first nearly flat but ultimately convex lateral and narrowly sulcate dorsal faces, carinate ventrally by the rather thick prominent suture, the very slightly fleshy green or purplish glabrous valves becoming papery, at first brownish but ultimately almost black, delicately cross-reticulate, inflexed as a complete septum 1.5-1.8 mm. wide; dehiscence apical and downward through the ventral suture, the septum also splitting in age and the valves somewhat coiled distally. Abundant in e., s.e. and n.-cen. Tex. and near the coast s. to Cameron Co., spring; endemic.

24. *Astragalus Lindheimeri* Gray. Annual, resembling forms of *A. Nuttallianus* but often coarser, with a slender taproot, thinly strigulose with straight appressed or sub-appressed hairs 0.35-0.5 mm. long; herbage green, the leaflets glabrous above; stipules free; leaves (10-) 20-65 mm. long, petioled but the uppermost quite shortly so; leaflets (11 or) 13 to 21, broadly to narrowly cuneate to cuneate-oblong or -oblongate, truncate-emarginate to deeply retuse, flat or loosely folded, of rather thick texture and 2-14 mm. long; pedicels in fruit 1.8-3 mm. long; calyx (4-) 5-8 mm. long; petals bicolored, the banner purple-margined around the prominent white but purple-veined eye, the wings white, the keel tip purple-maculate, the purple turning violet on drying; banner (12-) 13-18.5 mm. long; wings 11.2-17 mm. long; keel 9.5-12.9 mm. long; pod stipitate, the stout stipe (0.8-) 1-2.6 (-3) mm. long, ascending at a wide angle, horizontal or a little declined in line with the pedicel, the linear-oblong or -oblongate body gently and lunately or more abruptly and sub-basally incurved through about a right angle (the distal half then narrowly ascending and becoming perpendicular in a plane parallel to the raceme axis), 17-27 mm. long, 3.5-6 (-6.5) mm. in diameter, broadly cuneate or acuminate tapering at base, cuspidate at apex, compressed-triquetrous with flat or low-convex lateral faces and narrower narrowly sulcate dorsal face, carinate ventrally by the prominent thick suture, the thinly fleshy green glabrous valves becoming thinly leathery or stiffly papery, brownish or when ripe nearly black, inflexed as a complete septum 2.2-3.3 mm. wide. Incl. var. *bellus* Shinnars. Plains Country, frequent, infrequent s. to Edwards Plateau and e. to n.-cen. Tex., spring; also Okla.

25. *Astragalus reflexus* T.&G. Precocious winter annual, variable in stature according to site and season, commonly slender, thinly hirsute-hirsutulous (especially upward) with rather stiff straight horizontal or widely ascending hairs, the herbage green; stipules free; leaves 2-8 cm. long, the lowest shortly petioled, the rest commonly sessile; leaflets (9 or) 11 to 15 (to 19), oblong-ovate to -obovate or obovate-cuneate, sharply retuse, flat, thin-textured, (3-) 5-15 mm. long; pedicels 0.7-1.4 mm. long in fruit, persistent; petals bicolored, the banner and keel bluish- or reddish-violet, the wings pallid or white-tipped or -margined; banner 4.2-5.2 mm. long; wings 3.1-4 mm. long; keel 4.3-5 mm. long; pod reflexed, sessile on and disjuncting from an obscure gynophore 0.1-0.5 mm. long, the body narrowly to broadly ovate or triangular-ovate in dorsiventral view, 5.5-9 mm. long, 2.5-5.5 mm. in diameter, truncate or shallowly retuse at base, abruptly contracted distally into a subulate cusp about 0.5 mm. long, triquetrously compressed, carinate ventrally by the prominent straight or slightly incurved suture, deeply and openly sulcate dorsally, the pale-green or commonly purple-speckled glabrous valves becoming brownish, stiffly papery, prominently cross-reticulate and somewhat rugulose on the obtuse lateral angles, inflexed as a complete but narrow septum 0.4-1 mm. wide. Infrequent, Dallas to Travis cos., rarely s.e. to Gonzales and Walker cos., Apr.; endemic.

26. *Astragalus brazoensis* Buckl. Annual or winter annual, variable in stature according to site and season, dwarf and slender or quite coarse and robust, thinly strigulose with appressed or narrowly ascending straight hairs; stipules free; leaves (20-) 25-75 mm. long, the lowest petioled, the rest sessile; leaflets (11 or) 13 to 19, narrowly to broadly obovate-cuneate or orbiculate, retuse, flat, 3-10 (-13) mm. long; pedicels slender, at anthesis ascending and 0.5-0.8 mm. long, in fruit arched outward (a trifle thickened) and 0.7-1.5 mm. long, persistent; calyx (2.7-) 3-4.1 mm. long, often purplish; petals whitish, distally suffused with lilac or bicolored, the banner then broadly purple-margined, the wing tips white, the keel tip always purple; banner (5.4-) 6.7-8 mm. long; wings (5-) 5.5-7.2 mm. long; keel 4.5-5.9 mm. long; pod reflexed, sessile but elevated out of the calyx on a slender often decurved stipelike gynophore 1.5-2.3 mm. long, the body very strongly obcompressed, peltiform, subcircular in dorsiventral view or often a little wider

than long, 3.5-7 mm. long, 4.5-7.5 (-9) mm. in diameter, truncate or shallowly retuse at either or both ends, contracted at apex into a conic-subulate cusplike more or less incurved beak 0.7-1 mm. long, straight or the whole gently incurved (the ventral face then depressed in the middle and shallowly bowl-shaped), the rather firm green or purple-tinged glabrous valves becoming stiffly papery, brownish or stramineous, somewhat lustrous, prominently cross-reticulate and often rugulose on the narrow but obtuse lateral angles, inflexed as a narrow but complete septum 0.5-0.8 mm. wide; dehiscence tardy, after falling the pod separating into two halves along both sutures and through the septum; ovules 4. Local in Rio Grande Plains, Feb.-Apr.; also Tam.

27. *Astragalus Wrightii* Gray. Slender but ultimately stiff or rigid annual with a filiform taproot, silky-pilose throughout with fine mostly straight narrowly or loosely ascending basally thickened hairs; herbage silvery-cinereous or -canescent, in youth becoming greenish; stipules free; leaves 15-55 (-75) mm. long, the lower and median petioled, the upper subsessile; leaflets 7 to 13, broadly to narrowly elliptic or oblanceolate, acute or (in some early leaves) obovate and obtuse, flat or loosely folded, (2-) 4-17 (-20) mm. long; peduncles erect and stiffly ascending, 7-70 mm. long, the first usually and sometimes all longer than the leaf, the uppermost often (rarely all) shorter; racemes capitately 3- to 7-flowered; pedicels at anthesis subobsolete, in fruit thickened and 0.6-1 mm. long; calyx 5.2-6.2 mm. long; petals reddish-violet, lilac, or whitish faintly lilac-tinged, the color evanescent in drying; banner 5.2-6.2 mm. long; wings 4.7-5.5 mm. long; keel 4.7-5.5 mm. long; pod erect, sessile on and firmly attached to the receptacle, oblong or lance-oblong in profile, 7-13 mm. long, 2.5-3.5 mm. in diameter, straight or nearly so, truncate or broadly rounded at base, abruptly contracted at apex into a short subulate decurved beak, bluntly compressed-triquetrous, the ventral angle broad and obtuse, the lateral faces low-convex, the dorsal face narrowly sulcate, the green scarcely fleshy valves becoming brown or ultimately blackish, stiffly papery, transversely reticulate, loosely and densely pilose-hirsute, inflexed as a complete septum 1.2-2.2 mm. wide; dehiscence apical and downward through the ventral suture, the beak gaping to release the seeds, the dorsal suture finally splitting to expose the separating walls of the septum. Edwards Plateau from Brown, Lampasas and Bell cos. s. to Bandera, Kerr and Comal cos., spring; endemic.

44. OXYTROPIS DC.⁹³

CRAZY-WEED. PURPLE LOCO

A genus of about 150 to 300 species of north-temperate regions, reaching its southern limits in our state.

1. *Oxytropis Lambertii* Pursh var. *articulata* (Greene) Barneby. Perennial herb, often forming colonies by short rhizomes; stems several from the crown, very short; herbage all pubescent with hairs attached in the middle and with 2 free ends; petioles short; stipules broad, persistent, 7-24 mm. long; leaves basal, alternate, once-imparipinnately-compound, lower leaves shorter than the upper ones, 4-21 cm. long; leaflets (7 or) 9 to 19, narrowly linear to linear-oblong, 10-35 mm. long, 1-3.5 (-5.5) mm. broad, thick, firm, basally asymmetric; racemes 2-4 cm. thick at full anthesis, terminal on nearly leafless scapes 5-25 cm. long and commonly surpassing the foliage; flowers usually 10 to 25 per raceme, 15-26 mm. long; calyx with a tube and 5 lobes, silky-pilose, the tube 6-8 mm. long, the deltoid-subulate teeth 1.2-3 (rarely to 4) mm. long; corolla papilionaceous, pink-purple to almost white or various shades of rose or lavender; banner 18-25 mm. long; wings 15-26 mm. long, commonly much-dilated upward; keel 14-19 mm. long, the keel petals apically extending into a sharp erect point; stamens 10, diadelphous, 9 filaments coalescent, the tenth (uppermost) free; pod sessile, stiffly woody, the body ovoid to oblong-ovoid, commonly 7-10 mm. long and exserted, the beak 3-5 mm. long; seeds several. *Astragalus Lambertii* (Pursh) Spreng. var. *abbreviatus* (Greene) Shinnars. Scattered in the higher parts of the Plains Country and n.-cen. Tex. s. to Tarrant and Dallas cos., very rarely s. to Comanche and Travis cos., Apr.-June; Sask. and Man. s. and s.w. to Ariz., N.M. and Tex. (species as a whole); the var. in Okla. and Tex.

⁹³ Adapted from Rupert C. Barneby in Proc. Calif. Acad. Sci. ser. 4, 27:177-312. 1952.

One of the most dangerous of the loco weeds because it is readily eaten by grazing animals, often with fatal effects. Because of its abundance and wide distribution it is probably the most destructive of all the known loco weeds.

45. GLYCYRRHIZA L.

A genus of about 15 species in the temperate and subtropical parts of the world. Licorice of commerce is obtained from the roots of the European *G. glabra* L.

1. *Glycyrrhiza lepidota* Pursh. LICORICE. Perennial herb with tall (6-9 dm.) erect stems arising from stout sweet roots, the herbage all glandular-viscid; leaves alternate, once-imparipinnately-compound; stipules minute, slender; petioles short; leaflets 15 to 19, oblong-lanceolate, mucronate-pointed, sprinkled with little scales when young and with corresponding dots when old; flowers in spiciform axillary racemes; calyx somewhat 2-lipped, the upper lip nearly entire (that is, the 2 upper lobes nearly completely coalescent), the 3 lower lobes not coalescent so high; corolla whitish, very much as in *Astragalus*; stamens diadelphous, 9 filaments coalescent, the tenth (uppermost) free, the anthers alternating large and small (shorter ones smaller); fruit dry and indehiscent or scarcely dehiscent, laterally compressed, few-seeded, oblong, beset with hooked prickles suggesting the projections of cockleburs. Infrequent in alluvial and sandy soils, often in stream beds or damp roadside ditches, in the Trans-Pecos, higher parts of the Plains Country, e. locally to Wichita Co. along the Red River, Apr.-June; widespread in U.S. except the s.e. portion.

A good soil-binder but potentially a noxious weed.

46. ALHAGI GAGNEBIN

A genus with perhaps 3 species of the deserts of central and western Asia, of which 1 has been introduced in the deserts of North America.

1. *Alhagi camelorum* Fisch. CAMEL-THORN. Much-branched thorny glabrous shrubs, spreading by rhizomes, to about 1 m. high; leaves alternate, small, unifoliolate, the blade linear or linear-oblancoate to obovate; flowers numerous in short racemes; calyx with a campanuloid tube and 5 teeth or lobes; corolla papilionaceous, purplish-pink; fruit a flattened pod with 1 to several joints but these joints not separating from each other at maturity, indehiscent. Established along drainage ditches and streams, often in gypseous soils, in Culberson and El Paso cos. in the Trans-Pecos, June-July; introd. into Tex., Ariz., etc. from Asia.

A potentially pernicious weed.

47. AESCHYNOMENE L.⁹⁴ JOINT VETCH

Perennial herbs with erect, prostrate or sprawling stems, unarmed; leaves alternate, once-imparipinnately-compound, 1-10 cm. long; stipules peltate, appendiculate below the point of attachment or attached at base and not appendiculate; petioles short; leaflets 5 to 63; flowers 5-10 mm. long, in axillary or terminal racemes, the racemes usually not dense; calyx with a campanuloid tube and 5 teeth; corolla papilionaceous, yellowish; stamens 10, monadelphous, the filaments united into a sheath which is open at the lower side; fruit a loment, of 2 to 12 1-seeded joints which are severally indehiscent but separate from each other at maturity.

A genus of about 100 species of the warmer parts of the world.

1. Leaflets 5 to 11; stems prostrate or spreading 1. *A. viscidula*.
2. Leaflets 19 to 63; stems erect 2. *A. indica*.

1. *Aeschynomene viscidula* Michx. STICKY JOINT VETCH. Stems sprawling, 2-10 dm. long; herbage viscidulous-pubescent with glandular hairs; leaves 10-25 mm. long; leaflets 5 to 11; flowers 5-7 mm. long; fruit with 2 or 3 (to 5) joints. Locally abundant in grass-

⁹⁴ Adapted from Velva E. Rudd in Contr. U.S. Nat. Herb. 32:1-172. 1955.

lands on sandy soil, coastal s. Tex. from Calhoun to Willacy cos., inland to Brooks Co., Apr.-Sept.; s.e. U.S. s. to Braz.

2. *Aeschynomene indica* L. Stems erect, 5-25 dm. tall, glabrous to hispidulous; leaves 5-10 cm. long; leaflets 19 to 63; flowers 8-10 mm. long; fruit with 5 to 14 joints. Local in wet coastal areas, Kleberg Co. to Jefferson Co., Aug.-Sept.; N.C. to Tex., s. to Braz. and Arg.

Our plants have fruits only 2.5-3.5 mm. broad, which would place them technically in the taxon *A. evenia* Wright, which replaces *A. indica* in much of tropical America but seems not to be specifically separable from it.

48. HEDYSARUM L.

Hedysarum is said to comprise about 80 species of north-temperate Eurasia and North America; six occur in the United States.

1. *Hedysarum boreale* Nutt. Perennial herb 2-5 dm. tall; stems ascending; leaves once-compound, odd-pinnate, with 11 or 13 leaflets; leaflets entire, narrowly elliptic to linear-oblong, 1-2 cm. long; stipels absent from the leaflets; flowers in terminal spikelike racemes; calyx equally or subequally 5-cleft, the lobes narrow and nearly equal, a little longer than half the total calyx length; corolla pink-purple to red-purple, about twice as long as the calyx; keel nearly straight, obliquely truncate, not appendaged, longer than the wings; stamens diadelphous, 9 united, 1 free; legume flattened, dehiscent into several nearly bilaterally symmetrical reticulate roundish articles (each severally indehiscent). *H. cinerascens* Rydb. Rare in higher parts of Plains Country (Canadian River breaks n. of Phillips), May; Sask. to Ariz., N.M. and Tex.

49. NISSOLIA JACQ.⁹⁵

A genus of 12 species of warm, dry areas of North and South America.

1. *Nissolia platycalyx* Wats. Perennial climbing often twining vine, less often sprawling over herbaceous vegetation, the stems annual and 3-10 dm. long; leaves 4-7 cm. long, alternate, once-imparipinnately-compound; stipules lanceolate to deltoid-ovate; leaflets 5 (rarely 7), elliptic, 5-25 mm. long, 4-15 mm. broad, glabrous, obtuse; flowers 14-20 mm. long, solitary or 2 to 4 in axillary racemes shorter than the foliage; calyx with a campanuloid tube and 5 subequal teeth or lobes; corolla papilionaceous, yellow; stamens 10, monadelphous, the filaments coalescent into a sheath which splits eventually on the upper side; fruit a loment 3-4 cm. long, splitting into 2 to 4 joints, subglabrous at maturity, the terminal joint sterile, flat and winglike, conspicuously larger than the other joints. Rare at elev. of 5,000-6,000 ft. in the Chisos Mts. in the Trans-Pecos, May-Sept.; also Coah. and N.L.

50. STYLOSANTHES Sw.⁹⁶

PENCIL-FLOWER

Perennial herbs (sometimes bushy-branched above) with erect, ascending or sprawling-procumbent stems 1-6 dm. long; leaves alternate, pinnately trifoliolate (the rachis below the terminal leaflet only 1 mm. long); petioles 5-20 mm. long; stipules only slightly shorter than the petioles, adnate nearly the full length to the petiole, often conspicuously veiny; leaflets firm, elliptic, 1-2 (-3) cm. long, conspicuously veiny; stipels absent; flowers 5-10 mm. long, inconspicuous, short-pedicellate, solitary in the axils of distal leaves or in crude racemes by crowding of distal floriferous nodes; calyx with a long tube and 5 lobes; corolla papilionaceous, orangish-yellow; stamens 10, monadelphous, the filaments coalescent into a tube which splits on the upper side after anthesis; 5 anthers versatile alternating with 5 sub-basifixed ones; fruit a loment of 2 flattened achenelike joints which separate from each other at maturity, the distal joint fertile and beaked, the proximal one persistent and sterile, much-reduced.

⁹⁵ Adapted from Velva E. Rudd in Contr. U.S. Nat. Herb. 32:173-206. 1956.

⁹⁶ Adapted largely from Robert H. Mohlenbrock in Ann. Missouri Bot. Gard. 44:299-355. 1957.

A genus of 25 species occurring in Asia, Africa, South and North America.

- 1. Flowers in terminal bracted racemes 1-3 cm. long (somewhat less at early anthesis); branches glandular-pubescent; plants of southern Texas 1. *S. viscosa*.
- 1. Flowers in short terminal heads or racemes 1 cm. long or less; branches not at all glandular-pubescent (may be densely hispid); plants mostly of eastern Texas 2. *S. biflora*.

1. *Stylosanthes viscosa* Sw. Depressed usually prostrate herbs with stems 1-2 dm. long, the herbage densely viscid-glandular-pubescent; loment to 2.5 mm. broad, the upper (fertile) joint 2-4 mm. long, shortly hairy; beak short, less than half as long as the upper-joint body, usually about a third to a fourth as long, strongly uncinata, often coiled. Coastal s. Tex. from Aransas Co. to Cameron Co. in sandy prairies, May-Sept.; Tex., Mex., C.A., S.A. and Gr. Ant.

2. *Stylosanthes biflora* (L.) B.S.P. Usually erect or ascending and somewhat bushy-branched, (1-) 2-6 dm. tall; herbage pubescent or glabrous, never viscid or glandular; loment 2.5-3 mm. broad, the upper fertile joint 2.5-5 mm. long and puberulent; beak 0.5-1 mm. long, coiled to nearly straight. Incl. var. *hispidissima* (Michx.) Pollard & Ball, *S. riparia* Kearn. Frequent in e., s.e. and n.-cen. Tex., Apr.-Nov.; most of e. U.S.

51. ZORNIA J. F. GMEL.⁹⁷

Herbs; leaves alternate, with 2 or 4 leaflets palmately arranged; petioles as long as the leaflets; stipules elliptic-obovate, attached near but not at their base; stipels absent; inflorescence spicate, several-flowered; each flower subtended by 2 large bracts similar to the stipules of the leaves; flower calyx with a campanuloid tube and 5 lobes or teeth; corolla papilionaceous, yellow, 7-14 mm. long; stamens 10, the filaments united into a tube which abscises about half its length at maturity; 5 anthers versatile and alternate with 5 sub-basifixed ones; fruit a loment with 2 to 7 flattened indehiscent joints.

A genus of about 80 species of the warmer parts of the world.

- 1. Leaflets 4 1. *Z. bracteata*.
- 1. Leaflets 2 (2)
- 2(1). Mature spikes so elongate that the bracts overlap little if at all; joints of loment often not reticulate; mature loment elongate so the last 3 joints at least visible beyond the end of the bract 2. *Z. gemella*.
- 2. Mature spikes with bracts overlapping; joints of loment reticulate; mature loment either not as long as the bract or else only the last 1 or 2 joints protruding 3. *Z. reticulata*.

1. *Zornia bracteata* J. F. Gmel. VIPERINA. As in the key; frequent in sandy gravelly soils, Rio Grande Plains, n.-cen. and s.e. Tex., less frequent w. to the Llano area of Edwards Plateau and to e. Tex., June-Sept.; Coastal States, Va. to Tex.

2. *Zornia gemella* (Willd.) Vog. As in the key; including plants which have usually been referred to the Asian *Z. diphylla* (L.) Pers. Infrequent in sandy soils, Rio Grande Plains, rare in s.e. and e. Tex., spring-fall; Arg. and Parag., n.w. to Cuba and Tex. (See comments below.)

3. *Zornia reticulata* Sm. As in the key; infrequent or rare in sandy soils, Rio Grande Plains and s.e. Tex., spring-fall; Parag. n.w. to Ariz., Tex. and Cuba.

This is weakly differentiated from *Z. gemella*. Specimens which are not definitely determinate as one or the other are the rule rather than the exception.

52. DESMODIUM DESV.⁹⁸ TICK-TREFOIL. TICK-CLOVER. BEGGAR'S-TICKS

Annual or perennial, prostrate to erect or ascending herbs or subshrubs, variously pubescent with hooked trichomes often present (at least on the fruits, occasionally on the stems); leaves alternate (whorled in no. 2 and sometimes appearing opposite),

⁹⁷ Adapted largely from Robert H. Mohlenbrock in *Webbia* 16:1-141. 1961.
⁹⁸ Contributed by Bernice G. Schubert.

pinnately trifoliolate or (in no. 26) unifoliolate (or rarely quinquefoliate), petiole (or with petioles much-reduced as in no. 9); petiole sulcate, extending to become the leaf rachis, stipulate; stipules usually attenuate, rarely connate (as in no. 4), persistent or caducous; leaflets petiolulate; petiolules rather uniform throughout, rugose, dark, stout, densely pilose, 1.5-5 mm. long, stipellate (each lateral leaflet subtended by 1 stipel, the terminal by two); stipels usually subulate and persistent, often caducous or lacking in species 1 to 3; inflorescence composed of axillary or terminal stiff to lax often paniculately compound racemes; flowers appearing to be borne in pairs or threes (which are actually reduced secondary racemes), each pair subtended by a primary bract, each pedicel further subtended by a smaller secondary bract; pedicels to 2 cm. or more long; calyx bilabiate, the upper lobe bifid, the lower tridentate with a usually long-acuminate central tooth exceeding the two laterals; corolla white or pink to purplish (or greenish), *never yellow*; standard orbicular to ovate and often retuse, the short-unguiculate wings slightly adherent to the more or less falcate and mostly apically truncate long-unguiculate coherent keel petals; stamens monadelphous (in 3 of our species) or diadelphous, 9 and 1 (at least above); fruit a (1-) 2-multiarticulate stipitate loment with its lower suture usually more deeply indented than the upper, generally separating into 1-seeded mostly uncinulate-pubescent indehiscent (in our area) articles, sometimes glabrous on the sutures, rarely glabrous on the surfaces (as in no. 7).

A genus of more than 200 species in temperate to tropical areas excepting the western United States (Pacific slope), Europe and New Zealand. Our species coming south from the eastern and central states and north from Mexico. There is some taxonomic difficulty in a few species complexes but the basis for it is not completely clear, little cytological work having been done on the group. In general, the species do not seem to hybridize readily and their characters are relatively stable. Leaflets and stipules, bracts, pedicels and loment articles seem to offer the best diagnostic characters, size, shape and attachment of the loment articles being a good basis for recognizing groups of rather closely related species.

1. Stamens monadelphous; stipe of loment 3 times as long as calyx or more, usually equaling or exceeding the length of the pedicel; calyx scarcely lobed (2)
1. Stamens diadelphous; stipe of loment to 2.5 times as long as calyx or scarcely exceeding it, in our species rarely equaling pedicel in length; calyx 2-lobed, the upper lobe bifid, the lower lobe with the central tooth exceeding the laterals in length (4)
- 2(1). Inflorescences axillary and terminal; flowers white; pedicels slender; stipe of loment 5-9 mm. long 3. *D. pauciflorum*.
2. Inflorescence not axillary; flowers rose to purple (rarely white) (3)
- 3(2). Flowering stem leafless, arising from the base; stipules deciduous; pedicels slender; stipe of loment (5-) 10-22 mm. long 1. *D. nudiflorum*.
3. Flowering stem arising from a whorl of leaves; stipules persistent; pedicels stout; stipe of loment shorter, 4-10 mm. long 2. *D. glutinosum*.
- 4(1). Leaves unifoliolate 26. *D. psilophyllum*.
4. Leaves trifoliolate (5)
- 5(4). Primary bracts broadly lanceolate to ovate, gradually to abruptly long-acuminate, rather broad at base, leaving a prominent horizontal scar, finely striate, regularly subtending only 2 pedicels, each of these often further subtended (laterally) by a somewhat reduced or depauperate secondary bract (6)
5. Primary bracts lanceolate to lance-ovate, long-acuminate, prominently striate; secondary bracts similar but smaller, each subtending a single pedicel; pedicels 2 to 7 (commonly 3 to 5) in a fascicle (25)
- 6(5). Stipules ovate-attenuate, cordate to hemicordate at base or abaxially connate, splitting only at maturity (7)
6. Stipules linear to lance- or ovate-attenuate (11)
- 7(6). Stipules deciduous; articles of the loment glabrous on surfaces, uncinulate-pubescent on sutures only 7. *D. Lindheimeri*.
7. Stipules persistent; articles of the loment uncinulate-pubescent throughout (8)

- 8(7). Plants prostrate and trailing, the leaflets almost orbicular and the stipules obliquely cordate at base and reflexed at maturity, or if only partially prostrate and later becoming erect and more or less shrubby only basal leaflets orbicular and the stipules fused and splitting at maturity (9)
8. Plants erect; leaflets ovate to rhombic (10)
- 9(8). Stipules obliquely cordate at base and reflexed at maturity; loments with sub-rhombic to elliptic articles 5. *D. rotundifolium*.
9. Stipules connate, splitting at maturity; loments with articles semielliptic (essentially straight on the upper suture) 4. *D. canum*.
- 10(8). Stem and rachis of inflorescence patent-pilose with long tapering trichomes; leaflets not strongly reticulate 6. *D. canescens*.
10. Stem and rachis of inflorescence pilose with a preponderance of multicellular trichomes; leaflets strongly reticulate, usually with white blotches along midrib 8. *D. Tweedyi*.
- 11(6). Loments 1-3 (-4) -articulate, at least the lower suture curved; plants with small bracts (to 3 mm. long) and small flowers (to 6 mm. long) (12)
11. Loments multiarticulate (i.e., usually with 4 or more large articles) (17)
- 12(11). Plants erect with linear to linear-oblong or -lanceolate leaflets (13)
12. Plants prostrate to ascending or erect with ovate to ovate-oblong or almost orbicular leaflets (14)
- 13(12). Leaves sessile to very short-petiolate; petioles (when present) not more than 9 mm. long; leaflets linear-oblong, 7-15 mm. broad; pedicels stout, 1.4-4.5 mm. long 9. *D. sessilifolium*.
13. Leaves petiolate; petioles 4-18 mm. long; leaflets linear to linear-lanceolate, to 7 mm. broad; pedicels slender, 6-13 mm. long 10. *D. strictum*.
- 14(12). Leaflets elliptic to lance-ovate, large (terminal leaflet 50-67 mm. long), thick; stipules and bracts very early-deciduous; inflorescence lax; pedicels 6-17 mm. long 11. *D. obtusum*.
14. Leaflets chiefly ovate to rounded-ovate or oblong to orbicular, much smaller (terminal leaflet 9-30 mm. long); stipules mostly persistent (15)
- 15(14). Plants prostrate, trailing, glabrous to puberulent throughout; leaflets thickish; inflorescence lax 14. *D. lineatum*.
15. Plants erect; leaflets rather thin; inflorescence stout (16)
- 16(15). Leaves nearly sessile; petioles to 15 mm. long; stems and petioles mostly pilose; pedicels 4-9 mm. long 12. *D. ciliare*.
16. Leaves mostly petiolate; petioles 12-27 mm. long; plants essentially glabrous; pedicels (6-) 8-19 mm. long 13. *D. marilandicum*.
- 17(11). Plants with long stipules, large showy primary bracts (to 12 mm. long) and short-stipitate to sessile loments (18)
17. Plants with shorter stipules, smaller primary bracts and flowers and longer-stipitate loments (19)
- 18(17). Leaves short-petiolate (petioles 8-25 mm. long); petiolules to 3 mm. long; leaflets thickish, oblong to ovate-lanceolate, obtuse or acutish and with conspicuous venation; stipules 4.5-9.5 mm. long; stipels 2-4 mm. long; both sutures of loment articles curved or the lower obtusely angled 15. *D. canadense*.
18. Leaves longer-petiolate (petioles 40-97 mm. long); petiolules 3-5 mm. long; leaflets thin, ovate-acuminate, glaucous beneath; stipules 11-20 mm. long; stipels 5-9 mm. long; both sutures of loment articles regularly angled 16. *D. cuspidatum*.
- 19(17). Pedicels mostly short (3-12 mm. long) and stout (20)
19. Pedicels longer, 9-20 mm. long (24)

- 20(19). Plants with thin leaflets inconspicuously reticulate and rather inconspicuously to densely pilose; terminal leaflet mostly lanceolate and twice to many times longer than broad; stems sparsely if at all pilose, usually only uncinulate-puberulent 21. *D. paniculatum*.
20. Plants with coriaceous leaflets glabrous or densely pubescent or (if not coriaceous) at least with conspicuously reticulate venation (21)
- 21(20). Leaflets moderately to densely tomentose beneath, soft-velvety to touch, the upper surface moderately soft-pilose, not prominently reticulate (22)
21. Leaflets glabrescent to moderately pilose beneath and rather strongly reticulate (23)
- 22(21). Terminal leaflet usually rhombic to deltoid, acute to cuneate or truncate at base, width generally at least two thirds the length; leaflets thick; articles chiefly rhombic or with the upper suture somewhat angled . . 17. *D. viridiflorum*.
22. Terminal leaflet (except of the uppermost leaves) elliptic-ovate, mostly rounded at base, width about one half the length; leaflets thinner; articles rounded above (i.e., the upper suture curved rather than angled) . . 18. *D. Nuttallii*.
- 23(21). Leaflets uncinulate-pubescent along midrib and veins, otherwise essentially glabrous beneath; terminal leaflet obtuse to acute at apex; stipules early-deciduous 19. *D. Fernaldii*.
23. Leaflets mostly appressed-pilose on both surfaces (with uncinulate pubescence also above); stipules usually persistent through flowering; terminal leaflet obtuse and emarginate 20. *D. glabellum*.
- 24(19). Leaflets glabrous to puberulent, glaucous beneath . 22. *D. laevigatum*.
24. Leaflets appressed soft-pilose beneath, venation strongly reticulate 25. *D. Grahamii*.
- 25(5). Leaflets broad (terminal leaflet to 3 cm. wide), with prominent reticulation; bracts early-deciduous 23. *D. tortuosum*.
25. Leaflets narrower (terminal leaflet to 1.5 cm. wide), the venation not prominent; bracts persistent 24. *D. neomexicanum*.

1. *Desmodium nudiflorum* (L.) DC. Ascending to erect perennial herb with a simple sterile stem to about 2.5 dm. high bearing a whorl of leaves at its apex, and slightly to 3 times exceeded by the usually leafless and simple flowering scapes arising from the base; sterile stem glabrate or sparsely pilose; stipules awl-shaped, caducous; leaves trifoliate, 4 to 7, usually whorled, sometimes scattered along the stem; petioles more or less pilose with bent but not hooked trichomes, 4.5-12.5 cm. long; rachis of terminal leaflet similar to petioles, slightly more slender, 1.3-2 cm. long; terminal leaflet rhombic-obovate or broadly elliptic, abruptly acuminate, more or less cuneate at base, finely puberulent and sparsely pilose above, glaucous and moderately pilose below, 4.5-12 cm. long, 3.5-8 cm. wide; lateral leaflets oblique, the broader half semiovate, pubescence similar to that of the terminal leaflet, 3.8-10 cm. long, 3-5.5 cm. wide; inflorescence leafless except in occasional forms, racemose or racemose-paniculate, the rachis grooved, moderately pilose below with long curved white trichomes, becoming less so above where abundantly uncinulate-puberulent; bracts early-deciduous, the primary linear-lanceolate to narrowly ovate-acuminate, striate, more or less pilose on outer surface and minutely puberulent, long-ciliate, about 5 mm. long and 0.5 mm. wide; secondary bracts similar, much smaller, 0.5-0.8 mm. long; pedicels slender, uncinulate-puberulent, 10-23 mm. long; calyx minutely puberulent and with some scattered long stiff white trichomes, teeth of both lobes somewhat ciliate, 2.5-3.5 mm. long (including the tube and lobes); corolla rose to purple (rarely white), 6-9 mm. long, the petals subequal in length; the puberulent loment stipe equaling or exceeding the pedicel; loment 1- to 4-articulate; articles obpyramidal in outline with the sinuses between them broadly inverted-U-shaped, sutures glabrous throughout, the upper straight or slightly invaginated, surfaces densely uncinulate-puberulent, 7-12 mm. long, 4-5 mm. wide. Rare, in rich woods, e. Tex., Sept.; e. and cen. U.S., s. to n. Fla., s. Miss. and cen. La.

This and the two species which follow are closely related and have their nearest relatives in eastern Asia.

2. *Desmodium glutinosum* (Willd.) Wood. Erect simple-stemmed perennial herb to 1 m. tall, from a slender branching root about 3.5 dm. long; stem more or less terete, striate, patent-pilose and uncinulate-puberulent; leaves regularly trifoliolate, usually whorled at the base of the terminal inflorescence; stipules rather long-persistent, linear-lanceolate, striate, puberulent and spreading-pilose, ciliate, 8-12 mm. long, 0.4-0.5 mm. wide; petiole striate, uncinulate-puberulent and patent-pilose with long white tapering trichomes, 6-14.5 cm. long; leaf rachis similar, 2-4.3 cm. long; leaflets with moderate uncinulate-puberulence and scattered stiff white tapering gland-based trichomes on the upper surface, both types of pubescence denser on the lower surface (especially along midrib), the margins ciliate; terminal leaflet broadly ovate-acuminate with cuneate to truncate base, 7-13 cm. long, 6-12.3 cm. wide; lateral leaflets narrower, slightly oblique, 8-11.8 cm. long, 4-7 cm. wide; inflorescence simply racemose to rather much-branched, terminating the stem (except in rare forms), i.e., arising from the whorl of leaves; rachis densely uncinulate-puberulent and with long stout curved (but not hooked) trichomes interspersed; primary bracts early-deciduous, each subtending 2 or 3 (to several) pedicels (2 of which usually mature together, the remainder often not becoming mature), linear-lanceolate, attenuate, striate, uncinulate-puberulent and ciliate, 5-9 mm. long, 0.2-0.3 mm. wide; secondary bracts each subtending a single pedicel, more or less elliptic, puberulent, ciliate, caducous, 0.4-0.5 mm. long, 0.2 mm. wide; pedicels stoutish, puberulent to glabrescent, 3-8 mm. long, equaled or slightly exceeded by the remotely puberulent to glabrous stipe of the loment, 4-9.5 mm. long; calyx shallowly 2-lobed, puberulent, short-ciliate, with stout straight white trichomes on central tooth of lower lobe, 3-3.5 mm. long including lobes and tube; corolla purple, drying bluish or rarely white; the stipitate loment 1- to 4-articulate; articles subquadrate or obpyramidal, separated by inverted narrowly U-shaped sinuses, 8-11 mm. long, 4.5-6 mm. wide, the sutures essentially glabrous, the surfaces uncinulate-puberulent. Dry rocky woods, n.e. and n.-cen. Tex., June-Aug.; e. and cen. U.S.; N.L., S.L.P., Pue.

3. *Desmodium pauciflorum* (Nutt.) DC. Perennial herb from a slender to thick branched root system often with roundish or elliptical swellings at more or less regular intervals; erect or sprawling plants with slender leafy often much-branched stems bearing rather short terminal and axillary inflorescences; stems terete to angulate, striate, rather sparsely pilose with long tapering trichomes; stipules linear-lanceolate to narrowly ovate-attenuate, striate, uncinulate-puberulent, pilose and ciliate, caducous (few seen), 1.5-7 mm. long, about 0.5 mm. wide; stipels 0.5-1.5 mm. long, also caducous; petioles striate, moderately long-pilose, 55-66 mm. long; leaf rachis similar, 7-13 mm. long; leaves trifoliolate, the terminal and lateral leaflets nearly equal in size, the lateral slightly smaller and a little asymmetric, all moderately glandular-pilose and minutely puberulent on both surfaces, more abundantly pilose on midrib below, the margins ciliate; terminal leaflet rhomboidal, acute or abruptly acuminate at apex, cuneate at base, 5-9 cm. long, 4-6.2 cm. wide; lateral leaflets obliquely ovate, acute at apex, more or less rounded at base, 35-56 mm. long, 55-66 mm. wide; inflorescence mostly racemose or slightly branched, the terminal ones often more elongate than the axillary; rachis angulate, minutely and abundantly uncinulate-puberulent and scattered-pilose; primary bracts linear-lanceolate, puberulent, ciliate, 1-4 mm. long, 0.5-1 mm. wide, not usually long-persistent; secondary bracts similar, 0.5-1 mm. long, 0.5 mm. wide; pedicels uncinulate-puberulent, 4.5-14 mm. long; calyx minutely puberulent throughout and rather abundantly appressed-pilose, the teeth ciliate, 1.5-2 mm. long including the tube and lobes; corolla white, 4-5 mm. long; stipe of loment mostly puberulent, 5-9 mm. long; loment 1- to 3-articulate; articles more or less triangular in outline with the upper suture slightly invaginated at the mid-point of each article, densely uncinulate-puberulent on surfaces and scattered-pilose on upper suture, 8.5-13 mm. long, 6-8 mm. wide, sinus between the articles inverted V-shaped. Rich woods and wooded banks, apparently rare, e. Tex., July; e. and cen. U.S. southw.

4. *Desmodium canum* (Gmel.) Schinz & Thell. Perennial, herbaceous or becoming shrubby; stem prostrate to erect, to almost 3 m. tall, terete to subangulate, uncinulate-puberulent to -pubescent and somewhat pilose; stipules obliquely ovate-acuminate, striate, puberulent and pilose on the outer surface, ciliate, at least partially connate abaxially, long-persistent, 6-10 mm. long, 1-2 mm. wide; stipels subulate, puberulent, more or less

ciliate, 2-5.5 mm. long; petioles uncinulate-puberulent and long spreading-pilose, 13-35 mm. long; leaf rachis similar, shorter, to 15 mm. long; leaflets variable, mostly somewhat elliptic, acute at apex, rounded at base, rather lustrous, darker and uncinulate-puberulent above and with pilosity along midrib, rather densely pilose on the paler lower surface; terminal leaflet 4-9 cm. long, 25-45 mm. wide; lateral leaflets 3.3-6 cm. long, 18-27 mm. wide; racemes with angulate rachis ridged and grooved, densely uncinulate-puberulent; pedicels usually solitary, each subtended by 1 primary bract and 2 lateral bracts, all more or less persistent; primary bracts lance-acuminate, puberulent on the outer surface, ciliate, 2.2-4.5 mm. long, 0.5-0.7 mm. wide; secondary bracts similar, 1-1.8 mm. long, 0.2-0.5 mm. wide; pedicels uncinulate-puberulent, 5-10 mm. long; calyx with central tooth of lower lobe 2.5-3.5 mm. long and lateral teeth 2-3.5 mm. long, upper bifid lobe 2.5-3.5 mm. long; corolla with petals 3.5-6 mm. long; loment stipitate, to 8-articulate, the stipe 1.5-2 mm. long; articles essentially straight above, invaginated about two-thirds their width at the isthmi, uncinulate-pubescent throughout, 3.5-4 mm. long, 2.5-3 mm. wide; seed obtusely oblong, 1 mm. long, 0.5 mm. wide. DeWitt Co. in s. Tex., Oct.

Known by many synonyms in various parts of the world, the most common in our manuals being *D. incanum*, *D. supinum*, and *Meibomia cana*, *M. incana*, and *M. supina*. A nearly ubiquitous weed of warmer areas, common on grazed land in the American tropics and becoming so in Africa. Shape of leaflets very variable; characters of stipules and fruit constant.

5. *Desmodium rotundifolium* DC. Prostrate perennial herb with subangulate finely canaliculate stem usually with soft white dense pilosity and occasionally also with uncinulate puberulence; stipules ovate-acuminate, obliquely cordate and amplexicaul, strongly palmately veined, ciliate, usually pilose on outer surface, 5-11 mm. long; stipels linear or linear-lanceolate to elliptic-acuminate, striate, ciliate, 1-3.5 mm. long; petioles lineate and only a little less densely pilose than the stem, 2-4.6 cm. long; leaf rachis similar, 7.5-20 mm. long; leaflets orbicular to ovate, ciliate, abundantly appressed-pilose above, more densely so and somewhat spreading-pilose below; terminal leaflet chiefly cuneate at base, 35-53 mm. long, 31-49 mm. wide; lateral leaflets truncate to subcordate, 2.7-4 cm. long, 18-46 mm. wide; inflorescence axillary, racemose to racemose-paniculate, pilose as is the stem; primary bracts ovate-acuminate, occasionally bifid or trifid at apex, striate, ciliate, glabrous to somewhat puberulent on outer surface, 3-7 mm. long; secondary bracts slender, lingulate to slenderly oval, striate and long-ciliate, 1-3 mm. long; flowers usually borne in pairs or occasionally with a third central one which may or may not mature; pedicels stout, uncinulate-puberulent, 6-13 mm. long; calyx puberulent, the teeth of the lobes often pilose and ciliate, central tooth of lower lobe 3-5 mm. long and lateral teeth 3.5-4.5 mm. long, upper bifid lobe 3-5 mm. long; corolla at least twice as long as the calyx, 6-10.2 mm. long; loment stipitate, (3-) or 4- to 6-articulate; stipe uncinulate-puberulent, 3-6 mm. long; articles subrhomboidal to elliptic, usually the upper suture curved, the lower angled, uncinulate-puberulent throughout, 5-7.5 mm. long, 4-5 mm. wide; isthmi connecting the articles essentially central, 1-2 mm. wide. *D. Michauxii* (Vail) Daniels. Uncommon, dry woods, s.e. Tex., June-Sept.; Fla. to Tex. northw. to Mass., s. Vt., N.Y., s. Ont. and Mich.

6. *Desmodium canescens* (L.) DC. Perennial herb, often with many stems (to 8) from a long (1-4 dm.) brown taproot; stem much-branched and with various types of pubescence, long-tapering trichomes predominating; stipules deltoid to ovate-acuminate or -attenuate, truncate at base and obliquely lobed, striate, ciliate, puberulent on the outer surfaces (often with scattered pilosity until about the time of anthesis), glabrous within, becoming reflexed, 5-13 mm. long, 4.5-7 mm. wide; stipels linear- to lance-subulate, puberulent and ciliate, 1.3-6 mm. long; petioles terete and lineate to canaliculate, with pubescence similar to that of stem, 1.9-11 cm. long; leaf rachis similar, 7-35 mm. long; leaves usually trifoliolate; leaflets mostly thick and scabrous, moderately uncinulate-pubescent and with long tapering trichomes intermixed along midrib above, venation prominent and pubescence similar but denser below; terminal leaflet narrowly to broadly ovate with truncate to rhombic or rounded base and acute to gradually acuminate apex, 5-13 cm. long, 3-10 cm. wide; lateral leaflets slightly narrower in proportion to their length, somewhat oblique at base, 33-125 mm. long, 2-6.2 cm. wide; inflorescence racemose-paniculate, rather lax and becoming diffuse; rachises terete, lineate to canaliculate, with pubescence similar to that of stem; primary bracts ovate-attenuate, with pubescence similar to that of

stipules, not long-persistent, 3.5-7 mm. long; secondary bracts linear-attenuate, puberulent and ciliate, early-deciduous, 1.5-3 mm. long; pedicels with pubescence similar to that of petioles but with fewer long tapering trichomes, 8-14 mm. long; calyx minutely puberulent and pilose with long tapering trichomes along chief veins or scattered on teeth and lobes, the teeth (acute to) acuminate, long-attenuate, finely ciliate; upper bifid lobe 3-5 mm. long, central tooth of lower lobe 4.5-7 mm. long and lateral teeth 3.5-5 mm. long; corolla pinkish soon becoming green, approximately twice as long as calyx; loment 1- to 6-articulate, stipitate; stipe 2.5-6 mm. long, pubescent as the loment; articles uncinulate-pubescent with multicellular hairs intermixed and especially dense on isthmi and sutures, 7-9 mm. long, 5 mm. wide; loment sometimes with articles acutish below and with narrow isthmi or obtuse and with broad isthmi (the variation not having correlation with other characters). Dry sandy woods, e. and n.-cen. Tex., Sept.; e. half of U.S.

7. *Desmodium Lindheimeri* Vail. Erect branching perennial herb to 6 dm. tall; stem angulate, grooved, uncinulate-puberulent and -pubescent and sparsely scattered-pilose with slender white trichomes; stipules ovate, long-attenuate, densely pilose on the outer surface with long white trichomes, reflexed at maturity, not long-persistent, 6.5-8 mm. long, 1.5-2 mm. wide; stipels slenderly lance-attenuate, 1.5-4 mm. long; petioles densely uncinulate-puberulent and -pubescent and somewhat long spreading-pilose, 14-25 mm. long; leaf rachis similar, 6-14 mm. long; leaflets acute at apex, cuneate to obtuse at base, uncinulate-puberulent and more or less soft white-pilose above, densely long and soft white-pilose or tomentose below with prominent venation; terminal leaflet ovate to mostly rhombic in outline, 7-9 cm. long, 3-5.8 cm. wide; lateral leaflets more nearly ovate or elliptic, somewhat asymmetrical, 4.3-6 cm. long, 2-4 cm. wide; inflorescence paniculate, the rachis ridged and grooved, uncinulate-puberulent and -pubescent; primary bracts ovate-attenuate, striate, long appressed pilose on outer surface, ciliate, glabrous within, not long-persistent, 4.5-7 mm. long, 2-4.5 mm. wide; secondary bracts essentially glabrous but ciliate, 0.8-3 mm. long, 0.8-1 mm. wide; pedicels rather finely pilose with multicellular trichomes which are glandular at base; flowers blue-green or purple; calyx finely puberulent, somewhat ciliate, the long white trichomes along central tooth of lower lobe reaching 3 mm. in length; corolla to 7 mm. long; loment stipitate, to 5-articulate; stipe 2-3.5 mm. long; articles subrhombic to semiovalate in outline, the isthmi slightly excentric, the articles appearing somewhat contorted because of the infolding of their margins, surfaces glabrous, reticulate at maturity, the sutures densely uncinulate-pubescent, 7-11 mm. long, 5-8 mm. wide; seeds small, seeming never to fill article, to about 3 mm. long. *Meibomia Lindheimeri* Vail. Rare, known in Tex. only from the collections of Lindheimer, from near New Braunfels, Comal Co., made in Nov. 1850; also from scattered collections in n.e. Mex. as far s. as S.L.P.

The relationship of this species is with *D. canescens* and its relatives, especially *D. ochroleucum* M. A. Curtis of southeastern United States, which it resembles particularly in the characters of the loment.

8. *Desmodium Tweedyi* Britt. Perennial herb with rather slender (8 mm. thick) long root and 1 to several usually unbranched ridged and grooved stems; stems densely uncinulate-puberulent with minute hooked trichomes and abundantly pubescent with a mixture of stout long hooked trichomes and fewer multicellular somewhat glutinous ones; stipules obliquely ovate-attenuate, striate, long-ciliate, chiefly minutely puberulent on outer surface, puberulent to glabrous on the inner surface, 7.5-14.5 mm. long, 2.5-4 mm. wide; stipels linear-lanceolate, striate, puberulent and ciliate, 1-4.5 mm. long; petioles abundantly uncinulate-puberulent and -pubescent with long white tapering trichomes interspersed, 4-9 cm. long; leaf rachis similar, 1-2.6 cm. long; leaflets thick, reticulate, ovate-obtuse, with pale mottling along midrib, more or less obtuse and mucronulate at apex, rounded to truncate at base, long-ciliate with stout tapering trichomes, scattered uncinulate-pubescent above, densely so beneath with straight tapering trichomes along midrib of both surfaces; terminal leaflet 4-12 cm. long, 2-6.6 cm. wide; lateral leaflets slightly oblique and smaller (3-11 cm. long and 16-45 mm. wide); inflorescence racemose to slightly paniculate, the rachis finely ridged and grooved, densely pubescent with rather glutinous hooked and multicellular trichomes; primary bracts (each subtending 2 or 3 pedicels, the third flower not often developing fully) ovate-attenuate, striate, puberulent, ciliate, essentially glabrous within, not long-persistent, 5-8 mm. long, 2-4 mm. wide;

secondary bracts similar to the primary, lance- to ovate-attenuate, soon deciduous, 1-2.5 mm. long, 0.5 mm. wide; pedicels with pubescence dense and similar to that of the rachis, rather heavily glutinous, 1-2.2 cm. long; calyx minutely puberulent throughout and more or less glutinous, teeth of both lobes ciliate, central tooth (3-4 mm. long) of lower lobe with long stout tapering trichomes along its midrib and lateral teeth 2-3 mm. long, the upper bifid lobe, 2-3 mm. long; corolla white (when noted), about twice the length of calyx; loment stipitate, (2- to) 4- to 6-articulate; stipe 2-4 mm. long; articles subrhombic, somewhat acutely angled on the upper suture and obtusely so on the lower, reticulate on the surfaces, rather abundantly uncinete-pubescent throughout and often somewhat glutinous, 6-8 mm. long, 4.5-5 mm. wide, the isthmi 0.5 mm. wide. Scattered in calcareous sandy loam near creeks and rivers, n.-cen. Tex., Edwards Plateau and e. part of Plains Country, June-July; also Okla.

Desmodium Tweedyi seems to bridge the gap between *D. canescens* and *D. illinoense* Gray, and is doubtfully distinct from the latter species.

9. *Desmodium sessilifolium* (Torr.) T.&G. Erect perennial herb from a somewhat branched and thickened rootstock, the 1 to several stems sometimes branched at base (rarely so above), terete to angulate, densely uncinete-pubescent and -puberulent throughout; stipules lance- (to ovate-) attenuate, striate, puberulent and patent-pilose on outer surface, glabrous on the inner surface, ciliate, moderately persistent, 4-9.5 mm. long; stipels mostly linear-lanceolate, uncinulate-puberulent and more or less ciliate, 1.5-3 mm. long; petioles (if present) to 9 mm. long; leaf rachis lineate, uncinulate-puberulent, spreading-pilose with straight tapering trichomes along margins of the adaxial groove, 3-8 mm. long; leaves trifoliolate (occasional unifoliolate ones observed); leaflets linear-lanceolate to narrowly elliptic, gradually acuminate to almost obtuse at base and apex, mucronate, ciliate, rather prominently reticulate, moderately uncinulate-puberulent and pilose above, paler beneath, minutely puberulent and abundantly long-pilose; terminal leaflet 37-85 mm. long, 7-15 mm. wide; lateral leaflets 3-6.5 cm. long, 6-12 mm. wide; inflorescence racemose-paniculate, its branches more or less virgate and densely flowered; rachises terete to subangulate, often ridged and grooved, rather densely uncinete-pubescent; primary bracts subtending 2 or 3 pedicels, ovate-attenuate, striate, puberulent on outer surface and somewhat long-pilose, ciliate, 2.5-3.5 mm. long; secondary bracts similar, linear to lanceolate or ovate, 0.6-1.5 mm. long; pedicels with pubescence similar to that of rachis, 1.5-4.5 mm. long; calyx puberulent and somewhat long-pilose throughout, teeth of both lobes ciliate, central tooth of lower lobe 2.5-3.5 mm. long and lateral teeth 2-2.8 mm. long, upper scarcely bifid lobe to 2.5 mm. long; corolla pinkish or lavender to white, to about 6 mm. long; loment stipitate, 1- to 4-articulate; stipe 1.5-3 mm. long; articles curved on upper suture, rounded to subangulate on the lower, with uncinete and multicellular trichomes intermixed and dense on surfaces and sutures, 4-6 mm. long, 3-4.5 mm. wide. Dry sandy soils, frequent in e. and n.-cen. Tex., infrequent in s.e. Tex., rare in Plains Country, June-Sept.; local in e. U.S.

10. *Desmodium strictum* (Pursh) DC. Perennial herb from a long slender (to 5 mm. thick) somewhat branched root, with erect mostly simple stems; stem terete to angulate, lineate, rather densely uncinulate-puberulent above, less so below or glabrescent; stipules obliquely lance- to ovate-attenuate, striate, puberulent on the outer surface, somewhat ciliate, more or less persistent, 2-5 mm. long; stipels subulate to lanceolate, puberulent, usually ciliate at least at apex, 1.6-2 mm. long; petioles sparsely pilose on margins of groove or throughout and somewhat uncinulate-puberulent, 6.5-18 mm. long; leaf rachis similar, 4-7 mm. long; leaves trifoliolate; leaflets linear to linear-lanceolate or narrowly elliptic, obtuse to acute and mucronate, scattered puberulent and pilose above and below, moderately ciliate, venation finely reticulate and rather prominent, lower surface paler; terminal leaflet 3.8-6 cm. long, 4-7 mm. wide; lateral leaflets 2-4 cm. long, 2-6 mm. wide; inflorescence simply to diffusely racemose-paniculate; rachises terete to angulate, moderately to abundantly uncinulate-puberulent and -pubescent; primary bracts subtending 2 or 3 (or more) pedicels, ovate-acuminate, striate, puberulent and pilose over outer surface, glabrous on the inner surface, ciliate, 1.4-2 mm. long, about 0.5 mm. wide; secondary bracts similar, smaller; pedicels slender, rather stiff, densely uncinulate-pubescent, 6-13 mm. long; calyx puberulent throughout and rather abundantly pilose especially on lobes of both teeth, central tooth of lower lobe 2-2.5 mm. long and lateral teeth 1.5-2 mm. long, upper bifid lobe 1.5-2 mm. long; corolla almost twice the length of

calyx (color not noted); loment stipitate, 1- or 2-articulate; stipe 1.5 mm. long; articles slightly invaginated at center of upper suture and at isthmi above, rounded or obtusely angled below and deeply indented at isthmi, sparsely to densely uncinulate-puberulent and -pubescent and with straight multicellular trichomes often intermixed on surfaces and sutures, 4-6 mm. long, 3-4 mm. wide, the isthmi about 1 mm. wide. Reported from Texas but no material has been seen. The species occurs chiefly in sandy pine barrens from La. to Fla., n. to N.J. and is not common anywhere in its range; it should be sought in east Texas.

11. *Desmodium obtusum* (Willd.) DC. Erect perennial herb from a rather stout branched root system; stems usually several from the base, slender, simple, terete to subangulate, usually pale and lineate with prominent green to purple lines extending to branches of inflorescence, rather densely uncinulate-puberulent to -pubescent, with tapering (not hooked) trichomes only near nodes; stipules obliquely ovate-attenuate, striate, puberulent and abundantly pilose on outer surface, ciliate, deciduous (few seen), (3-) 4-6.5 mm. long, 2 mm. wide; stipels lance-attenuate (often bifid), puberulent, ciliate, persistent, 1.5-3 mm. long; petioles mostly densely uncinulate-puberulent and -pubescent with straight tapering trichomes chiefly along adaxial groove, 2-20 mm. long; leaf rachis similar (occasionally longer than petiole on upper portion of stem), 5-10 mm. long; leaves trifoliolate; leaflets narrowly ovate to ovate or elliptic, acute to obtuse and mucronate at apex, rounded at base, rather thick, usually conspicuously reticulate, uncinulate-puberulent and somewhat pilose above, more abundantly pilose beneath (especially along midrib), ciliate; terminal leaflet 5-6.7 cm. long, 2-3.3 cm. wide; lateral leaflets 3-4.2 cm. long, 15-27 mm. wide; inflorescence racemose-paniculate, diffuse with the branches often lax; rachis uncinulate-puberulent and -pubescent with straight often gland-tipped trichomes often intermixed; primary bracts ovate-attenuate, striate, puberulent and pilose over outer surface, ciliate, mostly subtending 3 to 5 pedicels, 2.5-3.5 mm. long, not persistent; secondary bracts linear to lanceolate or lance-ovate, ciliate, deciduous, 0.5-1.4 mm. long; pedicels spreading-ascending with pubescence similar to that of rachis of inflorescence, 6-17 mm. long; calyx puberulent and more or less long-pilose throughout, teeth of both lobes somewhat ciliate, central tooth of lower lobe attenuate and 2-3 mm. long, the broader lateral teeth 1.5-2.5 mm. long, upper bifid lobe 1.5-2 mm. long; corolla white or pale-pink to lavender-blue, about twice as long as calyx (5-6 mm.); loment stipitate, 1- to 3-articulate; stipe 1.5-2 mm. long; articles with upper suture curved (convex), lower suture rounded-obtuse, surfaces and sutures uncinulate-puberulent with some straight multicellular trichomes intermixed, 4-4.5 mm. long, 2.5-4 mm. wide. *D. rigidum* of Gray's Man. ed. 8. Rare and scattered in sandy open woodlands, e. and n.-cen. Tex., Oct.; scattered in e. U.S. s. to s.e. S.C., Fla. and Tex.

12. *Desmodium ciliare* (Willd.) DC. Perennial herb with slender ascending to erect stems often branched from base and arising from a somewhat stout often branched root (sometimes reaching 2 dm. in length); stems subangulate, strongly lineate, usually abundantly spreading-pilose with long slender tapering trichomes and often with short uncinulate-puberulence intermixed or with only the latter; stipules slenderly lance-attenuate, striate, minutely puberulent on outer surface and more or less pilose, ciliate, fairly long-persistent, 2.5-5 mm. long; stipels subulate, puberulent and ciliate, 0.7-2 mm. long; petiole long-pilose chiefly on the margins of the groove, 1-15 mm. long; leaf rachis similar, 2-9 mm. long; leaflets elliptic to slenderly ovate or almost rhombic, obtuse, mucronate, more or less prominently reticulate above and usually long-pilose and somewhat puberulent, similarly but not so densely pubescent below, ciliate; terminal leaflet 9-30 mm. long, 5-17 mm. wide; lateral leaflets only slightly (if at all) smaller; inflorescence racemose-paniculate; rachis angulate, uncinulate-puberulent, often scattered-pilose; primary bracts ovate-acuminate, striate, puberulent on outer surface, ciliate, soon deciduous, subtending 2 to several pedicels, 1.5-3 mm. long; secondary bracts subulate to slenderly ovate, puberulent and ciliate, each subtending 1 pedicel, 0.6-0.9 mm. long; pedicels densely uncinulate-puberulent, 4-9 mm. long; calyx minutely puberulent throughout, the teeth of both lobes finely ciliate, pilose with scattered long trichomes, central tooth of lower lobe 2-3 mm. long and lateral teeth 1.5-2.5 mm. long, upper bifid lobe 1.5-2.1 mm. long; corolla about twice as long as calyx, usually pink; loment stipitate, 1- to 3-articulate; stipe 1-1.5 mm. long; articles broadly elliptic, the upper suture of each article forming an arc, not deeply indented at isthmi, moderately uncinulate-puberulent

on sutures and surfaces and with some multicellular trichomes intermixed, 4-5.5 mm. long, 2.7-4 mm. wide. Dry sandy woods and clearings, e. and s.e. Tex., rare w. to n.-cen. Tex., Aug.-Oct.; s. Can., e. U.S.; recorded from Mex. and C.A.; W.I.

13. *Desmodium marilandicum* (L.) DC. Ascending to erect slender perennial herb with simple stems or branching from the base or several from the subligneous simple or branched slender often elongate root; stem terete to subangulate, lineate, essentially glabrous or sparsely to moderately uncinulate-puberulent, to 10 dm. or more tall (including terminal inflorescence); stipules narrowly ovate- to lance-attenuate, striate, puberulent on the outer surface, ciliate, moderately persistent, 2-4.5 mm. long; stipels subulate to lanceolate, puberulent, 1-2 mm. long; petiole subangulate to angulate, lineate, sparsely and minutely uncinulate-puberulent, not deeply sulcate, 12-27 mm. long; leaf rachis similar or slightly pilose, 5-10 mm. long, leaflets essentially glabrous above with reticulate venation rather prominent, paler beneath and with scattered pilosity especially along midrib, chief lateral veins and margins; terminal leaflet ovate to ovate-rhombic or sub-orbicular, obtuse and mucronulate, 19-24 mm. long, 1-1.7 cm. wide; lateral leaflets similar but mostly elliptic- to deltoid-ovate, 15-25 mm. long, 11-16 mm. wide; inflorescence chiefly terminal, racemose-paniculate and rather diffuse; rachis terete and strongly lineate, moderately uncinulate-puberulent; primary bracts ovate, acuminate, striate on the outer surface, puberulent, ciliate, not long-persistent, each subtending 2 to several pedicels, about 2 mm. long; secondary bracts lance-attenuate to linear, puberulent and ciliate, 0.7-1.3 mm. long; pedicels densely and minutely uncinulate-puberulent, (6-) 8-19 mm. long; calyx minutely puberulent throughout, scattered-pilose, teeth of both lobes finely ciliate, central tooth of lower lobe 2-3.5 mm. long and lateral teeth 1.5-2.5 mm. long, upper bifid lobe 1.5-2.2 mm. long; corolla reddish, drying bluish-green or darker, almost twice as long as calyx; loment stipitate, 1- to 4-articulate; stipe 1-2 mm. long; articles gently curved above, obtusely angled below, uncinulate-puberulent and -pubescent and with fine multicellular trichomes interspersed on surfaces and sutures, 4-5.5 mm. long, 3-4 mm. wide. Dry open woods, scattered and rare in e. and s.e. Tex., Aug.-Oct.; e. half of U.S.; Mex.

There seem to be some transitional plants which bridge the gap between the extreme forms of this and the preceding species.

14. *Desmodium lineatum* DC. Stems slender, simple to branched, trailing to prostrate, often forming mats, from a stout reddish-brown root to 3 dm. long and 1 cm. thick; stems terete, lineate, uncinulate-puberulent and -pubescent with long straight tapering trichomes often scattered about the nodes; stipules lance-attenuate to obliquely ovate-attenuate, striate, minutely puberulent on outer surface (occasionally also pilose), ciliate, moderately persistent, 2-5 mm. long; stipels lance-subulate, puberulent and ciliate, 0.5-2 mm. long; petioles lineate, more or less puberulent throughout, usually pilose in and about groove, 5-21 mm. long; leaf rachis similar, 3-8 mm. long; leaflets ovate or rhombic to obovate or orbicular, obtuse, moderately uncinulate-puberulent and scattered-pilose above, pilose below mostly on midrib, veins and veinlets, puberulent; terminal leaflet 1-2.6 cm. long, 13-29 mm. wide; lateral leaflets 8-22 mm. long and wide; inflorescence racemose to racemose-paniculate, axillary and terminal, lax; rachis subangulate, striate, densely uncinulate-puberulent; primary bracts ovate-acuminate, striate, puberulent on outer surface and more or less pilose, ciliate, 2-3 mm. long; secondary bracts linear to lanceolate, pubescent as the primary bracts, 0.6-1.4 mm. long; pedicels uncinulate-puberulent with some multicellular trichomes intermixed, 8-16 mm. long; calyx minutely puberulent throughout and somewhat pilose, teeth of both lobes rather finely ciliate, central tooth of lower lobe 2-3 mm. long and lateral teeth 1.5-2.2 mm. long, upper bifid lobe 1.5-2.5 mm. long; corolla twice as long as calyx; loment stipitate, 1- to 4-articulate; stipe 1-2 mm. long; articles ovate-orbicular or obovate, upper suture slightly curved, lower suture rather deeply indented, the isthmi narrow, uncinulate-pubescent with multicellular trichomes intermixed on surfaces and sutures, 3.5-5 mm. long, 2.5-3.5 mm. wide. *D. arenicola* (Vail) Herm., *Meibomia arenicola* Vail. Rare in sandy forested areas, e. Tex., May-Aug.; Fla. n. to s.e. Md. on the Coastal Plain; N.L.

15. *Desmodium canadense* (L.) DC. Erect perennial herb with 1 to several stems from a simple to branched brown root; stem terete and smooth below, becoming lineate, moderately to abundantly uncinulate-puberulent and -pubescent and usually densely

long patent-pilose above; stipules linear-lanceolate to lance-attenuate, striate, puberulent and usually pilose on the abaxial surface, ciliate, more or less persistent, 4.5-9.5 mm. long; stipels lanceolate to linear-lanceolate, puberulent and ciliate, 2-4 mm. long; petioles lineate, sparsely to abundantly pilose throughout, 8-25 mm. long; leaf rachis similar, 9-15 mm. long; leaflets elliptic to rhombic or almost orbicular in lower portion of plant, becoming ovate to lance-ovate above, short-acute to obtuse at apex, cuneate at base, uncinulate-puberulent and moderately appressed-pilose on upper surface, much paler and abundantly pilose on the lower surface, margins ciliate; terminal leaflet 48-105 mm. long, 20-38 mm. wide; lateral leaflets similar, slenderer, 45-82 mm. long, 19-28 mm. wide; inflorescence racemose-paniculate; rachis prominently ridged and grooved, pubescent as the stem and with some scattered multicellular trichomes; primary bracts lance- to ovate-attenuate, striate, puberulent and somewhat pilose on outer surface, ciliate, 4-10 mm. long; secondary bracts linear to liguliform or spatulate, puberulent on outer surface, more or less pilose, long-ciliate, 2.5-4 mm. long; pedicels densely uncinulate-puberulent, with scattered multicellular and stout long tapering trichomes often intermixed, 5-6 (-9.5) mm. long; calyx rather abundantly long-pilose throughout especially on lobes, teeth of both lobes finely ciliate, central tooth of lower lobe 5-7 mm. long and lateral teeth 4.5-5.5 mm. long, upper bifid lobe 4.5-5 mm. long; corolla somewhat more than twice as long as calyx; loment stipitate, 1- to 5-articulate; stipe 2-2.5 mm. long; articles curved above, obtusely angled below, densely uncinulate-pubescent throughout and with multicellular and straight tapering trichomes occasionally intermixed, 5-7 mm. long, 4-5 mm. wide. Reported from Wheeler Co. in the Panhandle but no Texan material has been seen; the description applies to the species as it occurs in open woods from N.S. to s. Sask., s. to N.E., Md., w. Va., W.Va., O., Ind., Ill., Mo. and Okla.

16. *Desmodium cuspidatum* (Willd.) Loud. Erect perennial herb to 1 m. tall or more; stems simple or branched from a stout root to 15 cm. long, angulate and grooved, mostly glabrous (only occasionally uncinulate-puberulent); stipules slenderly and obliquely ovate-attenuate, striate, minutely puberulent to glabrous, rarely somewhat ciliate, 1.1-2 cm. long; stipels linear-attenuate or subulate, striate, glabrous to puberulent, ciliate, 5-9 mm. long; petioles essentially glabrous, 4-9.7 cm. long; leaf rachis similar, 18-35 mm. long; leaflets ovate-acuminate, rounded to cuneate at base, essentially glabrous on both surfaces except for pilosity along midrib and veins, paler and glaucous below; terminal leaflet 8-14 cm. long, 42-67 mm. wide; lateral leaflets similar, somewhat oblique, 69-117 mm. long, 28-52 mm. wide; inflorescence racemose-paniculate; rachis angulate, lineate, rather abundantly uncinulate-pubescent; primary bracts (subtending 2 pedicels and usually an abortive third one) ovate-attenuate, striate, essentially glabrous, inconspicuously ciliate, deciduous, 6-12 mm. long, 4-5 mm. wide; secondary bracts linear, ligulate or ovate, glabrous to puberulent and ciliate, 1.5-3.5 mm. long; pedicels puberulent to pilosulous with (often glutinous-tipped) multicellular trichomes or uncinulate-pubescent, or glabrescent, 3.5-7 mm. long; calyx finely puberulent with ciliate teeth and some pilosity along central tooth of lower lobe which is 4.5-6 mm. long, the lateral teeth 4-5 mm. long, upper bifid lobe 4-4.5 mm. long; corolla rose-lavender, to 8 mm. long; loment stipitate, 1- to 7-articulate; stipe about 2.5 mm. long; articles triangular to rhombic or 5- or 6-angular, the isthmi usually broad, sutures densely uncinulate-puberulent, the surfaces less so, 7-10 mm. long, 4-5 mm. wide. *D. bracteosum* (Michx.) DC. Not common, but known from rich woods in 4 counties in n.e. Tex., Aug.-Sept.; e. and cen. U.S.

17. *Desmodium viridiflorum* (L.) DC. Erect suffrutescent perennial to 3 dm. high, with mostly simple terete somewhat ridged and grooved or lineate stems, moderately to sparsely pilose (with long tapering trichomes) and abundantly uncinulate-puberulent and -pubescent; stipules ovate- to lance-acuminate (usually long-attenuate), striate, appressed-pilose on outer surface, long-ciliate, 3-7 mm. long; stipels linear to lance-attenuate, puberulent and more or less pilose, ciliate, 0.5-4 mm. long; petioles ridged and grooved, uncinulate-puberulent and long patent-pilose, 5-65 mm. long; leaf rachis similar, 11-28 mm. long; leaflets mostly rhombic (or the terminal sometimes deltoid with truncate base), acute to acuminate or obtuse, about two thirds as wide as long, rather moderately spreading-pilose with short straight or uncinulate trichomes (or both), rather dark-green above, densely tomentose with long soft spreading white tapering trichomes

beneath; terminal leaflet 52-118 mm. long, 36-88 mm. wide; lateral leaflets slightly oblique, 4-10.2 cm. long, 2-6.5 cm. wide; inflorescence racemose-paniculate; rachis prominently furrowed, uncinulate-pubescent and sparsely patent-pilose; primary bracts ovate-acuminate, striate, long and soft pilose on the outer surface, ciliate, 2-4 mm. long, about half as wide; secondary bracts lance-attenuate to linear, puberulent and pilose, ciliate, 0.5-1.5 mm. long; pedicels uncinulate-puberulent and somewhat pilose, 3-8 mm. long; calyx soft spreading-pilose throughout, central tooth of lower lobe 2.5-4.5 mm. long and lateral teeth 2-4 mm. long, upper bifid lobe 2-3 mm. long; corolla lavender-blue to pink, said to turn green after anthesis, to about 9 mm. long; loment stipitate, (2- to) 4- or 5- (or 6-) articulate; stipe 3-6 mm. long; articles more or less rhombic, moderately to densely uncinulate-pubescent on surfaces and sutures, 5-9 mm. long, 3.5-5 mm. wide. Dry woods, e. Tex., infrequent, Sept.-Oct.; s.e. U.S. n. to Del. and inland only to Ark. and Tenn.

18. *Desmodium Nuttallii* (Schindl.) Schub. Perennial, herbaceous to suffrutescent, ascending to erect, to about 15 dm. tall; stem simple or branched from the base, densely to moderately uncinulate-pubescent and somewhat patent-pilose; stipules lance- to ovate-acuminate, striate, rather densely appressed-pilose on abaxial surface, ciliate, 2.5-5.5 (-6.5) mm. long, 1.5-2 mm. wide; stipels subulate, puberulent and usually densely white-pilose on abaxial surface, ciliate, 1.5-3.5 (-4) mm. long; petioles striate, rather densely uncinulate-pubescent and sparsely to densely patent-pilose with long straight trichomes, 5-25 (-33) mm. long; leaf rachis sometimes exceeding petioles in length, 4-16 (-23) mm. long; leaves occasionally unifoliolate at base, chiefly trifoliolate; leaflets ovate to rhombic in upper portions of plant, mostly elliptic-ovate below, acute to obtuse at apex, rounded at base, moderately appressed-pilose above and somewhat uncinulate-pubescent near base, densely soft tomentulose beneath; terminal leaflet 5.2-10 cm. long, 28-56 mm. wide; lateral leaflets elliptic to ovate, 3.4-8 (-10) cm. long, 21-51 mm. wide; inflorescence chiefly terminal, racemose-paniculate; rachis uncinulate-pubescent and occasionally more or less spreading-pilose; primary bracts ovate-acute, striate, pilose over outer surface, ciliate, 2-4 mm. long; secondary bracts lance-ovate, pilose and ciliate, 0.5-1.5 mm. long; pedicels chiefly uncinulate-puberulent and -pubescent, (2.5-) 3.5-6.5 mm. long; calyx puberulent throughout and at least somewhat long-pilose, the teeth of both lobes ciliate, central tooth of lower lobe 2-3.5 mm. long and lateral teeth 1.5-2.5 mm. long, upper bifid lobe 1.5-2 mm. long; corolla pink, 6-7 mm. long; loment stipitate, 1- to 4-articulate; stipe 2.5-4 mm. long; articles mostly rounded above and cuneate below, uncinulate-pubescent throughout, 4-7 mm. long, 3-4.5 mm. wide. Dry sandy open woods, e. and n.-cen. Tex., rare, June-Sept.; N.Y. to Ind., s. to n. Fla., Ala. and Tex.

19. *Desmodium Fernaldii* Schub. Stout perennial herb from a slender branching root to about 4 dm. long; stem terete to slightly angulate, finely puberulent and slightly to densely uncinulate-pubescent, to about 13 dm. tall; stipules lance-attenuate, striate, more or less pilose and puberulent on both surfaces, soon deciduous, 2-4 mm. long, about 0.8 mm. wide; stipels subulate or ovate-acuminate, puberulent, ciliate, 1-3 mm. long; leaflets rhombic to ovate, obtuse to acute at apex, cuneate to rounded at base, often acute at apex and truncate at base, dark-green above, moderately uncinulate-pubescent and somewhat short and straight pilose, paler beneath, uncinulate-pubescent and pilose along midrib and veins; terminal leaflet (4.5-) 6-8 (-9.3) cm. long, 2.5-5 cm. wide; lateral leaflets mostly elliptic to elliptic-ovate, 4-6 cm. long, 18-35 mm. wide; inflorescence racemose-paniculate, often densely flowered; rachis striate, angulate, uncinulate-puberulent and -pubescent; primary bracts ovate-acuminate, puberulent, pilose and ciliate, 1.5-2.5 mm. long, 1-1.5 mm. wide; secondary bracts similar, 1-1.5 mm. long, about 0.5 mm. wide; pedicels mostly uncinulate-puberulent, 5-8 mm. long; calyx puberulent and stiff-pilose throughout, central tooth of lower lobe 3-3.5 mm. long and lateral teeth 2-3 mm. long, upper bifid lobe 1.5-2.5 mm. long; corolla about twice as long as calyx; loment stipitate, 1- to 5-articulate; stipe 2.5-4 mm. long; articles more or less deltoid to rhombic, uncinulate-pubescent throughout, the upper suture slightly angled, the lower obtusely so, 5.5-8 mm. long, 3.3-5 mm. wide. Rare in sandy woods, e. Tex. (Newton, Smith and Polk cos.); s.e. Va. to S.C., La. and e. Tex.

20. *Desmodium glabellum* (Michx.) DC. Spreading to erect perennial herb from a rather thick long (to 4 dm.) branched root; stem simple to branched, terete to angulate,

lineate, uncinulate-puberulent and more or less spreading-pilose (at least near nodes), to about 1 m. tall; stipules obliquely ovate- to lance-attenuate, remotely striate, pilose on abaxial surface with long trichomes at base and shorter ones above, ciliate, 2-4 mm. long, 1-1.5 mm. wide; stipels subulate to linear-attenuate, minutely puberulent, ciliate, 1-2 mm. long; petioles lineate, sulcate, finely uncinulate-puberulent and sparsely to moderately ascending-pilose, 4-38 mm. long; leaf rachis similar, 2-16 mm. long; leaflets narrowly to broadly ovate to elliptic or rhombic, mostly obtuse and emarginate and mucronulate at apex, with rather prominent reticulate venation, somewhat uncinulate-puberulent and moderately to abundantly appressed-pilose above, similarly pilose on the paler lower surface; terminal leaflet 3-8 cm. long, 18-55 mm. wide; lateral leaflets chiefly elliptic-obtuse, 2-6 cm. long, 1-3.5 cm. wide; inflorescences racemose-paniculate, rather lax and diffuse; rachis angulate, densely uncinulate-puberulent and sparsely to moderately spreading-pilose; primary bracts ovate-acuminate, striate, puberulent and more or less pilose, ciliate, 1.2-3 mm. long, about 1 mm. wide; secondary bracts elliptic to lanceolate, puberulent and long-ciliate, 0.6-1.2 mm. long; pedicels densely uncinulate-puberulent and with occasional pilosity, 3.5-12 mm. long; calyx puberulent throughout, pilose especially on teeth of both lobes with short pointed trichomes and ciliate, central tooth of lower lobe 2.5-5.5 mm. long and lateral teeth 2.2-3.5 mm. long, upper bifid lobe 1.5-3.5 mm. long; corolla bright- to deep-rose, to 9.5 mm. long; loment stipitate, 1- to 5-articulate; stipe 3-5 (-7) mm. long; articles triangular to rhombic, uncinulate-pubescent throughout, with some multicellular trichomes intermixed, 6-8 mm. long, 3-5 mm. wide. *D. Dilleni* Darl. in part. Dry sandy woods, e. Tex. as far s. as Fort Bend Co., May-Sept.; s.e. Mass. to Mich. and Ill., s. to S.C., Ala., La. and Tex.

21. *Desmodium paniculatum* (L.) DC. var. *paniculatum*. Erect herbaceous perennial with several stems usually arising from an elongate branching root; stem slender, sub-angulate, lineate, glabrous to puberulent and scattered-pilose, often branched above, to 9 dm. high; stipules linear- to lance-attenuate, striate, puberulent, often pilose on abaxial surface, ciliate, 3-6 mm. long; stipels lance-attenuate, 1-3 mm. long; petioles angulate, more or less pilose along margins of the groove, otherwise glabrous to uncinulate-puberulent, 1-5.3 cm. long; leaf rachis similar, 5-17 mm. long; leaflets linear-lanceolate to linear-elliptic or lance-ovate, acute to acuminate at apex, rounded at base, mostly minutely puberulent and moderately to abundantly pilose on both surfaces, margins slightly revolute and ciliate; terminal leaflet 4.3-10 cm. long, 1-2.3 cm. wide; lateral leaflets similar, slightly smaller, 4-9.6 cm. long and 6.5-20 mm. wide; inflorescence racemose-paniculate, often very diffuse; rachis angulate, lineate, often ridged and grooved, minutely puberulent to uncinulate-pubescent with some pilosity of straight pointed trichomes interspersed; primary bracts lance- to ovate-attenuate, striate on outer surface, puberulent, somewhat pilose mostly at base, ciliate, deciduous, 1-3.5 mm. long; secondary bracts linear to slenderly ovate-attenuate, puberulent and ciliate, 0.5-1 mm. long; pedicels ascending, uncinulate-puberulent, 4-18 mm. long; calyx puberulent throughout and pilose with stout stiff straight pointed trichomes chiefly on lobes but also scattered on tube, teeth of both lobes ciliate, central tooth of lower lobe 3-5 mm. long and lateral teeth 2.5-4 mm. long, upper (scarcely) bifid lobe 2-3.5 mm. long; corolla not quite twice the length of calyx; loment stipitate, 1- to 5-articulate; stipe 3-4 mm. long; articles triangular to subrhombic, 5.5-7 mm. long, 3.5-4.5 mm. wide. *D. dichromum* Shinn. Scattered in clearings and borders of dry woods throughout the e. half of Tex., May-Sept.; N.H. to Ont., Ia. and Neb., s. to Fla., Ala., Miss., La. and Tex.; N.L.

21a. *Desmodium paniculatum* var. *epetiolatum* Schub. This variety differs from var. *paniculatum* in its sessile or very short petiolate leaves and the rounded articles of the loment. It is known in Texas only from Colorado County in the southeastern part of the state; Tex., N.C. and Va.

22. *Desmodium laevigatum* (Nutt.) DC. Ascending to erect perennial herb from a long woody root; stem stout, erect, somewhat branched, terete, lineate, glabrous to uncinulate-puberulent, 15 dm. tall; stipules apparently very early deciduous, only scars seen; stipels linear-lanceolate, puberulent on both surfaces, 1-3 mm. long; petioles angular, glabrous to uncinulate-puberulent, 18-66 mm. long; leaf rachis similar, 11-28 mm. long; leaflets dark and glabrous to sparsely puberulent above with distinct paler venation, glabrous to sparsely puberulent and/or short pilose beneath and glaucous, the

margins becoming revolute, more or less ciliate at base; terminal leaflet ovate-acute to more or less acuminate, mucronulate, rounded to acute at base, 43-84 mm. long, 28-52 mm. wide; lateral leaflets elliptic-oblong to ovate, obtuse at apex, truncate to rounded at base, 32-74 mm. long, 25-40 mm. wide; inflorescence chiefly racemose-paniculate, axillary and terminal; rachis terete to angulate, finely lineate, uncinulate-puberulent; primary bracts ovate-acuminate, striate, puberulent on both surfaces, more or less ciliate, 3-3.5 mm. long; secondary bracts slenderly ovate-acuminate, puberulent, ciliate, 1-2 mm. long; pedicels slender, lax, uncinulate-puberulent, 1-2 cm. long; calyx puberulent and somewhat short-appressed-pilose throughout, teeth of both lobes ciliate, central tooth of lower lobe 3.5-4.5 mm. long and lateral teeth 2.5-3.5 mm. long, upper bifid lobe 2.5-3.5 mm. long; corolla pink to deep-rose, about twice as long as calyx; loment stipitate, 2- to 5-articulate; stipe 6-6.5 mm. long; articles more or less rhombic, prominently reticulate, uncinulate-puberulent, 5-7 mm. long, 3.5-4 mm. wide. Dry sandy woods and clearings, e. Tex., May-Sept.; N.Y. to Ind. and Mo., s. to n. Fla., Tenn., La. and Tex.

23. *Desmodium tortuosum* (Sw.) DC. Erect perennial herb to 1 m. tall; stems simple or branched from base, terete, striate, uncinulate-pubescent and somewhat spreading-pilose with long tapering trichomes; stipules obliquely ovate-attenuate, striate, ciliate, puberulent on abaxial surface but becoming glabrous, often reflexed, long-persistent, 3-12.5 mm. long, 3-7 mm. wide; stipels lance-attenuate, striate, ciliate, more or less puberulent, 1-7 mm. long; petioles finely ridged and grooved, pubescent as is stem, 7.5-50 mm. long; leaf rachis similar, 4.5-20 mm. long; leaflets elliptic to ovate, mostly obtuse at apex, cuneate at base, venation prominently reticulate, sparsely to moderately uncinulate-puberulent to pilose on both surfaces, ciliate; terminal leaflets 2.4-8 cm. long, 1-3 cm. wide; lateral leaflets 2-5 cm. long, 1-2.4 cm. wide; inflorescence axillary and terminal, racemose to racemose-paniculate; rachis striate, uncinulate-puberulent and moderately to densely finely glandular-pilose; primary bracts narrowly ovate-attenuate, striate, long-ciliate, minutely puberulent on abaxial surface, not long-persistent, 5-6.5 mm. long, 0.5-1.5 mm. wide; secondary bracts similar but smaller, about 2 mm. long, 0.4-0.5 mm. wide; pedicels rather stiff, ascending to spreading at maturity, with pubescence similar to that of rachis, 1-1.6 cm. long; calyx minutely puberulent and rather abundantly pilose throughout, teeth of both lobes more or less ciliate, central tooth of lower lobe 3-4 mm. long and lateral teeth 2-3 mm. long, upper bifid lobe 2-3 mm. long; corolla 3-4 mm. long; loment stipitate, 5- to 7-articulate; stipe 0.5-1 mm. long; articles mostly orbicular, sometimes with margins alternately revolute and appearing rhomboidal, uncinulate-pubescent throughout, 3-3.5 mm. long, 2.6-3.5 mm. wide. *D. purpureum* (Mill.) Fawc. & Rendle. Cult. as a green manure in the s.e. U.S. and other parts of the world; found as an escape from cult. and becoming weedy in most trop. and warm areas; known from Newton and Tyler cos., Aug.-Sept.

24. *Desmodium neomexicanum* Gray. Annual herb from a slender taproot, much-branched from base, the branches slender, angulate and grooved, uncinulate-puberulent to -pubescent; leaves trifoliolate (or the lowermost often unifoliolate); leaflets linear-lanceolate to lance-ovate, gradually acuminate to an obtuse mucronulate apex, rounded to cuneate at base, bright-green and moderately uncinulate-puberulent to -pubescent above and with scattered stout tapering trichomes intermixed, paler below with similar pubescence, the straight tapering trichomes more abundant on midrib and chief lateral veins, the margins slightly revolute, ciliate; terminal leaflet 1.2-6 cm. long, 3-15 mm. broad; lateral leaflets slightly smaller; stipules obliquely ovate-acuminate, usually long-attenuate, striate, somewhat appressed-pilose, ciliate, (1.4-) 2.5-7 mm. long, 1-2 mm. wide; stipels subulate to linear-lanceolate, ciliate, 0.5-2.5 mm. long; petiole finely grooved, uncinulate-puberulent, 5-55 mm. long; leaf rachis similar, 8-12 mm. long; inflorescence racemose-paniculate, lax; rachis slender, rather sharply angulate, densely puberulent with both uncinulate and straight trichomes; primary bracts lance- to elliptic-attenuate, striate, puberulent and scattered-pilose, ciliate, becoming reflexed, 2.5-5.5 mm. long, 0.5-1 mm. wide; secondary bracts similar but very slender, 3-4 mm. long; pedicels slender, uncinulate-puberulent with some straight multicellular trichomes intermixed, 7-14 (-23) mm. long; calyx puberulent and scattered-pilose with stout trichomes, to 2 mm. long; corolla pink, about 4 mm. long; loment sessile to stipitate, to 5-articulate; stipe to 2 mm. long; articles (except the terminal) rhombic in outline, the margins more or less sinuate, surfaces reticulate, uncinulate-puberulent to -pubescent and with scattered long

tapering white trichomes (subterminal article glabrescent to glabrous), 3-4 mm. long, 2-3 mm. wide; terminal article usually more or less orbicular and glabrous, 3.5 mm. long and wide. *D. Bigelovii* Gray. Local in the mts. of Jeff Davis, Presidio and Brewster cos. in the Trans-Pecos, Aug.; Tex. to Ariz., southw. to Pue.; S.A., Peru, Bol. and Arg.

25. *Desmodium Grahamii* Gray. Prostrate or decumbent perennial herb, much-branched from the base, the thickish root also branched and spreading; stem slender, angulate, lineate, uncinulate-puberulent; stipules obliquely lance-attenuate, striate, ciliate, somewhat short-pilose on the outer surface, glabrous within, usually soon reflexed, 3-5.5 mm. long, 1-1.5 mm. wide; stipels lance-attenuate, puberulent, ciliate, 1.5-2.5 mm. long; petiole angulate, lineate, moderately to abundantly uncinulate-puberulent and scattered long-pilose, 1.2-2 cm. long; leaf rachis similar, 9-17 mm. long; leaflets with prominent reticulation, appressed-pilose with long slender tapering trichomes (usually bulbous at base) on the upper and the paler lower surface, ciliate, mucronulate; terminal leaflet almost orbicular on lower portions of plant to obtusely ovate above, truncate to obtuse at base, 25-37 mm. long, 17-25 mm. wide; lateral leaflets elliptic to ovate, obtuse at base and apex, 18-25 mm. long, 12-15 mm. wide; inflorescence racemose, terminal, the rachis not usually branched; rachis angulate, grooved, uncinulate-puberulent and occasionally scattered-pilose with straight tapering trichomes; primary bracts ovate or elliptic-attenuate, striate, puberulent and pilose on the outer surface, ciliate, 4.5-6.5 mm. long, 1.5-2 mm. wide; secondary bracts minute, elliptic to ovate, puberulent, ciliate (chiefly at apex), deciduous, 0.5-1 mm. long, 0.4 mm. wide; pedicels finely uncinulate-puberulent, 10-15 mm. long; calyx minutely puberulent throughout, pilose on teeth of both lobes, central tooth of lower lobe 4-5 mm. long and lateral teeth 3-4 mm. long, upper (scarcely bifid) lobe 3-4 mm. long; corolla purple, about twice as long as calyx; loment stipitate, 2- to 5-articulate; stipe 3-3.5 mm. long; articles elliptic to suborbicular, more deeply curved below than above, reticulate, finely uncinulate-puberulent throughout, 4.5-7 mm. long, 2.5-5 mm. wide. Higher parts of Davis and Chisos mts. in the Trans-Pecos, infrequent, July-Sept.; Tex. to Ariz., s. to the states of Mex. and Michoac. where it is rather frequent along roadsides.

26. *Desmodium psilophyllum* Schlecht. Erect perennial herb, much-branched from the base, to 9 dm. tall from a thickish (4 mm.) rather long (2 dm.) root; stem terete, finely ridged and grooved, minutely uncinulate-puberulent; stipules obliquely ovate-attenuate, striate, puberulent, more or less persistent, 1.5-3.5 mm. long, 0.5 mm. wide; stipels subulate, puberulent, ciliate, 0.5 mm. long; petioles angulate, somewhat puberulent, 6-9 mm. long; leaves unifoliolate; leaflets lance-ovate to ovate-obtuse, truncate to rounded at base, mucronulate at apex, moderately to abundantly uncinulate-puberulent throughout and with scattered pilosity of stout straight tapering trichomes especially along midrib and veins of both surfaces, occasionally with paler patches along midrib, the margins ciliate, 35-55 mm. long, 10-20 mm. wide; inflorescence terminal, racemose; rachis densely puberulent with uncinulate and more or less glutinous multicellular trichomes; primary bracts ovate, long-attenuate, striate, puberulent and somewhat spreading-pilose with short slender pointed trichomes, ciliate, 1-2 mm. long, 0.4-0.7 mm. wide; secondary bracts lance-attenuate, striate, puberulent and somewhat pilose, ciliate, 0.5-1 mm. long, 0.25 mm. wide; pedicels with pubescence like that of rachis, 4-10 mm. long; calyx puberulent throughout, pilose with multicellular and short straight pointed trichomes, central tooth of lower lobe 2-3 mm. long and lateral teeth 2-2.5 mm. long, upper bifid lobe 1.5-2.5 mm. long; corolla pink, twice as long as calyx or slightly longer; loment stipitate, 2- to 5-articulate; stipe 1.5-2.5 mm. long; articles elliptic to obovate, upper suture slightly curved, lower suture obtuse, uncinulate-pubescent on surfaces, somewhat so on sutures or almost glabrous, 4-4.5 mm. long, 3-3.5 mm. wide. *D. Wrightii* Gray. Canyons, s. margin of Edwards Plateau (e. to Travis Co.) and the Trans-Pecos, spring-autumn; Tex., Ariz. and Mex.

53. LESPEDEZA MICHX.⁹⁹

BUSH CLOVER

Unarmed annual or perennial herbs; leaves alternate, trifoliolate; stipules persistent; leaflets entire; stipels absent; flowers borne in pairs on loose or contracted racemes, often

⁹⁹ Contributed by Andre F. Clewell.

cleistogamous; calyx tube shorter than or equaling the lobes, the 5 subequal lobes persistent in fruit, often the calyx of cleistogamous flowers shorter than those of chasmogamous flowers; corolla papilionaceous (white to purple with purple throats) or absent (actually vestigial) in cleistogamous flowers; banner oblong to obovate or suborbicular, clawed, free or slightly adherent to the incurved obovate keel petals; stamens 10, diadelphous, the uppermost filament free; fruit a solitary flattened 1-seeded ovate or rounded indehiscent pod, often reticulated; style persistent (though easily broken in dried material), elongate on chasmogamous pods or very short and tightly recurved on cleistogamous pods.

A genus of about 90 species of Asia, Australia and North America. Several Asian species have been introduced for erosion control, forage and for use in wildlife management, especially for quail. A few hybrids often occur wherever two or more perennial species exist in moderate numbers, making identification somewhat difficult.

1. Stipules ovate to ovate-lanceolate; lateral veins of leaflets conspicuously parallel and extending to the margins, unbranched or uncommonly once-forked; annuals with stems mostly less than 4 dm. long (2)
1. Stipules narrow, subulate to setaceous; lateral veins of leaflets usually much-branched and anastomosing before reaching the margins; perennials with stems mostly more than 4 dm. long (3)
- 2(1). Stems upwardly appressed-pubescent; leaflets of the younger or upper leaves conspicuously ciliate marginally; petioles of the principal leaves mostly 4-10 mm. long 10. *L. stipulacea*.
2. Stems downwardly appressed-pubescent; leaflets not conspicuously ciliate; petioles of the principal leaves usually less than 3 mm. long . 11. *L. striata*.
- 3(1). Leaflets cuneate; flowers white or cream-colored with purple throats, mostly 2 to 4 per raceme; pods mostly 2.5-3 mm. long 9. *L. cuneata*.
3. Leaflets linear to ovate but not cuneate; flowers white to purple, if white or cream-colored then mostly 10 or more per raceme; pods 3-7 mm. long (4)
- 4(3). Stems erect or strongly ascending (5)
4. Stems procumbent or weakly ascending (9)
- 5(4). Rachis of the terminal leaflet notably longer than its petiole on the larger leaves 7. *L. capitata*.
5. Rachis of the terminal leaflets equaling or shorter than its petiole on the larger leaves (6)
- 6(5). Leaflets linear to linear-oblong, more than 3 times as long as wide 6. *L. virginica*.
6. Leaflets oblong, elliptic or ovate, less than 3 times as long as wide (7)
- 7(6). Corolla white or cream-colored; calyx about equaling or exceeding the pod; usually 16 or more flowers per raceme; larger leaflets generally ovate, at least half as wide as long 8. *L. hirta*.
7. Corolla purple; calyx about one half as long as pod; racemes with 4 to 14 flowers; leaflets generally oblong or elliptic, mostly less than half as wide as long (8)
- 8(7). Stem and upper surface of leaflets glabrous or glabrate; keel protruding beyond wing petals 4. *L. violacea*.
8. Stem and leaflets copiously short-appressed-pubescent or pilose; keel included within the wing petals 5. *L. Stuevei*.
- 9(4). Stems procumbent; stipules mostly under 4 mm. long; keel included within wings; leaflets to 25 mm. long (10)
9. Stems ascending, at least at the base; usually some stipules over 4 mm. long; keel either included or protruding beyond wings; leaflets sometimes more than 25 mm. long (11)
- 10(9). Stems appressed-pubescent 2. *L. repens*.
10. Stems pilose 1. *L. procumbens*.

- 11(9). Keel included within wings; leaflets rather coriaceous and reticulate, often nearly white below; longer stems ascending to 15 cm., then trailing for the rest of their length 3. *L. texana*.
11. Keel protruding beyond wings; leaflets membranous, green or gray-green below; stems not trailing 4. *L. violacea*.

1. *Lespedeza procumbens* Michx. TRAILING BUSH CLOVER. Perennial herb; stems procumbent, 3-18 dm. long, pilose throughout; stipules mostly 2-4 mm. long; leaflets soft-pubescent, ovate or elliptic, 12-25 mm. long; racemes bearing up to 8 to 12 flowers, often surpassing the foliage; calyx extending to about half the length of the pod; pods 4-5 mm. long. Roadsides and open sandy woodlands, e. and n.-cen. Tex., July-Sept.; most of e. and cen. U.S.

2. *Lespedeza repens* (L.) Bart. CREEPING BUSH CLOVER. Perennial herb; stems procumbent, 3-13 dm. long, sparsely appressed-pubescent; stipules subulate, 1.5-4 mm. long; leaflets membranous, elliptic or ovate, to 25 mm. long, green beneath, glabrous or glabrate above; racemes delicate, usually bearing up to 4 to 8 flowers, often surpassing the foliage; calyx at least a fourth to about half the length of the pod; corolla purple; keel about equaling the wings; pods 3-7 mm. long. Frequently in sandy or gravelly soils of roadsides and open woodlands, e. Tex., infrequent w. to n.-cen. Tex., Apr.-Sept.; e. and cen. U.S.

3. *Lespedeza texana* Britt. TEXAS BUSH CLOVER. Perennial herb; stems appressed-pubescent or rarely pilose, 2-15 dm. long, ascending only briefly at the base then sprawling, altogether the plant usually not more than 2 dm. tall; longer stipules 4-8 mm. long; leaflets firm-textured, mostly elliptic to 35 mm. long, gray-green beneath, usually glabrous or glabrate above; racemes delicate, mostly bearing 4 to 8 flowers, often surpassing the foliage; calyx extending about half the length of the pod; corolla violet; wings about equaling the keel; pods 4-7 mm. long. Usually in rocky calcareous soils, shaded cliffs and stream banks and canyons, Edwards Plateau, rare e. into limy cuestas in the Coastal Plain, June-Oct.; Tex. and Coah.

The firm, grayish leaflets and sprawling habit escape notice in pressed specimens. This has led some authors to consider it identifiable with *L. repens*.

4. *Lespedeza violacea* (L.) Pers. PRAIRIE CLOVER. Perennial herb; stems weakly ascending to nearly erect, 2-7 dm. long, sparsely appressed-pubescent; longer stipules filiform, 2.5-6 mm. long; leaflets membranous, light-green beneath, elliptic to broadly oblong, sometimes the leaves of successive nodes of notably contrasting sizes, mostly 2-5 cm. long; racemes delicate, mostly bearing 4 to 6 flowers, sometimes exceeding the foliage; calyx extending no more than a fourth the length of the cleistogamous pods and about half the length of the chasmogamous pods; corolla purplish, the keel extending beyond the wings; pods 4-7.5 mm. long. *L. prairea* Britt. Rare in n.-cen. Tex., July-Aug.; most of the n.e. and cen. U.S.

5. *Lespedeza Stuevei* Nutt. TALL BUSH CLOVER. Perennial herb; stems strongly ascending or erect, densely appressed-pubescent or pilose, 3-18 dm. tall, very leafy; leaflets elliptic or oblong, mostly 10-25 mm. long; terminal leaflets 2 or 3 times as long as broad, appressed-pubescent to pilose above; racemes included within or slightly extending beyond the foliage, each with 4 to 14 flowers; calyx extending up to half the length of the pod; corolla purple; pods sericeous-canescenscent, 5-6 mm. long. Frequent in sandy or gravelly soils on roadsides and in open woodlands, e. and n.-cen. Tex., w. to West Cross Timbers and rare in Llano region on Edwards Plateau, May-Oct.; most of e. U.S.

Lespedeza intermedia (Wats.) Britt., a species of eastern United States, including the Ozark Plateau, has been collected once in Texas (dry woods, Tarrant Co., in 1910). It is similar to *L. Stuevei*, but has stems appressed-pubescent, leaflets glabrous above and pods glabrate.

6. *Lespedeza virginica* (L.) Britt. SLENDER BUSH CLOVER. Perennial herb; stems strongly ascending or erect, appressed-pubescent or pilose, 3-16 dm. tall, very leafy; stipules mostly less than 4 mm. long; leaflets linear or linear-oblong, 3 to 10 times as long as broad, sparsely appressed-pubescent above (often only along the midrib), 15-40 mm. long; racemes included within or only slightly exceeding the foliage, usually bearing 4 to 8 flowers; calyx up to half the length of the pod; corolla purple, the keel about equaling

the wings; pods 4-7 mm. long. Frequent along roadsides and in sandy open woodlands, e. and n.-cen. Tex., rare w. to Llano region on Edwards Plateau, Aug.-Oct.; s. Can., e. U.S.; also mts. of N.L.

7. *Lespedeza capitata* Michx. ROUND-HEAD BUSH CLOVER. Perennial herb; stems erect, to about 2 m. tall; rachis of the larger terminal leaflets notably longer than its petiole; leaflets less than half as broad as long, quite variable in shape and indument, in our range generally oblong with closely appressed sericeous pubescence; racemes compact and subglobose, bearing 10 to 30 flowers, the peduncles about equaling or protruding slightly beyond the foliage; calyx exceeding the mature pod, 7-13 mm. long; corolla white with a purple throat. Very rare in sandy prairies and open woodlands, Grayson, Hemphill, Hardin and Lamar cos., July-Aug.; e. and cen. U.S.

8. *Lespedeza hirta* (L.) Hornem. HAIRY BUSH CLOVER. Perennial herb; stems erect, to 18 dm. tall, densely short-pubescent; leaflets elliptic or (ob-) ovate, the longer ones to 4 dm. long and at least half as broad as long; glabrous or appressed-pubescent above; racemes extending considerably beyond the foliage and bearing 16 to 44 flowers; calyx 6-12 mm. long, equaling or exceeding the pod; corolla cream-colored or white with a purple throat. Incl. var. *calycina* Schindl. Frequent in sandy soils, e. and s.e. Tex., rare w. to n.-cen. Tex., June-Sept.; s. Can., e. U.S.

9. *Lespedeza cuneata* (Dumont) G. Don. SERICIA, CHINESE BUSH CLOVER. Perennial herb; stems often erect with ascending branches, 4-15 dm. tall; leaves short-petiolate, crowded; leaflets narrowly cuneate, mostly 1-2 cm. long, apices retuse or truncate; racemes mostly shorter than the foliage, bearing 2 to 4 flowers; corolla cream-colored or white with a purple throat; pod 2.5-3 mm. long. *L. sericea* (Thunb.) Benth. Scattered or rare on sandy roadsides, e. and n.-cen. Tex., summer-fall; nat. of e. Asia and Austral., now widely introd. on roadsides and fields, especially in s.e. U.S.

10. *Lespedeza stipulacea* Maxim. KOREAN BUSH CLOVER. Bushy-branched tap-rooted annual with stems under 4 dm. long, antrorsely appressed-pubescent; stipules ovate to ovate-lanceolate, mostly 5-8 mm. long on the mainstem; stalk of terminal leaflet not much longer than the petiolules of the laterals (thus leaf subpalmate); petioles of the principal leaves mostly 4-10 mm. long; leaflets spatulate to obovate, mostly 1-2 cm. long, the upper or younger (i.e., bracteal) leaves conspicuously ciliate on the margins; flowers and fruits in short leafy racemes; corolla pink; pods about 3 mm. long. Scattered on sandy roadsides, e. Tex., June-Sept.; nat. of e. Asia, now widely introd. in N.A.

11. *Lespedeza striata* (Thunb.) H.&A. JAPANESE BUSH CLOVER. Bushy-branched taprooted annual with stems mostly under 4 dm. long, retrorsely appressed-pubescent; stipules ovate to ovate-lanceolate, 3-5 mm. long; stalk of the terminal leaflet not much longer than the petiolules of the laterals (thus subpalmate); petioles usually less than 3 mm. long; leaflets obovate to narrowly oblong, not conspicuously ciliate on the margin; flowers and fruits in short leafy racemes; corolla pink; pod 3-4 mm. long. Abundant in sandy open areas, e. Tex., infrequent w. to n.-cen. Tex., June-Sept.; nat. of e. Asia, now widely introd. in N.A.

54. VICIA L.¹⁰⁰

VETCH

Annuals, winter annuals, biennial or short-lived perennial trailing or climbing herbaceous unarmed vines; leaves alternate, once-paripinnately-compound; stipules herbaceous, persistent; leaflets 2 to 18, usually linear to elliptic-oblong and several times longer than broad; rachis of leaf terminating in simple or branched tendrils; flowers in pedunculate axillary usually loose few-flowered spikelike racemes; calyx with a tube and 5 usually unequal teeth or lobes; corolla papilionaceous, usually 3-10 mm. long, white, blue, violet or yellow (rarely even reddish), the wings coalescent with the keel; fruit a dry slightly flattened linear to narrowly elliptic 2-valved legume with 2 to many seeds.

A genus of perhaps 150 species in temperate regions of the earth. Some species are important silage, pasture and green-manure legumes, and several have been introduced for these purposes.

¹⁰⁰ Adapted largely from F. J. Hermann in U.S. Dept. Agric. Handbook No. 168, 84 pp. 1960.

1. Peduncle (if present) much shorter than the leaves; flowers few (often solitary or paired), sessile or subsessile in the upper leaf axils (2)
1. Peduncle well-developed, nearly equaling to much-exceeding the leaves; flowers 1 to many (3)
- 2(1). Pod pale-brown at maturity; flowers 18-30 mm. long; leaflets chiefly oblong to obovate; nectaries on calyx teeth conspicuous, yellowish-brown 1. *V. sativa*.
2. Pod almost black at maturity; flowers 10-18 mm. long; leaflets chiefly linear (except in var. *segetalis*); nectaries on calyx teeth usually inconspicuous, pale-stramineous 2. *V. angustifolia*.
- 3(1). Corolla 2-9 mm. long; racemes 2- to 8- (to 13-) flowered or flowers solitary (4)
3. Corolla more than 9 mm. long or else racemes (3- to) 10- to 40-flowered (8)
- 4(3). Peduncles 1- or 2-flowered; calyx lobes equal or subequal, shorter than or equaling the tube (5)
4. Peduncles (1- to) 3- to 12-flowered; calyx lobes unequal or subequal, lance-subulate, the longer equaling or exceeding the tube (6)
- 5(4). Calyx lobes deltoid, 0.5-1 mm. long, much shorter than the tube; plant slender; peduncles in fruit 2 cm. long; stipules moderately unequal 3. *V. minutiflora*.
5. Calyx lobes lanceolate, 2 mm. long, equaling the tube; plant much more robust and more pubescent (especially calyx and pod); peduncles in fruit 3 cm. long; stipules strikingly unequal 4. *V. Reverchonii*.
- 6(4). Peduncles (2- to) 5- to 12-flowered, at anthesis more than half the length of the leaves; calyx lobes markedly unequal, only the lower as long as the tube; flowers broad and showy 5. *V. ludoviciana*.
6. Peduncles 1- to 4- (to 5-) flowered, at anthesis half the length of the leaves or less; flowers narrow, rather inconspicuous (7)
- 7(6). Corolla 4.5-7 mm. long; upper calyx teeth not appreciably shorter or broader at the base than the lower; peduncles (1- or) 2- to 5-flowered 6. *V. Leavenworthii*.
7. Corolla 6-9 mm. long; upper calyx teeth much shorter and broader at the base than the lower; peduncles 1- or 2-flowered 7. *V. exigua*.
- 8(3). Mature inflorescence shorter than the subtending leaves, 2- to 12-flowered; flowers (12-) 15-20 mm. long 11. *V. americana*.
8. Mature inflorescences equaling or exceeding the subtending leaves, many-flowered; flowers 8-15 mm. long (9)
- 9(8). Flowers 8-12 mm. long, scattered in loose racemes; calyx teeth deltoid, subequal; corolla white, the keel blue-tipped 8. *V. caroliniana*.
9. Flowers 10-15 mm. long, overlapping in dense racemes; at least the lower calyx teeth lance-attenuate to subulate; corolla blue, violet or violet and white (banner often somewhat rosy) (10)
- 10(9). Raceme spreading-pubescent; lowest calyx lobe long-villous, 2-5 mm. long 9. *V. villosa*.
10. Raceme appressed-pubescent; lowest calyx lobe short-pubescent to glabrescent, 1-2 (-2.5) mm. long 10. *V. dasycarpa*.

1. *Vicia sativa* L. COMMON VETCH, SPRING VETCH. Glabrescent annual; stems to 1 m. long, erect-ascending or climbing; leaves with 8 to 16 leaflets terminating in a branched tendril; leaflets oblong to elliptic or obovate, 15-35 mm. long, 5-15 mm. broad, truncate to emarginate and mucronate at apex; stipules semisagittate, usually sharply serrate, the lower surface bearing a purplish nectary; flowers mostly paired in the upper axils, subsessile, 18-30 mm. long, violet-purple or rarely white; calyx 10-15 mm. long, the campanulate tube 5-7 mm. long, the subequal teeth linear-subulate and 3-9 mm. long, the 3 lower teeth bearing a conspicuous yellowish-brown nectary on the outer face; pod

nearly cylindrical to somewhat compressed, torulose, 25-70 mm. long, 5-8 mm. broad, brown, 4- to 12-seeded. Infrequent along roadsides in extreme n.e. Tex., May-June; nat. of Eur., now widely introd.

2. *Vicia angustifolia* L. NARROW-LEAVED VETCH. Glabrous or glabrate annual; stems decumbent, ascending, 1-6 dm. long, usually branched only at base; leaves with usually 4 to 10 (or 12) leaflets, those of the lower leaves oblong and truncate, of the upper linear to narrowly elliptic or lance-attenuate [in var. *segetalis* (Thuill.) Koch leaflets of the upper leaves oblong to oblong-obovate, 2-9 mm. broad, the apex truncate or emarginate and mucronate], 15-30 mm. long, 1-4 mm. broad; stipules semisagittate, serrate or the upper entire, often lacking a nectary; flowers commonly paired in the upper axils, 10-18 mm. long, blue or violet varying to white; calyx 7-11 mm. long, the campanulate tube 4-6 mm. long, the linear-lanceolate teeth about equal and 3-6 mm. long, the 3 lower teeth bearing a usually inconspicuous pale-stramineous nectary on the outer face; pod very dark-brown to almost black at maturity, terete. Occasionally escaped in e. Tex., May-June; Eur., now widely introd.

3. *Vicia minutiflora* Dietr. PYCMTY-FLOWERED VETCH. Glabrate or minutely pubescent winter annual; stems slender, branched, reclining or climbing, 3-8 dm. long; leaves relatively few and distant, 2-6 cm. long; bearing 4 to 6 leaflets and terminated by a simple or branched tendril; leaflets linear-elongate to narrowly oblong, 10-35 mm. long (those of the lower leaves sometimes obovate and 5-12 mm. long), the apex acute to rounded and mucronulate; stipules semisagittate, the upper lanceolate, subequal or 1 of the pair up to twice as broad as the other; peduncles shorter than the leaves, 5-20 mm. long, 1- (2-) flowered (the flower terminal when solitary), usually rigid and ascending-divaricate; flowers pale-blue or purplish-white, 5-6 (-8) mm. long; calyx sparsely villous, the tube 1.5-2 mm. long, the deltoid teeth 1-1.5 mm. long (much shorter than the tube) and subequal, the upper teeth usually somewhat shorter and broader; pods flat, glabrous, narrowly oblong-falcate, 2-3 cm. long, 4-4.5 mm. broad, with (4 to) 6 to 8 (to 12) seeds. Frequent, e., s.e. and n.-cen. Tex., spring; Fla. to Tex., n. to Tenn. and Mo.

4. *Vicia Reverchonii* Wats. Hairy-pod VETCH. Low spreading-pubescent stoutish winter annual; stems branched at base, the branches ascending to decumbent or reclining, 2-4 dm. long; leaves numerous, 15-50 mm. long, subsessile to short-petioled, bearing (4 to) 6 to 10 leaflets, terminating in a simple or branched tendril; leaflets elliptic to broadly oblong-cuneate or obovate, 5-17 mm. long, 3-7 mm. broad, more or less villous on both surfaces, at apex rounded to truncate-emarginate; stipules very unequal, 1 of the pair broadly semisagittate and often 4 times as broad as the other which is lanceolate or very narrowly semisagittate; peduncles stout, equaling or shorter than the leaves, 5-35 mm. long, 1-flowered; flowers blue or bluish, 5-7 mm. long; calyx villous, the tube 2 mm. long, the lanceolate teeth equal and 2 mm. long (equaling the tube); pods flat, appressed-villous, oblong-falcate, 25-30 mm. long, 4.5-5 mm. broad, 4- to 6-seeded, *V. minutiflora* f. *Reverchonii* (Wats.) Shinn. Rare and local in vicinity of Dallas, n.-cen. Tex., spring; also Okla.

5. *Vicia ludoviciana* Nutt. DEER PEA VETCH. Glabrous or pubescent winter annual; stems decumbent or climbing, 2-10 dm. long; leaves 3-9 cm. long, the rachis terminating in a usually forked tendril; leaflets 6 to 12, linear-oblong or elliptic to broadly elliptic, 6-25 mm. long, rounded or emarginate at apex; stipules semisagittate, usually more or less unequal; peduncles shorter than to exceeding the leaves, 2-4 cm. long; flowers solitary or 2 to 13 in a lax or dense raceme; corolla lavender-blue, 5-8 mm. long, the folded banner 1.5-4 mm. high; calyx somewhat pilose, the tube 1-2 mm. long, the teeth unequal, the lower teeth subulate and equaling the tube, the upper teeth shorter and broader; pods flat, glabrous, oblong, oblique at both ends, 2-3 cm. long, 4- to 8-seeded. Widespread in e. half of Tex.; represented with us by 3 varieties.

Var. *ludoviciana*. Perfectly glabrous; folded standard 2.5-4 mm. high; racemes with 2 to 12 flowers, fairly compact. E. half of Tex., w. sparingly to Edwards Plateau, spring; Mo., Fla., Miss., La., Okla., Tex. and N.M.

Var. *texana* (T. & G.) Shinn. Sparingly pubescent to nearly glabrous; peduncles very slender; racemes generally compact but with only 1 to 6 flowers; flowers 5-6.5 mm. long, the folded banner 1.8-2.5 mm. high. Coastal Plains of s.e. Tex. w. to n. part of Rio Grande Plains, spring; Miss. to Tex.

One author (Turner) thinks this race best treated as a few-flowered narrow-leaved extreme of *V. Leavenworthii* var. *Leavenworthii*; the two species and this form in particular are perplexing taxonomically and deserve much further study.

Var. *laxiflora* Shinn. Sparingly to rather densely grayish-pubescent; racemes loose, 3- to 13-flowered; flowers rather widely spaced, 5.5-8 mm. long; folded banner 1.5-2.5 mm. high, narrower and paler than in the other forms. Calcareous soils of Edwards Plateau and infrequent e. to n.-cen. Tex., spring; endemic.

6. *Vicia Leavenworthii* T. & G. Glabrescent to sparsely pilose or puberulent winter annual; stems usually much-branched and spreading at base, reclining or climbing, 3-6 dm. long; leaves 3-6 cm. long, terminating in a forked tendril; leaflets (8 or) 10 to 14, narrowly elliptic-lanceolate to oblong or elliptic to oblanceolate, 5-12 mm. long, acute or rounded and mucronulate or shallowly emarginate at apex; stipules mostly lanceolate, occasionally narrowly semisagittate; peduncles from shorter than to exceeding the subtending leaves, (1- or) 2- to 5-flowered; flowers bluish-lavender, 4.5-7 mm. long; calyx pubescent, the turbinate tube 1-1.5 mm. long, the subequal teeth lance-subulate and about equal to or longer than the tube; pods flattish, glabrous, oblong, oblique at both ends, 20-25 mm. long, 5-7 mm. broad, 4- to 6-seeded. Frequent in a variety of soils, e. half of Tex. rarely w. to Wichita, Taylor, Edwards and Kinney cos., intergrading with the *V. exigua* on a broad scale, spring; Mo., Okla., Ark. and Tex.

7. *Vicia exigua* T.&G. Glabrous or sparsely strigose, very slender winter annual; stems decumbent, ascending or erect, usually branching at base, 2-7 dm. long; leaves rather distant, 2-6 cm. long, terminating in a usually branched tendril; leaflets 4 to 12, narrowly linear to oblong, 5-25 mm. long, from rounded to acute or rarely emarginate and mucronate at apex, glabrous or occasionally sparsely strigose; stipules narrow, semisagittate, entire or incisely serrate; peduncles slender, 2-4 cm. long, shorter than the leaves, 1- or 2-flowered, aristate; flowers yellowish-white to purplish, (5-) 6-8 (-9) mm. long; calyx sparingly hirsute-strigose, the lanceolate teeth broad at base and from somewhat shorter than to equaling the tube, the upper teeth shorter than the lower and broader-based; pods oblong, oblique at apex, 2-3 cm. long, 4-6 mm. broad, glabrous, 4- to 7-seeded. *V. Thurberi* Wats., *V. producta* Rydb., *V. Leavenworthii* var. *occidentalis* Shinn. Frequent in w. Tex., e. less frequently to Rio Grande Plains and Coastal Bend area, rare in Plains Country, spring; Ore., Nev., Ut., Colo. and Tex. to n. Mex.

8. *Vicia caroliniana* Walt. PALE VETCH, WOOD VETCH. Slender perennial; stems trailing or climbing, to 1 m. long; leaflets 10 to 24, elliptic to oblong or oblong-lanceolate, obtuse, mucronulate, usually with 5 to 7 lateral veins on each side; stipules lanceolate or semisagittate, entire; peduncles elongate; racemes (including the peduncle) 6-10 cm. long, bearing 7 to 20 loosely disposed pedicelled flowers 8-12 mm. long; calyx nearly regular, the tube 2-2.7 mm. long, the subequal lobes broadly deltoid and about as broad as long (less than 1 mm.); corolla white, the keel blue-tipped; pod stipitate, narrowly oblong, obliquely long-beaked, 15-30 mm. long. Rare in wooded areas, e. Tex. and e. edge of Edwards Plateau, Apr.-June; e. U.S.

9. *Vicia villosa* Roth. HAIRY VETCH. Annual or biennial; stems spreading-villous, to 1 m. long; leaflets usually 10 to 20, narrowly oblong to linear-lanceolate, obtuse and mucronate to acute, 10-25 mm. long; peduncles elongate; racemes dense, 10- to 40-flowered, secund, plumose in bud; flowers 12-20 mm. long; calyx irregular, villous, the tube 2.3-4 mm. long and gibbous at base on the upper side, the pedicel apparently inserted ventrally, the lower linear-aciculate teeth long-villous and 2-5 mm. long, the upper teeth linear-deltoid and 0.8-1.5 mm. long; corolla violet and white to rose-colored or white, slender, the blades of the glabrous banner less than half as long as the claw; pod oblong, 2-3 cm. long, 7-10 mm. broad, obliquely beaked. Rare along roadsides in e. and n.-cen. Tex., Apr.-Aug.; nat. of Eur., now widely introd.

10. *Vicia dasycarpa* Ten. WINTER VETCH, WOOLLY-POD VETCH. Annual, rarely perennial; very similar to *V. villosa* but differing in its appressed-pubescent or glabrate stem and foliage, in its fewer- (usually only 5- to 15-) flowered racemes not plumose in bud, and in its shorter (1-2 mm. long) glabrescent lower calyx teeth. *V. villosa* var. *glabrescens* Koch. Infrequent on roadsides, e. and n.-cen. Tex., Apr.-Aug.; Eur., now widely introd.

11. *Vicia americana* Muhl. AMERICAN VETCH. Perennial; stems glabrous to sparsely pilose, trailing or climbing to 1 m. long; leaflets 8 to 18, linear to elliptic, mostly 15-35

mm. long, 1-14 mm. broad, the lateral veins prominent beneath in drying, at apex rounded to truncate or emarginate; stipules mostly sharply serrate; racemes shorter than the subtending leaves, loose, 3- to 9-flowered; flowers bluish-purple, 15-28 mm. long; calyx tube oblique, 3.5-5.5 mm. long, the variable teeth variously unequal with the lower usually lance-attenuate and 1.2-4 mm. long, the upper teeth short and broad; pod 25-35 mm. long. Widely distributed in the U.S. (except the s.e. states), and represented with us by 2 varieties:

Var. *americana*. Leaflets thin, broad, ovate to broadly elliptic or oblong, 4-14 mm. broad, obtuse to broadly rounded at apex, mucronate, the conspicuously branching lateral veins numerous and forming a 45° angle with the midrib. Rare in the higher parts of Guadalupe Mts. in the Trans-Pecos, spring-June; much of w. and n. U.S.

Var. *minor* Hook. Leaflets thick, narrow (1-4 mm. broad), linear to linear-oblong, at apex rounded or truncate, entire, the few lateral veins scarcely branched and forming a very narrow angle with the midrib. Rare in the higher parts of the Plains Country, May-June; much of w. U.S.

55. LATHYRUS L.¹⁰¹

PEA-VINE

Unarmed annual or perennial herbs or usually trailing or climbing vines; leaves alternate, once-paripinnately-compound, the rachis terminating in a simple or branched tendril; stipules present, persistent, usually semisagittate; leaflets 2 to 14, often linear or oblong but very variable, entire; flowers solitary to several in axillary racemes; calyx with a campanulate tube and 5 teeth or lobes, the lower lobes longer than the upper; corolla papilionaceous, white, pink, red or purplish, the wings free from the keel or nearly so but wings and keel closely fitted together in a common groove; stamens 10, diadelphous, nine filaments coalescent, the uppermost one free; style flattened, barbate on the ventral (upper) surface for about half its length, persistent; fruit a linear to oblong 2-valved several-seeded thin-walled promptly dehiscent legume, usually somewhat flattened.

A genus of about 120 species of the temperate regions of the world (except Australia).

1. Leaflets 2 (2)

1. Leaflets 4 to 14 (4)

2(1). Perennial; flowers 15 mm. long or more; pods 6-10 cm. long
.....3. *L. latifolius*.

2. Annuals; flowers 15 mm. long or less; pods 2-4 cm. long (3)

3(2). Pods and ovary pubescent, 5-8 mm. broad; introduced (cultivated) species
.....1. *L. hirsutus*.

3. Pods and ovary glabrous, 2-4 mm. broad; native species .2. *L. pusillus*.

4(1). Tendrils bristlelike, simple, not at all prehensile ..5. *L. polymorphus* subsp.
incanus.

4. Tendrils well-developed, prehensile, forked (5)

5(4). Leaflets 4 to 10, 10 times as long as wide; plants of Trans-Pecos Texas
.....6. *L. graminifolius*.

5. Leaflets (8 or) 10 to 14, 2 to 5 times as long as wide; plants of east and north-central Texas4. *L. venosus*.

1. *Lathyrus hirsutus* L. SINGLETARY PEA. Annual, sparingly hirsute (especially the stipules and calyxes); stems 2-10 dm. long, usually clambering, narrowly to broadly winged; stipules linear-lanceolate, usually entire, the upper lobe the larger, scarcely a fourth as long as the 2-linear-lanceolate to elliptic 3-8 cm. long leaflets; tendrils well-developed, branched; flowers 9-12 mm. long, red to bluish, 1 or 2 (to 4) per peduncle; peduncles usually exceeding leaves, often projecting past base of uppermost pedicel as a small brittle; calyx 5-7 mm. long, the teeth lanceolate or narrowly ovate-lanceolate and about equal to or slightly longer than the tube; banner broadly obcordate, the blade twice as long as the claw; wings and keel with claw somewhat shorter than blade; pod 25-40

¹⁰¹ Adapted largely from C. Leo Hitchcock in Univ. Wash. Publ., Biol. 15:1-104. 1952.

mm. long, 5-8 mm. broad, conspicuously hirsute with pustulose-based hairs, 4- to 10-seeded. Rare on roadsides, e. and n.-cen. Tex., spring; Eur., now widely escaped from introd.

2. *Lathyrus pusillus* Ell. Sparsely pubescent annual; stems prostrate to clambering or erect, 3-6 dm. long, narrowly to broadly winged; stipules lanceolate to lance-ovate, the upper lobe 2 to 3 times as long as the lower, the whole a third to three fourths the length of the 2 linear-lanceolate to elliptic 3-7 cm. long leaflets; tendrils well-developed, usually branched; flowers usually 2, about 1 cm. long, bluish; calyx 5-8 mm. long, the linear-lanceolate teeth about twice as long as tube; banner narrowly obcordate, scarcely delimited into blade and claw, reflexed but slightly; wings and keel narrow with claw somewhat shorter than blade; pods 3-4 cm. long, 2-4 mm. broad, 10- to 20-seeded. Infrequent, e., s.e., and n.-cen. Tex., spring; Gulf States n. to s. Kan. and Mo.; also reportedly in n. Mex.

3. *Lathyrus latifolius* L. PERENNIAL SWEETPEA, EVERLASTING PEA. Perennial from rootstocks, glabrous; stems 8-20 dm. long, very broadly winged, climbing; stipules broadly lanceolate to ovate, 3-5 cm. long, usually entire, the upper lobe 2 to 3 times as long as lower, leaflets 2, lanceolate-elliptic to obovate-lanceolate, as much as 15 cm. long and 5 cm. broad; tendrils well-developed; racemes 5- to 15-flowered, the peduncles often considerably exceeding leaves; flowers 15-20 mm. long, pinkish-red (white, red or striped); calyx 8-12 mm. long, the linear-lanceolate teeth subequal to tube; banner well-reflexed, nearly as broad as long, short-clawed like the wings and keel; pods 6-10 cm. long, 7-10 mm. broad, 10- to 25-seeded. Rarely escaped or persisting at old home-sites, spring; nat. of Old World, widely introd.

The seeds are poisonous.

4. *Lathyrus venosus* Willd. var. *intonsus* Butt. & St. John. Perennial from rootstocks, pubescent; stems 4-10 dm. long, erect or scandent; stipules linear-lanceolate to lanceolate, a sixth to half as long as leaflets, often constricted into 2 lobes, the margins entire to shallowly dentate; leaflets (8 or) 10 or 12 (or 14), paired or more frequently scattered, 3-6 cm. long, 1-3 cm. broad, narrowly to broadly elliptic or ovate-elliptic, thin to subcoriaceous, usually paler on lower surface, glabrous to densely short-pubescent; tendrils well-developed; racemes usually closely 5- to 25-flowered; peduncles from about half as long as to nearly equal the leaves; flowers 12-20 mm. long, bluish or purplish; calyx glabrous to hairy, 8-14 mm. long, the deltoid upper teeth scarcely as long as the lower lateral ones that are lanceolate to linear-lanceolate, these slightly shorter than but usually broader than the lowest tooth; fruits 4-6 cm. long, 5-8 mm. broad. Occasionally in open woods in n.e. Tex., Apr.-May; s. Can. through n.-cen. U.S., s. to Ga., Ala., Ark., Okla. and Tex.

5. *Lathyrus polymorphus* Nutt. subsp. *incanus* (Sm. & Rydb.) C. L. Hitchc. Perennial, simple or branched, 1-2 (-4) dm. long, villous or hirsute throughout; stems not winged; leaves 2-5 cm. long; stipules from less than half as long to nearly as long as leaflets, upper lobe narrowly lanceolate, lower lobe much shorter, a tooth often present at their juncture; leaflets 4 to 12 (commonly about 8), usually paired but often scattered, mostly 2-3 cm. long, linear or linear-elliptic to linear-oblong-elliptic or the shorter ones oblong-elliptic, 1.5-6 (usually 2-3) mm. broad, rather prominently veined; rachis rather broad but not winged, prolonged as a straight or curved nonprehensile bristle; racemes 2- to 5- (to 8-) flowered, the peduncles usually slightly surpassing leaves, to 6-7 cm. long; pedicels usually ascending and straight or nearly so; flowers 2-3 cm. long; calyx (7-) 8-10 (-11) mm. long, the teeth somewhat shorter than tube and all rather narrowly lanceolate, the upper 2 teeth not much shorter than the lower 3; corolla ochroleucous to magenta or deep-violet; pods coriaceous, 2-6 cm. long, 5-10 mm. broad, 2- to 10-seeded. The correct name for the species may be *L. decaphyllus* Pursh. Very rare in the Plains Country, known from one collection from Childress Co., Mar.; the species as a whole from S.D., Wyo., Neb., Colo., Kan., Okla. and Tex.

6. *Lathyrus graminifolius* (Wats.) White. Perennial from rootstocks, glabrous or sparsely hairy; stems 2-6 dm. long, erect or clambering, not winged; stipules linear-lanceolate; leaflets mostly 6 or 8 (4 to 10), usually scattered, linear, 4-13 cm. long, 1.5-4 (-15) mm. broad, usually at least 10 times as long as broad; tendrils well-developed; racemes (2- to) 4- to 20-flowered, often greatly exceeding leaves; flowers 12-16 mm.

long; calyx glabrous except for cilia or a few coarse hairs at base of tube, 6-8 mm. long, the linear-lanceolate teeth subequal or the upper 2 much shorter with all shorter than the tube; banner from pale-pink to rather deep bluish-orchid; wings white to pale-orchid; keel white or tip slightly colored; pods 3-5 cm. long, 4-7 mm. broad, 8- to 15-seeded. Higher parts of the Trans-Pecos mts., spring; Ariz., N.M., Son., Chih. and Tex.

56. CLITORIA L. PIGEON-WINGS. BUTTERFLY PEA

A genus of about 35 species mostly in warmer parts of the world. One species, *C. ternata* L., with 5 to 7 leaflets, is cultivated sometimes in Texas, but is not known as a wild plant.

1. *Clitoria mariana* L. Perennial herb; stems slender, 2-10 dm. long, suberect to trailing or scandent (never twining); leaves alternate, pinnately trifoliolate, 5-13 cm. long; stipules subulate, 3-10 mm. long; petioles well-developed, usually (2-) 3-7 cm. long; leaflets usually lance-ovate, (15-) 20-80 mm. long, acute, entire, much paler below than above; stipels present, setaceous, persistent; flowers 4-6 cm. long, solitary or in twos or threes on axillary peduncles that are usually a little shorter than the petioles; calyx with a slightly flaring tube 1-2 cm. long and 5 deltoid-acuminate teeth (the lower usually slightly longer than the upper); corolla papilionaceous, very large, bluish or lavender (the banner with a pale lozenge in the center); stamens diadelphous, 9 of the filaments coalescent, the tenth (uppermost) free; fruit a stipitate beaked 4- to 10-seeded flattened 2-valved promptly dehiscent legume 4-8 cm. long; seeds glutinous-sticky. Frequent in e. half of state w. to Eastland and Llano cos. and s. to Travis and Bastrop cos., May-Sept.; mostly e. U.S.; also reportedly in Ariz.

57. CENTROSEMA (DC.) BENTH. BUTTERFLY PEA

A genus of about 30 species of the warmer parts of the Americas.

1. *Centrosema virginianum* (L.) Benth. Perennial herbaceous vine; stems 2-16 dm. long, trailing or usually vigorously twining; leaves alternate, pinnately trifoliolate, 3-10 cm. long; petioles well-developed, often nearly as long as the leaflets; stipules setaceous, 2-5 mm. long, often deciduous; leaflets linear to ovate (quite variable), (1-) 2-6 (-8) cm. long, entire; stipels present, setaceous, fairly persistent, minute; flowers solitary (or in twos), pedicellate at the ends of axillary peduncles usually shorter than the foliage, each pedicel with 2 membranous bracts 3-5 mm. broad; flowers 2-3 cm. long; calyx deeply 5-lobed, the acute lobes longer than the cuplike tube; corolla papilionaceous, purplish or lavender to nearly white; banner with a small spur near the median base; stamens 10, diadelphous, 9 filaments coalescent, the tenth (uppermost) free; fruit a stipitate long-beaked linear 2-valved 4- to 10-seeded pod 4-12 cm. long. Frequent, e. half of Tex. w. to Erath, San Saba, Llano and Brooks cos., Mar.-Nov.; s.e. U.S.; e. Mex.

58. AMPHICARPAEA NUTT.¹⁰² HOG PEANUT

A genus of 3 species, 1 Asian, 1 African and 1 North American, all closely related to each other. The generic name is sometimes spelled *Amphicarpa*.

1. *Amphicarpaea bracteata* (L.) Fern. Taprooted annual; stems 2-20 dm. long, twining, glabrous or pubescent; leaves alternate, pinnately trifoliolate; petioles 2-10 cm. long; stipules persistent, membranous, 3-8 mm. long, broadly lanceolate to ovate; leaflets ovate to nearly deltoid, acute at apex, 1.2 to 2 times as long as broad, 2-10 cm. long, 18-70 mm. broad; rachis stalk of terminal leaflets 5-40 mm. long; flowers of two sorts; *chasmogamous flowers* in axillary racemes 15-90 (-150) mm. long; peduncle 1-4 (-6) cm. long; pedicels 2-4 (-5) mm. long, each subtended by 2 bracts; bracts 2-4 (-5) mm. long, ovate to fan-shaped, broadest above the middle, broadly obtuse to nearly truncate at apex; calyx of a tube which is more or less gibbous at base and 4-5 (-6) mm. long and 4 broadly lanceolate to deltoid lobes 0.5-2 mm. long; corolla papilionaceous, lilac-colored or nearly white; *cleistogamous flowers* either aerial or subterranean, usually produced on creeping

¹⁰² Adapted from B. L. Turner and O. S. Fearing in Southw. Nat. 9:207-218. 1964.

branches near the ground and commonly lacking well-developed petals and often with the ovary stipe reflexed to position the stigma next to the reduced androecium; stamens 10, diadelphous, 9 filaments coalescent, the tenth (uppermost) free; fruit a flattened thin-walled legume, often decidedly falcate. Infrequent in woods, e. and s.e. Tex., rare w. to n.-cen. Tex., May-Sept.; s.e. Can. and e. U.S.; also rare near Orizaba, Ver.

59. COLOGANIA KUNTH¹⁰³

Perennial herbs; stems procumbent (or erect), often twining, 1-15 dm. long, appressed-pubescent; leaves pinnately trifoliolate; petioles to 10 cm. long; stipules linear to ovate, 6- to 12-nerved, persistent; stipels linear to lanceolate; leaflets linear to ovate or obovate to oblong, at base varying from obliquely acute to rounded or rarely cordate, at apex acute to obtuse or rounded; flowers axillary, solitary or in pairs or rarely in axillary clusters, sometimes in racemes of reduced umbel-like aggregations; calyx gibbous at base, with a tube two thirds the total length and 4 lobes (the upper lobe representing 2 coalescent lobes); corolla papilionaceous, purple, sometimes magenta, reddish or reddish-purple to generally deep-royal-purple, rarely becoming bluish with white margins in age; banner 17-32 mm. long, 10-18 mm. broad, clawed; wings 15-22 mm. long, 2-6 mm. broad, auriculate at upper base, clawed; stamens 10, diadelphous, 9 filaments coalescent, the tenth (uppermost) free; fruit a linear to falcate legume, nearly terete at maturity, usually producing 6 to 12 seeds; cleistogamous flowers also commonly occur, these being reduced in size and commonly with parts (especially petals) lacking and with the style reflexed and juxtaposed to the reduced androecium.

A genus of about 10 species of mountainous areas of southwestern United States, Mexico, Central America and South America, difficult taxonomically because of cleistogamic reproduction and possibly hybridization. Plants rather closely related to *Cologania* and *Amphicarpaea* are soybean [*Glycine Max* (L.) Merr.] varieties found at edges of fields in e. Tex.; soybeans have distinctly 5-lobed calyxes instead of 4-lobed as in *Cologania*.

- 1. Leaflets ovate to lanceolate, 1 to 5 times as long as wide 1. *C. pallida*.
- 1. Leaflets linear, 5 to 20 times longer than wide 2. *C. angustifolia*.

1. *Cologania pallida* Rose. Stems 15-45 cm. long; petioles 1-3 cm. long; stipules 3-4 mm. long; leaflets ovate to elliptic, at base somewhat rounded to acute, at apex acute, sericeous and pale-green on both surfaces, mucronate; rachis stalk of terminal leaflet 6-10 mm. long; pedicels 12-14 mm. long; corolla purple; fruit 4-6 cm. long, 4-5 mm. broad. Davis and Guadalupe mts. in the Trans-Pecos, at elev. above 4,000 ft., July-Oct.; N.M., Ariz., Tex. and Coah.

Occasional populations exhibit evidence of past hybridization of this species and the next.

2. *Cologania angustifolia* H.B.K. Stems 15-50 cm. long; petioles 1-6 (-8) cm. long; stipules 2-4 mm. long; leaflets linear, 5 to 20 times as long as broad, 25-80 (-100) mm. long, 2-10 mm. broad; rachis stalk of terminal leaflets 3-8 mm. long; pedicels 5-8 mm. long; corolla purple to reddish-purple. *C. longifolia* Gray, *C. confusa* Rose. Davis and Chisos mts. in the Trans-Pecos, at elev. of 4,500 to 6,500 ft., July-Oct.; Ariz., N.M. and Tex., s.e. to Oax.

60. APIOS BOEHM. POTATO BEAN. GROUNDNUT

A genus of about 8 species of temperate eastern Asia and North America.

1. *Apios americana* Medic. AMERICAN POTATO BEAN. Perennial from tuberous rhizomes; stems annual, 1-3 m. long; twining and high-climbing; leaves alternate, once-pinnately 5- or 7-foliolate; petioles 15-70 mm. long; stipules setaceous, soon deciduous, 4-6 mm.

¹⁰³ Adapted with permission from the work of Olin S. Fearing, "A cytotaxonomic study of the genus *Cologania* and its relationship to *Amphicarpaea* (Leguminosae-Papilionoideae)," a doctoral dissertation done and filed at the University of Texas (1959).

long; rachis stalk of terminal leaflet and rachis internodes 1-3 cm. long; leaflets mostly ovate to lance-ovate, acuminate, rounded at base, (15-) 20-70 (-100) mm. long, pubescent usually; stipels 1-2 mm. long, deciduous; flowers in rather dense axillary racemes usually shorter than the foliage; peduncles (2-) 3-5 cm. long; pedicels only 2-6 mm. long, each with 2 minute promptly deciduous bractlets; calyx 5-11 mm. high, nearly truncate or the 5 sepals distinguishable only as slight undulations at the rim of the tube; corolla papilionaceous, about 1 cm. long; banner whitish dorsally, brown-red ventrally; keel sickle-shaped, very slender, brownish-red; wings down-curved, brown-purple; stamens 10, diadelphous, 9 filaments coalescent, the tenth (uppermost) free; fruit a linear slightly flattened legume 5-10 (-12) cm. long, 4-6 (-7) mm. broad, with coriaceous valves. Incl. var. *turrigera* Fern. Infrequent in e., s.e. and n.-cen. Tex., rare in Edwards Plateau (Tom Green Co.), usually in woods near streams, reported from Hemphill Co. in the Panhandle, May-Sept.; s.e. Can. and e. U.S.

61. ERYTHRINA L.

CORAL BEAN. COLORÍN

A genus of about 40 species of the warmer parts of the world. In addition to our native species, a South American species is cultivated in Texas, *E. crista-galli* L. It is a brilliantly red-flowered vine or tree, the flowers about 4 cm. long and 25 mm. broad.

1. *Erythrina herbacea* L. Thorny shrub or subshrub (at this latitude the branches tend to die back nearly to the ground each winter) with rather rigidly ascending stems 5-20 dm. tall, often growing up through other shrubby vegetation; leaves remote, alternate, once-pinnately 3-foliolate; terminal leaflet hastately 3-lobed to broadly hastately deltoid, 2-13 cm. long, 2-11 cm. broad, at apex long-acuminate, at base truncate or broadly cuneate; rachis 20-75 mm. long; petioles and rachises of leaves sometimes spiny; stipules and stipels present; flowers in a terminal raceme; peduncle very long and erect, 20-75 cm. long; pedicels 3-9 mm. long; calyx nearly tubular, gibbous or spurred basally, 5.5-11.5 mm. long on the lower side, 5-10 mm. long on the upper side, denticulate or entire at rim; corolla red, papilionaceous but this obscure because the entire structure is narrow and elongate (30-53 mm. long) and appears tubular on cursory examination; keel petals connate; stamens 10, monadelphous or diadelphous; fruit a torulose tardily dehiscent 2-valved subligneous several-seeded beaked blackish legume 75-210 mm. long; seeds scarlet, 5-13 mm. long, 4-8 mm. broad. Sandy woods on the Coastal Plain inland to Cass, Walker, Washington, Bastrop and Gonzales cos., cult. elsewhere, Apr.-June; Coastal States, N.C. to Ver., inland to S.L.P.

62. GALACTIA P. BR.

MILKPEA

Perennials with (rarely erect or) prostrate or trailing or usually twining and climbing herbaceous stems 3-30 dm. long; leaves alternate, once-pinnately 3- to 7-foliolate or in one species simple by reduction; stipules present, usually small and more or less early-deciduous; leaflets entire, variously shaped, usually firm-textured; stipels usually developed, minute and setaceous; flowers 1 or few to numerous in axillary racemes; peduncles short to long; calyx with a short nearly symmetrically campanulate tube and 4 longer acute lobes (the upper one representing the coalescence of 2 lobes); corolla (rarely absent, as in the cleistogamous flowers of *G. canescens*) papilionaceous, white to pink or lavender or purple (never yellow), 6-15 mm. long; stamens 10, diadelphous, 9 of the filaments coalescent, the tenth (uppermost) free; fruit a linear legume several cm. long, with several seeds (except the subterranean fruits of *G. canescens* which are 1-seeded and indehiscent).

A genus of about 50 species in the warmer parts of the world.

1. Leaves simple 10. *G. marginalis*.

1. Leaves compound, 3- to 5-foliolate (2)

2(1). Leaves nearly sessile, the petioles 1-3 mm. long 6. *G. longifolia*.

2. Leaves with well-developed petioles, these 6 mm. long or more (3)

3(2). At least some of the leaves 5-foliolate 8. *G. heterophylla*.

3. Leaflets 3, never 5 (4)

- 4(3). Stems short, erect, 3 dm. tall or less, not at all trailing or twining; flowers white
..... 9. *G. erecta*.
4. Stems elongate, trailing or twining; flowers lavender to pink (5)
- 5(4). Pods both subterranean and aerial; stems trailing but not twining; racemes 2 to 7
at the nodes; leaflets thick, leathery, the veins conspicuous and reticulate beneath
..... 7. *G. canescens*.
5. Pods never developing below soil surface; stems usually conspicuously twining (at
least at the tips); racemes 1 or 2 at the nodes, seldom more; leaflets thin, not
leathery or conspicuously reticulate beneath except in *G. texana* (6)
- 6(5). Peduncle plus raceme slender, elongate, the well-developed ones 1 dm. long or
more 3. *G. Macreei*.
6. Peduncle plus raceme short, mostly 1 dm. long or less (7)
- 7(6). Leaflets elliptic-linear to linear-oblong, 2 to 5 times longer than wide; flowers
10-14 mm. long; plants of Trans-Pecos Texas 5. *G. Wrightii*.
7. Leaflets commonly ovate to oval, rarely elliptical-linear, mostly 1 to 2 (sometimes 4)
times as long as wide; flowers 6-12 mm. long; plants of central and east Texas (8)
- 8(7). Legume distinctly falcate; leaves thick and leathery, conspicuously reticulate-
veined beneath; plants of rocky limestone soils in south-central Texas
..... 4. *G. texana*.
8. Legume straight or nearly so, the base or tip sometimes curved, but the whole legume
scarcely falcate; leaves thin, not conspicuously reticulate-veined beneath; plants of
sandy or gravelly soils in eastern Texas, rarely occurring on adjacent calcareous
soils (9)
- 9(8). Stems depressed, rarely twining except at tips, minutely puberulent; leaflets short-
strigose to glabrous on lower surface; calyx strigillose to glabrous, 6-9 mm. long;
keel petals 10-14 mm. long 1. *G. regularis*.
9. Stems and branches intricately twining, divergently or retrorsely pilose; leaflets pilose
beneath; calyx spreading-pilose, 4-5.5 mm. long; keel petals 6-10 mm. long
..... 2. *G. volubilis*.

1. *Galactia regularis* (L.) B.S.P. Stem prostrate or depressed, twining (if at all) only at tip, minutely puberulent; leaflets 3, elliptic to ovate-oblong, firm, short-strigose to glabrous beneath; peduncles and rachises of racemes stiff, minutely puberulent, 2-11 cm. long; fully developed but unexpanded calyces strigillose to glabrous, straight or nearly so, 6-9 mm. long, their basal bracts ovate; corolla violet-purple; keel petals 10-14 mm. long; legume canescent-strigose, 2-5 cm. long. Dry sandy soil in s.e. Tex., June-Aug.; Fla. to Tex., n. to N.Y., Pa. and Tenn.

2. *Galactia volubilis* (L.) Britt. DOWNY MILKPEA. Stems twining, 5-15 dm. long, sparsely to densely puberulent with spreading hairs; leaflets 3, mostly narrow to broadly oblong, oblong-ovate or elliptic with an obtuse to broadly rounded or even cordate base, glabrous or nearly so above, (1-) 2-4 (-6) cm. long, 10-25 (-35) mm. broad, thin or membranous and not conspicuously reticulate-veined beneath; peduncle and raceme together usually less than 1 dm. long, only 1 or 2 at any one node; flowers 6-12 mm. long, in clusters of 1 to 3 about 5-20 mm. apart on spreading pedicels (1-) 2-3 (-4) mm. long; corolla 6-10 mm. long, pink to roseate; legume always aerial, 20-55 mm. long, straight or nearly so, densely pubescent with spreading hairs. *G. mississippiensis* (Vail) Rydb. Frequent in woodlands, e. half of Tex. s. and w. to Palo Pinto, Burnet and Cameron cos., June-Aug.; most of e. U.S.

3. *Galactia Macreei* M.A.Curtis. Stems twining, 5-15 dm. long, with a minute retrorsely appressed pubescence; leaflets 3, mostly oblong to oblong-linear to oblong-ovate and sometimes oblong-lanceolate or elliptic, with a usually broadly rounded or obtuse but occasionally somewhat cordate base, (1-) 2-4 (-5) cm. long, 5-20 mm. broad, usually (1.5 to) 2 to 4 times as long as broad, thin or membranous and not conspicuously reticulate-veined beneath; peduncle and raceme together usually 1-3 dm. long (1) or even longer, slender to filiform, only 1 or 2 racemes at any node; flowers 11-15 mm. long, solitary or in twos or threes on retrorsely-appressed-puberulent spreading pedicels about 1-3 mm. long; corolla 10-14 mm. long, purple or pink with purple center; legume always

aerial, 3-7 cm. long, straight or nearly so, appressed-pubescent. Infrequent or rare in woodlands on sandy soil, n.e. Tex., July-Sept.; Coastal States, Va. to Tex. Seeming to intergrade somewhat with *G. volubilis*.

4. *Galactia texana* (Scheele) Gray. TEXAS MILKPEA. Stems twining, 3-15 dm. long; leaflets 3, ovate to elliptic, mostly 1 to 2 (to 4) times as long as broad, 1-6 cm. long, thickish and subcoriaceous, conspicuously reticulate-veined beneath; peduncle and raceme together less than 1 dm. long, raceme only 1 or 2 at any node; flowers 8-14 mm. long, all aerial, solitary or in twos or threes on short spreading pedicels at each node of the raceme; corolla lavender to lavender-pink; legumes all aerial, distinctly falcate, otherwise like those of *G. volubilis*. Rare in rocky calcareous canyons and stream-bottoms, Rio Grande Plains and s. part of Edwards Plateau (Kerr, Val Verde and Zavala cos.), summer; endemic.

5. *Galactia Wrightii* Gray. Stems twining, 3-15 dm. long; leaflets 3, elliptic-linear to linear-oblong, 2 to 5 times as long as broad, grayish, thickish or firm; peduncle and raceme together usually but not always less than 1 dm. long, only one raceme at any node; flowers solitary or in twos or threes on short spreading pedicels at each raceme node, 10-14 mm. long; corolla lavender or lavender-pink; legume always aerial, 2-6 cm. long, straight or nearly so. Frequent in Trans-Pecos mts., elev. 4,500-6,000 ft., May-Sept.; Ariz., N.M., Tex., Chih. and Son. Closely related to *G. volubilis* and separable mainly on geographic basis.

6. *Galactia longifolia* Hoehne. Stems twining, 6-20 dm. long; leaflets 3, mostly oblong to linear-oblong; petioles (0-) 1-3 mm. long; corolla pink or lavender; fruit always aerial, nearly straight, several cm. long. Very local in coastal Tex. (Aransas, Calhoun and Jackson cos.) where it was probably introd. from S.A., July-Sept.; Tex., Braz., Parag. and Arg.

7. *Galactia canescens* Benth. HOARY MILKPEA. Stems (5-) 10-30 dm. long, prostrate or less commonly trailing, *never* twining; leaflets 3, about like those of *G. texana*, firm and conspicuously reticulate beneath, often grayish or canescent; racemes often several per node, of 2 sorts: (1) short, aerial ones with (presumably chasmogamous) pinkish flowers and nearly straight legumes several cm. long, and (2) very short (usually 1-flowered) subterranean racemes with ecorollate cleistogamous flowers and small peanut-like 1-seeded indehiscent pods. Loose exposed sand, frequent in the sandy eolian plain of the Rio Grande Plains, infrequent or rare n. to Medina, Comal, Travis and Bastrop cos., with an outlying station in Somervell Co., Apr.-July; endemic.

8. *Galactia heterophylla* Gray. Stems 5-60 cm. long, prostrate or trailing, numerous; leaflets mostly oblanceolate, 1-3 cm. long, on most leaves 5 (on a few leaves 3), the 2 lower pairs attached at the same place, the terminal leaflet on a rachis stalk 1-4 mm. long; racemes very short, few-flowered; corolla mostly lavender (the banner often white dorsally); legume several cm. long, always aerial. *G. Grayi* Vail, a superfluous illegit. name. Sandy loam of Rio Grande Plains, infrequent also in Llano region on the Edwards Plateau, Apr.-Sept.; endemic.

9. *Galactia erecta* (Walt.) Vail. Stems 1-3 dm. long, stiffly erect, solitary, often zigzag or geniculate; leaflets 3, mostly linear-oblong, 15-50 mm. long, 7-18 mm. broad; racemes very short, axillary, few-flowered; corolla about 7-8 mm. long, essentially pure-white; legumes 2-4 cm. long, 5-8 mm. broad. Rare in deep pine-duff and podsol, long-leaf pine forests of Polk and Tyler cos., e. Tex., May-June; Coastal States, N.C. to Tex.

10. *Galactia marginalis* Benth. Stems ascending, 1-3 dm. long; leaves few, seemingly simple (by reduction), firm, lustrous, entire, broadly oblanceolate, at apex usually rounded, long-tapered to base; racemes so reduced that flowers usually appear solitary and sessile in axils; corolla 11-15 mm. long, purple. *G. heterophylla* (H. & A.) Vail, an illegit. name. Rare in sandy prairies or caliche areas, coastal Tex. from Kleberg to Matagorda Co. and inland to Travis, Karnes and Jim Wells cos., Mar.-Sept.; also Mex., C.A. and S.A.

The enlarged root is edible and formerly was used extensively. The species tends to disappear in grazed ranges and is now quite rare.

63. DIOCLEA H.B.K.

An American tropical genus of about 25 species, only one species reaching the United States.

1. *Dioclea multiflora* (T.&G.) Mohr. Said to be "semiwoody or woody" but ours appearing merely perennial; high-climbing or trailing twining vines; leaves alternate, once-pinnately-trifoliolate; petioles of well-developed leaves often 1-2 dm. long; stipules minute and quickly deciduous; rachis stalk of terminal leaflet (3-) 4-6 cm. long; leaflets usually orbicular, varying from very broadly ovate to subreniform, 5-15 cm. across, entire, apiculate; petiolules 3-6 mm. long, darkly pigmented; stipels minute or obsolescent; peduncles 7-11 cm. long, solitary, axillary, ascending, racemes 2-5 cm. long; calyx about 7 mm. long, with a tube about half the total length and 4 lobes (the upper representing 2 coalescent lobes); corolla 15-20 mm. long, papilionaceous, partly roseate (drying lavender), partly white; stamens 10, monadelphous, the uppermost filament free at the very base and for most of the distal half, coalescent with the rest only briefly; fruit a dry flattened oblong elastically dehiscent legume about 5-6 cm. long, often coriaceous. Rare, known only from woods along Mills Creek, 11 miles west of Kirbyville, Jasper Co. and just below Town Bluff Lake in Tyler Co., e. Tex., May; Ga., Fla., w. to Ark. and Tex.

64. PUERARIA DC.

An Asiatic genus of about 10 or 15 species, of which at least one is widely introduced.

1. *Pueraria lobata* (Willd.) Ohwi. KUDZU. Perennial; stems more or less villous and woody, twining and very high-climbing (up to 20 m., rarely to 30 m.); leaves alternate, once-pinnately-trifoliolate; petioles very elongate, often as long as the rest of the leaf; stipules ovate-lanceolate, the lower portion more or less adnate to the stem, mostly 8-12 mm. long; leaflets ovate-rhombic or ovate to more or less rotund, entire or often deeply 2- or 3-lobed, abruptly tapering to an acuminate tip, pubescent beneath, 5-12 (-20) cm. long; petiolules 3-10 mm. long; stipels setaceous, 5-9 mm. long; flowers in axillary racemes (5-) 10-20 (-30) cm. long; pedicels 2-8 mm. long; peduncle, rachis and pedicels densely appressed-silky-pubescent; calyx about 9-10 mm. long, with a tube a little less than half the total length and 4 lobes (the uppermost representing 2 coalescent lobes); corolla papilionaceous, 15-25 mm. long, violet-purple to reddish-purple; stamens 10, monadelphous, the uppermost filament coalescent to the rest only briefly, free at both ends; fruit a flattened elongate linear-oblong several-seeded thin-valved dehiscent legume 4-5 cm. long, tawny to red-brown-villous throughout. *P. Thunbergiana* (Sieb. & Zucc.) Benth. Frequent along road shoulders, e. and s.e. Tex., spring-fall; nat. to China and perhaps elsewhere, now widely introd. in warm-temperate moist regions.

Used as a ground cover and green manure, and by misguided highway landscapers to protect embankments from erosion, etc. It should be considered as a noxious weed since it has the capability of choking out all native vegetation. According to some authorities, the combined aggressiveness of this species and the Japanese honeysuckle (*Lonicera japonica*) may eventually have a telling influence upon forest reproduction in some parts of southeastern United States.

65. CANAVALIA DC.¹⁰⁴

JACKBEAN. SWORDBEAN

A genus of 51 species of the tropical and subtropical parts of the world. In addition to the species below, the horse bean, *C. ensiformis* (L.) DC., with ovate-elliptic leaflets, has been cultivated in Texas.

1. *Canavalia maritima* (Aubl.) Thou. Stems trailing or often twining, 5-30 dm. long or more; root presumably perennial; leaves alternate, once-pinnately-trifoliolate; stipules caducous; leaflets 3, subcoriaceous, oblong to nearly orbicular, 6-12 cm. long, obtuse to emarginate, often apiculate; petiolules developed; stipels subulate; flowers in axillary racemes with 2 or 3 pedicels at each node of the raceme, commonly resupinate; pedicels 3 mm. long; calyx 12 mm. long, bilabiate, the tube almost half the total length, the upper lip representing 2 coalescent lobes, the lower lip composed of 3 very short lobes, all pubescent; corolla papilionaceous, about 3 cm. long, pale-violet or lavender; stamens 10, monadelphous, the uppermost filament coalescent only briefly to the rest, free at both ends; fruit a coriaceous dehiscent legume about 15 cm. long and 25 mm.

¹⁰⁴ Adapted from Jonathan Sauer in *Brittonia* 16:106-181. 1964.

broad, moderately compressed, the 2 valves separating into a thick outer layer and thin inner layer; seeds $18 \times 13 \times 10$ mm., brown with darker marbling. Infrequent or rare, perhaps not persistent, in loose sand near the Gulf beaches, Padre Island, s. Tex., all year; on warm seabeaches throughout the world.

66. RHYNCHOSIA LOUR.¹⁰⁵

SNOUTBEAN

Climbing, trailing or erect perennials; stems 1 to several; leaves alternate, 1- or 3-foliolate; stipules present; blades entire, resinous-dotted, papilionaceous hairs present on upper and lower surface; stipels usually present; flowers peduncled or in axillary or terminal racemes; calyx bilabiate, with a short campanulate tube and 5 longer lanceolate lobes; corolla papilionaceous, yellow, sometimes tinged with red, purple or brown (especially on the standard); stamens 10, diadelphous, with 9 filaments fused, the upper one free; fruit a legume, flattened, oblong to orbicular or scimitar-shaped, mostly 1- or 2-seeded. *Dolicholus* Medic.

A genus of about 150 species in tropical and subtropical regions of both hemispheres.

1. Calyx not foliaceous; corolla exceeding the calyx (2)
1. Calyx foliaceous; corolla equal to or shorter than the calyx (4)
- 2(1). Flowers axillary 2. *R. texana*.
2. Flowers in racemes (3)
- 3(2). Longest terminal leaflets 15-37 mm. 1. *R. minima* var. *minima*.
3. Longest terminal leaflets 4.5-15 mm. 1. *R. minima* var. *diminifolia*.
- 4(1). Plants trailing or twining (5)
4. Plants erect (7)
- 5(4). Leaves unifoliolate, reniform 5. *R. americana*.
5. Leaves trifoliolate; leaflets ovate or ovate-rhombic (6)
- 6(5). Racemes very short-peduncled or sessile, less than 3.5 cm. long 3. *R. difformis*.
6. Racemes peduncled, 3-30 cm. long 4. *R. latifolia*.
- 7(4). Plants 15-90 cm. tall; leaves mostly trifoliolate; leaflets oval to elliptic 6. *R. tomentosa* var. *tomentosa*.
7. Plants 5-25 cm. tall; leaves mostly unifoliolate (at least toward the base), reniform to oval 7. *R. reniformis* var. *reniformis*.

1. *Rhynchosia minima* (L.) DC. var. *minima*. Stems trailing or twining, papilionaceous hairs descending to spreading (0.1-0.2 mm. long); leaves trifoliolate; longest rachis 17-62 mm.; longest leaflets 15-37 mm., rhombic to rhombic-orbicular, resin-dotted, sparingly pubescent; stipules lanceolate, 1.5-4.5 mm. long; flowers in axillary racemes 45-165 mm. long; calyx lobes narrowly lanceolate, 1.5-3 mm. long; corolla yellow (occasionally brown-tinged), 4-7 mm. long; legumes 12-20 mm. long, scimitar-shaped. *Dolicholus minimus* (L.) Medic. Frequent in the Coastal Plain inland to Newton, Houston, Travis, Bexar and Hidalgo cos., usually in clay soil, Apr.-Dec.; coastal Tex., La., Fla. and Ga.

Var. *diminifolia* Walraven. Stems trailing or twining, papilionaceous hairs descending to spreading (0.1-0.2 mm. long); leaves trifoliolate; longest rachis 8-28 mm.; longest leaflets 4-15 mm., rhombic to rhombic-orbicular, resin-dotted, sparingly pubescent; stipules lanceolate, 1.5-4.5 mm. long; flowers in axillary racemes 3-15 cm. long; calyx lobes narrowly lanceolate, 2-3.5 mm. long; corolla yellow (occasionally brown-tinged), 4.5-6.5 mm. long; legumes 9-17.5 mm. long, scimitar-shaped. Rare in Nueces and Cameron cos.; also coastal Fla. and Fla. Keys.

¹⁰⁵ Contributed by Wesley C. Walraven.

2. *Rhynchosia texana* T. & G. Stems trailing or twining, papilionaceous hairs ascending to descending (0.1-0.6 mm. long); leaves trifoliolate; longest rachis 8.5-12 mm., resin-dotted; stipules lanceolate, 1.3-4.5 mm. long; flowers 1 to 3, axillary; lower calyx lobe lanceolate, acuminate, 1.5-5 mm. long, the upper lobes shorter; corolla yellow, often tinged with red or brown, 3.5-7 mm. long; legumes scimitar-shaped, longest 11-19 mm. Incl. var. *angustifolia* Engelm., *Dolicholus texensis* (T. & G.) Vail. Frequent in calcareous and other soils, Trans-Pecos, Edwards Plateau, Rio Grande Plains and s. part of n.-cen. Tex., n. and e. to Mitchell, Palo Pinto, Dallas, McLennan, Brazos, Austin and Calhoun cos., Apr.-Oct.; Tex. to Ariz. and n. Mex.; Parag., Arg.

3. *Rhynchosia difformis* (Ell.) DC. Stems trailing or twining, papilionaceous hairs descending (0.2-1.5 mm. long); leaves mostly trifoliolate; longest rachis 18-56 mm.; longest leaflets 24-52 mm., ovate, pubescent, resin-dotted; flowers in short congested axillary racemes or glomerules to 35 mm. long; calyx lobes lanceolate to linear, 6-13 mm. long; corolla yellow, 5.5-11 mm. long; legumes 14-21 mm. long, 6-8 mm. broad, pubescent. *R. tomentosa* var. *volubilis* (Michx.) T. & G., *R. volubilis* (Michx.) Wood, *R. tomentosa sensu* Small. Very rare in e. Tex., known only from Smith and Montgomery cos., summer; Va. to Tex. and s. to n. Fla.

4. *Rhynchosia latifolia* (Nutt.) T. & G. Stems trailing or twining, papilionaceous hairs descending to spreading (0.5-1.1 mm. long); leaves trifoliolate; longest rachis 16-83 mm.; longest leaflets 30-77 mm., rotundly ovate to rotundly rhombic, resin-dotted; stipule 2.5-7.5 mm. long; flowers in elongate racemes 3-30 cm. long; calyx 8-15 mm. long; corolla yellow, 8.5-13 mm. long. *R. reticulata* var. *latifolia* (Nutt.) O. Ktze., *R. Torreyi* Vail, *Dolicholus latifolius* (Nutt.) Vail, *D. Torreyi* (Vail) Vail. Abundant in woodlands in sandy soil, e., s.e. and n.-cen. Tex., May-Aug.; Mo., s.w. to La. and Tex.

5. *Rhynchosia americana* (Mill.) C. Metz. Stems prostrate, trailing or twining, papilionaceous hairs spreading to descending (0.2-1 mm. long); leaves unifoliolate; longest petioles 14-47 mm.; longest blades 18-48 mm., reniform, resin-dotted; stipules 2.5-6.5 mm. long; longest raceme 2-20 mm., few-flowered; calyx 7-13 mm. long; corolla yellow, 6-10 mm. long; legumes 12-18 mm. long, 5-7 mm. broad. *R. menispermoidea* DC., *Dolicholus americanus* (Mill.) Vail. Frequent in sandy prairies and open woodlands on sandy or gravelly soil, Rio Grande Plains and n. to Comal, Bastrop, Fayette, Colorado and Harris cos., Mar.-Oct.; Tex., Tam. and Ver.

6. *Rhynchosia tomentosa* (L.) H. & A. var. *tomentosa*. Stems erect, never twining, 15-85 cm. tall, papilionaceous hairs ascending to descending (0.1-1.4 mm. long); leaves mostly trifoliolate; longest rachis 17-78 mm.; longest leaflets 28-61 mm., oval to elliptic, resin-dotted, often densely and softly pubescent; flowers several; axillary racemes compact and less than 3 cm. long; calyx 4-9 mm. long, the lobes lanceolate; corolla yellow, 4.5-8.5 mm. long; legume 13-19 mm. long, 5-7 mm. broad. *R. erecta* (Walt.) DC., *Dolicholus Drummondii* Vail, *D. erectus* (Walt.) Vail. Very rare in woodlands, e. Tex., summer; n. to D.C., Va., Ky. and Tenn.

7. *Rhynchosia reniformis* DC. var. *reniformis*. DOLLAR-LEAF. Stems erect, never twining, 4-22 cm. tall, papilionaceous hairs ascending to descending (0.2-1 mm. long); leaves unifoliolate; longest petioles 18-65 mm.; longest leaflets 25-54 mm., reniform or orbicular, often slightly cordate at base, resin-dotted; stipules 3-11 mm. long; racemes very reduced, often nearly sessile, 4-30 mm. long; calyx 4.5-10 mm. long, upper lobes ovate, lower lobes lanceolate; corolla yellow, 6-9.5 mm. long; legumes elliptic with lateral beaks, 11-19 mm. long, 4.5-7 mm. broad. *R. simplicifolia* (Walt.) Wood, *Dolicholus simplicifolius* (Walt.) Vail. Infrequent in pine woods, e. Tex., June-Sept.; Coastal States, N.C. to Tex. The author of the name is sometimes given incorrectly as "(Pursh) DC."

76. STROPHOSTYLES ELL.

FUZZY BEAN

Annual or perennial vinelike herbs; stems 1 or usually several, the early shoots erect but distally becoming trailing and often twining, (2-) 3-20 dm. long; stipules persistent; leaves alternate, petiolate, once-pinnately-trifoliolate; stipels present; racemes axillary, ascending, long-pedunculate (peduncles 5-30 cm. long), the raceme rachis very short so the flowers are few and racemes subcapitate; calyx with a short tube, more or less bilabiate, the upper 2 lobes almost completely coalescent; corolla papilionaceous, pink to purplish or cream-colored, 5-15 mm. long; keel very narrow and strongly curved

or sickle-shaped, the tip pointing back into the flower (but keel remaining in one plane, not contorted except slightly in *S. leiosperma* or spiral; cf. *Phaseolus*); stamens 10, diadelphous, 9 of the filaments coalescent, the tenth (uppermost) free; fruit a sessile linear slightly flattened short-beaked several-seeded promptly dehiscent legume; seeds usually pubescent (not in *S. leiosperma*).

A genus of 4 species of North America, very weakly distinguished from *Phaseolus* on the technical basis that the keel remains in a single vertical plane. Some authors, probably correctly, regard it as no more than a section of *Phaseolus*.

1. Flowers 5-8 mm. long; stalk of inflorescence (peduncle) slender, rarely exceeding 10 cm. in length; seeds 2-3 (-4) mm. long 3. *S. leiosperma*.

1. Flowers 9-15 mm. long; stalk of inflorescence stout, mostly 15 cm. or more in length; seeds 3-10 mm. long (2)

2(1). Bracts at base of individual flowers blunt, half as long as the calyx tube or less; leaflets without conspicuous lobes at base, 3 to 8 times as long as wide 2. *S. umbellata*.

2. Bracts at base of individual flowers acute, as long as the calyx tube or longer; leaflets lobed at base or (if not lobed) the leaflets 1 to 3 times as long as wide 1. *S. helvola*.

1. *Strophostyles helvola* (L.) Ell. AMBERIQUE BEAN. Annual (apparently); leaflets ovate or rhombic-ovate to ovate-oblong, or commonly 3-lobed and pandurate, with a mucronate broadly rounded to acute apex and broadly rounded to broadly cuneate base; peduncle stout, (9-) 15-30 cm. long; bracts at base of individual flower acutish, as long as calyx tube or longer; flowers 9-15 mm. long, mostly purplish; seeds 6-10 mm. long. *Phaseolus helvolus* L. Frequent in grasslands and open woodlands, usually on sandy soil, e., s.e. and n.-cen. Tex. rarely w. and s. to Eastland, Mason and Karnes cos., reported from Hemphill Co. in the Panhandle, June-Sept.; s. Can., e. U.S.

2. *Strophostyles umbellata* (Willd.) Britt. Perennial; leaflets narrowly (rarely broadly) ovate to lanceolate or narrowly oblong to rarely elliptic, 3 to 8 times as long as broad, never lobed, broadly rounded to acute at apex, broadly rounded (to cuneate) at base; peduncle stout, (9-) 12-30 cm. long; bracts at base of individual flowers blunt, half as long as the calyx tube or shorter; flowers 9-15 mm. long, mostly pale-purplish; seeds 3-6 mm. long. *Phaseolus umbellatus* (Willd.) Nutt. Frequent in e. and s.e. Tex., in sandy soils of pine woodlands, June-Sept.; e. U.S.

3. *Strophostyles leiosperma* (T.&G.) Piper. SLICK-SEED BEAN. Annual (apparently); leaflets nearly linear to lanceolate or lance-oblong to -elliptic, at apex acute to rounded, at base rounded; peduncle 3-10 (-11) cm. long, about 0.5 mm. thick; bracts at base of individual flower longer than calyx tube; flowers 5-8 mm. long, mostly lavender or pink; pods 15-35 mm. long; seeds 3-4 mm. long. *Phaseolus leiospermus* T. & G. Local in various soils, usually sandy loam, Plains Country, n.-cen., e. end s.e. Tex., the Llano region and n. part of Rio Grande Plains, May-Sept.; Miss. to Tex., n. to Ind., Minn., Neb. and Colo.

The slight contortion of the keel in this species indicates transition to *Phaseolus*.

68. PHASEOLUS L. BEAN. FRIJOLE

Annual or perennial often vinelike herbs; stems 1 or usually several, the early shoots erect but later distal stems usually twining, (2-) 3-30 dm. long; stipules persistent; leaves alternate, petiolate, once-pinnately-trifoliolate; stipels present; racemes axillary, ascending, long-pedunculate (peduncles 5-30 cm. long), the raceme rachis very short to elongate; calyx with a campanulate to narrowly campanulate tube and 5 lobes which are either longer than or shorter than the tube, equal or unequal, the 2 upper lobes usually coalescent farther than the others; corolla papilionaceous, white to purplish or lavender to brick-reddish; wings at anthesis in some species very elongate; keel usually narrow and always contorted or in one species usually giving one or slightly more spiral turns; stamens 10, diadelphous, 9 of the filaments coalescent, the uppermost free; fruit a usually linear slightly laterally compressed usually thin-walled legume with several seeds.

A genus of about 200 species in the warmer parts of the world, very important eco-

nomically, including *P. vulgaris* L., frijole or kidney bean; *P. limensis* Macf., lima bean; *P. aconitifolius* Jacq., moth or mat bean.

Also to be sought here is the very rare *Oxyrhynchus volubilis* Brandeg. (incl. *O. alienus* Piper), which, in 1921, was known to occur near Austin, Travis Co. This is a twining vine with greenish-yellow to purplish flowers (the keel not contorted); the seeds are 10-15 mm. long and 10-14 mm. in diameter, with conspicuous linear hilum extending over half the circumference of the seed. The species was probably introduced in Austin; it occurs naturally in Nuevo León, Tamaulipas, San Luis Potosí and the West Indies.

1. Plant annual; inflorescence 2- to 4-flowered 7. *P. acutifolius*.
1. Plants perennial; inflorescence 5- to many-flowered (2)
- 2(1). Leaflets linear to triangular-elongate, 5 to 20 times as long as wide 4. *P. angustissimus*.
2. Leaflets of a broader type, less than 5 times as long as wide (3)
- 3(2). Pods narrow, less than 5 mm. wide; stems and leaves conspicuously pubescent (4)
3. Pods broad, 5 mm. wide or more; stems and leaves glabrous to minutely pubescent (5)
- 4(3). Legumes short, curved, 2-3 cm. long; calyx (including lobes) 3-5 mm. long; flowers brick-red 1. *P. heterophyllus*.
4. Legumes linear, nearly straight, 4-8 cm. long; calyx 5-8 mm. long; flowers dark-purple 2. *P. atropurpureus*.
- 5(3). Leaflets triangular with conspicuous lobes at the base; legume 35 mm. long or shorter 5. *P. Wrightii*.
5. Leaflets triangular-ovate to oval, without conspicuous lobes at the base; legume 35-80 mm. long (6)
- 6(5). Stipules subulate, 3 mm. long or less; leaflets mostly acute at tip; calyx glabrous or essentially so; plants or central and east Texas ... 3. *P. polystachios*.
6. Stipules ovate, 4-8 mm. long; leaflets mostly obtuse or retuse, shortly apiculate at tip; calyx conspicuously short-pubescent; plants of igneous soils of Trans-Pecos Texas 6. *P. Metcalfei*.

1. *Phaseolus heterophyllus* Willd. Perennial; leaflets usually rhombic-ovate to rhombic-obovate, sometimes with a brief lobe near the middle on 1 or both sides, 15-40 mm. long, once or twice as long as broad; peduncles 10-25 cm. long; raceme rachis 2-8 cm. long; flowers remote on the raceme, not crowded, only 5-8 mm. long; calyx 3-5 mm. long, equally 5-lobed, the lobes as long as the tube; corolla at least partially brick-red; wings at anthesis elongated; pods short, curved, 2-3 cm. long, less than 5 mm. broad. *P. rotundifolius* Gray. Local in Jeff Davis Co., foothills of Davis Mts., at elev. of 4,000-6,000 ft., Aug.; Guat. n.w. to N.M. and Ariz.

2. *Phaseolus atropurpureus* DC. PURPLE BEAN. Perennial, often conspicuously pubescent; leaflets usually ovate to rhombic-ovate or sometimes narrowly rhombic-ovate or nearly lance-ovate, often with a brief lobe on one or both sides in the lower half, 2-5 cm. long, 1.2 to 3 (rarely more) times as long as broad, often canescent with grayish-pubescent at least beneath; peduncles (8-) 15-30 cm. long; raceme axis (3-) 4-8 cm. long; flowers usually crowded at anthesis but not in fruit, 15-20 mm. long, the internodes elongating after anthesis; calyx 5-8 mm. long, rather equally 5-lobed, the lobes much shorter than the tube; corolla at least distally a beautiful very dark red-purple or maroon, drying atropurpureous; wings at anthesis much-elongated; pods linear, nearly straight, 4-8 cm. long, less than 5 mm. broad. Rare and local in deep sands near the coast, Cameron, Kleberg and Kenedy cos. in extreme s. Tex., also exceedingly rare in Sierra Vieja and Chinati Mts. in Presidio Co., spring-Sept.; Salv., Guat., Mex. and Tex.

3. *Phaseolus polystachios* (L.) B.S.P. Perennial; leaflets ovate, usually acuminate or acute, entire, (3-) 4-10 (-13) cm. long, 1.2 to 1.6 times as long as broad, nearly glabrous above, usually pubescent beneath; peduncles 1-4 cm. long; raceme rachis 3-15 cm. long; flowers not crowded, only about 1 cm. long at anthesis; calyx nearly glabrous, 2.5-4 mm. long, rather equally 5-lobed, the lobes much shorter than the tube; corolla mostly lavender or pale-purple to nearly cream-colored; wings at anthesis much-elongated; pods 35-60 (-80) mm. long, 7-9 mm. broad. Very rare in Tex., known from Harrison Co. in n.e. Tex.

and also encountered in a canyon of the Edwards Plateau, where perhaps introd., summer; e. U.S.

Our Frio Canyon collection shows lobed leaflets and other characteristics which cast doubt on its referral here; it may be *P. Wrightii*.

4. *Phaseolus angustissimus* Gray. Perennial; leaflets linear to narrowly lanceolate or sometimes with a lanceolate main lobe and basally on each side with an angled corner or narrow short lobe, (2-) 3-10 cm. long, (1-) 2-10 mm. broad, 5 to 25 times as long as broad, mostly glabrous; peduncles usually 2-3 cm. long; raceme axis (1-) 2-15 cm. long (the internodes much-elongating after anthesis); flowers not crowded, 8-11 mm. long at anthesis; calyx nearly glabrous, about 3 mm. long, subequally 5-lobed, the lobes only slightly shorter than the tube; corolla pale-purple; wings at anthesis much-elongated; pods 2-3 cm. long, somewhat falcate, about 6-7 mm. broad at the widest point (in distal half), with a subulate beak 2-4 mm. long; seeds rugose. Dry canyons, Brewster and Presidio cos., s. Trans-Pecos, summer; Tex., N.M., Ariz. and Chih.

5. *Phaseolus Wrightii* Gray. Perennial; leaflets ovate in general outline but usually with an oblong main portion and in the lower half on 1 or both sides an oblong lobe shorter than the main portion, at apex rounded to acute, 2-7 cm. long, 1 or 2 times longer than broad, mostly glabrous; peduncles 2-10 cm. long; raceme axis 2-10 cm. long, apparently both peduncles and axes elongating after anthesis; calyx nearly glabrous, 2-3 mm. long, the lobes much shorter than the tube; corolla pale-purple; pods 25-35 mm. long, somewhat falcate, about 6 mm. broad, with a minute beak 1-2 mm. long; seeds rugose. Trans-Pecos mts. at 3,000-7,300 ft. elev., Aug.-Nov.; Tex., N.M., Ariz., Son., Chih. and Coah.

6. *Phaseolus Metcalfei* Woot. & Standl. Perennial from deep woody roots, often a rampant vine; leaflets broadly ovate to obovate or almost orbicular, about as long as broad, rarely lobed, at base rounded or narrowed, at apex very short-apiculate, 3-5 (-8) cm. long; stipules ovate, 4-8 mm. long; peduncles 1-2 dm. long; raceme axis 4-15 cm. long; flowers not crowded, 12-15 mm. long at anthesis; calyx short-pubescent, about 5 mm. long, subequally 5-lobed, the lobes much shorter than the tube; corolla pale-purplish; pods 35-80 mm. long, more than 5 mm. broad. Mts., among boulders, 4,000-7,300 ft. elev. in the Trans-Pecos, July-Sept.; Tex., N.M., Ariz., Son., Chih., S.L.P., Aguasc., Hgo., Zac., Pue. and Oax.

7. *Phaseolus acutifolius* Gray. TEPARY BEAN. Annual from slender taproots; leaflets linear to lanceolate (to narrowly rhombic-ovate), sharply acute, (2.5 to) 3 to 8 times as long as broad, rarely or perhaps never lobed; peduncles 5-40 mm. long; raceme axis (0-) 5-30 mm. long; flowers (1 or) 2 to 4 per inflorescence, 8-10 mm. long at anthesis; calyx pubescent, about 4 mm. long, subequally 5-lobed, the lobes much shorter than the tube; corolla creamy-blue to lavender; pods curvilinear, 4-7 cm. long. Rare in canyons, Trans-Pecos mts., 4,000-6,000 ft. elev., July-Sept.; Tex., N.M. and Ariz., s. to Jal.

A broad-leaved form is cultivated in southern United States and Mexico.

69. VIGNA SAVI

Annual or perennial herbs, with vinelike or trailing annual stems to 3 m. long, twining at the ends; stipules present; petioles well-developed; leaves once-pinnately-trifoliolate; stipels present; racemes axillary, usually long-peduncled and few-flowered; calyx campanulate, somewhat bilabiate, the upper 2 lobes (upper lip) somewhat coalescent; corolla papilionaceous, yellow or purple; wings with obovate blades that are auriculate near the base on the upper side; stamens 10, diadelphous, 9 of the filaments coalescent, the uppermost free; fruit a linear little if at all laterally compressed several-seeded thin-walled promptly dehiscent legume.

A genus of about 60 species in the tropical and subtropical parts of the world; 1 of our species is of great economic value.

- 1. Stipules small, inconspicuous, 2-5 mm. long; pods 3-7 cm. long; native species 1. *V. luteola*.
- 1. Stipules conspicuous, 7-15 mm. long; pods 10 cm. long or more; cultivated species 2. *V. unguiculata*.

1. *Vigna luteola* (Jacq.) Benth. Perennial; leaflets ovate to lanceolate or linear-lanceolate, obtuse to broadly cuneate at base, acute, 2-8 cm. long; peduncles usually several times longer than the foliage; flowers closely clustered at anthesis (internodes elongating, separating the fruits), 15-18 mm. long; calyx with tube 2-2.5 mm. long, the lobes 1.5-2.5 mm. long; corolla yellow; pods 3-7 cm. long. *V. repens* (L.) O. Ktze., not of Baker. Local in wet places, coastal tier of counties and inland to Hidalgo Co., Mar.-Nov.; trop. Am. n. to Gulf States, rarely to N.C.

2. *Vigna unguiculata* (L.) Walp. COWPEA, BLACK-EYED PEA, CREAM-PEA. Annual; leaflets 4-15 cm. long, ovate to ovate-hastate; corolla purple; pods 1 dm. or more long. Rarely volunteering at the edges of fields in the e. half of the state, where it is cult., summer; nat. of Old World (Asia?), now very widely introd. and cult.

When the peas are gathered very young they are called cream-peas; later they are black-eyed peas because of the increased pigmentation near the micropyle.

FAM. 92. KRAMERIACEAE DUM.¹⁰⁸

RATANY FAMILY

Low shrubs or perennial herbs from woody stocks, in the shrubby ones the stems often intricately branched and somewhat thornlike; herbage often densely grayish-pubescent; leaves alternate, usually linear or nearly so, simple, entire, acute; petioles short or absent; stipules absent; flowers perfect, bilaterally symmetrical, solitary in the axils of the distal leaves (sometimes clustered due to shortness of distal internodes); pedicels usually with 2 opposite foliaceous bracts; sepals 4 or 5, unequal; petals 5, very unequal, the upper 3 long-clawed, distinct or partly united and usually purplish or reddish in color, the 2 others much smaller, broad, thick, sessile, greenish (usually) and glandlike; stamens 4, free or adnate to the claw of the upper petal; each of the 2 thecae dehiscent by a pore; ovary 1-celled; ovules 2, collateral, pendulous, anatropous; fruit a nearly globose 1-seeded indehiscent pod, armed with straight sharp prickles; cotyledons thick; endosperm apparently absent.

An American family of a single genus of about 25 species from Chile to southern United States. It has been treated as a part of the Leguminosae but is more than adequately distinct and deserving of familial rank.

I. KRAMERIA L.

RATANY

Characters of the family.

- 1. Stems decumbent, completely herbaceous above ground; widespread in Texas 1. *K. lanceolata*.
- 1. Plants shrubby; in the Trans-Pecos and the southern half of Texas (2)
- 2(1). Pedicels densely glandular, very rarely not glandular but (if so) then the prickles of the fruit with scattered barbs near the apex as opposed to barbless prickles or whorled barbs at the apex of the prickles in the species below 2. *K. glandulosa*.
- 2. Pedicels without glands (3)
- 3(2). Leaves 2-6 mm. long; prickles of the fruit 2 mm. long or less at maturity, without barbs; petals 6-8 mm. long 3. *K. ramosissima*.
- 3. Leaves 5-25 mm. long, at least some of them 10 mm. long; prickles of the fruit 2-6 mm. long at maturity, with a whorl of barbs at apex; petals 8-12 mm. long 4. *K. Grayi*.

1. *Krameria lanceolata* Torr. CRAMERIA. Perennial herb from woody stocks; stems 1-18 dm. long, prostrate on ground or trailing over herbaceous vegetation, slender, silky-pubescent; leaves linear or nearly so or the larger ones oblong, 8-20 mm. long; fruit globose, the body woolly, 6-7 mm. thick, the subulate barbless spines 2-4 mm. long. The name *K. secundiflora* has been used incorrectly for this species in a number of books.

¹⁰⁸ Many of the characters are from B. L. Turner, "The Legumes of Texas." 1959.

Widespread over the state (missing only from the wettest, densest pine forests of e. Tex.), spring-fall; Kan. to Ariz. and s. to Chih., Coah. and Tex.

2. *Krameria glandulosa* Rose & Painter. RANGE RATANY. Intricately branched shrub 3-7 dm. tall, the herbage grayish-pubescent; leaves linear, 4-12 mm. long; pedicels densely glandular-pubescent or rarely the glands nearly absent; fruit globular, the body 6-7 mm. thick, the prickles of the fruit with scattered barbs near the apex. Frequent in desertic scrub in the Trans-Pecos, e. to Loving and Brewster cos., summer; Calif. and Son. e. to Tex.

3. *Krameria ramosissima* (Gray) Wats. CALDERONA. Intricately branched shrub 3-10 dm. tall, the herbage grayish-pubescent; leaves linear to linear-lanceolate, 2-6 mm. long, often fascicled in the axils; pedicels not glandular-pubescent; petals 6-8 mm. long; prickles of the fruit 2 mm. long or less at maturity, barbless. Locally abundant in dry scrubby vegetation in the Trans-Pecos and Rio Grande Valley, from Brewster Co. to Hidalgo Co., spring-fall; s. to Coah., N.L., and Tam.

4. *Krameria Grayi* Rose & Painter. WHITE RATANY. Intricately branched shrub 3-6 dm. tall, the herbage grayish-pubescent; leaves linear, 5-25 mm. long, at least some of them on each plant 10 mm. long or more; pedicels not glandular-pubescent; petals 8-12 mm. long; prickles of the fruit 2-6 mm. long at maturity, each with a whorl of barbs at apex. Frequent in desertic scrub in the Trans-Pecos, e. to Ward and Val Verde cos., summer; Baja Calif. and Calif., e. and s.e. to Tex. and Coah.

FAM. 93. GERANIACEAE JUSS.

GERANIUM FAMILY

Winter annual, biennial or perennial herbs; leaves alternate or basal, lobed or divided, stipulate; inflorescence cymose or a solitary flower; flowers perfect, regular or nearly so, 5-merous, hypogynous; sepals imbricated in the bud, persistent; glands of the disk 5, alternate with the petals; stamens (counting the sterile filaments) as many as or commonly twice as many as the sepals, when as many then opposite the sepals; ovary at base with 5 equal lateral lobes; carpels 2-ovuled, 1-seeded, when mature separating elastically with their long styles from the elongated axis.

A family of about 5 genera and some 750 species of temperate and subtropical regions.

1. Fertile stamens usually 10; ripe carpels plump, widely dehiscent on the inner suture to allow the seed to fall free; each separated stylar portion merely recurved upward, at most softly pubescent on the inner surface; seeds noticeably reticulate1. *Geranium*, p. 890.
1. Fertile stamens 5; ripe carpels fusiform, sharp-pointed at base, though dehiscent remaining tightly inrolled to enclose the seed; each separated stylar portion twisting spirally below the middle, bristly long-bearded on the inner surface; seeds smooth2. *Erodium*, p. 892.

1. GERANIUM L.¹⁰⁷

CRANESBILL

Annual or perennial herbs with much-branched stems and pinnate or palmately lobed petiolate leaves; flowers usually in pairs on a slender peduncle and slender pedicels that are subtended by narrow bracts; stamens 10 or rarely 5, all with perfect anthers, the 5 longer ones with glands at their base and alternate with the petals; stylar portions usually remaining attached by their apex to the summit of the torus.

Consisting of about 400 species mainly in temperate regions; many are used as ornamentals.

1. Plants perennial, with a stout simple or branched rootstock; petals always exceeding the sepals; stylar branches 2 mm. long or more; in mountains of west Texas (2)
1. Plants annual or biennial, without a thick rootstock, the taproot slender; petals not or scarcely surpassing the sepals; stylar branches rarely more than 1 mm. long; mostly east of the Pecos River (4)

¹⁰⁷ Adapted partly from G. N. Jones and F. F. Jones in *Rhodora* 45:5-53. 1943.

- 2(1). Petals 10-20 mm. long or (if slightly shorter) not white; stylar branches 5-8 mm. long1. *G. caespitosum*.
2. Petals 7-10 mm. long, white or pinkish; stylar branches 5 mm. long or less (3)
- 3(2). Stems, petioles and pedicels copiously glandular-villosulous; style column 20 mm. long or more, glandular-pubescent; stylar branches 4-5 mm. long2. *G. lentum*
3. Stems and petioles sparsely pilose, not glandular; style column to 18 mm. long, puberulent; stylar branches 2-3 mm. long3. *G. Wislizenii*.
- 4(1). Sepals orbicular-ovate, about 4 mm. long; style column with short ascending or subappressed hairs, not glandular; pubescence on stems, peduncle and pedicels directed downward6. *G. texanum*.
4. Sepals ovate-lanceolate to elliptic-lanceolate, 6-8 mm. long; style column with long spreading hairs, often glandular; pubescence spreading, usually a noticeable mixture of long and short hairs (5)
- 5(4). Stylar branches purplish, about 0.5 mm. long, terminating a very slenderly constricted neck; style column conspicuously and densely glandular-hirsute4. *G. dissectum*.
5. Stylar branches yellowish, 1 mm. long or more, terminating a short tapering neck; style column hirtellous, sometimes with scattered glandular hairs5. *G. carolinianum*.

1. *Geranium caespitosum* James. Perennial; stems tufted from a woody branched rootstock, procumbent to ascending or erect, to 7 dm. or more long, strigillose to pilosulous; leaf blades to 5 cm. wide, finely appressed-pubescent, orbicular to pentagonal in outline, divided into 5 rhombic lobes that are again 3-parted; sepals ovate-elliptic, mucronate, 3-veined, to 12 mm. long; petals obovate, usually deep rose-purple, to 18 mm. long; style column to 3 cm. long; stylar branches 5-8 mm. long; carpel bodies 4-5 mm. long, sparsely short-strigose; seeds reticulate, 3-4 mm. long. *G. atropurpureum* Heller. In canyons and open woods in w. Tex., May-July; from w. Tex. to Col., Ut., Ariz. and Mex.

2. *Geranium lentum* Woot. & Standl. Perennial; stems ascending or spreading from a stout rootstock, to 5 dm. long, glandular-pilose; leaf blades to 5 cm. wide, densely hispidulous-strigose or glandular-villosulous, orbicular in outline, divided into 5 rhombic to obovate obtuse lobes; sepals ovate-elliptic, mucronate, 7-8 mm. long; petals white, entire or emarginate, 8-10 mm. long; style column to 25 mm. long, glandular-pubescent; stylar branches 4-5 mm. long; carpel bodies about 4 mm. long, puberulent and sparsely hispid; seeds finely reticulate, 2.5-3 mm. long. Mts. of w. Tex., July-Aug.; from Tex. to Ariz. and Mex.

3. *Geranium Wislizenii* Wats. Perennial; stems tufted and erect from a simple rootstock, to 4 dm. long, retrorsely villosulous, not glandular; leaf blades to 8 cm. wide, sparsely strigose, pentagonal in outline, divided into 5 rhombic lobes that are again several times incised into obtuse or rounded segments; sepals ovate-elliptic to elliptic-lanceolate, mucronate, to 7 mm. long; petals entire, white, to 1 cm. long; style column to 18 mm. long, puberulent and more or less glandular; stylar branches 2-3 mm. long; carpel bodies 2-2.5 mm. long. Mts. of w. Tex., May-July; from Tex., Ariz. and n. Mex.

4. *Geranium dissectum* L. Annual or biennial, usually much-branched and straggly; stems to 6 dm. long, ascending, spreading-hirsute; leaves angulate-rotund in outline, to 7 cm. wide, deeply 5-parted, with the lobes of segments of upper leaves linear and acute; sepals elliptic-lanceolate, aristate, 6-8 mm. long; petals pinkish or reddish-pink, obovate, emarginate, about 5 mm. long; style column about 12 mm. long, conspicuously glandular-hirsute; stylar branches purplish and a little more than 0.5 mm. long, terminating a slender neck that is 2-3 mm. long; carpel bodies about 2.5 mm. long, short-hispid with divergent sharp hairs; seeds subglobose, about 2 mm. in diameter, strongly reticulate or pitted with small thick-walled squares or rounded areolae. Fields, roadsides and waste places in n.e. Tex., Apr.-May; local from Mass., w. to Mich. and s. to N.C.; also Tex. and Pac. slope; adv. from Eur.

5. *Geranium carolinianum* L. Annual or biennial, densely retrorse-hirsute, usually much-branched, with the branches to 8 dm. long and ascending; leaves to about 7 cm.

wide, suborbicular to reniform in outline, with obtuse linear-oblong to obovate ultimate segments; sepals ovate-lanceolate, aristate, about 7 mm. long, short-pilose, with villous-ciliate nerves; petals about as long as sepals, pale-pink or whitish, oblanceolate; style column about 13 mm. long, hirtellous and sometimes glandular; styler branches 1 mm. long or more; carpel bodies hirsute, about 3 mm. long; seeds oblong, about 2 mm. long, with irregular rows of elongate finely reticulate areolae. *G. Langloisii* Greene. Dry rocky woods and fields, about boulders, on gravelly or clay flats, and wastelands generally, in most of Tex. but especially in the cen. part., Mar.-May; from N.E., s. to Fla. and Tex., w. to Mich., Ill., Mo., Kan., Wyo., Ida. and s. B.C.

6. *Geranium texanum* (Trel.) Heller. Annual with spreading or ascending branches to 4 dm. long, pubescent with short appressed white hairs that point downward; leaf blades orbicular in outline, with rounded sinuses, to 4 cm. in diameter, 3-parted with these divisions again 3-lobed; sepals suborbicular to orbicular-ovate, shortly aristate, about 4 mm. long, essentially glabrous except on the 3 nerves; petals white and purple-tinged, oblong to oblong-obovate, entire, slightly exceeding the sepals; style column 1-1.2 cm. long, with short ascending or subappressed hairs; styler branches about 0.5 mm. long; carpel bodies about 3 mm. long, with long scattered hairs; seeds subglobose, 2 mm. in diameter, finely and closely pitted. *G. carolinianum* var. *texanum* Trel. In clayey or sandy soils, mostly in cen. and s. Tex. where it is apparently endemic, Mar.-Apr.

2. ERODIUM L'HER. STORK'S-BILL

Annual or biennial herbs forming rosettes and with spreading to ascending leafy branches; leaves petiolate, entire and palmately lobed to pinnatifid or pinnate-pinnatifid; peduncles axillary, bearing several flowers in an umbel; upper petals sometimes slightly smaller than the others; antheriferous stamens 5, opposite the sepals; ripe carpels fusiform, aristate below, hispid, at most tardily dehiscent, the persistent style column or "beak" (when freed) spirally twisting below, bearded on the inner surface; seed smooth.

About 90 species widespread in both the Old World and New World, in temperate and subtropical regions.

- 1. Leaf blades simple, basally cordate and shallowly or deeply palmately lobed; pubescence of short appressed hairs; petals 10 mm. or more long, noticeably exceeding the sepals, purplish-red 1. *E. texanum*.
- 1. Leaf blades pinnatifid or pinnate-pinnatifid, oblong to narrowly triangular in outline, the divisions toothed or narrowly lobed (2)
- 2(1). Leaf blades pinnate-pinnatifid; leaves rarely more than 5 cm. long, the petiole usually less than one fourth the length of blade; style column 5 cm. long or less 2. *E. cicutarium*.
- 2. Leaf blades pinnatifid; leaves more than 5 cm. long, the petiole a third or more as long as blade; style column 7 cm. long or more 3. *E. Botrys*.

1. *Erodium texanum* Gray. Plant prostrate or ascending, branched from base, the branches to 5 dm. long; leaves ovate in outline, to 35 mm. long, the lobes rounded and crenate; sepals elliptic, apiculate, 6-12 mm. long; petals broadly obovate; style column to 75 mm. long; seed tan-color, ellipsoid-conic, 4-5 mm. long. Rocky or sandy soils on limestone, in prairies and open areas in cen., s. and w. Tex., Feb.-Apr.; from Tex. to s. Ut. and s.e. Calif.

2. *Erodium cicutarium* (L.) L'Her. ALFILERILLO. Plant prostrate or ascending, much-branched from base, the nonstrigose branches to 5 dm. long and arising from a rosette of over-wintering leaves; mature leaves pinnate-pinnatifid; sepals elliptic, 2-6 mm. long, the short awns bristle-tipped; petals elliptic-obovate; style column to 5 cm. long; seed dull-brown, ellipsoid, 2-3 mm. long. In rocky or sandy soil in various types of habitat, roadsides, fields, lawns, waste places, ravines in w. and cen. Tex., Feb.-June; Que., w. to Mich. and Ill., s. to Va., Tenn., Ark. and Tex.; also Mex.; nat. of Eur.

3. *Erodium Botrys* (Cav.) Bertol. Plant robust, superficially resembling *E. cicutarium*; mainstem and branches strigose; mature leaves more than 10 cm. long, with a long petiole, the blade pinnatifid with the broad segments decurrent to produce a winged rachis;

sepals oblong, 6-7 mm. long at anthesis, with a conspicuous mucro; fruit with 2 furrows below the pits; style column 7-11 cm. long. In disturbed soils, rare in s.-cen. Tex. (Bexar Co.), Mar.-May; nat. of Medit. region.

A recent introduction that will undoubtedly soon become an established element in our flora.

FAM. 94. OXALIDACEAE R. BR. WOOD-SORREL FAMILY

Annual or perennial herbs, shrubs or rarely trees (in tropics), typically with sour sap (oxalic acid), with strong rootstocks to scaly bulbs; acaulescent or with leafy stems; leaves usually palmately compound; flowers perfect, regular, 5-merous, borne at the apex of a scape or on axillary peduncles, either solitary or in cymose or umbelliform clusters; sepals usually imbricate and often unequal; petals without basal glands; stamens 10 in ours, all perfect; filaments united at base into a short tube; anthers dorsally attached; ovary 5-celled, mostly with numerous ovules; styles 5, distinct; fruits a loculicidal capsule or berry.

About 900 species in several genera of worldwide distribution, mostly tropical. A few ornamental species, especially in the genus *Oxalis*, and edible fruits of the tropical Carambola (*Averrhoa Carambola* L.) are of economic importance.

1. OXALIS L.¹⁰⁸ WOOD-SORREL. LADY'S-SORREL

Annuals or perennials; leaves basal or alternate, simple to pinnate or palmately compound; leaflets usually 3, obovate to obcordate or obreniform, entire except for the notched or 2-lobed apex, downwardly folded together at night or with inclement weather; stipules small or absent; flowers closing at night and with inclement weather, nodding before and after blooming, often dimorphous or even trimorphous in the relative length of the stamens and styles; sepals persistent; petals sometimes weakly united at base, withering after expansion; stamens 10; capsule oblate, prismatic, cylindrical or subulate, membranaceous.

About 800 cosmopolitan species but mainly in South America and South Africa. The commonly cultivated Brazilian *O. rubra* St.-Hil. occasionally spreads from abandoned homesteads and dumps in east Texas. It may be distinguished by its pubescent trifoliolate leaves and inflorescences of pink or rose-color to sometimes white flowers that arise on slender stalks from a woody crown with taproot and root tubers.

- 1. Plant stemless; scape and leaves all basal; petals purple to pinkish-purple or lavender-pink (2)
- 1. Plant leafy-stemmed; petals yellow, sometimes tinged or marked with red (5)
- 2(1). Scapes and petioles more or less villous; leaflets with a narrow deep apical sinus, more or less pubescent and adorned with small scattered reddish-brown callosities; distribution in extreme southeastern Texas1. *O. corymbosa*.
- 2. Herbage entirely glabrous; leaflets with a truncated apex or with a broad apical sinus, without callosities (3)
- 3(2). Leaflets typically crescentiform or lunate, with elongated spreading lobes; sepals with as many as 6 more or less confluent apical tubercles; distribution mostly on the Edwards Plateau and in south Texas2. *O. Drummondii*.
- 3. Leaflets typically broadly obreniform to flabellate or broadly V-shaped, with short rounded lobes; sepals with usually 2 short distinct or somewhat confluent apical tubercles (4)
- 4(3). Plants in eastern third of Texas; leaflets 25 mm. wide or less3. *O. violacea*.
- 4. Plants in the mountains of Trans-Pecos Texas; leaflets usually about 30 mm. wide or more4. *O. amplifolia*.

¹⁰⁸ Ref.: George Eiten in Am. Midl. Nat. 69:257-309. 1963; Lloyd H. Shinnars in Field & Lab. 24:39-40. 1956.

- 5(1). Leaf blades simple (1-foliolate); stipules free, bristlelike; stigmas introrse 5. *O. dichondraefolia*.
5. Leaf blades 3-foliolate; stipules (when present) appearing as mere dilations at the base of the petiole; stigmas terminal (6)
- 6(5). Leaflets pinnate; flower stalk jointed; capsule drooping; stigmas 2-cleft 6. *O. Berlandieri*.
6. Leaflets palmate; flower stalk not jointed; capsule erect; stigmas capitate (7)
- 7(6). Leaflets thick, bluish-green; sepals and petals mostly tinged with red or purple; capsule usually longer than the pedicel; confined to Trans-Pecos Texas 7. *O. albicans*.
7. Leaflets mostly thinnish, light- or dark-green; sepals and petals very rarely tinged or marked with red; distribution east of Trans-Pecos Texas (8)
- 8(7). Corolla golden-yellow, very showy; petals 12-18 mm. long; confined to woodlands of east Texas 8. *O. Priceae*.
8. Corolla usually pale-yellow; petals mostly 5-12 mm. long; widespread (9)
- 9(8). Septate hairs present on stems, petioles and pedicels; pedicels (in fruit) horizontal to erect; inflorescence often regularly cymose; stipules absent; in mature plants stems arising from a thin definitely underground rhizome, the stems appearing singly (rarely 2 or 3 together) from the ground; main root not thicker than stems 9. *O. stricta*.
9. Septate hairs totally absent on all stems, petioles and pedicels; pedicels (in fruit) strongly deflexed to erect; inflorescence never regularly cymose; stipules present or absent; in mature plants stems few to many from crown of taproot, the horizontal stems (if present) on top of ground or only slightly covered; main root usually thicker than stems (10)
- 10(9). Stems several from main root, creeping or decumbent; stem ends of current season horizontal or erect; nodes of horizontal stems with single leaves and peduncles, with fascicles of leaves or with erect stems; stem hairs none to abundant, upwards-appressed, ascending, patent or retrorse, or usually these variously intermixed; seeds brown 10. *O. corniculata*.
10. Stems single, erect or decumbent, or several from main root and cespitose; stem ends of current season erect; nodes of horizontal stems with fascicles of leaves or with erect stems; stem hairs sparse to abundant, appressed upwards, rarely a few ascending; seeds brown, with strong white lines along the transverse ridges 11. *O. Dillenii*.

1. *Oxalis corymbosa* DC. Plants 1-3 dm. tall; bulb scales 3-ribbed; leaves as tall as or shorter than the scapes; petioles more or less villous; leaflets 3, the blades suborbicular to orbicular-obovate, with a narrow deep apical sinus, typically adorned with minute reddish-brown callosities (especially submarginally), 2.5-5 cm. wide, deep-green and usually with scattered hairs above, paler-green and more or less pubescent beneath, the lobes rounded; scapes villous; cymes mostly compound, commonly many-flowered; pedicels 1-3 cm. long, sparingly appressed-pubescent; sepals oblong-elliptic to linear, 4.5-6 mm. long, glabrous or nearly so, each bearing 2 thick apical tubercles; petals violet or rose-purple, 12-15 mm. long; shorter filaments mostly glabrous; longer filaments pubescent, unappendaged; styles pubescent. *O. Martiana* Zucc., *Ionoxalis Martiana* (Zucc.) Small. Waste places, cult. ground and fields in s.e. Tex., Mar.-June; nat. of trop. Am., introd. in U.S. from Fla. to Tex., n. to S.C.

Oxalis rubra St.-Hil., a native of Brazil and quite similar in appearance to this species, is often cultivated. It is superficially distinguished from *O. corymbosa* by its thick, hard, rough root-crown and taproot.

2. *Oxalis Drummondii* Gray. Plants 1-3 dm. tall, glabrous; bulb scales 3-ribbed; leaflets 3, deeply V-shaped, crescentic to lunate, sometimes broadly so, 1.5-6 cm. wide, glabrous, bright-green above, pale-green beneath, the lobes ovate to oblong or lanceolate; scapes nearly twice as long as leaves; cymes 4- to 8-flowered; pedicels 1-4 cm. long; sepals

oblong to linear-oblong or oblong-lanceolate, 5-7 mm. long, each bearing as many as 6 more or less confluent apical tubercles; petals violet, 15-23 mm. long; shorter and larger filaments sometimes pubescent, unappendaged; styles mostly pubescent; capsules broadly oblong, 7-9 mm. long, somewhat pubescent. *Oxalis vespertilionis* T. & G., *Ionoxalis Drummondii* (Gray) Rose, *I. vespertilionis* (T. & G.) Small. In sandy-gravelly soils in open oak woodlands, limestone soils and disturbed areas, mostly on the Edwards Plateau and in the Rio Grande Plains and Valley, rare eastw. to Gonzales and Coryell cos.; apparently endemic.

3. *Oxalis violacea* L. VIOLET WOOD-SORREL. Plants 1-4 dm. tall, glabrous, rarely without leaves; bulb scales 3-ribbed; leaflets 3, obreniform to flabellate, the sinus broad and open to essentially obsolete, 1-2.5 cm. wide, glabrous, bright-green above, slightly paler-green beneath, the lobes rounded; scapes about twice as long as leaves; cymes simple, 4- to 19-flowered; pedicels 1-3 cm. long; sepals oblong-elliptic to ovate-oblong, 4-6 mm. long, glabrous, each bearing 2 short irregular confluent apical tubercles; petals violet, 14-20 mm. long; shorter and longer filaments pubescent or the shorter ones sometimes glabrous; styles short and glabrous, becoming elongated and hispid with age; capsules globose-ovoid, 4-5 mm. long. *Ionoxalis violacea* (L.) Small. In sandy soil of pinelands and dry gravelly soils of open oak woods and grassy-brushy slopes, sometimes on rock outcrops, in e. fourth of Tex., Mar.-May (with leaves) and Aug.-Oct. (without leaves); from Fla. to Tex. and N.M., n. to Mass., N.Y., O., Ind., Wisc., Minn., S.D. and Colo.

4. *Oxalis amplifolia* (Trel.) Knuth. Plants 15-35 cm. tall, glabrous or nearly so, the bulb scales several-ribbed; leaves shorter than the scape; leaflets 3, V-shaped or somewhat obreniform, 2.5-4 cm. wide, deep-green, scarcely paler beneath than above; scapes only occasionally with hairs; cymes 7- to 12-flowered; pedicels 1-3 cm. long; sepals lanceolate to oblong, 4-5 mm. long, each with 2 short apical tubercles; petals violet, 12-16 mm. long; shorter and longer filaments pubescent, the longer ones each usually with a prominent appendage on the back below the middle. *Oxalis latifolia* Trel., *Ionoxalis amplifolia* (Trel.) Rose, (?) *I. monticola* Small. About cliffs and on ledges in mts. of the Trans-Pecos, May-Sept.; from Tex. to Ariz.

5. *Oxalis dichondraefolia* Gray. AGRITO. Stems or branches tufted, from a perennial woody rootstock, 5-30 cm. tall, herbaceous, pubescent with short gray hairs; stipules brownish, setaceous; leaflet as long as the petioles or shorter; blades suborbicular to quadrate-orbicular, inclined to obovate or ovate, 1-3 cm. long, truncate or retuse and more or less apiculate at the apex, finely pubescent on both surfaces, mostly shallowly cordate at the base; inflorescence 1-flowered; bracts setaceous, to 1 cm. long; sepals 8-10 mm. long, the outer ones deltoid to triangular-lanceolate, copiously pubescent, acute or acuminate at the apex, cordate at the prominently auricled base, the 2 inner sepals narrowly linear; petals yellow, about twice as long as the sepals, erose-undulate at the apex; stamens glabrous; pistil and styles pubescent; capsules broadly oblong to ovoid-oblong, 8-10 mm. long; seeds 2-2.5 mm. long. *Monoxalis dichondraefolia* (Gray) Small. On gravelly hills and on clay dunes in brushland and chaparral, also on limestone slopes, in the Rio Grande Plains and Edwards Plateau, flowering the year around; also adj. Mex.

6. *Oxalis Berlandieri* Torr. Plants to 35 cm. high; stem and branches woody or herbaceous, closely pubescent with loosely spreading or crisped hairs that are often very densely set on the younger parts; leaves scattered on the stem and the branches, the petioles loosely pubescent; leaflets cuneate to obovate or oblong-obovate, mostly 1-2.5 cm. long, ciliate and more or less pubescent on both sides but more copiously so beneath, those of the terminal leaflets emarginate or notched, those of the lateral ones singly or doubly notched at the apex; primary peduncles mostly longer than the petioles, several flowered; pedicels loosely pubescent, 4-10 mm. long; sepals 4-5 mm. long, the outer ones oblong to lanceolate, ciliate, sparingly pubescent; petals yellow, about 15 mm. long; longer filaments appendaged below the middle, pubescent above; styles pubescent; capsules broadly oblong or ovoid-oblong, 7-8 mm. long, pubescent on the angles; seeds about 2 mm. long. *Lotoxalis Berlandieri* (Torr.) Small. In sandy soils in pastures and live oak copses in the Rio Grande Valley and s. Coastal Tex., Mar.-Oct.; also adj. Mex.

7. *Oxalis albicans* H.B.K. Stems erect or partially decumbent, suffrutescent, 1-4 dm. tall, short-hirsute (usually densely so at least on the lower part), the tuberous roots fusi-

form (often slenderly so); leaflets deeply notched, cuneate-obreniform, with the lobes often conduplicate, bluish-green, 4-15 mm. broad, thick, with scattered hairs on both surfaces; peduncles as long as the petioles or longer, strigillose, 1- to several-flowered; pedicels strigillose, about 15 mm. long, refracted in fruit; sepals oblong-elliptic to lanceolate, 4-5 mm. long at maturity, often purple-tinged or purple; petals light-yellow to purplish, 6-10 mm. long; longer filaments glabrous; capsules columnar, rather stout, 1.6-2 cm. long, mostly exceeding the pedicel, minutely close-pubescent, gradually narrowed at the apex. *O. Wrightii* Gray, *Xanthoxalis albicans* (H.B.K.) Small. On gravelly-grassy flats, in igneous soils in canyons in mts. of the Trans-Pecos, June-Sept.; from Tex. to Ariz. and n. Mex.

We not only have subsp. *albicans* with hairs on the stem and pedicels crisped or straight and appressed upward but we also have subsp. *pilosa* (Nutt.) Eiten with hairs on the stem and pedicels straight and spreading to retrorse or occasionally appressed upwards.

8. *Oxalis Priceae* Small. YELLOW WOOD-SORREL. Stems erect or decumbent, to 4 dm. high, the horizontal slender rootstocks elongate, densely strigillose or spreading-villous; leaflets bright-green, 5-15 mm. wide, strigillose; peduncles conspicuously elongate and much-overtopping the stem or its branches, appressed-pubescent, 2- to 7-flowered; pedicels strigillose, conspicuously elongate (to 2 cm. long); sepals 5.5-6.5 mm. long at maturity; petals golden-yellow, 12-18 mm. long; filaments glabrous, more or less dilated, the inner ones often conspicuously so; capsules 1-1.5 cm. long. (?) *O. recurva* Ell., *O. recurva* var. *texana* (Small) Wieg., *Xanthoxalis texana* Small. In sandy soil in cut-over woods, fields and in open pinelands in e. Tex., Mar.-May; from Fla. to Tex., n. to N.C. and Mo.

Our plant is referable to subsp. *texana* (Small) Eiten with hairs all appressed upwards or with some intermixed ascending hairs.

9. *Oxalis stricta* L. YELLOW WOOD-SORREL, CHANCHAQUILLA. Plant typically erect or at length decumbent, tall, large-leaved, the stems subglabrous to densely covered with patent septate hairs, usually also with some short appressed nonseptate hairs, or the latter present alone but thinly so; white filiform succulent rhizomes present, easily broken off in collecting; leaves often purplish, petioles mostly with septate hairs at the base as well as nonseptate ones; stipules none; inflorescence mostly many-flowered, usually cymose; pedicels 1-2.5 cm. long, glabrous to densely pubescent with septate or nonseptate hairs or both; fruit glabrous to patent septate-hairy; seeds brown, only rarely with white markings on the transverse ridges. *O. europaea* Jord., *O. cymosa* (Small) Small, *Xanthoxalis cymosa* Small. Nat. to and common in e. and cen. U.S.; introd. into Eur. and widespread there, and perhaps present also in Afr. and w. Asia as a weed.

10. *Oxalis corniculata* L. CREEPING LADY'S-SORREL, AGRITO, JOCOYOTE. Stems creeping from a thin taproot, subglabrous to pubescent with appressed or spreading nonseptate (very rarely some septate) hairs, usually rooting at most nodes and sending up leaves and inflorescences only or also short aerial shoots; white succulent rhizomes none; leaves often purplish, with broad often auriculate stipules; inflorescence 1- to several-flowered, umbellate; fruit hoary with appressed nonseptate hairs and often longer patent septate hairs; seeds brown, only very rarely with white markings on the transverse ridges. Pantrop., spread into temp. areas in lawns, gardens, and in and around greenhouses (where it often becomes a noxious pest); reported from s. Tex.

11. *Oxalis Dillenii* Jacq. Usually caespitose, branching at base; stems usually densely strigose with white nonseptate hairs; white succulent rhizomes none; leaves mostly green; petioles never with septate hairs; stipules broad or narrow, not auricular; inflorescence 1- to several-flowered, mostly umbellate; pedicels densely strigose with nonseptate hairs; fruit hoary with appressed nonseptate hairs and often longer patent septate hairs; seeds brown with definite white markings on the transverse ridges. Incl. var. *radicans* Shinnery, *O. stricta* of Tex. auth., *O. Langloisii* Small. In sandy, rocky or gravelly soils in thickets, woodlands, pastures, canyons, river bottoms and limestone banks throughout Tex. except in the Panhandle and Trans-Pecos, Feb.-May; nat. to the U.S., very common in the e. and cen. states; very rare in w. Eur., where introd.

Those plants with creeping and rooting stems whose capsules are typically hoary from a covering of short appressed whitish hairs have been segregated as var. *radicans* Shinnery.

FAM. 95. LINACEAE S. F. GRAY¹⁰⁹

FLAX FAMILY

Herbs or shrubs; leaves simple, alternate, opposite or whorled; stipular glands present or none; flowers bisexual, regular, cymose; calyx 4- or 5-merous, imbricate; corolla 4- or 5-merous, convolute, the petals distinct or rarely united basally, fugacious; stamens commonly as many as and alternate with the petals, united at the base, sometimes with diminutive intervening staminodia; pistil 1, ovary superior; carpels 2 to 5, the locules often twice as many by the intrusion of false septa; ovules 2 per carpel; styles as many as carpels, separate or united; stigma capitate or slender; fruit a capsule or rarely fleshy; seeds flat, oily.

About 200 species in ten genera, widespread in tropical and temperate regions. Represented in Texas by a single genus.

1. LINUM L. FLAX

Annual or perennial herbs, mostly with scorpioid cymes; flowers 5-merous throughout; fruit a more or less completely 10-celled capsule, dehiscent into 10 or (along the false septa) into 5 parts; otherwise with the characters of the family.

About 150 species, widely distributed in subtropical and temperate regions.

1. Flowers blue or rarely white (2)
1. Flowers yellow (4)
- 2(1). Inner sepals with ciliate margins; stigmas slender; fruiting pedicels erect or ascending1. *L. usitatissimum*.
2. Inner sepals entire; stigmas capitate; fruiting pedicels spreading or recurved (3)
- 3(2). Perennial; petals more than 10 mm. long; styles 4-9 mm. long; Trans-Pecos Texas only2. *L. Lewisii*.
3. Annual; petals less than 10 mm. long; styles 1-3 mm. long; mostly central and northern Texas3. *L. pratense*.
- 4(1). Styles separate or nearly so; fruit ultimately dehiscent into 10 one-seeded segments (5)
4. Styles united to above the middle; fruit dehiscent along the false septa into 5 two-seeded segments (10)
- 5(4). Outer sepals entire (6)
5. Sepals all with glandular teeth (8)
- 6(5). Fruit pyriform, longer than broad; pollen with about 15 germinal pores4. *L. floridanum*.
6. Fruit spheroidal, as broad as or broader than long; pollen with 3 germinal pores (7)
- 7(6). Margins of inner sepals with conspicuous stalked glands; mature fruit in dried specimens usually adhering to the plant; leaves narrowly lanceolate or oblanceolate5. *L. medium* var. *texanum*.
7. Margins of inner sepals glandless or with very inconspicuous glands; mature fruit in dried specimens usually soon shattering; leaves elliptic to oblanceolate or obovate6. *L. striatum*.
- 8(5). Annual; styles united at the base; pollen with about 12 germinal pores9. *L. sulcatum*.
8. Perennials; styles completely separate; pollen with 3 germinal pores (9)
- 9(8). Leaves lanceolate to oblanceolate or broader, some of the lower ones in whorls of four7. *L. Schiedeanum*.
9. Leaves linear, the lower ones alternate or opposite8. *L. rupestre*.
- 10(4). Sepals entire or fringed, not glandular-toothed; flowers few, mostly terminating leafy branches (11)
10. Sepals glandular-toothed; flowers racemose or paniculate (12)

¹⁰⁹ Contributed by C. Marvin Rogers.

- 11(10). Upper leaves and bracts sparsely but conspicuously ciliate-margined; cartilaginous portion of false septa conspicuously wider toward the base of carpel 10. *L. imbricatum*.
11. Upper leaves and bracts not ciliate-margined; cartilaginous portion of false septa uniformly narrow or absent throughout 11. *L. hudsonioides*.
- 12(10). Plants grayish-puberulent throughout 12. *L. puberulum*.
12. Plants glabrous or nearly so throughout (13)
- 13(12). Outer sepals ovate, the broad scarious margins irregularly crenate, each of the coarse teeth bearing a delicate gland 13. *L. alatum*.
13. Outer sepals lanceolate or narrower, the margins not scarious or narrowly so, regularly (though sometimes sparsely) serrate with gland-tipped teeth (14)
- 14(13). False septa incomplete, the inner margin terminating in a loose fringe; sepals persistent in fruit 14. *L. vernale*.
14. False septa complete; sepals usually deciduous in fruit (15)
- 15(14). Leaves small, the lower tending to be hidden among the branches; plant broomlike, bushy with long slender stiffly spreading-ascending few-flowered branches 15. *L. aristatum*.
15. Leaves quite evident; plants not broomlike, rather few-branched at the base or in the inflorescence (16)
- 16(15). Styles more than 6 mm. long; petals more than 10 mm. long (17)
16. Styles less than 6 mm. long; petals less than 10 mm. long (19)
- 17(16). Stigmas black; sepals grayish or purplish 16. *L. rigidum* var. *filifolium*.
17. Stigmas pale; sepals green (18)
- 18(17). Fruit thin-walled (dark seeds commonly evident through the wall), elliptic, the base rounded 16. *L. rigidum* var. *rigidum*.
18. Fruit thick-walled, opaque, broadly ovoid, tapering abruptly at the flattened base ..
..... 16. *L. rigidum* var. *Berlandieri*.
- 19(16). Stipular glands absent; north Texas only 16. *L. rigidum* var. *compactum*.
19. Stipular glands present at least near the base of the plant; Trans-Pecos Texas only (20)
- 20(19). Stipular glands present near the base of the plant only 17. *L. australe* var. *australe*.
20. Stipular glands present and prominent throughout 17. *L. australe* var. *glandulosum*.

1. *Linum usitatissimum* L. COMMON FLAX, LINAZA. Glabrous annual, commonly branched at the base, 3-9 dm. tall; leaves linear to narrowly lanceolate, 15-35 mm. long; stipular glands none; inflorescence paniculate, the fruit at maturity on erect or ascending pedicels; sepals 6-8 mm. long, the outer entire, the inner with delicately fringed margin; petals blue or sometimes white, 10-15 mm. long; styles separate, 3-5 mm. long; stigmas slender; fruit broadly ovoid, 6-8 mm. high, dehiscing tardily into 10 segments; false septa incomplete, ciliate; seeds about 5 mm. long. *L. humile* Mill. Sporadic escape from cult., mostly s. and n.e. part of the state, Mar.-July; nat. of the Old World, now widely cult.

2. *Linum Lewisii* Pursh. BLUE FLAX, PRAIRIE FLAX. Glabrous perennial, branched at the base, 2-8 dm. tall; leaves linear to linear-lanceolate, 1-3 cm. long, crowded below, mostly alternate above; stipular glands none; inflorescence paniculate, few-branched, the fruit at maturity on spreading or recurved pedicels; sepals 3.5-5 mm. long, entire; petals blue or rarely white, 10-15 mm. long; styles separate, 4-9 mm. long; stigmas capitate; fruit ovoid, 5-7 mm. high, dehiscing into 10 parts; false septa incomplete, ciliate; seeds 4-5 mm. long. Sandy and rocky slopes, w. Tex., Apr.-Oct.; Alas., s. to Calif., Tex. and n. Mex.

3. *Linum pratense* (Nort.) Small. MEADOW FLAX. Glabrous annual, commonly branched at the base, 5-40 cm. tall; leaves linear to linear-lanceolate, 1-2 cm. long, crowded near the base, scattered above; stipular glands none; inflorescence paniculate, the fruit at maturity on spreading or recurved pedicels; sepals 3.5-4.5 mm. long, entire; petals blue or rarely white, 5-10 mm. long; styles separate, 1-3 mm. long; stigmas capitate; fruit ovoid, 4-6 mm. high, dehiscent into 10 parts; false septa incomplete, ciliate; seeds 3.5-4.5 mm. long. Sandy open places, n. and w. Tex., Mar.-July; s. Can., s. to cen. Mex.

4. *Linum floridanum* (Planch.) Trel. Erect glabrous perennial, 2-10 dm. tall; leaves linear-oblongate, 1-2 cm. long, the lowermost opposite, otherwise alternate throughout; stipular glands none; inflorescence paniculate, few-branched; sepals 2.5-4.5 mm. long, the outer entire, the inner glandular-toothed; petals yellow, 6-9 mm. long; staminodia none; styles separate, 2-4 mm. long; fruit ovoid-pyriform, 2-3 mm. high, dehiscent into 10 parts; false septa nearly complete, eciliate; seeds about 2 mm. long. Open pine woods, e. Tex., May-Aug.; principally along Coastal Plain, Tex. to N.C.

5. *Linum medium* (Planch.) Britt. var. *texanum* (Planch.) Fern. SUCKER FLAX. Erect glabrous perennial, 2-8 dm. tall; leaves narrowly lanceolate, 1-2.5 cm. long, the lower few opposite, otherwise alternate; stipular glands none; inflorescence paniculate; sepals 2-3.5 mm. long, the outer entire, the inner glandular-toothed; petals yellow, 5-8 mm. long; staminodia none; styles separate, 1-3 mm. long; fruit depressed-globose or subspherical, about 2 mm. high, tardily separating into 10 segments; false septa nearly complete, ciliate; seeds about 1.5 mm. long. Open fields, meadows and swales, e. Tex., May-Aug.; Tex. to Fla. and Bah. I., n. to Ia. and Me.

6. *Linum striatum* Walt. Glabrous perennial; stems usually several from the base, 3-10 dm. tall; leaves elliptic to oblanceolate or obovate, 15-35 mm. long, the lower opposite, the upper alternate; stipular glands none; inflorescence paniculate with spreading branches; sepals 1.5-3 mm. long, entire or the inner with a few diminutive marginal glands; petals yellow, 2.5-4.5 mm. long; staminodia none; styles separate, 1.2-2 mm. long; fruit depressed-globose or subspherical, about 1.75 mm. high, splitting freely upon drying into 10 segments; false septa nearly complete, ciliate; seeds about 1.2 mm. long. Open or semishaded marshes, margins of streams and roadside ditches, e. Tex., May-Aug.; Tex. to n. Fla., n. to Mich. and Mass.

7. *Linum Schiedeianum* Schlecht. & Cham. Glabrous perennial, 2-6 dm. tall; leaves lanceolate to oblanceolate, 1-2 cm. long, the lower in whorls of 4, the upper alternate; stipular glands present; inflorescence paniculate, the flowers on pedicels 1 mm. long or less; sepals 2-3.5 mm. long, glandular-toothed; petals yellow, 3-6 mm. long; diminutive staminodia present; styles separate, 1.5-3 mm. long; fruit broadly ovoid, to 2.5 mm. high, readily dehiscent into 10 segments; false septa incomplete, the septa usually with a few marginal cilia; seeds about 1.2 mm. long. Calcareous soils in the mts. of the Trans-Pecos, June-Aug.; s.e. N.M., s. through e. Mex. to Guat.

8. *Linum rupestre* (Gray) Engelm. ROCK FLAX. Glabrous or sparsely hairy perennial, 2-7 dm. tall; leaves linear to linear-lanceolate, 1-2 cm. long, alternate throughout or the lowermost opposite; stipular glands present; inflorescence paniculate; sepals 2.5-5 mm. long, glandular-toothed; petals yellow, 6-10 mm. long; diminutive staminodia present; styles separate, 3-6 mm. long; fruit ovoid, 2-3 mm. high, dehiscent into 10 sharp-pointed segments; false septa partially developed, ciliate; seeds about 1.5 mm. long. Principally calcareous soils, cen. and w. Tex., Apr.-Aug.; Tex., s.e. N.M., s. through e. Mex. to Guat.

9. *Linum sulcatum* Ridd. Glabrous erect annual, 2-8 dm. tall; leaves linear to linear-lanceolate, entire, 1-3 cm. long, alternate or the lowermost opposite; stipular glands present; inflorescence paniculate; sepals lanceolate, acuminate, 3-7 mm. long, conspicuously glandular-toothed; petals pale-yellow, 5-10 mm. long; staminodia none; styles 2-4 mm. long, united at the base; fruit ovoid, 2.5-3.5 mm. high, dehiscent into 10 sharp-pointed segments; false septa partially developed, ciliate; seeds about 2 mm. long. Prairies and open sandy gravelly fields, e. half of state, May-Aug.; Tex. to Ga., n. to Man. and N.E.

10. *Linum imbricatum* (Raf.) Shinn. TUFTED FLAX. Annual; stems 5-30 cm. long, spreading to erect, glabrous below, hirsute above; leaves narrow, opposite below, alternate above, 5-10 mm. long, strongly imbricate, the upper with sparsely ciliate margins; stipular glands none; inflorescence few-flowered, the upper pedicels mostly hidden by the sub-

tending leaves; sepals persistent, 4.5-6 mm. long, with broad scarious margins, prominently toothed; petals yellow, each with or without brick-red base, 6.5-8 mm. long; styles 2-4 mm. long, united nearly to the summit; fruit broadly ovoid, 2.6-3 mm. high, dehiscent into 5 segments; false septa complete, mostly hyaline; seeds 2-2.6 mm. long. *L. multicaule* Hook. Sandy open places, e.-cen. Tex., Mar.-July; Tex. and s. Okla.

11. *Linum hudsonioides* Planch. Annual, 5-30 cm. tall; stems ascending to erect, hirsutulous on the angles above, otherwise glabrous; leaves narrow, opposite near the base, alternate above, 5-10 mm. long, imbricated throughout, eciliate; stipular glands none; inflorescence few-flowered, the pedicels usually all exerted beyond the subtending leaves; sepals persistent, 4.5-7 mm. long, the broad scarious margins toothed; petals yellow, each with or without a brick-red base, 8-12 mm. long; styles 3-6 mm. long, united nearly to the summit; fruit broadly ovoid, 2.7-3.5 mm. high, dehiscent into 5 segments; false septa almost entirely hyaline; seeds 2-2.7 mm. long. Sandy or gravelly soils in cen. Tex., Mar.-Sept.; Tex., N.M., Okla. and Kan.

12. *Linum puberulum* (Engelm.) Heller. PLAINS FLAX. Densely gray-puberulent annual, 5-25 cm. tall; leaves linear, 1-2 cm. long, alternate throughout or the lowermost opposite; stipular glands present; inflorescence paniculate; sepals 5-7 mm. long, glandular-toothed; petals yellowish-orange to salmon with reddish base, 7-14 mm. long; styles 3-7 mm. long, united nearly to the summit; stigmas dark; fruit ovoid, 3.5-4 mm. high, dehiscent into 5 segments; false septa complete, inner half scarious; seeds 2.5-3 mm. long. Sandy or gravelly open areas, w. Tex., Apr.-Sept.; Ut. to w. Neb., s. to n. Mex.

13. *Linum alatum* (Small) Winkl. Glabrous annual, 1-4 dm. tall; leaves linear to narrowly linear-lanceolate, 1-3 cm. long, alternate or the lowermost opposite; stipular glands present; inflorescence paniculate; sepals 5.5-8 mm. long, aristate, the outer with wide undulate or crenate margin and a sessile gland near the summit of each crenation, the inner regularly and closely glandular-toothed; petals yellow with reddish base, 10-18 mm. long; styles 5-9.5 mm. long, united nearly to the summit; stigma pale; fruit ovoid, 3.5-4.5 mm. high, dehiscent into 5 segments; false septa complete, the inner portion scarious; seeds 2.3-2.8 mm. long. Sandy soil in open areas, s.-cen. Tex., Mar.-July; also n.e. Tam.

14. *Linum vernale* (Woot.) Small. Glabrous annual, 1-5 dm. tall; leaves linear, 1-1.5 cm. long, alternate or the lower opposite; stipular glands present in most plants; inflorescence open, paniculate; sepals 4-7 mm. long, glandular-toothed, the outer sparsely so; petals yellow-orange to salmon with maroon base, 10-15 mm. long; styles 4-8 mm. long, united nearly to the summit; stigmas dark; fruit ovoid, 3-4 mm. high, dehiscent into 5 segments; false septa incomplete, the margin a loose fringe; seeds 2-2.8 mm. long. Stony, commonly calcareous soils, w. Tex., Mar.-Sept.; Tex., s.e. N.M. and n. Mex.

15. *Linum aristatum* Engelm. Glabrous annual, 1-4.5 dm. tall, much-branched throughout; leaves linear, 5-20 mm. long, alternate or the lowermost opposite; stipular glands nearly always present; inflorescence a diffuse panicle; sepals slender, 6-9 mm. long, glandular-toothed; petals yellow, 8-12 mm. long; styles 4.5-7 mm. long, united nearly to the summit; stigmas pale; fruit ellipsoid, clearly longer than broad, 3.5-4 mm. high, dehiscent into 5 segments; false septa complete, the larger inner portion scarious; seeds 2.5-3 mm. long. Very sandy soil, w. Tex., May-Sept.; Tex. and n. Mex. to Ut.

16. *Linum rigidum* Pursh var. *rigidum*. Glabrous annual, 2-5 dm. tall; leaves linear, 1-3 cm. long, alternate; stipular glands none; inflorescence open-paniculate; sepals 5.5-9 mm. long, glandular-toothed; petals yellow, 10-17 mm. long; styles 6-10 mm. long, united nearly to the summit; stigmas pale; fruit ellipsoid, 3.5-4.5 mm. long, dehiscent into 5 segments; false septa complete, inner half scarious; seeds 3-3.5 mm. long. Sandy, gravelly open areas, n. Tex., May-Sept.; Tex., n. to Alta. and Man.

Var. *filifolium* Shinnars. In many ways intermediate between var. *rigidum* and var. *Berlandieri*, but differing from both in having grayish sepals, black stigmas, and petals usually banded below the middle with purplish-red. Plants of southernmost part of the range, sometimes perennial, have been called *L. elongatum* (Small) Winkl. S. and w. Tex.; also n. Mex.

Var. *Berlandieri* (Hook.) T.&G. Differing from the typical var. in being somewhat shorter and more compact, having stipular glands in most individuals, petals brick-red at the base, and thick-walled triangular-ovate fruit. Throughout the state; Tex. to Colo. and Kan.

Var. *compactum* (A. Nels.) Rogers. Differs from the typical var. in its compact habit and from all vars. in its small floral parts. N. Tex. to Alta. and Sask.

17. *Linum australe* Heller var. *australe*. Glabrous annual. 1-5 dm. tall; leaves linear, 1-2 cm. long, alternate; stipular glands present near base of plants; inflorescence open-paniculate; sepals 4-6.5 mm. long, glandular-toothed; petals yellow, 5-9 mm. long; styles 2-4 mm. long, united nearly to the summit; stigmas pale; fruit ovoid, 3-4 mm. high, dehiscent into 5 segments; false septa complete, inner half scarious; seeds 2.5-3 mm. long. Semi-shaded hillsides, mts. of w. Tex., June-Aug.; Tex. to Ariz. and s. Nev. to Alta.

Var. *glandulosum* Rogers. Differs from the typical var. in having slightly larger floral parts, smaller fruits and stipular glands throughout. Mts. of w. Tex.; Tex. to Ariz. s. to Pue.

FAM. 96. ZYGOPHYLLACEAE R. BR.¹¹⁰

CALTROP FAMILY

Prostrate to ascending annual or perennial herbs from an herbaceous to woody root-stock, shrubs or rarely small trees; branches diffuse, crooked at nodes; stipules present; leaves opposite or rarely clustered in fascicles at nodes or alternate, even-pinnate and once-compound or rarely irregularly pinnatifid; leaflets usually opposite and paired, entire; flowers perfect, regular or nearly so, 5-merous, pseudaxillary; peduncles solitary or rarely clustered; sepals 4 or 5, free, sometimes unequal, imbricate or valvate in bud, persistent to deciduous; petals 4 or 5, free, equal, spreading, imbricate, valvate or convolute in bud; stamens 10 to (12 to 15), usually in 2 whorls; filaments free or outer whorl connate basally to petals, sometimes winged basally or with a basal appendage; disk usually conspicuous; gynoeceium of 2 to 5 united carpels; ovary superior, 2- to 5- or 10-lobed and -loculed; ovules 1 to many per locule, the placentation axile; style usually persisting to form a beak on fruit apex; fruit a lobed or winged variously dehiscent capsule, or separating at maturity into 5 or 10 indehiscent mericarps; seeds 1 to many per locule.

A relatively small family of about 27 genera and 250 species. Widely distributed, with a number of old, relict genera found mainly in the warmer, drier regions of the world.

1. Erect woody shrubs or small trees (2)

1. Prostrate to ascending annual or perennial herbs (3)

2(1). Petals bright-yellow; leaflets 2; fruit a 5-lobed white- to red-woolly capsule ...
.....1. *Larrea*, p. 901.

2. Petals blue or purple; leaflets 4 to 8 pairs; fruit a 2-lobed minutely puberulent capsule
.....2. *Porlieria*, p. 902.

3(1). Leaves alternate; fruit a glabrous irregularly loculicidal capsule
.....3. *Peganum*, p. 902.

3. Leaves opposite; fruit at maturity separating into 5 or 10 indehiscent mericarps (4)

4(3). Intrastaminal glands absent; mericarps 10, tubercled, 1-seeded; beak of fruit
persisting after mericarps fall4. *Kallstroemia*, p. 903.

4. Intrastaminal glands present; mericarps 5, spiny, 3- to 5-seeded; beak of fruit falling
with mericarps5. *Tribulus*, p. 905.

1. LARREA CAV.

A New World genus with 1 species in North America and 4 species in the deserts of South America.

1. *Larrea tridentata* (DC.) Cov. CREOSOTE BUSH, GOBERNADORA, HEDIONDILLA. Ever-green shrubs to 3 m. high, aromatic with odor of creosote (especially when moist); numerous flexuous slender stems radiating and ascending divaricately from near ground level, with no well-defined trunk; bark gray; nodes dark, conspicuous, resinous, giving

¹¹⁰ Contributed by Duncan M. Porter.

stems a jointed appearance; leaves opposite, subsessile to short-petiolate; leaflets 2, opposite, divaricate, inequilateral, falcate, connate basally, ovate to oblong or obovate to sometimes lanceolate, apex acute, coriaceous, glossy dark-green to yellowish-green, resinous, 5-10 mm. long; flowers solitary, to about 25 mm. in diameter; sepals 5, unequal, 5-8 mm. long, imbricate in bud, caducous; petals 5, bright-yellow, obovate, concave, short-clawed, twisted on edge, 7-10 mm. long, about 5 mm. wide; stamens 10; filaments winged, with basal scales half to as long as filaments; capsule globose, 5-lobed and -loculed, densely white- to red-woolly, about 6 mm. in diameter; carpels 1-seeded, indehiscent, at length separating from capsule. *L. mexicana* Moric., *L. glutinosa* Engelm. Probably the most abundant plant on the alluvial plains of the Trans-Pecos, less common in the mts. and e. across the w. part of the Edwards Plateau to Howard, Crockett and Terrell cos., thence s.e. along the Rio Grande to Starr Co., mainly Feb.-Aug.; throughout the warm deserts of N.A. from Calif., Nev., Ut., Ariz. and N.M. to Tex. and across Baja Calif., Son., Chih., Coah., N.L. and Tam. to Dgo., Zac., Ags., and S.L.P., with outlying localities in Qro. and Hgo.

Various decoctions of the plant, especially extractions of the leaves and twigs, are considered in folk medicine to be effective in treating a variety of conditions; by some it is reputed to be poisonous. Some authors consider this species to be conspecific with the South American *L. divaricata* Cav., a name that has priority over *L. tridentata*, and which must be used if the two are merged.

2. PORLIERIA R. & P.

A New World genus of about 4 species, 1 in North America and several in the South American deserts. This interesting bicentric distribution is also found in *Larrea* and in several other genera of the family. *Porlieria* is closely related to *Guaiacum*, a genus of the Caribbean region and western Mexico, which differs in having minute deciduous stipules, fewer and larger leaflets, no staminal appendages and more ovules in each ovary locule.

1. *Porlieria angustifolia* (Engelm.) Gray. GUAYACÁN, SOAP-BUSH. Evergreen shrubs or small trees, to 7 m. high; trunk well-defined, to 25 cm. in diameter; branches many, spreading or straggling, stout, crooked, knotty; bark gray, fissured; stipules subulate, somewhat spinescent, persistent; leaves opposite or crowded in fascicles at nodes, pinnate, 1-3 cm. long, folded at night and often also in heat of day; leaflets 4 to 8 pairs, sessile or nearly so, dark-green, coriaceous, reticulate, linear-oblong to linear-spatulate, apiculate, base oblique, 5-15 mm. long, 2-3 mm. wide; peduncles in axils of minute bracts, solitary or sometimes clustered; flowers 12-20 mm. in diameter, fragrant; sepals 5, unequal, suborbicular, obtuse, concave, 5 mm. long, imbricate in bud; petals 5, blue to purple, obovate to nearly elliptical, short-clawed, apex often notched, about 1 cm. long; stamens 10; filaments each with a small crenate basal scale; capsule 2 or (3 or 4) -lobed and -loculed, obcordate, flat, reticulate, coriaceous, puberulent, 1-2 cm. in diameter, margin somewhat winged, apex abruptly attenuate-apiculate, septicidally dehiscent; seeds 1 per locule, yellowish-brown, reniform, enclosed in a thick fleshy scarlet aril. Frequent in brush, across the Rio Grande Plains from Cameron to Comal cos. and scattered through canyons along the valley of the Rio Grande to Brewster and Pecos cos. in the Trans-Pecos, Mar.-Sept.; s. into Chih., Coah., N.L. and Tam.

The bark of the root is used as a source of soap, and root extracts are used in folk medicine to treat various diseases.

3. PEGANUM L.

Densely foliaged, dichotomously and corymbosely branched, prostrate to ascending and globose herbs less than 1 m. high; stems herbaceous, pubescent to glabrous, from a perennial woody rootstock; stipules setaceous, 1-2 mm. long; leaves alternate, fleshy, irregularly pinnatifid; lobes linear, acute to apiculate, pubescent to glabrous, 2-6 cm. long; flowers solitary; sepals 4 or 5, foliaceous, conspicuous, irregularly pinnatifid to entire, the segments linear, acute to apiculate, valvate in bud, persistent; petals 4 or 5,

white to yellow, subequal, imbricate in bud; stamens 12 to 15, 1 whorl alternate with petals, other in pairs opposite petals; filaments linear, the bases dilated; ovary globose, (2 or) 3 (or 4) -lobed and -loculed; ovules many per locule; capsule subglobose, (2 or) 3 (or 4) -lobed and -loculed, chartaceous, irregularly loculicidally dehiscent; style persisting to form a beak as long as or longer than fruit body; seeds triangular, dark, curved, many per locule.

A genus of 3 species. One native to the Chihuahuan Desert of North America, one found across the Great Palaeartic Desert from Morocco to Manchuria, and the third occurring in and around the Gobi Desert in Asia.

1. Peduncle shorter than petals in flower, in fruit recurved and shorter than capsule 1. *P. mexicanum*.
1. Peduncle about twice as long as petals in flower, erect and longer than capsule in fruit 2. *P. Harmala*.

1. *Peganum mexicanum* Gray. GARBANCILLO, LIMONCILLO. Stems prostrate to decumbent, pubescent, becoming glabrate, often glaucescent, to 3 dm. long; leaves pubescent to glabrate; peduncles shorter than petals; sepals to twice as long as petals; petals pale-yellow, narrowly oblong, less than 1 cm. long, a third as wide; filaments scarcely dilated basally; disk annular; peduncles recurved in fruit, shorter than capsules; capsules less than 1 cm. in diameter, shorter than sepals. Infrequent, scattered in alluvial often gypsum-bearing soils; in the U.S. only in Hudspeth Co. in the Trans-Pecos, May-Oct.; s. through Son., Chih., Coah., N.L. and Tam. to Zac. and S.L.P.

The herbage is reputed to be poisonous to cattle and sheep.

2. *Peganum Harmala* L. Stems prostrate to ascending and globose, pubescent to glabrous, to 9 dm. long and 3 dm. high; leaves glabrous to slightly pubescent; peduncles about twice as long as petals; sepals usually longer than petals; petals white to yellow, oblong-elliptic, to 15 mm. long, one half as wide to as wide as long; filaments dilated basally; disk cupuliform; peduncles longer than capsules in fruit, erect; capsules to 15 mm. in diameter, much shorter than sepals. Scattered across the Trans-Pecos in Hudspeth, Reeves, Presidio and Pecos cos., in Edwards Co. on the Edwards Plateau, and in Garza Co. in the Plains Country, Apr.-Nov.; an introd. weed from the Great Palaeartic Desert, spreading from an introd. in Luna Co., N.M., in the 1930's; also known from Ariz. and Nev.

The seeds are the source of the dye "Turkey-red." Also reputed to be poisonous to stock.

4. KALLSTROEMIA Scop.

Prostrate or decumbent to ascending diffusely branching annual or perennial herbs; stems pubescent to glabrate, spreading radially from a central taproot; leaves opposite, even-pinnate, obovate to elliptical, 1 of each pair alternately smaller or sometimes abortive; leaflets 3 to 8 pairs, oblong or obovate to elliptical, inequilateral, somewhat unequal; flowers solitary, the peduncles emerging from axils of the alternately smaller leaves; sepals 5, lanceolate or subulate to ovate, pubescent, imbricate in bud, persistent or rarely deciduous; petals 5, orange or yellow (rarely white), obovate, apex rounded to slightly notched, convolute in bud, marcescent; stamens 10, in 2 whorls of 5 each, outer whorl opposite petals and adnate to them basally, usually slightly longer than inner whorl; ovary globose or ovoid, 10-lobed and -loculed, pubescent to glabrous; ovules 1 per locule; style forming a persistent beak on fruit apex; fruit body ovoid, 10-lobed, pubescent to glabrous, at maturity separating into 10 indehiscent 1-seeded unarmed mericarps.

The largest and most difficult New World genus of the family, with 17 species in the warm arid and dry tropical areas of the Americas. The species usually are to be encountered in disturbed, sandy, alluvial soils.

1. Flowers 25 mm. in diameter or larger (2)
1. Flowers less than 25 mm. in diameter (3)

- 2(1). Herbaceous annual; peduncles longer than subtending leaves; stamens as long as style1. *K. grandiflora*.
 2. Subwoody-based perennial; peduncles shorter than subtending leaves; stamens about two thirds as long as style2. *K. perennans*.
 3(1). Fruits glabrous3. *K. maxima*.
 3. Fruits pubescent (4)
 4(3). Petals orange; beak of fruit longer than fruit body .4. *K. parviflora*.
 4. Petals yellow; beak of fruit shorter than fruit body (5)
 5(4). Sepals persistent; base of broadly conical beak surrounded by conspicuous ring of hirsute trichomes5. *K. hirsutissima*.
 5. Sepals usually deciduous; base of cylindrical beak glabrous to pubescent but ring of hirsute trichomes absent6. *K. californica*.

1. *Kallstroemia grandiflora* Gray. DESERT POPPY, MEXICAN POPPY. Decumbent to ascending annual; stems densely sericeous and hispid, to 1 m. long; leaves elliptical, 1.5-7 cm. long; leaflets 4 to 8 pairs, elliptical to slightly obovate, appressed-hirsute, becoming glabrate, 8-25 mm. long, 2-5 mm. wide; peduncles longer than subtending leaves; sepals lanceolate, 6-16 mm. long, 1.5-2.5 mm. wide, persistent; petals orange or rarely white, broadly obovate, 1-2 cm. long, 7-15 mm. wide; fruit body ovoid, strigose, 4-5 mm. in diameter; beak cylindrical, 6-18 mm. long; mericarps about 3.5 mm. high and 1 mm. wide, tubercles rounded. Across the Trans-Pecos from El Paso Co. e. to Loving Co. and s. to Brewster Co., often in limestone soils, May-Nov.; from extreme s.e. Calif. through s. Ariz. and N.M. to Tex., through Son. and Chih. to Coah. and s. along the w. coast of Mex. through Sin., Dgo., Nay., Jal., Colima and Michoac. to Gro.

A common plant of the warm deserts of North America; in favorable years sometimes forming large populations many yards across.

2. *Kallstroemia perennans* B. L. Turner. Prostrate to ascending perennial, 1-2 dm. high; stems densely hispid and strigose, 1 to several from a thick subwoody rootstock; leaves elliptical, 20-55 mm. long; leaflets 4 to 5 pairs, oblong to ovate, densely appressed-hirsute, 13-18 mm. long, 6-10 mm. wide; peduncles shorter than subtending leaves; sepals lanceolate, 13-15 mm. long, 1.5-2.5 mm. wide, persistent; petals orange, obovate, 19-26 mm. long, about 10 mm. wide; fruit body broadly ovoid, hispid and strigose, 5-6 mm. high, 8-10 mm. wide; beak cylindrical, 6-10 mm. long; mericarps cross-ridged and more or less keeled, about 4 mm. high and 2.5 mm. wide. *K. hirsuta* L. O. Wms. This rare endemic of limestone soils is known from the w. Edwards Plateau in the vic. of Langtry, Val Verde Co., and from s.w. Brewster Co. and adj. Presidio Co. in the Trans-Pecos, May-Aug.; to be expected on the Mex. side of the Rio Grande.

3. *Kallstroemia maxima* (L.) H. & A. Prostrate to decumbent annual; stems sericeous and sparingly hirsute, becoming glabrate, to 1 m. long; leaves obovate, 1-6 cm. long; leaflets 3 or 4 pairs, broadly oblong to elliptical, 5-29 mm. long, 3-14 mm. wide; peduncles in fruit as long as or longer than subtending leaves; sepals ovate, 3-8 mm. long, 2-3 mm. wide, persistent; petals yellow, obovate, 7-8 mm. long, to 6 mm. wide; fruit body ovoid, glabrous, 5-6 mm. in diameter; beak widely conical basally, about as long as body; mericarps tuberculate, cross-ridged and slightly keeled, 3-4 mm. high, about 1 mm. wide. This widespread weedy Carib. and trop. Mex. species has been collected twice in Washington Co., s.-cen. Tex., in the 1930's, to be expected elsewhere in Tex., July-Oct.; in the U.S. known also from coastal Fla., Ga. and S.C.

4. *Kallstroemia parviflora* Nort. Prostrate to decumbent annual; stems hirsute and sericeous, becoming glabrate, to 1 m. long; leaves elliptical, 1-6 cm. long; leaflets 3 to 5 pairs, elliptical to oblong or oval, appressed-hirsute, 8-19 mm. long, 3.5-9 mm. wide; peduncles usually longer than subtending leaves; sepals lanceolate, 4-7 mm. long, 1-2 mm. wide, persistent; petals orange, narrowly obovate, 5-11 mm. long, 3.5-6 mm. wide; fruit body ovoid, strigose, 3-4 mm. high, 4-6 mm. wide; beak cylindrical, longer than body, 4-9 mm. long; mericarps rugose to tubercled, 3-4 mm. high, about 1 mm. wide. *K. intermedia* Rydb. The most common representative of the genus in Tex., occurring everywhere but in e. and s.e. Tex., the High Plains and the southernmost Rio Grande Plains, Apr.-Nov.; w. through N.M., Colo., Ariz. and s. Nev. to s.e. Calif., n. through

Okla., Kan. and Mo. to Ill. and Miss., from Son. through Chih., Coah., N.L., Dgo., Zac., Ags. and S.L.P. to Gto., Qro., and Hgo.

5. *Kallstroemia hirsutissima* Vail. CARPETWEED. Prostrate annual, forming a dense carpetlike mat; stems copiously gray-sericeous and hirsute, 15-70 cm. long; leaves obovate, 1-4 cm. long; leaflets 3 or 4 pairs, broadly elliptical to oblong-ovate or broadly ovate, densely hirsute and conspicuously ciliate, 12-19 mm. long, 5-11 mm. wide; peduncles shorter than subtending leaves; sepals subulate, 2.5-4 mm. long, about 1 mm. wide, persistent; petals yellow, obovate, 2-4 mm. long, about 1.5 mm. wide; fruit body broadly ovoid, strigillose, 4-5 mm. high, 6-8 mm. wide; beak broadly conical and white-hirsute basally, shorter than body, 1-4 mm. long; mericarps prominently tubercled, about 4 mm. high and 1 mm. wide. Found sparingly across the Rio Grande Plains from Cameron Co. to Kinney and Bexar cos. in Kerr Co. on the Edwards Plateau and in the Trans-Pecos in Jeff Davis, Pecos and Brewster cos., June-Nov.; from s.e. Ariz. and s. N.M. to Tex. and through Chih., Coah., N.L. and Tam. to S.L.P.

Reported to be poisonous to livestock.

6. *Kallstroemia californica* (Wats.) Vail. Prostrate to decumbent annual; stems hirsute and strigose, becoming glabrate, 10-65 cm. long; leaves elliptical, 1.5-6 cm. long; leaflets 3 to 6 pairs, elliptical to oval, appressed-hirsute, becoming glabrate, 4-17 mm. long, 1.5-9 mm. wide; peduncles shorter than subtending leaves; sepals lanceolate, 2-4 mm. long, 1-1.5 mm. wide, usually deciduous; petals yellow, obovate, 4-6 mm. long, 2.5-3 mm. wide; fruit body ovoid, strigillose, 3-5 mm. wide, to 4 mm. high; beak cylindrical, the base conical, shorter than body, 2-4 mm. long; mericarps about 3 mm. high and 1 mm. wide, with blunt oblong tubercles to 1.5 mm. long. Incl. var. *brachystylis* (Vail) Kearns & Peeb. *K. brachystylis* Vail. Found sparingly in the Trans-Pecos along the valley of the Rio Grande in El Paso, Hudspeth, Presidio and Brewster cos., common throughout the Rio Grande Plains and spreading n. to Kerr Co. on the Edwards Plateau and e. to Lavaca Co. in s.-cen. Tex., Mar.-Nov.; Calif., Ariz. and N.M. to Tex., from Baja Calif. through Son., Chih., Coah., Tam., Sin., Dgo., and S.L.P. to Nay.

5. TRIBULUS L. CALTROP

Prostrate to ascending diffusely branching annual or perennial herbs; stems appressed-sericeous and hirsute, spreading radially from a central taproot, to 3 m. long; leaves opposite, even-pinnate, elliptical, one of each pair alternately smaller or sometimes abortive; leaflets 3 to 7 pairs, oblong to ovate or elliptical, inequilateral; flowers solitary, the peduncles emerging from axils of the alternately smaller leaves; sepals 5, ovate to lanceolate, pubescent, imbricate in bud, deciduous; petals 5, bright-yellow or rarely white, obovate, apex rounded to lobed; stamens 10, in 2 whorls of 5 each, outer whorl opposite petals and adnate to them basally, usually slightly longer than inner whorl; intrastaminal glands present; ovary ovoid, 5-lobed and -loculed, densely hirsute-pilose; ovules 3 to 5 per locule; fruit at maturity separating into 5 indehiscent mericarps, each with 2 to 4 stout dorsal spines and occasional smaller spines and aristate tubercles; each mericarp divided internally by oblique transverse septa into 3 to 5 1-seeded compartments; beak falling with mericarps.

A genus of the Old World deserts, with perhaps several dozen species. Three species occur as introduced weeds in the Americas.

1. Prostrate annual; flowers 5-10 mm. in diameter; peduncles usually shorter than subtending leaves; intrastaminal glands free 1. *T. terrestris*.

1. Prostrate to ascending perennial; flowers 20-40 mm. in diameter; peduncles usually longer than subtending leaves; intrastaminal glands connate, forming a 5-lobed ring around ovary base 2. *T. cistoides*.

1. *Tribulus terrestris* L. CALTROP, GOAT HEAD, PUNCTURE WEED, AROJO DE FLOR AMARILLA, CADILLO. Prostrate annual; leaves 10-45 mm. long; leaflets 3 to 6 pairs, oblong to ovate, 4-11 mm. long, 1-4 mm. wide; flowers 5-10 mm. in diameter, the peduncles usually shorter than subtending leaves; sepals ovate, 2-3 mm. long, 1.5-2 mm. wide; petals 3-5 mm. long, 2-3 mm. wide; intrastaminal glands free; fruits to about 1 cm. in diameter (excluding spines), larger spines 4-7 mm. long. Abundant usually in sandy or gravelly

disturbed soils throughout the state except on the Gulf Coast and the extreme e. portion, Apr.-Nov.; nat. to Medit. region, now widely distributed as a weed throughout the warm-temp. areas of the world.

The spiny mericarps are a nuisance to both man and beast, injurious to bare feet and automobile tires, and occasionally fatal to stock if eaten. The plants are extremely difficult to eradicate once established in an area, as the seeds will remain viable in the soil for at least 8 years.

2. *Tribulus cistoides* L. BURR NUT. Prostrate to ascending perennial; leaves 15-75 mm. long; leaflets 5 to 7 pairs, oblong to elliptical, 10-19 mm. long, 4-8 mm. wide; flowers 2-4 cm. in diameter, the peduncles usually longer than subtending leaves; sepals lanceolate, 6-9 mm. long, 2-3 mm. wide; petals 8-22 mm. long, 5-16 mm. wide; intrastaminal glands connate into a 5-lobed ring around ovary base; fruits to about 15 mm. in diameter (excluding spines), larger spines 5-8 mm. long. Reported to occur in Tex., but no specimens from the state have been seen; in the U.S. known from coastal Fla., Ga. and La., to be expected along the Tex. Gulf Coast; nat. to the Old World, a pantrop. weed, especially common in the Carib. region and trop. Mex., usually found in maritime habitats.

FAM. 97. RUTACEAE JUSS.

CITRUS FAMILY

Armed or unarmed shrubs or perennial herbs, rarely small trees; leaves alternate or opposite, often pinnately or palmately compound or by reduction simple, usually firm and thickish and aromatic, furnished at least on the underside of the leaves (and usually throughout the epidermis) with aromatic oil glands (these obscure in *Ptelea*); petioles and/or rachises often wing-margined; stipules absent; flowers perfect or polygamous or dioecious, in various types of inflorescences; calyx usually 5- (or 4-) parted, sometimes gamosepalous, sometimes caducous, or rarely absent; corolla of 3 to 5 or rarely more usually imbricate petals, or rarely absent; stamens 1 to 3 times as many as the petals, usually twice as many, and free or variously connate near the base, when 2 whorls present the outer whorl opposite the petals; a "disk" usually present just above the level of the androecium and below the ovary; ovary and fruit superior, very diverse in the family, but usually of several carpels oriented around a central columella, sometimes the carpels only lightly coalescent, and sometimes reduced to one; ovules anatropous; endosperm usually copious.

More than 900 species in about 150 genera, mainly in the tropics and temperate regions, especially South Africa and Australia.

- 1. Leaves opposite or some of them subopposite (2)
- 1. Leaves alternate (4)
- 2(1). Leaves trifoliolate6. *Helietta*, p. 908.
- 2. Leaflets more than 3 on most leaves (3)
- 3(2). Leaves palmately compound8. *Choisya*, p. 909.
- 3. Leaves pinnately compound3. *Amyris (madrensis)*, p. 907.
- 4(1). Herbs or subshrubs (5)
- 4. Shrubs or small trees (6)
- 5(4). Leaves simple; fruit 2-celled5. *Thamnosma*, p. 908.
- 5. Leaves much-divided; fruit 4- or 5-celled4. *Ruta*, p. 907.
- 6(4). Fruit with a leathery bitter oily rind and several wedge-shaped acidulous juicy endocarps each with several seeds; stamens usually at least 151. *Citrus*, p. 907.
- 6. Fruit not a hesperidium; stamens fewer than 15 (7)
- 7(6). Fruit a berry or drupe (8)
- 7. Fruit samaralike or else a capsule or folliclelike (9)
- 8(7). Calyx 3- (rarely 4-) lobed; plants armed2. *Triphasia*, p. 907.
- 8. Calyx otherwise; plants unarmed3. *Amyris (texana)*, p. 907.
- 9(7). Fruit samaralike7. *Ptelea*, p. 909.
- 9. Fruit a capsule or folliclelike (10)

- 10(9). Fruit a 4- or 5-celled woody capsule 9. *Esenbeckia*, p. 910.
 10. Each pistillate flower bearing 1 to 5 bivalved folliclelike carpids
10. *Zanthoxylum*, p. 910

1. CITRUS L. CITRUS

An Asiatic genus of about a dozen species, of which several are cultivated in Texas and one is said to have escaped. The cultivated citrus fruit plants such as orange (*C. Aurantium* L.), grapefruit [*C. maxima* (Burm.) Merr. var. *uvacarpa* Merr. & Lee], lemon (*C. Limonia* Osbeck) and lime [*C. aurantifolia* (Christm.) Swingle] all have unifoliate leaves.

1. *Citrus trifoliata* L. TRIFOLIATE ORANGE, BITTER ORANGE. Shrub or small tree; branches usually armed with stout straight thorns; leaves deciduous, trifoliolate; leaflets elliptic or obovate, 17-40 mm. long, entire-margined; flowers solitary, perfect; calyx cup-shaped, 3- to 5-toothed; petals usually 4 or 5, whitish, fragrant; stamens at least 15; fruit globose or subglobose, about 4 cm. thick. *Poncirus trifoliata* (L.) Raf. Infrequent near old home-sites and in fencerows in the e. half of the state where it is cult. and occasionally occurs as an escape; nat. of Asia (probably originally Japan).

2. TRIPHASIA LOUR.

A monotypic genus of southeast Asia.

1. *Triphasia trifolia* (Burm. F.) P. Wils. LIMEBERRY. Spiny evergreen shrub 1-2 m. tall; spines paired at the nodes (or in the axils), 5-17 mm. long, straight; leaves alternate, trifoliolate; leaflets crenate, ovate to broadly elliptic, 1-4 cm. long; flowers solitary; calyx cup-shaped, 3- or 4-lobed; petals white, fragrant, 3 or 4, 12-16 mm. long, imbricate in bud; stamens 6 (or 8); fruit a berry, 1- to 3-seeded, globose, or slightly prolate, red, 10-16 mm. long, insipid, punctate with aromatic oil glands. Cult. in s. Tex. and said to have escaped; nat. of Asia, now widely introd. in warm regions.

3. AMYRIS P. BR.

Unarmed shrubs; leaves pinnately compound, alternate or opposite; flowers in terminal arrangements, inconspicuous, perfect; pedicels bibracteate; sepals 4 or 5; petals 4 or 5, whitish, 2.5-3 mm. long; stamens 8 or 10; ovary 1-celled; ovules 2, pendulous; fruits a small blackish globose juicy drupe, 4-12 mm. thick.

An American genus of perhaps 2 or 3 dozen species, ranging from Peru and Venezuela north to the West Indies and the warmer parts of Mexico, 2 species venturing even as far north as south Texas, and another as far north as Florida.

1. Leaves alternate, trifoliolate, glabrous 1. *A. texana*.
 1. Leaves opposite or subopposite, 5- to 11-foliolate, pubescent
 2. *A. madrensis*.

1. *Amyris texana* (Buckl.) P. Wils. LANTRISCO, CHAPOTILLO. Rounded shrubs often only 1 m. tall, less commonly to 2 m.; leaves alternate, trifoliolate, glabrous and shiny; leaflets 1-3 cm. long, 5-15 mm. broad; drupes 4-5 mm. thick. *A. parvifolia* Gray. Locally abundant in brush in s. Tex., n. along the coast to Jackson Co., spring-fall; Tex., N.L., Tam. and extreme n. Ver.

2. *Amyris madrensis* Wats. Shrubs 1-3 m. tall; leaves opposite or subopposite, 5- to 11-foliolate, dull and pubescent; leaflets ovate or rhombic-ovate, 15-30 mm. long, 7-20 mm. broad; drupes mostly 8-12 mm. thick. Infrequent or rare in brush in extreme s. Tex. (Cameron, Hidalgo and Willacy cos.), spring-fall; Tex., Coah, N.L. and Tam.

4. RUTA L. RUE

Glaucous unarmed perennial herbs 3-8 dm. tall, often woody at base; herbage with a strong disagreeable odor when bruised; leaves alternate, gland-dotted, twice or thrice

pinnately or ternately divided; flowers perfect, in terminal corymbose or paniced cymes; sepals 4 or 5, 3-4 mm. long, persistent; petals 4 or 5, 5-9 mm. long, cymbiform, yellow or greenish, imbricate in bud; disk thick, 8- to 10-lobed; stamens 8 or 10, lying in pairs; ovary 4- or 5-celled, more or less 4- or 5-lobed; ovules several in each cell; fruit a 4- or 5-celled capsule.

A Mediterranean and Asian genus of perhaps 50 species, of which at least 2 are widely introduced and weedy.

1. Petals entire or toothed; lobes of the capsule rounded . . . 1. *R. graveolens*.

1. Petals fringed; lobes of the capsule pointed 2. *R. chalapensis*.

1. *Ruta graveolens* L. RUE, RUDA. Characters as in the key. Infrequent along roadsides in s. and w. Tex., spring-fall; Eur., now widely introd.

Reputed to be a narcotic and stimulant. Rue is the symbol of grace.

2. *Ruta chalapensis* L. RUE. Characters as in the key. Infrequent or rare in Edwards Plateau and probably elsewhere in w. Tex.; nat. of N. Afr., now widely introd. in warm regions.

5. THAMNOSMA TORR. & FRÉM. DUTCHMAN'S BREECHES

A curiously distributed genus of 4 or 5 species, mostly in the warmer, drier parts of North America, but with 1 species in Socotra (Gulf of Aden or Arabian Sea), and 1 in South Africa.

1. *Thamnosma texana* (Gray) Torr. RUDA DEL MONTE. Unarmed perennial herb or subshrub usually less than 3 dm. tall; leaves alternate, simple, essentially linear and entire, very strongly gland-dotted, 5-15 mm. long, somewhat fleshy, disagreeably aromatic when bruised; flowers perfect, in racemes or racemose cymes; sepals 4; petals 4, imbricate in bud, at anthesis erect and somewhat incurved, together somewhat urceolate though not coalescent; disk well-developed; stamens 8; ovary 2-celled, 2-lobed, stipitate; ovules several in each cell; fruit a leathery 2-celled and 2-lobed capsule 3-7 mm. long, in the shape of inflated "dutchman's breeches" with the legs projecting upward. Frequent but inconspicuous, Rio Grande Plains, s. and w. parts of Edwards Plateau, the Trans-Pecos and s. parts of Plains Country, early spring (and again in fall); Tex., N.M. and Ariz. and n. Mex.

The plants east of the 100th meridian have mostly clear canary-yellow flowers. To the west the flowers are mostly purplish with only a slight yellow center, or even this becoming obscured in the extreme west; these more western populations are the f. *purpurea* (Woot. & Standl.) Lundell (*Rutosma purpurea* Woot. & Standl., *Thamnosma Aldrichii* Tharp).

6. HELIETTA TUL.

A genus of about 7 species of Paraguay, Argentina, Uruguay, Brazil, Venezuela, Cuba, Mexico and Texas, mostly inhabiting low, subhumid forests or xeric scrub.

1. *Helietta parvifolia* (Gray) Benth. BARRETA. Unarmed spindly shrubs (1-) 2-4 m. tall; leaves opposite, trifoliolate, 35-50 mm. long, mostly glabrate; leaflets sessile or nearly so, usually oblong-obovate, apically rounded; flowers in terminal panicles, perfect, small; calyx 3- or 4-parted, about 2 mm. broad; petals 3 or 4, imbricate in bud, ovate to broadly elliptic, 2.5-3 mm. long; stamens 3 or 4; ovary 3- or 4-celled, 3- or 4-lobed; fruit of 3 or 4 indehiscent samaralike carpels, separating from each other at maturity, each winged on the upper dorsum, 10-15 mm. long; ovules 2 in each cavity but seeds solitary by abortion, about 6 mm. long. Confined to gravel and rocky hills a few miles east of Rio Grande City, Starr Co., extreme s. Tex., where it was originally locally abundant, spring, occasionally later; Hgo., S.L.P., Tam., N.L. and Tex.

This species, as well as several other associated unique species, is threatened with extermination in Texas due to the massive bulldoze-clearing of the hills on which they grow in order that a pittance of forage might be obtained. The Texas Parks Department or Highway Roadside Parks Division should salvage some of this unique floral region before it is too late to do so.

7. PTELEA L.¹¹¹

Unarmed aromatic polygamo-dioecious deciduous shrubs with pallid or even whitish epidermis and bark; leaves alternate, trifoliolate, rather variable in pubescence; leaflets variable in shape, usually 2-6 cm. long; flowers in terminal panicles, greenish-white; sepals 4 or 5 (or 6), 1-2 mm. long, soon deciduous; petals 4 or 5 (or 6), imbricated in bud, commonly 4-5 (-6) mm. long, broadly elliptic to ovate or linear-oblong; stamens 4 or 5 (or 6), alternate to petals (reduced to vestiges in pistillate flowers); disk lobed, acting as a gynophore; ovaries compressed, 2- (or 3-) locular; ovules 2 in each locule but the lower one in each locule aborting; fruit an indehiscent samara in a single plane, with a thin wing all around.

A North American genus of 3 species of which we have only one.

1. *Ptelea trifoliata* L. SKUNK-BUSH, WAFER-ASH, COLA DE ZORRILLO. Nearly throughout the state but absent from extreme s. part, and in w. Tex. found only in protected canyons. We have several weakly distinguished and completely intergrading infraspecific taxa as follows:

1. Leaves with relatively small glands that are mostly less than 0.1 mm. across; fruits mostly 2-carpellate, the seed-bearing bodies usually less than 1 mm. thick and commonly near center or above middle of wings (2)
1. Leaves with glands 0.15-0.25 (-0.3) mm. across; fruits often 3-carpellate, the seed-bearing bodies often 2(-3) mm. thick and sometimes below the middle of the wings (3)
- 2(1). Herbage glabrate (forests of extreme e. Tex.)subsp. *trifoliata* var. *trifoliata*.
2. Herbage pubescent (Aransas Bay n.w. to s. margin of Edwards Plateau and n.e. to e., s.e. and n.-cen. Tex.subsp. *trifoliata* var. *mollis* T.&G.
- 3(1). Lateral leaflets commonly strongly inequilateral, the angles between the lower margins and the midvein as much as 90°; leaf blades firmly herbaceous to subcoriaceous, usually dull-dark-green above, paler to glaucous beneath; the glands often very large and numerous, the margins crenate to entire (canyons of the High Plains Country)subsp. *polyadenia* (Greene) Bailey.
3. Lateral leaflets nearly equilateral, the angles between the lower midveins usually not more than 50° (rarely to 60°); leaf blades flexible-herbaceous, bright-green and somewhat glossy above, margins serrulate to irregularly serrate-dentate (4)
- 4(3). Leaf blades paler beneath, usually with prominent whitish veins; leaflets attenuate to acuminate at tips, at least the terminal ones attenuate to petiolelike bases, often villous beneath (infrequent in Trans-Pecos mts.) . .subsp. *angustifolia* (Benth.) Bailey var. *angustifolia*.
4. Leaf blades pale and somewhat lustrous on both sides, the veins inconspicuous; leaflets acute to obtuse at tip, cuneate to sessile at base, glabrate (Edwards Plateau and n.-cen. Tex.)subsp. *angustifolia* var. *persicifolia* (Greene) Bailey.

8. CHOISYA H.B.K.

A small genus of mountainous areas of western North America.

1. *Choisya dumosa* (Torr.) Gray. MEXICAN ORANGE, ZORRILLO. Rounded unarmed shrub usually only 1-2 m. tall; leaves opposite or subopposite, palmately compound; leaflets 5 to 10 (rarely only 3), linear, 1-5 cm. long, 1-3 mm. broad, coriaceous, crenulate with distant gland-tipped teeth; flowers perfect, in axillary corymbiform clusters; sepals 4 or 5, 4-5 mm. long, deciduous, membranous; petals 4 or 5, spreading, white, obovate,

¹¹¹ Adapted partly from Virginia Long Bailey in Brittonia 14:1-45. 1962.

about 1 cm. long; fruits of 4 or 5 (or by abortion 3) coriaceous 2-valved carpels separating from each other at maturity; seeds mostly solitary, 3-4 mm. long, black. Infrequent in Trans-Pecos mts., summer-fall; Tex., N.M., Chih. and Coah.

9. ESENBECKIA H.B.K.

An American tropical genus of perhaps 2 dozen species, of which perhaps one still occurs in Texas.

1. *Esenbeckia Berlandieri* Baill. ЖОРОУ. Small tree 3-6 m. tall, with whitish bark on the smaller limbs; leaves alternate, digitately 3-foliolate; leaflets elliptic, glossy, dark-green, 3-15 cm. long, 1-5 cm. broad, rounded at apex, narrowed to base; flowers in terminal clusters, perfect; sepals 4 or 5, orbicular to elliptic, 1.5-2 mm. long, deciduous; petals 4 or 5, imbricate in bud, spreading, elliptic to obovate, 2.7-3 mm. long; stamens 4 or 5; ovules 2 in each of the 4 or 5 cells; fruit a thick-walled tough or even woody 4- or 5-celled loculicidal capsule 3-6 cm. long, rather deeply (4- or) 5-lobed on top and often (4- or) 5-ridged laterally. *E. Runyonii* Morton. Exceedingly rare, formerly known from 4 trees at Los Fresnos, Cameron Co. in extreme s. Tex., at a locality which has since been cleared of most vegetation, presumably no longer a member of our flora although cult. at several residences in Cameron Co., summer-fall; Tam., N.L., S.L.P., Ver., Gro. and probably elsewhere.

10. ZANTHOXYLUM L.

Shrubs or trees, dioecious or polygamous, the branchlets and often the foliage and even sometimes the trunk armed with usually curved prickles; leaves alternate, pinnately once-compound, usually deciduous; leaflets often glandular-crenate or serrate; flowers in terminal or axillary clusters, small, yellow-green; calyx of 4 or 5 sepals that are commonly more or less united or (in some species) apparently absent; petals 4 or 5; stamens 4 or 5, alternate with the petals, rudimentary in the pistillate flowers; carpels 2 to 5, essentially separate or sometimes slightly united basally, rudimentary in the staminate flowers; each carpel maturing into usually 1-seeded dry follicles; seeds usually glossy-black. *Fagara* L.

The name is sometimes incorrectly spelled "Xanthoxylum."

A genus of about 160 species in the warmer parts of the world. The leaves of some species are chewed as a counter-irritant in a primitive treatment for toothache.

- 1. Leaves 1-3 dm. long, those on flowering branches with 9 to 17 acute or acuminate leaflets 35-90 mm. long; inflorescence 6-15 cm. long .1. *Z. Clava-Herculis*.
- 1. Leaves averaging smaller, those on flowering branches with 5 to 11 blunt usually obtuse or rounded leaflets 8-35 mm. long; inflorescence usually smaller (2)
- 2(1). Sepals apparently absent; Trans-Pecos mts. 4. *Z. parvum*.
- 2. Sepals apparently present; east of the Pecos River (3)
- 3(2). Sepals, petals and stamens usually 4 each; flowers in short often lateral axillary inflorescences usually only 1-2 cm. long 3. *Z. Fagara*.
- 3. Sepals, petals and stamens usually 5 each; flowers in ample terminal panicles 2. *Z. hirsutum*.

1. *Zanthoxylum Clava-Herculis* L. PEPPERBARK, HERCULES-CLUB, PRICKLY ASH, TICKLE-TONGUE, TOOTHACHE TREE. Rounded shrub or tree; leaves relatively large, 1-3 dm. long; those on flowering branches with 9 to 17 acute or acuminate leaflets 35-90 mm. long; inflorescence terminal, ample, 6-15 cm. long; sepals, petals and stamens 5 each. Frequent in forested areas of e. and s.e. Tex., w. sparingly to n.-cen. Tex., spring; s.e. U.S .

2. *Zanthoxylum hirsutum* Buckl. TICKLE-TONGUE, TOOTHACHE TREE, PRICKLY ASH. Shrub or rarely small tree; leaves of flowering branches usually about 25-120 mm. long, with 5 to 11 obtuse leaflets 10-35 mm. long, the twigs and foliage usually more or less hirsutulous or pilosulous; flowers in terminal panicles 1-7 cm. long; sepals, petals and stamens 5 each. *Z. carolinianum* var. *fruticosum* Gray. Frequent shrubs in brushy areas of Edwards Plateau, lower parts of Plains Country and n.-cen. Tex., usually in calcareous soil but also frequent in sandy soils of Rio Grande Plains (where the pubescence is usually most dense), spring; Ark., Okla. and Tex.

Reports of *Z. insulare* Rose in Texas are based on misdetermined specimens of *Z. hirsutum*.

3. *Zanthoxylum Fagara* (L.) Sarg. COLIMA, UÑA DE GATO, CORREOSA. Shrub, rounded, very prickly; leaves usually 2-9 cm. long, with 5 to 9 (rarely to 13) usually broadly obovate or oval leaflets 7-15 (-20) mm. long; inflorescences lateral, inconspicuous, shorter than the foliage; sepals, petals and stamens 4 each. *Fagara Pterota* L. Frequent in brush of Rio Grande Plains and near the coast n. to Jackson and Matagorda cos., winter-spring; Ver., Qro., S.L.P., Tam., N.L., Coah., Tex., Fla., W.I. and C.A.

4. *Zanthoxylum parvum* Shinn. SHINNERS' TICKLE-TONGUE. Shrub to 15 dm. tall; leaflets 7 to 9, broadly elliptic- to ovate-lanceolate, obtuse, crenulate, pilosulous, 6-11 mm. long; inflorescence terminal on the branches, appearing in spring before the leaves expand; sepals apparently absent; petals 4; staminate flowers and fruit unknown. Known only from a few populations in the Davis Mts. in the Trans-Pecos at elev. of 4,000-5,000 ft., Apr.; endemic.

FAM. 98. SIMAROUBACEAE DC.

QUASSIA FAMILY

Trees or spiny shrubs with usually bitter bark, mostly dioecious, the young branches more or less pubescent; leaves alternate, simple to pinnate, lacking pellucid dots; flowers perfect or unisexual, borne in axillary clusters or racemes or in panicles or spikes; sepals and petals (sometimes absent) 3 to 8; stamens mostly as many as or twice as many as sepals, obdiplostemonous, distinct, borne on or at base of floral disk; fruit various, in ours schizocarpous, the mericarps becoming samaralike or drupelike.

About 120 species in 20 genera mostly in temperate or tropical regions in both hemispheres.

1. Slender trees; leaves odd-pinnate; fruit a samara1. *Ailanthus*, p. 911.
1. Spiny shrubs; leaves simple, sometimes scalelike; fruit a drupe (2)
- 2(1). Leaves well-developed; petals 4 or 5; stamens 8 to 102. *Castela*, p. 911.
2. Leaves reduced to ephemeral scales; petals 5 to 8; stamens usually 12 or more3. *Holacantha*, p. 912.

1. AILANTHUS DESF.

About 10 species in Australasia.

1. *Ailanthus altissima* (Mill.) Swingle. COPAL TREE, TREE-OF-HEAVEN. Graceful tree of rapid growth, polygamo-dioecious, propagated by seeds and basal suckers, to 20 m. tall, the smooth trunk and branches containing a large pith, the open crown broadly globose; leaves to 6 dm. long, odd-pinnate, as much as 25-foliolate; leaflets elliptic-oblong to lanceolate, acuminate, falcate, to 15 cm. long and 45 mm. wide; flowers greenish or yellowish, in large terminal panicles, the staminate somewhat malodorous; calyx regular, the 5 lobes imbricated; petals 5, infolded-valvate; stamens 10 in staminate flowers, 2 or 3 in perfect flowers; disk lobed; ovary 2- to 5-parted into flat 1-celled divisions, in fruit becoming 1 to 5 oblong-elliptic membranaceous 1-seeded samaralike mericarps 3-5 cm. long. *A. glandulosa* Desf. Usually found in waste places such as alleyways, fencerows and similar places, rather weedy, mostly in e. third of Tex., Apr.-June; introd. from Asia and established from Mass. and s. Ont., s.w. to Tex.

2. CASTELA TURP.

GOAT-BUSH

Thirteen species, mostly in tropical America.

1. *Castela texana* (T. & G.) Rose. ALLTHORN, BISBIRINDA, CHAPARRO AMARGOSO. Low polygamo-dioecious shrub with spinescent branchlets and axillary spines, densely branched, to about 2 m. tall, the young branches with grayish-white intensely bitter bark; leaves sessile, coriaceous, linear-oblong to lanceolate or narrowly obovate, obtuse

to acute and mucronulate at apex, vernicose above, silvery- or grayish-canescens beneath, with the margins strongly revolute, to 25 mm. long and 7 mm. wide; flowers 3-4 mm. long, solitary or fascicled in the axils, with the pedicel 2-3 mm. long, red to salmon-pink or orange-color on outer surface, usually yellowish on inner surface; sepals and petals 4, subtended by 4 minute ovate bracts; petals narrowly obovate; stamens 8, inserted on a fleshy disk, the filaments basally hirsute; carpels 4, lightly coherent during development; fruit usually 4 distinct and widely spreading bright red drupelike mericarps 6-10 mm. long, subglobose, slightly compressed. *C. erecta* Turp. subsp. *texana* (T. & G.) Cronq., *C. tortuosa* Liebm., *C. Nicholsonii* β *texana* T. & G. On gravelly hills and bluffs in thickets and in mesquite prairies from Terrell Co. s. to Cameron Co. and e. to Travis Co., Mar.-May; also n.e. Mex.

3. HOLACANTHA GRAY

CRUCIFIXION THORN

Two species in southwestern United States and northern Mexico.

1. *Holacantha Stewartii* C. H. Mull. Sprawling or depressed dioecious shrub to 6 dm. high, with rigid spine-pointed intricately arranged branches, the younger gray-green stems with densely matted appressed silky hairs; branches and spines (6 cm. long or more) with a single axillary bud and no lateral or extra-axillary buds at the bases; leaves scalelike, ephemeral; flowers unisexual, produced in dense clusters; sepals 6, ovate, acute, pubescent, about 1 mm. long; petals 6, fleshy, dorsally pubescent, deeply concave, with narrow thin margins, about 4 mm. long and 1.7 mm. wide; stamens about 12; filaments 1.5-2 mm. long, strongly hirsute at the broadened base, glabrous at the subulate apex; fruit persistent for 1 or 2 years; carpels usually 6, lightly coherent during development, later distinct, lenticular-ovate, acute, the ventral margins obtusely ridged, 8-9 mm. long, 5-6 mm. broad, 3-4 mm. thick, glabrous, red or green, smooth, vernicose. On gravelly hills and cliffs of canyons in s. Trans-Pecos Tex. and n. Mex., spring.

FAM. 99. MELIACEAE JUSS.

MAHOGANY FAMILY

Trees or shrubs with hard scented wood and with alternate usually compound dotless leaves without stipules; inflorescences composed of panicles of perfect mostly 5- or 6-merous small regular flowers; sepals imbricate in bud; petals imbricate or valvate in bud; stamens mostly 8 or 10, monadelphous; anthers 2-celled, opening lengthwise, often sessile in tube formed by the united filaments; ovary superior, often 3- to 5-celled, the base surrounded by a ring or cuplike disk; styles and capitate stigma united; fruit a capsule or drupe.

More than 1,000 species in about 50 genera, mostly in tropical regions.

1. MELIA L.

Characters of the family. About 10 species native to Asia.

1. *Melia Azedarach* L. CHINABERRY-TREE, PRIDE-OF-INDIA, CANELÓN, PARAÍSO. Tree to 15 m. tall, with a broad spreading rounded crown; leaves bipinnate, 3 dm. long or more; leaflets numerous, ovate to elliptic-lanceolate, acuminate, to about 6 cm. long and 3 cm. wide, the margins crenate-dentate; flowers fragrant, with puberulent pedicels 3 mm. long; sepals small, elliptic, 1-2 mm. long, puberulent with simple or stellate hairs (like pedicels); petals narrowly oblanceolate or spatulate, white to pale-lavender, about 1 cm. long, widely spreading; stamen tube purplish, cylindrical, 8-10 mm. long, with numerous irregular teeth at orifice and 10 to 12 included anthers; drupes yellow, subglobose, thin-fleshy, about 15 mm. in diameter, bitter or bitter-sweet and astringent, a single seed in each cell of the bony putamen. In thickets, floodplain woods and borders of woods in e. half of Tex., Mar.-May; nat. of Asia but cult. and escaped as far n. as s.e. Va. in the U.S.

FAM. 100. MALPIGHACEAE JUSS.

MALPIGHIA FAMILY

Shrubs or trees, sometimes scandent, commonly invested with simple hairs that are medifixed; leaves opposite, stipulate, entire to dentate or rarely lobate, often with petiolar glands and jointed petioles; flowers usually perfect and showy, variously arranged, cleistogamous flowers often present; sepals 5, usually glanduliferous in the normal flowers; petals 5, conspicuously clawed; stamens 5 or 10, some often sterile, the anthers diverse; styles usually 3, distinct or united; fruit drupaceous, nutlike, capsular or of 1 to 3 samara-like mericarps.

About 850 species in perhaps 60 genera, mostly in the American tropics and subtropics.

1. Fruit a capsule or drupe, glabrous or puberulent at most; receptacle flat or depressed; stamens 10, all perfect (2)
1. Fruit of winged samaras or nutlike, long-strigose; receptacle usually pyramidal; stamens 5 or 6 (3)
- 2(1). Fruit a fleshy drupe, not separating; leaves glandless, typically ovate to elliptic-lanceolate; calyx with 6 to 10 noticeable glands ... 1. *Malpighia*, p. 913.
2. Fruit dry, separating into 3 carpels that dehisce; leaves with 2 petiolar glands, typically linear-lanceolate; calyx without glands ... 2. *Thryallis*, p. 913.
- 3(1). Fruit of 2 or 3 winged samaras; plant viny, the stems twining; stamens 6, all perfect or some without anthers 3. *Janusia*, p. 913.
3. Fruit a crested nutlet; plant shrubby, the stems straight; stamens 5, only 2 perfect 4. *Aspicarpa*, p. 914.

1. MALPIGHIA L.

About 35 species, mostly in tropical America.

1. *Malpighia glabra* L. BARBADOS CHERRY, MEXICAN MYRTLE, MANZANITA. Shrub to 25 dm. tall, diffusely branched; leaves opposite, short-petioled, entire, ovate to elliptic-lanceolate, acute to acuminate, to 7 cm. long and 4 cm. wide, glabrous or nearly so, bright-green; flowers with slender articulated bracteolate pedicels, in short axillary cymes, about 15 mm. broad; calyx with 6 to 10 glands; petals variously dentate, pink to reddish or somewhat purplish; fruit red, broadly ovoid, a stony 3-celled 3-lobed drupe, the carpels crested or winged on the back and indehiscent, about 8 mm. long, edible. In thickets, brushlands and palm groves in s. Tex., Mar.-Oct.; from s. Tex. to n. S.A. and the W.I.

2. THRYALLIS L.

About 12 species in southwestern United States and Mexico.

1. *Thryallis angustifolia* (Benth.) O. Ktze. Low slender essentially glabrous shrub to 4 dm. tall, the somewhat strigose stems herbaceous above; leaves opposite, sessile or petiolate, entire, usually somewhat glaucescent, linear to linear-lanceolate or rarely oval, obtuse-mucronate to acuminate, pale beneath, to 55 mm. long and 13 mm. wide; racemes laxly flowered, to about 15 cm. long; flowers usually yellow or orange-color, becoming reddish with age, with articulated bracteolate pedicels about 6 mm. long; calyx glandless or essentially so; sepals ovate-oblong to lanceolate, bearded at apex, 3-4 mm. long; petals entire or dentate, persistent, larger ones to 7 mm. long, the lamina triangular-ovate to ovate-oblong; capsules subglobose, 3-lobulate, 3-4 mm. long, the carpels separating and dehiscent. *Galphimia angustifolia* Benth. On rocky open or thinly wooded hills and in prairies from the Edwards Plateau southw. in Tex., Apr.-Oct.; also n. Mex.

3. JANUSIA Juss.

Twelve species in southwestern United States to Argentina.

1. *Janusia gracilis* Gray. Stems slender, wiry, somewhat scandent, pale-pubescent; leaves opposite, short-petiolate, entire, linear to narrowly lanceolate, acute at apex, to 35

mm. long and 7 mm. wide, silky-strigose (especially beneath), the margin with several toothlike glands near base; peduncle 2-flowered; bracts linear, about as long as the bibracteolate pedicels; flowers small, of two kinds, yellow to orange-yellow, becoming reddish-brown with age, solitary or in axillary clusters; sepals and petals 5 each, the petals undulate; *petaliferous* flowers with glandular calyx, a 3-angled style and 3 ovaries, the entire to denticulate petals 4-6 mm. long and with a rhombic-ovate lamina; *cleistogamous* flowers with a style and only 2 ovaries; fruit of 2 or 3 veiny samaras 9-12 mm. long. On open rocky hills, river terraces and sandstones in the Trans-Pecos, Apr.-Sept.; from w. Tex. to s. Ariz. and n. Mex.

4. ASPICARPA RICH.

ASP-HEAD

Slender branching shrubs with erect or reclining stems; leaves opposite, entire, sessile or short-petiolate; flowers of two kinds; *petaliferous* flowers in mostly terminal clusters, pedicellate, with glandular calyx and orbicular-obovate fimbriate rose-color petals, the glands about half the length of the sepals; *cleistogamous* flowers sessile or on long peduncles in the axils of the lower leaves, with a glandless calyx; fruit of 2 crested nutlets.

About a dozen species in southwestern United States to Argentina.

1. Cleistogamous flowers sessile in the leaf axils 1. *A. hyssopifolia*.
1. Cleistogamous flowers pedunculate, subtended by a pair of foliaceous bracts (2)
- 2(1). Peduncles of the pair of solitary flowers as long as or commonly longer than the leaves 2. *A. longipes*.
2. Peduncles of the umbellate (?) cleistogamous flowers much shorter than the leaves. 3. *A. humilis*.

1. *Aspicarpa hyssopifolia* Gray. Stems erect, numerous from a woody base, to 3 dm. tall; leaves sessile to somewhat clasping, linear to linear-lanceolate or sometimes oblong-elliptic, acute, with scattered appressed hairs on the margins and on the midrib beneath, to 25 mm. long and 6 mm. wide; petaliferous flowers with ovate sepals about 2.5 mm. long, the petals 5-7 mm. long; nutlet reticulate, 3-5 mm. long. On open or brushy limestone hills and slopes in the Edwards Plateau and southw. in Tex., June-Aug.; also n. Mex.

2. *Aspicarpa longipes* Gray. Stems numerous from a woody base, to 1 m. tall, usually much less, strigillose with appressed hairs, sometimes partly scandent; leaves ovate to ovate-oblong, rounded or abruptly pointed at apex, cordate to subcordate at base, strigose with appressed hairs, the primary veins conspicuous on the pale lower surface, to 45 mm. long and 15 mm. wide; *petaliferous* flowers with ovate sepals 3.5-4.5 mm. long, the petals 6-8 mm. long; peduncles of *cleistogamous* flowers usually surpassing the leaves, 2-flowered; nutlets 4-5 mm. long. On dry rocky slopes in the Trans-Pecos, July-Sept.; also n. Mex.

3. *Aspicarpa humilis* (Benth.) Juss. Low ascending shrub, the stems to about 4 dm. long, strigillose; leaves broadly ovate to oblong-lanceolate, obtuse to acute at apex, truncate to subcordate at base, to 25 mm. long, sparingly strigillose, paler beneath; *petaliferous* flowers in terminal clusters, with ovate sepals 2.5-3 mm. long, the petals 5-6.5 mm. long; peduncles of *cleistogamous* flowers usually much shorter than the leaves; nutlets 4.5-5 mm. long. On dry rocky hills in the Trans-Pecos, summer; also n. Mex.

Although some authors include Texas in the area of distribution for this plant, no specimen that might be placed here with surety has been seen from the state. It is quite possible that *A. humilis* and *A. longipes* represent only phases of the same species.

FAM. 101. POLYGALACEAE R. BR.

MILKWORT FAMILY

Represented in Texas only by the genus *Polygala* that differs from other genera in the family primarily by its 2-celled dehiscent capsular fruit that very rarely has one of the cells aborted.

About 800 species in 12 genera of world-wide distribution.

I. POLYGALA L.¹¹²

POLYGALA. MILKWORT

In our region herbaceous annuals or suffruticulose perennials with simple entire leaves; leaves alternate, opposite or whorled, sessile to shortly petiolate; flowers in terminal or axillary racemes, subsessile to distinctly pedicellate; sepals 5, the 3 outer herbaceous or the 2 lower very rarely petaloid, free or the 2 lower connate, persistent or deciduous; the 2 inner sepals (wings) usually petaloid, much larger than the others, deciduous; persistent; petals typically 3, united at base, the lower (keel) cymbiform, clawed, occasionally 3-lobed, unappendaged or usually with an apical beak or crest; the 2 upper petals ligulate to ovate, sometimes galeate, united to staminal tube or keel (or both) at least at base; 2 lateral petals rarely present, always minute; stamens 8 or rarely 6, the filaments united nearly to apex into a sheath split on the upper side, adnate to keel and upper petals at base; anthers usually confluent 1-celled, opening by an apical or introrse-apical pore; ovary 2-celled; ovules solitary, pendulous from the apex of the central placenta; style usually slender and often elongate, bent, more or less excavated at apex; stigma 2-lobed, often tufted; capsule equally or unequally 2-celled, winged to margined or marginless, compressed contrary to the partition, usually membranous-herbaceous, the cells usually dehiscent; seeds globose to fusiform or conic, usually pubescent and almost always arillate.

About 550 species of world-wide distribution.

1. Keel blunt, without crest or beak (2)
1. Keel with crest or beak (8)
 - 2(1). Capsule and leaves not obviously glandular (3)
 2. Capsule and leaves bearing large glands (7)
 - 3(2). Leaves nearly uniform, oval to ovate (4)
 3. Leaves more or less dimorphous, the lower ones oval to oblong, the upper ones longer and linear to oblong or elliptic to ovate (5)
 - 4(3). Plants erect, densely hirsute; wings 4-5 mm. long; capsule 8.5-13 mm. long ...
..... 1. *P. ovatifolia*.
 4. Plants prostrate or only slightly ascending, glabrous; wings about 4 mm. long; capsule about 2 mm. long 2. *P. rimulicola*.
 - 5(3). At least some leaves oblong-obovate and somewhat truncate-mucronate at apex, these widest above the middle; depth of the entire or merely denticulate-lobulate scarious margin of aril less than the height of the corneous umbo
..... 3. *P. Palmeri*.
 5. Leaves never oblong-obovate, obtuse to acuminate at apex; depth of the lobed or lobulate scarious margin or aril equaling or exceeding the height of the corneous umbo (6)
 - 6(5). Capsule merely ciliate at maturity; aril not veil-like
..... 4. *P. longa*.
 6. Capsule pubescent on sides at maturity or (if merely ciliate) the aril veil-like
..... 5. *P. obscura*.
 - 7(2). Leaves obovate 6. *P. glandulosa*.
 7. Leaves linear to oblong-lanceolate 7. *P. macradenia*.
 - 8(1). Keel with a conic or cylindrical beak, not crested (9)
 8. Keel with a fimbriate crest (12)
 - 9(8). Leaves squamiform, 4 mm. or less long (10)
 9. Leaves not squamiform, with a distinct lamina (11)
 - 10(9). Plants green, about 15 cm. tall; racemes 4- to 6-flowered, 2.8 cm. long or less; flowers white; capsule oblong, 2.8 mm. long 10. *P. minutifolia*.
 10. Plants glaucous, 15-40 cm. tall; racemes many-flowered, to 10 cm. long; flowers pink and rose-color; capsule cuneate to cuneate-obovate, 3-4 mm. long
..... 11. *P. maravillasensis*.

¹¹² Adapted from S. F. Blake in Contr. Gray Herb. 47:1-122. 1916; N. Am. Fl. 25:305-379. 1924.

- 11(9). Leaves essentially similar throughout, narrowly elliptic to oval or rarely sub-orbicular, the pubescence (like on the stem) densely spreading or sometimes spreading-incurved 8. *P. Lindheimeri*.
11. Leaves mostly linear to lanceolate but sometimes with the lower ones broader, the puberulence merely incurved like on the stem 9. *P. Tweedyi*.
- 12(8). Capsule unmarginated or narrowly and equally marginated on both cells (13)
12. Capsule winged or marginated on the upper cell, marginless on the lower (25)
- 13(12). Sepals not decurrent on the pedicels; pedicels not winged; flowers never truly yellow, the racemes never compounded into a cymose panicle (14)
13. Sepals decurrent on the winged pedicels; flowers yellow or orange, often turning green in drying or (if white) with the racemes compounded into a cymose panicle (24)
- 14(13). Cleistogamous flowers present, borne on short leafless basal branches; flowers bright rosy-purple, in loose racemes21. *P. polygama*.
14. Cleistogamous flowers absent; flowers white to purple (15)
- 15(14). Wings less than half as long as keel; stem glaucous; aril cellular, equitant, not obviously lobed20. *P. incarnata*.
15. Wings equaling or exceeding keel, rarely slightly shorter; stem not glaucous; aril 2-lobed, rarely obsolete (16)
- 16(15). Racemes cylindric or conic-cylindric or at least distinctly tapering above (17)
16. Racemes capitate to ovoid or cylindric, obtuse or merely apiculate (21)
- 17(16). Plants biennial or perennial, usually several-stemmed
.....15. *P. alba*.
17. Plants annual, single-stemmed (18)
- 18(17). Wings 3-3.3 mm. long18. *P. Hookeri*.
18. Wings 1.2-3 mm. long (19)
- 19(18). Leaves whorled at least to middle of stem14. *P. verticillata*.
19. Leaves alternate throughout or whorled only at base of stem (20)
- 20(19). Stem finely stipitate-glandular or puberulous12. *P. paniculata*.
20. Stem glabrous13. *P. leptocaulis*.
- 21(16). Wings broadly elliptic or oval, (2.8-) 4.5-6.3 mm. long, about twice as long as keel; aril more than half as long as seed16. *P. sanguinea*.
21. Wings equaling or but little longer than keel; aril usually less than half as long as seed (22)
- 22(21). Leaves all alternate17. *P. mariana*.
22. Leaves whorled at least below (23)
- 23(22). Wings ovate to ovate-oblong, merely acute and short-mucronate; racemes 6-12 mm. thick18. *P. Hookeri*.
23. Wings acuminate and strongly cuspidate from a deltoid base; racemes 10-17 mm. thick19. *P. cruciata*.
- 24(13). Racemes solitary at tips of stems and branches, capitate or thick-cylindric, 9-20 mm. thick; bracts mostly deciduous22. *P. nana*.
24. Racemes several or many, cymosely arranged at apex of stem and branches, 6-13 mm. thick; bracts persistent23. *P. ramosa*.
- 25(12). Stems glabrous or at most with scattered minute incurved puberulence; flowers 3-5 mm. long; upper cell of capsule noticeably longer than lower cell, the broad scarious wing erose24. *P. hemipterocarpa*.
25. Stems strigillose or puberulous; flowers usually smaller than above; upper cell of capsule only slightly longer than lower cell, very narrowly and evenly winged or keeled25. *P. scoparioides*.

1. *Polygala ovatifolia* Gray. Suffrutescent at base, branched, erect, 3 dm. tall or less, densely and softly spreading-pilose; leaves ovate or on the branches sometimes ovate-

oblong, 1.2-3 cm. long, 6-13 mm. wide, acute to obtuse at apex, rounded or cuneate at base, short-pilose on both sides with spreading hairs; petioles about 2 mm. long; racemes rather loose, 2-6.5 cm. long; sepals ovate-lanceolate, acute, 3 mm. long, deciduous; wings oblong to oval, 4-5 mm. long, abruptly short-pointed, pilose, soon deciduous; capsule ciliate, orbicular, 8.5-13 mm. long; seed 4 mm. long; aril with rather broad lobed and lobulate scarious margin. On rocky hills and slopes in w. Edwards Plateau and Rio Grande Plains, Apr.-July; Tex., N.M. and n. Mex.

2. *Polygala rimulicola* Steyerem. Delicate perennial from a woody base, glabrous throughout or minutely puberulent with incurved hairs; stems numerous, very slender, prostrate or slightly ascending, branching, 1-5 cm. long, green; leaves similar throughout, subsessile, elliptic-ovate, 1.5-4 mm. long, 1-2.5 mm. wide, acute to slightly cuspidate, slightly fleshy; flowers 1 or 2, terminal, rose-purplish and white, 5 mm. long; pedicels at maturity recurved and nodding, 2 mm. long; upper sepal persistent, ovate, 1.5-2 mm. long, 1 mm. wide, acute, glabrous; lower sepals free, deciduous, oblong-obovate, 2-3 mm. long, 1 mm. wide, acute, glabrous; wings deciduous, oblique, broadly obovate, 4 mm. long, 2.5 mm. wide, obtuse at apex, narrowed at base, veiny, glabrous; keel unbeaked, inflated, greenish-yellow, pouch-shaped, 3 mm. long, the outer upper and lower ends rounded, the inner upper ends terminating in 2 short parallel straight appendages extending toward the base of the flower, the upper third of the keel covered with numerous erect short fine hairs; upper petals united to the keel about three-eighths their length, white at the base, purplish-red at apex, linear-oblong, 4-5 mm. long, 1 mm. wide, subtruncate at apex, slightly puberulent within; stamens 7; capsule venose, broadly obovate-oval, 2 mm. long, 1.5-2 mm. wide, emarginate, sparingly covered with short incurved hairs, densely sericeous-pubescent in the sinus of the emarginate apex; seed oblong, 1-1.5 mm. long, densely sericeous-pubescent with long hairs; aril globose, 0.5 mm. high, with a large umbo at each side, corneous, glabrous. In crevices of boulders and cliffs, endemic to the Guadalupe Mts. in the Trans-Pecos, June-Oct.

The glabrous globose aril with no conspicuous lobes, the unbeaked keel, persistent upper sepal, prostrate habit, minute leaves and flowers, and essentially glabrous condition of stem, leaves, and fruit distinguish this species.

3. *Polygala Palmeri* Wats. Stems several, 12-18 cm. tall, densely and subcanescently pubescent with spreading-incurved hairs; leaves from oval below to oblong or commonly oblong-obovate above, the middle and upper leaves 15-16 mm. long and 4.5-7 mm. wide, obtuse to truncate and mucronate at apex, cuneate at base, thick, incurved-spreading-pubescent; racemes 35-45 mm. long, canescently pubescent, 6- to 11-flowered; flowers pale-greenish-yellow and purplish; wings obovate, 5.7-6 mm. long, 2.8 mm. wide, acutish, pubescent nearly all over with spreading-incurved hairs; keel equaling wings; capsule oval-ovate, somewhat narrowed above, rounded at base, ciliolate, 1 cm. long; seed 6 mm. long; aril 1.5 mm. deep, with spreading-pilose umbo and much narrower subentire scarious margin extended into short anterior and dorsal subhorizontal lobes. On open or brushy limestone slopes on s.w. Edwards Plateau, May-Aug.; also Coah.

4. *Polygala longa* Blake. Several-stemmed, suffruticulose below, 1.5-5 dm. tall, densely incurved-griseous-puberulous; lower leaves oblong to oblong-elliptic or linear and 8-17 mm. long, the middle and upper oblong-lanceolate to linear and 17-36 mm. long and 1.5-4 mm. wide, acute to acuminate or sometimes obtuse at apex, griseous-puberulous; racemes loose, 2-10.5 cm. long; flowers purplish; sepals lanceolate, pubescent, 2.2-3.5 mm. long; wings oval to suborbicular, 3.5-5.5 mm. long, 2.4-4 mm. wide, rounded at apex, rather sparsely pubescent; keel 4-5.7 mm. long; capsule oval, ciliolate, 7-8 mm. long; seed 4-4.5 mm. long; aril 1 mm. high, the dorsal margin 1.5 mm. long, the umbo 0.4 mm. high, pilose, the scarious margin strongly lobulate, with subdistinct or distinct dorsal and shorter lateral lobes. On rocky grassy slopes, among rubble on talus, in rocky washes and arroyos, and about caprock, mostly limestone, in w. part of Edwards Plateau and the Trans-Pecos, Apr.-Nov.; from Tex. to s. Ariz. and n. Mex.

This species, *P. racemosa* Blake and *P. reducta* Blake probably represent one highly variable species.

5. *Polygala obscura* Benth. Many-stemmed, suffruticulose below, 1.2-4 dm. tall, grayish-puberulous with incurved or rarely slightly spreading hairs; lower leaves oblong to oval-oblong and 12-28 mm. long and 4-7 mm. wide, the middle and upper oblong to

oval-ovate or lanceolate to linear and 18-42 mm. long and 1.5-12 mm. wide, obtuse to acuminate, puberulous; raceme loose, 3.3-9 cm. long; flowers purplish; sepals lanceolate, acute; wings oval-obovate to elliptic, 4.5-5.8 mm. long, 2-3.5 mm. wide, rounded, sparsely pubescent along middle and toward apex; keel nearly glabrous, 4.8-5 mm. long; capsule oval, when young usually densely puberulous, in age glabrate and ciliate or more or less puberulous on sides, 8-9 mm. long; seed 4-4.8 mm. high; aril 1.3-3 mm. long, veil-like, appressed, with broad irregularly lobulate scarious margin and pubescent umbo but without distinct lateral and dorsal lobes. *P. puberula* Gray. On open or brushy dry slopes, rare in Edwards Plateau and the Trans-Pecos, May-Aug.; from Tex. to Ariz. and s.-cen. Mex.

6. *Polygala glandulosa* H.B.K. Stems very numerous from a thick woody rootstock, suffruticose, diffuse, 1-2 dm. long, somewhat gray-pubescent with incurved hairs, densely leafy; leaves obovate to oval-obovate or rarely suborbicular-oval to cuneate-obovate, 4.5-10 mm. long, 1.5-6 mm. wide, rounded to subtruncate and mucronate at the apex, cuneate to rounded at base, thick, densely translucent-glandular-dotted, incurved-puberulous or short-pilosulous; flowers 1 or 2 on short axillary racemes, purple; sepals oblong-ovate, obtuse, 1.2-1.5 mm. long, ciliate and puberulous, the upper often subpersistent; wings spatulate-obovate, about 7.5 mm. long and 3.5 mm. wide, rounded at apex, long-cuneate at base, short-pilose and sparsely ciliate; keel 3-lobed, 4.5 mm. long; capsule elliptic, deeply emarginate, slightly pilose, dotted with whitish glands; seed oblong, appressed-hairy; aril galeiform, equitant, with very short lobes, about one fourth as long as seed. On gravelly hills in scrub and about boulders on crest of chalky hills in s. Rio Grande Valley, Apr.-Aug.; s. to cen. Mex.

7. *Polygala macradenia* Gray. Stems numerous, 3.5-21 cm. long, crowded, suberect to ascending, fruticulose below, from a thick woody rootstock, flexuous, densely leafy, canescently incurved- or incurved-spreading-puberulous; leaves linear-oblong to oblong-lanceolate, 2-6.3 mm. long, 0.6-1.3 mm. wide, obtuse, rounded at base, flattened above, thick, densely and canescently puberulous, thickly gland-dotted; racemes 1- or 2-flowered; flowers purple; sepals oblong-ovate, obtuse, pilosulous and gland-dotted, 1.7-2.1 mm. long; wings obovate, 5-5.5 mm. long, about 2.5 mm. wide, rounded at apex, cuneate at base, sparsely spreading-puberulous, ciliolate, purple; keel 4.5 mm. long; capsule oblong to oblong-ovate, canescently incurved-puberulous and gland-dotted, 5-5.5 mm. long; seed silky-pilose, comose at apex, 4 mm. long; aril 1.2-1.6 mm. high, with corneous vaulted sparsely pubescent umbo 0.9-1.1 mm. high and three short descending scarious-ended subappressed lobes. On dry rocky slopes, rock outcrops and plains, mostly limestone, in upper Rio Grande Plains, South Plains, w. Edwards Plateau and s. Trans-Pecos, Apr.-Oct.; from Tex. to s. Ariz. and n. Mex.

8. *Polygala Lindheimeri* Gray. Stems several from a fruticulose base, suberect to decumbent, densely pilose to pilosulous with wide-spreading or sometimes incurved-spreading hairs, about 18 cm. long; lower or all the leaves elliptic to oval or rarely orbicular, mucronate at the obtuse to rounded apex, rounded to cuneate at base, 5-13 mm. long, 3-12 mm. wide, coriaceous, spreading-pilosulous or incurved-spreading-puberulous, reticulate; middle and upper leaves usually oblong to oblong-lanceolate, acute at each end; racemes 2- to 8-flowered, geniculate, 1-3.5 cm. long; upper sepal ovate, acute, ciliate and pubescent or puberulous, persistent, 2.8-3.2 mm. long; lower sepals 2 mm. long; wings oblong-obovate, 4.5-6 mm. long, 2.3 mm. wide, barely retuse at the rounded apex, cuneate at base, pilosulous; keel 4.2-4.8 mm. long, the beak 0.6-1.1 mm. long; capsule oblong, striate, pilosulous, 4.8 mm. long, 2.4 mm. wide; seed silky-pilose, 3.3 mm. long; aril 1.8 mm. deep, entirely corneous, the umbo 0.4 mm. deep, with indistinct appressed dorsal and oblong entire lateral lobes 1.4 mm. long. On brushy limestone hills and bluffs in s.w. Tex., s. to Zapata Co. and w. to Presidio Co., Mar.-Oct.; also N.M. and n. Mex.

9. *Polygala Tweedyi* Britt. Suffruticose, several- to many-stemmed, spreading to erect, incurved-puberulous, usually densely leafy, 7-28 cm. tall; leaves more or less distinctly dimorphous or sometimes uniform, linear to lanceolate or elliptic to ovate-lanceolate, 4-26 mm. long, 1-6 mm. wide, the lowest broader than the others, sometimes orbicular, acute to acuminate or rarely subobtuse, coriaceous, more or less reticulate, incurved-puberulous; peduncles 1 cm. long or less, terminal and pseudo-oppositifolious,

sometimes arising near base of stems; racemes 3- to 22-flowered, geniculate, 4-46 mm. long; bracts elliptic, coriaceous, persistent, 1.2 mm. long; pedicels incurved-puberulous, 1-1.5 mm. long; flowers purple or lavender or rarely whitish, the keel partly yellow; upper sepal persistent, elliptic to ovate, ciliolate and puberulous, 2-2.8 mm. long; lower sepals 1.8-2.4 mm. long; wings obovate to oblong-obovate, 4-5.3 mm. long, 1.8-2.3 mm. wide, obtuse to rounded at apex, cuneate at base, glabrous or sparsely incurved-puberulous along midline; keel 3.5-5.3 mm. long, sometimes puberulous, the beak 0.5-1.4 mm. long; capsule oval to oblong, striate, puberulous or subglabrous, 4-4.5 mm. long, 2-2.8 mm. wide; seed silky, 2.8-3.5 mm. long; aril corneous, 1.2-2.2 mm. high, with 2 linear or linear-oblong appressed lateral lobes. *P. texensis* Robins. On rocky-gravelly hills, among boulders and on old lake-bed deposits from cen. Tex., w. to Presidio Co. in the Trans-Pecos, May-Aug.; from Okla. and Tex., w. to s. Ariz. and n. Mex.

10. *Polygala minutifolia* Rose. Stems very numerous, fruticulose, green, erect, about 15 cm. tall, sparsely strigillose or subglabrous; leaves squamiform, minute, linear-lanceolate, 1-4 mm. long, about 0.5 mm. wide, acuminate, sparsely incurved-puberulous; racemes straight, 4- to 6-flowered, 28 mm. long or less; flowers white; sepals ovate to elliptic, acute, 2.2-2.7 mm. long, the upper persistent; wings oval-obovate, 4 mm. long, 2.2 mm. wide, truncate-rounded at apex, glabrous; keel 3.5 mm. long, the blunt beak 0.7 mm. long; capsule oblong, nearly glabrous to sparsely pubescent toward apex, 2.8 mm. long; seed sericeous, 2.3 mm. long; aril 0.8 mm. long, with 2 oblong lateral lobes. On ledges in mts. of the Trans-Pecos, June-July; also n. Mex.

11. *Polygala maravillasensis* Correll. Plants broomlike, 2-4 dm. tall; stems from a woody base, erect or erect-ascending, rather stout and stiff, glabrous and usually glaucous-bluish; leaves squamiform, linear-subulate, mostly less than 1.5 mm. long, marginally incurved-puberulous, early-fugacious; racemes many-flowered, straight, simple or branched, to 1 dm. long; flowers pink and rose-color, with pedicels 1.5-2.5 mm. long; sepals 2-2.5 mm. long, elliptic, obtuse, the upper persistent; wings obovate, rounded at apex, about 4.5 mm. long and 2 mm. wide; the 2 upper ligulate petals deep-rose-color; keel 3.5-4 mm. long (including the beak); capsule cuneate to cuneate-obovate, glabrous, 3-4 mm. long; seeds sericeous, 2 mm. long; aril 1 mm. long, with 2 short lateral lobes. In crevices of cliffs on mts. in s. Trans-Pecos Tex., June-July; endemic.

12. *Polygala paniculata* L. Slender erect annual, to 4 dm. tall, densely pedicellate-glandular; leaves whorled at extreme base of stem, otherwise alternate, linear to linear-spatulate, rarely linear-obovate, mucronate, 8-18 mm. long, 1-4 mm. wide; racemes loose, cylindric, 5-6 mm. thick, the axis becoming 95 mm. long; pedicels 0.7-1 mm. long; flowers rosy or purplish, rarely white; sepals ovate to oblong-ovate, obtuse, 1.3 mm. long; wings obovate to spatulate-obovate, 2-2.5 mm. long, 0.7-1 mm. wide, rounded at apex, long-cuneate at base, 3-nerved; keel 2-2.5 mm. long, the crest of 3 or 4 lobes on each side; capsule elliptic, 1.7 mm. long; seed appressed-pubescent, 1.5 mm. long; aril 0.4-0.8 mm. long, the 2 lobes appressed. Tex. (*vide* Blake), Ver., the W.I. and S.A.

13. *Polygala leptocaulis* T.&G. Slender annual, to 5 dm. high, glabrous, branched above; leaves all scattered, linear to subfiliform, 8-25 mm. long, 1 mm. or less wide, acuminate, slightly revolute; racemes cylindric, loose or rather dense, 5-5.5 mm. thick, the axis to about 10 cm. long; pedicels 0.8-1 mm. long; flowers rosy, rarely white; sepals ovate, obtuse, 1 mm. long; wings obovate, about 2 mm. long and 0.9 mm. wide, rounded at apex, cuneate at base, 3-nerved; keel 2 mm. long, the crest of 2 or 3 lobes on each side; capsule oblong, often very slightly narrowed toward apex, with a row of glands on each side of septum, 1.6-1.8 mm. long; seed subcylindric, appressed-pubescent, 1.2 mm. long; aril minute, 2-lobed, about one tenth as long as seed. In savannahs and low open pine-lands in e. Tex., May-June; along Coastal Plains from Miss. to Tex., also Mex., C.A., Cuba and S.A.

14. *Polygala verticillata* L. Erect single-stemmed glabrous annual, 5-40 cm. tall, usually freely branched; leaves in whorls of 4 or 5 up to middle of stem or throughout, rarely with only 1 or 2 whorls below with the rest alternate, those of the branches scattered, linear to narrowly elliptic, 5-30 mm. long, 0.7-5.5 mm. wide, acute to acuminate at each end and cuspidate; peduncles to 9 cm. long; racemes conic to cylindric-conic, acute to acuminate, dense or loose, 2.2-4.5 mm. thick, the axis 35 mm. long or less; bracts subulate, glandular-denticulate, deciduous; pedicels 0.2-1 mm. long, rarely to 2 mm. long; flowers

whitish and greenish, rarely purplish-tinged; sepals ovate, ciliolate, 0.9-1.1 mm. long; wings obovate-oval, 1.6-2 mm. long, 1.1-2 mm. wide, broadly rounded at apex, short-clawed, about 3-nerved; keel 1.2-1.5 mm. long, the crest on each side of a lamella and 1 or 2 lobes; capsule oval, 1.8-2.1 mm. long; seed pilosulous, 1.5-1.8 mm. long; aril 0.7-1 mm. long, the 2 lobes linear-oblong or obovate. Incl. var. *isocycla* Fern. and var. *sphenostachya* Penn. In prairies, sandy post-oak and pine woodlands in the e. third of Tex., May-July; from Fla. to Tex., Okla., Colo. and Ut., n. to Mass. and s. Man.

Plants found in our area with most of the leaves alternate or with only 1 or 2 whorls below have been segregated as var. *ambigua* (Nutt.) Wood.

15. *Polygala alba* Nutt. Stems numerous from a perennial rootstock, often with a cluster of short leafy branches at base, erect or ascending, simple or sparsely branched, 2-3.5 dm. tall; leaves scattered except for 1 or 2 whorls at base, the lowest spatulate-obovate, 4-12 mm. long, 1.5-2.5 mm. wide, the others linear, acuminate, cuspidate, 8-25 mm. long, 1-1.5 mm. wide; racemes dense, conic-cylindric, 2-8.5 cm. long, 5-8 mm. thick; flowers white with a green center, the crest often purple; sepals ovate to oblong, obtuse, 1.3-1.5 mm. long; wings elliptic, about 3 mm. long and 1.5 mm. wide, rounded at apex, short-cuneate at base; keel 3 mm. long, the crest of 4 lobes on each side; capsule elliptic to oblong-elliptic, 2.5-3 mm. long, 1.3-1.6 mm. wide; seed pilose, 2.3-2.5 mm. long; aril 0.8-1.5 mm. high, the 2 lobes oblong, appressed. Sandy soil, rocky hills, mesquite plains, in cedar thickets, on rimrock and breaks and in dry washes in all but extreme e. Tex., Mar.-Oct.; from e.-cen. Tex., n. to Minn., w. to S.D., Wash. and Ariz., s. to s. Mex.

16. *Polygala sanguinea* L. Slender erect annual, 4 dm. tall or less, simple or branched; leaves all alternate, numerous, linear to elliptic-linear, 7-39 mm. long, 1-4.5 mm. wide, acute to acuminate and mucronulate, erect or ascending, papillose-serrulate on margin with subglandular teeth; peduncles 3-30 mm. long; racemes capitate to thick-cylindric, very obtuse and dense, 6-14 mm. thick, the axis 7-40 mm. long; bracts subulate, 1-1.5 mm. long, at length deciduous; pedicels 1.1-1.5 mm. long; flowers greenish and rosy or purplish, rarely white; sepals oval to elliptic-ovate, acute to subacute, glabrous, 1.3-1.8 mm. long; wings ovate-oval, 4.8-6.3 mm. long, 2.5-3.5 mm. wide, rounded at apex, short-clawed, 9-nerved; keel 2.5-2.7 mm. long, the crest on each side of a lamella and a cuneate lobe, or these connate; capsule cuneate-suborbicular, with short flattened sterile base, 2.5-3 mm. long, 2-2.5 mm. wide; seed subglobose-pyriform, pointed at base, rounded at apex, short-pilose, 1.5-1.7 mm. long; aril 1-1.3 mm. long, the 2 lobes linear or linear-oblong, scarious, appressed. *P. viridescens* L. In bogs and moist open flatwoods in n.e. Tex., May-July; from N.S. to s. Ont. and Minn., s. to Tenn., Okla., La. and n.e. Tex.

At anthesis the pedicels are 1.5 mm. long or less and the wing is more than 4.5 mm. long. These characteristics readily separate this species from *P. mariana*.

17. *Polygala mariana* Mill. Slender erect annual, 1.5-4 dm. tall, sparsely papillose-puberulent above; leaves all alternate, linear or the lower spatulate, 6-24 mm. long, 0.5-2.5 mm. wide, cuspidate, usually ascending; racemes capitate to short-cylindric, obtuse to apiculate, 6-11 mm. thick, the axis 5-35 mm. long; bracts subulate-ovate, erose, often ciliolate, deciduous; pedicels 1.8-2 mm. long or more; flowers pink or purple; sepals elliptic to ovate-lanceolate, obtuse to subacuminate, sometimes ciliolate, 0.8-1.8 mm. long; wings broadly elliptic to elliptic-obovate, 3-5 mm. long, 1.3-3 mm. wide, slightly apiculate at apex, cuneate at base, commonly 6-nerved; keel papillose below, 2.3-3.2 mm. long, the crest on each side of a lamella and a single lobe; capsule suborbicular to rhombic-suborbicular, with a broad stipelike sterile base, about 2.2 mm. long, 1-2 mm. wide; seed subglobose-pyriform, rostrate at base, rounded or apiculate at apex, short-pilose, 1.1 mm. long; aril 0.4 mm. long, the 2 oblong cellular lobes fastened to the point of seed, loosely descending and standing forward. *P. Harperi* Small. In low moist open pinelands and savannahs, and on seepage slopes in s.e. Tex., Apr.-Sept.; from Fla. to Tex., n. to N.J., Del., Md. and Ky.

At anthesis the pedicels are about 2 mm. long or occasionally longer and the wings are rarely more than 4.5 mm. long. These characteristics readily separate *P. mariana* from *P. sanguinea*.

18. *Polygala Hookeri* T. & G. Slender erect or procumbent annual, papillose-puberulent above, 1-2.5 dm. tall; leaves in remote whorls of 3 or 4 or the uppermost scattered, linear, 4-10 mm. long, 0.5-1 mm. wide, acutish, barely mucronulate, strongly revolute, glanduliform-puberulous; peduncles mostly 3-7 cm. long; racemes conic-cylindric, acuminate or

at least apiculate, loose, 6-9 mm. thick, the axis 7-40 mm. long; bracts triangular-ovate, ciliolate, spreading, persistent, 1 mm. long; pedicels 1.5-2 mm. long; flowers pink; sepals broadly ovate, short-mucronate, ciliolate, 1.1-1.4 mm. long; wings oblong-ovate, about 3 mm. long, 1.3-1.5 mm. wide, inflexed and very short-mucronate at apex, rounded at the oblique sessile base, stipitate-glandular-ciliolate on the upper margin, 7-nerved; keel 2.8 mm. long, the crest on each side of a triangular lamella and 2 entire lobes; capsule orbicular, plump, strongly winged beneath on the stipelike base, 1.4-2.2 mm. long and wide; seed plump, ellipsoid, somewhat shining, short-pubescent, 1.2 mm. long; aril equaling the seed, the 2 linear lobes appressed. In low pinelands in e. Tex., Apr.-Aug.; along the coast from Fla. to Tex.

19. *Polygala cruciata* L. Slender erect annual, 6-40 cm. tall, simple or usually cymosely branched; leaves in whorls of 3 or 4 throughout or the uppermost scattered, linear to linear-elliptic, the upper largest, 8-35 mm. long, 1-5 mm. wide, usually apiculate at the obtuse to rounded apex, narrowed at base; peduncles to 5 cm. long; racemes thick-cylindric to ovoid-cylindric, obtuse to apiculate, 1-1.7 cm. thick, the axis 6 cm. long or less; bracts subulate-attenuate from an ovate base, ciliolate, spreading, persistent, 1.5-2.5 mm. long; pedicels 2-2.4 mm. long; flowers rosy-purple to greenish or rarely white; sepals ovate, obtuse to acutish, ciliolate, 0.8-1.4 mm. long; wings broadly deltoid-ovate, 3.5-5.6 mm. long, 2.7-3.6 mm. wide near base, subsessile or very shortly clawed at the truncate or slightly oblique base, acuminate and strongly cuspidate at apex, about 9-nerved; keel 2.8-3.5 mm. long, the crest on each side of a lamella and 2 or 3 entire or bifid lobes; capsule suborbicular, very plump, strongly oblique and winged below on the stipelike base, 2-2.2 mm. long, 1.8-2.1 mm. wide; seed ellipsoid, plump, short-pubescent, 1.1-1.3 mm. long; aril 0.9-1.1 mm. long, the 2 linear lobes appressed. In and on edge of bogs, on seepage slopes and in savannahs in e. Tex., May-Sept.; from Fla. to e. Tex., n. along the coast to Va. and inland to Ky.

20. *Polygala incarnata* L. Simple or sparsely branched annual, about 35 cm. tall, the glaucous stem sulcate and sparsely leaved; leaves scattered (the very lowest often opposite or even whorled), linear, 4-6 mm. long, 0.3-0.6 mm. wide, acuminate, cuspidate, glaucous; peduncles 2-3.5 cm. long; racemes dense, 6-38 mm. long, 1-1.3 cm. thick in flower, 5.5-6 mm. thick in fruit; pedicels 0.5 mm. long; flowers rose-purplish; sepals oblong-ovate to lanceolate, rounded to subacuminate, serrulate, 2-2.5 mm. long; wings linear-oblong, about 3 mm. long and 0.6 mm. wide, somewhat undulate-convolute, obtuse to submucronulate, not clawed; upper petals 6.7 mm. long; keel 7 mm. long, united with the staminal tube and upper petals into a trough 5 mm. long; crest on each side of about 3 lobes, these variously lobed or cleft; capsule suborbicular-ovate, cordate at base, 2.4 mm. long, 2 mm. wide; seed plump, pilose, 2.2 mm. long; aril 1.1 mm. high, membranaceous-cellular, equitant, erect, scarcely lobed. In open grassy areas, savannahs and bogs, and open flat woodlands in the e. third of Tex., May-Sept.; from Fla. to Tex. and Mex., n. to L.I., N.J., Pa., s. Ont., s. Mich., s. Wisc., Ia. and Neb.

21. *Polygala polygama* L. Stems solitary to many from a biennial rootstock, erect or ascending, simple or sparsely branched, 1.5-3 dm. tall, glabrous, bearing loose racemes of cleistogamous flowers from the base or (in late season) from the axils of the leaves; leaves all alternate or the very lowest sometimes opposite, the lower or sometimes all spatulate to obovate and obtuse to rounded and mucronulate, slightly fleshy, the longer upper leaves usually linear to spatulate-linear and acutish, 12-31 mm. long, 2-8 mm. wide; peduncles 1-2 cm. long; racemes cylindric, obtuse, loose, 9-14 mm. thick, the axis 13.5 cm. long or less; bracts ovate to oblong-ovate, glabrous, deciduous, 1-1.3 mm. long; pedicels 1-4 mm. long; flowers pink to pink-purple, rarely pale-lilac or nearly white; sepals oval to oval-ovate, rounded to acutish, glabrous, 1.3-2.2 mm. long; wings oval to oval-obovate, 3.2-6 mm. long, 2-3.8 mm. wide, obtuse or rounded at apex, cuneate or clawed at base, about 3-nerved, glabrous; keel 3-5 mm. long, the crest on each side of a lamella and 2 or 3 divided lobes; capsule oval, margined, sometimes erose, plump, 2.5-4 mm. long, 2-3 mm. wide; seed ellipsoid, short-pointed at base, plump, pilose, 1.8-2.8 mm. long; aril 0.8-2 mm. long, the pilose corneous umbo terminating the beak of the seed, the 2 linear-elliptic to oval cellular-scarious lobes appressed. Incl. var. *obtusata* Chod. In bogs, low sandy soil in open woodlands and along streams in open woods in e. Tex., Apr.-June; from Fla. to e. Tex., n. to N.S., s.w. Que., s. Ont., Mich., Wisc. and Minn.

22. *Polygala nana* (Michx.) DC. Stems several from an annual or biennial rootstock, simple, erect to ascending, 7-17.5 cm. tall; basal leaves tufted, spatulate to obovate or elliptic-obovate, 15-43 mm. long, 3-17.5 mm. wide, rounded and sometimes mucronulate at apex, narrowed at base, thickish, 3- to 5-nerved; stem leaves few, alternate, linear-spatulate to oblanceolate or obovate, 1.3-4 cm. long, 1.5-8 mm. wide, rounded to acuminate and mucronulate at apex; peduncles solitary, 23-75 mm. long; racemes conic-capitate, becoming ovoid-ellipsoid or thick-cylindric, acute to very obtuse, 1-1.7 cm. thick, 1-3.7 cm. long; bracts linear-subulate, ciliolate, at length deciduous or sometimes persistent, 5.5-6.5 mm. long; flowers subsessile, yellow turning deep- or bright-green in drying; sepals elliptic-lanceolate to linear-subulate, 3-5.3 mm. long, cuspidate-acuminate, ciliate; wings elliptic, 6.5-7.5 mm. long, 1.8-2.8 mm. wide, acuminate and somewhat involute at apex into a cusp to 1 mm. long, scarcely narrowed at base, sparsely ciliolate, 3- to 5-nerved; keel 4.5-5.8 mm. long, the crest on each side of 3 linear entire to 3-parted lobes; anthers 6; capsule oval to suborbicular-oval, 1.6-2 mm. long, 1.2-1.6 mm. wide; seed ellipsoid to subpyriform, pilose, with a prominent thick blunt rostrum at base, 0.8-1.8 mm. long; aril 0.7-1.1 mm. long, the 2 linear scarious lobes appressed, one third to nearly as long as seed. *Pilostaxis nana* (Michx.) Raf. On seepage slopes, in savannahs and low open pinelands in s.e. Tex., Apr.-June; from Fla. to S.C. and Tex.

Plants of this species are sometimes confused with the more eastern *P. lutea* L. The cusp of the largest sepals of that species, however, is less than 1 mm. long and the sepals are orange-color instead of yellow.

23. *Polygala ramosa* Ell. Erect glabrous annual, 1.5-4 dm. tall, fibrous-rooted; stems solitary, simple or branched; basal leaves in a small tuft, elliptic to obovate, 7-20 mm. long, 2-6 mm. wide, rounded at apex, usually narrowed into a petiolelike base; stem leaves linear to spatulate or elliptic, 7-24 mm. long, 1.5-8 mm. wide, acute to obtuse at each end; branch leaves linear, reduced; racemes numerous, terminal and on axillary branches forming a flattish cymose panicle to 14 cm. broad, the separate racemes loosely flowered and 7-11 mm. thick and 18 mm. long or less; bracts lance-ovate, ciliolate, spreading, persistent, 1.5 mm. long; pedicels narrowly winged, 1.3-2.3 mm. long; flowers yellow, turning very dark-green in drying; sepals ovate, ciliolate, acuminate, 1.1-2 mm. long; wings obovate to elliptic-obovate, strongly cuspidate at the somewhat involute apex, 2.9-3.5 mm. long, 1.1-1.3 mm. wide, 3-nerved; keel 2.1 mm. long, the crest on each side of a lobed lamella and a 2- or 3-parted lobe; capsule suborbicular, plump, 0.8 mm. long and wide; seed ellipsoid, very plump, short-hairy, 0.6-0.7 mm. long; aril 0.2 mm. long, the 2 lobes oval, appressed. *Pilostaxis ramosa* (Ell.) Small. In seepage areas of savannahs, open slopes and in boggy open pinelands in s.e. Tex., May-Sept.; from Fla. to Tex., n. to N.J.

24. *Polygala hemipterocarpa* Gray. Stems several, sparsely branched, erect from a fruticulose base, sulcate, essentially glabrous, slightly glaucous, 12-56 cm. tall; leaves linear, 6-23 mm. long, 0.6-1 mm. wide, acute to subacuminate and mucronate at apex, obtuse at base, thickish, flattish above, beneath convex, 1-nerved, scarcely sulcate, glabrous; racemes 3-21 cm. long; flowers white, greenish-veined; sepals oval to ovate, obtuse, 1.6-2.3 mm. long; wings obovate, 3.5-4 mm. long, 1.6-1.8 mm. wide, rounded at apex, 5-nerved; keel 3.4 mm. long, the crest on each side of about three 2- to 4-lobed processes; capsule oblong, 5 mm. long, 2.3 mm. wide, the upper cell noticeably the longer and broadly scarious-winged with the wing erose-crenulate, the lower cell wingless, filled by the seed; seed short-silky-pilosulous, 2.7 mm. long; aril (of seed in winged cell) 2 mm. long, the 2 scarious lobes linear; aril of seed in wingless cell obsolescent. Grassy stony slopes of canyons in mts. of the Trans-Pecos, May-July; from w. Tex. to s. Ariz. and Mex.

The broad, irregularly erose-crenulate wing of the upper cell of the capsule distinguishes this species from *P. scoparioides* with the wing uniformly narrow and essentially entire.

25. *Polygala scoparioides* Chod. Stems numerous, angulate, finely incurved-puberulous, 9-30 cm. tall, slightly glaucescent; leaves linear-acicular, 7-14 mm. long, 0.6-1.3 mm. wide, acute to acuminate at each end, mucronate, more or less strongly bisulcate beneath, glabrous or nearly so; racemes 15-78 mm. long; flowers white, greenish-veined; sepals oblong-ovate, rounded, glabrous, 1.3 mm. long; wings spatulate-obovate, 2.6-3 mm. long, 1.3-1.6 mm. wide, barely mucronulate at the obtuse apex, 5-veined; keel 2.8 mm. long, the crest on each side of 3 weak lobes; capsule oblong-elliptic, very narrowly winged on

upper side, 3-3.5 mm. long, 1.6 mm. wide, the upper cell slightly the longer, both cells dehiscent; seed subcylindric, puberulous, 2.5-3 mm. long; aril 1-1.9 mm. long, the 2 linear lobes appressed. Incl. var. *multicaulis* Gray. On limestone slopes and hills, in rubble of talus slopes and in crevices of limestone ledges on w. edge of Edwards Plateau and in the Trans-Pecos, Apr.-Nov.; from Tex. to Ariz. and n. Mex.

Closely allied to *P. hemipterocarpa*.

FAM. 102. EUPHORBIACEAE JUSS. SPURGE FAMILY

Herbs, shrubs or trees; leaves opposite or alternate or whorled, usually stipulate (but stipules commonly very small or caducous); highly variable as to inflorescence and flower form but the flowers are always unisexual; petals can be present or absent; a lobate "disk" is commonly present at least in the pistillate flowers; the ovary is nearly always 3-celled and each locule has a separate style which in some species is deeply dissected (exceptions are *Crotonopsis* with one locule; *Croton monanthogynus* with only one locule well-developed; *Jatropha dioica* and *Bernardia obovata* regularly have fewer than 3 locules); the placentation is axile and the ovules pendulous (attached near the middle in *Reverchonia*), anatropous, with a ventral raphe; seeds 1 or 2 per cell, when 2 then collateral; the micropyle in many species is covered by a caruncle; the fruit is usually a capsule (except an achene in *Crotonopsis*), when ripe the dorsal walls of the locules usually separate septically from the central placental axis called the columella (this small, fragile or obsolete in *Stillingia*, *Acalypha* and those species mentioned above as having regularly fewer than 3 cells); the seeds are liberated through the ventral (axile) openings of the locules which are in many species eventually loculicidal.

A vast and diverse family of over 200 genera and several thousand species. It is said by some authors that most Euphorbiaceae are poisonous. A number of our species are known to be toxic to livestock. The starchy, tuberous roots of *Manihot* species replace grains as staple starchy crops in much of the hot, forested lowlands of South America; these roots have to be specially treated, steeped, dried and heated, before the edible materials (mandioca, cassava, tapioca) can be prepared from them. The Brazilian rubber trees (genus *Hevea*) are widely planted in Malaysia and Africa. The castor-bean (*Ricinus*) formerly was valuable for its oil. Croton oil is prepared from species of *Croton*. Some species of the family are valued as ornamentals (*Breynia*, *Acalypha*, *Ricinus*, *Codiaeum*, etc.).

1. Flowers without perianth, borne from a rather small cup-shaped or urn-shaped calyxlike involucre (individual bracts not discernible except as lobes at the rim), often with glands attached to the top between the lobes and near the rim; staminate flowers each of a single naked stamen, few to many, in groups within the involucre; pistillate flower solitary, central, with a 3-lobed ovary (one ovule per locule); sap usually milky20. *Euphorbia*, p. 955.
1. Flowers with a calyx, manifestly unisexual (2)
 - 2(1). Leaves palmately lobed, the margins usually serrate (3)
 2. Leaves not palmately lobed (6)
 - 3(2). Leaf blades peltate16. *Ricinus*, p. 953.
 3. Leaf blades not peltate (4)
 - 4(3). Flowers in terminal racemes19. *Manihot*, p. 955.
 4. Flowers in forking cymelike panicles (5)
 - 5(4). Leaves and stems armed with translucent aciculate stinging hairs18. *Cnidoscolus*, p. 954.
 5. Leaves and stems essentially glabrous or only sparingly pubescent17. *Jatropha*, p. 953.
 - 6(2). Stems perennial, fleshy, rising wandlike 2-6 dm. from underground horizontal rootstocks (oozing "blood" when freshly broken); leaves fasciculate on short lateral spurs; male and female flowers borne on separate plants; cells of ovary 1 or rarely 2; seeds 1 per locule; columella absent ...17. *Jatropha (dioica)*, p. 953.
 6. Plants otherwise (7)

- 7(6). Plants clothed with stellate or forked hairs or lepidote scales (8)
7. Plants with simple or malpighiaceus hairs or glabrous (11)
- 8(7). Seeds not carunculate; anthers erect in bud; plants shrubby; staminate calyx lobes 3; hairs stellate or forked10. *Bernardia*, p. 942.
8. Seeds usually carunculate; anthers turned inward and down in bud; plants herbaceous or shrubby; staminate calyx lobes 4 or usually 5; plants clothed with stellate or forked hairs or lepidote scales (9)
- 9(8). Margins of pistillate calyx lobes with a number of linear lacinations 6. *Julocroton*, p. 939.
9. Margins of pistillate calyx lobes essentially entire (10)
- 10(9). Fruit one-seeded, indehiscent 5. *Crotonopsis*, p. 937.
10. Fruit usually 3-seeded and always dehiscent 4. *Croton*, p. 929.
- 11(7). Ovules 2 in each of the 3 cells of the ovary, collateral; seeds ecarunculate, wedge-shaped; stamens (at least the outer ones) opposite the sepals; if plant entirely staminate then leaves entire and plant subglabrous (12)
11. Ovules 1 in each cell; seeds mostly carunculate; stamens (at least the outer ones) alternate with the sepals; if plant entirely staminate then margins of leaves crenate or serrate or plants pubescent (14)
- 12(11). Plants shrubby, mostly 4-6 dm. tall; male and female flowers on separate plants, both sorts of flowers with petals 1. *Andrachne*, p. 925.
12. Plants herbaceous or if appearing subshrubby then shorter than 2 dm.; male and female flowers either on separate plants or on the same plant, neither kind of flower petaliferous (13)
- 13(12). Annual herbs of sandy soils, with only a single main stem; flowers and upper stipules distinctly purplish-red; leaves at least 4 times as long as broad; flowers in groups of 6 to 12 per axil; pistillate calyxes relatively small in relation to fruit, hidden by fruit in a distal view 3. *Reverchonia*, p. 929.
13. Annual or perennial herbs, usually several-stemmed from the base; flowers and upper stipules sometimes pale-reddish but not distinctly purple; leaves rarely as much as 4 times as long as broad; flowers solitary or in two or threes in the axils; lobes of pistillate fruiting calyxes long enough to be visible from a distal view 2. *Phyllanthus*, p. 925.
- 14(11). Stamens 2 or 3 or rarely 4 per male flowers; inflorescences terminal spikes or spiciform thyrses; juice of plant often milky (15)
14. Stamens more than 3, or if so few (in *Tragia*) then inflorescences lateral, flowers pedicelled and plants with stinging hairs; juice never milky (17)
- 15(14). Lower part of ovary enlarged and indurated after anthesis and at maturity separating from the upper dehiscent portion and persisting as a 3-pointed gynobase; columella fragile and not long persisting after dehiscence 15. *Stillingia*, p. 951.
15. Ovary and dehiscence otherwise, columella persistent (16)
- 16(15). Seeds with caruncles falling at dehiscence13. *Sebastiania*, p. 951.
16. Caruncles absent; seeds white, persistent on the placenta and columella long after dehiscence14. *Sapium*, p. 951.
- 17(14). Stamens 2 to 5 (up to 10 in terminal flowers) per male flower; pubescence of stiff stinging hairs intermingled with soft spreading ones 12. *Tragia*, p. 947.
17. Stamens more numerous, usually 8 to 20; pubescence otherwise (18)
- 18(17). Plants shrubby, with fascicled spatulate leaves .. 9. *Adelia*, p. 942.
18. Plants herbaceous; foliage otherwise (19)
- 19(18). Inflorescence terminal or apparently so; petals absent 11. *Acalypha*, p. 943.

19. Inflorescences axillary; petals present at least in the pistillate flowers and usually in both kinds (20)
- 20(19). Perennials, not aquatic; hairs on some of them (when present) malpighiaceae; capsules not glandular-setulose 7. *Argythamnia*, p. 939.
20. Aquatic annuals; hairs not dibrachiate; capsules glandular-setulose 8. *Caperonia*, p. 942.

1. ANDRACHNE L.

Unarmed mostly glabrous low (mostly less than 1 m. high) shrubs, usually rhizomatous; leaves alternate, 4-32 mm. long, 1 to 2 times as long as broad, entire, penninerved, with short petioles; stipules 1-2 mm. long, darkly pigmented; staminate and pistillate flowers borne on separate plants, petaliferous, borne solitary or in small groups on short pedicels from the upper axils; *staminate* calyx deeply 5-lobed; petals 5, alternate with and shorter than the sepals and rising from beneath a disk; stamens 5, opposite the sepals; rudimentary ovary of 3 columnar structures; *pistillate* calyx deeply 5-lobed; petals 5, alternate with and shorter than the sepals and rising from beneath a fleshy disk; ovary 3-celled, each cell with 2 collateral ovules; capsules 3-5 mm. long; seeds 2 per cell, wedge-shaped, about 3 mm. long.

A genus of about 15 species scattered in warmer parts of the world; the genus *Savia* Willd. is weakly segregated from it.

1. Leafy twigs 10-30 (-55) cm. long, usually weakly arcuate; leaf blades mostly more than 1 cm. long; staminate pedicels 6-12 mm. long; pistillate pedicels 8-22 mm. long 1. *A. phyllanthoides*.
1. Leafy twigs 5-10 cm. long, grayish-white, rigidly straight; leaf blades mostly less than 1 cm. long; staminate pedicels 2-3.2 mm. long; pistillate pedicels 3-4 mm. long 2. *A. arida*.

1. *Andrachne phyllanthoides* (Nutt.) Coult. MAIDENBUSH. Leafy twigs 10-30 (-55) cm. long, usually weakly arcuate; leaf blades elliptic-oblong to obovate-oblong, occasionally nearly round, (6-) 10-15 (-32) mm. long, 1 to 1.6 times as long as broad, apically usually rounded, occasionally emarginate, rarely shortly acute; *staminate* pedicels 6-12 mm. long, the calyx 4.5-7 mm. across; *pistillate* pedicels 8-12 (-22) mm. long, the calyx 7-11 mm. across; capsules 4-5 mm. long, 7-7.5 mm. across; seeds 3-3.2 mm. long. *Savia phyllanthoides* (Nutt.) Pax & K. Hoffm. Infrequent to rare, limestone cliffs and crevices near streams, Edwards Plateau and n.-cen. Tex., (summer-) fall; Mo., Ark., Okla. and Tex.; reportedly also in Ala.

2. *Andrachne arida* (Warnock & M. C. Johnst.) G. L. Webst. Intricately branched shrubs (25-) 40-60 (-75) cm. tall; leafy twigs 5-10 cm. long, rigidly straight; leaf blades 4-10 mm. long, 1.2 to 2 times as long as broad, apically rounded or obscurely mucronulate, basally rounded; *staminate* pedicels 2-3.2 mm. long, the sepals about 1.8-2 mm. long; *pistillate* pedicels 3-4 mm. long, the calyx 5-5.5 mm. across; capsules 3.5-4 mm. long, about 7 mm. across; seeds 2.7-3 mm. long. *Savia arida* Warnock & M. C. Johnst. Rare in limestone desert mts., s. Brewster and Presidio cos. in the Trans-Pecos, July-Oct.; also Coah.

2. PHYLLANTHUS L.¹¹³

LEAF-FLOWER

Trees, shrubs or herbs; branches persistent or deciduous (in the latter instance, leaves on main stem then reduced to scales); leaves entire; petioles short; stipules deciduous or persistent; male and female flowers borne on same plant in ours (except perhaps in *P. ericoides* and *P. polygonoides*); flowers usually axillary, solitary or in cymes, apetal-

¹¹³ Contributed by Grady L. Webster.

ous, gamosepalous; disk usually present; *staminate flowers* with mostly 3 to 6 stamens, the filaments free or connate; disk usually dissected; pistillode absent; pollen grains colpate (in local taxa); *pistillate flowers* pedicellate or sessile; calyx lobes usually 5 or 6, entire; disk continuous or segmented (rarely absent); carpels 3 (in ours); ovules 2 in each locule, hemitropous; styles free or united, bifid or variously divided or dilated; fruits capsular and ballistically dehiscent (indehiscent in some exotic taxa); seeds usually 2 in each locule, collateral; seed coat dry and crustaceous; endosperm copious; embryo straight or slightly curved.

A polymorphic genus of some 700 species, best developed in the Old World tropics.

1. Perennials with leaves spirally arranged on all axes; disk of female flower dissected into 6 obtuse segments; seeds verruculose (2)
1. Annuals with leaves distichous at least on ultimate axes; disk of female flower entire (except in *P. abnormis*); seeds smooth, striate or verruculose (3)
- 2(1). Subshrubs with distinctly woody stems; leaves small (mostly less than 5 mm. long) and sharp-pointed; filaments united their entire lengths into a column; seeds about 1 mm. long 1. *P. ericoides*.
2. Perennial with woody caudex bearing wiry herbaceous stems; leaves larger and usually not sharp-pointed; filaments united about halfway into a column; seeds 1.1-1.5 mm. long 2. *P. polygonoides*.
- 3(1). Main axes leafy and floriferous; leaves distichous; stamens 3; anthers dehiscing more or less horizontally; seeds verruculose (4)
3. Main axes with leaves reduced to scales, the developed leaves and flowers borne on specialized deciduous branchlets; seeds various (5)
- 4(3). Filaments free; stems terete, not winged; capsule 1.7-2 mm. in diameter; seeds 0.8-1 mm. long 3. *P. carolinensis*.
4. Filaments connate; stems compressed-winged; capsule 2.9-3.2 mm. in diameter; seeds 1.2-1.5 mm. long 4. *P. pudens*.
- 5(3). Leaves minutely rough-scrabrid beneath; female flowers (and capsules) sessile; stamens 3, the filaments completely connate; anthers dehiscing vertically; seeds transversely ribbed on sides and back 5. *P. Urinaria*.
5. Leaves not scabrid beneath with sharp point; female flowers distinctly pedicellate; stamens 2 or 3; anthers dehiscing horizontally or obliquely; seeds not transversely ribbed (6)
- 6(5). Leaves oblique at base; stamens 3, the filaments connate halfway or less; style branches capitate; fruiting calyx lobes 3-3.5 mm. long; female disk entire; seeds verruculose, 1.5-1.8 mm. long 6. *P. Niruri*.
6. Leaves not oblique at base; stamens (in most male flowers) 2, the filaments entirely connate; style branches not capitate; fruiting calyx lobes scarcely over 1 mm. long; female disk cut into 3 segments; seeds longitudinally striate, 1.1-1.5 mm. long 7. *P. abnormis*.

1. *Phyllanthus ericoides* Torr. Subshrub 5-10 (-15) cm. high, with woody caudex to 15 mm. thick, monoecious (and also dioecious?); stems woody; leaves spirally arranged, densely imbricate and appressed, narrowly oblanceolate, pungently tipped, glaucous, pitted, 1.5-3.5 (-5) mm. long, 0.7-1.5 mm. broad; stipules attenuate-acuminate, 0.7-1.3 mm. long; flowers solitary, the female at distal axils; *male flowers* with pedicels 0.6-0.8 mm. long; calyx lobes 6, narrowly oblong-lanceolate, 0.9-1.2 mm. long; disk segments 6, orbicular; stamens 3; filaments completely connate, the column 0.3-0.5 mm. high; anthers discrete, dehiscing vertically, 0.3-0.35 mm. long; *female flowers* with pedicels becoming 0.9-1.2 mm. long; calyx lobes 6, ovate to elliptic, glaucous, 1.1-1.4 mm. long; disk segments 6, obtuse; ovary smooth; styles thickish, about 0.3 mm. long, emarginate; capsules obovate, about 2 mm. in diameter; seeds dark-brown, verruculose, 0.9-1 mm. long. Rocky calcareous soil, known only from 1 station in Terrell Co. in the Trans-Pecos, summer (?); also known from 1 station in Chih.

2. *Phyllanthus polygonoides* Spreng. Glabrous perennial herb, becoming more or less suffruticose, 1-5 dm. high, mostly monoecious but unisexual plants not uncommon;

branches upright, whiplike; leaves spirally arranged, not markedly imbricate on expanded axes, narrowly oblong to obovate, acute or mucronulate at the tip, obtusish at base, glaucous beneath and with lateral veins sometimes visible, mostly 5-10 mm. long, 1.5-5 mm. broad; stipules acuminate, auriculate at base, mostly 1-2 mm. long; cymules unisexual or bisexual, with 1 (rarely 2) female flower and/or several male flowers; *male flowers* with pedicels 1.5-3.5 mm. long; calyx lobes 6 (rarely 5), oblong to obovate, 0.7-1.3 mm. long; disk segments 6, orbicular; stamens 3; filaments 0.6-0.8 mm. long, connate into a column 0.4-0.5 mm. high; anthers dehiscing more or less vertically, about 0.3 mm. long; *female flowers* with pedicels 2.5-7 mm. long; calyx lobes 6 (rarely 5), ovate to obovate, acute, green and herbaceous, pinnately veined, 1.5-2.5 mm. long in fruit; disk segments 6, obcuneate; ovary smooth or nearly so; styles spreading or ascending, 0.25-0.3 mm. long, bifid, the style branches subcapitate; capsules oblate, 2.7-3.2 mm. in diameter; seeds usually dark-brown, irregularly verruculose, (1.1-) 1.2-1.4 (-1.5) mm. long. Cen., s., and w. Tex., commonly on rocky calcareous soils, Apr.-Nov. or throughout the year on the Rio Grande Plains; Okla. and Tex., s. into the Mex. plateau, with outliers in Mo. and La.

3. *Phyllanthus caroliniensis* Walt. subsp. *caroliniensis*. Glabrous erect annual monoecious herb 1.3 dm. high; branches terete to somewhat compressed but not winged; leaves distichous, elliptic to obovate, obtuse or rounded and sometimes apiculate at the tip, acute at the base, 5-20 (-30) mm. long, 4-10 (-13) mm. broad; stipules lanceolate, acuminate, basally denticulate, (0.5-) 0.8-1.3 mm. long; most axils on all axes floriferous; cymules bisexual, with 1 or 2 male and 1 or 2 female flowers; *male flowers* with pedicels 0.5-1 mm. long; calyx lobes 6 (rarely 5), oblong to ovate or suborbicular, 0.5-0.8 mm. long; disk segments 6 (5), more or less cuneate; stamens 3; filaments free, 0.2-0.3 mm. long; anthers dehiscing transversely, about 0.3 mm. broad; *female flowers* with pedicels becoming geniculate-reflexed and 0.5-1 (-1.5) mm. long; calyx lobes 6 (rarely 5), linear-lanceolate to narrowly spatulate, greenish or reddish, with unbranched midrib, 0.7-1.2 (-1.4) mm. long; disk patelliform, entire or nearly so; ovary smooth; styles nearly free, spreading, bifid, 0.3 mm. long or less, style branches obtuse or subcapitate; capsules oblate, 1.7-1.9 mm. in diameter; seeds fuscous-brown, verruculose (with verrucae in wavy lines), 0.8-1 mm. long. An infrequent weed in e. and n.e. Tex. (from Tarrant and Harris cos. eastw.), June-Nov.; Ill. and Pa., s. to Arg. and Urug.

4. *Phyllanthus pudens* Wheeler. Erect annual monoecious herb 2-5 dm. high; stems compressed and distinctly but narrowly winged, scabridulous; leaves distichous, oblong or elliptic, acute or obtuse and apiculate at the tip, obtuse to rounded at the base, 1-2 cm. long, 3-10 mm. broad; stipules ovate-lanceolate, acuminate, basally more or less denticulate, 1.2-2 mm. long; most axils on all axes floriferous; cymules bisexual, with 1 to 3 male and 1 or 2 (rarely 3) female flowers; *male flowers* with pedicels about 0.5 mm. long; calyx lobes 5 or 6, ovate, 0.5-0.7 mm. long; disk segments 5 or 6, suborbicular or cuneate; stamens 3; filaments completely united into a column 0.2-0.3 mm. high; anthers dehiscing horizontally, about 0.25 mm. broad; *female flowers* with pedicels becoming geniculate-reflexed and (1-) 1.4-2.2 mm. long; calyx lobes 6 (rarely 5), oblong to ovate, often reddish at base, herbaceous with unbranched midrib, 0.7-1.2 mm. long; disk patelliform, 6-angled, entire; ovary smooth; styles horizontal, bifid, basally fused into a triangular platform 0.5-0.6 mm. across, style branch tips subcapitate; capsules oblate, sometimes reddish-tinged, 2.9-3.2 mm. in diameter; seeds yellowish- to fuscous-brown, verruculose (with verrucae in irregular wavy lines), 1.2-1.5 mm. long. Coastal prairies, from Matagorda Co. to Chambers Co. and e., May-Nov.; also s. La.

5. *Phyllanthus Urinaria* L. Erect or procumbent annual monoecious herb, 1-5 dm. high; primary axes angled, with spirally arranged scale leaves 2-3 mm. long, the stipules of scale leaves auriculate and denticulate; deciduous branchlets (3-) 5-10 cm. long, flattened and winged, with 20 to 35 distichous leaves; leaves mostly oblong, acute or obtuse and apiculate at tip, obtuse or inequilateral at base, hispidulous beneath and marginally, 6-25 mm. long, 2-9 mm. broad; stipules unequal, the longer 0.8-1.5 mm. long; flowers only on branchlets, the 5 to 20 proximal axils with solitary female flowers, distal axils with cymules of several male flowers; *male flowers* with pedicels less than 0.5 mm. long; calyx lobes 6, elliptic to obovate, 0.3-0.5 mm. long; disk segments 6, roundish; stamens 3; filaments completely united into a slender column 0.1-0.15 mm.

high; anthers discrete, dehiscent vertically, less than 0.2 mm. long; *female flowers* subsessile (pedicel not exceeding 0.5 mm. even in fruit); calyx lobes 6, reflexed in fruit, linear-oblong, 0.6-0.9 mm. long, dorsally hispidulous, midrib unbranched; disk patelliform, 6-angled; ovary conspicuously papillate-bullate; styles flattened, bifid, fused into a horizontal plate 0.3-0.4 mm. across, style branches obtuse; capsules oblate-spheroidal, 2-2.2 mm. in diameter, smooth or scurfy; seeds light-brown, with 12 to 15 sharp transverse ridges on back and sides, often laterally foveolate as well, 1.1-1.2 mm. long. Reported only from Jefferson Co., summer (?); Old World trop., introd. into the Am. trop. and (sporadically) into the Gulf States.

6. *Phyllanthus Niruri* L. subsp. *lathyroides* (H.B.K.) G. L. Webst. Glabrous erect annual monoecious herb, 1-5 dm. high; primary axes terete, with spirally arranged scale leaves 1.5-3 mm. long; stipules of scale leaves narrowly lanceolate-acuminate, entire, not auriculate; deciduous branchlets 6-12 cm. long, more or less terete, with 15 to 30 (rarely fewer) distichous leaves; leaves elliptic, obtusely pointed, inequilateral at base, with 8 to 10 pairs of lateral veins, 1-2 cm. long, 4-9 mm. broad; stipules unequal, linear-lanceolate, the longer 1.2-1.8 mm. long; flowers only on branchlets, proximal cymules with 3 to 7 male flowers, distal ones with solitary female flowers; *male flowers* with pedicels 1.2-1.8 mm. long; calyx lobes 5 (rarely 6), obovate, 1.5-3 mm. long, 1-1.8 mm. broad; disk segments 5 (6), roundish, thickened and punctate; stamens 3; filaments 0.5-0.8 mm. long, united about half way into a column; anthers dehiscent more or less obliquely, 0.2-0.4 mm. long; *female flowers* with straightish pedicels 4-7 mm. long; calyx lobes 5, elliptic to obovate, clearly to obscurely pinnately veined, 3-3.5 mm. long; disk patelliform, 5-angled, rather massive; ovary smooth; styles free and ascending, bifid, 0.5-0.6 mm. long, style branches capitate; capsules oblate, about 3.5 mm. in diameter; seeds dark-brown, densely verruculose, 1.5-1.8 mm. long. In Tex. definitely recorded only from Ottine Swamp, Gonzales Co., excessively rare and now possibly extinct, summer (?); otherwise known from n. Mex. s. to Arg.

7. *Phyllanthus abnormis* Baill. Erect or somewhat procumbent annual monoecious herb, 1-5 dm. high; primary axes terete, basally thickened and sometimes lignescent (plants then appearing as though perennial), above with spirally arranged scale leaves 0.7-1.5 mm. long; stipules of scale leaves deltoid, often reddish, not auriculate; deciduous branchlets 3-6 (-17) cm. long, subterete, glabrous or scabridulous, with 15 to 30 distichous leaves; leaves elliptic to oblong, obtuse to emarginate at tip, cuneate to subcordate at base, smooth or scabridulous, with rather conspicuous lateral veins, 3-10 mm. long, 1-4 mm. broad; stipules ovate- to linear-lanceolate, acuminate, 0.6-1.5 mm. long; flowers only on branchlets, first few proximal cymules with paired male flowers, distal cymules usually with 1 male and 1 female flower; *male flowers* with pedicels 0.7-1.5 mm. long; calyx lobes 4 (5 or 6 in the first few larger proximal flowers), ovate or elliptic, 0.5-1 mm. long; disk segments 4 (5 or 6), roundish; stamens 2 (3 in larger proximal flowers); filaments completely connate into a column 0.2-0.3 mm. high; anthers connivent, dehiscent transversely, about 0.3 mm. broad; *female flowers* with straightish pedicels 1-3 (-3.5) mm. long; calyx lobes 5 or 6, often unequal, ovate to obovate or oblong, midrib unbranched, 0.7-1.1 mm. long; disk segments 3, more or less unequal (one or more often bifid or divided), ligulate to reniform; ovary smooth; styles spreading, free, bifid, about 0.2 mm. long, style branches unthickened; capsules oblate, often reddish-tinged, 2.3-2.7 mm. in diameter; seeds yellowish-brown, finely longitudinally ribbed, 1.1-1.5 mm. long. Two varieties are distinguished as follows:

Var. *abnormis*. Stems smooth and glabrous to densely scabridulous; leaves usually smooth; female flower always accompanied by 1 male flower; disk segments loriform, usually unequal, the larger ones often bifid or divided but all segments as long as or longer than broad; seeds (1.2-) 1.3-1.4 mm. long. Sandy soils, w. Tex. to e.-cen. Tex., Apr.-Oct.; extending into n. Mex. (Tam.) and with a disjunct population in peninsular Fla.

Var. *riograndensis* G. L. Webst. Stems and leaves densely scabridulous; female flower accompanied by 1 to 3 male flowers; disk segments equal or nearly so, broader than long; seeds 1.1-1.3 mm. long. Known only from semidesert scrub, lower Rio Grande Valley (Webb to Hidalgo cos.), Apr.-Nov.

3. REVERCHONIA GRAY¹¹⁴

A monotypic genus.

1. *Reverchonia arenaria* Gray. Glabrous annual herb becoming 5 dm. high, with sparsely branched taproot; main stem subterete, smooth, glaucous-white; lower lateral branchlets 2-3 dm. long (upper ones shorter), mostly 1.5-2 mm. thick; stipules lanceolate, acuminate, persistent, to 2.3 mm. long, usually much shorter; leaf blades elliptic to narrowly oblong-elliptic or nearly linear, (15-) 20-40 (-45) mm. long, (1.8-) 2.5-8 (-9) mm. wide, apiculate at tip, narrowed to the base; petiole 1-3 mm. long; flowers in reduced bracteolate cymules axillary to the leaves on lateral branchlets (never on main stem), each cymule typically producing 1 central female and 4 to 6 lateral male flowers; *male flowers*: pedicel slender, 1.5-2.5 mm. long; calyx lobes 4, ovate-oblong, submedianly constricted, 1-veined, obtuse, purplish to pinkish with a narrow central stomatiferous greenish strip, 1.5-2.5 mm. long, 0.7-1.5 mm. broad; disk of 4 roundish lobes continuous across the center of the flower (between the stamens), with the outline of an I-beam; stamens 2, opposite the outer calyx lobes; filaments free, subterete, 0.7-1.2 mm. long; *female flower*: pedicel stout, 1.5-2 mm. long at anthesis, becoming as much as 8.7 mm. in fruit; calyx lobes 6 (rarely 5), oblong, colored and distally constricted as in the male but not especially inflated, becoming as much as 2.9 mm. long; disk flat, rather thin, 1.1-1.8 mm. in diameter, roundish or 6-angled in outline; styles erect, 0.5-0.8 mm. high, united halfway or less, the stigmas somewhat dilated, emarginate or slightly bilobed; capsule oblate-spheroidal, smooth, stramineous, 7-9.8 mm. in diameter; columella usually deciduous; seeds trigonous, dark- or reddish-brown, smooth on the back (tangential face), papillate on the lateral (radial) faces, (4.4-) 4.7-6.2 (-6.6) mm. long. Local in deep sand of dunes in the Plains Country and Trans-Pecos, summer-fall; Ut., Ariz., N.M., Okla., Tex. and Chih.

4. CROTON L. CROTON

Herbs or shrubs, with stellate trichomes or peltate scales on the epidermis of at least some parts; leaves alternate (seeming opposite or whorled just below the inflorescence), unlobed, marginally serrate or entire, diverse in shape, petiolate; stipules present though often small and caducous; flowers in terminal spikes or racemes, when both male and female flowers are on the same plant the spikes are androgynous; *staminate flowers*: calyxes with 5 or rarely 4 or 6 deep or shallow lobes, valvate in bud; petals absent or present, when present as many as the calyx lobes and alternate with them; disk (of lobes) often present when the petals are absent; stamens 5 or more, usually 10 to 20 in ours; rudiment usually absent or poorly developed, usually represented merely by a mound in the center; *pistillate flowers*: calyxes with 5 or 6 or up to 9 deep or shallow lobes, valvate in bud; petals absent or when present as many as the calyx lobes and alternate with them; disk sometimes present as a series of lobes, usually present when petals absent; ovary 3-celled (or in *C. monanthogynus* with fewer cells), each cell with one pendulous ovule, the ovules usually markedly carunculate and with a decided raphe; styles 3, each one or more times dichotomous; capsule 3-celled (or with only 1 recognizable cell in *C. monanthogynus*) and 3-seeded (1-seeded in *C. monanthogynus*).

This is a genus of more than 600 species of herbs, shrubs and trees in warm regions of the world. Many, or perhaps all, of them are aromatic, and to many are ascribed medicinal properties, but the only known pharmaceutical is croton oil, obtained from the Old World *C. Tiglium* L. The seeds of several of our species furnish much food for doves and other wild birds. The herbage of several of our species is reputed to be toxic upon ingestion. The glandular secretions of the epidermal hairs of *C. ciliatoglandulifer* cause contact dermatitis and conjunctivitis. Plants of the genus generally increase greatly in abundance under the prevalent agricultural regime of abusive overstocking. Stock animals rarely eat Crotons, even where desirable herbage is scarce or absent.

¹¹⁴ Adapted from Grady L. Webster and Kim I. Miller in *Rhodora* 65:193-207. 1963.

1. Styles only once-dichotomous, giving 6 ultimate stigmatic ends per flower (or only 4 in *C. monanthogynus*) (2)
1. Styles or at least some of them on each plant more than once-dichotomous (in *C. argyranthemus* some styles may appear trifold or quadrifold), giving usually at least 10 ultimate stigmatic ends per flower (11)
- 2(1). Leaves distinctly serrate; a minute gland present on each side of the base of the midvein on the lower surface of the blade; lower petioles usually less than half as long as the blades they support 14. *C. glandulosus*.
2. Leaves not serrate (sometimes appearing very minutely serrate in *C. Torreyanus*, *C. Cortesianus* and *C. fruticulosus*); blades not biglandular below at base (in species 1, 2 and 3 often with several stalked glands at the base) (3)
- 3(2). Petioles of lower leaves usually at least half as long as the blades they support (often as long as the blades in *C. leucophyllus* and *C. Lindheimerianus*) (4)
3. Petioles of most leaves less than a third as long as the blades they support; collections almost always fragmentary, usually of outer branches of shrubby plants (7)
- 4(3). Styles 2, ultimate stigmatic ends 4 per flower; mature capsule 1-seeded 20. *C. monanthogynus*.
4. Styles 3, ultimate stigmatic ends 6 per flower; mature capsule 3-seeded (5)
- 5(4). Pistillate calyx lobes very unequal with 3 lobes well-developed and 2 lobes weak or suppressed 18. *C. leucophyllus*.
5. Pistillate calyxes with 5 equal or subequal lobes (in *C. Lindheimerianus* rarely only 4 lobes well-developed) (6)
- 6(5). Mature pistillate calyxes about half as long as the fruit; stamens and styles usually at least 1 mm. long; collections usually fragmentary, usually broken near ground level but the lower part usually obviously ligneous and perennial 17. *C. Pottsii*.
6. Mature pistillate calyxes at least three quarters and usually fully as long as the fruit; stamens and styles usually about 1 mm. long, rarely more than 1.5 mm. long; collections often of complete plants showing annual taproots 19. *C. Lindheimerianus*.
- 7(3). Leaf blades oblong (most of them distinctly more than twice as long as broad, tomentose beneath, above short-pubescent and not tomentose) 5. *C. Torreyanus*.
7. Leaf blades tapering from near the middle to the apex (8)
- 8(7). Leaf blades ovate, tapering from near the base to the apex, often shallowly cordate at base (tomentose on both surfaces but less densely so above, usually about twice as long as broad) 4. *C. fruticulosus*.
8. Leaf blades widest near the middle, tapering to a pointed apex and to a pointed or shortly rounded base, rarely with cordate tendencies (9)
- 9(8). Both male and female flowers present on same plant. 6. *C. suaveolens*.
9. Male and female flowers on separate plants (10)
- 10(9). Petioles 2-4.5 mm. long 7. *C. Sancti-Lazari*.
10. Petioles 5-29 mm. long 8. *C. Cortesianus*.
- 11(1). Pistillate calyxes (or most of them) having at least 6 lobes, usually 6 to 9 (12)
11. Pistillate calyxes 5-lobed (in *C. argyranthemus* a few of them 6-lobed) (13)
- 12(11). Leaves pinnate-nerved, the lateral (secondary) nerves of the lower surface curving, not parallel, most of them prominent; petals of staminate flowers not conspicuous; styles 1-2 mm. long 15. *C. capitatus*.
12. Leaves pinnate-nerved, the secondaries of the lower surface straight and rather strictly parallel, not raised above the tomentum; staminate flowers with 5 conspicuous silvery-scaly petals; styles about 4 mm. long 16. *C. Coryi*.
- 13(11). Most petioles of lower mature leaves at least half as long as the blades they support (14)
13. Most petioles less than half as long as the blades they support (17)

- 14(13). Most styles 1-2 mm. long, the ends not spreading; leaf blades broad, rounded apically or if pointed the angle greater than 100° ... 10. *C. punctatus*.
14. Most styles 3-5 mm. long, the ends tending to spread; leaf blades tapered from near the middle to the pointed acute apex which forms a $40-70^\circ$ angle (15)
- 15(14). Stipules and margins of leaves conspicuously glandular-ciliate 3. *C. ciliatoglandulifer*.
15. Stipular and foliar glandular ciliation (when present) not noticeable without a lens (16)
- 16(15). Epidermis rather densely stellate-pubescent or even thinly tomentose 1. *C. humilis*.
16. Epidermis nearly glabrous, the trichomes few and remote and markedly appressed 2. *C. Soliman*.
- 17(13). Styles 2-4 mm. long (usually 3 mm.), relatively slender, near their midpoints appearing trifid or quadrid; leaves and stems conspicuously silvery-scaly, brightest on the underside of the leaves; staminate and pistillate flowers appearing on the same plant 9. *C. argyranthemus*.
17. Styles at most 3 mm. long (usually 2 mm.), relatively thick and squat, the first dichotomy being near the base; leaves when scaly not brightly so; staminate flowers never occurring on the same plant as pistillate flowers (18)
- 18(17). Leaves scaly silvery-canescens beneath, dark-grayish above; base of plant usually manifestly ligneous with several stems (perennial but flowering first year) 11. *C. dioicus*.
18. Leaves green to yellowish-green or yellowish-gray, never at all silvery; specimens often fragmentary but when intact the single stem can be seen to arise from the thick annual taproot (19)
- 19(18). Plants often as much as 6 dm. tall; mature capsules 5-8 mm. long 12. *C. texensis*.
19. Plants more robust, often 10 dm. tall; mature capsules 8-9 mm. long 13. *C. Parksii*.

1. *Croton humilis* L. SALVIA. Weak shrub 5-23 dm. tall, usually rather freely branched, often growing up through other shrubs; leaf blades (15-) 20-80 mm. long, 1-2 (-5) cm. broad, ovate, widest about a third the length from the base and long-tapered to the acute or very slightly acuminate apex, basally rounded or rarely very slightly marginally entire or with very minute glandular teeth, often near the base on each side of the petiolar attachment with a few stalked glands about 0.5 mm. long, or rarely longer; surfaces of the blade with a dense but thin stellate-tomentum; petioles of the mature leaves (7-) 10-30 (-60) mm. long, mostly at least half as long as their blades; stipules of a group of 2 to 5 stalked glands about 0.5 mm. long, soon falling; racemes often androgynous, less commonly unisexual (occasionally entire plants seem to be unisexual); *staminate flowers*: calyxes 5-lobed; petals 5, thin, slightly shorter than the sepals; stamens 30 to 35; *pistillate flowers*: calyx of 5 essentially distinct linear sepals; petals absent or represented by a disk of 5 linear lobes alternate with and about half to a third as long as the sepals; styles 3-5 mm. long, usually twice-dichotomous, giving up to 12 or more usually spreading ultimate stigmatic ends; capsule nearly globose, 4-5 mm. long; columella slender; seeds ellipsoidal, with prominent caruncle. *C. Berlandieri* Torr. Locally abundant, in brush, Rio Grande Plains (Nueces, Zapata, Starr, Willacy, Hidalgo and Cameron cos.), nearly all year following rains; Fla., Tex., N.L., Tam. S.L.P., Ver., Yuc., P.R. and Jam.

2. *Croton Soliman* Cham. & Schlecht. Taprooted slender-branched shrub 5-10 dm. tall; leaf blades (2-) 3-8 cm. long, (1-) 2-4 cm. broad, widest about a third the length from the base and long-tapered to the acute or slightly acuminate apex, basally rounded, marginally with a sparse fringe of glandular projections less than 1 mm. long, minutely serrulate near the base on each side of the petiolar attachment with a few glandular projections about 0.6 mm. long, the surface nearly glabrous with very rare scattered stellate trichomes; petioles of mature blades more than half as long as their blades; stipules of 4 or 5 stalked glands 1-1.5 mm. long, easily dislodged; racemes androgynous, few-flowered; *staminate flowers*: calyxes 5-lobed; petals 5, thin, slightly shorter than the

sepals; stamens about 15 or 20; *pistillate flowers*: calyx of 5 lanceolate acute gland-margined sepals 3-4 mm. long; petals absent or represented by 5 linear disk lobes 2-3 mm. long and alternate with the sepals; styles 3-5 mm. long, usually twice-dichotomous, giving up to 12 or more usually spreading ultimate stigmatic ends; capsule nearly globose, about 5 mm. long; columella slender; seeds ellipsoidal, about 4.5 mm. long, with prominent caruncle. Very rare, known from 1 shrub in n.e. Cameron Co. in extreme s. Tex., nearly all year; Oax., Ver., Hgo., S.L.P. and Tex.

3. *Croton ciliatoglandulifer* Ort. Taprooted weak-stemmed shrub 5-10 (-20) dm. tall; leaf blades (2-) 3-8 cm. long, (1-) 2-4 cm. broad, ovate, widest about a third the length from the base and long-tapered to the acute or very slightly acuminate apex, basally rounded or less commonly very shallowly cordate, marginally usually rather densely glandular-ciliate-fringed (the cilia 1-2 mm. long), often serrulate, the glands nearest the petiolar attachment often longer than the rest, the surfaces with a dense but thin stellate-tomentum; petioles of mature leaves noticeably more than half as long as their blades; stipules of a group of stalked glands 2-3 mm. long; racemes sometimes androgynous; *staminate flowers*: calyx 5-lobed; petals 5, thin, white, slightly longer than the sepals; stamens 30 to 45; *pistillate flowers*: calyx of 5 essentially separate linear glandular-ciliate sepals; petals absent or represented by a disk of 5 stalked glands about half as long as and alternating with the sepals; styles 3-6 mm. long, usually twice- (some thrice-) dichotomous, giving up to 18 usually spreading ultimate stigmatic ends; capsule nearly globose, about 6 mm. long; columella slender; seeds about 5 mm. long, with prominent caruncles. Infrequent or rare in brush, s. Tex. (Kleberg and Starr cos.), nearly all year; widespread in the warmer parts of Mex., n. to Ariz. and Tex.

In Tamaulipas and Nuevo Leon are found plants seemingly intermediate between this species and *C. humilis*. Some authors have misspelled the name "ciliatoglandulosus."

4. *Croton fruticosus* Torr. ENCINILLA, HIERBA LOCA. Shrub 15-100 cm. tall; leaf blades ovate to ovate-lanceolate, tapering more than half their lengths to the apex, 2-8 cm. long, 1.5 to 2.5 times as long as broad, apically attenuate, acute (angle 20-35°), basally truncate or usually slightly cordate, below tomentose or merely stellate-pubescent, above sparsely stellate-pubescent, marginally essentially entire but minutely glandular-serrulate; petioles (0.2 or) 0.3 to 0.4 (to 0.5) times as long as their blades; stipules columnar-papillate, about 0.1 mm. long, almost hidden by the trichomes; flowers in androgynous racemes; *staminate flowers*: sepals 5, lance-ovate, acute, tomentose dorsally; petals 5, oblanceolate to spatulate-unguiculate, about 2 mm. long, a little longer than the sepals; disk 0.8 mm. across, the glands bulbous and 0.2-0.3 mm. long and opposite the sepals; stamens 14 to 16; *pistillate flowers*: sepals 5, lanceolate, about 2.2 mm. long, dorsally stellate-pubescent; petals absent; glands annular, bulbous, whitish, rather large; styles 3-4.5 mm. long, bifid nearly to the base; capsules subglobose, 5-6 mm. long; columella rather slender; seeds 4-5 mm. long, 3.2-3.8 mm. wide; caruncle 0.7-0.8 mm. long, broadly reniform. Frequent in brush on limestone uplands, Edwards Plateau and Trans-Pecos, infrequent on caliche cuevas in Rio Grande Plains, summer-fall; S.L.P., Tam., N.L., Coah., Tex. and N.M.

5. *Croton Torreyanus* Muell. Arg. VARA BLANCA. Shrub 1-2 m. tall; leaf blades oblong, 1.5-4 (-6) cm. long, (1.5 to) 2 to 3 (to 4) times as long as broad, apically acute (with an angle of 40° or more) to rounded or truncate, usually apiculate, basally rounded, marginally entire, tomentose; petioles 0.1 to 0.2 times as long as their blades; stipules linear-subulate, 2-3.1 mm. long; flowers in androgynous racemes; *staminate flowers*: sepals 5, lance-oblong, acute, subcucullate, 1.7-2 mm. long, tomentose dorsally; petals 5, oblanceolate, about as long as the sepals; disk brownish, about 0.9 mm. across, with indistinct bulbous lobes opposite the sepals; stamens 11 to 16; *pistillate flowers*: sepals 5, lance-subulate, 1.2-2.3 mm. long, tomentose dorsally; petals absent; disk flat, thin, obscurely 5-lobed; ovary subglobose; styles 3, 1.8-3.5 mm. long, bifid essentially to the base; capsules oblong, 6-7.1 mm. long; columella rather stout; seeds oblong to elliptic-oblong, 4.5-5.6 (-6) mm. long, 3-3.5 (-3.9) mm. broad; caruncle semilunate, about 0.5 mm. long. Calcareous loams and uplands, Rio Grande Plains and n.w. to extreme e. Brewster Co., summer-fall; S.L.P., N.L., Tam., Coah. and Tex.

Apparently intergrades with *C. incanus* H.B.K. to the south in Hidalgo.

6. *Croton suaveolens* Torr. SCENTED CROTON. Hemispheric shrub 20-35 (-50) cm. tall; leaf blades rather thick, obovate to ovate or broadly elliptical, 20-54 mm. long, 10-36

mm. broad, about twice or a little less than twice as long as broad, broadest near the middle, rounded to obtuse and apiculate or angled apically (90-120°), narrowed or rounded basally, marginally entire, densely and shaggily tomentose at least below; petioles 5-20 mm. long, stout and tomentose like the stems; stipules a little longer than the tomentum, of 5 to 10 unequal glandular papillae each 0.2-0.5 mm. long and bearing a few stellate trichomes, arranged palmately on the thin disk (0.3 mm. across); male and female flowers usually on the same plant, the racemes then androgynous; *staminate flowers*: sepals 5, ovate, about 2 mm. long; petals 5, slightly longer than the sepals; glands about 0.2 mm. long, narrowly oblong; stamens 14 to 16; *pistillate flowers*: sepals 5, lanceolate or narrowly triangular-acuminate; petals reduced to mere stalked glandular papillae between the sepals; glands of the disk thin, narrow, elongate, brownish; ovary subglobose; styles 4-6 mm. long, bifid to the base; capsules oblong to subglobose, 6-8 mm. long and broad; columella stout; seeds 5.5-7 mm. long (including the caruncle which is reniform and 2.5 mm. broad and 1 mm. long). Infrequent, locally abundant on syenite bluffs above Old Fort Davis, Jeff Davis Co. in the Trans-Pecos, summer-fall; also Coah.

7. *Croton Sancti-Lazari* Croizat. Shrub 1-3 (-4) dm. tall; leaf blades ovate to elliptic-ovate, 10-30 (-45) mm. long, 5-15 (-19) cm. broad, about twice as long as broad or a little more, widest just below the middle, apically acute or rounded, basally rounded or occasionally narrowed, marginally entire, densely and shaggily canescent-stellate-tomentose below; petioles stout, 2-3 (-4.5) mm. long; stipules 0.1 mm. long, papillose-glandular, usually hidden by the trichomes; male and female flowers never on the same plant; *staminate flowers*: calyxes hemispheric or broadly campanulate, with 5 (rarely 4) triangular-acute lobes 2 mm. long; petals 5 (rarely 4), 1.8-2 mm. long, whitish; glands 5, orangish, 0.2 mm. long, oblong or rounded, opposite the sepals; stamens 9 to 12 (usually 11); *pistillate flowers*: calyx deeply 5-lobed, tomentose; glands 5, opposite the sepals; petals absent or only the merest glandular-rudiments present; ovary globose; styles 1.5-2 mm. long, bifid to the base; capsules 5.5-6 mm. long; columella 3.8-4.5 mm. long; seeds 4.4-4.7 mm. long including the caruncle which is broadly reniform and about 0.8 mm. long. *C. abruptus* M. C. Johnst. Desert areas of s. Brewster and s. Presidio cos. in the Trans-Pecos, infrequent, Apr.-Oct.; Chih., Coah. and Tex.

8. *Croton Cortesianus* H.B.K. PALILLO. Shrub 1-2 m. tall, weak-stemmed; leaf blades lance-elliptic to narrowly ovate or narrowly obovate, widest near the middle, tapering to a pointed apex and to a pointed or shortly rounded base, rarely or never with cordate tendencies, 3-10 cm. long, 2.5 to 3.5 times as long as broad, thinly stellate-tomentose beneath, glabrous above, marginally entire or microscopically serrulate; stipules subulate, about 1 mm. long, caducous; petioles 5-29 mm. long, those of the lower leaves about a third as long as their blades, or shorter; male and female flowers on separate plants; *staminate flowers*: sepals 5, tomentose dorsally, 2 mm. long, acute; petals 5, equaling sepals; glands 5, bulbous, opposite the sepals; stamens 12 to 16; *pistillate flowers*: sepals 5, acute, tomentose dorsally, about 2 mm. long; petals 5, linear, about half as long as sepals; disk very small; ovary subglobose; styles bifid essentially to the base, 4-5 mm. long; capsule 6-8 mm. long, very long-fuzzy or setulose; seeds about 5 mm. long, 3.5-4 mm. broad. *C. trichocarpus* Torr. Infrequent in thickets, Cameron, Hidalgo and Starr cos., extreme s. Tex., spring-fall (winter); very abundant and widespread in Mex., especially e. Mex., n. to Tex.

9. *Croton argyranthemus* Michx. SILVER CROTON. Perennial herb or usually somewhat subshrubby, (5-) 10-30 cm. tall, subrhizomatous and spreading basally; leaf blades oblanceolate-elliptic to less commonly narrowly obovate, 1-5 cm. long, commonly (2 to) 3 to 5 times as long as broad, basally acute, marginally entire, apically acute or blunt or rounded, beneath silvery-scaly (the scales overlapping and with ciliate edges and rounded nonprominent umbos), above with similar structures but there very sparse; petioles 2-10 mm. long, much less than half as long as their blades; stipules subulate, about 0.2 mm. long, caducous; flowers almost always in androgynous racemes; *staminate flowers*: calyx campanulate, about 5 mm. across, 5-lobed about half the length, the lobes deltoid-acute, silvery-scaly dorsally; petals 5, about as long as the calyx, silvery-scaly dorsally; glands of the disk bulbous, opposite, the calyx lobes; stamens 10 to 12; *pistillate flowers*: calyx 4-5 mm. long and broad, 5-lobed about two thirds the length, silvery-scaly dorsally, the lobes acute; petals absent; glands 5, laminar, coherent to the calyx cup below and opposite the lobes; ovary subglobose; styles each appearing trifid or quadrifid most of the length,

3-4 mm. long; capsule about 5-5.3 mm. long; columella weak, narrowly 3-winged; seed about 4.7 mm. long, acute apically. Locally abundant in loose sandy soil, e. Tex. and Rio Grande Plains; e. to Ga. and Fla.

10. *Croton punctatus* Jacq. **HIERBA DEL JABALI, BEACH-TEA.** Perennial herb or usually subshrubs, (5-) 10-30 cm. tall, rhizomatous and extensively spreading; leaf blades ovate, less commonly elliptic, (2-) 3-5 cm. long, (7-) 16-35 mm. broad, basally rounded or rarely very shallowly cordate, even more rarely narrowed, marginally entire, apically rounded to acute (angle greater than 100°), on both surfaces densely stellate-tomentose, the central processes of the stellae setulose or some of them commonly damaged and appearing as brown spots; petioles of the lower leaves about half as long as their blades; stipules obsolete; male and female flowers rarely on the same plant; *staminate flowers*: in racemes usually only 1 cm. long; calyx campanulate, deeply 5-lobed, tomentose; petals absent; disk of 5 bulbous structures opposite the sepals; stamens about 12; *pistillate flowers*: in racemes about 1 cm. long; calyx deeply 5-lobed; petals absent; gland annular; ovary subglobose; styles 1-2 mm. long, each near the base twice-dichotomous; capsule 6-8 mm. long, 6-11 mm. broad, 3-celled and 3-seeded; columella thinly 3-winged; seeds 5-6 mm. long, with large caruncle. *C. maritimus* Walt. Locally abundant in loose deep sands all along the coast, nearly all year; coastal areas from N.C. to Venez.; also Sin.

11. *Croton dioicus* Cav. **ROSVAL, HERBA DEL GATO, RUBALDO.** Perennial herb 15-50 cm. tall; leaf blades linear-lanceolate, less commonly narrowly ovate-oblong or narrowly elliptical, or even rarely broadly ovate, (10-) 20-40 (-65) mm. long, (2 to) 3 to 5 (to 13) times as long as broad, apically acute or less often rounded, basally rounded, marginally entire, beneath lepidote as the stems and of the same color, above less densely lepidote and greener; petioles 3-6 (-15) mm. long, from a twelfth to two fifths as long as their blades; stipules about 0.1 mm. long; male and female flowers always on separate plants; *staminate flowers*: in racemes 2-8 cm. long; calyx hemispheric, about 3 mm. across, with 5 deltoid acute lobes; petals absent; disk flat; stamens 10 to 12; *pistillate flowers*: racemes about 1 cm. long; calyx hemispheric, about 3 mm. across, with 5 deltoid acute lobes; petals absent; disk flat; ovary globose, densely whitish-lepidote; styles 0.5-1.5 mm. long, twice- or thrice-dichotomous; capsules globose, 5-6 mm. long; columella stout, 3-winged by the persistence of portions of the septa; seeds 3.5-4.5 (-5) mm. long; caruncle about 0.3 mm. long. *C. gracilis* H.B.K., *C. neomexicanus* Muell. Arg. Widespread and locally very abundant in w. part of Tex. e. to Hardeman, Coleman, McMullen and Duval cos., summer-fall; Oax., Hgo., Pue., S.L.P., Dgo., Zac., Chih., Coah., N.L., N.M., Tam. and Tex.

12. *Croton texensis* (Kl.) Muell. Arg. **TEXAS CROTON, SKUNK-WEED.** Annual herb 2-8 dm. tall; leaf blades linear-lanceolate to narrowly ovate-oblong, (10-) 15-35 (-50) mm. long (sometimes much-reduced at top of plant), (3 to) 4 to 5 (to 6) times as long as broad, apically rounded or acute, basally rounded, marginally entire, grayish to yellowish-green and densely clothed with stellate trichomes (less densely above than below); petioles a fourth to two fifths as long as their blades; stipules simple, 0.1-0.2 mm. long; male and female flowers always on separate plants; *staminate flowers*: in racemes 1-2 cm. long; calyx hemispheric, 2-4 mm. across, with 5 deltoid acute lobes; petals absent; glands distinct, opposite the calyx lobes; stamens 8 to 12; *pistillate flowers*: in racemes about 1 cm. long; calyxes hemispheric, 2.5-4 mm. across, with 5 deltoid acute lobes; petals absent; disk thin, annular; ovary depressed-globose; styles 3, repeatedly dichotomous, 1-2 mm. long; capsules globose or globose-ovoid, 4-6 mm. long, broader, stellate-tomentose and usually slightly warty; columella 3-4 mm. long, 3-winged by persistence of parts of the septa, fragile; seeds ovoid, 3.5-4 mm. long, the caruncle about 1 mm. long. *C. virens* Muell. Arg., *C. luteovirens* Woot. & Standl. Abundant in n.-cen. Tex., e. part of Plains Country and w. and s. parts of e. Tex., in sandy loam, also occurring scattered through the higher parts of the Plains Country and localized in loose blowing sand in the Trans-Pecos (El Paso Co.), summer-fall; S.D. and Wyo., s. to Tex. and widespread in the Southwest (Son., Chih., Ariz., N.M., Ut. and Colo.) w. of the Front Ranges.

The plants from west of the Front Ranges are often shorter and more yellowish-green and the flower and fruit parts average slightly smaller than those from farther east; this is the sort which occurs near El Paso.

13. *Croton Parksii* Croizat. Very like *C. texensis* but larger in all dimensions, the plants on the average more robust, and the mature capsules 8-9 mm. long and very

strongly warty. Very abundant, loose fine sandy loam, coastal parts of Rio Grande Plains, summer-fall; endemic. Intergrading with *C. texensis* in a zone from Jim Wells and Kleberg cos. n.e. to Aransas Co.

14. *Croton glandulosus* L. Taprooted annual stellate-pubescent herb, 5-55 cm. tall; branches usually numerous, ascending; leaf blades oblong to ovate-oblong or linear, rarely nearly lanceolate, 8-63 mm. long, (1.2 to) 1.5 to 6 times as long as broad, apically and basally rounded, serrate, bearing on the lower surface at the base (on each side of the petiolar attachment) a whitish cartilaginous usually obconical "gland" which is usually cupped at the distal end; stipules minute, often glandular-papillate or merely a minute cluster of stipitate glands; petioles of the mature leaves half to two thirds as long as their blades, those of the higher leaves a fourth to a sixth as long as their blades; male and female flowers on the same plant, in terminal androgynous racemes about 1 cm. long; *staminate flowers*: 2.5-4 mm. across; sepals 5 (rarely 4), essentially separate, deltoid to ovate-oblong; petals 5 (or 4), 1 to 1.5 times as long as the sepals, oblanceolate, ochroleucous; glands orange, bulbous, opposite the sepal, 0.1-0.3 mm. long; stamens 7 to 13; *pistillate flowers*: sepals 5, almost free, about 1.5 mm. long at anthesis (much-acrescent afterwards), linear-oblanceolate; petals perhaps represented in some populations by fragile linear structures about 0.1 mm. long; disk flat, crenate with 5 scallops, 1 opposite each sepal; ovary subglobose; styles 3, 1.5-2 mm. long, each once-dichotomous near the base; capsules subglobose, 4.5-5.5 mm. long; seeds 2.9-4 mm. long, grayish, often mottled. Widespread in open sandy or loamy areas over the state, with several intergrading races, spring-fall. We have the following:

Var. *septentrionalis* Muell. Arg. Usually more than 25 cm. tall, with larger leaves usually more than 3 cm. long, the pubescence exceedingly variable but the central process of the trichomes not more than 6 times as long as the radii and the basal glands 0.5-0.8 mm. thick terminally; seeds oblong, 3-4 mm. long. Frequent in e. and s.e. Tex., becoming less frequent in n.-cen. Tex. and the e. part of the Plains Country; occurring generally in s.e. U.S.

Var. *Lindheimeri* Muell. Arg. Plants averaging 1-2 dm. tall, the larger leaves about 25 mm. long; central process of trichomes mostly shorter than the radii; basal glands 0.1-0.4 mm. thick terminally; seeds 3-4 mm. long, oblong. Frequent in the Plains Country and Rio Grande Plains, becoming infrequent in n.-cen. and s.e. Tex.; also Tam.

Var. *pubentissimus* Croizat. Plants relatively robust, usually 2-3 dm. tall, the larger leaves ovate and about 3 cm. long or longer; central processes of the trichome many times longer than the radii (often 2 mm. long); basal glands 0.7-1 mm. across apically; seeds 3-4.5 mm. long, nearly as broad as long. Locally in coastal sands (Aransas, Harris, Kenedy, Kleberg, Nueces and Willacy cos.). A few plants exhibit all the characters of this race except the central processes of the trichome are short as in the other races.

15. *Croton capitatus* Michx. HOGWORT, WOOLLY CROTON. Taprooted annual herb, stellate-tomentose, (2-) 3-10 (-15) dm. tall, usually widely branched; leaf blades (2-) 3-10 (-15) cm. long, lanceolate to ovate or lance-elliptic, blunt or acute, basally usually rounded or rarely shallowly cordate, marginally subentire or minutely serrate; stipules subulate, caducous; male and female flowers on the same plant, in terminal androgynous spikelike racemes 1-2 (-3) cm. long; *staminate flowers*: sepals 5, nearly free, subulate or deltoid, about 1 mm. long; petals 5, oblanceolate, about 1 mm. long; glands minute; stamens 7 to 12; *pistillate flowers*: calyx deeply 6- to 9-lobed, the lobes oblong or linear, 2-3 mm. long at anthesis, later accrescent and almost as long as the fruit; petals absent; styles 3, each deeply twice- or thrice-dichotomous, about 1 mm. long; ovary subglobose; capsule nearly globose, 6-9 mm. long; seeds 3.5-5.2 mm. long. Sandy soil in the e. half of the state, in summer through fall. Represented with us by two races:

Var. *capitatus*. Leaf blades usually blunt, not strongly tapered from the base, the petioles nearly as long at the top of the plant as at the middle; seed smooth and uniformly colored (not mottled), nearly orbicular in outline, lenticular (ventrally compressed), larger (about 5 mm. in diameter). Infrequent in extreme n. part of n.-cen. Tex. and n.e. part of Plains Country; Tex., Okla., Kan., Ark., Mo., Ill., Ind., Ky., Tenn. and Ga.

Var. *Lindheimeri* (Engelm. & Gray) Muell. Arg. Leaf blades mostly acute, long-tapered from near base to apex, the petioles long at the middle of the plant but diminishing toward the top; seeds longer than broad (the degree of ventral compression very

variable), mottled when fully mature, the slight roughening of the testa evident under a lens. *C. Engelmannii* Ferg. and var. *albinooides* Ferg., *C. Muelleri* Coult. and var. *albinooides* (Ferg.) Croizat, *C. capitatus* var. *albinooides* (Ferg.) Shinners. Very abundant in e., s.e. and n.-cen. Tex. and the Rio Grande Plains; Tam., Tex., Okla., Mo., Tenn., Ark., La., Miss., Ala., Ga. and Fla.

16. *Croton Coryi* Croizat. Taprooted annual (3-) 6-10 dm. tall, very densely and shaggily whitish-stellate-tomentose all over; leaf blades ovate to narrowly ovate, (3-) 4-7 cm. long, basally rounded or uncommonly slightly cordate, marginally entire, apically rounded to slightly acute; petioles of mature leaves more than half as long as the blades; stipules subulate, deciduous; flowers in terminal androgynous spikelike racemes; *staminate flowers*: calyx of 5 nearly separate sepals about 3 mm. long; petals 5, about 3.5 mm. long, oblanceolate, covered with silvery scales; disk of 5 small bulbs opposite the sepals; stamens 12 to 15, with filaments exceeding the petals; *pistillate flowers*: calyx of usually about 7 subulate lobes; petals absent; disk obsolete; ovary subglobose; styles slender, about 4 mm. long, usually each one twice-dichotomous; capsule shallowly tricocous, 4.5-5 mm. long; seeds somewhat ovoid, acute at the micropylar end, about 4 mm. long, with a lunate caruncle, dark-brown when immature, mottled gray-brown when mature. Locally abundant in loose fine sand in s. Tex. (Brooks, Jim Hogg, Kenedy, Kleberg, Nueces and Willacy cos.), summer-fall; endemic.

17. *Croton Pottsii* (Kl.) Muell. Arg. LEATHER-WEED. Perennial herb, probably rhizomatous, 1-4 (-6) dm. tall; main stems several from the crowns, thinly but densely tomentose; leaf blades ovate-oblong or obovate-oblong to nearly orbicular or ovate-elliptic, 8-60 mm. long, the lower ones 1 or 2 times as long as broad, the upper 1.5 to 3.5 times as long as broad, apically acute or rounded, basally rounded, marginally entire; petioles of lower leaves 0.5 to 1.5 times as long as their blades, of upper leaves 0.25-0.5 times as long as their blades; stipules subulate; flowers in terminal androgynous spikelike racemes 10-25 mm. long; *staminate flowers*: calyx of 5 (rarely 4) nearly distinct lanceolate to deltoid subcucullate sepals; petals 5 (rarely 4), oblanceolate, a little longer than the sepals; disk with 5 orangish bulbous glands opposite the sepals; stamens 11 to 15 (to 18); *pistillate flowers*: calyx 1.5-3 mm. long at anthesis, of 5 nearly distinct oblong acute lobes appressed to ovary and 0.4 to 0.5 times as long as the capsule at maturity; petals absent; styles 3, bifid essentially to the base, 1.5-3 (-4.5) mm. long; capsules oblong to ovoid-oblong, rounded at both ends. Desert grasslands and scrub in the w. half of the state, spring-fall. Represented with us by two races as follows:

Var. *Pottsii*. Leaf blades longer than 15 mm.; branches at bases of old racemes diverging from each other at angles of 20 to 50°; leafy stems and branches usually straight; racemes mostly longer than 1 cm.; staminate calyx 2.5-4.5 (-6) mm. across; capsule 4-6 (-7) mm. long; columella 3.2-3.9 mm. long; seed 3.5-4.3 mm. long not including the caruncle; central processes of trichomes shorter than the radii, the tomentum thus relatively smooth or appearing appressed. *C. corymbulosus* Engelm. Abundant in deserts and desert grasslands in the Trans-Pecos and s. part of Plains Country, infrequent in Edwards Plateau and rare in w. part of Rio Grande Plains; Qro. n.w. to Son., Ariz., N.M. and Tex.

Var. *thermophilus* (M. C. Johnst.) M. C. Johnst. Leaf blades 15 mm. long or less; branches at bases of old racemes diverging at angles of 50 to 80°; leafy stems and branches tending to zigzag; racemes mostly about 1 cm. long; staminate calyx 2-2.8 mm. across; capsule about 4 mm. long; columella 2.9-3.1 mm. long; seed 3-3.25 mm. long not including the caruncle; central processes of trichomes longer than radii, the tomentum thus relatively shaggy. *C. corymbulosus* var. *thermophilus* M. C. Johnst. S. Brewster Co., in desert scrub, Trans-Pecos; also Coah.

18. *Croton leucophyllus* Muell. Arg. Taprooted annual 1-3 (-5) dm. tall, thinly stellate-tomentose, widely branched; leaf blades ovate to ovate-oblong, (1-) 2.4 (-5) cm. long, basally rounded or rarely narrowed, marginally entire, apically rounded or often a little acute, much less densely stellate above than below; stipules subulate, caducous; petioles of lower leaves 0.5 to 1 times as long as their blades; flowers in terminal androgynous racemes less than 1 cm. long; *staminate flowers*: sepals 5, deltoid, about 1 mm. long; petals 5, oblanceolate, slightly surpassing the sepals; disk nearly obsolete; stamens about 9; *pistillate flowers*: calyx lobes 5, markedly unequal, the three farthest from the raceme axis well-developed and oblong, the two nearest the axis minute and subulate; styles 3, slender, each bifid nearly to the base; capsule about 4 mm. long; seed

about 3.5 mm. long. *C. Palmeri* Wats. Locally abundant in calcareous clay soil, Rio Grande Plains, (summer-) fall; Tam., N.L., Coah. and Tex.

19. *Croton Lindheimerianus* Scheele. Taprooted annual herb 2-50 cm. tall, profusely and widely branched; leaf blades lanceolate to nearly orbicular, 1-8 cm. long, 0.8 to 3 times as long as broad, apically blunt to acute, basally rounded, marginally entire, stellate-tomentose (less densely above); petioles ascending, 0.5 to 2 times as long as the lower blades to 0.25 to 0.65 times as long as the upper blades; stipules glandlike; flowers in few-flowered terminal erect androgynous spikelike racemes 10-15 mm. long; *staminate flowers*: calyx 2-2.5 mm. across, of 5 (occasionally 4) nearly distinct sepals which are oblong-lanceolate, subcucullate and acute; petals linear-oblancoelate, about as long as the sepals; disk small and thin, with 5 indistinct lobes opposite the sepals; stamens 7 to 9 (reportedly rarely to 12); *pistillate flowers*: calyx about 3 mm. long, of 5 nearly distinct sepals which are at first nearly lanceolate, acute, appressed to and about as long as the ovary, becoming dilated or oblancoelate and 0.7 to 1.1 times as long as the capsule at maturity; petals absent; disk thin, lobed, very small and flat; ovary subglobose; styles 2-3 mm. long, each bifid to the base; capsules 4-5 mm. long and almost as broad, rounded at both ends; columella 3.2-3.7 mm. long; seeds oblong, 3.2-3.6 mm. long not including caruncles. Widespread but local over the state in sandy or alluvial usually disturbed soil, spring-fall.

Represented with us by two varieties as follows:

Var. *Lindheimerianus*. Leaf blades suborbicular to rhombic-ovate or oblong, many of them less than twice as long as broad, the apexes rounded to broadly acute, most with apical angles greater than 95°; plants densely velvety-appressed tomentose; at least some of the fruiting pedicels curved, the fruit drooping at maturity. Scattered over the state, most common in n.-cen. Tex. and Rio Grande Plains; Tex., Okla., Kan., Ark., Coah., N.L. and Tam.

Var. *Tharpia* M. C. Johnst. Leaf blades lance-ovate, many of them more than twice as long as broad, acute, most with apical angles less than 90°; plants relatively rough- or shaggy-tomentose; fruiting pedicels erect. Local in the Trans-Pecos, s. part of Plains Country and w. Edwards Plateau, usually in alluvial desertic flats or floodplains; Coah., Tex. and Ariz.

20. *Croton monanthogynus* Michx. PRAIRIE-TEA. Taprooted annual herb 4-35 cm. tall, profusely and widely branched, appressed stellate-pubescent, the small central limb or umbo of the trichomes rounded and often brownish so that the stems appear minutely brownish-lentiginous; leaf blades ovate-oblong to nearly round (lower) or to narrowly elliptic (upper), 10-25 mm. long, 1 to 2 times as long as broad (lower) or 2 to 4.5 times as long as broad (upper), apically rounded (lower) to acute (upper), basally rounded or narrowed, marginally entire; petioles half to 1 (to 2) times as long as their blades (lower) or only half to a fourth as long (upper); stipules 0.05-0.3 mm. long, glandlike; flowers in terminal androgynous racemes only 1 cm. long; *staminate flowers*: calyx 1.7-2.3 mm. across; sepals 4, rarely 5, nearly distinct, ovate-lanceolate, subacute, cucullate; petals narrowly oblong to oblancoelate, about as long as the sepals; disk very flat with five glands about 0.1 mm. long; stamens (4 or) 5; *pistillate flowers*: sepals 5, subequal, narrowly oblong-lanceolate, 1.5-2 mm. long, acute, appressed to the ovary and accrescent, about half to two thirds as long as capsule at maturity; petals absent; disk very flat, thin; ovary ovoid or subglobose, 2-celled with 1 cell large and 1-ovulate, the other small and the ovule early aborted; styles 2, 0.8-1.2 (-1.5) mm. long, bifid almost to the base; capsules ovoid, prolonged apically, tapering from well below the middle to the apex, 4 mm. long, with 1 large central fertile locule and a very small abortive locule, dehiscing septically into 2 equal valves which then break equally loculicidally; seed 2.8-3.1 mm. long. Abundant in calcareous soil in much of the state except absent in the higher parts of the Plains Country and absent from Trans-Pecos deserts, spring-fall; Gulf States n. to Md., O., Ind., Ia., w. to Kan., Okla., Tex., Tam. and N.L.

5. CROTONOPSIS MICHX.

RUSH-FOIL

Taprooted annuals 1-9 dm. tall; stem usually solitary at the base and 1-2 (-2.5) mm. thick, much-branched near the middle, the branches rather rigidly ascending or erect, covered rather densely by stellate trichomes with usually raised umbos, the radii of the trichomes more or less coalescent at their bases (usually not to their tips) into scalelike

structures, the trichomes white and often giving a silvery sheen to the stems; leaves alternate, essentially sessile or with slender petioles 1-2 mm. long; blades linear to narrowly lanceolate or narrowly elliptic, entire, 1-4 cm. long, lower surface silvery-vested like the stems, above much less densely pubescent with stellate-trichomes that occasionally are nearly simple or have only a few radii; stipules minute, subulate, caducous; flowers in androgynous axillary spikes 3-40 mm. long, with 1 to 6 pistillate flowers below and several staminate ones above; *staminate flowers* minute: calyx about 1 mm. long, deeply 4- to 5-lobed, vested externally like the stems; the white delicate petals slightly shorter than the calyx lobes and spatulate; stamens about 6; *pistillate flowers*: calyx deeply 4- to 5-lobed, about 1 mm. long in flower, slightly longer after anthesis, vested externally like the stems; disk suppressed; ovary with seemingly a single cell, elliptic or ovate in outline but plumply elliptic in transection (thus somewhat compressed), with a single apically attached ovule; style branches 3, minute, each microscopically bifurcate very near the apex; fruit an achene 2.5-3 mm. long, in outline elliptic or ovate but in transection plumply elliptic, with stellate trichomes like those of the stems but the umbos often raised into spinelike processes; seed lenticular, with no apparent caruncle, the coat very thin and closely invested by the fruit wall; endosperm copious, as thick as the embryo; embryo straight.

A genus of two species endemic to eastern and southern United States, both species in Texas; obviously closely allied to *Croton monanthogynus* and might well be placed in the genus *Croton*.

1. Spikes not densely flowered, several cm. long, usually (at least by fruiting state) with 3 to 6 pistillate flowers setting fruit in the lower part; staminate flowers usually more than 1 mm. across, the filaments surpassing the calyx lobes and much longer than the anthers; fruit often obovate-elliptic in outline, the radii of the numerous trichomes separate nearly to the umbo (scalelike coalescent portion thus minute), the free portion of the radii much longer than the coalescent portion and often raised slightly to give the fruit a fuzzy appearance when it is viewed under the dissecting microscope; umbos of trichomes either rounded or usually sharp and spinelike and as long as the radii; upper surfaces of the leaves of midstem with stellate trichomes, the radii free to the center and appressed, the trichomes sparse so that the radii of adjacent ones do not overlap, the number of radii usually 5 to 8 per trichome; leaves usually 1-3 mm. broad; lower surface of leaves with stellate trichomes, the free portion of the radii as long as or longer than the coalescent portion1. *C. linearis*.

1. Spikes usually less than 1 cm. long, with 1 or 2 crowded fruits at the base (appearing sessile in the axil of the subtending leaf); staminate flowers usually less than 1 mm. across, the filaments not surpassing the calyx lobes and only slightly longer than the anthers; fruit usually ovate in outline, less commonly elliptic, the radii of the sparse trichomes coalescent for most or all their length and appressed, the umbo usually blunt or rarely spinelike; lower surfaces of midstem leaves with scalelike stellate trichomes, the coalescent portion of the radii longer than the free portion, upper surfaces with stellate trichomes with radii free their entire length and often slightly raised, those nearest the midvein often with only 1 to 3 radii and these conspicuously raised and often pointing away from the midrib toward the margin so that the surface is pilose as seen under a lens; leaves (1-) 2-4 (-6) mm. broad2. *C. elliptica*.

1. *Crotonopsis linearis* Michx. Characters as given in the key. *C. spinosa* Nash. Local in deep loose fine sand, openings in forested areas, e. Tex., rare w. to n.-cen. Tex. (Anderson, Dallas, Henderson, Shelby and Smith cos.), June-Aug.; S.C., Ga., Fla., Va., Ill., Okla., Tex., Miss. and Mo. Most abundant in Fla., perhaps adv. in Tex. though collected at Dallas as long ago as 1876.

2. *Crotonopsis elliptica* Willd. Characters as given in the key. Frequent in deep fine loose sandy soil, openings in forested areas, e. Tex., (May-) June-Sept.; widespread in e. U.S., w. to Kan., Okla. and Tex.

6. JULOCROTON MART.

A tropical American genus of a couple of dozen species, of which we have one. The genus is very weakly distinguished from *Croton*, and it has recently been treated as sect. *Julocroton* (Mart.) G. L. Webst. of that genus.

1. *Julocroton argenteus* (L.) Didr. Taprooted annual herb (2-) 3-7 (-10) dm. tall, profusely and widely branched, thinly white-stellate-tomentose; leaf blades ovate to rhombic-ovate, (2-) 3-7 (-15) cm. long, basally rounded, apically usually rounded or rarely slightly acute, marginally usually finely serrate, with 3 to 5 veins from the base; petioles of mature leaves about half as long as their blades; stipules subulate, hirsutestellate, 5-10 mm. long; flowers in terminal androgynous spikelike racemes 2-4 cm. long; *staminate flowers*: sepals 5, nearly distinct, deltoid, 1.5-2 mm. long; petals 5, linear, slightly surpassing the sepals; disk thin, with 5 bulbs opposite the sepals; stamens 12 to 15; rudiment obsolete; *pistillate flowers*: calyx very unequally 5-lobed, the 3 sepals away from the raceme axis well-developed, narrowly deltoid, marginally laciniate-fringed to laciniate-serrate and accrescent so that they are as long as the capsule at maturity, the 2 sepals nearest the raceme axis nearly obsolete; petals absent; disk very thin and nearly obsolete, with minute glands opposite the sepals; ovary subglobose, 3-celled, 3-ovulate; styles 3, about 2 mm. long, each twice-dichotomous; capsule about 5 mm. long, 3-celled, 3-seeded, loculicidal and septicial; columella 4-4.5 mm. long; seeds 3.5-4 mm. long, oblong, carunculate, dark-gray-brown mottled. *Croton argenteus* L. Local in loamy soils along the Rio Grande in Cameron and Hidalgo cos., summer-fall; Arg. to Tex.

7. ARGYTHAMNIA P. BR.¹¹⁵

WILD MERCURY

Perennial herbs, with appressed or subappressed malpighiaceous hairs or rarely glabrous and with erect, ascending, spreading or trailing stems usually from a woody crown; leaves alternate, usually basally trinerved, with malpighiaceous hairs or rarely glabrous, entire or serrate; flowers in axillary bracteate racemes, the lower 1 to 3 flowers pistillate, the remaining all staminate (or in some species the staminate flowers borne on different plants from the pistillate); *staminate flowers*: sepals 5, valvate; petals 5, in the Texas species free from the androphore; glands 5, adnate to or free from the androphore; stamens 7 to 10 in 2 whorls, the filaments coherent and forming an androphore; staminodia present or absent; *pistillate flowers*: sepals 5, imbricate, accrescent in fruit and often becoming 2 to 3 times longer than when in flower; petals 5, well-developed or rudimentary or absent; glands 5, opposite the sepals, inserted on disk of the ovary; ovary subglobose, sessile; ovules solitary in each cell, anatropous, pendulous, with a ventral raphe; endosperm present; styles 3, in all Texas species essentially distinct or joined only toward the base, once-bifid, glabrous or pubescent on upper side below the bifurcation; stigmas terete or flattened and dilated; fruit a schizocarpous capsule splitting into three 1-seeded cocci leaving a persistent columella; seeds ovoid to subspheroidal, ecarunculate, slightly roughened to faveolate, the cotyledons broader than the radicle.

Our species are all of the subgenus *Ditaxis* (Vahl) Croizat. It includes about 50 species native to North America and South America, mostly in the subtropics and tropics with just a few in the warm-temperate zone. The leaves and flowers of some species often dry a dull-purple. When such are boiled, the water turns a reddish-purple.

1. Inflorescences elongated, much longer than the leaves (2)
1. Inflorescences usually congested in the leaf axils, shorter than the leaves (5)
- 2(1). Glands of the pistillate flowers wider than long; glands of the staminate flowers rectangular, adnate to the base of the androphore (3)
2. Glands of the pistillate flowers linear; glands of the staminate flowers linear, free from the androphore (4)

¹¹⁵ Contributed by John W. Ingram.

- 3(2). Staminate petals obovate-cuneate; stamens 10; androphore slender; pistillate glands thick; styles erect1. *A. aphoroides*.
3. Staminate petals ovate to cordate; stamens 7 or 8; androphore stout; pistillate glands thin; styles spreading2. *A. simulans*.
- 4(2). Glands of all flowers glabrous3. *A. mercurialina* var. *mercurialina*.
4. Glands of all flowers pubescent3. *A. mercurialina* var. *pilosissima*.
- 5(1). Stems, leaves and ovaries glabrous5. *A. humilis* var. *laevis*.
5. Stems, leaves and ovaries pubescent (6)
- 6(5). Style branches terete; glands of the pistillate flowers triangular6. *A. neomexicana*.
6. Style branches flattened and dilated at tip; glands of the pistillate flowers linear (7)
- 7(6). Male and female flowers on separate plants; plants silvery from appressed malpighiaceae hairs; styles bifid only one fourth their length; stamens 104. *A. argyrea*.
7. Male and female flowers on the same plant; plants pubescent but not silvery; styles bifid one half their length; stamens usually 8 or 9 ..5. *A. humilis* var. *humilis*.

1. *Argythamnia aphoroides* Muell. Arg. Stems several, to 5 dm. tall, ascending, unbranched, densely pubescent; leaves sessile or subsessile, usually elliptic, sometimes lanceolate or oblanceolate, 20-45 mm. long, 1-2 cm. wide, densely villous (particularly the lower surface), entire; staminate and pistillate flowers usually borne on separate plants, in racemes to 6 cm. long; *staminate flowers*: sepals lanceolate to oblong-lanceolate, 4 mm. long, pubescent dorsally, glabrous within, entire; petals obovate-cuneate, 4-5 mm. long, clawed; glands wider than long, adnate to base of androphore; androphore 3-4 mm. long; stamens 8 to 10, 5 in the lower whorl; *pistillate flowers*: sepals lanceolate, about 5 mm. long, pubescent dorsally and near the apex ventrally; petals absent or rudimentary; glands thick, square or rectangular in outline; ovary densely pilose; styles erect, pubescent, bifid one half their free part; stigmas flattened and dilated; seeds subspheroidal, 4-5 mm. wide and long, faintly reticulate. *Ditaxis aphoroides* (Muell. Arg.) Pax. In dry sandy and rocky soil over limestone on the Edwards Plateau, Apr.-June; rare endemic.

2. *Argythamnia simulans* J. Ingram. Stems several, to 5 dm. tall, ascending to erect, unbranched, with appressed hairs; leaves sessile to subsessile, elliptic to lanceolate or oblanceolate, 2-9 cm. long, 7-25 mm. wide, acute to obtuse, with hairs on both sides, entire; flowers usually in androgynous racemes 4-10 cm. long; *staminate flowers*: sepals lanceolate or oblong-lanceolate, 2.5-3 mm. long, pubescent dorsally, glabrous within; petals ovate to cordate, 2-3 mm. long, the claws free from the androphore; glands wider than long, adnate to base of androphore; androphore stout, 1.5-2 mm. long; stamens 7 or 8 in 2 whorls, 5 in the lower whorl; *pistillate flowers*: sepals ovate, 4.5-6 mm. long, pubescent dorsally; petals frequently absent, when present punctiform to lanceolate; glands wider than long, thin; ovary with hairs; styles thick, pilose, spreading, bifid one half their free part; stigmas flattened and dilated; seeds subspheroidal, about 3 mm. long and 4 mm. wide, apiculate, faintly reticulate. Frequent on rocky and sandy soil over limestone on the Edwards Plateau, Mar.-July; endemic.

3. *Argythamnia mercurialina* (Nutt.) Muell. Arg. Stems several, to 7 dm. tall, ascending, unbranched, pubescent; leaves sessile or subsessile, lanceolate or elliptic to elliptic-ovate or elliptic-obovate, 30-85 mm. long or sometimes longer, 10-35 mm. wide, pubescent on both surfaces; flowers usually in androgynous racemes 4-12 cm. long; *staminate flowers*: sepals oblong-lanceolate or lanceolate to narrowly oblanceolate, about 3 mm. long, pubescent dorsally, glabrous within; petals oblanceolate to broadly oblanceolate, about 3 mm. long, the claws free from the androphore; glands linear, free from the androphore, pubescent or not; androphore slender, about 2 mm. long; stamens usually 8, 5 in the lower whorl, the whorls sometimes not entirely distinct; *pistillate flowers*: sepals lanceolate, about 4.5 mm. long, acute, pubescent dorsally, glabrous within; petals usually absent, when present 1 to 5, punctiform to lanceolate; glands linear, glabrous or pubes-

cent; ovary densely or sparsely pubescent; styles spreading, stout, pubescent, bifid only toward tip; stigmas flattened and dilated; seeds subspheroidal, about 5 mm. long and wide, apiculate, faintly and irregularly reticulate. We have the following two varieties:

Var. *mercurialina*. Glands of all flowers glabrous. *Ditaxis mercurialina* (Nutt.) Coult. Dry prairies over limestone in sand in cen. and e. Kan., s. to Gillespie, Hays and Caldwell cos. (also isolated in Jeff Davis and Culberson cos.) in Tex., Eddy Co., N.M. and Navajo Co., Ariz.; Apr.-July.

Var. *pilosissima* (Benth.) Shinners. Glands of all flowers pubescent. Sandy soil over limestone on the Edwards Plateau, s. in the Rio Grande Plains, Apr.-July; endemic.

4. *Argythamnia argyrea* Cory. Stems several, to 4 dm. tall, moderately branched, silvery with appressed hairs; leaves lanceolate or elliptic to ovate or oblanceolate, 15-40 mm. long, 5-10 mm. wide, acute, densely silvery-pubescent; petioles about 1 mm. long; staminate and pistillate flowers on separate plants; staminate flowers in racemes to 2 cm. long, the pistillate flowers solitary on peduncles to 1 cm. long; *staminate flowers*: sepals linear-lanceolate, 3-4 mm. long, densely pubescent dorsally; petals linear-lanceolate, 3-5 mm. long, free from the androphore; glands linear, erect, free from the androphore; androphore about 2.5 mm. long; stamens 10 in two whorls of 5; *pistillate flowers*: sepals lanceolate-ovate to ovate, about 4 mm. long, pubescent outside and in the upper half within; petals elliptic-ovate, about 1 mm. long; glands linear, about 2 mm. long, acute; styles erect, pubescent, bifid only one fourth or less of their free part; stigmas flattened. Atascosa, La Salle and Maverick cos., Apr.-July; endemic.

5. *Argythamnia humilis* (Engelm. & Gray) Muell. Arg. Stems few to many, to 45 cm. long, weak, usually trailing or spreading, freely branching, pubescent or not; leaves elliptic to oblanceolate, 1-5 cm. long, 5-15 mm. wide, acute to rounded, pubescent or not, narrowing into a petiole 2-3 mm. long; flowers in androgynous racemes to 1 cm. long; *staminate flowers*: sepals linear-lanceolate to oblong-lanceolate, 2-3 mm. long, glabrous or with hairs outside, glabrous inside, entire; petals narrowly lanceolate to oblanceolate, about 3 mm. long; glands linear, erect, free from the androphore; androphore stout, 0.5-1 mm. long; stamens 8 or 9 in two whorls with 5 in the lower whorl; *pistillate flowers*: sepals lanceolate or ovate-lanceolate, about 3 mm. long, glabrous or with hairs outside, glabrous inside, the margin with minute glandular teeth; petals often absent, when present 1 to 5, linear and about 0.2 mm. long or lanceolate and 0.5 mm. long; glands linear, erect, obtuse or emarginate; ovary glabrous or pilose with stiff hairs; styles erect, thick, glabrous or with stiff hairs, bifid one half their free part; stigmas flattened and dilated; seeds ovoid-spheroidal, about 2.5 mm. long and 4 mm. wide, apiculate, slightly roughened to reticulately ridged with stellately marked pits. We have two variants.

Var. *humilis*. Plants pubescent. *Ditaxis humilis* (Engelm. & Gray) Pax. In dry grassland and scrub at higher elev. in e. Colo. and w. Kan. s. through cen. Tex. and e. N.M. to Tam., N.L. and e. Coah.; Apr.-Oct.

Var. *laevis* (Torr.) Shinners. Plants entirely glabrous and rather succulent, becoming brittle when dried. Usually above 3,000 ft., on basic soils and gypsum flats in w.-cen. Tex. and the Trans-Pecos, Apr.-Oct.; also s.e. N.M.

6. *Argythamnia neomexicana* Muell. Arg. Stems several, to 3 dm. long or sometimes longer, usually much-branched, usually spreading to trailing, with appressed hairs; leaves elliptic to oblanceolate, 10-35 mm. long, occasionally longer, 3-20 mm. wide, acute, with appressed hairs on both sides, the margin entire or bearing minute glands; petioles 2-5 mm. long; flowers in congested androgynous racemes 5-10 mm. long; *staminate flowers*: sepals narrowly lanceolate to lanceolate, 2-3 mm. long, with hairs outside, glabrous inside, entire; petals oblanceolate to elliptic, about 3 mm. long; glands erect, obtuse to acute, free from the androphore; androphore slender, 1.5-2 mm. long; stamens 10 in two whorls of 5; *pistillate flowers*: sepals lanceolate, 3-5 mm. long, with hairs dorsally, glabrous or with hairs inside, the margin white, bearing minute glands; petals obovate to oblanceolate-obovate, about 2 mm. long; glands triangular in outline, thick; ovary with dense setose hairs that extend beyond the styles, the hairs with one arm much longer than the other; styles setose, bifid over one half their free part; stigmas terete, not flattened and dilated; seeds ovoid, truncate at base, about 2.5 mm. long, reticulately ridged with stellately marked pits. *Ditaxis neomexicana* (Muell. Arg.) Heller. In desert areas in calcareous soil in w. Edwards Plateau, Rio Grande Plains and the Trans-Pecos, Feb.-Nov.; w. in the U.S. and s. to Tam., N.L. and Coah.

This taxon is doubtfully distinct from *A. serrata* (Torr.) Muell. Arg., of Arizona, California and northwestern Mexico; apparently forming an intergrading complex that needs further intensive study.

8. CAPERONIA ST.-HIL.

A tropical genus of about 40 species, of which we have one.

1. *Caperonia palustris* (L.) St.-Hil. Annual herb, (2-) 3-10 dm. tall, stout, mostly simple in the lower half, with few ascending branches above, the upper stem and branches with spreading whitish occasionally gland-tipped hairs; leaves alternate; blades broadly lanceolate or elliptic-lanceolate, (3-) 5-15 cm. long, serrate, with numerous closely parallel secondary nerves ending at the marginal teeth, the tertiaries percurrent; petioles 3-25 mm. long, pubescent like the adjacent stem; stipules triangular to subulate, 3-5 mm. long; flowers in lax secund androgynous spikes in the upper axils, the peduncles about half as long as the leaves; each flower subtended by a minute bract; *staminate flowers* 6 to 20 per spike, sessile; calyx 5-lobed, the lobes about 1 mm. long; petals spatulate-lanceolate, obtuse, slightly exceeding the calyx; androphore columnar, bearing two whorls of short stamens and prolonged above the upper whorl; stamens short, about 5 in each whorl; *pistillate flowers* 1 to 6 per spike, essentially sessile; calyx deeply and unequally 6-parted, with 3 longer (2-3 mm. long) lobes opposite the carpels and 3 shorter ones opposite the petals, all the lobes acute, the whole calyx glandular-setulose on the exterior; petals 5 or 6, shorter than the longer calyx lobes, whitish, clawed, caducous soon after anthesis; disk absent; ovary tricocous, densely glandular-setulose; styles 3, laminar, each about 4- or 5-lobed about half the length; capsule deeply tricocous, about 4 mm. high and 6 mm. broad, loculicidal and septicidal; columella short; seeds about 3 mm. long, nearly spherical, foveolate. Frequent in rice fields and other marshy areas, s.e. Tex. (Harris, Jefferson and Matagorda cos.), July-Oct.; widespread in warmer parts of Am., s. to Parag. and n. to Tex., La. and Fla. The species arrived in Tex. about 1920.

9. ADELIA L.

A tropical American genus of about 15 species.

1. *Adelia Vaseyi* (Coulter) Pax & Hoffm. Erect usually narrow shrub 1-2 (-3) m. tall, the branches usually ascending; leaves alternate or usually fascicled at short shoots; essentially sessile, spatulate or linear-spatulate, pale-green, basally attenuate, marginally entire, apically rounded or rarely emarginate, (1-) 2-3 (-4) cm. long; male and female flowers on separate plants; flowers solitary in the axils or in few-flowered glomerules at the short shoots, pedicellate; *staminate flowers*: pedicels 2 mm. long, puberulent; calyx nearly globose, valvate in bud, of 5 essentially free dorsally puberulent linear-elliptic sepals about 2 mm. long; petals absent; disk thin, annular, puberulent; androphore columnar, 0.5-1 mm. high, puberulent; stamens about 14 to 17, arising from a zone just below the top of the androphore; filaments about 1.5 mm. long; rudiment of 3 bifurcate objects 0.5-1 mm. high at the top of the androphore; *pistillate flowers*: pedicels 3-5 mm. long (elongating to 5-20 mm. in fruit), puberulent; calyx valvate in bud, of 5 (or 6) lanceolate dorsally puberulent sepals 2-3 mm. long; petals absent; disk of 5 (or 6) lobes opposite the sepals; ovary subglobose, 3-celled and 3-seeded; styles 3, subulate, shortly lacinate marginally; capsules shallowly tricocous, 6-7 mm. high, 7-8 mm. broad, the 3 carpels first separating from each other and then each splitting at the ventral angle to release the seed; columella about 5 mm. long; seed nearly globose or usually slightly prolate, 4-5 mm. long, dark-brown to black; caruncle absent. Infrequent in brush on loamy soils, Rio Grande delta (Cameron and Hidalgo cos.), Jan.-June; also Tam.

10. BERNARDIA MILL.

Unarmed shrubs 5-15 (-25) dm. tall, much-branched; branches of 2 kinds, elongated ones 5 to 25 cm. long and short lateral spurs with very short internodes (these spurs bearing the inflorescence and then eventually bearing from their apexes more elongate

branches); herbage and capsules rather densely stellate-tomentose or at least with forked or branched hairs; leaves alternate (the ones on the spurs appearing fascicled); blades simple, 7-30 mm. long, 5-20 mm. broad, apically obtuse or rounded, crenate; petioles 1-3 (-5) mm. long; stipules very small, brownish, deciduous; male and female flowers always on separate plants, in much-reduced inconspicuous inflorescence; *staminate flowers*: few to several in racemes from the axils of the spurs or rarely from the elongating branchlets; peduncles 1-3 mm. long and terminating in a whorl of 1 to 4 triangular-cordate bracts to 1 mm. long; pedicels about 1 mm. long; calyx lobes 3, minute, greenish; petals absent; stamens 3 to 18; *pistillate flowers*: seemingly solitary and sessile in the axils of the spurs (only one per spur maturing fruit) or rarely appearing terminal or in the axils of an elongate branch; calyx of 4 or 5 minute sepals; petals absent; disk obsolete; ovary 2- or 3-celled, 1- to 3-seeded; styles 2 or 3, bifid or fimbriate-lacerate; capsules 6-8 mm. long, 6-10 mm. broad, dehiscing septicidally and loculicidally; columella present or absent; seeds 5-6 mm. long, 4-5 mm. broad, ecarunculate.

An American genus of perhaps 30 species.

1. Leaves predominately elliptic or oblong, prominently reticulate beneath, densely stellate-pubescent, drying dark-green; capsules mostly 3-celled, 3-seeded; stamens mostly more than 10 per flower1. *B. myricaefolia*.
1. Leaves predominately obovate, not prominently reticulate beneath, drying grayish-green, the hairs merely forked or branched, sometimes stellate; capsules mostly 2-celled and 1- or 2-seeded; stamens mostly fewer than 10
.....2. *B. obovata*.

1. *Bernardia myricaefolia* (Scheele) Wats. OREJA DE RATÓN, PALO DE TARUGO. Shrub usually 10-25 dm. tall, with rather dense stellate pubescence; leaf blades usually narrowly elliptic but rather variable, drying dark-green; stamens 12 to 18; capsule usually 3-celled and 3-seeded, 7-8 mm. long, about 1 cm. thick; columella well-developed; seeds about 6 mm. long, 5 mm. broad. Widespread in Rio Grande Plains n. to Travis, Hays, Comal, Bexar and Val Verde cos., in brush on calcareous soil, spring-fall; Tam., N.L., Coah. and Tex.

2. *Bernardia obovata* I. M. Johnst. Shrub, usually only about 5 dm. tall, with rather sparse pubescence of merely forked or branched hairs (only stellate in spots); leaf blades obovate or rarely subelliptic, drying pale-grayish-green; stamens 3 to 8 per flower; capsule usually 2-celled and 1- or 2-seeded, 6-7 mm. long, about 6 mm. broad at the broadest point; styles 2; columella in the usual sense absent. Widespread in dry scrub in the Trans-Pecos, e. to Crane and Val Verde cos., summer-fall; N.M., Tex., Coah. and Chih.

11. ACALYPHA L.¹¹⁶

THREE-SEEDED MERCURY

Annual or less commonly perennial herbs or rarely subshrubs; stems erect or decumbent, branched or unbranched; leaves alternate, varying greatly in size and shape, entire or toothed, petiolate; stipules small, lanceolate; male and female flowers either on the same or separate plants; inflorescence rarely paniculate, mostly spicate; spikes terminal or axillary bearing staminate and pistillate flowers in various relative positions (i.e., pistillate flowers may appear on the basal portion of the spike with the staminate above or vice versa; if on separate spikes, pistillate may be terminal, staminate axillary); *staminate flowers* in clusters with each subtended by an inconspicuous lanceolate bract, apetalous, with 4-parted calyx, 4 to 8 (and reportedly to 16) stamens united at base, each stamen with 2 unilocular pendulous anther sacs often becoming twisted with maturity; pollen grains tricolporate; *pistillate flowers* subtended by a variously lobed often foliaceous bract, apetalous, with 3-parted calyx; main style branches divided several times (except in *A. Poirerii*); ovary usually 3-locular; ovules solitary in each locule; seeds ovoid, carunculate, variously pitted or tuberculate, brown to black or with a tawny mottling; endosperm whitish; embryo straight; cotyledons much broader than the radicle.

¹¹⁶ Contributed by Lillian W. Miller.

A genus of about 390 species distributed in temperate and tropical regions of both the New World and Old World.

- 1. Male and female flowers on separate plants; perennial herbs or subshrubs (2)
- 1. Male and female flowers on the same plant; annual or perennial herbs (3)
- 2(1). Leaves deeply lobed (radiate)4. *A. radians*.
- 2. Leaves crenate5. *A. hederacea*.
- 3(1). Flowering spike with pistillate flowers at the base and staminate flowers at the apex (4)
- 3. Pistillate and staminate flowers on separate spikes (10)
- 4(3). Plants with woody root and herbaceous stems; spikes terminal
.....1. *A. Lindheimeri*.
- 4. Plants herbaceous throughout; spikes axillary (5)
- 5(4). Fruit one-seeded9. *A. monococca*.
- 5. Fruit three-seeded (6)
- 6(5). Leaves linear or narrowly ovate to lanceolate, margins entire to slightly crenate; petiole usually less than one fourth length of leaf blade (7)
- 6. Leaves narrowly ovate or elliptic to lanceolate or broadly rhombic, margins crenate to serrate; petiole one fourth as long as or equal to length of leaf blade (8)
- 7(6). Leaves lanceolate to linear-lanceolate, margins crenate to remotely crenate; staminate portion of spike not usually greatly exceeding the pistillate bracts
.....8. *A. gracilens* var. *gracilens*.
- 7. Leaves linear, margins entire (or rarely remotely crenate); staminate portion of spike often exceeding the pistillate bracts8. *A. gracilens* var. *Delzii*.
- 8(6). Leaves narrowly rhombic to broadly lanceolate; pistillate bracts with dense long spreading hairs, cut into 9 to 12 lanceolate lobes ...7. *A. virginica*.
- 8. Leaves ovate or elliptic to broadly rhombic; pistillate bracts cut into 7 to 9 lobes (9)
- 9(8). Pistillate portion of spike with few bracts deeply cut into 7 to 9 lanceolate lobes, sparsely pubescent6. *A. rhomboidea*.
- 9. Pistillate portion of spike compact with several bracts shallowly cut into 7 to 9 lanceolate lobes, densely pubescent10. *A. Poiretii*.
- 10(3). Perennial herbs or subshrubs, decumbent; staminate spike terminal; pistillate flowers axillary5. *A. hederacea*.
- 10. Annual herbs (11)
- 11(10). Pistillate bracts foliaceous with mostly 8 to 12 shallow deltoid lobes, the median lobe much larger than the others3. *A. neomexicana*.
- 11. Pistillate bracts divided deeply into 13 to 17 linear lobes
.....2. *A. ostryaefolia*.

1. *Acalypha Lindheimeri* Muell. Arg. Perennial herb, mostly erect, branching, 2-5 dm. tall, with sparse recurved hairs and long soft hairs; leaf blades thin, rhombic to ovate-rhombic, serrate, 19-58 mm. long, 9-28 mm. wide, sparse to moderately dense short stiff hairs on both surfaces; petioles 2-17 mm. long, mostly 0.1 to 0.2 as long as blade; stipules 1-1.5 mm. long; spikes terminal, androgynous, compact, 5-48 mm. long; pistillate portion of spike bearing many bracts with each subtending a single flower; bracts 4-12 mm. long, 5-11 mm. wide, cut into 3 to 8 (mostly 5 to 7) moderately deep lobes with recurved and short stiff hairs sparse on lower surface and white short-stalked plus red and white long-stalked glands mostly on lower surface; fruit a 3-seeded capsule, glabrous at base, sparsely hirsute at apex; seeds brown, shallowly pitted, 1.4-1.9 (mostly 1.7) mm. long. In dry sandy soil in Wichita Co. s. to Gonzales Co. w. to Culberson and Presidio cos., spring-fall; s. N.M. into s.e. Ariz. and n. Mex.

2. *Acalypha ostryaefolia* Ridd. Annual herb; stems erect, branched, 35-70 cm. tall, with sparse to moderately dense recurved and short stiff hairs and long-stalked white glands varying from sparse to dense; leaf blades thin, 33-82 mm. long, 16-53 mm. wide, ovate, base slightly cordate, 3- to 5-nerved, dentate, with sparse short stiff hairs; petioles

14-66 mm. long (usually about equal to blade length); stipules 1-1.5 mm. long; male and female spikes on the same plant; *staminate spikes* axillary, 5-34 mm. long; *pistillate spikes* terminal, somewhat loose; bracts 3-7.5 mm. long, 5-12 mm. wide, deeply cut almost to the base into 9 to 19 (mostly 13 to 17) filamentous lobes with white long-stalked glands sparse, surface of bract lobes muricate; bract subtending a single pistillate flower; styles 1-2 mm. long, basal portion very slightly fleshy and green; capsule 3-seeded, slightly puberulous, when mature echinate, with fleshy projections near apex; seed brown, tuberculate, 1.6-2.2 mm. long. Dry sandy soil in open woods, fields, roadsides from Cooke and Grayson cos. w. to Nolan Co. s. to Medina, San Patricio and Harris cos., summer-fall; Pa. to s. Fla., Ia. and Okla. to w. Tex., N.M. and Ariz.

3. *Acalypha neomexicana* Muell. Arg. Annual herb; stems erect, simple or branched, 10-35 cm. tall, with sparse to dense recurved hairs; leaf blades somewhat rhombic, serrate, 19-50 mm. long, 7-27 mm. wide, with sparse short stiff hairs; petioles 9-43 mm. long, usually half to equal the length of blade; stipules 0.5-1 mm. long; male and female spikes on same plant; *staminate spike* axillary, 1-4.5 mm. long; *pistillate spikes* terminal, those terminating short axillary branches appearing almost as axillary spikes, moderately compact; bracts 5-12 mm. long, 5-9.5 mm. wide, shallowly cut into 5 to 17 (mostly 9 to 13) deltoid acute lobes, the median lobe frequently elongated to become several times longer than the other lobes, with sparse short stiff hairs and few white long-stalked glands; styles 2-2.5 mm. long, white; capsule 3-seeded, smooth below, pubescent above, occasional glands present; seeds brown, with large deep pits in distinct rows, 1.2-1.6 (mostly 1.2-1.4) mm. long. Moist shady conditions in mts., usually along streams in Hudspeth, Culberson, Jeff Davis and Brewster cos., summer-fall; s. N.M. and Ariz. into n. Mex.

4. *Acalypha radians* Torr. Perennial herb, somewhat decumbent, much-branched, 2-4 dm. tall; stem with dense short stiff and long-spreading hairs; leaf blades reniform to orbicular, deeply lobed, 5-12 mm. long, 8-20 mm. wide, with sparse to dense recurved hairs and sparse to dense soft spreading hairs, also occasional white short-stalked glands; petioles 4-16 mm. long, usually as long as or exceeding the length of the blade; stipules 0.5-1 mm. long; male and female spikes on separate plants; *staminate spikes* terminal, 14-57 mm. long; *pistillate spikes* mostly terminal, compact, some axillary; bracts 3.5-10 mm. long, 6-16 mm. wide, each subtending a single flower, cut about half their length into 7 to 13 (mostly 8 to 10) broad blunt-tipped lobes, with recurved short stiff and long-spreading hairs varying from sparse to dense (usually dense) and sparse white short-stalked glands; styles 9-14 mm. long, bright-red; capsule 3-seeded, with short stiff and long soft hairs and sparse white short-stalked glands; seeds brown, shallowly pitted, 1.5-2 (mostly 1.8) mm. long. Dry sandy or gravelly sites from Llano and Burnet cos. e. to Austin Co. s. to Zapata, Hidalgo and Cameron cos., summer-fall; also n. Mex.

5. *Acalypha hederacea* Torr. Subshrub or perennial herb, somewhat sprawling, branching, 15-40 cm. tall; stem with dense recurved and short stiff hairs, also few long soft hairs; leaf blades orbicular or reniform, crenate, thin, 7-24 mm. long, 8-25 mm. wide, with sparse recurved and long-spreading hairs and dense short stiff hairs; petioles 5-24 mm. long, usually equal to blade length or longer; stipules 0.3-1 mm. long; staminate and pistillate spikes usually on separate plants; *staminate spikes* terminal, 16-84 mm. long; *pistillate spikes* terminal and axillary, compact; bracts (each subtending a single flower) 4-8.6 mm. long, 7.3-12 mm. wide, cut about one fourth their length into 8 to 14 (mostly 10 to 12) broad blunt lobes, with short stiff hairs moderately dense to dense and recurved long soft hairs sparse, also white short-stalked glands sparse and red short-stalked glands occasional; styles 5-14 mm. long, bright- or dark-red; capsule 3-seeded, with dense long soft hairs and few white short-stalked glands; seeds brown, shallowly pitted, 1.4-2 (mostly 1.5-1.8) mm. long. Dry rocky or gravelly soil from Presidio, Brewster and Pecos cos. e. to Bexar Co. and s. to Cameron Co., summer-fall; also n. Mex.

Some authors unite this taxon with the widespread Mexican species, *A. monostachya* Cav.

6. *Acalypha rhomboidea* Raf. Plant herbaceous, 15-60 cm. tall; stems simple or branching, above densely pubescent with recurved hairs, below sparsely pubescent; leaf blades thin, 3-nerved at base, 17-103 mm. long, 8-45 mm. wide, ovate to broadly rhombic, crenate-serrate, subglabrous (short stiff hairs few); petioles 3-72 mm. long, mostly one half as long as or equal to length of blade; stipules lanceolate, 0.3-1 mm. long; spikes

androgynous, axillary; *staminate* flower cluster terminating the flowering spike, rarely exceeding the pistillate bracts; calyxes sometimes appearing reddish-brown, or green; *female* bracts 1 to 3 (each subtending 1 to 3 flowers) at base of spike, 4.6-5.3 mm. long, 6.5-30 mm. wide, cut about one half their length into 5 to 11 (mostly 7 to 9) oblong-lanceolate lobes, hirsute to long-ciliate and with stalked white glands sparse to dense; capsule 3-seeded, smooth at base, becoming pubescent and sometimes glandular at apex; seeds brown or mottled, with shallow pits in rows, 1.2-2 (mostly 1.5-1.7) mm. long. Moist to dry sandy sites, rare in Tex. from Tarrant and Dallas to Sabine, Panola and Harris cos., summer-fall; Me., s. to Ga. and La., w. to Mich., Minn., N.D. and Tex.

7. *Acalypha virginica* L. Annual herb; stems erect, sparsely branched, 1-5 dm. tall, with sparse to dense recurved and long soft spreading hairs; leaf blades thin, narrowly rhombic to broadly lanceolate, crenate, 12-112 mm. long, 4-38 mm. wide, with few short stiff hairs; petioles 2-65 mm. long, mostly a fourth to a half as long as blade; stipules 0.5-1 mm. long; spikes androgynous, axillary; pistillate bracts 1 to 3 (each subtending 1 to 3 flowers) at base of spike, 4.6-8 mm. long, 6.5-21 mm. wide, deeply cut a half or more its length into 8 to 16 (mostly 10 to 14) lanceolate lobes, with short stiff hairs sparse and long spreading hairs on margins and sparse to dense on lower surface, also white and red short-stalked glands very sparse; staminate upper portion of spike 1-21 mm. long, usually less than 1 cm.; the spikes very rarely axillary; styles white, about 2 mm. long; capsule 3-seeded, pubescent, glandular; seeds brown, shallowly pitted in rows, 1.2-1.8 (mostly 1.5) mm. long. Moist or dry sandy soil, Clay Co. to Bowie Co. s. to Angelina and Brazos cos., summer-fall; N.H. s. to S.C., Ga. and La. w. to Ia. and Neb. s. to Tex.

8. *Acalypha gracilens* Gray. Annual herb; stems erect, simple or branching mostly at base, 1-6 dm. tall, with moderately dense to dense recurved hairs; leaf blades thin, narrowly ovate to broadly lanceolate or linear, margins slightly crenate to almost smooth or entire, 16-63 mm. long, 4-21 mm. wide, with sparse to dense short stiff suppressed hairs on both surfaces; petioles 2-17 mm. long, one tenth to two tenths the length of the blade; stipules 0.3-1 mm. long; spikes androgynous or rarely some of them entirely staminate, axillary; *staminate* spike or portion of spike 0.5-28 mm. long, occasionally surpassing the bract; *female* bracts 1 to 3 (each subtending 1 to 3 flowers) at the base, 4-14 mm. long, 6-17 mm. wide, cut about a fourth its length into 7 to 19 (mostly 9 to 13) deltoid acute lobes, with sparse to dense short stiff hairs and few long hairs on margins, with moderately dense sessile red, short red and long-stalked white glands; styles 1-2 mm. long, slender, white or pinkish; capsule 3-seeded, sparsely pubescent and occasionally glandular; seeds brown or mottled, pitted in rows, 1.2-2.1 mm. long.

We have 2 varieties.

Var. *gracilens*. Leaves narrowly ovate to broadly lanceolate, slightly crenate to almost smooth, 3 to 5 times as long as broad; petiole usually about two tenths the length of leaf blade; staminate part of spikes 0.5-28 mm. long, often not exceeding the female bract; seeds 1.2-2.1 (mostly 1.3-1.6) mm. long. Usually in dry sandy soil, rare in Bowie and Shelby cos. s. and w. to Gonzales Co., summer-fall; Me., N.Y. and Minn. s. to Fla. and Tex.

Var. *Delzii* L. Mill. Leaves linear, rarely slightly crenate to entire, 4 to 6 times as long as broad; petioles usually 0.1 to 1.6 times as long as leaf blades; staminate part of spikes 2.5-26 mm. long, frequently much-surpassing the bract; seeds 1.2-1.9 (mostly 1.5-1.7) mm. long. In dry sandy soil from Bowie Co. s. to Travis, Liberty, Brazoria and Gonzales cos., summer-fall; e. into La. and Ark.

9. *Acalypha monococca* (Engelm.) L. Mill. Annual herb; stems erect, simple or branched, 15-40 cm. tall, with sparse to moderately dense recurved hairs; leaf blades thin, linear or lanceolate, very slightly crenate to entire, 20-69 mm. long, 3-13 mm. wide, frequently 6 to 7 times as long as wide, with few short stiff hairs; petioles 2-12 mm. long, mostly one tenth to two tenths the length of blade; stipules 1 mm. long; spikes androgynous or rarely a few may be entirely staminate, axillary; *staminate* parts of spike 0.5-28 mm. long, frequently much-exceeding the pistillate bract; *pistillate* bracts 1 to 3 (each subtending 1 to 3 flowers) per spike at base, 4-13.5 mm. long, 5-16 mm. wide, cut about one third the length into 7 to 17 (mostly 9 to 13) deltoid acute lobes, with sparse to dense short stiff hairs and long spreading hairs on the margin, also red short-stalked

glands sparse to dense and white long-stalked glands sparse; styles 1.5-2 mm. long, mostly whitish; capsule 1-seeded, pubescent, occasionally sparsely glandular; seeds brown to mottled, shallowly pitted, 1.4-2.4 (mostly 1.7-2.2) mm. long. *A. gracilens* var. *monococca* Engelm. Dry sandy soil from Grayson, Jack and Titus cos. s. to Gillespie, DeWitt and Harris cos., summer-fall; Ark., Kan. and s. Ill. into Tex.

10. *Acalypha Poiretii* Spreng. Annual herb; stems erect, simple or branched, 4-36 cm. tall, densely pubescent with recurved hairs; leaf blades ovate to elliptic, 1-5 cm. long, 7-35 mm. wide, crenate, subglabrous; petioles 6-40 mm. long, usually half to equal the length of the blade; stipules lanceolate, 0.5-1 mm. long; spikes axillary and terminal, androgynous, compact; *staminate* part of spike rarely exceeding the pistillate bracts; *pistillate* bracts at base of spike (each usually subtending only 1 flower), 3-5 mm. long, 4-8 mm. wide, shallowly cut into 7 to 9 lanceolate lobes, densely hirsute to long-ciliate and with stalked white glands sparse; styles simple or nearly so; capsule 3-seeded, smooth at base, becoming pubescent toward apex; seeds brown or slightly mottled with shallow pits in rows, 1-1.5 mm. long. Dry sandy or gravelly sites in Cameron, Wilson, Starr and Hidalgo cos., summer-fall; s. into Mex.

12. TRAGIA L.¹¹⁷

NOSEBURN

Perennial herbs, sometimes becoming suffrutescent, erect or decumbent to trailing or twining; stems solitary to many from the woody crown of the taproot, alternately branched; pubescence of stiff stinging hairs intermingled with soft spreading hairs; leaves alternate, petiolate or sessile, the margins entire to serrate or coarsely toothed to lobed; stipules lanceolate to ovate, acute to attenuate, entire, ciliate, usually persistent; racemes androgynous, opposite the leaves at the upper nodes (actually terminal, but soon surpassed by the branch from the axil of the subtending leaf), the lower 1 (or 2) flowers pistillate, the remaining 2 to 20 or more staminate; individual flowers bracteolate; bracts of the pistillate flowers lanceolate, ciliate, entire or 3-lobed; bracts of the staminate flowers lanceolate, pubescent, entire; flowers apetalous; calyx-lobes 3 to 6 (or 7); disk absent in all flowers; *staminate flowers* pedicellate, the slender pedicels with an abscission zone below the middle (the basal portion persistent); stamens 2 to 6 (to 10 in the terminal flowers), typically 2 to 4; filaments connate at least at the base, the anthers free; pistillode small; *pistillate flowers* pedicellate with an abscission zone below the middle of the pedicel, the entire structure with the calyx and columella usually persistent; staminodia absent; ovary usually of 3 carpels, subglobose, hispid to densely hispid with stiff stinging hairs; styles 3, spreading or coiling outward at anthesis, united at the base to half or more their length; stigmatic surfaces smooth, roughened or papillate; fruit an explosively dehiscent capsule, the cocci separating from a persistent columella; columella with 3 interocular points apically; seeds 1 per locule; seed coat dry, crustaceous, smooth or slightly rough, brownish-black or with a tawny mottling when mature, ecarunculate; endosperm whitish; embryo straight; cotyledons foliaceous and considerably broader than the terete radicle.

A genus of about 150 species of nettle-like plants that are widely distributed in tropical and subtropical or warm-temperate regions of both the New World and Old World.

1. Stamens 2; calyx lobes of the staminate flowers usually 4 or 5 (rarely 6); plants never twining (2)
1. Stamens 3 or 4 (rarely 5, up to 10 in the terminal flowers); calyx lobes of the staminate flowers 3 or 4 (to 5, up to 7 in the terminal flowers); plants often twining (3)
- 2(1). Leaf blades cuneately narrowed at base; seeds 3-4 mm. long 10. *T. urens*.
2. Leaf blades rounded to obtuse at base; seeds 4-4.5 mm. long 9. *T. Smallii*.
- 3(1). Inflorescence with conspicuous stalked glandular hairs; seeds 1.9-2.2 mm. long ..
..... 1. *T. glanduligera*.
3. Inflorescence without conspicuous stalked glandular hairs; seeds 2.8-5.3 mm. long (4)

¹¹⁷ Contributed by Kim I. Miller.

- 4(3). Stems essentially glabrous; leaf blades deeply and sharply toothed, cuneately narrowed at base; filaments connate one-third to one-half or more their length 8. *T. nigricans*.
4. Stems pubescent; leaf blades variously marginated, truncate to cordate or hastate at base; filaments connate only at base (5)
- 5(4). Persistent base of the staminate pedicel usually as long as or exceeding the subtending bract; stigmatic surfaces extremely papillate; styles connate one-third to one-half their length with a slight constriction at the juncture with the ovary 3. *T. urticifolia*.
5. Persistent base of the staminate pedicel conspicuously shorter than the subtending bract; stigmatic surfaces smooth to papillate; styles free or connate without a constriction at the juncture with the ovary (6)
- 6(5). Leaf blades broadly ovate, 45-130 mm. long, 36-100 mm. broad, acuminate, deeply cordate at base; seeds 4.3-5.3 mm. long 2. *T. cordata*.
6. Leaf blades rounded to triangular or lanceolate, scarcely acuminate, not broadly ovate, with a deeply cordate base; seeds 2.6-4 mm. long (7)
- 7(6). Calyx lobes of the pistillate flowers longer than the gynoecium at anthesis; staminate flowers 14 to 75 per inflorescence, usually compactly arranged on the axis 4. *T. betonicifolia*.
7. Calyx lobes of the pistillate flowers shorter than the gynoecium at anthesis; staminate flowers 2 to 30 per inflorescence, usually not compactly arranged on the axis (8)
- 8(7). Stigmatic surfaces not papillate (except in aberrant specimens where the papillation is slight and always in combination with narrowly lanceolate leaf blades); styles connate one-third to one-half or more their length and usually terminating in slender round recurved tips; leaf blades usually 2 to 4 times as long as broad 6. *T. ramosa*.
8. Stigmatic surfaces papillate; styles connate only at the base or slightly more (to one-fourth their length); leaf blades rounded to triangular (9)
- 9(8). Plants copiously to densely pubescent especially on the young stems, the entire plant having a grayish-green cast; leaf blades crenate to serrate or dentate, truncate to sagittate at base; staminate flowers 3 to 30 per inflorescence 7. *T. amblyodonta*.
9. Plants not densely pubescent on the stems and leaves; leaf blades serrate, truncate to shallowly cordate at the base; staminate flowers 3 to 6 (to 10) per inflorescence, fruits usually of 2 kinds on the same plant, 3-seeded and wingless or 1-seeded and winged 5. *T. brevispica*.

1. *Tragia glanduligera* Pax & Hoffm. Stems to 1 m. or more long, trailing and twining; leaves elliptic to ovate, 25-40 mm. long, 15-20 mm. broad, apically acute to acuminate, basally truncate to cordate, marginally crenate to serrate; racemes with the lowermost 1 (or 2) nodes pistillate, the remaining 10 to 30 nodes staminate; bracts of the pistillate flowers 0.9-2 mm. long, abaxially sparsely pubescent; bracts of the staminate flowers subcucullate, 0.5-1.5 mm. long; glandular hairs present over the entire inflorescence; *staminate flowers*: pedicels 1-2 mm. long, the lower persistent part 0.3-0.7 mm. long; calyx lobes 3, 0.7-1.2 mm. long; stamens 3; filaments thickened and fleshy, 0.2-0.4 mm. long, connate basally; *pistillate flowers*: pedicels 1-2.3 mm. long, elongating to 3-7 mm. in fruit; calyx lobes 6, 0.7-1.5 mm. long at anthesis, 1.2-2.3 mm. long in fruit; styles connate for one-third their length, the stigmatic surfaces papillate; fruit 2-2.5 mm. long, 4-5 mm. broad; columella 1.5-2 mm. long; seeds 1.9-2.2 mm. long. Usually in dry sandy soil in Kenedy, Willacy, Hidalgo and Cameron cos., spring-fall; s. to Yuc.

2. *Tragia cordata* Michx. Stems to 15 dm. long or more, trailing and twining; leaves broadly ovate, 45-130 mm. long, 36-100 mm. broad, apically acuminate, basally cordate, marginally coarsely serrate; racemes with the single lowermost node pistillate, the remaining 20 to 60 nodes staminate; bracts of the pistillate flowers 1.6-2 mm. long, abaxially sparsely pubescent; bracts of the staminate flowers subcucullate, 1.5-2 mm. long; *staminate flowers*: pedicels 1.5-2.2 mm. long, the lower persistent part 0.7-1 mm. long; calyx lobes

3 (or 4), 0.7-1.5 mm. long; stamens 3 (to 5); filaments thickened and fleshy, 0.2-0.5 mm. long, connate basally; *pistillate flowers*: pedicels 1-1.5 mm. long, elongating to 2.5-3 mm. in fruit; calyx lobes 6 (or 7), 1.5-2 mm. long at anthesis, 2-3 mm. long in fruit; styles connate for one-fourth to one-third their length; stigmatic surfaces papillate; fruit 5-7 mm. long, 11-13 mm. broad; columella 2.2-3.4 mm. long; seeds 4.3-5.3 mm. long. Rocky wooded bluffs along streams and rich soil in open woods in e. Tex. from Bowie Co. s. to Jasper Co., spring-fall; Ind. s. to Ga. and Fla., Mo., Okla. and Tex.

3. *Tragia urticifolia* Michx. Stems 25-65 cm. tall, erect to decumbent; leaves triangular-lanceolate to narrowly ovate, 27-67 mm. long, 9-32 mm. broad, apically acute, basally cordate to truncate, margins serrate; racemes with the lowermost 1 (or 2) nodes pistillate, the remaining 11 to 40 nodes staminate; bracts of the pistillate flowers 1-1.5 mm. long, glabrous or abaxially sparsely pubescent; bracts of the staminate flowers subcucullate, 0.7-1.5 mm. long; *staminate flowers*: pedicels 1.5-2 mm. long, the lower persistent part 1-1.8 mm. long, as long as or exceeding the subtending bract; calyx lobes 3 (or 4), 1.2-2.1 mm. long; stamens 3; filaments thickened and fleshy, 0.3-0.8 mm. long, connate basally; *pistillate flowers*: pedicels 0.5-1 mm. long, elongating to 3-4 mm. in fruit; calyx lobes (5 or) 6, 1.3-2.2 mm. long at anthesis, 2-3 mm. long in fruit; styles connate for one-third to one-half their length with a constriction at the juncture with the ovary; stigmatic surfaces extremely papillate; fruit 3.5-4.5 mm. long, 7-8 mm. broad; columella 2-2.8 mm. long; seeds 3-4 mm. long. Sandy soil in open woods and fields in e. Tex. w. to Gonzales and Bastrop cos., n. to Wood and Upshur cos., spring-fall; N.C. s. to Fla. and w. to Ark. and e. Tex.

4. *Tragia betonicifolia* Nutt. Stems 2-5 dm. tall, erect or decumbent to trailing; leaves ovate to ovate-lanceolate or triangular-lanceolate, 15-55 mm. long, 9-35 mm. broad, apically acute, basally cordate to truncate, marginally sharply serrate; racemes with the lowermost 1 (or 2) nodes pistillate, the remaining 14 to 75 nodes staminate; bracts of the pistillate flowers 1.5-2 mm. long, abaxially sparsely pubescent; bracts of the staminate flowers subcucullate, 1-2 mm. long; *staminate flowers*: pedicels 0.7-1 mm. long, the lower persistent part 0.3-0.6 mm. long; calyx lobes 3 or 4 (or 5), 1.2-2.3 mm. long; stamens 3 or 4 (or 5); filaments thickened, 0.4-1 mm. long, connate basally; *pistillate flowers*: pedicels 0.7-1 mm. long, elongating to 3-4 mm. in fruit; calyx lobes 6, 1.8-3 mm. long at anthesis, 3-5 mm. long in fruit; styles connate only at the base or slightly more; stigmatic surfaces papillate; fruit 4-5 mm. long, 7-9 mm. broad; columella 2.5-3 mm. long; seeds 3-4 mm. long. *T. urticifolia* var. *texana* Shinnery. Dry sandy soil in open woods and fields in cen. Tex. from Wichita and Lamar cos. s. to Duval and Jim Wells cos., e. to Galveston Co. and w. to Uvalde and Stonewall cos., spring-fall; Mo. and Kan. s. through Okla. and Ark. to s. Tex.

5. *Tragia brevispica* Engelm. & Gray. Stems 2-10 dm. long or longer, erect to trailing and twining; leaves broadly triangular, 18-50 mm. long, 13-30 mm. broad, apically acute, basally truncate to shallowly cordate, marginally finely and shallowly serrate; racemes with the lowermost node pistillate, the remaining 3 to 6 (to 10) nodes staminate; bracts of the pistillate flowers 1-1.4 mm. long; bracts of the staminate flowers subcucullate, 1-1.8 mm. long; *staminate flowers*: pedicels 1-1.5 mm. long, the lower persistent part 0.4-0.7 mm. long; calyx lobes 3 or 4 (or 5), 1-1.5 mm. long; stamens 3 or 4 (or 5); filaments slender to thickened and fleshy, 0.3-0.6 mm. long, connate basally; *pistillate flowers*: pedicels 0.5-1 mm. long, elongating to 2-4 mm. in fruit; calyx lobes 6, 1.3-2 mm. long at anthesis, 1.8-3.5 mm. long in fruit; styles connate only at the base or to one-third their length; stigmatic surfaces papillate; fruits often of 2 kinds on the same plant; some fruits 3-seeded and wingless, typically dehiscent, 3.5-4 mm. long, 6.5-7 mm. broad; some fruits with 1 to 3 (typically 2) distinct wings, more or less indehiscent; columella 1.8-2.8 mm. long; seeds 2.8-3.8 mm. long. Open woods and fields in the limestone region of cen. Tex. from Grayson and Delta cos. s. to Kleberg Co., Brazos Co. w. to Edwards and Scurry cos., spring-fall; possibly extending into Mex.
