EDITOR'S PREFACE

The **MANUAL OF THE VASCULAR PLANTS OF TEXAS** is a continuation of the systematic account of the ferns and flowering plants of Texas initiated in 1942 with the publication of Volume 3, Part I of Lundell's **FLORA OF TEXAS**. As originally projected, the **FLORA OF TEXAS** was planned as a ten-volume work, with volumes 1 and 2 to contain the history of botanical exploration, the key to the families, a catalogue of all the species, and maps of the species showing distribution according to counties. Volumes 3 through 10 were designated to include a series of definitive treatments covering all vascular plants of the state.

With the issuance of Volume 1, Part I in 1955, the original plan was changed, and the **FLORA** was converted into a serial publication. Volume 3 was completed in 1961, Volume 1 under the new plan was issued in 1966, and Volume 2 was published in 1969. With the issuance of Volumes 1, 2 and 3, the **FLORA OF TEXAS** will be continued as a serial devoted to monographic papers.

When the projected two-volume introduction to the **FLORA** was abandoned in 1955, and the publication converted into a serial, plans were made to bring out a **MANUAL OF THE VASCULAR PLANTS OF TEXAS** to incorporate much of the material initially planned for these volumes.

Based on published parts of the **FLORA OF TEXAS**, but involving revision of these, and the treatment of the entire flora in a more concise form, the **MANUAL** is designed to make available the first complete taxonomic treatise covering all the vascular plants of the state.

The **FLORA OF TEXAS** will serve as a continuing serial of monographic papers to provide a base for updating future editions of the **MANUAL**.

—C. L. LUNDELL
Director of the Foundation

AUTHORS' PREFACE

This is the first complete assemblage of information regarding all of the plant resources of Texas. It is a taxonomic, floristic and, to some extent, ecologic and economic treatment of all the native and naturalized flowering plants and ferns known to occur in Texas.

It is hoped that this work will prove to be a valuable teaching and research tool for teachers and students in the schools, colleges and universities of Texas and southwestern United States, generally, and for biologists everywhere who are interested in any or all aspects of the flora of Texas. The ever-increasing interest in all native vegetation in fields of economic botany, as represented by agricultural, medical, pharmaceutical, chemical, and all other such agencies in both private and government circles has stressed the need for works such as this *MANUAL*. It will make possible the identification of the plants of this part of the country and also aid such agencies as those noted in their search for plants. We hope that this work will fulfill these needs.

The senior author would like to emphasize that to have been given the time and support to prepare a work of this nature is a rare privilege. It is a reflection of the broad-mindedness and serious interest of the supporters and administrators of Texas Research Foundation in not only the agriculture of Texas but in all phases of the botanical resources of the state. We are, indeed, grateful to Texas Research Foundation, its Board of Trustees, and its Director, C. L. Lundell, for support and encouragement during the course and preparation of this research. The junior author wishes to express his appreciation to the Department of Botany, The University of Texas at Austin, and its Chairmen, Harold Bold and B. L. Turner, for encouragement and time allowed for research on this project. Without the cooperative support of these two institutions the authors could not have succeeded in producing this *MANUAL*.

When this project was first proposed, and during its initial stages, some of our colleagues were of the opinion that it was "too soon" to attempt the preparation of a *MANUAL* of the vascular plants of Texas. Our response was, and continues to be, "When is soon enough?" We were of the opinion that further and constant delay was against, not in favor of, the ultimate production of a *MANUAL*. Realizing this, we decided to move ahead.

We knew from the beginning that in order to produce this work we would need all the support, encouragement and cooperation that we could possibly obtain. We are pleased to say that throughout the project we have received far more of each of the above than we had anticipated in our most optimistic moments of planning.

We are indebted to hosts of individuals who have made this work possible. First, we wish to acknowledge our indebtedness to the many plant collectors who, from the early days of Jean Louis Berlandier, Charles Wright, Thomas Drummond, Ferdinand J. Lindheimer, Julien Reverchon and many others,

to the present time, have gone through all the vicissitudes of exploration to make available specimens upon which our present knowledge of the flora of Texas is founded. Through their efforts of more than a century we now have a sound basis for the preparation of a work such as this.

We were most fortunate to have the unselfish cooperation and collaboration of many capable colleagues who willingly contributed treatments of their special groups. These individuals and the contributions they provided us are: Loran C. Anderson (*Chrysothamnus*); Lyman Benson (Cactaceae); Andre F. Clewell (*Lespedeza*); L. Turner Collins (*Orobanche*, Section *Myzorrhiza*); Lincoln Constance (Hydrophyllaceae); Helen B. Correll (Phrymaceae, Plantaginaceae); Frank S. Crosswhite (*Penstemon*); Imre J. Eifert (*Caesalpinia*, *Hoffmanseggia*); Walter S. Flory (*Cooperia*, *Zephyranthes*); Lowell David Flyr (*Brickellia*); John D. Freeman (*Trillium*); Howard Scott Gentry (*Agave*); Vernon L. Harms (*Heterotheca*); F. G. Hawksworth and Delbert Wiens (*Arceuthobium*); Richard H. Hevly (Martyniaceae); Noel H. Holmgren (*Castilleja*); Hugh H. Iltis (Cappariaceae); John W. Ingram (*Argythamnia*); Robert S. Irving (*Hedeoma*, *Rhododon*); Howard S. Irwin (*Cassia*); R. Roy Johnson (*Porophyllum*); Walter H. Lewis (*Hedyotis*); Mildred E. Mathias and Lincoln Constance (Umbelliferae); Ronald L. McGregor (*Echinacea*); Thomas R. Mertens (*Polygonum*); Kim I. Miller (*Tragia*); Lillian W. Miller (*Acalypha*); Harold N. Moldenke (Avicenniaceae, Verbenaceae); Cornelius H. Muller (*Quercus*); Royce L. Oliver (*Sisyrinchium*); Kittie F. Parker (*Hymenoxys*); Willard W. Payne (*Ambrosia*); Donald J. Pinkava (*Berlandiera*); Duncan M. Porter (Zygophyllaceae); A. Michael Powell (*Perityle*); Peter H. Raven (Onagraceae, excepting *Calylophus*); Clyde F. Reed (Amaranthaceae, Chenopodiaceae, Nyctaginaceae); James L. Reveal (*Eriogonum*); C. Marvin Rogers (Linaceae); David J. Rogers (*Manihot*); Reed C. Rollins, Elizabeth A. Shaw and Ray J. Davis (Cruciferae); Norman H. Russell (Violaceae); Bernice G. Schubert (*Desmodium*); Lloyd H. Shinnars (Convolvulaceae); John Strother (*Dyssodia*); Tod F. Stuessy (*Melampodium*); Henry J. Thompson and Joyce Roberts Zavortink (Loasaceae); Howard F. Towner (*Calylophus*); Wesley C. Walraven (*Rhynchosia*); U. T. Waterfall (*Physalis*); Grady L. Webster (*Phyllanthus*); Delbert Wiens (Viscaceae family description and key, *Phoradendron*); Robert L. Wilbur (Cistaceae); James S. Wilson (*Persicaria*). Except for minor editorial changes and those made so as to maintain consistency in presentation, these contributions have been published without alteration. We also wish to acknowledge the assistance of Gerald W. Thomas in the preparation of the Introduction.

The many researchers who have produced monographs, revisions and published notes have immeasurably lightened our burden. Their published works have in many instances been adapted to the Texas plants for inclusion in this work, and are acknowledged where they occur in the text. The publication of a "Catalogue of the Flora of Texas" in 1937 by V. L. Cory and H. B. Parks and the subsequent publication in 1962 of F. W. Gould's "Texas Plants—a Checklist and Ecological Summary" were most helpful in bringing to a focus the species of plants that were to be found in Texas. These two publications served as much-appreciated guideposts during the initial phases of this work.

We have relied upon and, in some instances, drawn to some extent upon various Manuals and comprehensive published floristic studies, reference works and other such publications in the assemblage of this work. Without their availability, the identification of plants and the preparation of some parts of our text would have been a most difficult task. Our appreciation and grateful acknowledgment is herewith accorded the authors and publishers of these works. All such works that have not been acknowledged somewhere in the text are cited in the Selected References section, not only as an acknowledgment of their usefulness to us but also as a convenience for those who might wish to consult them. We would like to note particularly the generosity of Philip A. Munz in permitting us to use material from "Abbreviations of Authors' Names" and "Glossary" that was assembled by David D. Keck for their "A California Flora" (1959). In regard to the abbreviations of authors' names, we are indebted to many individuals who supplied us with supplementary information, especially to George H. M. Lawrence, who checked numerous names for us in the files of the Hunt Botanical Library.

There are many individuals, too numerous to mention by name, who have been directly or indirectly helpful to us in our research, and to whom we are most grateful. Foremost among these are the curators of various herbaria in which Texas specimens are deposited. In regard to specimens, those of Barton H. Warnock from Trans-Pecos Texas that we were able to study were most helpful. We are indebted to Chester M. Rowell for his having made available to us his research findings in the Plains Country prior to their publication. Our understanding of the taxonomy of many of the grasses was helped immensely by the cooperation of our colleague, Frank W. Gould. The assistance of Lyman B. Smith and Elbert L. Little, Jr. in helping to solve some difficult determinations is gratefully acknowledged. Several botanists actively participated in field work on the project. Among these was the late Ivan M. Johnston who was especially helpful in the initial planning of the work and whose untimely death was a real and personal loss to the senior author. Others who participated in field work were Lyman Benson, Kenton L. Chambers, Gabriel Edwin, Howard Scott Gentry, Craig A. Hanson, Elbert L. Little, Jr., Eugene C. Ogden, James L. Reveal, Reed C. Rollins, Charles Schweinfurth, C. Earle Smith, Jr., Henry K. Svenson and Dieter C. Wasshausen. We are indebted to all of them.

In addition to help received from professional botanists, a number of highly skilled amateurs have either directed us to new elements in the flora or have provided assistance in one way or another. Among these are the late Robert Runyon of Brownsville and Lance Rosier of Saratoga, Geraldine Watson of Silsbee, Peggy A. Amerson of Mt. Pleasant, Jim D. Bowmer of Temple, Fred B. Jones of Corpus Christi, and Raymond J. Fleetwood, now of Angleton. The majority of Mexican-American common names cited here are those published in 1947 by Mr. Runyon in his "Vernacular Names of Plants Indigenous to the Lower Rio Grande Valley of Texas."

We are indebted to the Big Bend National Park Service, especially to Park Naturalists Douglas Evans and Roland Wauer, and to the Texas State Parks and Wildlife Service personnel, especially William M. Gosdin and Eugene A. Walker, who were most generous in permitting us to collect within the

boundaries of the domains for which they were responsible. We are equally indebted to many ranchers, farmers and other individuals who permitted us to botanize on their lands.

The financial aid and encouragement of the National Science Foundation through its several grants (Nos. G15901; GB-572; GB-3138; N-3228) made it possible for us to explore more fully every floristic region in the State of Texas, provided means for us to visit various institutions to further our research on the project, and enabled us to publish the work. We are, indeed, grateful to the National Science Foundation and its officials for this much-needed support. We are equally grateful to the Hoblitzelle Foundation for its help in the publication of this work.

We wish to thank Miss Mary Humphries, Librarian of Texas Research Foundation, and Mrs. Sharon L. Horn, research assistant to Reed C. Rollins, Harvard University, for their much-appreciated bibliographic assistance. W. Andrew Archer generously made available to us both bibliographic material and herbarium specimens, for which we are most grateful.

The careful and painstaking work of Mrs. Aileen Maddox in typing the manuscript and in assisting with the preparation of the Index is gratefully acknowledged. Her ability to transcribe at times almost undecipherable hieroglyphics made our burden much lighter than it would have otherwise been. Lastly, our wives, Helen B. Correll and LaVerne A. Johnston, were a continuous source of help and encouragement during the course of this work. We are most grateful to them.

The main purpose of this work, as is that of any Manual, is to provide a means for the identification of the plants in the region under consideration; namely, Texas. For the most part, we feel, the text is uncomplicated and straightforward and needs no explanation. Several points, however, should be clarified. Although the families are arranged phylogenetically essentially in accordance with the Engler and Prantl System, many of the genera and the species within a family or genus, respectively, are not arranged in phylogenetic order. This phase needs more study than time allowed for the present and remains to be done in hoped-for future revisions of this work. In the Keys the first number in each couplet, except in the first pair, is accompanied by a number in parenthesis. This number in parenthesis refers back to the previous couplet from which the present one was derived. With this aid one can quickly and readily retrace one's steps back to the very beginning of the Key if need be. The branches or "legs" of each couplet are always terminated either by a plant name or by a number in parenthesis that refers to a subsequent couplet. In regard to measurements and numbers of parts given in some sections of the text, as "petals (5-) 7-9 (-12) mm. long," such may be interpreted as "petals usually 7-9 mm. long but sometimes as short as 5 mm. or as long as 12 mm. long." The less common extremes in measurements and numbers of parts are enclosed in parentheses.

A factor that has undoubtedly affected our vegetation more than any other in the past, and is a continuing factor, is the grazing and browsing by wild and domestic animals; first the buffalo, antelope and deer, and later the cattle, horses, sheep, goats, antelope and deer. Because of this, and the

fact that Texas is a leading cattle-raising state, emphasis in some parts of the Introduction is placed upon the vegetational composition with respect to forage.

We can not over-emphasize the need for greater conservation and a need for the utmost intelligence in the handling of the plant resources of Texas. An ample representation of each of the many different plant communities found in the state should be obtained by the state and set aside and conserved as examples for future generations. Greater restraint should be practiced in the use of our pasturelands before many of our valued species are greatly reduced or even exterminated. Overgrazing is far too prevalent throughout much of the state. Some species, such as all of our native orchids, should be protected, and a state law should exist forbidding the cutting of our magnificent native magnolia (*Magnolia grandiflora*) mainly for the making of railroad ties and furniture.

Finally, we believe that a MANUAL, in so far as possible, should epitomize and extol the results of the labor of all those who have gone before. If it were otherwise it would be for them a case of "love's labor lost." To evolve knowledge of any sort, we should build on the results that have accrued to us through the work of others. We like to think of the present work as an evolverment of this nature, but the authors can not relinquish the responsibility of its contents. They are solely responsible for any shortcomings that may be found within these covers.

INTRODUCTION¹

The vital statistics of Texas are, or should be, familiar to every school child in the state. They have been heralded far and wide, and are engraved in granite at a roadside park near the geographical center of the state. With slight modification and updating, this reads:

Texas is 860 miles north to south and 773 miles east to west. Enclosed within the 4,137 mile perimeter of the state are 267,339 square miles. Brewster County, alone, is larger than Connecticut. Texas has a 624 mile coastline and 90 peaks in the Trans-Pecos a mile or more high. Each year about 56 inches of rain fall in the pine-hardwood forests along the Sabine River, which forms part of the state's eastern boundary. Less than 8 inches fall in the Chihuahuan Desert in the extreme west. This is likened to Miami and Phoenix, respectively.

The wide variety of rainfall, soils and elevation in Texas result in great differences in its vegetation in any given area. Nearly half of the grass species indigenous to the United States are to be found in Texas, and almost 5,000 species of vascular plants are found in the state. Texas is the only state in which both Rocky Mountain and eastern varieties of oaks and pines are native, while in the extreme south are found many subtropical species.

The major plant zones of Texas have been given various designations, but they are all basically and broadly those mapped by V. L. Cory and H. B. Parks in their 1937 "Catalogue," and later by F. W. Gould in his 1962 "Texas Plants." The fundamental breakdown and following discussion is based on the zones as designated in our Map 1.

THE TIMBER BELT (Region 1)

The Timber Belt, also known as Pineywoods and East Texas Forest Region, contains approximately 15,000,000 acres. For the most part it is a gently rolling or hilly country, averaging 200 to 500 feet in elevation, with numerous streams feeding into several large rivers, an ideal habitat for a diversified flora. It is characterized by extensive pine and pine-hardwood forests with intermittent swamps and occasional cultivated or pasture land, and represents the most mesophytic area in Texas. It also represents the southwestern terminus of the vast southeastern United States pine-hardwood forest that extends east to Florida and northeast at least to Virginia, and in giving the general distribution of species it is here considered as a part of southeastern United States. Most of the genera and many of the species in this region are also found east and northeast of Texas.

This is an area of relatively high rainfall with annual averages of 35 to more than 50 inches. The monthly average rainfall is rather uniformly distributed throughout the year although in any given year small deficiencies

¹ Prepared with the collaboration of Gerald W. Thomas, Dean of Agricultural Sciences, Texas Tech University.

or excesses are likely in some months. Temperatures usually are high in summer, and the area is comparatively free from persistent winds. The winters are mild.

Soils are mostly light-colored to dark-gray sands or sandy loams of usually acid reaction. Very few evident rock outcrops occur. The most notable are the sandstone ridge formations that extend from Newton and Jasper counties, northwestward through Tyler and Angelina counties to Cherokee County, and the ferruginous rock formation in Morris County and vicinity.

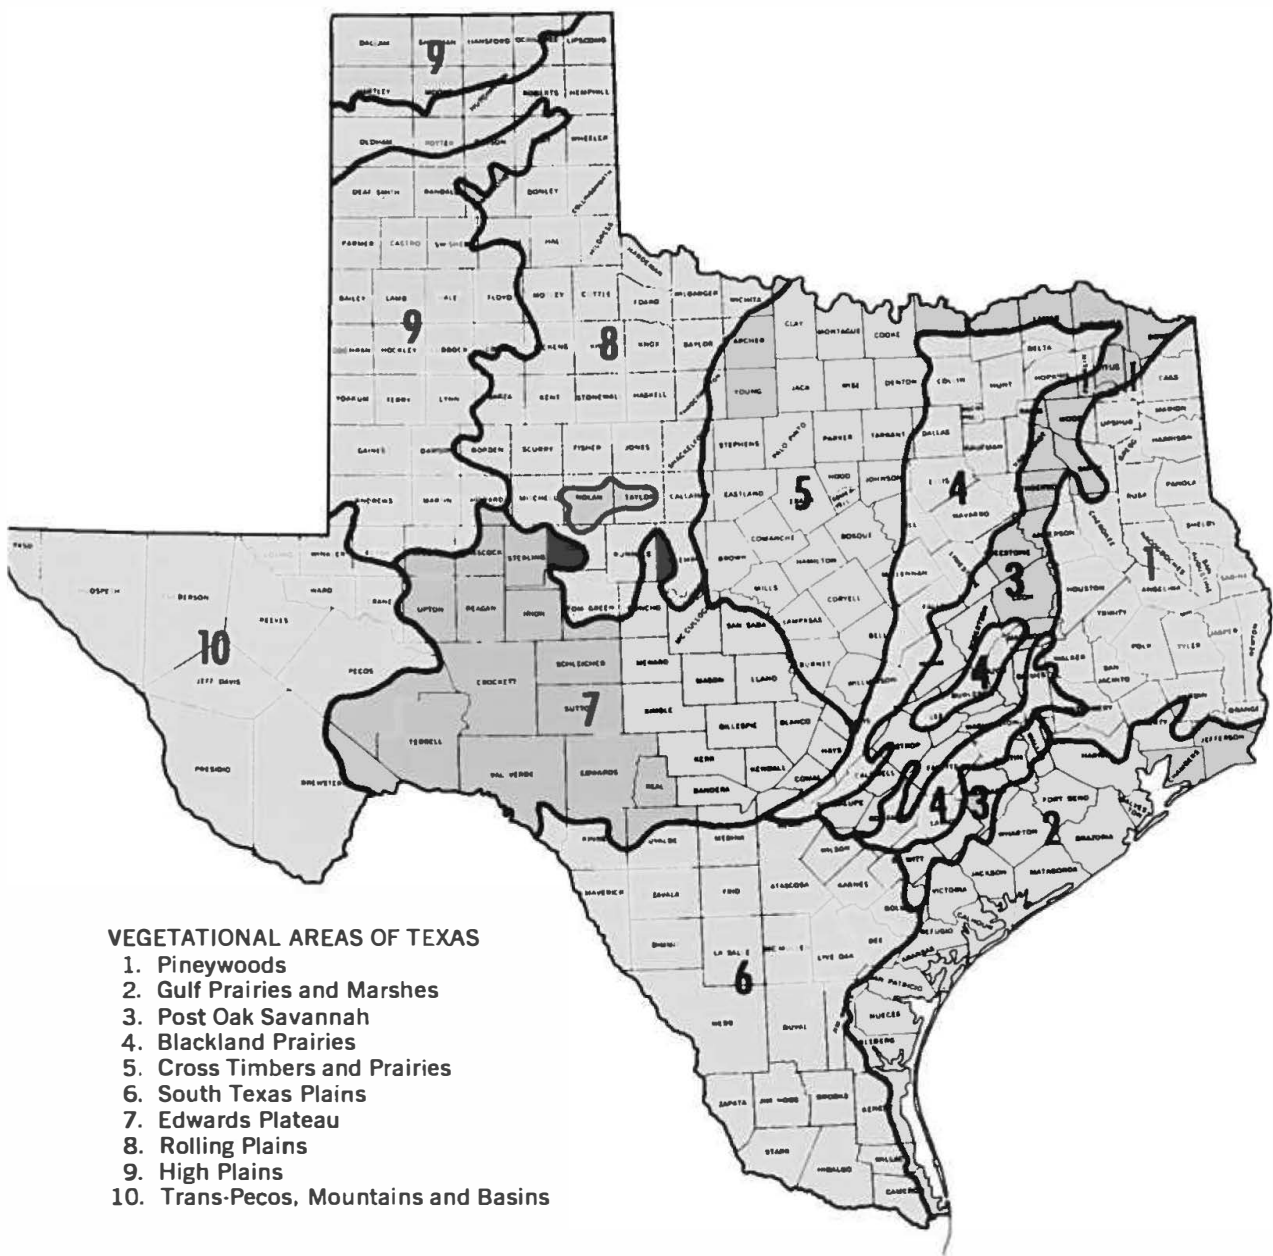

Although at the turn of the century this was a region primarily of small farms and woodlands, today it is essentially one of forestry and ranching. The major commercial timber species are loblolly, shortleaf, longleaf and slash pines. Many hardwoods, such as oaks, elm, magnolia, hickory and maple, also are present in the overstory. Most ecologists consider the pine forest as a subclimax or fire disclimax. Ranches are extremely varied in size and type of operation. The principal class of livestock is cattle. Deer are numerous and must be considered in vegetational management.

Herbs and shrubs abound in the Timber Belt, many of which provide forage for native and domesticated animals. These are predominantly species of *Andropogon*, *Sporobolus*, *Panicum*, *Paspalum*, *Muhlenbergia*, *Eragrostis*, *Chasmanthium*, Indian grass (*Sorghastrum avenaceum*), native legumes and occasional shrubs. Many other grasses as well as a large variety of herbs are represented to form an extremely complex association of forbs and brush species. Common invaders are broomsedge (*Andropogon virginicus*), smutgrass (*Sporobolus indicus*), yankee weed (*Eupatorium compositifolium*), red lovegrass (*Eragrostis oxylepis*), green brier (*Smilax* spp.) and yaupon (*Ilex vomitoria*).

Introductions of grasses and legumes, mostly for improved pastures, have complicated the plant successional patterns. Some of these plants have invaded or have been overseeded in native vegetation. The most important of these are Bermuda grass (*Cynodon Dactylon*), Dallis grass (*Paspalum dilatatum*), Vasey grass (*Paspalum Urvillei*), carpet grass (*Axonopus affinis*), *Medicago* spp., *Lespedeza* spp. and others.

In pockets throughout the region are evergreen shrub bogs, open seepage slopes and cypress-tupelo swamps. They are characterized by usually having peat moss (*Sphagnum* spp.) present in varying degrees. The shrubs in and about these habitats are mostly viburnums, hollies, rhododendrons, wax-myrtles, hypericums, dogwoods, vacciniums, leatherwood (*Cyrilla racemiflora*), and occasionally a sprinkling of poison sumac (*Rhus vernix*). Often the herbaceous vegetation is quite different from that of the surrounding country, and is represented by such uncommon species as nodding-nixie (*Apteria aphylla*), *Bartonia texana*, *Viola lanceolata*, grass-of-Parnassus (*Parnassia asarifolia*), bogmoss (*Mayaca Aubletii*), pitcher plant (*Sarracenia alata*), rose pogonia (*Pogonia ophioglossoides*), bearded grass-pink (*Calopogon barbatus*), small wood orchid (*Habenaria clavellata*) and yellow fringed orchid (*H. ciliaris*).

In the extreme southeast, centered in Jasper, Tyler and Newton counties, are savannahs of broad, level, grassy, open pinelands. These are characterized by a fluctuating water-table, and they support a rather distinctive and

Map 1. Vegetational Areas of Texas. From "Texas Plants—A Checklist and Ecological Summary" by Frank W. Gould (1962; 1969). Used with permission of Texas Agricultural Experiment Station, Texas A&M University.

interesting flora. This includes several orchids, as the snowy orchid (*Habenaria nivea*), crested fringed orchid (*H. cristata*), grass-pink (*Calopogon pulchellus*) and several species of ladies' tresses (*Spiranthes* spp.), yellow stargrass (*Aletris aurea*), pipeworts (*Eriocaulon* spp.), whitehead bog-button (*Lachnocaulon anceps*), several meadow beauties (*Rhexia* spp.), clubmosses (*Lycopodium* spp.), milkworts (*Polygala* spp.), small butterwort (*Pinguicula pumila*), bluehearts (*Buchnera* spp.), sundews (*Drosera* spp.), seedboxes (*Ludwigia* spp.), and numerous sedges, grasses and bulrushes that are indigenous to this type of plant community. The savannahs and shrub bogs commonly grade into one another. Plants in this border-zone are often a mixture of those in the two communities.

GULF PRAIRIES AND MARSHES AREA (Region 2)

The Gulf Prairies and Marshes Area occupies approximately 9,500,000 acres along the coast of Texas. The Gulf or Coastal Prairies Area is a nearly level, slowly drained plain less than 150 feet in elevation, with numerous sluggish rivers, creeks, bayous and sloughs. It is characterized by level grasslands that support ranching and farming, low flat woodlands especially along the streams, swamps and fresh-water marshes. The Marsh Area is limited to narrow belts of low wet marsh interspersed with dunes immediately adjacent to the coast.

Average annual rainfall varies from less than 30 inches in the west to about 50 inches in the east. The growing season usually is more than 300 days, with warm temperatures and high humidity. On the average, rainfall is fairly uniformly distributed throughout the year with slight highs in September and late spring.

Soils in the coastal Marsh Area are acid sands, sandy loams and clays. The upland prairie soils tend to be heavier textured acid clays or clay loams, although there are some sandy loams. In general, soils have slowly permeable profiles. The soil moisture is not readily available to the vegetation. Typical range sites include blackland, sandy prairie, lowland flats, coastal sands, salt meadow and salt marsh.

Most of the marsh is grazed by cattle in large land holdings. Ranches and rangelands of the uplands of the Gulf Prairies are interspersed with farms. The better soils are highly productive under cultivation, or as improved pasture or native range. Wildlife, particularly deer, are an important consideration in management of the vegetation.

The climax vegetation of the Gulf Prairies is largely grassland (tall grass prairie) or post oak savannah. However, much of the area has been invaded by trees and brush such as mesquite (*Prosopis glandulosa*), oaks (especially *Quercus virginiana*), prickly pear (*Opuntia* spp.) and several acacias. The principal climax plants are tall bunch grasses such as big bluestem (*Andropogon Gerardi*), seacoast bluestem (*Schizachyrium scoparium* var. *littoralis*), Indian grass, eastern gamagrass (*Tripsacum dactyloides*), gulf muhly (*Muhlenbergia capillaris*), species of *Panicum* and others. Some invading plants, other than brush species, include yankee weed, broomsedge, smutgrass, western ragweed (*Ambrosia psilostachya*), tumblegrass (*Schedonnardus paniculatus*) and many annual weeds and grasses.

The salt marsh areas typically support species of *Carex*, *Cyperus*, *Eleocharis*, *Juncus*, *Scirpus*, several cordgrasses (*Spartina* spp.) and seashore saltgrass (*Distichlis spicata*).

Introduced grasses, such as Bermuda and carpet grass, are common in tame pastures and some have escaped into uncultivated areas.

The families Amaranthaceae and Chenopodiaceae are well-represented in the Coastal Prairies and Marshes. In the eastern half are to be found many of the same species that occur in the Timber Belt. To the south, however, are found such subtropical plants as black mangrove (*Avicennia germinans*), *Scaevola Plumieri* and *Borreria verticillata*. Many additional interesting species are also found in the southern coastal area, such as the introduced but well-established *Callisia repens*, and *Aneilema nudiflorum*, leafless cress (*Cressa nudicaulis*), *Polygonum striatulum*, saltbush (*Atriplex klebergorum*), *Thurovia triflora*, *Willkommia texana*, Swallen's lovegrass (*Eragrostis Swallenii*) and Texas pink-root (*Spigelia texana*).

Aquatic plants abound in this region. Among these are *Wolffia* spp., *Wolffiella lingulata*, parrot's feather (*Myriophyllum* spp.), pondweeds (*Potamogeton* spp.), duckweeds (*Lemna* spp.), duck meat (*Spirodela* spp.), water-lilies (*Nymphaea* spp.), cow-lily (*Nuphar luteum*), *Hygrophila lacustris* and arrowheads (*Sagittaria* spp.). The beneficial aquatic plant species as well as open water for fish and wildlife in many of the streams, canals, lakes and ponds are being threatened by several introduced noxious, weedy species. Foremost among these are the water hyacinth (*Eichhornia crassipes*) and alligator weed (*Alternanthera philoxeroides*). The native cat-tails (*Typha* spp.) also belong here. Other species that can and may prove to be troublesome in this and other regions of Texas are aquatic species of water-primrose (*Ludwigia* spp.), water-lettuce (*Pistia Stratiotes*), common frogbit (*Limnobium Spongia*) and American featherfoil (*Hottonia inflata*). In bays and open waters along the Gulf Coast are to be found such species as *Cymodocea filiformis*, *Thalassia testudinum*, *Halophila Engelmannii*, *Halodule Beaudettei*, and rarely *Posidonia oceanica*. Some of these are often found washed up on the beaches along the coast.

POST OAK SAVANNAH AREA (Region 3)

The Post Oak Savannah Area comprises approximately 8,500,000 acres, and lies immediately west of the primary forest region. In addition to this area, both the East and West Cross Timbers are classed as Post Oak Savannah. Some authorities consider this plant association as a part of the oak-hickory or deciduous forest formation. Others prefer to class the area as a part of the true prairie association of the grassland formation. This latter view is based on the fact that the understory vegetation is typically tall grass. There also is evidence that the brush and tree densities have increased tremendously from the virgin condition.

Topography of the Post Oak Savannah is gently rolling to hilly. Elevations are 300 to 800 feet above sea level. Annual rainfall is 35 to 45 inches. The high rainfall month usually is May or June.

Soils on the uplands are light-colored, acid sandy loams or sands. Bottom-land soils are light-brown to dark-gray and acid, ranging in texture from

Map 2. Texas county outline map.

sandy loams to clays. Typical range sites, based primarily on these soil differences, are deep sands, uplands and bottomlands.

Most of the Post Oak Savannah is still in native or improved pastures, although small farms are common. Brush control and good management have shown that the area is capable of producing an abundance of forage, primarily tall grasses. Improved pastures are commonly seeded to Bermuda grass, Dallis grass, Vasey grass, carpet grass and clovers. All classes of livestock are grazed but cattle are the most common.

Climax grasses include little bluestem (*Schizachyrium scoparium* var. *frequens*), Indian grass, switchgrass (*Panicum virgatum*), purpletop (*Tridens flavus*), silver bluestem (*Bothriochloa saccharoides*), Texas wintergrass (*Stipa leucotricha*) and *Chasmanthium sessiliflorum*. The overstory primarily is post oak (*Quercus stellata*) and blackjack oak (*Quercus marilandica*). Many other brush and weedy species also are common. Some invading plants are red lovegrass, broomsedge, splitbeard bluestem (*Andropogon ternarius*), yankee weed, bull nettle (*Cnidoscolus texanus*), green brier, yaupon, smutgrass and western ragweed.

BLACKLAND PRAIRIES (Region 4)

The Blackland Prairies region consists of about 11,500,000 acres, including the San Antonio and Fayette Prairies. Topography is gently rolling to nearly level, well-dissected with rapid surface drainage. Elevations above sea level are 300 to 800 feet.

Average annual rainfall varies from 30 inches in the west to slightly more than 40 inches in the east. The monthly distribution pattern shows highs in May to the north to an almost uniform pattern at College Station in the south-central region.

Blackland soils are fairly uniform dark-colored calcareous clays interspersed with some gray acid sandy loams. For the most part, this fertile area has been brought under cultivation, although a few excellent (but very small) native hay meadows and a few ranches remain.

Research on the native vegetation of the Blackland Prairies indicates that it should be classed as true prairie with little bluestem as a climax dominant. Other important grasses are big bluestem, Indian grass, switchgrass, side-oats grama (*Bouteloua curtipendula*), hairy grama (*Bouteloua hirsuta*), tall dropseed (*Sporobolus asper*), silver bluestem and Texas wintergrass. Under heavy grazing, Texas wintergrass, buffalo grass (*Buchloë dactyloides*), Texas grama (*Bouteloua rigidisetata*), smutgrass and many annuals increase or invade. Mesquite also has invaded hardland sites of the southern portion of the Blackland Prairies. Post oak and blackjack oak increase on the medium- to light-textured soils.

Some excellent improved pastures have been established on cultivated lands within the Blackland Prairies. These have been seeded to various grasses including Dallis, Bermuda and some native species.

Although classed as a true prairie, this region has much timber, especially along the streams that traverse it. The tree species include a variety of oaks, pecan, cedar elm (*Ulmus crassifolia*), bois d'arc (*Maclura pomifera*) and mesquite. Very few species are unique to the area but the endemics

Dasistoma macrophylla and *Vernonia vulturina* grow in Dallas County and a rose (*Rosa ignota*) is apparently endemic to the area.

CROSS TIMBERS AND PRAIRIES (Region 5)

There are roughly 17,000,000 acres in the Cross Timbers and Prairies. About 1,000,000 acres make up the East Cross Timbers, about 3,000,000 acres the West Cross Timbers and about 6,500,000 acres the Grand Prairie. The remaining area is sometimes called the North Central Prairies. Most of this region is rolling to hilly, deeply dissected and with rapid surface drainage. Average annual rainfall is 25 to 40 inches. April, May and June are the high rainfall months.

The East and West Cross Timbers range from open savannah to dense brush, largely of post and blackjack oaks. Additional species, such as cedar elm and pecan, occur along the streams. Mesquite, despite constant efforts by ranchers to remove it, is still well-established, especially to the south. The East Cross Timbers is a poorly defined region lying along the Red River mainly between Grayson and Clay counties and ending southward between the Blackland and Grand prairies. The West Cross Timbers lie immediately west of the Grand Prairie.

Soils of the North Central Prairies are brown, neutral to slightly acid, sandy or clay loams. Some areas are rather stony. The Grand Prairie typically has dark-colored calcareous clays over limestone. Both the East and West Cross Timbers have acid or slightly acid sandy or sandy loam soils.

Land use in this region is variable. Although the better soils are under cultivation, there are many large ranches which predominantly raise cattle. Other classes of livestock, including goats, are found on some ranches and farms.

In spite of the wide variation in soils and range sites, the climax understory vegetation is rather uniform. The predominant grasses are little bluestem, big bluestem, Indian grass, switchgrass, Canada wild-rye (*Elymus canadensis*), side-oats and hairy grama, tall dropseed and Texas wintergrass. Brush species also have invaded the prairie proper, along with the weedy annual and perennial grasses, including *Erioneuron pilosum*, Texas grama, red grama (*Bouteloua trifida*), tumble windmill grass (*Chloris verticillata*), tumblegrass, red lovegrass and some perennial weeds.

RIO GRANDE PLAINS (Region 6)

The Rio Grande Plains region, also known as the South Texas Plains or Tamaulipan Brushlands, consists of about 20,000,000 acres. The topography is level to rolling, and the land is dissected by arroyos or by streams flowing into the Rio Grande and Gulf of Mexico. Elevations range from about sea level to 1,000 feet. It is characterized by open prairies and a growth of mesquite, granjeno (*Celtis pallida*), cacti, clepe (*Ziziphus obtusifolia*), coyotillo (*Karwinskia Humboldtiana*), guayacan (*Porlieria angustifolia*), white brush (*Aloysia gratissima*), brasil (*Condalia Hookeri*), bisbirinda (*Castela texana*), cenizo (*Leucophyllum* spp.), huisache (*Acacia Farnesiana*), catclaw (*A. Greggii*), black brush (*A. rigidula*), guajillo (*A. Berlandieri*) and other small trees and shrubs which are found in varying degrees of abundance and composition.

Average annual rainfall is 16 to nearly 30 inches, increasing from west to east. At irregular intervals drouths occur in the area. An all-time low record of 2.82 inches fell at Cotulla during 1917. Average monthly rainfall is lowest during January and February and highest in May or June. After a mid-summer depression, another peak is reached in September. Summer temperatures are high, with extremely high evaporation rates in the Laredo area.

Soils range from clays to sandy loams, and vary in reaction from very basic to very slightly acid. A wide range of soil profile types is responsible for great differences in soil drainage and moisture holding capacities. Typical range sites include deep sands, hardlands, shallow ridges, bottomlands, alkali flats and mixed sandy land.

Although there are large acreages of cultivated land in the Rio Grande Plains, most of the area is still range land. Land holdings predominantly are large cattle ranches. Deer and other wildlife species are common.

About 100 to 150 years ago this area supported, on its rockier, more broken uplands, a dense brush dominated by chaparro prieto or black brush (*Acacia rigidula*), guajillo (*A. Berlandieri*) and other low shrubs, many of them thorny. The flatter, deeper-soiled areas supported an open brush or savannah with mesquites and other shrubs in mottes or scattered. A mixture of short or desert grasses and forbs constituted the matrix of the vegetation. Since the settlement of the area, the density of mesquite and other woody plants has increased in many areas.

There are distinct differences in climax plant communities and successional patterns on the various range sites. Characteristic grasses of the sandy loam soils are seacoast bluestem, species of *Setaria*, *Paspalum*, *Chloris* and *Trichloris*, silver bluestem and coast sandbur (*Cenchrus incertus*). The dominants on the clay and clay loams are silver bluestem, Arizona cottontop (*Trichachne californica*), buffalo grass, curly mesquite (*Hilaria Belangeri*) and species of *Setaria*, *Pappophorum* and *Bouteloua*. Low saline areas are characterized by gulf cordgrass (*Spartina spartinae*), seashore saltgrass and sacaton (*Sporobolus Wrightii*). Grasses of the oak savannahs are mainly seacoast bluestem, Indian grass, switchgrass, crinkle-awn (*Trachypogon secundus*) and species of *Paspalum*.

On the rolling open or brush-covered hills saladillo (*Varilla texana*) and its root-parasite, broomrape (*Orobanche multiflora*), form extensive stands in saline and gypsophilous soils. The endemic, *Frankenia Johnstonii*, is occasionally associated with them. The uncommon damiana (*Turnera diffusa*), *Gochmatia hypoleuca*, *Amyris madrensis* and *Mortonia Greggii* are scattered infrequently among the Cactaceae and more common shrubs while the rare ashy dogweed (*Dyssodia tephroleuca*) is local only near the Rio Grande. The Malvaceae are also abundantly represented here as well as in the coastal area.

In the extreme southern part of the Rio Grande Plains region is the Rio Grande Valley, also known as the Brownsville Area, where small groves of native palm (*Sabal texana*) still survive the encroachments of agriculture. In these groves and in the surrounding brush-country occur shrubs, vines and herbs that have their affinity farther to the south. A few of these are

Tournefortia volubilis, David's milkberry (*Chiococca alba*), *Urvillea ulmacea*, *Serjania* spp., *Isocarpha oppositifolia*, tropical heartseed (*Cardiospermum corindum*), Palmer's bloodleaf (*Iresine Palmeri*), *Colubrina Greggii*, *Verbena cameronensis* and *Egletes viscosa*.

In dunes and sandy soils to the southeast are found such plants as the endemic *Monarda maritima* and the more widespread *M. fruticulosa*, *Croton Parksii*, *C. Coryi*, sand brazier (*Brazoria arenaria*), Texas senna (*Cassia texana*), Silveus-grass (*Trichoneura elegans*) and Texas grass (*Vaseyochloa multinervosa*).

EDWARDS PLATEAU (Region 7)

The Edwards Plateau comprises about 24,000,000 acres of "Hill Country" in west-central Texas. Included in the region as herein designated is the granitic Central Basin or Llano Area, centering in Burnet, Llano and Mason counties, and the Stockton Plateau to the west. The Cedar Brakes and part of the Mesquite Belt occur on the Plateau, and are characterized by a dense growth of *Juniperus Ashei*, scrub oaks and mesquite. On the east and south, the Balcones Escarpment, with its spectacular canyons, forms a distinct boundary to the Edwards Plateau, but on the north and west the Plateau blends into and interfingers with other regions. The surface is generally rough, elevations ranging from slightly less than 1,000 feet to more than 3,000 feet.

Average annual rainfall varies from less than 15 inches in the west to more than 33 inches in the east. On the average, there are more years with below average rainfall than above. Drouths have occurred in the area frequently but the most severe and prolonged drouth on record was from 1950 to 1958. The seasonal rainfall pattern shows a typical high in May and June and again in September. This pattern shifts to a late summer high on the western edge of the Stockton Plateau.

Soils are usually shallow, with a wide range of surface textures. They are underlain by limestone or caliche on the Plateau proper and in the Central Basin by granite or gneiss. Typical range sites include adobe hills, shallow uplands, rough stony hills and deep valley soils.

The Edwards Plateau predominantly is range land, with cultivation largely confined to the deeper soils, valley bottoms and around the larger towns. It has an excellent but often sparse mixture of forage plants, and ranches are often stocked with combinations of cattle, sheep and goats to make full use of the few edible plants. Deer are abundant on much of the area and serve as a valuable source of income for many ranchmen.

The most important climax grasses of the Plateau include switchgrass, several species of bluestems and gramas, Indian grass, Canada wild-rye, curly mesquite and buffalo grass. The rough, rocky areas typically support a tall or mid-grass understory and a brush overstory complex made up primarily of live oak, Texas oak, shinnery oak, junipers and mesquite. The northwestern portion of the Edwards Plateau grades into "mesquite-tobosa country" similar to that of the Rolling Plains, whereas the Stockton Plateau portion supports the shorter vegetation of semi-desert grassland. Throughout the region, the brush species are generally considered as "invaders" with the

climax largely grassland or open savannah, except on the steeper, rockier canyon slopes which have continually supported a dense cedar-oak thicket.

The rough, irregular surface of the Plateau is well-drained, being dissected by several perennially flowing river systems that have their origin in the large number of springs in this limestone-based region. Noteworthy is the growth of cypress along most of the streams and rivers. Because of the many large canyons and rugged terrain, this area is botanically of much interest and has consequently been visited by many botanical collectors. The ferns as well as many of the flowering plants are primarily lithophilous, being represented mainly by various species of lipferns (*Cheilanthes* spp.), cloak-ferns (*Notholaena* spp.) and cliff brakes (*Pellaea* spp.). Columbine (*Aquilegia canadensis*), endemics such as *Anemone edwardsensis* and wand butterfly-bush (*Buddleja racemosa*), and other species are sometimes found together on large boulders in shaded ravines along with such species as mock-orange (*Philadelphus* spp.), American smoke-tree (*Cotinus americana*), spicebush (*Benzoin aestivale*) and the endemic silver bells (*Styrax platanifolia* and *S. texana*). Near the western edge of the Plateau are found such species as *Pistacia texana* in sheltered canyons and *Bauhinia congesta* in the Anacacho Mts., and in streams and canals in the Del Rio area occurs the largest known *Physostegia*, *P. Correllii*, towering to more than 8 feet high.

The Plateau is a region of endemism. Some of the endemics, in addition to those above, are netleaf forestiera (*Forestiera reticulata*), plateau milk-vine (*Matelea edwardsensis*), basin bellflower (*Campanula Reverchonii*), Lindheimer crownbeard (*Verbesina Lindheimeri*), *Lythrum ovalifolium*, *Tridens Buckleyanus*, twisted-leaf yucca (*Yucca rupicola*), sotol (*Dasy-lirion heteracanthium*), bracted twist-flower (*Streptanthus bracteatus*) and cliff bedstraw (*Galium Correllii*). In addition to endemism, the Plateau flora reveals a close relationship to that of Mexico. For instance, on limestone are found the uncommon fern species, *Anemia mexicana*, whitefoot lipfern (*Cheilanthes leucopoda*), halberd-fern (*Tectaria heracleifolia*) and hairy maidenhair fern (*Adiantum tricholepis*). Two other ferns on the granite of the Llano Area are the rare American pillwort (*Pilularia americana*), of wide but erratic distribution, and rock quillwort (*Isoetes lithophila*), of local occurrence.

ROLLING PLAINS (Region 8)

The Rolling Plains, along with the High Plains, form the "Panhandle" of Texas. They are a part of the Great Plains region of central United States. The Rolling Plains area in Texas consists of approximately 24,000,000 acres of gently rolling to moderately rough topography. It is dissected by narrow intermittent stream valleys flowing east to southeast. Elevation is 800 to 3,000 feet. The southeastern portion is sometimes referred to as the Reddish Prairies while the middle portion is often referred to as a part of the "South Plains".

Annual rainfall ranges from about 22 inches in the west to almost 30 inches in the eastern portion. Although seasonal precipitation is highly variable, May and September normally are the high rainfall months.

Typically there is a summer dry period, with high temperatures and high evaporation rates.

Soils vary from coarse sands along outwash terraces adjacent to streams to tight clays or red-bed clays and shales. Soil reaction is neutral to slightly basic. Some typical range sites include hardland, mixed land, sandy land, sandy rough breaks and bottomland.

Approximately two thirds of this area is still in range land. The primary class of livestock is cattle, most of which are grazed on large ranches as cow-calf operations.

The original prairie vegetation included tall and mid-grasses, such as little bluestem, big bluestem, sand bluestem (*Andropogon Hallii*), side-oats grama, Indian grass, switchgrass, hairy grama, blue grama, Canada wild-rye and western wheatgrass (*Agropyron Smithii*). Buffalo grass, curly mesquite, tobosa (*Hilaria mutica*), species of three awn (*Aristida* spp.), sand dropseed, hooded windmill grass (*Chloris cucullata*) and *Cenchrus* species tend to increase under grazing. Mesquite is a common invader on all soils. Shinnery oak (*Q. Havardii*) and sand sage (*Artemisia filifolia*) increase or invade on the sandy lands. In addition to brush invaders, heavy grazing tends to increase sandburs (*Cenchrus* spp.), hairy tridens, red grama, Texas grama, tumblegrass, gummy lovegrass (*Eragrostis curtipedicellata*), Texas croton (*Croton texensis*), western ragweed and many other annuals and weedy perennials.

HIGH PLAINS (Region 9)

The High Plains region is also known as the Staked Plains or Llano Estacado, and comprises about 20,000,000 acres. It is a part of the central Great Plains. It is a relatively level high plateau rather sharply separated from the Rolling Plains by the Cap Rock Escarpment and dissected in the north by the Canadian and Red River breaks and in the south by the Brazos and Colorado River systems. Some of the Escarpment walls along the Canadian and Red River reach a height of 800 feet or more. Elevation is 3,000 to 4,500 feet, sloping gently toward the southeast. The southern part is sometimes referred to as the South Plains. The surface is spotted with "playa lakes" which sometimes cover more than 40 acres and contain several feet of water after heavy rains. According to their degree of wetness, these "playa lakes" support various vegetation compositions that differ from that of the surrounding terrain.

Average annual rainfall is 15 to 21 inches, with some years showing as little as 12 and others more than 45 inches. Extended drouths have occurred in the area, the worst in 1917-18, in the 1930's and during 1951-56. Rainfall generally is low during the winter, high in April and May, low in midsummer and high in September and October. The average frost-free period is 179 to 225 days.

Soils range in surface texture from clays on hardland sites in the north to medium textures on mixed land sites and sands on the Southern High Plains. Surface soils are generally underlain with caliche accumulations at depths of 2 to 5 feet.

Although cultivation has increased tremendously with underground water

irrigation, large areas of range land remain on the High Plains. Ranches are primarily cattle operations, usually in large holdings. The principal large wildlife species is antelope.

The vegetation on the High Plains is variously classified as mixed-prairie, short-grass prairie and in some locations as tall-grass prairie. There are distinct differences among the plant communities found on the hardlands, mixed lands, sandy lands, draws and caliche breaks. Successional patterns usually are different and relatively uncomplicated compared with other areas of Texas.

The most abundant native grasses are buffalo grass and blue grama (*Bouteloua gracilis*). These grasses respond as "increasers" on most range sites, although blue grama often may be a "decreaser." Total density or ground cover tends to be higher under grazing, particularly in the intermediate range condition classes. Other important grasses are side-oats grama, black grama (*Bouteloua eriopoda*), little bluestem, western wheatgrass, Indian grass and switchgrass. Sand dropseed and sandbur are common on the sandy lands to the south.

The High Plains region characteristically is free from trees or brush, but mesquite and yucca have invaded some of the area. Sand sage and shinnery oak are common on the deep sandy lands and cedars have spread out from some of the breaks onto the Plains proper. Forbs are common, but not in the abundance or in the complicated patterns found in other regions of Texas. Some of the more interesting species found in the Plains Country are smooth cliff brake (*Pellaea glabella*), gay feather (*Liatris lancifolia*), *Crepis runcinata*, *Townsendia texensis*, and numerous Eriogonums, including the rare *E. Correllii*.

TRANS-PECOS, MOUNTAINS AND BASINS (Region 10)

The Trans-Pecos region consists of approximately 19,000,000 acres of mountains and arid valleys in the extreme western part of Texas. As the name implies, the area includes the region west of the Pecos River. The extreme southeast portion is considered by some to be a part of the Stockton (Edwards) Plateau. It is a region of diverse habitats and vegetation, varying from desert valleys and plateaus to wooded mountain slopes and summits that support forests of conifer and hardwoods. Elevation is about 2,500 to more than 8,500 feet. Treatment of this region as a single vegetational area is justified only in view of its extreme variability and the impracticability of recognizing more vegetational units. The region includes the main representation of the Chihuahuan Desert in the United States. Also, in the Trans-Pecos are to be found the most arid localities in Texas, with very scant growth of arid-land grasses and shrubs.

The average annual precipitation over most of the area is less than 12 inches. Precipitation increases at the higher elevations, to 16.1 inches at Fort Davis and a reported 20 inches on Mt. Locke. Although records at many locations are incomplete, there is much evidence of extreme variability. The high rainfall months usually are July and August.

Soils have developed from outwash materials from the mountains and are varied in surface texture and profile characteristics. In general, soil reaction

Map 3. Environmental map of Texas to show major elevation lines, variations in precipitation, wind and evaporation at different locations, and temperature factors, all of which influence plant growth and distribution in the state. Data compiled from numerous sources. Adapted from "Texas Plants—A Checklist and Ecological Summary" by Frank W. Gould (1969). Courtesy of Texas Agricultural Experiment Station, Texas A&M University.

is basic and some areas show accumulations of alkali as a result of poor drainage. Typical range sites are stony hills, clay flats, sands, salty-saline soils, gypsum flats, deep upland, rough stony mountains, gravelly outwash and badlands.

Cultivated areas are confined largely to the irrigated valleys. Most of the land remains in native range in large holdings. Ranch operations typically are with cattle or sheep, some mixed cattle and sheep and some Angora goats.

Because of the numerous ecological sites, many vegetation types exist. The most important of these are creosote-tarbrush desert shrub, grama grassland, yucca and juniper savannahs, piñon pine and oak forests, and a limited amount of ponderosa pine forests. Saline sites support salt brush (*Atriplex* spp.), alkali sacaton (*Sporobolus airoides*) and other salt-tolerant plants.

Some of the important climax forage plants are *Bothriochloa* spp., side-oats grama, green sprangletop (*Leptochloa dubia*), Arizona cottontop, bush muhly (*Muhlenbergia Porteri*), plains bristlegrass (*Setaria macrostachya*), Indian grass, alkali sacaton, vine-mesquite (*Panicum obtusum*), dropseeds, blue grama, black grama, chinograss (*Bouteloua ramosa*) and other species of grama, tobosa, sacaton and three awns. Common invaders are burro grass (*Scleropogon brevifolius*), fluffgrass (*Erioneuron pulchellum*), *Erioneuron pilosum*, ear muhly (*Muhlenbergia arenacea*), sand muhly (*M. arenicola*), *Croton dioicus*, snakeweeds (*Xanthocephalum* spp.) and Cactaceae.

The flora of the Trans-Pecos is rich and varied, and much of it is rather localized. About one out of twelve species of the Texas flora occurs in the Trans-Pecos and nowhere else in Texas. On the eastern edge along the Pecos River is a region of low rainfall and high evaporation where the principal growth consists of such shrubs as lechuguilla (*Agave lecheguilla*), ocotillo (*Fouquieria splendens*), several species of *Yucca*, cenizo and other arid-land plants. In the more arid areas, chino and tobosa grasses prevail. In places creosote bush (*Larrea tridentata*) and tarbrush (*Flourensia cernua*) grow with tussocks of burro and salt grasses. There is also some mesquite.

In the dunes of Crane, Ward and Winkler counties are to be found such interesting plants as adder's tongue (*Ophioglossum petiolatum*), shinnery oak, *Maurandya Wislizenii*, big sandreed (*Calamovilfa gigantea*), *Cyperus onerosus*, and the rare endemic *Proboscidea sabulosa*.

Extending westward to El Paso, the families Compositae, Nyctaginaceae, Euphorbiaceae, Aizoaceae, Labiatae, Cruciferae, Hydrophyllaceae, Rubiaceae and Malvaceae are especially abundantly represented. For instance, the genera *Galium* and *Sphaeralcea* are each represented by 20 or more species and *Euphorbia* by nearly 30. Species of *Gilia* and *Ipomopsis* in the Polemoniaceae are also rather numerous. In Presidio County, at Capote Falls, the highest in Texas, are the endemic columbine (*Aquilegia Hinckleyana*) in the spray of the falls and the cockroach plant (*Haplophyton Crooksii*), *Sageretia Wrightii* and *Setcreasea leiandra* on boulder-covered slopes nearby.

In the higher, more mesophytic mountains are to be found such species as Texas madrone (*Arbutus xalapensis*), Mexican manzanita (*Arctostaphylos*

pungens), deer's-ears (*Swertia radiata*), valerians (*Valeriana texana* and *V. arizonica*), American bittersweet (*Celastrus scandens*), American spike-nard (*Aralia racemosa*), fragile fern (*Cystopteris fragilis*), bladder fern (*C. bulbifera*), maidenhair spleenwort (*Asplenium Trichomanes*), and malefern (*Dryopteris Filix-mas*). In the conifer forests only on the higher mountains are found several tuber-bearing species of *Solanum*, relatives of the cultivated potato; *S. Fendleri* is especially prevalent.

Endemics to the lower, hotter parts of the Trans-Pecos deserts include *Andrachne arida*, *Euphorbia perennans*, *E. Golondrina*, *E. theriaca*, *E. Fendleri* var. *triligulata*, *Lycium berberioides* and *Ericameria triflora*.

SUMMARY OF THE FLORA OF TEXAS

The flowering plants and ferns of Texas are incorporated in 1,216 genera in 174 families. In the count given below each species is represented by one entity, be it the nomenclatural type, subspecies or variety. Additional taxa below specific rank, other than those that represent the species count, are included in their proper category. In other words, there are 5,479 taxa to be found in Texas. Of this number, 379 species, 17 subspecies, 66 varieties and 2 forms are considered to be endemic to the state; about 8.3% of the total.

Species	4,839
Subspecies	44
Varieties	532
Forms	39
Hybrids	25
Total number of taxa in Texas	5,479

ARTIFICIAL ANALYTICAL KEY TO THE HIGHER TAXA OF THE VASCULAR PLANTS OF TEXAS

KEY TO THE MAJOR GROUPS

1. Rushlike, fernlike, mosslike or quill-leaved plants without true seeds or flowers, reproducing chiefly by spores I. *Pteridophyta*, p. 17.
1. Habit various; plants producing seeds (2)
 - 2(1). Plants producing seeds but not true flowers, i.e., either having "cones" (with seeds borne more or less exposed on the upper surfaces of the scales of the cones) or fleshy structures with the basic structures of cones (as juniper "berries"), or cones with only a few thin scales (as in Ephedraceae) II. *Gymnospermae*, p. 18.
 2. Plants producing true flowers, i.e., the seeds borne enclosed in specialized structures (ovaries) (*Angiospermae*) (3)
 - 3(2). Plants with several if not all of the following characters: vascular bundles scattered in the usually solid internodes (these bundles can be seen as scattered dots in the stem-transsection); cotyledon (seed leaf) solitary; when flower parts in whorls then some in whorls of 3, at least not in whorls of 5 parts; leaves parallel-veined; root system fibrous (i.e., most roots adventitious); plants nearly always herbaceous III. *Monocotyledoneae*, p. 18.
 3. Plants with several if not all of the following characters: vascular bundles of young stems forming an interrupted cylinder (seen as a ring of dots in stem-transsection); cotyledons usually 2, rarely more or one; flower parts (when in whorls) often in 4's or 5's, less often in 3's, 2's, 6's, etc.; leaves usually reticulate-veined; roots either fibrous or not; plants herbaceous or woody, the wood forming concentric layers when present; young stems nearly always hollow or with a pithy zone in the center IV. *Dicotyledoneae*, p. 21.

I. PTERIDOPHYTA (p. 36 of text)

1. Foliage leaves scalelike or long-subulate, sometimes united into toothed sheaths (2)
 1. Foliage leaves or entire frond with broad or narrow, entire, toothed, pinnate, pinatifid or variously dissected blades (6)
 - 2(1). Stems hollow, fluted, jointed; sporangia borne under peltate scales in a cone ... 5. *Equisetaceae*, p. 41.
 2. Stems solid, not fluted or jointed; sporangia borne in the axils of scalelike or small leaflike or long-subulate bracts (3)
 - 3(2). Leaves rushlike, long-subulate, more than 3 cm. long, borne in a tuft on a short cormlike stem 4. *Isoetaceae*, p. 40.
 3. Leaves scalelike, flat, sometimes concave or cymbiform, less than 3 cm. long, borne on erect or creeping elongate stems and branches (4)
 - 4(3). Plants often forming broomlike clumps; stem naked except for distantly placed minute scalelike leaves; sporangia subtended by 2 minute scale leaves and scattered on upper part of branches 1. *Psilotaceae*, p. 36.
 4. Plants not in broomlike clumps; stem with closely placed or imbricated leaves; sporophylls not bifid, borne in cones (5)

- 5(4). Plants with erect fruiting stems; cones cylindric; spores of 1 kind 2. *Lycopodiaceae*, p. 36.
5. Plants with ascending or spreading fruiting branches; cones more or less quadrangular; spores of 2 kinds 3. *Selaginellaceae*, p. 38.
- 6(1). Plants usually large and conspicuous, growing in soil or on rocks or trees, or (if free-floating or submerged) large and dendroid; spores of 1 kind, minute (7)
6. Plants small, free-floating or partially submerged or rooted in mud; spores of 2 kinds, borne in sporocarps (11)
- 7(6). Fertile fronds with 2 distinct parts, the fertile part being in the form of a spike or panicle and arising from the petioles, the sterile part of the frond being either entire or pinnately dissected 6. *Ophioglossaceae*, p. 42.
7. Fronds not as in *Ophioglossaceae* (8)
- 8(7). Sporangia borne on the back of (the lower side of) or on the margin of the blade (9)
8. Sporangia in panicles or (sometimes fingerlike) spikes developed from the modified blade or parts of the blade (10)
- 9(8). Plants never free-floating nor dendroid; sporangia usually long-stalked 11. *Polypodiaceae*, p. 49.
9. Plants usually free-floating or very rarely deeply submerged, the sterile leaves forming a floating sterile rosette; sporangia sessile or nearly so 12. *Parkeriaceae*, p. 69.
- 10(8). Plants always erect, robust; sterile blades pinnate-pinnatifid to bipinnate, 40 cm. long or more when well-developed 8. *Osmundaceae*, p. 45.
10. Plants vinelike and twining or (if erect) small and with the sterile blades simply pinnate and less than 25 cm. long 7. *Schizaeaceae*, p. 45.
- 11(6). Plants rooting in mud or on muddy bottoms; rootstocks creeping; leaves quadri-lobulate or filiform, not imbricate or matted, distant . 9. *Marsileaceae*, p. 46.
11. Plants free-floating or resting on mud; rootstocks pinnately branched; leaves deeply 2-lobed, imbricate, matted 10. *Salviniaceae*, p. 48.

II. GYMNOSPERMAE (p. 70 of text)

1. Stems jointed; leaves reduced to more or less deciduous scales that are distant and opposite or in whorls or 3's; ovules or seeds in small thin-scaled cones which in one species become fleshy 16. *Ephedraceae*, p. 80.
1. Stems not jointed; leaves needlelike or linear, or (if scalelike) persistent and closely imbricate; ovules or seeds in thick-scaled cones that are sometimes berrylike (2)
- 2(1). Leaves (in the adult state) short, scalelike or awl-shaped; cones either dry and woody or fleshy at maturity 15. *Cupressaceae*, p. 76.
2. Leaves elongate, narrowly linear or needlelike; cones dry and woody at maturity (3)
- 3(2). Leaves in sheathed fascicles of 2 to 5 or solitary, long-persistent; cones usually more or less elongate; cone scales and bracts distinct, each of the scales usually with 2 winged seeds 13. *Pinaceae*, p. 70.
3. Leaves spreading in 2 ranks, usually seasonally deciduous; cones globose; cone scales club-shaped, without distinct bracts, flat or peltate, with two 3-angled or somewhat 3-winged seeds 14. *Taxodiaceae*, p. 75.

III. MONOCOTYLEDONEAE (p. 84 of text)

1. Plants 1 cm. long or usually less, thalluslike, stemless, usually floating 30. *Lemnaceae*, p. 343.
1. Plants usually larger, not with above combination of characters (2)

- 2(1). Each pistillate flower with 4 free carpels each of which at fruiting time is long-stipitate; submerged aquatics with linear leaves 21. *Ruppiaceae*, p. 94.
2. Carpels either coalescent or if free then not stipitate (3)
- 3(2). Carpels 2 to numerous, free from each other (4)
3. Carpels solitary or if more than 1 then these (at base or throughout) coalescent for more than a third their length (7)
- 4(3). Carpels numerous per female flower 23. *Alismataceae*, p. 95.
4. Carpels 2 to 9 per flower (5)
- 5(4). Ovules numerous; flowers showy, yellow 24. *Butomaceae*, p. 100.
5. Ovules solitary; flowers inconspicuous (6)
- 6(5). Perianth of 4 free, rounded, shortly clawed valvate segments 1-4 mm. long 19. *Potamogetonaceae*, p. 86.
6. Perianth absent (genus *Zannichellia* of) 20. *Zannichelliaceae*, p. 93.
- 7(3). Ovary inferior; perianth clearly epigynous (8)
7. Ovary superior or apparently so, in some taxa the perianth reduced or absent, in some the perianth adnate to the ovary for a very short distance basally (15)
- 8(7). Partly or wholly submerged plants; ovules numerous, spread all over the inner surface of the carpels or on the intrusive septa 25. *Hydrocharitaceae*, p. 100.
8. Plants not submerged or if partly so the ovules confined to placental areas (9)
- 9(8). Twining vines with net-veined leaves 40. *Dioscoreaceae*, p. 424.
9. Habit otherwise; leaves parallel-veined (10)
- 10(9). At least the inner 3 tepals dissimilar to one another, the flower thus not radially symmetrical (11)
10. At least the inner 3 tepals (and usually the outer ones, too) equal to each other or nearly so, the flower thus approaching true radial symmetry (13)
- 11(10). Ovule solitary in each cell 43. *Marantaceae*, p. 433.
11. Ovules more numerous (12)
- 12(11). Flowers only slightly zygomorphic, reddish or orange, in terminal thyrses on erect stems to 12 dm. tall 42. *Cannaceae*, p. 432.
12. Flowers strongly zygomorphic, the lower of the 3 inner tepals strikingly different from the other 2, forming a labellum; stems usually less than 5 dm. long 45. *Orchidaceae*, p. 434.
- 13(10). Leaves equitant, distichous and folded along the midrib; stamens 3 41. *Iridaceae*, p. 425.
13. Leaves not equitant; stamens 3 or 6 (14)
- 14(13). Stamens 3; basal leaves usually linear and grasslike and stem or scape leaves scalelike 44. *Burmanniaceae*, p. 433.
14. Stamens usually 6; basal leaves usually broader; plants very diverse in habit 39. *Amaryllidaceae*, p. 413.
- 15(7). Palmlike plants with perennial stem 5-70 cm. thick at ground level and fanlike leaves 4-12 dm. broad 28. *Palmae*, p. 340.
15. Habit otherwise (16)
- 16(15). Submerged perennials mainly of salt-water gulfs and bays, occasionally inland in brackish water 20. *Zannichelliaceae*, p. 93.
16. Plants terrestrial or if submerged then occurring mainly in fresh or slightly brackish water, rarely (*Posidonia*) marine (17)
- 17(16). Plants grayish-lepidote epiphytes 34. *Bromeliaceae*, p. 354.
17. Plants aquatic or terrestrial, not epiphytic (18)
- 18(17). Wholly submerged fresh or brackish water or rarely marine aquatics 22. *Najadaceae*, p. 94.
18. Not wholly submerged (19)

- 19(18). Proper perianth absent or nearly so, the flowers borne in dense heads, spikes or racemes or thickly crowded on a fleshy axis or else variously disposed in panicles, when genitalia subtended by scalelike structures these never numbering precisely 3 in 1 series or 6 in 2 series (20)
19. Proper perianth present, often in 2 series of 3 members each (in some families the outer or inner or both series scalelike) (25)
- 20(19). Flowers crowded on a terminal elongate fleshy axis which below the flower-bearing zone usually has a large foliaceous partially or wholly sheathing bract (spathe) which covers the inflorescence during its early development 29. *Araceae*, p. 341.
20. Axis of inflorescence not fleshy; bract (if present) not so large and not covering the young inflorescence (21)
- 21(20). Inflorescence a series of globose heads at the upper nodes, the uppermost heads of staminate flowers, the lower ones of pistillate flowers 18. *Sparganiaceae*, p. 86.
21. Inflorescence otherwise (22)
- 22(21). Inflorescence solitary, terminal, globose or hemispheric, 2-15 mm. thick, exceedingly dense, not subtended by large bracts (bracts only 1-4 mm. long) 33. *Eriocaulaceae*, p. 352.
22. Inflorescences not globose or hemispheric, or if so (as in some *Cyperaceae*) then closely subtended by several bracts several times as long as the inflorescence is thick (23)
- 23(22). Inflorescence a very dense brownish spike 12-40 cm. long and 1-2 cm. thick with thousands of minute flowers, the male above, female below; "cat-tails" 17. *Typhaceae*, p. 84.
23. Inflorescence otherwise (24)
- 24(23). Leaves distichous (and sometimes equitant); with rare exceptions each floret subtended by 2 scales (the lower or lemma abaxial and with 1 midvein; the upper or palea adaxial and with 2 unequal nonmedial nerves) 26. *Gramineae*, p. 103.
24. Leaves tristichous; each floret subtended by a single abaxial scale (seemingly 2 scales in *Hemicarpha*, or by a sac in *Carex*, or by bristles in addition to the scale in some genera) 27. *Cyperaceae*, p. 261.
- 25(19). Desert plants with spreading rosettes of tough perennial sublinear arcuate leaves which at margins have rows of curved spines several mm. long (genus *Hechtia* of) 34. *Bromeliaceae*, p. 354.
25. Habitally not as above or if slightly similar then marginal spines minute or absent (26)
- 26(25). Calyx irregular, glumaceous, the 2 persistent lateral sepals cymbiform and dorsally keeled or winged, the third sepal larger, obovate and enfolding or forming a hood over the corolla in bud and deciduous with it 32. *Xyridaceae*, p. 348.
26. Calyx otherwise (27)
- 27(26). The 3 inner tepals (petals) quite distinct in color and/or texture from the 3 outer ones (sepals) (28)
27. The 6 tepals all rather similar in color and texture, either all dry and scalelike or all corolline (29)
- 28(27). Ovary completely 3-celled; lower part of leaves sheathing the internodes 35. *Commelinaceae*, p. 356.
28. Ovary incompletely 3-celled or 1-celled; leaves not sheathing 31. *Mayacaceae*, p. 347.
- 29(27). Perianth of 6 scalelike dry brown noncorolline tepals 37. *Juncaceae*, p. 368.
29. Perianth of 6 corolline tepals or with 6 corolline segments (30)

- 30(29). Usually floating, partially submerged or at least rooting in mud; inflorescence subtended by spathe-like leaf sheath; seeds usually ribbed; flowers usually somewhat zygomorphic 36. *Pontederiaceae*, p. 366.
30. Dry-land or marsh plants; inflorescence usually not subtended by a spathe-like leaf sheath; seeds various, usually not ribbed; flowers almost always radially symmetrical 38. *Liliaceae*, p. 378.

IV. DICOTYLEDONEAE (p. 447 of text)

1. Plants cactuslike, leafless (or with vestigial permanently deciduous leaves on the young stems) with fleshy stems and spines borne in clusters on specialized areas (areoles) 131. *Cactaceae*, p. 1087.
1. Plants not as above, either with or without leaves and either unarmed or with solitary spines or thorns (these never clustered in specialized structures) (2)
 - 2(1). Flowers with all the petals united at their edges (at least near the base) into a single structure, this corolla often deciduous as a unit and often shaped like a saucer, a cup or a trumpet (3)
 2. Flowers not as above, if any petals joined then not all of them involved or else not joined at their edges (occasionally the petals may seem to be joined somewhat in bud but not in the mature open flower), or petals absent (61)
 - 3(2). Flowers epigynous or partly so, i.e., the perianth and stamens when present appearing to be attached to the top or near the middle of the sides of the ovary (4)
 3. Flowers hypogynous or perigynous, the sides of the ovary free from the perianth or the floral cup, the perianth attached below the ovary (15)
 - 4(3). Perianth (actually a corolline calyx) S-shaped or U-shaped; stamens 6 58. *Aristolochiaceae*, p. 506.
 4. Perianth otherwise; stamens more or fewer than 6 (rarely 6 in *Ericaceae* and *Styracaceae*) (5)
 - 5(4). Anthers 5 or 4, coalescent but filaments free (anthers exceptionally free in the genera *Ambrosia*, *Xanthium*, *Iva*); fruit an achene and usually crowned by the modified calyx of bristles or scales; style branches usually 2, usually divergent; flowers usually very small and aggregated in involucre heads 174. *Compositae*, p. 1523.
 5. Anthers usually free (exceptions: *Cucurbitaceae*; 1 genus of *Campanulaceae*); fruit diverse but rarely an achene (exception: *Valerianaceae*); style branches 1 to 20; flowers rarely aggregated in involucre heads (6)
 - 6(5). Stems trailing or twining, often vinelike, often scabrous, often with lobed leaves; fruits with a leathery or tougher rind and fleshy placental tissue inside and numerous flattish seeds either buried in flesh (watermelon) or in 2 to many longitudinal rows on the several (3 to 5, usually) placentas which are on the walls of the chamber (as pumpkin, gourd, cucumber, etc.); stamens often united 171. *Cucurbitaceae*, p. 1506.
 6. Plants not with the cucurbitaceous character-combination (7)
 - 7(6). Anthers 8 or more (8)
 7. Anthers 5 or fewer (rarely 6 in *Ericaceae*) (10)
 - 8(7). Stamens numerous, a cluster of them present at the base of each petal 146. *Symplocaceae*, p. 1191.
 8. Stamens 8 to 16 (9)
 - 9(8). Leaves and branchlets nearly glabrous, at least never with stellate or lepidote vestiture; fruit a many-seeded berry; anthers appendaged (genus *Vaccinium* of) 140. *Ericaceae*, p. 1173.
 9. Leaves and branchlets with at least some stellate or lepidote vestiture; fruit winged or few-seeded, round and dry; anthers unappendaged 145. *Styracaceae*, p. 1189.

- 10(7). Placenta free, central, attached to base of locule (genus *Samolus* of) 141. *Primulaceae*, p. 1181.
10. Placenta when axile not free from the sides (in a few taxa the placenta is apical) (11)
- 11(10). Leaves alternate (rarely fortuitously subopposite in Goodeniaceae) (12)
11. Leaves opposite or whorled (13)
- 12(11). Style not indusiate 172. *Campanulaceae*, p. 1514.
12. Style beneath the stigma with an indusium (a 2-lobed cup-shaped pollen receptacle) 173. *Goodeniaceae*, p. 1522.
- 13(11). Fruit an achene or an achenelike structure or at least indehiscent and with a single maturing ovule 170. *Valerianaceae*, p. 1503.
13. Fruit a capsule, berry, drupe or schizocarp (14)
- 14(13). Stipules present (these sometimes in the form of leaflike structures which add to the number of "leaves" at a node) 168. *Rubiaceae*, p. 1479.
14. Stipules absent but stipular lines sometimes evident . 169. *Caprifoliaceae*, p. 1496.
- 15(3). Corolla forming a cap over the tiny flower and falling as a unit at the onset of anthesis, the petals separating from each other only at the base; stamens opposite petals but not attached to the corolla, persistent after the corolla falls (genus *Vitis* of) 113. *Vitaceae*, p. 1015.
15. Corolla not behaving as in grape flowers (16)
- 16(15). Gynoecium at anthesis or shortly before anthesis with a 2-lobed ovary (or appearing as 2 carpels or 2 ovaries) but only a single style owing to fusion of the styles above the ovary-lobes; 1 or each lobe of the ovary maturing into a folliclelike structure; stigma massive (17)
16. Ovary entire or if deeply 2-lobed then styles not united or if so the single style gynobasic; stigmas not often massive (18)
- 17(16). Sap milky or not; stigma free from or only loosely coherent to anther- and/or corolla tissue 150. *Apocynaceae*, p. 1211.
17. Sap always milky; stigma massive and united to anther-tissue and often to some corolla tissue to form a "crown" or "gynostegium" .151. *Asclepiadaceae*, p. 1219.
- 18(16). Leaves pinnately twice-compound 91. *Leguminosae*, p. 761.
18. Leaves simple to pinnately once-compound or palmately compound (19)
- 19(18). Anthers more than 3 times as numerous as the petals (or as the corolla lobes) (20)
19. Anthers numbering from 3 times as numerous as the petals or corolla lobes to as few as 2 per flower (24)
- 20(19). Viciously armed desert plants with tubular reddish flowers 122. *Fouquieriaceae*, p. 1069.
20. Plants unarmed (21)
- 21(20). Filaments not coalescent (22)
21. Filaments either coalescent to form a tube or at least coalescent at base (23)
- 22(21). Herbs with deeply dissected leaves and highly zygomorphic flowers (genus *Delphinium* of) 72. *Ranunculaceae*, p. 634.
22. Woody plants with mostly entire leaves and actinomorphic flowers 146. *Symplocaceae*, p. 1191.
- 23(21). Filaments forming a tube which loosely sheaths the style(s) for most of the length 115. *Malvaceae*, p. 1025.
23. Filaments not forming a tube 117. *Theaceae*, p. 1059.
- 24(19). Stamens (6 or) 7 to 18, usually precisely 2 or 3 times as numerous as the petals or corolla lobes (25)
24. Stamens 2 to 5 (or very rarely 6), as many as the petals or corolla lobes or fewer than them (32)

- 25(24). Carpels free, equal in number to the calyx segments or corolla lobes, each maturing into a follicle 86. *Crassulaceae*, p. 714.
25. Carpels coalescent into a compound pistil (26)
- 26(25). Viciously armed desert shrubs with tubular reddish flowers 122. *Fouquieriaceae*, p. 1069.
26. Either unarmed or else flowers not red (27)
- 27(26). Petals typically 3; flowers extremely zygomorphic; stamens 8 or rarely 6 101. *Polygalaceae*, p. 914.
27. Petals or corolla lobes 4 to 7; flowers only slightly if at all zygomorphic; stamens (6 or) 7 to 18 (28)
- 28(27). Anthers often with little hornlike appendages and dehiscent by apical slits, clefts or pores 140. *Ericaceae*, p. 1173.
28. Anthers unappendaged, usually opening longitudinally (29)
- 29(28). Woody plants with stellate or lepidote vestiture . 145. *Styracaceae*, p. 1189.
29. Plants herbaceous or woody, vestiture absent or else not stellate or lepidote (30)
- 30(29). Flowers perfect; plants herbaceous and with acidulous juice; leaves usually palmately compound with 3 leaflets (pinnately compound in 1 species and reduced to 1 leaflet in 1 species) 94. *Oxalidaceae*, p. 893.
30. Flowers unisexual; plants herbaceous or shrubby (31)
- 31(30). Stamens 15 or 16; rounded shrubs or small trees with entire leaves; fruits fleshy, persimmonlike, with several seeds 144. *Ebenaceae*, p. 1189.
31. Stamens (6 to) 8 to 10; leaves often lobed; fruits dry, capsular, usually with 3 seeds (genera *Manihot*, *Cnidoscolus* and *Jatropha* cf) .. 102. *Euphorbiaceae*, p. 923.
- 32(24). Ovule viviparous, i.e., germinating while still on the parent-plant; opposite-leaved mangrovelike small rhizomatous shrubs growing on salty mud flats along the coast 156. *Avicenniaceae*, p. 1311.
32. Ovule not viviparous; plants not growing in salty mud or if so then not shrubby (33)
- 33(32). Succulent perennial twining vines with alternate simple entire leaves; flowers whitish, in spikelike inflorescences several cm. long . 68. *Basellaceae*, p. 611.
33. Nontwining vines or if so then not succulent or flowers and inflorescences not as described above (34)
- 34(33). Fruit an incompletely celled capsule (i.e., 1-celled with incomplete partitions), dehiscent apically 69. *Caryophyllaceae*, p. 612.
34. Fruit otherwise, if capsular then dehiscent differently (35)
- 35(34). Fruit a circumscissile capsule; herbs with leaves nearly all basal and flowers in dense spikes terminating the scapes 167. *Plantaginaceae*, p. 1475.
35. Fruit not a circumscissile capsule or if so then habit otherwise (36)
- 36(35). Fruit a capsule terminated by 2 prominent curved and incurved beaks, 1-3 dm. long 162. *Martyniaceae*, p. 1445.
36. Fruit not as above (37)
- 37(36). Herbs with opposite leaves and the odor of wet wool (or a wet dog); stamens 3 (rarely 2); flowers minute, white, in terminal dichasia or compound cymes; calyx minute, annular, involute (often unrolling after anthesis) or with minute teeth; fruit a 1-seeded achenelike structure 170. *Valerianaceae*, p. 1503.
37. Plants not as above, usually with 2, 4 or 5 stamens and with the calyx usually better-developed (38)
- 38(37). Herbs usually with linear leaves; fruit a capsule, more or less completely 10-celled, at maturity splitting into 5 or 10 parts which fall away separately 95. *Linaceae*, p. 897.
38. Herbs, shrubs or trees; fruit not as in flax (39)

- 39(38). Leaves alternate and stipulate (the stipules sometimes small, deciduous) (40)
39. Leaves alternate, opposite or whorled, either not having stipules or if with stipules then opposite (41)
- 40(39). Fruit subglobose, drupaceous (with several stones), reddish, usually 5-10 mm. thick 106. *Aquifoliaceae*, p. 993.
40. Fruit a capsule or schizocarp 116. *Sterculiaceae*, p. 1055.
- 41(39). Leaves opposite or whorled and with stipules, the evidence of stipules sometimes reduced to mere stipular lines or membranes at the sides of the node (here may also be sought certain Rubiaceae whose essential epigyny has been overlooked) 148. *Loganiaceae*, p. 1200.
41. Leaves opposite or alternate, without the slightest evidence of stipules (42)
- 42(41). Stamens 2 or 4, fewer than the 5 corolla lobes (the number of corolla lobes may be obscure in highly zygomorphic corollas) (43)
42. Stamens 5 in flowers with 5 corolla lobes or 4 in flowers with 4 corolla lobes (this usually easily ascertained) (52)
- 43(42). Fruit solitary, achenelike, dry, ellipsoid, 1-celled, 1-seeded 166. *Phrymaceae*, p. 1475.
43. Fruit not achenelike (in a few taxa the fruit schizocarpous and the parts of the fruit achenelike) (44)
- 44(43). Fruit not capsular, either schizocarpous and breaking into 1-seeded achenelike parts or else drupaceous; leaves always opposite (45)
44. Fruit a capsule or a samara; leaves opposite or alternate (47)
- 45(44). Flowers strongly zygomorphic; style usually manifestly bifurcate near the apex (the lower branches usually shorter than the upper); fruit a schizocarp ... 158. *Labiatae*, p. 1342.
45. Flowers usually only slightly if at all zygomorphic; style usually microscopically if at all bifurcate at apex; fruit schizocarpous or drupaceous (46)
- 46(45). Fruit a 1-seeded drupe 147. *Oleaceae*, p. 1192.
46. Fruit a schizocarp or a drupe with 2 or more seeds . 157. *Verbenaceae*, p. 1312.
- 47(44). Plants not green, appearing to be devoid of chlorophyll, terrestrial 163. *Orobanchaceae*, p. 1449.
47. Plants green (very darkly so, almost black in some Scrophulariaceae or orange in the stem-parasite *Cuscuta* of the Convolvulaceae) (48)
- 48(47). Seeds compressed, winged, sometimes comose; mostly woody climbers but a few shrubs and trees 161. *Bignoniaceae*, p. 1442.
48. Seeds sometimes flat but wingless or if winged then the plant herbaceous (49)
- 49(48). Seeds minute, attached to a free central placenta in the 1-celled ovary; fruit a 2- or 4-valved capsule; small herbs 164. *Lentibulariaceae*, p. 1452.
49. Seeds attached to axile or nearly axile placentas in the 2-celled ovary; fruit a capsule or a samara (50)
- 50(49). Corolla lobes usually convolute in bud; capsule elastically dehiscent, the seeds ballistically ejected at dehiscence 165. *Acanthaceae*, p. 1456.
50. Corolla lobes usually imbricated or valvate in bud; capsule not elastically dehiscent (or fruit a samara in some taxa), the seeds not ballistic (51)
- 51(50). The 2 stamens opposite each other or at least widely separated on the nearly actinomorphic corolla 147. *Oleaceae*, p. 1192.
51. The 2 or 4 stamens not widely separated in the usually strongly zygomorphic corolla 160. *Scrophulariaceae*, p. 1408.
- 52(42). Only a single seed maturing in each flower (see also *Cryptantha texana* of the Boraginaceae) (53)
52. At least 2 and commonly more seeds produced by each flower (54)

- 53(52). Fruit dry, either achenelike or capsular; herbs or unarmed shrubs with usually perfect flowers 142. *Plumbaginaceae*, p. 1185.
53. Fruit fleshy, drupaceous; thorny shrubs or trees with unisexual flowers 143. *Sapotaceae*, p. 1187.
- 54(52). Placenta obviously free-central, attached at base of the single cell of the ovary; stamens opposite the corolla lobes 141. *Primulaceae*, p. 1181.
54. Placenta axile or parietal, or if basal then the ovary with more than 1 cell, or if placentation difficult to determine, at least not obviously free-central; stamens alternate with the corolla lobes (but this very obscure in some flowers) (55)
- 55(54). Ovary 3-celled; style usually 3-cleft at apex; plant never twining; sepals united by translucent webbing tissue 153. *Polemoniaceae*, p. 1262.
55. Ovary usually 2- or 4-celled, rarely 1-celled (56)
- 56(55). Placentae parietal (but often intruded deeply into the chamber and meeting at the center, their parietal nature then revealed only by very careful dissection); seeds small and numerous; anthers after anthesis shrivelling into a spiral or helix; leaves opposite (except in genus *Nymphoides*, of aquatic plants); cymes never scorpioid 149. *Gentianaceae*, p. 1204.
56. Placentae axile or axile-basal (except parietal in some *Hydrophyllaceae* with scorpioid cymes and more than 1 stigma); seeds few to numerous; anthers after anthesis not shrivelling into a spiral or a helix; leaves opposite or alternate (57)
- 57(56). Fruit drupaceous or a deeply lobed schizocarp of 2 to 4 achenelike mericarps 155. *Boraginaceae*, p. 1280.
57. Fruit a capsule or berry (58)
- 58(57). Each flower with a single (sometimes shallowly 2-lobed) stigma (59)
58. Each flower with 1 or 2 styles and at least 2 stigmas (60)
- 59(58). Herbs or shrubs; leaves alternate (sometimes fascicled); flowers almost exclusively radially symmetrical; fruit a capsule or berry 159. *Solanaceae*, p. 1386.
59. Either coarse stellate-tomentose alternate-leaved biennials or winter annuals with nearly regular yellow flowers (genus *Verbascum*) or opposite-leaved herbs with strongly zygomorphic corollas (genus *Penstemon*); fruit a capsule 160. *Scrophulariaceae*, p. 1408.
- 60(58). Often herbaceous twining vines or rhizomatous or stoloniferous creeping herbs, very rarely shrubs (1 species of *Bonamia* and 1 of *Ipomoea*); flowers usually solitary from the axils; ovary usually 2- or 3- or 4-celled 152. *Convolvulaceae*, p. 1241.
60. Never twining, usually small erect taprooted herbs, very rarely shrubby (1 species of *Nama*); flowers in cymes or helicoid or scorpioid cymes, or solitary; ovary usually 1-celled (2-celled in *Nama*) 154. *Hydrophyllaceae*, p. 1272.
- 61(2). Completely submerged fresh-water aquatics with much-reduced flowers and very peculiar habits (cf. also *Haloragaceae* and *Lemnaceae*) (62)
61. Either terrestrial plants or if aquatic then not completely submerged (or only briefly so at some seasons), the flowers always aerial or with a less bizarre habit (63)
- 62(61). Leaves whorled; plants usually seemingly free-floating 71. *Ceratophyllaceae*, p. 633.
62. Leaves alternate, distichous; plants attached to rocks usually in swift-flowing water 85. *Podostemaceae*, p. 713.
- 63(61). Stem-parasites not in contact with the soil (64)
63. Nonparasitic or if parasitic then appearing rooted in soil (66)

- 64(63). Vegetative parts immersed in the host; external parts (flowers) appearing as warts or bumps on the woody stems of leguminous shrubs of the genus *Dalca* ..
..... 59. *Rafflesiaceae*, p. 509.
64. Vegetative portions more extensive and conspicuous (65)
- 65(64). Vegetative parts appearing threadlike, the leaves reduced to minute scales (genus *Cassytha* of) 77. *Lauraceae*, p. 660.
65. Vegetative parts usually leafy bushes, if not leafy then stems not at all threadlike ...
..... 56. *Viscaceae*, p. 503.
- 66(63). Shrublets or subshrubs with creeping underground organs, forming colonies on low salty ground near the coast; leaves well-developed (cf. *Salicornia* where they are mere scales), opposite, fleshy, linear; pistillate flowers aggregated into and largely sunken in the axes of short axillary inflorescences; staminate flowers in spikelike axillary inflorescences 64. *Bataceae*, p. 599.
66. Habitally diverse, if fleshy then having leaves reduced to scales or alternate leaves or the inflorescences different from *Batis* (67)
- 67(66). Corolla absent, the flower either with no perianth or with only one series of perianth parts (sepals or "tepals"); (also see here *Rumex* with 2 dissimilar whorls of sepals) (68)
67. Each flower with both calyx and corolla or occasionally in families with unisexual flowers the petals absent from the pistillate ones or in some taxa petals present only in the chasmogamous flower but absent from cleistogamous ones (125)
- 68(67). Trees with flowers and fruits small and numerous in spherical heads; leaves palmately lobed (69)
68. Trees, shrubs, herbs or vines with flowers not in spherical heads or if so then leaves not palmately lobed (70)
- 69(68). Bark furrowed; leaves deeply 5- or 7-lobed to resemble a star, smooth and shiny (genus *Liquidambar* of) 88. *Hamamelidaceae*,
p. 726.
69. Bark exfoliating in thin sheets; leaves 3- or 5-lobed, usually with broad rounded shallow sinuses, the undersurfaces usually pubescent . 89. *Platanaceae*, p. 727.
- 70(68). Sepals coalescent at least near their bases either above the receptacle in hypogynous flowers or above the floral cup or hypanthium in perigynous flowers or above the ovary in epigynous ones (71)
70. Sepals free from each other either completely to the receptacle in hypogynous flowers or above the ovary in epigynous ones, or sepals absent (83)
- 71(70). Calyx tube S-shaped or U-shaped 58. *Aristolochiaceae*, p. 506.
71. Calyx tube not S-shaped or U-shaped (72)
- 72(71). Ovary completely inferior (73)
72. Ovary superior or only partly inferior near the base (75)
- 73(72). Herbs usually growing partially submerged or in mud but the flowers aerial ..
..... 135. *Haloragaceae*, p. 1136.
73. Plants never aquatic (74)
- 74(73). Erect herbs with merely opposite leaves and a pungently fetid odor (like that of a wet dog) 170. *Valerianaceae*, p. 1503.
74. Erect or often trailing herbs with whorled leaves and not strongly odoriferous (genus *Galium* of) 168. *Rubiaceae*, p. 1479.
- 75(72). Pistils several, free from each other 72. *Ranunculaceae*, p. 634.
75. Pistil solitary (76)
- 76(75). Seeds (or ovules) campylotropous, with embryos curved around the periphery surrounding the perisperm or endosperm (77)
76. Seeds not as above (80)
- 77(76). Seeds several to numerous (78)
77. Seeds solitary (79)

- 78(77). Stamens more numerous than sepals 66. *Aizoaceae*, p. 602.
78. Stamens as many as the sepals 69. *Caryophyllaceae*, p. 612
- 79(77). Calyx scalelike or scarious in texture 62. *Amaranthaceae*, p. 551.
79. Calyx not scalelike but usually corolline 63. *Nyctaginaceae*, p. 574.
- 80(76). Branches of inflorescence scorpioid (genus *Penthorum* of)
..... 87. *Saxifragaceae*, p. 717.
80. Branches of inflorescence (if any) not scorpioid (81)
- 81(80). Leaves pinnately compound (genus *Fraxinus* of) .. 147. *Oleaceae*, p. 1192.
81. Leaves simple (82)
- 82(81). Ovary 1-celled; stigma solitary; stamens 2 to 5 .. 55. *Urticaceae*, p. 498.
82. Ovary usually 3-celled; stigma usually more than 1; stamens usually more than 5 ..
..... 102. *Euphorbiaceae*, p. 923.
- 83(70). Stamen solitary; leaves opposite; low-growing subaquatics or aquatics; perianth
absent 103. *Callitrichaceae*, p. 985.
83. Stamens more numerous or if only 1 then the leaves alternate or else the plants
woody; calyx often present (84)
- 84(83). Carpels several, distinct (see also *Zanthoxylum* of the *Rutaceae*)
..... 72. *Ranunculaceae*, p. 634.
84. Carpels (when more than 1) united at least at their bases (at least at anthesis) (85)
- 85(84). Ovary completely inferior as shown by micro- or macroscopic scales or sepals
at top (use strong lens) and/or in some taxa by stamens at the very top of the
ovary (86)
85. Ovary superior or at least half-superior (93)
- 86(85). Climbing twining plant (genus *Agdestis* of) ... 65. *Phytolaccaceae*, p. 600.
86. Plants not climbers or twiners (87)
- 87(86). Plants herbaceous (88)
87. Plants woody; fruit a nutlike structure (90)
- 88(87). Ovary of several folliclelike structures partially or almost wholly immersed in
the inflorescence axis and associated floral tissue (genus *Anemopsis* of)
..... 46. *Saururaceae*, p. 448.
88. Ovary not as in *Anemopsis* (89)
- 89(88). Fruit a small indehiscent 1-seeded nut 57. *Santalaceae*, p. 506.
89. Fruit a schizocarp of 2 mericarps 137. *Umbelliferae*, p. 1139.
- 90(87). Nut subtended by a cupule of more or less consolidated bracts
..... 52. *Fagaceae*, p. 465.
90. Nut not having a basal cupule of bracts (91)
- 91(90). Leaves compound 50. *Juglandaceae*, p. 457.
91. Leaves simple (92)
- 92(91). Stipules present; leaves usually serrate 51. *Betulaceae*, p. 462.
92. Stipules absent; leaves usually entire-margined 138. *Cornaceae*, p. 1170.
- 93(85). Thorny shrubs, the thorns either straight or curved; fruits fleshy (see also
Maclura of the *Moraceae*) (94)
93. Unarmed trees, shrubs, herbs or vines, if with occasional thorns (as in *Maclura*,
Moraceae) the "fruit" an aggregate of achenes (97)
- 94(93). Thorns usually paired and short, occasionally somewhat curved; fruit orange;
styles 2 (species *Celtis pallida* of) 53. *Ulmaceae*, p. 492.
94. Thorns solitary (occasionally branched), elongate; fruit white to red or black, rarely
orange; styles usually not 2 (95)
- 95(94). Flowers with floral cup at rim of which are the 5 sepals and 5 stamens alternate
with the sepals (genus *Condalia* of) 112. *Rhamnaceae*, p. 1008.
95. Flower without a floral cup; stamens usually more than 5 (96)

- 96(95). Fruits white, translucent, drying black; ovule solitary, basal, with curved embryo (genus *Phaulothamnus* of) 65. *Phytolaccaceae*, p. 600.
96. Fruit opaque, red; ovules and seeds several, anatropous 127. *Flacourtiaceae*, p. 1078.
- 97(93). Annual herbs; sepals 4; fruit a compressed-flattened 2-celled pod with a thin narrow vertical septum parallel to the direction of compression 80. *Cruciferae*, p. 671.
97. Annual or perennial herbs or shrubs, trees or vines (98)
- 98(97). Plants herbaceous (include in this category woody-based vines and herbs which may have slightly woody stems at base but which die back to near the base every year) (99)
98. Plants woody, never vinelike (112)
- 99(98). Embryo curved, occupying the periphery of the rounded ovule and surrounding the perisperm and/or endosperm (100)
99. Embryo otherwise (108)
- 100(99). Each pistillate or perfect flower maturing only 1 seed (101)
100. Each pistillate or perfect flower maturing several seeds (rarely only 1 in *Claytonia* of the *Portulacaceae*) (105)
- 101(100). Fleshy vines with spreading white perianth ... 68. *Basellaceae*, p. 611.
101. Herbs (102)
- 102(101). Sepals dry, scalelike, for the most part not green 62. *Amaranthaceae*, p. 551.
102. Sepals herbaceous in texture (103)
- 103(102). Fruit with several hooked bristles (genus *Petiveria* of) 65. *Phytolaccaceae*, p. 600.
103. Fruit not with hooked bristles (104)
- 104(103). Stipules absent 61. *Chenopodiaceae*, p. 527.
104. Stipules present (Subfamily *Illecebroideae* of) 69. *Caryophyllaceae*, p. 612.
- 105(100). Leaves alternate; flowers in terminal racemes .. 65. *Phytolaccaceae*, p. 600.
105. Leaves alternate or opposite; flowers not in terminal racemes (106)
- 106(105). Leaves usually opposite; ovary never even slightly inferior; fruit usually dehiscent by terminal valves 69. *Caryophyllaceae*, p. 612.
106. Leaves alternate or if opposite then the fruit opening otherwise and not uncommonly at least slightly inferior (107)
- 107(106). Each flower with 2 bracteoles (or "sepals") at base which often enclose the bud; ovary 1-celled or incompletely several-celled 67. *Portulacaceae*, p. 605.
107. Flowers rarely bibracteolate; ovary completely several-celled 66. *Aizoaceae*, p. 602.
- 108(99). Fruit a capsule of several folliclelike parts, each part dehiscent through the apical portion of the ventral suture 46. *Saururaceae*, p. 448.
108. Fruit not as in *Saururaceae* (109)
- 109(108). Flowers unisexual; fruits capsular, 3-celled 102. *Euphorbiaceae*, p. 923.
109. Flowers usually bisexual; fruits achenelike, indehiscent (110)
- 110(109). Leaves palmately lobed or palmately or pinnately compound (genera *Alchemilla* and *Sanguisorba* of) 90. *Rosaceae*, p. 728.
110. Leaves not palmately lobed (111)
- 111(110). Stipules usually present, usually deciduous, never sheathing or scarious; placenta apical; ovule anatropous; achene usually not shiny, often neither lenticular nor trigonous 55. *Urticaceae*, p. 498.
111. Stipules (when present) usually sheathing; placenta basal; ovule orthotropous; achene usually smooth and shiny, either lenticular or trigonous 60. *Polygonaceae*, p. 510.

- 112(98). Plants with curved prickles on the herbage (genus *Zanthoxylum* of)
 97. *Rutaceae*, p. 906.
112. Plants not having curved prickles (113)
- 113(112). Embryo curved, occupying the periphery of the rounded ovule and surrounding the perisperm and/or endosperm (go back to couplet 102).
113. Embryo not as above (114)
- 114(113). Leaves opposite (115)
114. Leaves alternate (117)
- 115(114). Fruit a berry borne in a spike (genus *Garrya* of)
138. *Cornaceae*, p. 1170.
115. Fruit a drupe or samara (116)
- 116(115). Fruit a drupe or a simple samara147. *Oleaceae*, p. 1192.
116. Fruit a double samara, with the seed-bearing bases connate and the 2 blades diverging as in maple fruit108. *Aceraceae*, p. 1001.
- 117(114). Flower with pronounced floral cup or hypanthium; fruit an achene, sheathed by the remains of the floral cup; style long, persistent, plumose; Trans-Pecos mountains (genus *Cercocarpus* of) 90. *Rosaceae*, p. 728.
117. Flowers without pronounced floral cups or long persistent plumose styles; mostly east of Trans-Pecos Texas (118)
- 118(117). Leaves pinnately compound (genus *Pistacia* of) .104. *Anacardiaceae*, p. 986.
118. Leaves simple (119)
- 119(118). Carpels separating from each other at maturity (but persistent on torus) and each dehiscing ventrally, folliclelike (genus *Firmiana* of)
116. *Sterculiaceae*, p. 1055.
119. Carpels when more than 1 not separating from each other (120)
- 120(119). Seeds numerous, each surrounded by a basal coma of hairs
 47. *Salicaceae*, p. 448.
120. Seeds often 1 or few, with coma absent (121)
- 121(120). Androecium of 4 series, each series of 3 stamens whose anthers open by 2 or 4 uplifting valves, often an additional 3 staminodia present
 77. *Lauraceae*, p. 660.
121. Androecium otherwise, usually the stamens fewer than 12; anther dehiscence usually by longitudinal slits (122)
- 122(121). Sap usually milky; flowers unisexual, aggregated very closely either on the outside on the inflorescence axis or (in figs) lining the inside of a hollow receptacle, the entire pistillate or bisexual inflorescence at maturity constituting the "fruit" or syncarp and falling as a unit 54. *Moraceae*, p. 496.
122. Sap not milky; flowers perfect or unisexual, not forming synanthetic "fruits" that fall as unitary syncarps, each pistillate or perfect flower maturing a separate fruit (123)
- 123(122). Flowers perfect or unisexual with both sexes on the same plant, solitary or in few-flowered fascicles; calyx 4- or 5-merous; fruit a samara, a roundish drupe or a nutlike structure 53. *Ulmaceae*, p. 492.
123. Flowers unisexual, usually with male and female flowers on separate plants or sometimes on the same plant, on small spikes or aments; calyx absent at least in staminate flowers; fruit either a small wax-coated sphere or an elongate drupe (124)
- 124(123). Fruit a small wax-coated sphere; leaves subpersistent, usually toothed or lobulate above the middle 48. *Myricaceae*, p. 459.
124. Fruit an elongate leathery-skinned drupe; leaves deciduous, usually entire-margined 49. *Leitneriaceae*, p. 457.
- 125(67). Ovary inferior or mostly so (126)
125. Ovary superior or mostly so (here also see *Nelumbo* of the *Nymphaeaceae* whose separate ovaries are mostly immersed in the receptacle and certain *Rhamnaceae* and *Celastraceae* in which the massive disk may appear to adhere lightly to the side of the ovary) (134)

- 126(125). Fruit consisting of 2 achenelike mericarps which at maturity separate from each other and from the receptacle 137. *Umbelliferae*, p. 1139.
126. Fruit otherwise (127)
- 127(126). Embryo curved, forming the periphery of the roundish or disklike ovule, surrounding the perisperm and/or endosperm (go back to couplet 107).
127. Embryo and ovule otherwise (128)
- 128(127). Herbs usually with brittle stems; herbage very rough to the touch with barbed or sometimes stinging hairs; petals usually large and showy; stamens usually numerous; ovary 1-celled with 1 to 5 placentas; fruit a capsule or achene 130. *Loasaceae*, p. 1082.
128. Herbs or woody plants; herbage rarely rough or stinging; stamens few to numerous; ovary usually several-celled; fruit a capsule, drupe, berry, pome or follicetum (129)
- 129(128). Fruit a pome 90. *Rosaceae*, p. 728.
129. Fruit not a pome or if resembling one then seeds numerous (130)
- 130(129). Fruit a drupe 138. *Cornaceae*, p. 1170.
130. Fruit a berry, capsule or follicetum (131)
- 131(130). Leaves compound 136. *Araliaceae*, p. 1139.
131. Leaves simple (sometimes deeply lobed) (132)
- 132(131). Usually a long hypanthium present and prolonged above and completely obscuring the top of the ovary; stamens (often 8) usually precisely twice as numerous as the petals; fruit a capsule 134. *Onagraceae*, p. 1120.
132. Top of ovary often plainly visible at or slightly above the point of attachment of the stamens and perianth (except in *Ribes*); fruit a capsule, berry or follicetum (133)
- 133(132). Plants partially submerged weak-stemmed aquatics (genus *Myriophyllum* of) 135. *Haloragaceae*, p. 1136.
133. Plants not partially submerged 87. *Saxifragaceae*, p. 717.
- 134(125). Filaments monadelphous or diadelphous, or confluent with a gynophore (anthers free or united) (135)
134. Filaments distinct from each other or joined into more than 2 groups (145)
- 135(134). Pistil solitary and simple, often folliclelike at maturity; stigma solitary (136)
135. Pistil solitary but compound, rarely folliclelike; stigmas mostly more than 1 (137)
- 136(135). Upper 3 petals united at their clawlike base; lower 2 petals purplish or greenish, glandlike, separate 92. *Krameriaceae*, p. 889.
136. Not as in *Krameria* 91. *Leguminosae*, p. 761.
- 137(135). Flowers strongly bilaterally symmetrical; carpels usually 2; stamens monadelphous or diadelphous (138)
137. Flowers nearly radially symmetrical; carpels more than 2; stamens monadelphous (139)
- 138(137). Sepals 2; petals 4; stamens diadelphous 79. *Fumariaceae*, p. 667.
138. Sepals 5; petals usually 3; stamens monadelphous 101. *Polygalaceae*, p. 914.
- 139(137). Filament tube elongate and forming a more or less loose sheath not only around the ovary but also around the elongate style(s); stamens numerous; flowers perfect 115. *Malvaceae*, p. 1025.
139. Filament tube not so elongate (or if so then stamens only 10); stamens numerous or fewer; flowers perfect or unisexual (140)
- 140(139). Leaves bipinnately compound 99. *Meliaceae*, p. 912.
140. Leaves simple or palmately compound (141)
- 141(140). Carpels 3 as shown by number of stigmas or placentas (142)
141. Carpels 5 (143)

- 142(141). Placentae axile-apical; ovules 1 per cell 102. *Euphorbiaceae*, p. 923.
 142. Placentae parietal; ovules more numerous 129. *Passifloraceae*, p. 1079.
- 143(141). Fruit separating at maturity into 5 or 10 uni- or biovulate mericarps which fall separately 95. *Linaceae*, p. 897.
 143. Fruit not a schizocarp or if so then the cells several-seeded (144)
- 144(143). Stamens 10; herbs; leaves usually palmately or pinnately trifoliolate but in one species unifoliolate 94. *Oxalidaceae*, p. 893.
 144. Stamens 5 or if more numerous then plants woody; leaves simple 116. *Sterculiaceae*, p. 1055.
- 145(134). Aquatic perennial herbs with thick horizontal rhizomes, rooted in mud at bottom of water; leaves (at least those borne at or near the surface of the water) usually peltate or very deeply rounded-cordate 70. *Nymphaeaceae*, p. 630.
 145. Habit not as in the water-lily family (146)
- 146(145). Pistils several (each simple) and quite separate (even at base) at all stages of development (147)
 146. Pistil 1, either simple or compound (in some taxa the carpels united only near their bases as for example the Simaroubaceae, Magnoliaceae and genera of Rutaceae, Saxifragaceae, Hamamelidaceae, etc.) (151)
- 147(146). Flowers with a floral cup (or "hypanthium") at the rim of which are attached the sepals, petals and stamens; stipules usually present; endosperm absent 90. *Rosaceae*, p. 728.
 147. Calyx, corolla and androecium hypogynous or nearly so; stipules present or often absent; endosperm usually present (148)
- 148(147). Herbs (149)
 148. Trees, shrubs or vines (150)
- 149(148). Leaves usually fleshy and succulent, simple, unlobed or usually so, with entire or toothed margins 86. *Crassulaceae*, p. 714.
 149. Leaves not succulent, usually deeply lobed or compound 72. *Ranunculaceae*, p. 634.
- 150(148). Twiners and climbers 74. *Menispermaceae*, p. 656.
 150. Trees or shrubs 76. *Annonaceae*, p. 659.
- 151(146). Carpels numerous, crowded together to cover the prolonged floral axis, cohering to each other and in fruit forming a fleshy or rather woody conelike fruit, each folliclelike carpel opening longitudinally by a dorsal slit and each carpel uni- or biovulate; trees or shrubs 75. *Magnoliaceae*, p. 656.
 151. Gynoecium and fruit not as in the Magnoliaceae (152)
- 152(151). Flowers bilaterally symmetrical; petals 3, bilobed; stamens 5, each filament with a scale and all 5 scales connivent over the stigma; capsules explosively dehiscent 111. *Balsaminaceae*, p. 1008.
 152. Character combination not as above (153)
- 153(152). Flowers bilaterally symmetrical; lowermost petal spurred or gibbous; fruit a capsule with 3 valves and 3 parietal placentae 126. *Violaceae*, p. 1074.
 153. Character combination not as above (154)
- 154(153). Embryo curved around the periphery of the roundish or disklike seeds, surrounding the perisperm and/or endosperm (go back to couplet 100).
 154. Ovules and seeds not as in centrospermous plants (155)
- 155(154). Fertile stamens precisely as many as sepals and alternate with them and/or as many as petals and opposite them (156)
 155. Fertile stamens either more numerous than petals or sepals or if as few as petals or sepals then opposite the sepals and alternate with the petals (160)

- 156(155). Vines; fruit a several-seeded berry 113. *Vitaceae*, p. 1015.
156. Mostly trees, shrubs or herbs; fruit mostly drupes or capsules or (if vines) then fruit a drupe (157)
- 157(156). Petals 6 or 9, yellow; leaves usually spiny-margined; anther valves lifting like trap-doors (genus *Berberis* of) 73. *Berberidaceae*, p. 654.
157. Petals fewer, usually (4 or) 5; leaves rarely spiny; anthers dehiscing by longitudinal slits (158)
- 158(157). Fruit a drupe or a schizocarpous capsule; floral cup well-developed, the sepals, petals and stamens perigynous at the margin of the cup 112. *Rhamnaceae*, p. 1008.
158. Fruit usually a capsule; floral cup absent; perianth parts and stamens hypogynous (159)
- 159(158). Opposite-leaved herbs; capsule circumscissile (genus *Anagallis* of) 141. *Primulaceae*, p. 1181.
159. Alternate-leaved plants; capsule not circumscissile . . 116. *Sterculiaceae*, p. 1055.
- 160(155). Fruit a specialized capsule completely divided into 2 cells by a thin partition, each cell then with 2 placentae situated at the juncture of the partition and the walls, at dehiscence the 2 valves separating from the persistent partition (starting at base) and falling free 80. *Cruciferae*, p. 671.
160. Fruit not a silique or silicle (161)
- 161(160). Flowers bilaterally symmetrical, perfect, solitary in the axils of distal leaves (which are simple, exstipulate); petals 5, very unequal, the upper 3 long-clawed and distinct or partly united and usually purplish or reddish, the 2 others much smaller, broad, thick, sessile, greenish and glandlike; ovary 1-celled 92. *Krameriaceae*, p. 889.
161. Flowers (especially corolla) not as above (162)
- 162(161). Very thorny dark green desert shrubs, essentially leafless; sepals and petals 4; stamens 8; fruit a small blackish berry 125. *Koerberliniaceae*, p. 1073.
162. Character combination not as above (163)
- 163(162). Leaves palmately compound, opposite; flowers bilaterally symmetrical; fruit a leathery structure with 1, 2 or 3 seeds 109. *Hippocastanaceae*, p. 1004.
163. Character combination not as above (164)
- 164(163). Leaves tubiform, basal, trumpet-shaped, dilated upward, to 7 dm. long, partially filled with fluid, with a ridge on the adaxial side and terminated by an expanded hood to 8 cm. long; stamens numerous . . 83. *Sarraceniaceae*, p. 712.
164. Character combination not as above (165)
- 165(164). Rosettelike low nearly acaulous herbs; leaf blades usually rotund, the margins with gland-tipped hairs that exude drops of clear glittering glutinous fluid; insectivorous by means of folding leaf blades 84. *Droseraceae*, p. 712.
165. Character combination not as above (166)
- 166(165). Herbs; flowers large, terminal, usually conspicuously pedunculate; buds usually drooping until shortly before anthesis when the peduncle becomes fully erect and the 2 or 3 large sepals fall completely from the flower; petals 4 to 8 or more, usually showy; stamens many 78. *Papaveraceae*, p. 662.
166. Character combination not as above (167)
- 167(166). Tree with opposite palmately lobed leaves on long slender reddish petioles; fruit of geminate samaras (*Acer rubrum* of) . . . 108. *Aceraceae*, p. 1001.
167. Character combination not as above (168)
- 168(167). Shrub or tree with alternate simple stipulate leaves; flowers usually perfect, small, borne in small axillary pedunculate clusters or heads, with 3 sepals, petals, stamens and staminodes, and 2 long styles; capsule bivalvate, opening loculicidally from the top; seed 1 in each cell 88. *Hamamelidaceae*, p. 726.
168. Character combination not as above (169)

- 169(168). Epidermis usually nearly throughout the plant with aromatic oil-glands visible under a lens and detectible in fresh material by smell; leaves often compound (but never 2-foliolate); hypogynous disk usually present just above the androecium and below the ovary; stamens 3 to 15; ovary with more than 1 cell 97. *Rutaceae*, p. 906.
169. Character combination not as above (170)
- 170(169). Trees with simple alternate stipulate serrate leaves; cymes axillary, pedunculate, the peduncle adnate about the middle of a narrow short-petioled foliaceous membranous bract; stamens numerous; fruit a nut (genus *Tilia* of) 114. *Tiliaceae*, p. 1023.
170. Character combination not as above (171)
- 171(170). Perennial herbs forming colonies by creeping rhizomes; stems erect, the sterile ones terminated by a solitary peltate leaf, the flowering ones with 2 leaves and a single short-pedunculate nodding large flower; sepals 6, fugacious; petals 6 or 9, waxy-white (Yucca-like), to 4 cm. long; stamens 12 to 18; fruit a large yellow berry with many seeds on a single lateral placenta (genus *Podophyllum* of) 73. *Berberidaceae*, p. 654.
171. Character combination not as above (172)
- 172(171). Ovary with a slender axis 1-5 cm. long, at the base of which are 5 small cells, each with 2 ovules; at maturity when dry the cells suddenly separating from the axis and coiling up on their styles which are also adnate to the full length of the axis 93. *Geraniaceae*, p. 890.
172. Character combination not as above (173)
- 173(172). Pistil simple, folliclelike with a single style and stigma and a single ventral placenta 91. *Leguminosae*, p. 761.
173. Pistil not simple as shown by 2 or more stigmas, 2 or more cells, or 2 or more placentae (174)
- 174(173). Flowers unisexual; carpels 3 or rarely seemingly 2 (as in *Croton monanthogynus*) or 1 (as in *Crotonopsis*); fruit usually a capsule (achene in *Crotonopsis*) and usually with a well-developed central axis (columella) which persists after dehiscence; ovules 1 or 2 in each of the 1, 2 or usually 3 cells, attached to an apical-axial (columellar) placenta 102. *Euphorbiaceae*, p. 923.
174. Flowers usually bisexual; carpels 2 to 10, if 3 then character combination not as above (175)
- 175(174). Herbs with alternate palmately compound leaves (rarely reduced to 1 leaflet); flowers hypogynous, often somewhat bilaterally symmetrical; stamens 6 to 27 or more, as long as or usually longer than the petals; ovary borne on a slender gynophore (rarely nearly sessile), 1-celled (2-celled in *Wislizenia*), usually capsular with 2 valves and many seeds 81. *Capparidaceae*, p. 706.
175. Character combination not as above (176)
- 176(175). Petals and stamens either definitely perigynous, i.e., inserted in a floral cup or "calyx tube" or very slightly epigynous (the cup attached to the very basal part of the ovary) (177)
176. Petals and stamens hypogynous (rarely very slightly or obscurely perigynous as in some *Sapindaceae* and some *Celastraceae*) (180)
- 177(176). Leaves opposite; hypanthium urceolate; petals 4, fugacious, rose-color to purple (rarely white or yellow); stamens 8, basally appendiculate; anthers dehiscent by apical pores 133. *Melastomataceae*, p. 1118.
177. Character combination not as above (178)
- 178(177). Herbs; leaves mostly basal; ovary very shortly at base adnate to a floral cup; stigmas 4; capsule 1-celled, 4-valved; stamens 5, plus 5 staminodes (genus *Parnassia* of) 87. *Saxifragaceae*, p. 717.
178. Ovary superior; style 1, 2, 3 or 5, never 4; stamens 4 to numerous (179)

- 179(178). Flowers usually uniformly 5-merous (except for the gynoecium of *Physo-carpus*); stamens 10 to 40, inserted near the rim of the floral cup not very far from where the petals are inserted; stipules present . . . 90. *Rosaceae*, p. 728.
179. Flowers 4- to 7-merous; stamens 4 to numerous, usually inserted well down into the calyx tube or floral cup, whereas the petals are inserted near the rim between the short calyx teeth; stipules minute or usually absent 132. *Lythraceae*, p. 1113.
- 180(176). Shrubs or trees with numerous twigs and very numerous alternate scalelike or nearly terete leaves only about 1 mm. long, the entire plant often appearing grayish; flowers pink or white, very small, inconspicuous 121. *Tamaricaceae*, p. 1068.
180. Character combination not as above (181)
- 181(180). Leaves opposite, simple and gland-dotted (as seen with transmitted light); styles often separate or nearly so or only lightly cohering until after anthesis; mostly herbs or weak-stemmed shrubs; sepals, petals and stamens free and hypogynous or stamens in 5 phalanges opposite the petals; placentae parietal or usually axile; ovules usually numerous; fruit a capsule; stamens 6 to numerous, when numerous tending to be in as many groups as there are petals 118. *Hypericaceae*, p. 1059.
181. Character combination not as above but if most of the characters are similar then the leaves mostly alternate or the styles permanently united (182)
- 182(181). Perennial herbs with alternate or falsely verticillate simple leaves and yellow or red usually fugacious petals; styles permanently united often into a club-shaped or fungoid structure; sepals, petals and stamens free and hypogynous; placentae 3, parietal (or deeply intruded); seeds 1 to 22 per capsule; stamens 3 to 50, not clumped 123. *Cistaceae*, p. 1070.
182. Character combination not as above (183)
- 183(182). Stamens more than 15, usually numerous; flowers large; petals 25-50 mm. long (184)
183. Stamens 15 or fewer, usually 5 or 10; petals usually shorter (185)
- 184(183). Herbs; leaves palmately lobed; petals pinkish to orange; fruit a rather soft oblong-ovoid capsule 30-50 mm. long with numerous seeds on parietal placentae 124. *Cochlospermaceae*, p. 1073.
184. Shrubs; leaves not lobed; petals white; fruit a capsule about 15 mm. thick and with few seeds on axile placentae 117. *Theaceae*, p. 1059.
- 185(183). Shrubs or small trees of eastern Texas; flowers usually white, in elongate racemes usually 5-20 cm. long and only 1 cm. thick (186)
185. Habit various but if flowers in elongate racemes then plants herbaceous (187)
- 186(185). Fruit dehiscent 139. *Clethraceae*, p. 1172.
186. Fruit indehiscent 105. *Cyrillaceae*, p. 992.
- 187(185). Woody plants, occasionally scandent or perennial vines somewhat woody at base, commonly with a pubescence of medifixed hairs; leaves opposite, stipulate, simple; each sepal usually with 2 dorsal glands (absent in *Thryallis*); petals conspicuously clawed 100. *Malpighiaceae*, p. 913.
187. Character combination not as above (188)
- 188(187). Shrubs of dry areas, the branches thorny; leaves alternate, simple, either small and sparse or absent; ovary deeply lobed and at maturity the lobes largely separate (except immediately at base), each maturing into a somewhat dryish reddish drupelike mericarp 98. *Simaroubaceae*, p. 911.
188. Character combination not as in *Castela* or *Holacantha* (189)
- 189(188). Fruit indehiscent and usually fleshy, usually 1-seeded except in *Sapindus* (190)
189. Fruit dehiscent, usually dry at maturity (192)

- 190(189). Leaves pinnately compound; fruit a colorless or yellowish berry (genus *Sapindus* of)110. *Sapindaceae*, p. 1005.
190. Leaves compound or simple; fruit a usually reddish drupe (191)
- 191(190). Leaves simple, usually stipulate; stamens never more numerous than petals; drupes usually nearly circular in transection, not resinous, usually glabrous106. *Aquifoliaceae*, p. 993.
191. Leaves usually compound, usually exstipulate; stamens as many as or rarely twice as many as the petals; drupes usually somewhat flattened, resinous, often pubescent104. *Anacardiaceae*, p. 986.
- 192(189). Leaves opposite (193)
192. Leaves alternate (196)
- 193(192). Leaves compound 96. *Zygophyllaceae*, p. 901.
193. Leaves simple (194)
- 194(193). Flowers with thick-lobed disk that fills the bottom of the calyx and sometimes hides much of the ovary; plants woody, with 4-sided green-barked branchlets; seeds with bright-red arils (genus *Euonymus* of) ...107. *Celastraceae*, p. 998.
194. Disk (if present) not so thick; plants various in habit but usually mostly herbaceous in texture; seeds not with bright-red arils (195)
- 195(194). Stamens 6; sepals united high up into a tube ...120. *Frankeniaceae*, p. 1067.
195. Stamens 2 or 3, or 5 or 10; sepals free119. *Elatinaceae*, p. 1066.
- 196(192). Leaves simple but deeply pinnatifid into linear lobes (genus *Peganum* of) 96. *Zygophyllaceae*, p. 901.
196. Leaves not as in *Peganum* (197)
- 197(196). Leaves compound (198)
197. Leaves simple (200)
- 198(197). Trees with pinnately compound leaves; leaflets 13 to 41 98. *Simaroubaceae*, p. 911.
198. Herbs or vines, if woody then with leaflets fewer than 13 (usually only 3) (199)
- 199(198). Fruit with 5 cells and numerous seeds 94. *Oxalidaceae*, p. 893.
199. Fruit usually with 3 cells and only 1 seed in each110. *Sapindaceae*, p. 1005.
- 200(197). Shrubs (201)
200. Herbs or herbaceous vines (202)
- 201(200). Leaf blades often biglandular at base; styles apically fringed; fruit a many-seeded capsule128. *Turneraceae*, p. 1079.
201. Leaf blades never biglandular; styles not fringed; fruit usually a few-seeded capsule or a follicle or achene107. *Celastraceae*, p. 998.
- 202(200). Petals white; leaves linear; capsule 4-beaked, depressed-globose 82. *Resedaceae*, p. 712.
202. Petals yellow; leaves not linear; capsule not 4-beaked, usually elongate (203)
- 203(202). Leaf blades ovate to narrowly lanceolate, to 6 cm. long, serrate; herbs usually 10-100 cm. tall (genus *Corchorus* of)114. *Tiliaceae*, p. 1023.
203. Leaf blades suborbicular or nearly so, 1-3 cm. long; herbs only 5-30 cm. tall (*Oxalis dichondraefolia* of) 94. *Oxalidaceae*, p. 893.

DIVISION I. PTERIDOPHYTA²**FERNS AND FERN ALLIES**

Terrestrial epiphytic, saxicolous or occasionally aquatic plants with a life cycle of two distinct phases—Sporophyte and Gametophyte. The sporophyte is usually differentiated into root, stem, and leaf provided with vascular tissue (phloem and xylem), and produces spores asexually that are either alike (plants homosporous) or of two very unlike kinds called microspores and megaspores (plants heterosporous). The spores germinate to produce the gametophyte or minute inconspicuous sexual stage (prothallium). In the homosporous series the prothallia are similar but may be either monoecious or dioecious; in the heterosporous series they are dissimilar and dioecious—the ones developing from microspores bearing only male reproductive organs (antheridia), and those from megaspores only female organs (archegonia). Fertilization consists of the impregnation of an egg cell (archegonia) by the coiled motile male cell (spermatozoid); the resulting growth is the sporophyte or usually conspicuous asexual stage commonly known as a fern or fern ally.

The Pteridophyta include more than 9,000 species in about 215 genera. Although world-wide in distribution, they attain their greatest number and most luxuriant development in the tropics and subtropics. Of the approximately 345 species in about 60 genera found in North America north of Mexico, 111 species, representing 35 genera, occur in Texas.

FAM. 1. PSILOTACEAE EICHLER**WHISK FERN FAMILY**

Terrestrial or more or less epiphytic perennial plants with short creeping coralloid rhizomes; aerial stems and branches wiry, dichotomously branched, with minute remote alternate scalelike leaves; sporangia somewhat depressed-globose and 3-celled, opening at the apex into 2 or 3 valves, sessile in the axils of the usually 2-lobed minute sporophylls on the upper part of the numerous branches; spores all alike, numerous.

A small family of two genera, *Tmesipteris* of Oceania and Australasia, with several species, and *Psilotum*.

1. PSILOTUM Sw.

Characters of the family. About 3 species that are widely distributed in tropical or warm temperate regions throughout the world.

1. *Psilotum nudum* (L.) Beauv. Plant dichotomously branched 3 to 5 times, usually about 25 cm. tall, rarely to 5 dm. tall; common stalks simple, 3-angled, up to 4 mm. thick; branches lightly winged along the 3 angles; scalelike leaves about 1 mm. long; sporophylls rudimentary. In swamps and low wet woods about base of trees and stumps, more or less partly saprophytic, in s.e. Tex., summer; from Fla., n. to S.C., w. to Tex., through Mex. and C. A. to s. S. A. and in W.I.; also widely distributed in the Old World trop.

FAM. 2. LYCOPODIACEAE REICHB.**CLUBMOSS FAMILY**

Low terrestrial erect or trailing perennial plants; stems mostly prostrate or arching and giving rise to aerial peduncles or branches, alternately branched or repeatedly dichoto-

² Cf. D. S. Correll in C. L. Lundell, *Flora of Texas I*: 3-121. 1955, and *Ferns and Fern Allies of Texas*. 1956, for more detailed treatments.

moss, densely or sparsely covered with small leaves; leaves numerous, mostly small and thin, 1-nerved, usually uniform and imbricate, several- to many-ranked, rigidly ascending to spreading-reflexed; sporophylls similar to the vegetative leaves or more or less modified, crowded into a cone at the apex of the aerial stems; sporangia large, in the axils of the sporophylls, uniform, 1-celled; spores all alike (plants homosporous), small, globose, light yellow; prothallia fleshy, tuberous, monoecious.

This family is composed of two genera, the monotypic genus *Phylloglossum*, of Australia and New Zealand, and *Lycopodium*.

1. LYCOPODIUM L. CLUBMOSS

Characters same as those of the family. About 450 species that are found mainly in temperate and mountainous tropical regions.

- 1. Stems arching and rooting, not truly prostrate; stem leaves spreading radially
 1. *L. alopecuroides* var. *alopecuroides*.
- 1. Stems prostrate (2)
- 2(1). Foliage leaves unlike sporophylls; stem leaves spreading, arranged so as to appear 2-ranked 3. *L. carolinianum*.
- 2. Foliage leaves and sporophylls similar (3)
- 3(2). Sporophylls incurved, appressed; cone slender, only slightly thicker than the supporting peduncle 2. *L. adpressum*.
- 3. Sporophylls more or less spreading; cone stout, 2 to 3 times the diameter of the supporting peduncle 1. *L. alopecuroides* var. *pinnatum*.

1. *Lycopodium alopecuroides* L. var. *alopecuroides*. FOXTAIL CLUBMOSS. Peduncles to 35 cm. tall; cone 2-10 cm. long; leaves linear-lanceolate, bristle-toothed below, 6-8 mm. long; sporophylls similar to leaves in shape and size. In wet places in savannahs and boggy areas in low open pinelands in s.e. Tex., July-Nov.; from Fla., in the Coastal Plain, n. to N.Y. and w. to Tex.; also S. A.

The outstanding characteristic by which var. *alopecuroides* is most easily recognized in the field is the arching stem that usually roots at the tip when it touches the ground, and the several more or less erect peduncles.

Var. *pinnatum* (Chapm.) Lloyd & Underw. CREEPING FOXTAIL CLUBMOSS. The prostrate habit of this variety is the only characteristic separating it from var. *alopecuroides*. *L. prostratum* Harper. Apparently isolated in Travis Co.; also from cen. La., e. to Fla. and n. along the coast to N.C.

2. *Lycopodium adpressum* (Chapm.) Lloyd & Underw. SOUTHERN CLUBMOSS. Peduncles to 3 dm. tall and about 3 mm. in diameter; cone slender, 2-7 cm. long; leaves linear-lanceolate to lanceolate, entire or slightly toothed below, 6-7 mm. long; sporophylls similar to the leaves. *L. alopecuroides* var. *adpressum* Chapm. In depressions in savannahs and flat open pinelands, bogs and sphagnous habitats in e. and s.e. Tex., June-Oct.; mostly on Coastal Plain from Fla., n. to N.Y. and w. to Tex.

The incurved appressed leaves on the peduncle and the slight difference in size between the peduncle and cone are distinctive.

3. *Lycopodium carolinianum* L. SLENDER CLUBMOSS. Peduncles slender, rigidly erect, to 25 cm. tall and 1.5 mm. in diameter; cones 1-5 cm. long and about twice the diameter of the peduncle; leaves of the peduncle subulate, in whorls or scattered, about 5 mm. long; sporophylls broadly ovate to deltoid, acuminate, about as long as the peduncle leaves. Rare in depressions in savannahs and open flat pinelands in s.e. Tex., July-Sept.; from Fla., n. to N.Y., w. to Tex.; also occurring as variants in S.A., Asia, Afr., Austral. and N. Zeal.

The erect slender peduncle with scattered small leaves and sporophylls different from the foliage leaves are distinctive.

FAM. 3. SELAGINELLACEAE METT.

SPIKEMOSS FAMILY

Small terrestrial or saxicolous plants of spreading habit, prostrate to ascending or suberect, usually profusely branched, with slender stems; stems leafy, usually producing wiry elongate rhizophores at some or all the nodes; leaves all alike or of two kinds, elliptic to lanceolate, several-ranked or in two planes, numerous, minute, 1-nerved, obscurely ligulate, approximate to widely imbricate; sporophylls somewhat modified, borne in compact sessile cones at the apex of branches; sporangia of two kinds (plants heterosporous), solitary in the axils of sporophylls, 1-celled; megasporangia containing 1 to 4 rather large megaspores; microsporangia containing numerous microspores.

Only one genus in the family.

1. SELAGINELLA BEAUV.

Characters same as those of the family. About 700 species are recognized in this complex genus that is highly developed in tropical and subtropical regions of both hemispheres.

1. Plants delicately thin-herbaceous, flaccid, in moist habitats; stem leaves distant, spreading 1. *S. apoda*.
1. Plants not as above, in xerophytic habitats; stem leaves closely or loosely imbricate, not noticeably spreading (2)
 - 2(1). Plants forming conspicuous rosettes (3)
 2. Plants typically forming dense mats, not noticeably rosulate (4)
 - 3(2). Leaves conspicuously white-marginate, broadly rounded or at most short-cuspidate at the apex 2. *S. lepidophylla*.
 3. Leaves not conspicuously white-marginate, with a long white seta terminating the acute apex 3. *S. pilifera*.
 - 4(2). Plants wholly prostrate or creeping and spreading, not erect (5)
 4. Plants assurgent to ascending or erect (9)
 - 5(4). Stems definitely dorsiventral; leaves strongly upswept in habit, those of the lower side of stem usually somewhat larger than the leaves of the upper side (6)
 5. Stems not at all dorsiventral; leaves all alike and symmetrically arranged on the stem (8)
 - 6(5). Seta of leaves stout, yellowish-white, not sharply distinguished from the leaves 9. *S. Wrightii*.
 6. Seta of leaves slender, whitish, arising rather abruptly at apex of leaves (7)
 - 7(6). Seta persistent, 0.5 mm. long or more 12. *S. peruviana*.
 7. Seta readily broken off in age, usually less than 0.3 mm. long 13. *S. arizonica*.
 - 8(5). Leaves linear-lanceolate to subulate, usually about 2 mm. long 10. *S. Underwoodii*.
 8. Leaves typically ovate-elliptic, usually 1.5 mm. long or less 8. *S. mutica*.
 - 9(4). Leaves without a conspicuous terminal seta, 1.5 mm. long or less 7. *S. viridissima*.
 9. Leaves with a prominent terminal seta, usually more than 1.5 mm. long (10)
 - 10(9). Plants rigidly erect to strongly ascending, usually much less than 1 dm. tall 6. *S. Riddellii*.
 10. Plants assurgent to laxly ascending or weakly erect, often 1 dm. tall or more (11)
 - 11(10). Stems short and compact, more or less dorsiventral with the leaves of the lower side larger than those of the upper side 11. *S. densa* var. *scopulorum*.
 11. Stems lax and open, not dorsiventral, with the leaves all alike (12)

- 12(11). Leaves lance-aciculate, evenly attenuate to an elongate yellowish-white seta that is about 1 mm. long4. *S. rupincola*.
12. Leaves subulate-attenuate to an acutish apex, giving rise rather abruptly to a short whitish seta that is 0.5 mm. long or less5. *S. × neomexicana*.

1. *Selaginella apoda* (L.) Spring. MEADOW SPIKEMOSS. Plants annual, frequently forming light- or bright-green mats on moist soil among grasses; leaves ovate to ovate-lanceolate, asymmetrical, the margins serrulate, 1-2 mm. long and about 1 mm. wide; cones to 2 cm. long and 4 mm. in diameter. *S. ludoviciana* A. Br. In moist places, usually in partial shade, in e. and s.e. Tex., w. into the Edwards Plateau and Rio Grande Plains, May-Dec.; from Me., w. to B.C., s. to Fla. and Tex.

2. *Selaginella lepidophylla* (Hook. & Grev.) Spring. RESURRECTION PLANT, SIEMPRE VIVA, FLOR DE PIEDRA. Plant hygrosopic, forming a distinct rosette of bright-green cespitose branches when moist, the branches inrolled to form a tight nestlike ball when excessively dry, to about 2 dm. across when expanded; leaves about 1 mm. long, broadly ovate to suborbicular, rounded to slightly cuspidate at apex, ciliolate on the prominently hyaline margins; cones at the ends of the ultimate branchlets, strongly quadrangular, to 15 mm. long and 1.5 mm. wide. On dry limestone ledges, bluffs and talus slopes, especially under and around large boulders where soil has accumulated on north-facing slopes, up to 6,500 ft. alt. in w. Tex., Apr.-Jan.; from Tex. and N.M., s. to s. Mex.

The plant is widely sold as a novelty and, in Mexico, great numbers are collected for this purpose.

3. *Selaginella pilifera* A. Br. RESURRECTION PLANT. Similar in habit and characteristics to *S. lepidophylla* but usually smaller in size and with more slender, less rigid, stems and paler green bristle-tipped leaves that are ovate to elliptic-lanceolate and about 2 mm. long; cones to 1 cm. long and 1.5 mm wide. *S. Pringlei* Baker, *S. pilifera* var. *Pringlei* (Baker) Morton. On rocky slopes and floors of limestone canyons, up to 6,000 ft. alt. in w. Tex., June-Oct.; from Tex., N.M. and n. Mex.

4. *Selaginella rupincola* Underw. Stems assurgent to nearly erect, ascendingly branched, to 7 cm. long or more, the shoots equally clothed on all sides by 8 ranks of appressed linear-lanceolate leaves that are 2-3 mm. long and are terminated by elongate whitish or occasionally tawny setae that form a conspicuous tuft at the end of sterile shoots, with 15 to 20 cilia on each side; cones quadrangular, to 1 cm. long. On shaded cliffs and ledges of igneous rocks, on open rocky hillsides, and in depressions on large boulders, up to 6,000 ft. alt. in w. Tex., July-Oct.; from Tex. to Ariz. and cen. Mex.

5. *Selaginella × neomexicana* Maxon. Because of its abortive spores and intermediate morphological characters, this plant is considered to be a putative hybrid of *S. mutica × S. rupincola*. The erect to ascendent branches with buds at their base are characteristics of *S. rupincola* while the typically linear-lanceolate leaves (usually with a strongly carinate apex) suggests *S. mutica*. On dry granite rock ledges, cliffs and canyon walls, slopes and boulders, up to 5,500 ft. alt. in w. Tex., June-Nov.; from Tex. to Ariz.

6. *Selaginella Riddellii* Van Eselt. Plants erect to ascending, cespitose, to 12 cm. tall; leaves triangular- to linear-lanceolate, acute-setaceous, deeply sulcate dorsally, 1.2-1.8 mm. long, minutely 6- to 12-ciliate on each side. *S. arenicola* Underw. subsp. *Riddellii* (Van Eselt.) R. Tryon. In sandy or gravelly soil in open woods, on sunny ledges, open rocky slopes, dry sandy ridges and barrens, in e. third of Tex., throughout the year; Ala. to Okla. and Tex.

7. *Selaginella viridissima* Weath. Plants erect or ascending, densely cespitose, usually about 1 dm. tall; leaves subulate-linear to linear-lanceolate, mucous at apex, about 1.5 mm. long, the margin sparsely denticulate. *S. Coryi* Weath. On large boulders, ledges and walls of canyons and on high mt. slopes, up to 7,500 ft. alt. in w. Tex., June-Aug.; Tex. and Coah.

Readily separated from other Texas species having an erect growth by its rather thick and convex mucous leaves. Its erect habit and differently shaped nonciliate leaves also separate it from the mucous-leaved *S. mutica*.

8. *Selaginella mutica* D. C. Eat. Plants wholly prostrate to form dense mats; leaves 6-ranked, typically ovate-elliptic and obtuse to subacute, 1-2 mm. long, minutely ciliolate on each side with about 9 cilia. On rocks of various kinds (limestone, basalt and sand-

stone), cliffs and ledges in steep dry canyons and on mt. slopes, up to 7,000 ft. alt. in w. Tex., Apr.-Oct.; from e. Ut., Colo. and Ariz., e. to w. Tex.

The several varieties found in Texas may be distinguished as follows:

1. Cilia (at least the upper) short, stiff, strongly ascending; sporophylls merely short-fimbriate; leaves with a short (0.2 mm. or less) terminal seta. var. *limitania* Weath.
1. Cilia of the foliage leaves long, weak and spreading; sporophylls definitely ciliate (2)
- 2(1). Leaves mucous or at most short-mucronatevar. *mutica*.
2. Leaves with a terminal seta to 0.4 mm. longvar. *texana* Weath.

9. *Selaginella Wrightii* Hieron. Plants wholly prostrate, the main stems rather rigid, to 12 cm. long, rooting at the branch nodes; leaves in 6 to 8 ranks, linear-lanceolate, the apical seta rufous-lutescent, with short-pungent cilia on the margins; cones erect, quadrangular, usually numerous, to 3 cm. long. On dry rocks, open hills, caprock, exposed flat rock outcrops, and on walls and ledges of canyons, usually on limestone, frequently forming large mats, up to 4,000 ft. alt. in w. half of Tex., Mar.-Dec.; from cen. Tex. and N.M. to cen. Mex.

A creeping plant often found carpeting shallow soil on limestone outcrops and commonly on ledges of north-facing cliffs. The erect spikes are usually produced in great abundance. In its prostrate habit and recurved sterile branchlets *S. Wrightii* superficially resembles *S. peruviana*. The stems, however, of *S. Wrightii* are shorter, the leaves chartaceous to subcoriaceous, decidedly greener, and much longer (up to 3.5 mm. long), the attenuate apex is tipped by a short, stiff, lutescent seta, and longer cilia.

10. *Selaginella Underwoodii* Hieron. Plants wholly prostrate; leaves loosely imbricate, linear-lanceolate to subulate, 1.5-2.5 mm. long, long-setigerous at the rather abruptly acute apex, at first bright-green, becoming brownish with age. On cliffs, rock ledges and rocky mt. slopes, floors of canyons, up to 8,000 ft. alt. in w. Tex., July-Oct.; from s.w. Tex and w. Okla. to Wyo., Ut., Ariz. and Chih.

11. *Selaginella densa* Rydb. var. *scopulorum* (Maxon) R. Tryon. Stems short, forming flat cushionlike mats; leaves ligulate to ligulate-lanceolate, setaceous; sporophylls eciliate toward the apex. On cliffs, talus slopes, ledges, among boulders or in thin soil over rocks, on igneous or sedimentary rocks, in Tex. found only in Brewster Co. on a sandstone slope 3 miles e. of Study Butte; Alta. to B.C., s. to Tex., Ariz. and n. Calif.

12. *Selaginella peruviana* (Milde) Hieron. Plants wholly prostrate; leaves curving upward to give a definite dorsiventral aspect to the plant, subulate to lanceolate-subulate, to 3 mm. long, setigerous at the acute apex, with 7 to 10 whitish widely spreading oblique or ascending cilia on each side. *S. Sheldonii* Maxon. On ledges of various types of rock (mostly igneous) and talus slopes, edge of rim-rock, in soil or on rocks along streams, commonly forming large mats, up to 7,600 ft. alt. in cen. and w. Tex., June-Oct.; from w. Okla. to Tex., N.M., Coah. and Chih.

13. *Selaginella arizonica* Maxon. Leaves linear-lanceolate, mostly 2-3 mm. long and about 0.5 mm. wide, with 12 to 22 oblique cilia on each side; cone to 5 mm. long; sporophylls ovate-deltoid, to 2 mm. long. On rocky slopes, ledges and cliffs or in depressions on boulders, up to 5,500 ft. alt., in several cos. in the cen. Trans-Pecos Tex. with an isolated locality in Mason Co. on the Edwards Plateau, July-Oct., from cen. Tex. to Ariz. and n. Mex.

Allied to *S. peruviana* but the shorter subsistent seta separates it from that species. Although the stiff straight or reflexed scabrous setae are readily broken off in age there are always some leaves in all plants that retain their setae.

FAM. 4. ISOETACEAE REICHB.

QUILLWORT FAMILY

Small herbaceous perennial aquatic or terrestrial sedgelike plants with short unbranched 2- to 5-lobed subterranean cormlike rhizomes that produce numerous branched roots and a tuft of compact erect or recurved rushlike leaves (sporophylls); leaves bearing a small membranous ligule on the inner surface just above the sporangium;

sporangia of two kinds, sunken in the axils of the leaf bases, more or less covered by a velum; the microspores germinate into prothallia that bear only a solitary antheridium; the megaspores germinate into prothallia that bear only archegonia.

This family is represented by two genera, *Isoetes* and *Stylites*.

1. ISOETES L. QUILLWORT

Characters same as those of the family. About 75 species that are widespread in temperate and tropical regions of both hemispheres.

1. Velum complete; megaspores dark-brown when wet, small-tuberculate; leaves 12 cm. long or less; plants light-brown at base 1. *I. lithophylla*.
1. Velum narrow, usually covering not more than one third of sporangium; megaspores whitish, nearly smooth to granular; leaves usually much more than 15 cm. long; plant usually blackish-brown at base 2. *I. melanopoda*.

1. *Isoetes lithophylla* Pfeiffer. ROCK QUILLWORT. Leaves 6 to 14. In shallow depressions and temporary pools on rock outcrops and mts. of granite, found only in Burnet and Llano cos. on the Edwards Plateau where it is apparently endemic, Apr.-June.

2. *Isoetes melanopoda* Gay & Durieu. Leaves 10 to 50. *I. melanopoda* var. *pallida* Engelm. In shallow ponds, bogs, old buffalo wallows, wet thickets and woods (especially pinelands), in seasonal streams and temporary sedge-grass puddles in meadows and prairies, and in temporary pools on granite outcrops, widely distributed but uncommon in e. Tex., w. to Mason Co. on the Edwards Plateau, Mar.-Oct.; from N.J., w. to Minn., S.D. and Ill., s. to Ga., La., Okla. and Tex.

FAM. 5. EQUISETACEAE RICH. HORSETAIL OR SCOURING-RUSH FAMILY

Large or small terrestrial rushlike plants with wide-creeping branching perennial rhizomes; roots felted, annual; aerial stems perennial or annual, cylindric, fluted, stout or slender, jointed, simple or with whorls of branches at the solid nodes, with usually hollow internodes, often roughened by a coating of silex; stomata arranged in regular rows or broad bands in the grooves; stem leaves minute, reduced and united to form toothed sheaths at the nodes, the free or connivent apical teeth persistent or deciduous; sporophylls aggregated into a cone or strobile at the summit of the main stem or at the apex of the branches, modified as stalked peltate scales; sporangia 6 or 7 under each scale, opening down the inner side; spores all alike, numerous, green; prothallia in damp places above ground, green, monoecious or dioecious, variously lobed.

The family is represented only by the following genus.

1. EQUISETUM L.

Characters same as those of the family. A complex genus consisting of about 23 species that are widespread in both hemispheres.

1. Aerial stems dimorphic; fertile stems light-brown, early-withering; sterile stems green, with regular whorls of branches 1. *E. arvense*.
1. Aerial stems uniform, without regular whorls of branches (2)
- 2(1). Cones rounded at the summit, without a firm sharp tip; stems annual, soft and easily crushed 2. *E. kansasum*.
2. Cones tipped by a firm dark point; stems perennial (evergreen), firm and resistant or somewhat soft (3)

- 3(2). Sheaths dilated upward, green (when young), with a narrow black band at the summit below the promptly deciduous teeth, frequently with a second irregular band below; stems smoothish, only slightly scabrous .3. *E. laevigatum*.
3. Sheaths cylindric, tightly pressed to the stem, ashy-gray, usually with 2 black bands, sometimes entirely black, the teeth mostly subsistent or irregularly deciduous; stems firm, scabrous4. *E. hyemale* var. *affine*.

1. *Equisetum arvense* L. BOTTLE BRUSH. Sterile stems to 75 cm. tall, usually much smaller; sheaths of fertile stems with 8 to 12 brown lance-acuminate teeth; cones cylindric to ovoid, obtuse, to 4 cm. long and 1 cm. in diameter; sheaths of sterile stems tipped with about 12 sharp brown teeth. In sandy or clayey soil along streams and about lakes, in meadows, low ground and open woodlands, and on railroad embankments, in Tex. found only at Buffalo Spring (now known as Buffalo Lakes) in Lubbock Co., in the Plains Country; from Nfld., w. to Alas. and s. to N.C., Ala., Tex. and Calif.; also Euras. and N. Afr.

2. *Equisetum kansanum* J. H. Schaffn. Stems 3-10 dm. tall, 2-7 mm. in diameter, usually very smooth to the touch, light-green; sheaths elongate, dilated upward, pale-green except for a narrow black band at summit, the articulate teeth soon deciduous; cone sessile or shortly pedunculate, 1-2.5 cm. long, 5-8 mm. in diameter. In moist or dry sandy or clayey soil, on bluffs, along irrigation ditches and lakeshores, in prairies, ditches, sloughs and among grasses and shrubs in marsh and swamp areas, mostly in the Plains Country, Trans-Pecos and s.e. Edwards Plateau, with a lone station in Somervell Co. in the Blackland Prairies; from Mich. to B.C., s.w. through the Lake States to Mo., Tex., N.M. and s. Calif.; also n. Mex.

Except for the absence of the hard blackish apicule on its cone, the smoother texture of its cone, and its annual habit, this species approaches very closely *E. laevigatum*. Two rather insignificant growth forms of this species occur in Texas; f. *caespitosum* (A.A.Eat.) Broun, with many small rough stems clustered around a large central one, and f. *variegatoides* (A.A.Eat.) Broun, with 6 to many small prostrate to ascending stems arising from the apex of the rhizome or about the old stems of the previous year.

3. *Equisetum laevigatum* A. Br. COLA DE CABALLO, CAÑUELA. Stems mostly clustered, 3-15 dm. tall, to 8 mm. in diameter. Distinguished from *E. hyemale*, which it closely resembles, by its smoothness, long green sheaths with a narrow black limb, and darker green color. In sandy soil or sandy loam along streams and lake banks, on seepage slopes, in alluvial thickets, marshes, meadows, prairies, sandy barrens and rocky creek beds of canyons, rather generally distributed in w. and cen. Tex., e. to Somervell and Waller cos. in the Blackland Prairies and s. to Starr Co. in the Rio Grande Plains; from Anticosti Is. and Que. to B.C., s. to N.C., La. and Tex.; also Mex. and Guat.

4. *Equisetum hyemale* L. var. *affine* (Engelm.) A.A.Eat. CAÑUELA. Stems erect, evergreen, stout, up to 3 m. tall and 25 mm. in diameter, fluted with numerous ridges that are scabrous with bands of siliceous tubercles; sheaths 5-12 mm. long, cylindric, not dilated above, usually with a black band at the base and apex, the marginal teeth long and flexuous; cone ovoid to cylindric-ellipsoid, apiculate, 15-25 mm. long, 5-10 mm. in diameter. *E. prealtum* Raf., *E. robustum* A. Br., *E. hyemale* var. *robustum* (A. Br.) A. A. Eat. In sandy or loamy soil in open or wooded areas along streams and on alluvial flats, in seepage and on wet ledges, rather generally distributed throughout Tex. but most frequent in the Blackland Prairies and on the Edwards Plateau; represented in most of the U. S. and Can. as well as in Mex. and Euras.

Two insignificant forms of this species occur in Texas; f. *Drummondii* (Milde) Broun having very tight sheath adorned with black and white rings, and f. *texanum* (Milde) Broun with long green amplified sheaths.

FAM. 6. OPHIOGLOSSACEAE PRESL

ADDER'S-TONGUE FAMILY

Succulent or herbaceous terrestrial or occasionally epiphytic plants with short fleshy rhizomes bearing numerous fibrous to tuberous-thickened roots; fronds solitary or clustered, the blade erect or bent in bud (not circinate), erect or pendent when epiphytic, consisting

of a basal common stalk bearing at its apex a simple to variously compounded sessile or stalked sterile blade and (if fertile) one or more erect or pendent stalked spore-bearing spikes or panicles; sporangia in two rows, naked, opening by a transverse slit, formed from the interior tissue of the sporophyll; spores numerous, all alike, yellowish; prothallia subterranean, not green.

This family is composed of four genera, including the monotypic Australasian genus *Helminthostachys*, the monotypic South African genus *Rhizoglossum* and the following genera.

- 1. Veins dichotomous and open; sterile blades ternately divided and variously dissected, rarely simple1. *Botrychium*, p. 43.
- 1. Veins reticulate; sterile blades simple or rarely palmatifid2. *Ophioglossum*, p. 43.

1. BOTRYCHIUM Sw. GRAPE-FERN

Succulent to thin-herbaceous plants of rich moist woods, with erect rhizomes bearing fleshy or tuberous-thickened coarse roots; fronds solitary or several, erect or spreading; common stalks entirely or partly underground, erect; sterile blades erect or bent down in veneration, subsessile to long-stalked, more or less ternately divided and variously dissected or rarely simple, with the ultimate segments mostly small, free-veined; fertile panicles long-stalked, usually bipinnate; sporangia rather large, globose, sessile or essentially so; buds for the following season borne at the apex of the rootstocks, exposed or enclosed within the base of the common stalk.

About 40 species widespread mainly in temperate regions.

- 1. Blade long-stalked, coarsely divided, the comparatively few ultimate segments ovate to oblong-lanceolate with the margins crenulate to serrulate1. *B. dissectum* var. *tenuifolium*.
- 1. Blade sessile, rather finely divided, the numerous ultimate segments oblong and coarsely toothed at the apex2. *B. virginianum*.

1. *Botrychium dissectum* Spreng. var. *tenuifolium* (Underw.) Farw. Plants slender, lax, 10-35 cm. tall; common stalks rarely as much as 8 cm. long; sterile blades thick-herbaceous, to 2 dm. long and 25 cm. wide; fruiting spikes long-stalked, to 12 cm. long. *B. tenuifolium* Underw., *B. obliquum* of auth. In low wet open woods, swamps, moist sandy pinelands, frequently on or about rotting wood, widely distributed but uncommon in the Timber Belt, s. to Jefferson Co. in the Coastal Prairies and w. to Brazos Co. in the Blackland Prairies; from Fla. to e. Tex., n. at least to Mo., s. Ind., and the Coastal Plain of Va. and Md.

2. *Botrychium virginianum* (L.) Sw. RATTLESNAKE-FERN. Plants slender, erect, 8-75 cm. tall; common stalks rarely less than 1 dm. long; sterile blades thin-membranous, to 3 dm. long, often broader than long; fruiting spikes to 25 cm. long. In moist rich woodlands and thickets, occasionally in alluvial soil of swamps, widespread but uncommon in the Timber Belt, w. to Kerr Co. on the Edwards Plateau; from Lab. and Nfld., s. to Fla., w. of B.C. and Ariz.; also Mex. and Euras.

2. OPHIOGLOSSUM L. ADDER'S-TONGUE

Small fleshy-succulent terrestrial or epiphytic plants of wet or moist soils, with short (sometimes bulbous) subterranean rhizomes bearing fibrous roots; fronds one or more from the same rhizome, erect in veneration, glabrous; common stalks slender, terete; sterile blades simple or palmatifid (in the Floridian *O. palmatum* L.), sessile or short-stalked, with the veins profusely reticulate; fertile spikes slender, erect, long-stalked; sporangia large, coalescent in two ranks, subglobose; spores numerous, yellow; buds of the following season borne at the apex of the rhizomes, exposed, free.

About 40 species of wide distribution in both hemispheres.

1. Rootstocks globose-bulbous; leaf blades (when spread out) with a cordate to very broadly cuneate base1. *O. crotalophoroides*.
1. Rootstocks cylindrical to subglobose, not globose-bulbous; leaf blades with a rounded to cuneate base (2)
 - 2(1). Blade distinctly and prominently apiculate; principal veins characteristically forming large primary areoles in which are included numerous veinlets forming secondary areoles4. *O. Engelmannii*.
 2. Blade rounded to acute at apex, rarely minutely apiculate; principal veins forming areoles not enclosing smaller secondary areoles but sometimes with included free veinlets (3)
 - 3(2). Blade inserted near base of plant; rootstocks subglobose2. *O. nudicaule* var. *tenerum*.
 3. Blade inserted towards middle of plant; rootstocks cylindrical (4)
 - 4(3). Blade small, usually less than 5 cm. long, typically ovate-lanceolate and acute, with 4 to 8 parallel veins passing down through base of blade3. *O. petiolatum*.
 4. Blade larger, usually more than 5 cm. long, broadly elliptic to oblong-elliptic or very rarely ovate, rounded at apex, typically with 8 to 20 parallel veins passing down through base of blade5. *O. vulgatum*.

1. *Ophioglossum crotalophoroides* Walt. Plant usually small, to 15 cm. tall; rootstocks about 8 mm. in diameter; common stalks mostly less than 3 cm. long; sterile blades orbicular-ovate to ovate, to 35 mm. long and 25 mm wide; fruiting spikes usually on short stalks that are to 7 cm. long, thick and abbreviated, sharp at apex, 3-4 mm. in diameter; sporangia 3 to 12, partly imbedded in the rachis. *O. pusillum* Nutt. In damp pastures, moist sandy soil of open pine forests, and on grassy slopes, rare in s.-cen. and s.e. Tex. (Bastrop, Hardin and Harris cos.), found once on top of Enchanted Rock (Llano Co.), reported by Reverchon from Newton Co. in the Timber Belt; from cen. peninsular Fla. to S.C. and w. to Tex.; also from Mex. to S. A.

2. *Ophioglossum nudicaule* L. f. var. *tenerum* (Prantl) Clausen. Plant mostly small and inconspicuous, to 12 cm. tall; common stalks mostly less than 1 cm. long; sterile blades ovate to elliptic or somewhat oblanceolate, to 15 mm. long and 8 mm. wide; fruiting spikes on very slender elongate weak stalks, much exceeding the sterile blades, with a sharp tip, to 2 mm. in diameter; sporangia as many as 12 on each side of the rachis. On grassy slopes and in wet meadows, damp depressions in pinelands, moist open woods, and on the edge of bogs, rare in Hardin Co. in s.e. Tex.; from Fla. and Ga., w. to Tex.; also Mex. to Arg., the W. I., Sumatra and the Phil.

3. *Ophioglossum petiolatum* Hook. ADDER'S TONGUE. Plant to 21 cm. tall; common stalks 2-9 cm. long; sterile blades thin in texture, to 6 cm. long and 1.7 cm. wide; fruiting spikes on stalks to 9 cm. long, 1-4 cm. long; sporangia to 1 mm. in diameter. In moist meadows, damp grassy places, depressions in old inland or coastal dunes, occasionally in moist woodlands and thickets, in Tex. only in Wink Co. in dunes about 10 miles n.e. of Kermit, in the Plains Country; in Fla., S.C. and Tex., Mex., the W. I. and n. S. A.; also in trop. Afr., Asia and Oceania.

4. *Ophioglossum Engelmannii* Prantl. Plant to 25 cm. tall; common stalks to 1 dm. long; sterile blades mostly elliptic, to 1 dm. long and 35 mm. wide; fruiting spikes on slender stalks to 1 dm. long, cylindrical, apiculate, to 3 cm. long and 4 mm. in diameter; sporangia to about 30 on each side of the rachis. *O. vulgatum* f. *Engelmannii* (Prantl) Clute. Usually found in large colonies in thin black soil on limestone barrens or ledges, rocky woodland slopes, in cedar brakes or in clayey soil along streams, occasionally invading pastures and old fields, generally distributed and rather frequent in the Blackland Prairies, with a few stations in the Timber Belt; from Va. to cen. Fla., w. to s. Ill., Kan. and Ariz.; also Mex.

5. *Ophioglossum vulgatum* L. Plant often tall and slender, to 35 cm. tall; common stalks to about 9 cm. long; sterile blades ovate to lanceolate, to 12 cm. long and 5 cm. wide; fruiting spikes on slender elongate stalks that are to 17 cm. long, to 4 cm. long and 3-5 mm. in diameter, compressed-cylindrical apiculate; sporangia to 30 on each side

of rachis. In moist open woods, meadows, alluvial woodlands and swamps, rare in several cos. in the n. Timber Belt of e. Tex. and in Jefferson Co. in the Coastal Prairies, reported (*vide* Clausen) from Denton and Harris cos.; from P. E. I. and N. S., s. to Fla., w. to Ont., Tex. and (?) Ariz.; also Mex., Alas. and Euras.

FAM. 7. SCHIZAEACEAE MART. CURLY-GRASS FAMILY

Terrestrial plants, rigidly erect to climbing, small and inconspicuous to rather large and prominent, with short or slender-creeping to ascending rhizomes; fronds erect to twining, of diverse forms; sporophylls borne on the fronds or on specialized fronds; sporangia superficial, borne singly or in a double row on narrow specialized leaf segments or upon slender ultimate divisions of specialized nonfoliose pinnae, usually obovoid, sessile, having a complete articulated annulus at the apex, dehiscing by a longitudinal slit, without indusia or with false indusia; prothallia green, flat, simple or somewhat filamentous and branched.

This family comprises four genera with about 160 species that are almost entirely confined to tropical regions of both hemispheres. They are rare in temperate regions.

1. Plants erect; sterile pinnae ovate to lanceolate 1. *Anemia*, p. 45.
 1. Plants climbing, twining; sterile and fertile pinnae palmate
 2. *Lygodium*, p. 45.

1. ANEMIA Sw.

About 90 species, mostly in tropical America.

1. *Anemia mexicana* Kl. Fronds to 5 dm. tall, from a hairy creeping rhizome; stipe to 3 dm. long; sterile portion of blade deltoid-ovate, pinnate, to 22 cm. long and 15 cm. wide; sterile pinnae in 4 to 6 pairs, subcoriaceous, with serrulate margins; fertile pinnae long-petioled, to 3 dm. long and 5 mm. in diameter, glandular, the pinnules composed of densely clustered sporangia. *Ornithopteris mexicana* (Kl.) Underw. On partially sheltered limestone ledges and bluffs, wooded rocky slopes, bank of dry ravines, rock walls of limestone conglomerate and clay in canyons and gorges, in s. half of the Edwards Plateau, with a lone station in Austin Co. in s.e. Blackland Prairies; also Mex. (s. to Hgo. and Mor.).

2. LYGODIUM Sw. CLIMBING FERN

Several species that are most abundant in tropical regions of both hemispheres.

1. *Lygodium japonicum* (Thunb.) Sw. Slender twining plants mostly of low woods and thickets with slender hairy rhizomes; fronds climbing, vinelike, pinnate, often several m. in length; sterile pinnae triangular-lanceolate in outline, long-acuminate, to 2 dm. long, the ultimate segments ovate to linear-lanceolate; fertile pinnae divided similarly to the sterile ones, to 1 dm. long, the ultimate segments deltoid to flabellate; sporangia obovoid, borne in a double row on the contracted fingerlike revolute segments of the ultimate lobes; false indusia membranous, scalelike, hooded, attached to short oblique veins. In sandy damp woods, usually along streams and rivers, and along roadside ditches, established in several cos. in the s.e. corner of Tex.; nat. of Asia and the Austral. trop., but escaped and well-established at several localities from Fla. to N.C., w. to La. and Tex.

FAM. 8. OSMUNDACEAE R. BR. CINNAMON FERN FAMILY

Large terrestrial to subaquatic plants of low moist soils and wet places with creeping to erect woody rhizomes, rarely arborescent, the roots hard and fibrous; fronds erect-spreading, occasionally as much as 18 dm. or more tall, clustered; stipes scaleless; blades

bipinnatifid to bipinnate, rather coarse, uniform to entirely dimorphic or with some of the pinnae dimorphic, with the usually forked veins free and extending to the margins of the ultimate segments; sporangia in dense paniculate clusters, entirely replacing the vegetative tissue of certain pinnae or whole fronds, naked, large, globose, usually short-stalked, longitudinally cleft into two halves, with the ring or annulus few-celled or wanting; spores green.

This family comprises three genera, the following and two Old World genera, that include about 20 species.

1. OSMUNDA L.

Rather coarse plants; fronds in a large crown from a woody rhizome, arranged in two circles, the inner circle fertile, erect and developing first, the outer circle sterile and spreading; blades wholly spore-bearing or with part of the pinnae spore-bearing either near the middle or at the apex, the spore-bearing tissue red or brown; sporangia short-stalked, densely clustered on the ultimate veinlets; spores copious, green.

About 10 species, mostly in the north temperate regions of both hemispheres.

1. Sterile blades pinnate-pinnatifid, the ultimate segments entire; fertile fronds separate, cinnamon-colored at maturity 1. *O. cinnamomea*.
1. Sterile blades bipinnate, the pinnules serrulate; upper pinnae modified for spore production 2. *O. regalis* var. *spectabilis*.

1. *Osmunda cinnamomea* L. CINNAMON FERN. Fronds several, erect, dimorphic, to 15 dm. tall; stipes irregularly coated with a loose cinnamon-colored tomentum; sterile blades lanceolate to oblong-lanceolate, acuminate, to 1 m. long and 35 cm. wide; pinnae opposite to subopposite, deeply pinnatifid, with a tuft of tomentum persisting at the base of each pinna; fertile blades succulent, nonfoliose, soon withering. Usually in moist or wet soil of swamps, marshes, on open or wooded seepage slopes, along streams, on the edge of lakes and bogs and occasionally on wet ledges, rather generally distributed in the Timber Belt, s. to Orange Co. in the Coastal Prairies, w. to Gonzales, Lee and Milam cos. in the Blackland Prairies, with a lone station in Uvalde Co. on the Edwards Plateau; throughout e. N. A. from Nfld. to Minn., s. to cen. Fla. and N. M.

2. *Osmunda regalis* L. var. *spectabilis* (Willd.) Gray. ROYAL FERN. Fronds clustered, to 18 dm. tall; stipes slender, glabrous; blades broadly elliptic to oblong-ovate, with the lower 2 to 6 pairs of pinnae sterile, the upper pinnae transformed into fertile ones. In swamps, marshes, moist woods, depressions in savannahs and prairies, on stream banks and seepage slopes, and in or on the edge of lakes, generally distributed and common in the Timber Belt, s. and s.w. to Jefferson and Victoria cos. on the Coastal Prairies, w. to Travis Co. in the Blackland Prairies adj. to the Edwards Plateau; from Nfld. to Sask., s. to Fla. and Tex.; also Berm., the W. I., Mex., C. A. and S. A.

FAM. 9. MARSILEACEAE R. BR.

PEPPERWORT FAMILY

Plants herbaceous, rooting in mud, creeping, often partly submerged, rarely floating, with slender branched rhizomes; leaves erect or floating, distichous, more or less remote, filiform or with long-petiolate 2- to 4-foliate blades; leaflets (when present) of a cuneate type, with close dichotomous venation; sporocarps hard, bony, globose to ellipsoid, pilose or essentially glabrous, pedunculate, one to several borne on the rhizome near the base of the petiole or upon the petiole; sori solitary within the compartments, each producing both megaspores and microspores; megaspores germinate into prothallia that bear mostly archegonia; microspores germinate into prothallia that bear antheridia.

This family comprises three genera containing more than 70 species that are found chiefly in the Old World.

1. Leaf blade 4-foliate 1. *Marsilea*, p. 47.
1. Leaves filiform 2. *Pilularia*, p. 48.

I. MARSILEA L. WATER CLOVER

Small plants forming dense colonies; leaves long-petiolate, with cruciform (4-foliate) blades; sporocarps subglobose to ellipsoid, mostly with 2 teeth near the base, splitting into 2 valves at maturity and emitting numerous sori on a gelatinous receptacle; sori including both megasporangia and microsporangia.

About 60 species of wide distribution, mainly in the Old World.

1. Sporocarps several on a special branch or from a common peduncle (2)
1. Sporocarps solitary, with paleaceous hairs or naked; leaves and petioles naked or sparsely pubescent (3)
 - 2(1). Leaflets and petioles with long loose hairs, without colored stripes; sporocarps densely covered with reddish hairs that are to 3 mm. long 1. *M. macropoda*.
 2. Leaflets and petioles essentially glabrous, usually developing (with age) reddish-brown stripes on the lower surface; sporocarps losing (with age) its light-brown hairs 2. *M. mexicana*.
- 3(1). Leaflets narrowly and obliquely cuneate, usually irregularly toothed or crenulate at the apex 5. *M. tenuifolia*.
3. Leaflets flabellate to broadly cuneate, with entire or undulate-crenulate margins (4)
- 4(3). Rhizome without conspicuous fascicled branches; peduncle usually very short, often scarcely as long as the sporocarp, usually free from the petiole or attached at its very base; sporocarp with rather long coarse reddish hairs 3. *M. mucronata*.
4. Rhizome producing fascicled branches that are paleaceous at their tips; peduncle about twice the length of the sporocarp or more, usually attached above the base of the petiole; sporocarp sparsely provided with short coarse hairs 4. *M. uncinata*.

1. *Marsilea macropoda* A. Br. Plants robust, to 25 cm. tall, forming large mats; leaflets broadly cuneate, to 5 cm. long and 2 cm. wide; sporocarps 2 to 6 on erect or ascending branched peduncles that are 2-3 cm. long, obliquely obovate, 6-8 mm. long, 5-6 mm. in diameter. In mud or sandy soil and water of swamps, marshes, woodland bogs, ditches, streams, and on the edge of ponds and lakes, apparently endemic to Tex. where it is widespread and rather frequent in the Rio Grande Plains, n. and e. to Jackson Co. in the Coastal Prairies, Travis Co. in the Blackland Prairies, and in the cos. bordering the Edwards Plateau.

2. *Marsilea mexicana* A. Br. Plants to 2 dm. tall; leaflets broadly cuneiform to obovate-flabellate, 1-1.5 cm. long, typically marked with reddish-brown stripes (or glands?) parallel with the veins on the lower surface; sporocarps densely clustered on special branchlets, these bearing also slender terete rigid rootlike structures, obovoid to ellipsoid, about 4 mm. long, dark-colored. In shallow water or on mud flats of pools and ponds in Aransas Co. on the Tex. coast; from Tex. and Mex., s. to Hond.

3. *Marsilea mucronata* A. Br. Plants to 2 dm. tall; leaflets obovate to spatulate, truncated to rounded at the entire or toothed apex, to 15 mm. long, about as wide as long; sporocarps oval to ellipsoid, to 18 mm. long, 3-6 mm. in diameter. *M. vestita* of auth. Usually in black waxy mud along streams and rivers, in and about ponds, in silt of lakes, and in ditches or depressions such as old buffalo wallows in prairies that are periodically inundated, the most widespread *Marsilea* in Tex., occurring in every section but the Timber Belt, most frequent and abundant in the Blackland Prairies and on the Edwards Plateau; from s. Sask. and Alta., s. to Tex., N. M., Ariz. and Coah. e. to Fla.

4. *Marsilea uncinata* A. Br. Plants to 2 dm. tall; rhizomes producing fascicled branches that are paleaceous at their tips; leaflets obovate to broadly flabellate, to 3 cm. long and wide; sporocarps subglobose to ellipsoid, 4-8 mm. long, 3-6 mm. in diameter, more or less covered with short reddish hair. In or on the edge of permanent ponds, along spring branches and in shallow water of brooks, ditches and bayous, rather generally distributed but uncommon in the Blackland Prairies and in several isolated localities in every section of Tex. except the Timber Belt; apparently confined to Tex. and La.

5. *Marsilea tenuifolia* Kunze. Plants slender, 5-17 cm. tall; leaflets narrowly cuneate, truncate and usually irregularly toothed at apex, more or less falcate, to 25 mm. long, 2-8 mm. wide; sporocarps on short slender peduncles, 5-8 mm. long, 4-5 mm. in diameter. *M. vestita* var. *tenuifolia* (Engelm.) Underw. & Cook. On the edge of lakes, in shallow beds of creeks, and in periodically inundated depressions, especially in old buffalo wallows, rare on the Edwards Plateau, in Travis Co. in the Blackland Prairies and in the s. part of the Plains Country; apparently confined to Tex. and Okla.

2. PILULARIA L. PILLWORT

Six widely distributed species.

1. *Pilularia americana* A. Br. AMERICAN PILLWORT. Very small inconspicuous plants of muddy situations, with slender wide-creeping rhizomes bearing at the nodes one to several leaves, forming dense mats; leaves setiform, solitary or sometimes several together from the nodes, glabrous, 2-6 cm. long, rarely to 1 dm. long; sporocarps produced just below surface of ground, axillary, pedunculate, globose, brownish-yellow, 2-3 mm. in diameter. In shallow temporary muddy pools on rock flats and depressions in clayey prairies, only in Burnet Co. on the Edwards Plateau; from s. Calif. to Ore., also isolated in s.-cen. Kan., w.-cen. Okla., w. Ark. and cen. Ga.

FAM. 10. SALVINIACEAE DUM. SALVINIA FAMILY

Plants minute or small, aquatic, free-floating or on mud, with a branched rhizome bearing simple roots (*Azolla*) or essentially stemless with some of the leaves modified as roots (*Salvinia*); leaves 2-ranked or in whorls, opposite or alternate, simple or lobulate; sporocarps soft, thin-walled, borne singly or two or more on a common stalk at the base of the leaves, 1-celled, with a central often branched receptacle, unisexual, bearing either megasporangia containing a solitary megaspore or microsporangia containing numerous minute microsporangia; massulae within macrosporangia bearing septate or non-septate glochidia with barbed tips; megasporangia germinate into prothallia bearing archegonia; microspores germinate into prothallia bearing antheridia.

This family comprises 2 genera of wide distribution—*Salvinia* and *Azolla* with about 16 species.

1. AZOLLA LAM. WATER FERN

Minute reddish or green free-floating plants, occasionally on mud, mostly densely matted and resembling some species of liverworts, with the stems pinnately branched and concealed by roots and imbricating leaves; leaves distichous, 2-lobed, with the upper lobe floating and the lower lobe submersed; sporocarps borne in one or two pairs on the lower leaf lobe.

This genus consists of about 6 species of wide distribution.

1. Glochidia not septate; plants to 1 cm. in diameter; leaves about 0.5 mm. long, not closely imbricate 1. *A. caroliniana*.
1. Glochidia many-septate; plants usually more than 1 cm. in diameter; leaves 0.7 mm. long or more, closely imbricate 2. *A. mexicana*.

1. *Azolla caroliniana* Willd. Plants forming floating mats to 3 cm. across; leaves minute, deeply bilobed, imbricate, mostly with hyaline margins, to 0.9 mm. long and 0.6 mm. wide, the upper emersed lobes oval or suborbicular-quadrate, deep-green to purplish-red, somewhat convex, hollow, provided with numerous 2-celled hairs, the lower submersed lobes glabrous, larger and paler than the upper lobes. On still water of swamps, ponds, lakes and in slow-moving water of streams and resting on mud, up to 5,500 ft. alt., sporadically distributed from Wood Co. in the n.e. Timber Belt, s. to

Orange Co. on the Coastal Prairies and Cameron Co. in the Rio Grande Plains, w. to Jeff Davis and Presidio cos. in the Trans-Pecos; from Fla. w. to Tex., n. to N.C., O. and Alas.; also the W. I. and Mex. to Patagonia.

2. *Azolla mexicana* Presl. Plants similar to *A. caroliniana* but with larger leaves; leaves tinged with purplish-cerise, papillose, with narrow hyaline cellular-papillose margins, the lower lobe usually much larger than the upper lobe. Floating on surface of lakes and ponds and in quiet waters of streams and irrigation canals in the Rio Grande Valley of s. Tex.; from s. Tex. and Mex., s. to n. S. A., n. to Ut., B.C., Wisc. and Ill.

FAM. 11. POLYPODIACEAE S. F. GRAY

TRUE FERN FAMILY

Usually large terrestrial or epiphytic plants of diverse habits with short or elongate creeping to suberect rhizomes; fronds clustered or remote, pendent to erect-spreading, commonly stalked, occasionally dimorphic; blades simple to much decomposed and variously dissected, with the veins simple to mostly forked, free or united and forming areoles with or without included veinlets; sporangia long-stalked, provided with an incomplete vertical annulus and opening transversely, borne either upon the veins on the lower surface or near the margins of ordinary leaf blades in lines or clusters (sori), occasionally borne on wholly fertile fronds or on partially sterile blades; sori naked or covered by a membrane (indusium) that develops from either the vein or modified leaf-margin; prothallia green.

This family, that includes about 50 genera and several thousand species, is by far the largest family of ferns in that it includes more than two thirds of the living ferns. They are found throughout the world from arctic to tropical regions in dense rain forests to desert areas.

1. Blades simple, pinnatifid or once-pinnate; pinnae or primary divisions entire, toothed or pinnatifid (2)
 1. Blades twice-pinnate or more dissected (20)
 - 2(1). Blades simple 12. *Polypodium*, p. 62.
 2. Blades not simple (3)
 - 3(2). Primary divisions or pinnae with the margins entire, undulate, irregularly toothed or incised, never distinctly pinnatifid (4)
 3. Primary divisions or pinnae distinctly pinnatifid (13)
 - 4(3). Sterile or leafy blades deeply pinnatifid, with greater portion of the rachis winged (5)
 4. Blades distinctly pinnate (7)
 - 5(4). Plants epiphytic or on rocks; fronds all alike 12. *Polypodium*, p. 62.
 5. Plants terrestrial in low wet places; fronds dimorphic (6)
 - 6(5). Primary segments with entire to undulate margins; sterile blades with the pinnae commonly opposite or essentially so; sporophylls with the divisions closely rolled together, beadlike 9. *Onoclea*, p. 61.
 6. Primary segments with serrulate margins; sterile blades with the pinnae commonly alternate; sporophylls with the divisions narrowly linear 11. *Lorinseria*, p. 62.
 - 7(4). Sori submarginal; indusia formed in part by the somewhat modified leaf margins (8)
 7. Sori dorsal; indusia not formed by the leaf margins (9)
 - 8(7). Fronds densely pubescent or scaly (or both), sometimes yellow- or white-farinosose beneath 8. *Notholaena*, p. 58.
 8. Fronds not densely pubescent or scaly beneath 6. *Pellaea*, p. 53.
 - 9(7). Sori linear to oblong-elliptic, never orbicular 13. *Asplenium*, p. 63.
 9. Sori reniform to orbicular (10)

- 10(9). Sori in a single row on either side of the midrib; veins all free (11)
10. Sori in two rows or more; veins free or sometimes anastomosing (12)
- 11(10). Pinnae with bristly teeth on the margins, the fertile pinnae much reduced; indusia orbicular 19. *Polystichum*, p. 66.
11. Pinnae without bristly teeth on the margins; fertile pinnae subequal to the sterile ones; indusia reniform-orbicular 20. *Nephrolepis*, p. 67.
- 12(10). Blades pinnately lobed; pinnae with spinulose-toothed margins; veins usually free 17. *Phanerophlebia*, p. 66.
12. Blades irregularly several-lobed; pinnae with smooth sinuate margins; veins anastomosing to form areoles 18. *Tectaria*, p. 66.
- 13(3). Blades pentagonal, waxy beneath or densely hispid-pubescent (14)
13. Blades not pentagonal, glabrous to laxly pubescent (15)
- 14(13). Blades densely hispid-pubescent 5. *Bommeria*, p. 53.
14. Blades white- or yellow-waxy beneath, otherwise glabrous 8. *Notholaena*, p. 58.
- 15(13). Sori submarginal; indusia formed in part by the somewhat modified leaf margins 3. *Pteris*, p. 52.
15. Sori dorsal; indusia not formed by the leaf margins (16)
- 16(15). Sori orbicular to reniform-orbicular (17)
16. Sori linear to elliptic, never orbicular (19)
- 17(16). Plants rather small, mostly less than 4 dm. tall; lowermost pinnules pinnatifid with the lobes toothed; indusia inferior, cuplike, cleft into narrow or broad segments with age 15. *Woodsia*, p. 64.
17. Plants usually large, mostly more than 5 dm. tall; pinnules coarsely toothed at most, never pinnatifid; indusia (when present) superior, reniform-orbicular, with a narrow sinus (18)
- 18(17). Acicular, unicellular hairs present on the costae above; segments of the fronds ciliate; stipe bundles 2, these united below the base of the blade; rhizome scales ciliate (sometimes sparingly so); rhizomes slender, mostly creeping; fronds membranous, mostly deciduous; veins reaching the margin 21. *Thelypteris*, p. 67.
18. Acicular hairs absent on the costae above; segments of the fronds not ciliate; stipe bundles 3 to 7, free to above the base of the blade; rhizome scales not ciliate, sometimes toothed; rhizomes massive, short-creeping to erect; fronds herbaceous to coriaceous, sometimes evergreen; veins ending short of the margin in elongate hydathodes 22. *Dryopteris*, p. 68.
- 19(16). Sori parallel to and contiguous to the midrib of the leaf segments on specialized veins 10. *Woodwardia*, p. 61.
19. Sori borne obliquely to and away from the midrib of the leaf segments on ordinary veins 14. *Athyrium*, p. 64.
- 20(1). Sori submarginal or essentially marginal; indusia usually formed in part by the somewhat modified leaf margins (21)
20. Sori dorsal; indusia not formed by the leaf margins (26)
- 21(20). Sori globular, cup-shaped and somewhat bivalvate 1. *Dennstaedtia*, p. 51.
21. Sori neither globular nor valvate (22)
- 22(21). Plants mostly large and coarse; rhizome hairy, not scaly; stipe (above base) and rachises stramineous; blades ternately divided; sporangia borne on a continuous veinlike receptacle connecting the apices of the veins 2. *Pteridium*, p. 51.
22. Plants mostly small and delicate; rhizome scaly, sometimes also hairy; stipes and rachises varying from stramineous to reddish-purple or blackish; sporangia borne at or near the apices of unconnected veins (23)

- 23(22). Sori borne on the under surface of the recurved portion of the ultimate segments; blades with only the apical margin of the ultimate segments recurved 4. *Adiantum*, p. 52.
23. Sori not borne on the under surface of a recurved marginal lobule but on the leaf surface under a recurved marginal lobule (when this is present) (24)
- 24(23). Margin usually strongly modified and reflexed, elongate and continuous; pinnae scaleless, mostly glabrous, sometimes white-waxy beneath; rhizomes multicipital or creeping 6. *Pellaea*, p. 53.
24. Margin reflexed or not, mostly interrupted (25)
- 25(24). Vein ends thickened; margin mostly reflexed, sometimes modified; rhizomes multicipital or creeping; pinnae glabrous or mostly hairy or scaly, not waxy 7. *Cheilanthes*, p. 55.
25. Vein ends thickened or not; margin not or scarcely reflexed, not modified; rhizomes multicipital; pinnae scaly, hairy, or mostly white- or yellow-waxy 8. *Notholaena*, p. 58.
- 26(20). Sori linear-elliptic; indusia curved and crescentiform 14. *Athyrium*, p. 64.
26. Sori round; indusia not curved or crescentiform (27)
- 27(26). Plants rather large, usually more than 5 dm. tall; indusia superior, reniform-orbicular, attached at the sinus (28)
27. Plants small, mostly less than 4 dm. tall; indusia not as above (29)
- 28(27). Acicular, unicellular hairs present on the costae above; segments of the fronds ciliate; stipe bundles 2, these united below the base of the blade; rhizome scales ciliate (sometimes sparingly so); rhizomes slender, mostly creeping; fronds membranous, mostly deciduous; veins reaching the margin 21. *Thelypteris*, p. 67.
28. Acicular hairs absent on the costae above; segments of the fronds not ciliate; stipe bundles 3 to 7, free to above the base of the blade; rhizome scales not ciliate, sometimes toothed; rhizomes massive, short-creeping to erect; fronds herbaceous to coriaceous, sometimes evergreen; veins ending short of the margin in elongate hydathodes 22. *Dryopteris*, p. 68.
- 29(27). Blades thick-membranous, broadest above the middle; indusia inferior, cuplike, cleft into narrow or broad segments with age 15. *Woodsia*, p. 64.
29. Blades thin-herbaceous, broadest below the middle or at the base; indusia attached by one side at the base, hoodlike 16. *Cystopteris*, p. 65.

1. DENNSTAEDTIA BERNH.

HAY-SCENTED FERN

About 70 species, mainly in tropical regions.

1. *Dennstaedtia globulifera* (Poir.) Hieron. Usually large plants with slender wide-creeping rhizomes; fronds not joined to the rhizome, more or less clustered to somewhat distant, erect or arching, devoid of scales; stipes rather stout, to 1 m. long, bright-yellowish-brown, lustrous; blade ample, thick-membranous, deltoid-lanceolate, 1-3 m. long and broad, coarsely tripinnate; ultimate segments toothed; veins free, simple or branched; sori numerous, marginal, solitary, terminal on the free veinlets; indusia cuplike or pouchlike, formed in part by a more or less modified recurved segment of the leaf margin. Rare in caves of Val Verde Co.; from s.w. Tex., s. through Mex., C. A. and the W. I. to n. S. A.

This primarily tropical fern, the largest species in our region, is well-established in the protective environment of caves or "sinks" north of Comstock.

2. PTERIDIUM SCOP.

BRACKEN

Coarse plants with slender woody subterranean branching rhizomes, often forming large colonies; fronds erect-ascending, spreading, borne singly; stipes stout, partly woody,

continuous with the rhizome; blades ternately divided, broadly triangular, rigidly herbaceous to coriaceous, the ultimate segments with entire margins, with the veins free and mostly forked; sori linear, marginal, continuous; indusia double, continuous, the outer one formed by the reflexed membranous margin of the ultimate segments, the minute inner one delicate and nearly concealed by the numerous sporangia.

One world-wide species represented by several geographic varieties.

1. Indusia glabrous; ultimate segments glabrous beneath or only slightly pubescent on part of the segment; east Texas 1. *P. aquilinum* var. *pseudocaudatum*.
1. Indusia ciliate or pubescent on the outer surface, or both; ultimate segments densely or sparsely pubescent beneath; Trans-Pecos 1. *P. aquilinum* var. *pubescens*.

1. *Pteridium aquilinum* (L.) Kuhn var. *pseudocaudatum* (Clute) Heller. Fronds to about 2 m. tall; stipes dark-purple-brown at the base to stramineous above; blades nearly or quite glabrous, about 5 dm. long, the 3 main divisions usually bipinnate; terminal pinnules long-produced, 7 to 15 (averaging 9) times as long as broad. *Pteris aquilina* var. *pseudocaudata* Clute, *Pteridium latiusculum pseudocaudatum* (Clute) Maxon. In dry woodlands and thickets in the Timber Belt of e. Tex. and in the s. half of the Blackland Prairies, s.w. to Wilson Co.; from Fla. to Tex., n. to Mass., Ind., Mo. and Okla.

Var. *pubescens* Underw. Plant similar to var. *pseudocaudatum* but with the blades usually densely pubescent to sericeous-tomentose on lower surface; longest entire segment or entire part of segment 3 to 5 (averaging 4) times as long as broad. Rocky open-wooded slopes of high mts. in Jeff Davis Co. in Trans-Pecos Tex., over 7,000 ft. alt.; from several isolated localities in Que., Ont., and Mich. to S.D., Alas., B.C. and w. U. S., s. to Tex. and Mex.

3. PTERIS L. BRAKE

About 250 species that are mostly found in tropical and subtropical regions of both hemispheres.

1. *Pteris multifida* Poir. HUGUENOT-FERN. Fronds clustered, usually drooping, 1-6 dm. long; stipes slender, sulcate, lustrous, to 28 cm. long; blades ovate to ovate-elliptic in outline, to 35 cm. long, pedately divided; ultimate segments linear-lanceolate and serrate along the sterile margins, 4-7 mm. wide, with the veins free and simple or forked; sori linear, marginal, mostly not continuing to the extreme base and apex of the pinnae; indusia single, linear, membranous, formed by the modified reflexed margins of the segments. *Pycnodoria multifida* (Poir.) Small. Naturalized in e. Tex. and in the Rio Grande Valley, commonly on masonry; believed to be a nat. of China but cult. throughout the world, occurring as an escape in the U. S. from Fla. to N. C. and Tex.

4. ADIANTUM L. MAIDENHAIR FERN

Delicate terrestrial or rock-inhabiting plants of moist wooded slopes, ravines and stream banks, with slender creeping to short and ascending scaly rhizomes; fronds suberect to pendent, distichous or in several ranks; stipes slender, strong, usually blackish and lustrous, glabrous or rarely pubescent, scaly at base only; blades pedately or pinnately decomposed, variously dissected, rarely simple; ultimate segments oblique, petiolate or sessile, articulate and deciduous in some species, membranous to subcoriaceous, mostly glabrous, with the veins free and forking or rarely anastomosing; sori borne along or rarely between the ends of the ultimate veins, appearing marginal on the back of the reflexed apex of the lobules of the pinnules or ultimate segments; indusia formed in part by the reflexed margins of the lobules.

About 200 species, mainly in tropical America. Many species are cultivated.

1. Fronds smooth; ultimate segments obovate-cuneate or rhombic, usually prominently incised1. *A. Capillus-Veneris*.
1. Fronds pilose with whitish hairs; ultimate segments suborbicular, not prominently incised2. *A. tricholepis*.

1. *Adiantum Capillus-Veneris* L. CULANTRILLO. Rhizome slender, creeping; fronds numerous, clustered or scattered along rhizome, to 7 dm. long, laxly ascending or pendulous; blades broadly ovate to lanceolate, to 4 dm. long and 35 cm. wide. *A. modestum* Underw., *A. tricholepis* f. *glabrum* Clute. Limestone rocks, ledges and cliffs, especially along streams and about pools in canyons and ravines, frequent on the Edwards Plateau and in the Trans-Pecos, e. to Harris Co. on the Coastal Plain and s.w. to Zavala Co. in the Rio Grande Plains, with a few stations in the Blackland Prairies and n.-cen. Plains Country; from Va., s. to Fla., w. to Ky., Tenn., Mo., Ariz. and Mex. to n. S. A.; also Euras.

2. *Adiantum tricholepis* Fée. HAIRY MAIDENHAIR FERN. Rhizome short, stout; fronds several, cespitose, erect-recurved to pendulous, to 7 dm. long; blades oval to ovate, to 4 dm. long and 35 cm. wide. On moist limestone cliffs along wooded streams on the Edwards Plateau; uncommon in Tex., Mex. and Guat.

5. BOMMERIA FOURN.

A small genus of 4 species that occur from Texas to California southward to Guatemala.

1. *Bommeria hispida* (Mett.) Underw. HAIRY BOMMERIA. Small terrestrial or saxicolous fern with slender wide-creeping scaly rhizomes; fronds erect, usually 10-15 cm. tall, rarely more; stipes slender, much longer than the blades, light-brown, hairy and sparingly scaly; blades deltoid, pentagonal, pinnatifid to tripinnatifid, the main rachis winged throughout, herbaceous to coriaceous, hispid on upper surface, hispid and rusty-tomentose on lower surface, to 10.5 cm. long and wide, with the veins free and forked or anastomosing; sporangia following the veins throughout, naked or rarely protected by the reflexed margins of the segments. *Gymnogramma hispida* Mett., *Gymnopteris hispida* (Mett.) Underw. Crevices of bluffs, on steep rocky slopes and flat rocks, in mts. of Trans-Pecos Tex.; from w. Tex. to Ariz. and Dgo.

6. PELLAEA LINK CLIFF BRAKE

Rather small or occasionally large rigid rock-inhabiting plants with slender long-creeping to short stout multicapital rhizomes; fronds erect to recurved; stipes and rachis slender, wiry, pale-brown or tan-colored to purplish-black, often shiny; blades 1- to 4-pinnate, the segments jointed and deciduous, with the free veins forked; sori intramarginal, terminal on the veins, elongate, at length contiguous laterally to form a marginal line, protected by the reflexed margins of the fertile segments, the margin often modified as a thin or membranous tissue.

About 80 species that are widespread but most abundant in tropical and subtropical regions.

1. Blades linear-oblong to oblong-lanceolate, pinnate-pinnatifid (trifoliate) or if bipinnate below with the 2 to 3 pairs of pinnules distinctly mucronate (2)
1. Blades triangular-ovate to broadly oblong or lanceolate, bipinnate to tripinnate or if simply pinnate with the pinnules nonmucronate (3)
- 2(1). Stipe dark-castaneous to ebeneous; pinnae all trifoliate; midvein of segments noticeably light-brown beneath3. *P. ternifolia* var. *ternifolia*.
2. Stipe purplish-brown; lowermost pinnae usually pinnate; midvein of segments beneath not apparent3. *P. ternifolia* var.

Wrightiana.

- 3(1). Pinnules or ultimate segments sharply long-mucronate
4. *P. longimucronata*.
3. Pinnules or ultimate segments not sharply long-mucronate (4)
- 4(3). Rachises uniformly fractiflex throughout6. *P. ovata*.
4. Rachises not fractiflex, at most slightly flexuous (5)
- 5(4). Rhizome slender, widely creeping, about 1.5 mm. in diameter; rachises of pinnae densely hispidulous7. *P. intermedia*.
5. Rhizome stout, usually multicapital, not widely creeping; rachises of pinnae glabrous to pubescent (6)
- 6(5). Pinnules or ultimate segments ovate to suborbicular, deeply cordate to subsagittate at base5. *P. sagittata* var. *cordata*.
6. Pinnules or ultimate segments elliptic to linear-lanceolate or rarely ovate, broadly cuneate to truncate or rarely shallowly subcordate at base (7)
- 7(6). Stipe reddish-brown, glabrous to very sparsely pubescent with long flaccid articulate hairs; blade bluish-green1. *P. glabella*.
7. Stipe dark-purple to blackish, provided with appressed crisp hairs; blade dull-green to grayish-green2. *P. atropurpurea*.

1. *Pellaea glabella* Kuhn. SMOOTH CLIFF BRAKE. Fronds clustered, to 3 dm. tall; blades oblong to lanceolate, to 9 cm. long, usually less than 5 cm. wide, pinnate to bipinnate (at least below). In crevices and on ledges of limestone or calcareous sandstone, in exposed situations, found only along John Rey Creek in Potter Co. in the n. Plains Country; from Que. to B. C., s. through N. E. to Va., Tenn., Ark., Okla., n.w. Tex. and Colo.

2. *Pellaea atropurpurea* (L.) Link. PURPLE CLIFF BRAKE. Fronds clustered, erect-spreading, to 45 cm. tall; blades deltoid-ovate to oblong or lanceolate, to 3 dm. long and 2 dm. wide, simply pinnate to bipinnate below; pinnae oblong to lanceolate. On rock ledges, among rocks, on cliffs, canyon walls, banks and talus slopes of limerock, and in open rocky woods, usually in partial shade, up to 6,500 ft. alt., represented throughout the state but most abundant on the Edwards Plateau and in the Trans-Pecos, rarest on the Coastal Prairies where rock outcrops are practically unknown; from Vt. and Ont. w. to S. D., s. to Fla. and s.w. through Tex., N. M., Ariz. and Mex. to Guat.

3. *Pellaea ternifolia* (Cav.) Link var. *ternifolia*. Fronds clustered, to 45 cm. tall; blades narrowly oblong-lanceolate to linear-lanceolate, to 3 dm. long and 7 cm. wide, pinnate-pinnatifid (at least below). Among rubble of shaded talus slopes and on ledges of igneous rock, usually in the protection of boulders and shrubs, up to 7,500 ft. alt., rare in the Trans-Pecos; from w. Tex., s. through Mex. and C. A. to Peru, Arg. and n. Chile; also Hisp. and H. I.

Var. *Wrightiana* (Hook.) A. Tryon. Fronds clustered, to 3 dm. tall; blades linear-oblong to lanceolate, to 25 cm. long and 3 cm. wide, pinnate-pinnatifid to bipinnate below. *P. Wrightiana* Hook. In crevices of ledges, shelter of boulders and on rocky ridges, on igneous rocks and sandstone, usually in exposed situations, up to 7,500 ft. alt., most frequent and widespread in s. and e. Edwards Plateau and in the s.w. Trans-Pecos, less common and s. to McMullen Co. in the Rio Grande Plains, n. to Palo Pinto Co. in the Cross Timbers, and e. to Washington Co., Blackland Prairies, and Tyler Co. in the Timber Belt; from e. Tex. and s.w. Okla. through Ariz. and n. Mex. to Baja Calif.

4. *Pellaea longimucronata* Hook. Fronds clustered, to 45 cm. tall; blades triangular-ovate to narrowly triangular-lanceolate, to 25 cm. long and 12 cm. wide below middle, bipinnate to occasionally tripinnate below. On and about granite boulders and in crevices of cliffs, up to 5,200 ft. alt., rare and of local occurrence in the Trans-Pecos and w. Edwards Plateau; from w. Tex. to Colo., Ariz. and Nev.; also n. Mex.

5. *Pellaea sagittata* var. *cordata* (Cav.) A. Tryon. Fronds approximate, erect or erect-arcuate, to 6 dm. tall; blades ovate-oblong, bipinnate to rarely tripinnate below. *P. cardiomorpha* Weath., *P. cordata* (Cav.) Sm. In shallow cavernous places in cliffs, on wet bluffs, in crevices on ledges of canyon walls and in rubble of talus slopes, up to 8,000 ft. alt., rare and of local occurrence in Trans-Pecos Tex., s. to cen. Mex.

6. *Pellaea ovata* (Desv.) Weath. Fronds approximate on slender rhizomes, to 1 m. or more tall; blades oblong, lax, to 7 dm. long and 15 cm. wide, divaricately bipinnate to

tripinnate. *Pteris flexuosa* Kaulf., *Pellaea flexuosa* (Kaulf.) Link. On dry ledges and talus slopes of limestone, calcareous rocks or granite, on or at the base of cliffs, and in rich soil in open rocky woodlands, in exposed or partially sheltered situations, up to 5,200 ft. alt., rather widespread and frequent in the s. and e. parts of the Edwards Plateau, w. to Brewster Co. in the Trans-Pecos, n. to Palo Pinto Co., with an isolated (possibly cult.) station in Chambers Co. in the Coastal Prairies; from Tex. to N. M., through e. Mex. to C. A. and S. A.

7. *Pellaea intermedia* Mett. Fronds distant on widely creeping slender rhizomes, to 4 dm. tall; blades broadly triangular-ovate to ovate-lanceolate or triangular-lanceolate, to 25 cm. long and 2 dm. wide, bipinnate to tripinnate. Incl. f. *pubescens* (Mett.) Broun and var. *pubescens* Mett. On dry rocky slopes and ledges, cap rock, cliffs and about boulders of limestone and igneous rocks, up to 7,000 ft. alt., rather frequent and generally distributed in the Trans-Pecos, with outlying stations in Val Verde Co. on the Edwards Plateau and Upton Co. in the extreme s. Plains Country; from s.w. Tex. to n. Mex.

7. CHEILANTHES Sw.

LIPFERN

Small evergreen plants with scaly short to wide-creeping multicipital rhizomes, usually found on rocks exposed to intense sunlight; fronds uniform, rigidly erect-spreading, mostly tomentose to glandular-pubescent or paleaceous; stipes wiry, blackish to reddish-brown or stramineous; blades pinnate to bipinnate-pinnatifid or more decomposed, often finely divided, with the veins free and thickened at the tips; sori borne at the thickened tips of the veins, marginal, roundish and distinct or narrowly confluent; indusia formed by the thin reflexed margin of the ultimate segments.

About 125 species widespread in temperate and tropical regions.

1. Blade broadly triangular to triangular-lanceolate or triangular-pentagonal (2)
1. Blade ovate to elliptic- or linear-lanceolate (5)
- 2(1). Rhizome slender, widely creeping12. *C. lendigera*.
2. Rhizome short, stout (3)
- 3(2). Frond essentially glabrous or glabrescent; stipe blackish or dark-purplish brown .
.....11. *C. aemula*.
3. Frond glandular-pubescent or hispid (4)
- 4(3). Stipe reddish-purple to purplish-brown, glandular-hirsute with brownish or
yellowish capitate hairs 1. *C. Kaulfussii*.
4. Stipe stramineous, hispid with whitish hairs 2. *C. leucopoda*.
- 5(1). Rhizome slender, widely creeping (6)
5. Rhizome stout, decumbent to suberect or shortly creeping (10)
- 6(5). Pinnae scaleless (7)
6. Pinnae conspicuously scaly (8)
- 7(6). Stipe and rachis terete, densely arachnoid-villous beneath
.....12. *C. lendigera*.
7. Stipe and rachis deeply channeled on the upper side, essentially glabrous
..... 9. *C. Wrightii*.
- 8(6). Ultimate segments hairy throughout; the larger scales of blade shortly ciliate at
the base13. *C. Lindheimeri*.
8. Ultimate segments glabrous above, essentially devoid of hairs throughout (9)
- 9(8). Scales of blade not ciliate, inconspicuously dentate .15. *C. Fendleri*.
9. Scales of blade long-ciliate (at least at the base)14. *C. Wootonii*.
- 10(5). Frond essentially glabrous to sparsely pubescent; ultimate segments not orbicular
or beadlike (11)
10. Frond densely pubescent, sometimes provided with prominent scales; ultimate seg-
ments usually minute, orbicular and beadlike (12)
- 11(10). Stipe and rachis terete throughout10. *C. alabamensis*.
11. Stipe and rachis deeply channeled on the upper side ... 9. *C. Wrightii*.

- 12(10). Frond provided with conspicuous scales that are ovate to ovate-lanceolate or narrowly lanceolate (13)
12. Frond scaleless or sometimes with extremely narrow palaceous hairs (16)
- 13(12). Blade rough on both surfaces with scattered short harsh whitish pustulate hairs; scales serrulate 5. *C. horridula*.
13. Blade not rough, densely long-pubescent; scales not serrulate (14)
- 14(13). Scales of rachises ovate-lanceolate, with a cordate base, closely imbricate; blade provided above with coarse white crisped flexuous hairs 6. *C. villosa*.
14. Scales of rachises narrowly lanceolate to linear, loosely imbricate (15)
- 15(14). Ultimate segments closely enveloped and held together by a mass of entangled hairs arising from both surfaces; pubescence and scales light-brown 7. *C. Eatonii* f. *Eatonii*.
15. Ultimate segments glabrescent above and separate, fewer and several times larger than in typical *C. Eatonii*; pubescence and scales usually deep-castaneous 7. *C. Eatonii* f. *castanea*.
- 16(12). Blade rough on both surfaces with scattered short harsh whitish pustulate hairs 5. *C. horridula*.
16. Blade not rough; hairs slender, not pustulate (17)
- 17(16). Stipe and rachis densely tomentose with hairs not noticeably articulate 8. *C. tomentosa*.
17. Stipe and rachis sparsely or densely hispidulous with noticeably articulate hairs (18)
- 18(17). Blade laxly villous-hirsute beneath with crisped hairs 3. *C. lanosa*.
18. Blade coarsely tomentose beneath 4. *C. Feei*.

1. *Cheilanthes Kaulfussii* Kunze. Fronds clustered, to 35 cm. tall, glandular-hirsute throughout with brownish to yellowish capitate hairs; blades short, broadly triangular-pentagonal, to 15 cm. long, ternately tripinnate to tripinnate-pinnatifid. In crevices of rock ledges and among boulders on hillsides and mt. slopes, up to 7,500 ft. alt., rare in the Trans-Pecos and in Llano Co. on the Edwards Plateau; from cen. Tex. through Mex. and C. A. to Col. and Venez.

2. *Cheilanthes leucopoda* Link. WHITEFOOT LIPFERN. Fronds clustered, to 3 dm. tall; blades triangular-pentagonal, sparsely glandular-pubescent throughout with yellowish hairs, to 16 cm. long and wide, tripinnate-pinnatifid to quadripinnate (at least below). On exposed limestone slopes and ledges on hills, mountainsides and in canyons, confined to several cos. on the Edwards Plateau; from s.w. Tex. to Dgo. and S. L. P.

3. *Cheilanthes lanosa* (Michx.) D. C. Eat. HAIRY LIPFERN. Fronds approximate, to 4 dm. tall; blades linear-oblong to oblong-elliptic or narrowly oblong-lanceolate, to 3 dm. long and 7 cm. wide, bipinnate-pinnatifid to occasionally tripinnate (at least below). On dry rocky slopes and ledges of sandstone in non-calcareous areas, only in McLennan Co. in the Blackland Prairies; from Conn. and N.Y., s. to Ga., La., Kan. and Tex.

4. *Cheilanthes Feei* Moore. SLENDER LIPFERN. Fronds cespitose, erect-spreading, to 25 cm. tall, usually much smaller; blades ovate to deltoid-ovate or linear-oblong, to 13 cm. long and 4 cm. wide, tripinnate or rarely bipinnate-pinnatifid. *C. lanuginosa* Hook. On dry rocky slopes and in dry crevices of boulders, cliffs and ledges of limestone or calcareous sandstone, usually exposed to intense sunlight, up to 7,000 ft. alt., rather generally distributed in the Plains Country and Trans-Pecos of n. and w. Tex., e. through the Edwards Plateau to Hamilton and Palo Pinto cos. in the n.w. Cross Timbers; from Ill. and Wisc., w. to B. C., s. to Ky., Ark., Okla., Tex., N. M., Ariz., s. Calif. and in adj. Mex. (Coah. and Chih.).

5. *Cheilanthes horridula* Maxon. Fronds clustered, to about 3 dm. tall; blades narrowly lanceolate to oblong-lanceolate, to 2 dm. long and 5 cm. wide, bipinnate to bipinnate-pinnatifid (at least below). *C. aspera* Hook., *Pellaea aspera* (Hook.) Hook. & Baker. In sheltered or exposed rock crevices of limestone or sandstone, where the plants are usually

so firmly imbedded that they are difficult to collect intact, up to about 4,000 ft. alt., rather frequent and generally distributed on the Edwards Plateau and in the Trans-Pecos, n. and e. to several cos. in the s. Plains Country and w. Blackland Prairies, s. along the Rio Grande to Starr Co. in the Rio Grande Plains; also Chambers Co.; from the Arbuckle Mts. of Okla., mainly through s.-cen. and w. Tex. to Dgo.

6. *Cheilanthes villosa* Davenp. Fronds clustered, to 35 cm. tall, usually much shorter; blades linear-oblong to narrowly oblong-lanceolate, acuminate, to 25 cm. long and 5 cm. wide, tripinnate to occasionally tripinnate-pinnatifid or rarely quadripinnate. In dry crevices of limestone ledges, cliffs and boulders or among granite boulders, in canyons and on mt. slopes, up to 6,000 ft. alt., generally distributed but uncommon in the Trans-Pecos and in Val Verde Co. on the Edwards Plateau; from w. Tex. to s. Ariz. and n. Mex.

7. *Cheilanthes Eatonii* Hook. & Baker f. *Eatonii*. Fronds tufted, to 4 dm. tall; blades oblong-lanceolate to narrowly lanceolate, to 6 cm. wide, mostly tripinnate. On and about igneous and limestone rocks on ledges and talus slopes, on bluffs and about large boulders in thinly wooded areas, chaparral and similar locations, up to 8,000 ft. alt., generally distributed and rather frequent in the Trans-Pecos, extending eastw. through the Edwards Plateau to Brown and Wilson cos., with an isolated station in Morris Co. in the n.e. Timber Belt where it occurs on ferruginous rocks and ledges in Daingerfield State Park; from n.e. Tex. to w.-cen. Okla., Colo. and Ariz. s. to Zac. and Hgo.

This species is represented in Texas by two intergrading phases—the densely villous typical form and the more or less glabrescent f. *castanea* (Maxon) Correll (*C. castanea* Maxon).

8. *Cheilanthes tomentosa* Link. WOOLLY LIPFERN. Fronds clustered, to 6 dm. tall; blades oblong-lanceolate to linear-lanceolate, acuminate, to 45 cm. long and 9 cm. wide, bipinnate-pinnatifid to tripinnate. In crevices of ledges on cliffs, on and about boulders, on wooded hillsides and mt. slopes, usually on sandstone, granite or siliceous rock, up to 7,000 ft. alt., rather generally distributed but of local occurrence in the n. half of the Blackland Prairies, in the s.e. Edwards Plateau and s. half of the Trans-Pecos, e. to Tyler Co. in the Timber Belt, s. to Atascosa Co. in the Rio Grande Plains and n.w. to Mitchell Co. in the extreme s. Plains Country; from Va., s. to Ga. and w. to Mo., Okla., Tex., Ariz. and n. Mex.

9. *Cheilanthes Wrightii* Hook. Fronds approximate, usually rigidly erect, usually less than 15 cm. tall, rarely to 25 cm.; blades lanceolate to elliptic-lanceolate, to 12 cm. long and 4 cm. wide, mostly tripinnatifid or bipinnate-pinnatifid. On exposed gravel and talus slopes and terraces, in crevices of igneous boulders and ledges in ravines and canyons, up to 5,000 ft. alt., rather generally distributed but uncommon in the s. and w. cos. of the Trans-Pecos; from w. Tex. to Ariz. and Mex. (s. to Dgo.).

10. *Cheilanthes alabamensis* (Buckl.) Kunze. ALABAMA LIPFERN. Fronds clustered, to 5 dm. tall; blades elliptic to narrowly lanceolate, to 35 cm. long and 8 cm. wide, bipinnate to bipinnate-pinnatifid. *C. microphylla* of auth. On limestone hillsides, in rock crevices and under protecting ledges in ravines and canyons, up to 5,500 ft. alt., often associated with *Pellaea atropurpurea*, rather widely distributed and frequent on the Edwards Plateau and in the Blackland Prairies and Trans-Pecos, with outlying stations in Walker Co. in the Timber Belt, Zapata Co. in the Rio Grande Plains and in several cos. in the s. Plains Country; from Fla. and Ala., n. to Va., w. to Mo., Okla., Tex., Ariz. and n. Mex.; also Jam.

11. *Cheilanthes aemula* Maxon. Fronds clustered, to 65 cm. tall; blades to 35 cm. long and 26 cm. wide at the base, deeply tripinnate-pinnatifid below, otherwise tripinnate nearly throughout. Shaded banks, among boulders, on ledges in limestone canyons, mainly on the Edwards Plateau, also in "western Texas," and in Austin Co. in s.e. Blackland Prairies; from s.-cen. Tex. and s. N.M. to cen. Mex. (s. to S. L. P.).

12. *Cheilanthes lendigera* (Cav.) Sw. Fronds scattered on a slender creeping rhizome, to 4 dm. tall; blades triangular-lanceolate to oblong- or elliptic-lanceolate, acuminate, to 2 dm. long and 7 cm. wide, tripinnate to quadripinnate. In crevices on cliffs and boulders in moist shaded ravines and canyons, up to 7,000 ft. alt., found only in the Chisos Mts., Brewster Co., in the Trans-Pecos; from w. Tex. and Ariz. through Mex. to Venez. and Ecu.

13. *Cheilanthes Lindheimeri* (Sm.) Hook. FAIRY SWORDS. Fronds scattered on a slender creeping rhizome, often forming extensive colonies, to 35 cm. tall; blades ovate-lanceolate to elliptic-lanceolate, to 2 dm. long and 5 cm. wide, tripinnate or quadripinnate. On dry shaded boulders and rock ledges of usually granite or sandstone, among talus rubble, in canyons, and on bluffs and cliffs, up to about 7,000 ft. alt., most frequent in the s. and w. Trans-Pecos and in the s.e. Edwards Plateau, with outlying stations in Palo Pinto Co. in the n. Cross Timbers and in McMullen Co. on the Rio Grande Plains; from Tex. to Ariz. and Mex. (s. to Dgo. and S. L. P.).

14. *Cheilanthes Wootonii* Maxon. BEADED LIPFERN. Fronds scattered on slender rhizomes, to 3 dm. tall; blades narrowly oblong to oblong-lanceolate, acuminate, to 18 cm. long and 5 cm. wide, tripinnate to tripinnate-pinnatifid or occasionally quadripinnate. In dry rocky places at the base of boulders and ledges or in shallow caverns formed by fallen boulders, up to 4,000 ft. alt., rare and of local occurrence in several cos. in the Trans-Pecos, with a questionable station in Hays Co. on the Edwards Plateau; from Okla., s.e. Colo. and s.-cen. Tex. to Ariz. and Son.

15. *Cheilanthes Fendleri* Hook. Fronds scattered on a slender creeping rhizome, to 3 dm. tall, usually much smaller; blades narrowly ovate-lanceolate to oblong-lanceolate, to 15 cm. long and 35 mm. wide, tripinnate, rigidly herbaceous. In rock crevices, at the base of boulders and along ledges, in shaded canyons and on dry wooded banks, up to 8,000 ft. alt., uncommon in the mts. of Hudspeth and Jeff Davis cos. in the Trans-Pecos, with an isolated locality in Crosby Co. in the Plains Country; from n.w. Tex. to Colo. and Ariz.

8. NOTHOLAENA R. BR.

CLOAKFERN

Small saxicolous ferns with glandular, paleaceous or variously hairy fronds from a short multicapital rhizome, very rarely without an indument, usually xerophytic; fronds rigidly erect or erect-spreading, uniform; stipes often longer than the blades, usually dark and rigid; blades linear to pentagonal, 1- to 4-pinnate and variously lobulate or pinnatifid, thick-herbaceous to coriaceous, sometimes white- to yellow-ceriferous beneath; veins all free, sometimes enlarged at the tips; sori usually submarginal, oblong to suborbicular, borne at the tip of veins; indusia wanting but the leaf margin either revolute and partially concealing the sporangia or flattish, the sporangia often somewhat protected and hidden by the hairy, scaly or waxy vestiture.

About 60 species that are found mainly in arid regions of both hemispheres. Included by some workers in *Cheilanthes*.

1. Indument of lamina (including upper and lower surface but excluding rachis) of scales or hairs, not ceraceous (2)
1. Indument of lamina (including upper and lower surface but excluding rachis) lacking or wholly (or at least in part) ceraceous (3)
- 2(1). Indument of scales (at least in part) 1. *N. sinuata*.
2. Indument of hairs only 2. *N. aurea*.
- 3(1). Indument of lamina ceraceous and of scales or hairs, or lacking (4)
3. Indument of lamina wholly ceraceous (8)
- 4(3). Indument lacking 13. *N. parvifolia*.
4. Indument of scales or hairs (or both) in addition to wax (5)
- 5(4). Indument on lower surface of lamina ceraceous and of large stiff brown trichomes 4. *N. Schaffneri* var. *Nealleyi*.
5. Indument on lower surface of lamina ceraceous and of scales and sometimes also tomentose (6)
- 6(5). Scales on lower surface of lamina long-ciliate or dissected 3. *N. Aschenborniana*.
6. Scales on lower surface of lamina entire or nearly so (7)

of the Trans-Pecos and Edwards Plateau, sparingly distributed in several extreme s. cos. in the Plains Country, e. to Anderson Co. on the e. edge of the Blackland Prairies, and s. to McMullen and Webb cos. in the Rio Grande Plains.

Var. *integerrima* Hook. is found in habitats similar to those of the other two phases. It has a wider area of general distribution than var. *cochisensis*, being found from s. Okla. and the w. half of Tex. to s.e. Ariz. and Mex. (s. to Ver.). In Tex. it is widespread and rather common in the Trans-Pecos and Edwards Plateau, more frequent than the other phases in the s. half of the Plains Country n. to Motley Co., e. to Palo Pinto Co. and s. to Zapata and Starr cos. in the Rio Grande Plains.

Var. *cochisensis* (Goodd.) Weath. (*HELECHILLO*) occurs from Tex. to Ariz. and Mex. It is widespread and frequent in the Trans-Pecos where it is usually abundant on high slopes and summits of limestone mts. It extends n.e. to Motley Co. in the Plains Country and e. to Sterling and Edwards cos. on the Edwards Plateau.

2. *Notholaena aurea* (Poir.) Desv. Fronds clustered, to 7 dm. tall; blades linear to linear-lanceolate, abruptly acute, to 45 cm. long and 35 mm. wide, pinnate-pinnatifid. *N. ferruginea* Desv., *N. bonariensis* (Willd.) C. Chr. On talus slopes and in crevices of ledges and cliffs, on canyon walls and about the base of boulders, up to 6,500 ft. alt., apparently confined to the w. and s. parts of the Trans-Pecos; from Tex. to Ariz. and Mex., s. to Arg.; also Jam. and Hisp.

3. *Notholaena Aschenborniana* Kl. Fronds clustered, to 5 dm. tall, usually much shorter; blades oblong to oblong-lanceolate, to 4 dm. long and 3 cm. wide, bipinnate to usually bipinnate-pinnatifid. On rocky slopes and ledges and in deep limestone canyons, up to 5,000 ft. alt., rare in the mts. of the Trans-Pecos and in Val Verde Co. on the Edwards Plateau; from w. Tex. to Ariz. and Mex.

4. *Notholaena Schaffneri* (Fourn.) Underw. var. *Nealleyi* (Seaton) Weath. Fronds clustered, to 2 dm. tall; blades linear-oblong to oblong-lanceolate, to about 15 cm. long and 6 cm. wide, pinnate-pinnatifid to pinnate-bipinnatifid. *N. Nealleyi* Seaton. On exposed or partially shaded rock ledges and in crevices of cliffs and canyon walls, at moderate elev., uncommon on the Edwards Plateau and in the Rio Grande Plains and Trans-Pecos; from s.w. Tex. to Ver.

5. *Notholaena Grayi* Davenp. Fronds clustered, to 35 cm. tall; blades oblong-lanceolate to lanceolate, to 18 cm. long and 4 cm. wide, pinnate-pinnatifid to bipinnate-pinnatifid. On talus slopes, in rock crevices and rocky barrens of granite and limestone, up to 6,000 ft. alt., rare in the Trans-Pecos and Edwards Plateau; from cen. Tex. to s.e. Ariz. and Mex. (s. to Jal.).

6. *Notholaena aliena* Maxon. Fronds clustered, to 16 cm. tall; blades linear to linear-oblong, to 85 mm. long and 15 mm. wide, pinnate-pinnatifid to sometimes bipinnate below. On bluffs, ledges, rocky hills and talus slopes, found only in Brewster Co. in the Trans-Pecos; from Tex. and n. Mex. (Tam., Coah. and Chih.).

7. *Notholaena candida* (Mart. & Gal.) Hook. var. *Copelandii* (C. Hall) R. Tryon. Fronds clustered, to 35 cm. long; blades triangular-ovate to broadly elliptic-lanceolate, pinnate-pinnatifid to bipinnate-pinnatifid, abruptly reduced to a narrowed tapering simply pinnatifid apex. *N. Copelandii* C. Hall. On limestone ledges and in crevices of canyon walls and bluffs, on open rocky slopes, at the base of cap rock and about boulders, up to 4,500 ft. alt., rather frequent in the cen. and s. parts of the Edwards Plateau and rare in the Trans-Pecos; in s.w. Tex. and n.e. Mex. (s. to n. S. L. P.).

8. *Notholaena Standleyi* Maxon. Fronds clustered, to 27 cm. tall; blades triangular-pentagonal, to 6 cm. long and 8 cm. wide, bipinnatifid to tripinnatifid. *N. Hookeri* D. C. Eat. On dry rock ledges and in crevices, on talus slopes, cliffs, canyon walls, and on and among boulders, up to 6,500 ft. alt., rare and of local occurrence on the Edwards Plateau but generally distributed and rather frequent in the Trans-Pecos; from w. Okla. and Tex. to Colo., Ariz. and Mex.

9. *Notholaena neglecta* Maxon. Fronds clustered, to 25 cm. tall, usually less than 1 dm.; blades triangular-pentagonal to elongate-pentagonal, to 85 mm. long and 65 mm. wide, tripinnate to quadripinnate in the basal half. In dry crevices of limestone ledges and cliffs, and on rocky slopes and in canyons, up to about 4,000 ft. alt., rare on the Edwards Plateau and in the Trans-Pecos; from s.w. Tex. and s.e. Ariz. to n. Mex.

10. *Notholaena Greggii* (Kuhn) Maxon. Fronds small, clustered, rarely more than 15 cm. tall; blades ovate-lanceolate to oblong-lanceolate, to 1 dm. long and 5 cm. wide

below middle, bipinnate-pinnatifid to tripinnate (at least below). In exposed crevices of rocks and at base of ledges of limestone and gypsum on open mt. slopes and in canyons, at moderate elev., found only along the Rio Grande in Brewster and Presidio cos.; apparently confined to s.w. Tex. and n. Mex.

11. *Notholaena limitanea* Maxon. Fronds clustered, to 25 cm. tall; blades deltoid-ovate to narrowly triangular-lanceolate, usually subpentagonal, to 25 cm. long and 16 cm. wide, 3- to 5-pinnate. *Pellaea limitanea* (Maxon) Morton. On limestone ledges and in talus rubble at base of limestone cliffs, up to 7,000 ft. alt., found only in the Chisos Mts. in Brewster Co. in the Trans-Pecos; from w. Tex. to s. Ut., Ariz. and Mex.

Our plant is referable to var. *mexicana* (Maxon) Broun. It differs from var. *limitanea* in its 3- to 4-pinnate narrow blade with the basal pinnae one fourth to one third (not half) as long as the blade and curved-ascending, not spreading.

12. *Notholaena dealbata* (Pursh) Kunze. Fronds clustered, to 12 cm. tall; blades triangular-ovate, to 1 dm. long and 8 cm. wide, tripinnate to quadripinnate, gradually less dissected above. *N. nivea* Desv. var. *dealbata* (Pursh) Davenport, *Pellaea dealbata* (Pursh) Prantl. In dry crevices on cliffs and boulders of limestone and other calcareous rocks, usually in partial shade, at moderate elev., concentrated in the e. part of the Edwards Plateau and in the Cross Timbers, with a station in Coleman Co. in the s. Plains Country and a questionable station in El Paso Co. in the Trans-Pecos; from Mo. and Neb. to Okla. and w.-cen. Tex.

13. *Notholaena parvifolia* R. Tryon. Fronds clustered, usually small, to 4 dm. tall but averaging about 15 cm.; blades triangular-ovate to ovate-oblong or narrowly triangular-lanceolate, to 23 cm. long and 15 cm. wide, tripinnate to quadripinnate, very rarely only bipinnate. *Pellaea microphylla* Kuhn. On limestone ledges in gorges and canyons, and on high limestone hills and talus slopes, face of cap rock, in shaded or exposed situations, apparently confined to limestone, up to 6,500 ft. alt., frequently and generally distributed in the Trans-Pecos, less frequent on the Edwards Plateau, with outlying stations in Howard Co. in the Plains Country and Brazos Co. in e. Blackland Prairies; from e. Tex. to n. Mex.

9. ONOCLEA L. SENSITIVE FERN

A monotypic genus native in the Northern Hemisphere.

1. *Onoclea sensibilis* L. Coarse herbaceous plant with slender branching rhizome to about 7 mm. thick and copiously rooting and with few light-brown elliptic fugacious scales; fronds conspicuously dimorphic, erect-ascending, scattered along the rhizome; stipes slender, greenish or tinged with brown; *sterile frond* to 13 dm. high, glabrous, thin-herbaceous, withering with frost; blades broadly triangular, deeply pinnatifid, the rachis winged; pinnae few, subopposite (especially the lowermost pinnae), oblong-lanceolate to elliptic-lanceolate, obtuse to acute, entire to undulate or the lower and sometimes the middle pinnae sinuately lobed; veins freely anastomosing; *fertile frond* to 8 dm. high, rigidly erect, persistent over winter; blades bipinnate, with the pinnae much-contracted; pinnules rolled into closed berrylike bodies (sporangia) and forming a narrow close panicle. In swamps, open flooded woodlands, meadows, sandy bogs, thickets along streams and about lakes, and on seepage slopes, widespread and rather frequent in the Timber Belt s. to Jefferson Co. in the Coastal Prairies, w. to apparently disjunct stations in Burnet Co. on the Edwards Plateau and Wilson Co. in the Rio Grande Plains; from Nfld. to Ont., Minn. and S.D., s. to n. Fla. and Tex.

10. WOODWARDIA SM. VIRGINIA CHAIN FERN

About 12 species found mainly in temperate regions of both hemispheres.

1. *Woodwardia virginica* (L.) Sm. Rather large coarse terrestrial plants; rhizome woody, ropelike, creeping-elongate and branching, black, to about 2 cm. thick, naked to densely chaffy (especially at apex) with brownish broadly lanceolate scales; fronds erect-ascending, uniform, borne at intervals along the rhizome, 4-15 dm. high; stipes

black to chestnut-brown at the base, green or reddish-brown above, glabrous, lustrous, 3-9 dm. long; blades broadly ovate to oblong-elliptic or elliptic-lanceolate, bluntly acute, pinnate-pinnatifid, subcoriaceous, 3-6 dm. long, 12-30 cm. wide; pinnae linear-lanceolate to elliptic-lanceolate, acuminate, with small brown scales along the midrib, 7.5-15 cm. long, 12-35 mm. wide, deeply pinnatifid; ultimate segments obliquely ovate to oblong-lanceolate, obtuse to acute, 5-6 mm. wide, with the margins somewhat reflexed; sori double, contiguous to confluent, borne on the transverse veins forming the outer side of the areoles, oblong-linear, chainlike. *Anchistea virginica* (L.) Presl. In sphagnun bogs, swamps, moist thickets and meadows, and along streams, rather generally distributed in the Timber Belt and in the extreme s.e. border cos. in the Coastal Prairies, w. to Gonzales, Lee and Milam cos. in the Blackland Prairies; from Fla. to Tex., n. to N. S., Ont. and Ill.; also Berm.

11. LORINSERIA PRESL CHAIN FERN

A monotypic genus.

1. *Lorinseria areolata* (L.) Presl. Slender herbaceous plants; rhizomes slender, widely creeping, chaffy with brown ovate-lanceolate to lanceolate scales, to 4 mm. thick; fronds dimorphic, scattered on the rhizome; *sterile fronds* spreading, to 75 cm. high; stipes slender, greenish or stramineous, sometimes purplish-brown toward the base, 15-35 cm. long; blades ovate-oblong to ovate-deltoid, acuminate, usually deeply pinnatifid, sometimes pinnate below, membranous, 1.5-4 dm. long; ultimate segments alternate, linear-lanceolate to oblong-lanceolate, acute to acuminate, lightly or sometimes deeply sinuate, serrulate, usually connected by wings on the rachis or the lower pairs free, to 13 cm. long and 2 cm. wide, the veins joined in the numerous hexagonal areoles; *fertile fronds* erect, usually surpassing the sterile ones; stipes stout, purplish-brown, lustrous, 3-6 dm. long; blades ovate-oblong, obscurely pinnatifid or pinnate, 1.5-3 dm. long; pinnae alternate, distant, linear, often connected by a slight wing along the rachis, mostly less than 5 mm. wide; sori linear to elliptic, in a single row on each side of the midrib. *Woodwardia angustifolia* Sm., *W. areolata* (L.) Moore. In sandy bogs and low sandy woods, swamps, marshes, thickets, on seepage slopes and along streams, generally distributed and rather frequent in the Timber Belt s. to Jefferson Co. in the Coastal Prairies and Bastrop and Gonzales cos. in the Blackland Prairies; from Fla. to Tex., Ark. and Mo., n. to N. S. and Mich.

12. POLYPODIUM L. POLYPODY

Small or large epiphytic or occasionally terrestrial or rock-inhabiting plants with slender much-branched scaly creeping rhizomes; fronds erect-ascending to pendent, articulate to knoblike prominences of the rhizome; stipes slender, wiry, scaly; blades simple to tripinnate, frequently only pinnatifid, glabrous to pubescent or scaly, ultimate segments entire, with the veins free and forking or variously areolate; sori orbicular to elliptic, large, depressed, terminal, dorsal on the tip of the vein branches, in a more or less distinct row on each side of the midrib; indusia wanting.

This genus comprises perhaps several hundred species that are found mainly in tropical and subtropical regions of both hemispheres.

1. Blades entire to only slightly sinuate 1. *P. erythrolepis*.

1. Blades deeply pinnatifid (2)

2(1). Plants usually growing on trees east of the Pecos River; scales of blades subentire to only sparingly and minutely ciliolate 2. *P. polypodioides* var.

Michauxianum.

2. Plants growing on rocks west of the Pecos River; scales of blade with the margins toothed or copiously ciliate 3. *P. thyssanolepis*.

1. *Polypodium erythrolepis* Weath. Fronds arising at short intervals on a slender creeping rhizome, suberect to arcuate-spreading, to 15 cm. long; blades usually lanceolate to oblanceolate or rarely ovate. Forming mats in soil along streams and on cliffs in

canyons, up to 6,500 ft. alt., rare in the Davis Mts. in Jeff Davis Co. in the Trans-Pecos; infrequent in w. Tex. and n. Mex. (s. to Dgo.).

2. *Polypodium polypodioides* (L.) Watt var. *Michauxianum* Weath. RESURRECTION FERN. Fronds distant on a slender creeping rhizome, to about 2 dm. long; blades oblong to triangular-oblong, to 5 cm. wide, deeply pinnatifid. Growing on various species of trees, especially oaks, occasionally on rock ledges, boulders, old buildings and mossy banks, usually in moderately shady and damp locations, at low elev., generally distributed and common in the Timber Belt, in the e. half of the Coastal Prairies, sparsely scattered in the Blackland Prairies and Cross Timbers n.w. to Parker Co. and s.w. to Atascosa Co. in the Rio Grande Plains and Uvalde Co. on the Edwards Plateau; from Md., Ill. and Mo. to Fla., Tex., Mex. and Guat.

3. *Polypodium thyssanolepis* Kl. Fronds distant on a slender creeping rhizome, to 6 dm. tall, usually about 15 cm. tall (in our region); blades ovate-oblong to triangular-lanceolate or oblong, to 25 cm. long and 12 cm. wide, deeply pinnatifid, the segments characteristically irregular in length and width. On rocky open slopes and in crevices of cliffs and boulders, up to 7,500 ft. alt., apparently confined to and rare in the Trans-Pecos; from w. Tex. to Ariz., Mex. and S. A.; also Jam. and Hisp.

13. ASPLENIUM L.* SPLEENWORT

Small or rather large delicate terrestrial or rock-inhabiting plants, often epiphytic (especially in tropical regions), with short-creeping to erect scaly rhizomes; fronds clustered, uniform or rarely slightly dimorphic, evergreen, erect to spreading; blades pinnate (in ours) or simple to quadripinnate or variously pinnatifid; pinnae or segments usually variously toothed or incised, occasionally subentire; veins nearly always free and forked, rarely casually anastomosing; sori produced along veinlets, linear to oblong-elliptic, straight or slightly curved, usually oblique, separate; indusia always present, lateral, characteristically membranous.

About 650 species of wide distribution, mainly in tropical and subtropical regions.

1. Pinnae roundish, not noticeably auriculate nor hastate at base, usually less than 6 mm. long at maturity1. *A. Trichomanes*.
1. Pinnae deltoid to oblong, more or less auriculate or hastate at base, usually more than 6 mm. long at maturity (2)
- 2(1). Some of the fronds with a prolonged naked apex bearing a proliferous bud; pinnae very irregularly and coarsely serrate2. *A. Palmeri*.
2. Fronds neither naked nor proliferous at apex; pinnae subentire to regularly serrate to crenate or crenulate, rarely incised (3)
- 3(2). Fronds all fertile, erect or ascending; margins of subcoriaceous pinnae subentire to crenulate; stipe and rachis blackish3. *A. resiliens*.
3. Fronds slightly dimorphic, the fertile erect, the sterile smaller and spreading; margins of herbaceous pinnae subentire to deeply serrate or incised; stipe and rachis chestnut-brown4. *A. platyneuron*.

1. *Asplenium Trichomanes* L. MAIDENHAIR SPLEENWORT. Fronds clustered, to 25 cm. tall, usually much smaller, arcuate-spreading; blades narrowly linear-oblong, to 2 dm. long and 15 mm. wide, pinnate; pinnae suborbicular to obovate or broadly elliptic, somewhat asymmetrically cuneate to truncate at base, minutely crenulate on the rounded margins. In sheltered crevices of ledges and cliffs, up to 7,800 ft. alt., rare in the Davis Mts. of the Trans-Pecos; from N. S. and Que., s. to Ga., w. to Ore. and Alas., and s.w. to Tex., N.M. and Ariz.; also Euras.

2. *Asplenium Palmeri* Maxon. Fronds clustered, arcuate-spreading, to 2 dm. tall; blades linear to linear-lanceolate, to 17.5 cm. long and 18 mm. wide, pinnate, the usually naked apex flagelliform and radican, giving rise to a new plant by means of a terminal proliferous bud; pinnae broadly triangular to oblong, usually with the margins crenate-serrate. On moist shaded slopes and in crevices of granite cliffs, localized in the Davis Mts. in the Trans-Pecos; from w. Tex., N.M. and Ariz. through Mex. to Guat.

* See Appendix.

3. *Asplenium resiliens* Kunze. LITTLE EBONY SPLEENWORT. Fronds clustered, to 35 cm. tall; blades subcoriaceous, linear-oblong to narrowly linear-oblong, to 28 cm. long and 3 cm. wide, pinnate; pinnae deltoid to linear-oblong, with the margins subentire or crenulate. *A. parvulum* Mart. & Gal. In crevices of cliffs, boulders or ledges of limestone, granite or in calcareous soils, usually in shaded dry situations, up to 7,000 ft. alt., widespread and frequent on the Edwards Plateau and in the Trans-Pecos, s. to Frio Co. in the Rio Grande Plains, n. to Palo Pinto Co. in the Cross Timbers and e. to Angelina Co. in the Timber Belt and Orange Co. (probably on shell mounds) in the Coastal Prairies; from s. Pa. s. to Fla., w. to Ill., Okla., N.M. and Ariz. into Mex.; also Jam.

4. *Asplenium platyneuron* (L.) D.C.Eat. EBONY SPLEENWORT. Fronds clustered, somewhat dimorphic, to 5 dm. tall; blades herbaceous, linear-lanceolate to narrowly elliptic-lanceolate, to 37 cm. long and 65 mm. wide, pinnate; pinnae oblong to lanceolate or triangular, with the margins essentially entire to crenate-serrate or serrate. *A. ebenum* Ait. Most frequent in sandy loam on rich wooded banks and slopes along streams and on the edge of flooded woodlands, also on hummocks in swamps, rotting logs, talus slopes, boulders, ledges and in thickets, rarely semiepiphytic, generally distributed and frequent in the Timber Belt, rather widely distributed but of local occurrence in the Blackland Prairies (n.w. to Parker Co. and s.w. to Wilson Co.), sparsely represented in the e. part of the Coastal Prairies; from Me. and Ont., s. to Fla., w. to Ia. and Tex., sporadically in Kan. and Colo.; also S. Afr.

14. ATHYRIUM ROTH LADY FERN

About 200 species that are in tropical and subtropical regions throughout the world.

1. *Athyrium Filix-femina* (L.) Roth var. *asplenioides* (Michx.) Farw. SOUTHERN LADY FERN. Rather large terrestrial plant; rhizome shortly creeping, with light-brown scales, about 7 mm. in diameter; fronds clustered, to 12 dm. high; stipes yellowish-green, often tinged with red or brown, stramineous when dry, sparingly scaly below; blades ovate-lanceolate to elliptic-lanceolate, acuminate, pinnate-pinnatifid to rarely subtripinnate (at least below), thin-herbaceous to subcoriaceous, essentially glabrous throughout, usually exceeding the length of the stipe, to 35 cm. wide; pinnae shortly stalked, elliptic-lanceolate to narrowly lanceolate, acuminate, spreading horizontally or curved-ascending with age, to 4 cm. wide; pinnules or ultimate segments mostly decurrent on the rachis, sometimes subpetiolate, oblong-lanceolate, obtuse to shortly acuminate, incised to serrate or lobulate with the lobules often again toothed; sori short, 3 to 10 pairs in each segment; indusia mostly curved, with gland-tipped cilia. *A. asplenioides* (Michx.) Eat. In sandy bogs, moist sandy woods, swamps, wet thickets and on stream banks, generally distributed and rather common in the Timber Belt and in several n. border cos. in the Coastal Prairies, w. to Williamson Co. in the Blackland Prairies; from Fla. to Tex., n. to e. Mass., Ind. and Mo.

15. WOODSIA R. BR. WOODSIA

Rather small plants of rock outcrops, rocky woods and fields with short tufted scaly rhizomes; fronds erect-ascending, clustered; stipes slender, sometimes jointed near the base, somewhat scaly; blades linear to narrowly elliptic-lanceolate, pinnate to bipinnate with the segments lobed or pinnatifid, membranous, glabrous to scaly, with the veins free and usually forked; sori round, borne on the back of the simply forked free veins; indusia basal, thin, roundish, early opening at the top and splitting into several spreading segments, the segments broad and subentire to filiform.

This genus includes about 40 species, mainly of temperate and boreal regions.

1. Indusial lobes broad, jagged but not long-laciniate at apex; plants mostly in the eastern half of Texas 1. *W. obtusa*.
1. Indusial lobes laciniate at least one-third of their length; plants apparently confined to the Plains Country and west of the Pecos River (2)

- 2(1). Indusial lobes with a broad base, deeply laciniate on the upper half; fronds typically glanduliferous2. *W. Plummerae*.
 2. Indusial lobes deeply laciniate to near the base into filamentous lobes; fronds normally eglandular3. *W. mexicana*.

1. *Woodsia obtusa* (Spreng.) Torr. **BLUNT-LOBED WOODSIA**. Fronds clustered, to 5 dm. tall; blades elliptic-lanceolate to broadly lanceolate, to 4 dm. long and 1.5 cm. wide, pinnate-pinnatifid to bipinnate (at least below). Among rocks or along rather dry shaded ledges, on rock outcrops and cliffs, commonly in sandstone and granite regions, also on well-drained wooded banks, roadside banks, talus slopes and sandy knolls in woods, usually at moderate or low elevations, generally distributed and rather frequent in the Timber Belt and Cross Timbers (n.w. to Montague Co.), in the e. part of the Edwards Plateau and apparently isolated in Hudspeth and Jeff Davis cos. in the Trans-Pecos; from Que. to Minn. and Neb., s. to Ga. and s.w. to w. Tex.

2. *Woodsia Plummerae* Lemm. Fronds clustered, to 35 cm. tall; blades elliptic-lanceolate, to 25 cm. long and 1 dm. wide, pinnate-pinnatifid to bipinnate. On moist shaded cliffs and ledges, talus slopes and at the base of boulders, usually on or about igneous rocks, up to 7,500 ft. alt., uncommon in the s. and w. parts of the Trans-Pecos, rare and isolated in Palo Duro Canyon, Randall Co., in the Plains Country; from w. Tex. to Ariz. and Chih.

3. *Woodsia mexicana* Fée. Fronds clustered, to 35 cm. tall; blades lanceolate, to 25 cm. long and 8 cm. wide, pinnate-pinnatifid to occasionally bipinnate. On shaded or sometimes sunny rock ledges and boulders, in moist soil on slopes and in crevices of cliffs, up to 7,000 ft. alt., uncommon in the Trans-Pecos; from w. Tex. to Ariz. and Mex. (s. to S. L. P. and Ver.).

16. CYSTOPTERIS BERNH.

Delicate plants of moist wooded slopes and rocky areas with slender creeping and branching scaly rhizomes; fronds several, clustered, weakly erect-spreading, more or less succulent; stipes slender, stramineous to reddish-brown; blades 1- to 4-pinnate, the ultimate segments cut-toothed, with few sparingly branched veins; sori roundish, borne on the back of veins near the base of shallow sinuses; indusia membranous, hoodlike, attached by a broad rounded base on the inner side partly under the sori, early withering to expose the sori.

This genus includes about 18 species that are found in temperate and boreal regions of both hemispheres.

1. Blade broadest at the base, long-tapering, commonly bearing bulblets beneath; most of the veins ending in a sinus; lower pinnules not decurrent on the midrib
1. *C. bulbifera*.
 1. Blade broadest above the base, not noticeably long-tapering; most of the veins ending in a tooth; lower pinnules decurrent on the midrib ..2. *C. fragilis*.

1. *Cystopteris bulbifera* (L.) Bernh. **BLADDER FERN, BULBLET FERN**. Fronds weak, usually clustered, commonly spreading or trailing, to 1 m. long or more; stipe slender, stramineous, 1-2 dm. long; blade narrowly lanceolate, often much-elongated and attenuate from a broad base, 1- or 2-pinnate, with the pinnae coarsely toothed or pinnatifid, the segments toothed or incised, typically bearing beneath fleshy bulblets in the axils of the pinnae and segments; bulblets often producing new plants when they fall on moist soil; indusia truncate. In pockets on ledges in narrow part of upper McKittrick Canyon, Guadalupe Mts.; from Nfld. to Ut., s. to Ga., Tex. and Ariz.

2. *Cystopteris fragilis* (L.) Bernh. **FRAGILE FERN**. Fronds clustered or somewhat distant, erect-spreading, delicate, to 45 cm. tall, usually much smaller; blades narrowly triangular-ovate to oblong-lanceolate, to 25 cm. long and 12 cm. wide, bipinnate to occasionally bipinnate-pinnatifid. In crevices of cliffs, on the walls of sink holes, on boulders, moist banks and wooded talus slopes, usually in sheltered areas, up to 8,000 ft. alt., local and rare in the Devil's Sink Hole, Edwards Co., on the Edwards Plateau, in the Trans-Pecos and s. Blackland Prairies. The species, in the broad sense, occurs

from Lab. to Alas., s. to Ga. and s.w. to Tex., N.M., Ariz., s. Calif. and n. Mex.; also S. A., Greenl., Icel. and Euras.

17. PHANEROPHLEBIA PRESL

Rather large terrestrial or saxicolous plants with short thick ascending to erect densely scaly rhizomes and fasciculate fronds; stipes shorter than the blades, provided with large pale-brown hair-pointed persistent spreading scales; blades imparipinnate or with a pinnatifid apex, coriaceous, glabrous, scaly (especially the rachis and costae); pinnae numerous, usually falcate, unlobed or auriculate on the upper side at the base, spinulose-toothed; veins several times forked, free or casually anastomosing but not forming regular areoles, not reaching the margin; sori dorsal on the veins, not confined to the anterior branches, in two or more rows on each side of the midrib; indusia peltate, persistent or caducous.

This genus consists of about 20 species that occur mostly in temperate or subtropical regions in America. Placed in the genus *Cyrtomium* by some authors.

1. Pinnae mostly auricled on the upper side at the base . . . 1. *P. auriculata*.
 1. Pinnae only cuneate at the base, not auricled 2. *P. umbonata*.

1. *Phanerophlebia auriculata* Underw. Fronds clustered, to 65 cm. tall; blades rigidly herbaceous, elliptic-lanceolate to lanceolate, pinnate, to 45 cm. long and 2 dm. wide. On damp shaded canyon walls, under overhanging ledges, and in cracks in granite cliffs and cavernous recesses, rare in several cos. in the Trans-Pecos; w. Tex. to Ariz. and n. Mex.

2. *Phanerophlebia umbonata* Underw. Fronds approximate, to 7 dm. tall; blades elliptic-lanceolate to lanceolate, subcoriaceous, to 5 dm. long and 28 cm. wide, pinnate. In damp places on canyon walls and cliffs, and in forested ravines along streams, rare in the Trans-Pecos; w. Tex. and n. Mex.

18. TECTARIA CAV.

About 200 species that are found mainly in the tropics of both hemispheres.

1. *Tectaria heracleifolia* (Willd.) Underw. HALBERD-FERN. Rather large saxicolous plants; rhizome stout, erect to curved-ascending, 1-2 cm. thick, the apex minutely brown-paleaceous; fronds several, clustered, erect-arching, 4-9 dm. high; stipes lustrous, sulcate, stramineous to dark-brown, with deciduous scales at the reddish-brown base, about equal to or longer than the blade; blades dark-green, deltoid-ovate, pinnately 3- or 5-lobed (very rarely 7-lobed), thick-herbaceous to subcoriaceous, glabrous except for the glandular-puberulent veins, 2-6 dm. long, 1.5-3 dm. wide; pinnae variable, typically deltoid-ovate to oblong-lanceolate, the terminal pinna symmetrical, the lateral pinnae more or less falcate, usually deeply lobed or the margins variously irregularly undulate-crenate to lobulate, broadly rounded at the base, acuminate to long-attenuate at apex, the lowermost pinnae petioled, to 3 dm. long and 12 cm. wide; veins prominent, the areoles rather large and often with simple or once-forked included veinlets; sori numerous, in 2 rows between the lateral veins, to 3 mm. in diameter; indusia orbicular, entire, centrally peltate, persistent, deciduously puberulent. In limestone sink-holes and caverns in limestone bluffs where exists partial shade and protection from extremes of heat and cold, occasionally in dark canyons, shaded rock outcrops and railroad tunnels, in several cos. on the Edwards Plateau where it is uncommon; from Fla. and s.-cen. Tex., throughout the W.I., from Mex. to C. R. and in Venez.

19. POLYSTICHUM ROTH

About 135 species, mainly in temperate and tropical regions in both hemispheres.

1. *Polystichum acrostichoides* (Michx.) Schott. CHRISTMAS FERN. Rather coarse terrestrial plants; rhizome stout, short-creeping and ascending, to 1 cm. thick, with

light-brown lanceolate acuminate scales; fronds clustered, essentially evergreen, to 7 dm. high; stipes rather stout, to 17 cm. long or more, densely chaffy with the scales continuing along the rachises; blades elliptic-lanceolate to lanceolate, acuminate, pinnate, rigidly herbaceous to subcoriaceous, 3-6 dm. long to 13 cm. wide; pinnae oblong-lanceolate to narrowly lanceolate, acute to subacuminate, distinctly auricled at the base on the upper margin or sometimes incised, the margins with appressed bristly teeth, to 65 mm. long and 15 mm. wide, the lowermost pinnae sterile or only fertile at the tips, the uppermost pinnae fertile and conspicuously contracted; sori crowded, in 2 to 4 rows, often confluent with age; indusia peltate, entire, persistent. On rocky rich wooded hillsides or steep banks of ravines along streams, along sandy creeks and in swamps and thickets, widespread and frequent throughout e. and s.e. Tex., w. to Waller Co. in the Blackland Prairies; from N. S. to Wisc., s. to Fla. and Tex.; also Mex.

20. NEPHROLEPIS SCHOTT SWORD FERN

About 30 species that are widely distributed mainly in tropical and subtropical regions of both hemispheres.

1. *Nephrolepis exaltata* (L.) Schott. Showy graceful epiphytic or terrestrial plants; rhizome short, more or less erect, provided with light-brown lance-setaceous scales, stoloniferous; stolons wiry, widely creeping; fronds erect-spreading or recurved-pendent from tree trunks and walls, to 2 m. long or more; stipe (and rachises) slender, wiry, brownish and lustrous, at first slightly scaly, the stipe short; blades linear-lanceolate, acuminate, firmly membranous, pinnate, to 16 cm. wide; pinnae numerous, sessile, horizontally placed, contiguous to subimbricate, the lowermost pinnae triangular-ovate and obtuse, the upper ones lanceolate and acuminate, upcurved-falcate, with the margins irregularly undulate-serrulate, auricled on the upper margin at the base, to 8 cm. long and 15 mm. wide near the middle; veins close, once- or twice-forked; sori submarginal; indusia firm, orbicular-reniform. In open woodlands, rocky banks and on trees, naturalized in e. Tex. and on the Edwards Plateau; from Fla. and Tex., through Mex., Bah. I., Berm., throughout the W. I., and in the Old World trop. and subtrop.

21. THELYPTERIS SCHMID.

Terrestrial plants of moist woodlands and rocky places, with stout or mostly slender strong long-creeping sparsely scaly rhizomes; scales of the rhizome ciliate, entire, fibrous; fronds erect-ascending, somewhat distant, deciduous; stipes stramineous, essentially scaleless, with two bundles at the base; blades uniform, thin-membranous, bipinnatifid to pinnate-pinnatifid or bipinnate-pinnatifid, pubescent with acicular hairs, rarely sparsely scaly; ultimate segments usually entire or nearly so, rarely serrate or coarsely toothed, ciliate; veins few, simple or once-forked, reaching the margins; sori dorsal on the veins, median or supramedial; indusia small or sometimes absent, reniform, usually glandular or ciliate.

A large world-wide genus of several hundred species that attains its optimum development in temperate and subtropical Asia.

- 1. Ultimate segments with the margins serrate or coarsely toothed 6. *T. Torresiana*.
- 1. Ultimate segments with the margins entire to crenate or nearly pinnatifid, never serrate (2)
- 2(1). Basal veins of the adjoining ultimate segments united below the sinus, with the resulting veinlet running to the sharp sinus 2. *T. dentata*.
- 2. Veins all free (except in *T. × versicolor*) (3)
- 3(2). Blades more or less triangular, pinnatifid; indusia wanting 5. *T. hexagonoptera*.
- 3. Blades lanceolate, pinnate; indusia present (4)
- 4(3). Veins forked; indusia glabrous 1. *T. palustris* var. *Haleana*.
- 4. Veins simple; indusia pubescent (5)

- 5(4). Basal veins of adjoining ultimate segments free 3. *T. Kunthii*.
 5. Basal veins of some adjoining ultimate segments united or arcuate so as to touch one another 4. *T. × versicolor*.

1. *Thelypteris palustris* Schott var. *Haleana* Fern. SOUTHERN MARSH FERN. Fronds erect from a slender rhizome, to 12 dm. tall; blades lanceolate to elliptic-lanceolate, to 2 dm. wide, pinnate-pinnatifid to rarely bipinnate, slightly pubescent (especially the rachis). *Dryopteris Thelypteris* var. *Haleana* (Fern.) Broun. In open sandy bogs, swamps and meadows, or in open low woodlands (especially along streams), rare in several cos. in the Timber Belt and in Jefferson Co. in the Coastal Prairies and Waller and Colorado cos. in the Post Oak Prairies; from Fla. to La. and e. Tex., n. to (?) Pa.

2. *Thelypteris dentata* (Forsk.) E. St. John. DOWNY SHIELD FERN. Fronds clustered, erect-ascending from a thick rhizome, to 12 dm. tall; blades ovate-oblong to lanceolate, to 8 dm. long and 28 cm. wide, pinnate-pinnatifid, shortly pilose throughout and minutely glandular on lower surface. *Dryopteris dentata* (Forsk.) C. Chr. On rocky wooded slopes, on hummocks in swamps, and along wooded streams, at low elev., rare in the Timber Belt; from Fla. to Tex., in part escaped from cult.; also from Mex. to Arg., the W. I., Asia and Afr.

3. *Thelypteris Kunthii* (Desv.) Morton. SOUTHERN SHIELD FERN. Fronds approximate in 2 rows on a creeping rhizome, erect or ascending, to 15 dm. tall; blades ovate-oblong to oblong-lanceolate or elliptic-lanceolate, to 4 dm. wide, pinnate-pinnatifid, glandular and whitish-pubescent on lower surface. *Dryopteris normalis* C. Chr., *D. augescens* var. *Lindheimeri* (A. Br.) Broun, *Thelypteris augescens Lindheimeri* (A. Br.) R. St. John, *T. normalis* (C. Chr.) Moxley. On the edge of sandy creeks, in swamps, low woods and deep canyons, on wet bluffs and ledges, especially at the base of dripping limestone bluffs, frequently associated with *Adiantum Capillus-Veneris*, rather widespread and frequent in the Timber Belt, less common in the Coastal and Blackland prairies, w. through the s. part of the Edwards Plateau to Terrell and Brewster cos. in the Trans-Pecos; from Fla. to S.C. and Tex.; also Bah. I., Berm. and the W. I.

4. *Thelypteris × versicolor* R. St. John. Plants that appear to be intermediates of *T. Kunthii* and *T. dentata* are here considered to be hybrids of those species. The basal venation in the material examined irregularly resembles either of its parent-species. *Dryopteris × versicolor* (R. St. John) Broun. Usually found associated with one or both of its putative parents; Fla., La. and s.e. Tex.

5. *Thelypteris hexagonoptera* (Michx.) Weath. BROAD BEECH FERN. Fronds distant, arising at short intervals on a slender creeping rhizome, to 8 dm. tall; blades broadly triangular, to 38 cm. long and broad, bipinnatifid, with the lower usually larger pair of segments directed downward and away from the rachis at a different angle from the upper segments. *Phegopteris hexagonoptera* (Michx.) Fée, *Dryopteris hexagonoptera* (Michx.) C. Chr. On sandy wooded slopes and in ravines along streams, in open rocky thickets, and on the edge of low swampy woods and bogs, at low elev., rare in the Timber Belt; from Fla. to e. Tex., n. to Que. and Minn.

6. *Thelypteris Torresiana* (Gaudich.) Alston. Fronds clustered on a stout rhizome, to 2 m. or more tall; blades deltoid-ovate to triangular-lanceolate, to 9 dm. or more long and 4 dm. wide, bipinnate-pinnatifid, membranous, setaceous with silvery-white hairs. *Thelypteris setigera* of auth., *Dryopteris setigera* of auth. Along streams in pinelands, in swamps, marshes and on moist wooded banks, in e. Tex.; nat. of Asia and adj. I., escaped from cult. and more or less established in cen. peninsula Fla., Ala., Tex. and trop. Am.

22. DRYOPTERIS ADANS.

Terrestrial or saxicolous plants of moist woodlands, bogs, and cliffs, with stout erect or short-creeping scaly rhizomes; scales of the rhizome glabrous, not ciliate, entire or toothed, fibrous; fronds erect, often approximate, commonly evergreen; stipes stramineous, with 3 to 7 free bundles; blades coriaceous to subcoriaceous, pinnate-pinnatifid to tripinnate; ultimate segments mostly toothed, often subspinulose, glabrous, not ciliate, sometimes capitate-glandular, sparingly or densely scaly; veins free, simple or mostly forked, ending short of the margin in elongate hydathodes; sori dorsal on the veins,

inframedial to submarginal; indusia reniform, large, persistent, glabrous, sometimes glandular on margin or back.

A large world-wide genus of about 150 species that are found mainly in tropical and subtropical regions of both hemispheres.

1. Scales of the rachises few, ovate- to elliptic-lanceolate, essentially entire; lowermost pinnae greatly reduced and broadly triangular 1. *D. cristata*.

1. Scales of the rachises many, filiform to narrowly lanceolate, usually serrate to lacerate; lowermost pinnae somewhat reduced and narrowly triangular-lanceolate 2. *D. Filix-mas*.

1. *Dryopteris cristata* (L.) Gray. CRESTED SHIELD FERN. Fronds inconspicuously dimorphic, clustered on a thick rhizome, thick-herbaceous, glabrous on upper surface, sparsely scaly on lower surface, to 12 dm. tall; sterile fronds broad and spreading, usually evergreen; fertile fronds narrow and erect; blades (of both types of fronds) linear-oblong to lanceolate or narrowly elliptic-lanceolate, to 8 dm. long and 15 cm. wide, pinnate-pinnatifid to nearly bipinnate. In marshes, bogs, swamps, thickets and meadows, and on springy wooded slopes, at low elevations, if extant only in the n.e. corner of the Timber Belt (Bowie Co., "margin of sandy bog near Texarkana," October 27, 1925, *E. J. Palmer 29404*, p. p.); from Nfld. to Ida., s. to e. Va., N.C., s.e. Ark., n.-cen. La. and n.e. Tex.

2. *Dryopteris Filix-mas* (L.) Schott. MALE FERN. Fronds clustered on a stout rhizome, to 12 dm. tall, ascending; blades oblong-lanceolate to elliptic-lanceolate, thin-herbaceous, up to 1 m. long and 3 dm. wide, pinnate-pinnatifid to almost bipinnate. In crevices and clefts of huge ledges and bluffs, on shaded talus slopes at base of cliffs, and in rich soil of cool rocky woods, up to 8,500 ft. alt., rare on Mt. Livermore and Sawtooth Mt. in the Davis Mts. of the Trans-Pecos; from Nfld. to B. C., s. to Vt., Mich., and in the mts. to w. Okla., w. Tex., N.M., Ariz., s. Calif. and Mex.; also Greenl. and Euras.

FAM. 12. PARKERIACEAE HOOK.

FLOATING FERN FAMILY

Aquatic or semiaquatic plants with roots on the stipes; stems creeping, sparsely scaly, reduced; fronds alternate, successive, viviparous, fleshy-herbaceous, dimorphic, reticulate-veined, floating or emergent; sporophylls erect, taller and more finely divided than the sterile fronds, the linear ultimate segments with the margins evenly and narrowly revolute; sporangia solitary.

Only one genus.

1. CERATOPTERIS BRONGN.

Characteristics of the family. Three species, mostly in the tropics and subtropics of both hemispheres; edible aquatic plants.

1. *Ceratopteris thalictroides* (L.) Brongn. Fronds erect, strict, to 75 cm. long, usually much smaller; stipes 4-27 cm. long; lamina of sterile frond narrowly deltoid to oblong, to 28 cm. long and 13 cm. wide, 1- or 2-pinnate or -pinnatifid with the pinnae ovate-lanceolate; segments linear-lanceolate to oblong, acute, to 25 mm. long and 5 mm. wide; sporophylls taller than the sterile fronds, the oblong lamina 2- to 5-pinnately divided with the pinnae and smaller divisions distant; ultimate segments flagelliform, 1-5 cm. long, the margins narrowly revolute to cover 1 or 2 rows of areolae and sporangia. Well-established in spring-fed back-waters of the San Marcos River in Hays Co. where it was originally introd. (probably about 1960); nat. apparently to both hemispheres; also in s. Fla.

It is quite possible that the other two species in this genus, *C. pteridoides* (Hook.) Hieron. and *C. deltoidea* Benedict, may be introduced in Texas rivers. In contrast to *C. thalictroides*, they both have broadly deltoid fronds. The sterile fronds of *C. pteridoides* are usually simple with broad basal lobes and short, often swollen, stipes that are widest at base of blade and tapered downward, while the sterile fronds of *C. deltoidea* are pinnately divided, with long, slender stipes.

DIVISION II. SPERMATOPHYTA

SEED-BEARING OR FLOWERING PLANTS

Plants producing seeds that contain the young plants in a dormant condition until germination. Sporophylls arranged in groups (flowers) of definite or indefinite numbers, heterosporous, those bearing microsporangia (anther sacs) termed stamens, those producing macrosporangia (ovules) carpels. The gametophytes very much reduced, the female being confined within the macrosporangia where its egg-cell is fertilized by the spermatozoid of the male gametophyte (pollen tube), the sporophyte thus beginning its development while still attached to the sporophyte of the preceding generation. Eventually detached in an embryonic stage, together with the enclosing tissues, as a seed.

The seed-bearing plants form the most numerous plant group in existence, more than 200,000 species being known. The seed-habit, now restricted to the Spermatophyta, is also known to have occurred in ancient fernlike plants. This category is now considered essentially one of convenience rather than distinction because of the apparent diverse ancestry of its component members.

CLASS I. GYMNASPERMAE³

Plants monoecious or dioecious, more or less resinous trees or shrubs; ovules and seeds not enclosed in an ovary, typically borne on scales that are arranged in a cone or strobilus, or sometimes terminal on naked or bracteate stalks; microsporangia mostly embedded in microphylls that are arranged in a cone or strobilus; male and female cones distinct, dissimilar.

The Gymnosperms comprise an ancient remnant of about 700 species of trees and shrubs that are considered to have been most abundant in the Mesozoic. The group contains such relicts as the Cycads, the Ginkgo tree, *Metasequoia* and Araucarias.

FAM. 13. PINACEAE LINDL.

PINE FAMILY

Resinous evergreen or rarely deciduous monoecious trees or shrubs, with whorled opposite or rarely alternate branches; leaves linear, needlelike or scalelike, arranged in spirals; flowers surrounded at base by the persistent bud scales, unisexual, the staminate consisting of many spirally arranged stamens with 2 pollen sacs, the ovulate of many scales that bear 2 pendent ovules on their inner surface; fruit a woody cone, maturing the first, second or third season; seeds with or without wings; embryo axile in the copious endosperm; cotyledons several.

A family of 10 genera and about 250 species that are widely distributed over the Northern Hemisphere. Our pines are of considerable economic importance in east Texas for timber, naval stores and pulpwood.

1. Leaves in bundles of 2 to 5 that are surrounded at base by a persistent or very rarely deciduous scaly sheath; cones maturing the second or third year
.....1. *Pinus*, p. 71.
1. Leaves not in sheaths, solitary, often appearing 2-ranked; cones maturing the first year2. *Pseudotsuga*, p. 74.

³Cf. D. S. Correll in C. L. Lundell, *Flora of Texas* I: 322-368. 1966 for a more detailed treatment.

1. PINUS L. PINE

Evergreen trees or rarely shrubs, with furrowed to laminate or thin scaly bark, rather hard or often soft wood; leaves of two kinds, the secondary forming the ordinary foliage leaves, needlelike, borne in clusters of 2 to 5 or rarely 1, terminating short rudimentary branchlets in the axils of scalelike primary leaves, surrounded at the base by a persistent or rarely deciduous membranous sheath, persistent from 2 to 8 years; staminate flowers clustered at the base of the season's growth, forming a distinct zone on the twig which becomes naked after the flowers have fallen, each flower subtended by an involucre of several scales, composed of many 2-celled anthers; ovulate flowers subterminal or lateral, solitary, in pairs or clustered, sessile or stalked, consisting of many ovule-bearing scales, subtended by nonaccrescent bracts and bearing 2 pendent ovules; fruit a woody cone, maturing the second year or sometimes the third year, opening and shedding the seeds at maturity or (in some species) remaining closed and persistent on the branches for years; cone-scales elongated, variously thickened and appendaged at the exposed apex (the *apophysis*), with the ends of the growth of the previous year appearing as terminal or dorsal brown protuberances or scars (the *umbo*); seeds usually obovoid, often with conspicuous membranous wings, their coats crustaceous; cotyledons 3 to 15 or sometimes more.

A genus of about 100 species widely scattered over the Northern Hemisphere. The genus includes species that are important for timber, paper pulp, and naval stores.

The vast forest of pines of southeastern United States reaches its southwestern limits in east Texas. The boundary of its westernmost extension in Texas is represented by its natural occurrence in the following counties, reading north to south: Fannin, Lamar, Franklin, Rains, Van Zandt, Henderson, Anderson, Leon, Madison, Brazos, Burleson, Lee, Bastrop, Fayette, Colorado, Wharton, Fort Bend and Brazoria. One or more species of eastern species of pines occur in each of the 59 counties in Texas including and lying to the east of the above-cited counties.

1. Distribution east and southeast Texas, west to Bastrop County (2)
1. Distribution from the west-central Edwards Plateau north into the Plains Country and west into the Trans-Pecos, east to Real and Uvalde counties (5)
- 2(1). Needles mostly 25 cm. long or more, consistently 3 in a bundle; bundle sheaths of new leaves on young twigs usually 25 mm. long or more; mature cones mostly over 15 cm. long; terminal buds silvery white1. *P. palustris*.
2. Needles usually much less than 25 cm. long, 2 or 3 in a bundle; bundle sheaths of new leaves on young twigs 20 mm. long or less; mature cones mostly less than 12 cm. long; terminal buds brownish (3)
- 3(2). Leaves about 10 (5-12) cm. long, mostly 2 but sometimes 3 in a bundle; bundle sheaths mostly less than 10 mm. long; mature cones 4-7 cm. long5. *P. echinata*.
3. Leaves about 17 (12-23) cm. long, mostly 3 but sometimes 2 in a bundle; bundle sheaths mostly more than 12 mm. long; mature cones usually 8 cm. long or more (4)
- 4(3). Leaves almost invariably 3 in a bundle; cones sessile2. *P. taeda*.
4. Leaves 2 or 3 in a bundle; cones short stalked3. *P. Elliottii*.
- 5(1). Needles 5 in a bundle; bundle sheaths early deciduous, 1.5-2 cm. long8. *P. strobiformis*.
5. Needles usually less than 5 in a bundle; bundle sheaths persistent, of various lengths (6)
- 6(5). Needles more than 100 mm. long, mostly 3 (only occasionally 2, 4 or 5) in a bundle; bundle sheaths more than 10 mm. long; mature cones more than 7 cm. long; seeds with prominent wings4. *P. ponderosa*.
6. Needles 25-45 mm. long, 2 or 3 (rarely 1) in a bundle; bundle sheaths about 5 mm. long; mature cones usually less than 5 cm. long; seeds wingless or essentially so (7)

- 7(6). Needles 2 (sometimes 1 or 3) in a bundle, stout, semicircular in transverse section, yellow-green; mature cones usually more than 4 cm. long; seeds typically soft-shelled6. *P. edulis*.
7. Needles 2 or 3 in a bundle, slender, often triangular in transverse section, dark blue-green; mature cones mostly less than 4 cm. long (8)
- 8(7). Needles mostly 3 in a bundle; seeds thick-shelled; distribution in the Trans-Pecos region7. *P. cembroides*.
8. Needles mostly 2 in a bundle; seeds thin-shelled; distribution mostly on the Edwards Plateau7. *P. cembroides* var. *remota*.

1. *Pinus palustris* Mill. LONGLEAF PINE, LONGLEAF YELLOW PINE. Tree to 30 m. tall, with a long clear trunk to 75 cm. in diameter and short stout branches to form a small open crown; twigs stout, orange-brown; buds large, invested by numerous silvery-white spreading fringed scales; bark orange-brown, composed of thin papery scales, usually plated on large trees; leaves in bundles of 3, in dense tufts at the ends of stout branchlets, subtended by a scarious bract, 20-45 cm. long, bright-green, slender, flexible, pendulous, 3-sided; bundle sheath 25 mm. or more long, persistent; bract symmetrically decurrent and rounded or truncated at base; male flowers dark-rose-purple, numerous in clusters; female flowers dark-purple, in clusters of 2 to 4; conelets with shortly mucronate scales; cones sessile, narrowly ovoid-elongate to cylindrical, essentially symmetrical, 15-25 cm. long, when deciduous usually leaving a few scales on the tree; cone-scales thin, flat, rounded at apex; apophysis reddish-brown, commonly wrinkled, somewhat elevated along a transverse keel, the prominent umbo with a small persistent reflexed prickle; seeds about 12 mm. long, mottled; seed-wing about 4 cm. long, semi-elliptic, somewhat irregular at apex, striped. *P. australis* Michx. f. Mostly in deep sands or coarse sandy loams in several cos. in extreme s.e. Tex.; in the Coastal Plain from s.e. Va. to cen. Fla., w. to s.e. Tex.

In southeastern United States this is an important timber tree and a leading world producer of naval stores.

2. *Pinus taeda* L. LOBLOLLY PINE, OLDFIELD PINE. Tree to 35 m. tall, with a long clear trunk 6-12 dm. in diameter and spreading and ascending branches to form a large open crown; twigs reddish-brown to dark-yellow-brown; buds with numerous narrow triangular reddish-brown scales that are often reflexed at their free tips; bark nearly black and scaly on young stems, dark-brown on older parts and to 5 cm. thick, divided into irregular scaly blocks; leaves in bundles of 3 or sometimes 2, subtended by a scarious bract, 12-23 cm. long, yellow-green to grayish-green, slender though somewhat rigid, sometimes twisted; bundle sheath 1.5-2 cm. long, persistent; bracts decurrent and somewhat constricted into an obliquely cuneate base; male flowers yellow, in large clusters; female flowers yellow, solitary or in clusters of 2 or 3; conelets erect, their scales subacuminate; cones sessile ovoid-cylindric to narrowly conical, essentially symmetrical, 7-12 cm. long; cone scales thin; apophysis tawny, sometimes lustrous, flattened, wrinkled, somewhat elevated along a transverse keel, the entire umbo forming a stout triangular spine with somewhat concave sides; seeds about 7 mm. long, pebbly to the touch, dark-brown, mottled with black; seed-wing about 2 cm. long, semiobovate, lustrous, yellowish-brown to somewhat grayish-black. In sands, sandy loams or gravelly soils in flatwoods, on ridges and hills, and savannahs in e. Tex., w. to Bastrop, Burleson, Leon, Anderson, Smith and Wood cos.; on the Coastal Plain and Piedmont from s. N.J. and Md., s. to cen. Fla. and w. to e. Tex. and n. in the Miss. Valley to s.e. Okla., Ark. and s. Tenn.

This species comprises the so-called "Lost Pines" of Bastrop County. This romanticism is misleading since the pines of Bastrop and Fayette counties are now known to be definitely connected with the main body of pines that are the principal component of the east Texas forest.

3. *Pinus Elliottii* Engelm. SLASH PINE, PITCH PINE, YELLOW SLASH PINE. Tree to 35 m. tall, with a tall tapering trunk to 1 m. in diameter and horizontal branches to form a rounded crown; twigs roughened with spreading scales; bark broken up into rather large flat flakes; leaves stout, dark green and lustrous, ascending in rather tight clusters to appear broomlike, borne in fascicles of 2 or 3, 12.5-27 cm. long; fascicle

sheaths 1-1.5 cm. long; cones stalked, 7.5-15 cm. long, usually falling from tree by the end of the second year, elongate and ovoid-conic when unopened, ovoid-conic when open; cone scales with lustrous tan faces, transversely keeled, each with an elongate umbo that bears a small recurved spine; seeds somewhat triangular, with a thin brittle shell, the wings dark-brown. *P. caribaea* of auth.

This species is commonly planted in reforestation. Plantations have been seen or are known to occur in Austin, Montgomery, Tyler, Jasper and Newton counties. It reproduces well and, in time, this species should become a naturalized element in the flora of Texas. Slash pine occurs on the Coastal Plain from s. S.C. to cen. Fla. and s.e. La.; planted and tending to escape in s.e. Tex.

4. *Pinus ponderosa* Laws. PONDEROSA PINE, WESTERN YELLOW PINE. Tree to about 35 m. tall, with a straight trunk 9-12 dm. in diameter and rather stout branches forming a pyramidal open crown; twigs short and congested, emitting a turpentine-like odor when bruised; bark blackish and furrowed on young trees, yellowish-brown to cinnamon-red and plated on old trunks; leaves usually in bundles of 3 but occasionally 2 on the same tree, rarely 4 or 5, subtended by a scarious bract, 1-3 dm. long, gray-green to dark-yellowish-green, flexible to somewhat rigid; bundle sheath 1.5-2 cm. long, persistent, the scales at first dull-brown but soon becoming blackish with age; bract about 3 mm. long after loss of the lanceolate fimbriate apical portion, the base umbonate and scarcely or not at all decurrent; male flowers yellow; female flowers clustered or in pairs, dark-red; cones essentially sessile, ovoid to ovoid-conic or ellipsoid, more or less symmetrical, light-reddish-brown, 8-15 cm. long, when deciduous usually leaving a few basal scales on the tree; cone scales thickish; apophysis diamond-shaped, tawny-yellow to dull-brown, lustrous, elevated along a transverse keel, the prominent umbo armed with a sharp usually persistent prickle; seeds ovoid, about 7 mm. long, somewhat compressed toward the apex, brownish-purple; seed wing about 25 mm. long, semiobovate. *P. brachyptera* Engelm. In canyons and on upper slopes of mts. in the Trans-Pecos; widespread from the mts. of w. Tex., w. to s. B. C. and w. and n.w. U.S. and s. to n.-cen. Mex.

This is an important timber tree in western United States. In the Chisos Mts. some specimens with 4 and 5 needles tend toward the var. *arizonica* (Engelm.) Shaw of northern Mexico, southern Arizona and southwestern New Mexico.

5. *Pinus echinata* Mill. SHORTLEAF PINE, SHORTLEAF YELLOW PINE. Tree to 30 m. tall, with a long clear trunk 6-9 dm. in diameter and rather short spreading branches to form a narrow pyramidal crown; twigs at first pale-green, usually with a bluish or purplish bloom, in time smooth and reddish-brown; buds with several slender red-brown scales; bark nearly black and roughened on young stems, reddish-brown and separated into irregular flat scaly plates on older parts; leaves in bundles of 2 or 3 on same branch, subtended by a scarious bract, 7-12 cm. long, dark-blue- or yellow-green, slender, flexible; bundle sheath 6-12 (-15) mm. long, persistent; bract irregularly decurrent with the decurrent portion soon exfoliated; male flowers yellowish-brown to pale-pink, in large clusters; female flowers light-pink, solitary or in clusters of 2 or 3; conelets with mucronate scales; cones sessile, releasing their seeds at maturity but remaining on the branches for many years, ovoid to conical, essentially symmetrical, 4-6.5 cm. long; cone scales thin, rounded at the apex; apophysis reddish-brown, thin or thickened along a transverse keel, the prominent umbo armed with a small sharp straight or curved often deciduous prickle; seeds nearly triangular, with rounded sides, about 7 mm. long, brown, usually mottled with black; seed wing about 12 mm. long, semiobovate, stramineous, sometimes streaked with yellow-brown. On well-drained hills, flatwoods and slopes in e. Tex., w. to Burleson and Henderson cos.; from s.e. N. Y. and N. J., s. to n. Fla. and s.w. to s. Mo., e. Okla. and e. Tex.

An important timber tree in southeastern United States.

6. *Pinus edulis* Engelm. PINYON, NUT PINE, COLORADO PINYON PINE. Small trees to 10 m. or more tall, with a short trunk 6 dm. or more in diameter and a compact globose spreading crown; bark furrowed into scaly ridges, gray to reddish-brown; needles 2 (sometimes 3 or rarely 1) in a bundle, stout, yellowish-green, with whitish lines on their outer rounded surface; bundle sheath about 5 mm. long, cones ovoid, 3.5-5 cm. long, light-brown or tan-color, with thick blunt scales; seeds brown, wingless, usually soft-shelled, about 13 mm. long, oily and edible. *P. cembroides* var. *edulis* (Engelm.) Voss.

On mt. slopes in extreme n. Trans-Pecos, also reportedly on breaks of the Prairie Dog Town Fork of the Red River in Deaf Smith Co. in the Plains Country; from Tex., w. to Colo., Ut., Ariz. and n. Mex., with several local areas in n.w. Okla., s.w. Wyo. and s.e. Calif.

E. L. Little, Jr. has observed that *P. edulis* is more or less consistently parasitized by *Arceuthobium* while *P. cembroides* is relatively immune. The edible seeds of this species are gathered from the wild and are sold as "pinyon nuts."

7. *Pinus cembroides* Zucc. MEXICAN PINYON, MEXICAN PINYON PINE, PINO PIÑONERO. Small trees to 10 m. or more tall, with a trunk 5 dm. or more in diameter and a compact globose spreading crown; bark deeply furrowed into scaly ridges, reddish-brown or blackish, with flattened plates on large trunks; needles 3 (sometimes 2) in a bundle, 25-45 mm. long, slender, dark-bluish green; bundle sheath about 5 mm. long; cones ovoid, 2.5-4 cm. long, reddish-brown, with thick blunt scales; seeds brown, usually hard-shelled, about 1 cm. long, oily and edible. On mesas and mt. slopes of s. half of Trans-Pecos Tex.; from Tex., w. to s.e. Ariz. and n. Mex.

Var. *remota* Little. This plant, which is somewhat remotely centered in the Edwards Plateau of west-central Texas, is characterized by having usually 2 needles in a bundle and thin-shelled seeds. According to Little, the trees have persisted on the Edwards Plateau at low elevations probably since the glacial periods when the distribution probably was continuous.

8. *Pinus strobiformis* Engelm. SOUTHWESTERN WHITE PINE, PINO ENANO. Tree to 25 m. tall, with a trunk to about 1 m. or more in diameter and rather slender branches forming a broad rounded crown; spring shoots reddish-brown and pubescent; twigs and branchlets tough and pliant, glabrous, usually with a glaucous bloom; buds with ovate-lanceolate loosely imbricated brownish scales having scarious margins; bark smooth and whitish-gray on young trunks, grayish or dark-brown and deeply furrowed on older trunks; leaves in bundles of 5, at first subtended by a scarious bract, 4-9 cm. long, bluish-green, slender, entire to very sparsely serrulate; bundle sheath 1.5-2 cm. long, early deciduous; bract from a swollen base not noticeably decurrent; male flowers reddish-brown in appearance, in short spikes; female flowers bright reddish-purple, several in a cluster; conelets smooth; cones short-stalked to subsessile, pendent, oval to subcylindric, symmetric, yellowish-brown, 7-25 cm. long, dehiscent at maturity; cone scales thick, rounded at apex; apophysis pale-tawny-yellow or yellow-ochre, lustrous, commonly prolonged and somewhat reflexed, the thickened apex and unarmed umbo raised above the surface of the cone; seeds oval, 5-12 mm. long, wingless or essentially so, reddish-brown mottled with black. *P. flexilis* of auth., *P. flexilis* var. *reflexa* Engelm., *P. reflexa* (Engelm.) Engelm. In canyons and on upper slopes of mts. in cen. and n. Trans-Pecos; from the mts. of w. Tex., w. to Ariz. and s. to cen. Mex.

2. PSEUDOTSUGA CARR.

Seven species in North America and eastern Asia.

1. *Pseudotsuga Menziesii* (Mirb.) Franco. DOUGLAS-FIR, BLUE DOUGLAS-FIR. Pyramidal evergreen trees with long whorled branches, usually drooping branchlets and rough furrowed bark, to 50 m. or more tall, with a straight trunk to about 15 dm. in diameter; the twigs somewhat roughened by the bases of fallen leaves, glabrous or pubescent; leaves short-stalked, linear, spreading on all sides of twigs or sometimes in 2 rows, 1.5-3 cm. long, about 1.3 mm. wide, flat, slightly grooved and dark-blue-green above, paler beneath, rounded at apex, falling away after from 6 to 8 years to leave a rounded sessile leaf scar; cones ellipsoid to ovoid-ellipsoid, reddish-brown, 4-7 cm. long, with thin rounded scales and long thin conspicuously 3-pointed bracts projecting beyond the scales; seeds dull-russet-brown with areas of white. *P. Douglasii* (Lindl.) Carr., *P. taxifolia* (Lamb.) Britt., *P. mucronata* (Raf.) Sudw. In canyons and on upper slopes in the mts. of the Trans-Pecos; from w. Tex. to Mont., Alta. and B.C., s. to Calif., Ariz. and n. Mex.

One of the most important timber trees that, according to the best authorities, has the largest total stand of any timber tree in the United States. Our plant is usually referred

to var. *glauca* (Mayr) Franco on the basis of its more compact habit and more ascending branches, the shorter more or less bluish-green leaves, and smaller cone (about 5 cm. long) with spreading and often reflexed bracts.

FAM. 14. TAXODIACEAE WARMING

TAXODIUM FAMILY

Deciduous or essentially evergreen trees with light-brown furrowed and scaly bark and upright or spreading branches; branchlets of two kinds, those near the apex of the shoot persistent and with axillary buds, those on the lower part of the shoot without axillary buds and deciduous; winter-buds globose, scaly; leaves alternate, subulate or flat and linear with stomatic bands below, those of the deciduous branchlets usually spreading in two ranks, those of the persistent branchlets spreading radially; staminate flowers ovoid, consisting of 6 to 8 stamens and forming terminal drooping panicles; pistillate flowers scattered near the ends of the branches of the preceding year, subglobose, consisting of 2-ovuled scales; fruit a short-stalked globose or ovoid cone that ripens the first year, consisting of many thick coriaceous peltate scales that are dilated from a slender stipe into an irregularly 4-sided often mucronate disk; each fertile scale with 2 unequally 3-angled seeds with 3 thick wings.

About 16 species in 10 genera in both hemispheres.

1. TAXODIUM RICH.

BALD CYPRESS

Trees with light-green deciduous leaves and slender leafy branchlets of the season that are deciduous in autumn, monoecious, often with erect columnar "knees" produced from the roots in areas of frequent flooding; flowers unisexual, the two kinds on the same branches; staminate flowers in panicles of short or slender spikes, with few stamens; filaments scalelike, peltate, bearing 2 to 5 anther cells; pistillate aments ovoid, in small clusters, scaly, with a pair of ovules at the base of each scale; cone closed, globular, composed of thick and angular somewhat peltate scales that bear two 3-angled seeds at their bases.

Three species in southern United States and Mexico. Important timber trees that are commonly grown for their ornamental qualities.

1. Distribution in Texas north of the Rio Grande Valley; deciduous; branches of staminate flowers short and crowded, the flowers commonly in short compact secondary branches1. *T. distichum*.
1. Distribution in Texas confined to the Rio Grande Valley; essentially evergreen; branches of staminate flowers long and slender, open, composed of single flowers or tight clusters of several flowers2. *T. mucronatum*.

1. *Taxodium distichum* (L.) Rich. BALD CYPRESS, SOUTHERN CYPRESS. Tree occasionally to 50 m. tall, with a tapering trunk strongly buttressed at the swollen base, pyramidal when young, in old age usually spreading to form a broad rounded head; bark reddish-brown or gray, with long fibrous or scaly ridges; young branchlets green, becoming brown the first winter; the 2-ranked feathery leaves linear to linear-lanceolate, flat, apiculate, 1-1.5 cm. long, soft bright-green to yellowish-green or whitish below, turning dull-orange-brown before falling; panicle of staminate flowers 10-12 cm. long; cone globose or obovoid, about 25 mm. across; disk of hard scales, rugose, usually without a mucro; seeds heavy, angular, about 1 cm. long. In swamps and along rivers and streams in e. Tex, w. from Brazoria Co. to Real and Uvalde cos. on the Edwards Plateau in cen. Tex.; from Del. to Fla., w. to Ill., Mo., Ark. and Tex.

Especially in wet and frequently inundated areas the roots produce woody cylindrical projections to 2 m. tall and 3 dm. in diameter that are called "cypress-knees." An important timber tree that is sometimes grown for its ornamental value. Individuals of this species exhibit some remarkable genetic differences. For example, near Saratoga two trees growing side by side have the appearance of two entirely different species. One, with open crown, has its branches ascending, while the other, with a dense closed crown, has spreading and descending branches.

2. *Taxodium mucronatum* Ten. MONTEZUMA BALD CYPRESS, SABINO, AHUEHUETE, CIPRÉS. Large tree with straight trunk enlarged near the base, up to 30 m. high; bark brownish-red, relatively smooth to shallowly furrowed, fibrous, more or less shredded; leaves linear, 6-12 mm. long, spreading in nearly 2-ranked sprays, these and some young branchlets falling with appearance of new growth; staminate cones small, ovoid, 1.5-2.5 mm. long, in slender spikes 5-15 cm. long; ovulate cones subglobose, 15-25 mm. in diameter; seeds dark-reddish-brown, 4-8 mm. long, irregularly angular because of crowding. Along the Rio Grande and occasionally along resacas in Cameron and Hidalgo cos. in the Rio Grande Valley; from s. Tex., s. on the Mex. tableland and along the coast of the Gulf of Mex.

This species is the famous large tree of Santa María del Tule, Oaxaca, Mexico, which, according to the best authority, has a height of about 39 meters and a trunk circumference of 52 meters, with the spread of its branches about 42 meters.

FAM. 15. CUPRESSACEAE BARTL.

CYPRESS FAMILY

Monococious or dioecious trees or shrubs, with imbricated opposite or whorled scalelike (or rarely linear) leaves, decurrent and thickly clothing the branchlets, or jointed at base; flowers small, unisexual, terminal on the branchlets or axillary; stamens with several pollen sacs attached at the lower half of the thin shieldlike connective; ovuliferous scales several, opposite or whorled, bearing at base 1 to many erect ovules; cones woody or fleshy, the scales shield-shape or imbricated; seeds often angled or winged; cotyledons 2 or more.

A family of about 19 genera and about 130 species widely distributed over both hemispheres.

1. Fruit a woody dehiscent cone, long-persistent; seeds winged, numerous under each scale; leaves scalelike, decussate1. *Cupressus*, p. 76.
1. Fruit an indehiscent berrylike cone, formed by the coalition of the scales, not long-persistent; seeds not winged, 1 or 2 under each scale; ovules 1 or 2
.....2. *Juniperus*, p. 76.

1. CUPRESSUS L.

Fifteen or more species native to warm temperate Asia, southern Europe, northern Africa, southwestern United States and Mexico.

1. *Cupressus arizonica* Greene. ARIZONA CYPRESS, CEDRO BLANCO. Resinous aromatic monoecious evergreen tree to about 25 m. tall, usually less than 10 m. tall, with a straight trunk usually 5 dm. or less in diameter and a conical or rounded crown; twigs numerous, stout, 4-angled, 1.5-2 mm. thick, branching nearly at right angles in all directions; bark on young or small trunks smooth and shedding in thin scales to expose the red inner bark, on older or larger trunks rough and thick and becoming furrowed and fibrous or checkered, often exfoliating, mostly gray or blackish; leaves scalelike, triangular-ovate, sharp-pointed, pale-blue-green, commonly with a whitish bloom, about 2 mm. long; cones short-stalked, globose, 2-2.5 cm. in diameter, hard and woody, gray, often glaucous, with 6 to 8 flattened scales bearing a hard point in center, remaining attached for several years; seeds purplish-brown, somewhat triangular, about 2 mm. long. Incl. var. *bonita* Lemm., *C. glabra* Sudw. In Tex. known only from high forested canyons in the Chisos Mts. in Brewster Co.; from w. Tex. and s.w. N.M. to s. Calif. and n. Mex.

Used mainly for fence posts, in shelterbelts and as an ornamental.

2. JUNIPERUS L.

More or less aromatic evergreen dioecious or sometimes monoecious trees or shrubs with thin shredded or thick checkered or furrowed bark and soft close-grained often reddish wood; branches often slender; leaves persistent for several years, scalelike or sometimes awl-shaped, sometimes jointed at base, opposite or in whorls of 3, decurrent at the base; flowers small, terminal; staminate flowers solitary or clustered, their scales

ovate or peltate, bearing 3 to 6 anther cells; ovulate flowers subglobose, of 2 to 3 series of scales; ovules 1 or rarely 2 to each scale; cones berrylike by the coalition of the fleshy scales; seeds 1 to several, wingless; cotyledons 2 to 6.

About 60 species that are widely distributed over the Northern Hemisphere.

Juniperus communis L., the common juniper, has been reported from the Plains Country and Trans-Pecos Texas, but these reports undoubtedly were based upon misidentified specimens.

In all species of *Juniperus* the juvenile leaves and frequently those on leading shoots are needlelike. Any one species may also have glaucous individual trees as well as those with bright-green foliage. A common teratological condition in *Juniperus*, caused by parasitic insects, is the exertion of the seed at the tip of the cone. This is known in several Texas species, and, according to Morton (*Rhodora* 43: 345. 1941), it is known altogether in about 16 species.

With few exceptions, cedars are trees and shrubs of poor dry soils. In Texas, they are especially common on breaks and rim rocks of mesas in the central and western parts of the state.

1. Leaf margins irregularly minutely cellular-serrulate or cellular-denticulate, not smooth (under magnification) (2)
1. Leaf margins entire and smooth, sometimes hyaline (under magnification) (6)
- 2(1). Mature fruits reddish or copper-colored; large hilum of seeds reaching about halfway up their surface (3)
2. Mature fruits blue or bluish-black; small hilum of seeds about one third way up their surface (5)
- 3(2). Seeds 1 or 2; cones without a bloom, usually less than 8 mm. in diameter, the pulp usually resinous and soft; leaves frequently in threes; leaf gland usually prominent and more or less swollen and elevated, round; bark of trunk furrowed 2. *J. Pinchotii*.
3. Seeds 3 or 4; cones more or less glaucous, usually more than 8 mm. in diameter, the pulp dry and solid; leaves usually in pairs, opposite; leaf gland usually inconspicuous and flat, depressed or rounded with the leaf curvature, oval to elliptic; bark of trunk furrowed or checkered (4)
- 4(3). Bark of trunk checkered; twigs rather thick and spreading; leaf gland frequently ruptured 1. *J. Deppeana*.
4. Bark of trunk furrowed, not checkered; twigs thin and drooping; leaf gland rarely ruptured 1. *J. Deppeana* var. *Sperryi*.
- 5(2). Cones mostly 4-7 mm. long when mature; seed solitary or rarely some in pairs, sometimes flattened, prominently ridged and obtuse; leaf gland elliptic and flat or depressed; plants of the Trans-Pecos region and Plains Country 3. *J. monosperma*.
5. Cones mostly 7-8.5 mm. long when mature; seeds 1 or 2, not flattened when solitary, ridgeless and pointed at the tip; leaf gland (when evident) round and somewhat swollen; plants confined to the Edwards Plateau of central Texas 4. *J. Ashei*.
- 6(1). Species in the Trans-Pecos region and Plains Country of west and northwest Texas; leaf gland elliptic, elongate, rarely oval; mature leaves always paired and only slightly (if at all) overlapping the ones directly above (7)
6. Species of central and east Texas; leaf gland usually small and oval or round, rarely elliptic, much shorter than the distance from the gland to the leaf tip; mature leaves in pairs or occasionally with some in threes, usually overlapping to some degree the ones above (8)
- 7(6). Cones red-brown or grayish-brown, usually more than 8 mm. in diameter, 4- to 12-seeded; branchlets drooping; leaves sharply acuminate; leaf gland shorter than or nearly equal the distance from the gland to the leaf tip; apparently confined to the Chisos Mountains 5. *J. flaccida*.
7. Cones bright-blue, usually less than 8 mm. in diameter, 1- or 2-seeded; branchlets not noticeably drooping; leaves bluntly obtuse to subacute; leaf gland as long as or mostly longer than the distance from the gland to the leaf tip; distribution north of the Chisos Mountains 6. *J. scopulorum*.

- 8(6). Branches mostly pendulous; ultimate twigs usually less than 1 mm. thick; leaves bluntly obtuse to acute, mostly less than 1.5 mm. long; cones mostly ovoid and 3-5 mm. long; distribution in extreme southeast Texas
7. *J. silicicola*.
8. Branches typically horizontally spreading; ultimate twigs usually 1 mm. thick or more; leaves acute to acuminate, 1.5-2 mm. long; cones essentially globose and 5-8 mm. in diameter; distribution rather general in east Texas
8. *J. virginiana*.

1. *Juniperus Deppeana* Steud. ALLIGATOR JUNIPER, WESTERN JUNIPER. Small dioecious tree to about 15 m. high, usually much smaller, with a short thick trunk to about 1 m. in diameter and stout spreading branches that form a broad-pyramidal or round-topped crown; bark thick, grayish or dark-brown, deeply furrowed into checkered or square plates; branchlets and leafy twigs slender; leaves on mature fruiting or flowering branches opposite, closely appressed, rhombic-ovate, broadly obtuse to acute and sometimes apiculate at apex, 1.5-3 mm. long, the margins minutely cellular-serrulate or cellular-denticulate, glandular on the somewhat keeled back, often with whitish drops of resin, bluish-green and often more or less glaucous; staminate cones ellipsoid, green-brown, up to 6 mm. long; mature fruit reddish-brown to tan or sometimes purplish-red, glaucous, subglobose to broadly ellipsoid, 8.5-12 mm. in diameter, maturing the second year, the mealy brownish pulp drying tightly around the seeds; seeds 1 to 5 (usually 4) per fruit, about 7 mm. long, light-chestnut-color or tannish. Incl. var. *pachyphloea* (Torr.) Martinez, *J. pachyphloea* Torr. On grassy open rocky hills and slopes and in scrub oak areas in the mts. and foothills of the Trans-Pecos; from w. Tex., w. to cen. Ariz. and s. to cen. Mex.

The wood of this species is used for fence posts and fuel.

Var. *Sperryi* Correll. This plant, which is rare in the Davis and Guadalupe mts., is characterized by having bark longitudinally furrowed and scaly; branches and branchlets flaccid and drooping; twigs slender; leaves usually sparsely sprinkled with glistening specks and the inconspicuous dorsal gland rarely ruptured; fruit dry and similar to that of var. *Deppeana*.

2. *Juniperus Pinchotii* Sudw. RED-BERRY JUNIPER, PINCHOT JUNIPER. Large dioecious or rarely monoecious shrub or small tree with shrubby aspect, to about 6 m. high, usually with several or numerous stems arising from the base to form a dense clump; bark thin, ashy-gray, longitudinally fissured into persistent scales; branches somewhat rigid, their slender tips erect or ascending; wood with nearly white sapwood and light-brown-reddish tinged heartwood; leaves on mature fruiting or flowering branches in twos and threes, closely appressed, triangular-ovate, acute, 1.5-2.5 mm. long, the margins minutely cellular-serrulate or cellular-denticulate, usually with a roundish gland on the somewhat thickened back, yellowish-green; mature fruit variable in size and color, reddish- or copper-brown, with very little or no bloom, subglobose to slightly ellipsoid, with a thick dryish sweetish pulp, 6-10 mm. in diameter; seeds 1 or 2 per fruit, about 5 mm. long, broadly ovoid, pointed, indistinctly ridged, lustrous-chestnut-brown; hilum somewhat bilobed and covering the seed for about one-half its length from the base. *J. erythrocarpa* Cory, *J. texensis* Van Melle, *J. monosperma* var. *Pinchotii* (Sudw.) Van Melle. In gravelly or rocky soils on open flats and dry hills, in arroyos and canyons, on caprocks and talus slopes, commonly about limestone and in gypseous soils from cen. Tex., n. to Plains Country and w. to the Trans-Pecos; from cen. Tex. to s.e. N.M. and w. Okla.

This species has a remarkable viability for sprouting from charred or cut stumps after burning or cutting. The sprouts grow very rapidly at first and are willowy. In addition to their difference in fruit-color, the branchlets of *J. Pinchotii* tend to be more slender and erect than those of *J. Ashei* which are usually stiffish and recurved. This species is used locally for fuel and fence posts but it is considered to be only moderately durable when in contact with soil.

3. *Juniperus monosperma* (Engelm.) Sarg. ONE-SEEDED JUNIPER, CHERRY-STONE JUNIPER. Large dioecious shrub or small tree with shrubby aspect, to about 6 m. high, usually with several small trunks arising from the base or branched near the base, forming a low open and bushlike crown; bark light-ashy-gray, ridged, divided into thin shreddy fibrous scales; branchlets slender, tetragonal; leaves on mature fruiting and

flowering branches in pairs or rarely in threes, closely appressed or sometimes slightly spreading, ovate, acute to acuminate, often rough to the touch, 2-3 mm. long, the margins minutely cellular-serrulate or cellular-denticulate, with or without a conspicuous elliptic and flat or depressed gland on the usually thickened and rounded back, grayish-green; staminate cone brownish, ovoid-ellipsoid, about 4 mm. long; mature fruit dark- or pale-blue to purplish-violet and glaucous, subglobose or globose-ovoid, with a thin sweetish resinous pulp, 4-7 mm. long; seeds mostly 1 or rarely 2 or 3 per fruit, pale-chocolate- or chestnut-brown, ovate, obtuse, prominently ridged, sometimes flattened; hilum whitish, covering the seed for about one-third its length from the base. Incl. f. *gymnocarpa* (Lemm.) Rehd., *J. gymnocarpa* (Lemm.) Cory, *J. mexicana* var. *monosperma* (Engelm.) Cory. Mostly on steep slopes and broken ground about rimrocks and breaks, in eroded soils of arroyos and plains and in brushlands, in the n. Plains Country and Trans-Pecos; from n.w. Okla. and w. Tex. to Ut., Nev., s.e. Ariz. and n. Mex.

The multistemmed plant that produces small bluish or bluish-black, commonly glaucous, fruits and that occurs in the Trans-Pecos and in the northern Panhandle is what we consider to be this species.

4. *Juniperus Ashei* Buchh. ROCK CEDAR, POST CEDAR, MEXICAN JUNIPER, MOUNTAIN CEDAR. Large dioecious shrub or small tree with shrubby aspect, to 6 m. high, usually with several trunks arising from a short furrowed main trunk or sometimes branching from the ground, rarely with a single trunk, forming a broad globular or open irregular crown; bark thin, ashy-gray, in long narrow persistent shreddy scales; wood heavy, with pale-brown heartwood and a broad zone of nearly white sapwood; branches spreading, their tips often recurved, the twigs grayish with age; leaves on mature fruiting or flowering branches in pairs or less frequently in threes, closely appressed, triangular-ovate, acute, 1-2 mm. long, to 1 mm. wide, the margins minutely cellular-serrulate or cellular-denticulate, with or without an oval or roundish more or less swollen gland on the back, dark-gray-green; staminate cones with about 12 overlapping peltate scarious scales that are brownish at the obtuse to rounded erose tips; mature fruit dark-blue, glaucous, globose-ovoid, with a thin sweet resinous pulp, 7-8.5 mm. long, 6-7.5 mm. wide; seeds one or sometimes two per fruit, broadly ovate, pointed, not flattened when single, 5-6 mm. long, 3.5-4.5 mm. wide, light-yellow-brown to chocolate-brown, without ridges or angles but with several very shallow grooves extending lengthwise; hilum smooth, whitish, covering the seed for about one-third its length from the base. *J. mexicana* of auth., *J. sabinoides* (H.B.K.) Nees (not Griseb.), *Sabina sabinoides* (H.B.K.) Small. In rocky soil in canyons, ravines, arroyos and about rimrocks and breaks, and on eroded slopes and flats, often forming thickets or "cedar brakes," centered on the Edwards Plateau, extending s. to Zavala Co., n.e. to Dallas Co., w. to Terrell Co. and n. to Nolan, Taylor and Stephens cos.; from s. Mo. and n. Ark., s.w. to Tex., s.e. N.M. and n. Mex.

In central and west Texas the wood of this species is the main source of fence posts which are extremely durable when in contact with the soil. As far as known, the cedar-apple rust does not occur on this species.

5. *Juniperus flaccida* Schlecht. WEEPING JUNIPER, DROOPING JUNIPER, MEXICAN DROOPING JUNIPER, TASCATE. Small dioecious trees to 9 m. high, with a short furrowed trunk and spreading branches and slender drooping branchlets to form a globose crown; twigs leathery and drooping; leaves on mature fruiting and flowering branches opposite, narrowly ovate, commonly spreading at the acuminate apex, with entire margins, with or without a more or less elliptic gland on the back; fruit dark- or dull-reddish-brown, with a bloom, subglobose, 8.5-12 mm. in diameter, with a mealy pulp interspersed with resinous glomerules that dries tightly about the seeds, resin often conspicuous on outer coat of fruit; seed 4 to 12, pinkish. On forested or open rocky slopes of the Chisos Mts. in the Trans-Pecos; from w. Tex. to s. Mex., with a doubtful locality in Real Co. on the Edwards Plateau.

6. *Juniperus scopulorum* Sarg. ROCKY MOUNTAIN JUNIPER. Large or shrubby dioecious tree to 12 m. high, with a short stout trunk to about 9 dm. in diameter that is often divided to near the ground into several slightly spreading stems and stout spreading-ascending branches to form an open irregularly round-topped crown; bark thin, dark-reddish-brown or gray tinged with red, divided by shallow fissures into narrow flat connected ridges that break up on the surface into persistent shredded fibrous scales; branchlets slender and 4-angled, becoming terete with age; leaves on mature fruiting

and flowering branches opposite and in pairs, closely appressed but usually not noticeably overlapping, ovate to ovate-elliptic, obtuse to acute, about 2 mm. long, the margins smooth, usually with a somewhat obscure elongate-elliptic gland on the back, dark-green or sometimes pale and glaucous; staminate cone subglobose to ellipsoid, 2-4 mm. long; mature fruit developed in 2 years, bright-blue, covered with a glaucous bloom, globose, with a sweet resinous pulp, 5.5-8.5 mm. in diameter; seeds one or usually two per fruit, rarely more, ovate, acute, prominently grooved and angled, about 5 mm. long, lustrous light-chestnut-brown; hilum small, 2-lobed. In rocky areas in canyons and on breaks in the Guadalupe Mts. of the Trans-Pecos and in the n. Plains Country; from N. D. and Mont., w. to B. C., Wash., Nev. and Ariz., s. to Tex. and in extreme w. Okla.

This species is very closely allied to *J. virginiana* but it tends to have larger fruits that take 2 years to mature, less acute and less overlapping leaves that have a longer dorsal gland, and more fibrous-shredded reddish-brown or grayish-brown bark. In spite of these differences, when they are found in proximity they are extremely difficult to distinguish one from the other.

7. *Juniperus silicicola* (Small) Bailey. SOUTHERN RED CEDAR, SAND CEDAR, COAST JUNIPER. Medium-sized dioecious tree to 10 m. high or more, with a short single trunk to 6 dm. in diameter and ascending or spreading branches to form a dense pyramidal or somewhat irregular rounded crown; bark thin, reddish-brown, exfoliating in fibrous shreds; branchlets and twigs slender, terete or 4-angled, typically pendulous, the ultimate twigs mostly less than 1 mm. thick; leaves on mature fruiting or flowering branches opposite in pairs or sometime in threes or more, imbricate and closely appressed, ovate or triangular-ovate, blunt to acute at apex, 1-2 mm. long, dark-bluish-green, the margin smooth, with an oval-oblong gland on the back; staminate cones ellipsoid, to 5 mm. long, yellowish-brown; fruits blue, with a waxy glaucous bloom, 5 mm. or less in diameter, subglobose to ellipsoid-ovoid, with a soft resinous pulp; seed usually solitary, ovoid, acute, usually prominently grooved. *J. barbadensis* of auth., *J. lucayana* of auth., *Sabina silicicola* Small. Usually in sandy soils in s.e. Tex.; on the Coastal Plain mostly near the coast from s.e. N. C., s. to cen. Fla. and w. to s.e. Tex.

This species is very similar to *J. virginiana* but it typically has more slender, elongated and pendulous branches and branchlets, smaller and more blunt leaves and smaller cones.

8. *Juniperus virginiana* L. EASTERN RED CEDAR. Medium-sized to large dioecious or sometimes monoecious trees to 30 m. high but usually much smaller, with an erect solitary trunk to about 1 m. in diameter and numerous spreading or erect branches to form a dense pyramidal to almost columnar crown; bark thin, reddish-brown, fibrous and shredding into long narrow fringed scales; wood with a red fragrant heartwood; twigs rounded or 4-angled, slender; leaves on mature fruiting and flowering branches opposite or rarely in threes, closely appressed and nearly always overlapping the leaf above, rhombic-ovate, acute to acuminate, sometimes apiculate, 1.5-2 mm. long, the margins smooth, with or without a rounded or oval gland on the back, dark-bluish-green; staminate scales tipped with yellow at the rounded smooth apex; mature fruit developed in one year, dark-blue or bluish-purple, glaucous, globose to subglobose or sometimes ovoid, with a dry resinous pulp, 5-8 mm. in diameter; seeds one or two or rarely more per fruit, ovate to subglobose, bluntly pointed, yellowish-brown, 2-4 mm. long, 1.5-3 mm. wide, very shallowly pitted; hilum small, inconspicuous. A field and pasture tree of dry sandy and rocky soils, commonly in old fields, along fence-rows and on the edge of forests in e. Tex. and the n. Plains Country in the Tex. Panhandle; from s.w. Me., w. to n. N. Y., s. Can. and s.w. N.D., s. to Kan., w. Okla., n.w. and e. Tex., and Ga.

An important source of fence posts. Also a source of timber for chests, paneling and for cedar-leaf oil. Commonly cultivated.

FAM. 16. EPHEDRACEAE DUM.

EPHEDRA FAMILY

Shrubs or viny shrubs with jointed opposite or fascicled branches, usually dioecious; leaves scalelike, opposite or whorled, mostly reduced to membranaceous sheaths that are more or less connate at base, persistent or tardily deciduous; flowers unisexual, with decussate persistent bracts; stamens monadelphous, subtended by a membranous 2-lobed calyxlike perianth; anthers dehiscent by terminal pores: ovulate flowers composed of one

or two erect ovules enclosed in an urn-shaped perianth that becomes hardened in fruit; seed-coats 1, separating into 2 and ending in an elongated stylelike micropyle; embryo axillary, surrounded by copious endosperm; cotyledons 2.

A single genus with representatives in the arid regions of the Northern Hemisphere.

1. EPHEDRA L. MORMON-TEA. MEXICAN-TEA

Desert shrubs with jointed *Equisetum*-like photosynthetic stems and branches, and persistent or deciduous scalelike leaves.

A geologically ancient genus of about 40 species that are distributed over the desert or semidesert regions of Asia, northern Africa and North America. An Old World species produces the drug, "ephedrine," that has proved to be somewhat efficacious in the treatment of nasal colds, asthma and hay fever. Although they are not the most palatable of browse, they are often heavily grazed in times of emergency, at which times they attain much importance.

- 1. Leaves and bracts of cones in threes; bracts of ovulate cones clawed (2)
- 1. Leaves and bracts of cones in twos, very rarely with some in threes; bracts of ovulate cones not clawed (3)
- 2(1). Leaves 5 mm. long or more, their tips rigid and awnlike, with age becoming gray and shredded, persistent; terminal buds spinose . 1. *E. trifurca*.
- 2. Leaves less than 5 mm. long, their tips flat and recurved, with age remaining firm or falling off; terminal buds not spinose 2. *E. Torreyana*.
- 3(1). Plants erect, yellowish to tan-colored or bright-green, usually somewhat glaucous, typically with clusters of straight stems that are closely parallel to form a broom-like appearance; leaf bases somewhat swollen, brown to blackish and persistent (4)
- 3. Plants typically sprawling, spreading or climbing, dull- to grayish-green, the stems and branches rarely forming parallel clusters; leaf bases not noticeably swollen, grayish or with a thin dark-brown central line or tan basal line encircling the stem, not long-persistent (5)
- 4(3). Ovulate cone sessile or on a short scaly peduncle; bracts of ovulate cone thin, broadly rounded, the inner ones membranous or herbaceous; seed solitary or occasionally with some paired; staminal column noticeably exceeding the bracts; connate portion of most leaves about as long as the free portion; distribution in Trans-Pecos Texas and in extreme western part of the Edwards Plateau 3. *E. aspera*.
- 4. Ovulate cone on a long naked peduncle that has a pair of bracts only at its base and summit; bracts of ovulate cone firm, acute, the inner ones becoming fleshy; seeds paired; staminal column usually scarcely exceeding the bracts; connate portion of most leaves much shorter than the free portion; distribution in Edwards Plateau and Panhandle in Texas 4. *E. Coryi*.
- 5(3). Stems stout and stiffish, spreading; peduncles (when present) of mature cones concealed by bracts; seed solitary or rarely with some paired; connate portion of leaves prominent, mostly about as long as or longer than the free portion; anthers sessile (or essentially so) on staminal column 5. *E. antisiphilitica*.
- 5. Stems usually slender and somewhat contorted, more or less climbing or trailing; peduncles of mature cones more or less exposed; seeds always paired; connate portion of leaves abbreviated, mostly much shorter than the free portion; anthers definitely stipitate 6. *E. pedunculata*.

1. *Ephedra trifurca* Torr. LONGLEAF EPHEDRA, CAÑATILLA. Erect shrub to 2 m. high; branches rigid, hard, terete, to 3.5 mm. thick, solitary or whorled at the nodes; internodes 3-9 cm. long; young stems pale-green, almost smooth, with numerous small longitudinal furrows, becoming yellow, then gray-green; bark of older stems cinereous, cracked and somewhat irregularly fissured longitudinally; terminal buds 1 cm. long, spinose; leaves ternately whorled, 5-13 mm. long, subspinously tipped from a dorsomedian thickening, connate for one-half to three-fourths their total length; sheath at first membranaceous, later fibrous, shredded and grayish, persistent; cones sessile or shortly scaly-pedunculate,

solitary or numerous in a whorl at the nodes of the young branches, elliptic to obovate; staminate cones 6-9 mm. long; staminate bracts ternate, in 8 to 12 whorls, obovate, slightly clawed, 3-4 mm. long, 2-3 mm. broad, membranaceous, reddish-brown, the lower whorls empty; perianth almost equaling the subtending bract, staminal column 4-5 mm. long, one-fourth exserted, with 4 to 5 short-stipitate anthers; ovulate cones 10-14 mm. long; ovulate bracts ternate, in 6 to 9 whorls, orbicular, clawed, 8-12 mm. long and broad, translucent except for the reddish-brown center and basal portion, margins entire; seed solitary or (occasionally) two or three, usually tetragonal, light-brown, smooth, 9-14 mm. long, 1.5-3 mm. wide, equaling the bracts; tubillus straight, twisted, about 1 mm. long, conspicuously exserted. Sandy and gravelly soils on hills and plains, along dry creek beds in arroyos and in desert scrub areas in w. Tex., e. to Loving, Ward and Pecos cos.; from w. Tex. and s. N.M., w. to Calif. and adj. Mex.

This species is easily recognized by its yellowed and spinosely-tipped branches and the frayed but persistent spinose leaves of the older stems.

2. *Ephedra Torreyana* Wats. TORREY EPHEDRA, TORREY JOINT-FIR. Erect shrub to 1 m. high; branches rigid, hard, terete, to 3.5 mm. thick, solitary or whorled at the nodes; internodes 2-5 cm. long; young stems pale-blue-green, glaucous, almost smooth, with many small longitudinal furrows, becoming gray; bark of older stems cinereous, cracked and irregularly fissured; terminal buds less than 4 mm. long, conical but not spinose; leaves ternately whorled, 2-5 mm. long, obtusely or occasionally acutely pointed from a brownish-green dorsomedian thickening, connate for one-third to two-thirds their total length, in age spreading and recurved; sheath at first membranaceous, later thickened and grayish, subpersistent; cones sessile, solitary to several in a whorl at the nodes of the young branches, ovate; staminate cones 6-8 mm. long; staminate bracts ternate, in 6 to 9 whorls, ovate, slightly clawed, 2-3.5 mm. long, 2-3 mm. broad, membranaceous, cream-colored to pale-yellow, the lower whorls empty; perianth exceeding the subtending bract; staminal column 2.5-4 mm. long, one-fourth to one-half exserted, with 5 to 8 sessile or short-stipitate anthers; ovulate cones 9-13 mm. long; ovulate bracts ternate, in 5 to 6 whorls, obovate, clawed, 6-9 mm. long, 6-10 mm. broad, hyaline except for the orange-yellow to greenish-yellow center and basal portion, the margins minutely toothed and undulate; seeds solitary or two, occasionally three, trigonal or tetragonal, light-brown to yellow-green, scabrous, 7-10 mm. long, 1.6-3 mm. wide, equaling or slightly exceeding the bracts; tubillus straight, somewhat contorted, about 1 mm. long, conspicuously exserted. On breaks and dry rocky or sandy hills and slopes, frequently in gypseous soils, in w. Trans-Pecos and the n.w. Panhandle, with isolated stations in Howard Co.; from w. Colo. to w.-cen. Tex., w. to n. Ariz. and Nev.

3. *Ephedra aspera* Engelm. BOUNDARY EPHEDRA, POPOTILLO. Erect shrub to 13 dm. high; branches rigid, firm, terete, to 3 mm. thick, opposite or whorled at the nodes; internodes 1-5.5 cm. long; young stems pale- to dark-green, strongly asperous to smooth and glaucous, with numerous small longitudinal furrows, with age becoming yellow; bark of older stems cinereous, cracked and fissured; terminal buds about 1.5 mm. long, obtuse-conical; leaves opposite, very rarely with some ternately whorled, 1-2.5 mm. long, obtusely tipped from a dorsomedian thickening, connate for one-half to seven-eighths their length; sheath splitting but the parts subpersistent; cones sessile or short- and scaly-pedunculate, paired or sometimes solitary or whorled at the nodes of the younger branches; staminate cones elliptic-ovate, 4-7 mm. long; staminate bracts opposite, in 6 to 10 whorls, obovate, about 3 mm. long and 2 mm. broad, membranaceous, yellow to red-brown, the lower whorl empty; perianth slightly exceeding the subtending bract; staminal column 4-5 mm. long, one-third exserted, with 4 to 6 sessile or very short-stipitate anthers; ovulate cones ovate, 6-10 mm. long; ovulate bracts opposite, in 5 to 7 whorls, orbicular, 2-5 mm. long and broad, thickened, red-brown, the margins membranaceous; seed solitary, in cross section circular to slightly trigonal, with a minute indentation at the tip between the angles, smooth to slightly roughened, tan to light-brown or chestnut, 5-8 mm. long, 2.5-4 mm. broad, exceeding by one third to one half the bracts; tubillus almost straight, contorted, about 0.5 mm long, slightly exserted.

E. Reedii Cory, *E. nevadensis* Wats. var. *aspera* (Engelm.) L. Benson. On rocky hills and in dry ravines and arroyos, on gravelly plains and arid talus slopes, and arid flats on the w. edge of the Edwards Plateau and in the Trans-Pecos, with disj. stations in Webb Co. in the Rio Grande Plains; in s.w. U. S. and n. Mex.

The swollen persistent somewhat roughened blackish leaf bases of this species and *E. Coryi* separate them from all other species found in Texas. In turn, the essentially sessile 1-seeded ovulate cones and long-connate leaves distinguish *E. aspera* from *E. Coryi*.

4. *Ephedra Coryi* E. L. Reed. CORY EPHEDRA. Erect shrubs, growing from spreading rhizomes, to 1 m. high; branches terete, to 2.5 mm. thick, opposite or whorled at the nodes; internodes 2-4.5 cm. long; young stems almost herbaceous, bright-green, slightly asperous, with numerous small longitudinal furrows, with age becoming yellow; bark of older stems red-brown, cracked and fissured irregularly; terminal buds 1-3 mm. long, obtusely conical; leaves opposite, acutely tipped from a dorsomedian thickening, connate for one-third to three-fourths their length; sheath membranaceous-margined, soon falling to leave the brown to blackish thickened and persistent base; cones usually noticeably pedunculate, paired to numerous at the nodes of the young branches; staminate cones obovate, 4-7 mm. long; staminate bracts opposite, slightly connate at the base, in 5 to 9 whorls, ovate, 2-4 mm. long, 2-3 mm. broad, membranaceous, light-yellow, the lower whorl empty; perianth slightly exceeding the subtending bracts; staminal column 2-4 mm. long, one-fourth exerted, with 5 to 8 sessile or short-stipitate anthers; ovulate cones obovate to spherical, 7-15 mm. long; ovulate peduncle 3-20 mm. long, with two pairs of bracts, one basal, the other subterminal; ovulate bracts opposite, in 3 to 4 whorls, ovate-acute at first, with age becoming yellow, fleshy and orbicular at maturity; seeds paired, trigonal, brown to chestnut or sometimes purplish and glaucous, smooth, 5-7 mm. long, usually equaling or slightly exceeding the bracts; tubillus somewhat recurved, about 1 mm. long, slightly exerted, early deciduous. Usually in loose sands or sandy soils in dune areas and on dry prairies in the s. Plains Country in w. Tex.; also s.e. N. M.

5. *Ephedra antisiphilitica* C. A. Mey. CLAPWEED, JOINT-FIR, POPOTE, CAÑATILLA. Erect or spreading shrub to 1 m. high; branches stiff, hard, terete, up to 4 mm. thick, alternate or whorled at the nodes; internodes 2-5 cm. long; young stems green, glaucous, almost smooth, with many small longitudinal furrows, with age becoming yellow-green, then gray-green; bark of older stems cinereous, slightly cracked and fissured; terminal buds 2-3 mm. long, obtusely pointed; leaves binate, 1-3 mm. long, obtusely tipped from a dorsomedian herbaceous thickening, connate for two-thirds to nine-tenths their total length; sheath membranaceous, later splitting and falling; cones essentially sessile, solitary or paired or sometimes several at the nodes of the young branches; staminate cones elliptic, 5-8 mm. long; staminate bracts in 5 to 8 pairs, obovate, one-eighth connate at the base, 2-3.5 mm. long, 2-3 mm. broad, slightly thickened, the margins membranaceous, pale-green to reddish, the lower pair empty; perianth slightly exceeding the subtending bract; staminal column 4-5 mm. long, one-half exerted, with 4 to 6 sessile or very short-stipitate anthers; ovulate cones elliptic, 6-11 mm. long; ovulate bracts in 4 to 6 pairs, orbicular-ovate, 3-6 mm. long, one-eighth to seven-eighths connate, the inner pairs becoming red and fleshy-succulent when ripe; seed solitary or rarely some paired, trigonal or occasionally tetragonal, light-brown to chestnut, smooth, 6-9 mm. long, 2-3.5 mm. broad, conspicuously exerted; tubillus straight, somewhat contorted, about 0.5 mm. long, slightly exerted. Incl. var. *brachycarpa* Cory, *E. texana* E. L. Reed. In gravelly or rocky soil on plains, hills, breaks, rimrocks, and in arroyos, ravines and canyons, in most of the s. Panhandle, Edwards Plateau and Rio Grande Plains, with some apparently isolated stations in the cen. and s. Trans-Pecos; from s.w. Okla. through most of the w. two-thirds of Tex., s. to n.e. Mex.

This coarse plant is readily distinguished from all other species found in Texas by the very narrow pale-orange-yellow or tannish band that encircles the stem at the very base of the connate leaves.

6. *Ephedra pedunculata* Engelm. VINE JOINT-FIR, COMIDA DE VÍBORA. Vinelike shrub, trailing on ground or clambering over bushes, trees and rocks, often to a height of 7 m.; branches lax, firm, terete, to 3 mm. thick, alternate, opposite or sometimes whorled at the nodes; internodes to 7 cm. long; young stems gray-green, glaucous, almost smooth, with several moderately deep longitudinal furrows, with age becoming more green, then yellow-green; bark of older stems cinereous, slightly cracked and fissured; terminal buds 1-3 mm. long, narrowed; leaves binate, to 3 mm. long, obtusely tipped from a dorsomedian herbaceous thickening, connate below the middle; sheath membranaceous, splitting with age; cones with a peduncle to 2 cm. long, solitary or several at the nodes of the young branches; staminate cones suborbicular to broadly elliptic, 4-8 mm. long;

staminate bracts in 6 to 12 pairs, obovate, free or one-eighth connate at the base, 1.5-3.5 mm. long, 1.5-3 mm. broad, slightly thickened, the margins membranaceous, pale-yellow to reddish, the lower pair empty; perianth slightly exceeding the subtending bract; staminal column 3-5 mm. long, one-half exserted, with 4 to 6 definitely stipitate anthers; ovulate cones elliptic, 6-10 mm. long; ovulate bracts in 3 to 6 pairs, ovate, one-eighth to seven-eighths connate, the inner parts becoming red and fleshy-succulent when ripe; seeds paired, trigonal, light-brown to chestnut, smooth, 4-9 mm. long, 2-3.5 mm. broad, conspicuously exserted; tubillus slightly kinked, somewhat contorted and exserted, about 0.5 mm. long. Widely sprawling or climbing over trees, shrubs, fences and boulders from Howard Co., s. through the w. Edwards Plateau to Hidalgo Co. in the Rio Grande Plains; from s.w. Tex. e. of the Pecos River, s. to S. L. P.

This species is readily separated from *E. antisiphilitica*, with which it is often confused, by its clambering vinelike habit, its 2-seeded ovulate cones that are commonly borne on a somewhat naked peduncle, and the definitely stipitate anthers.

CLASS 2. ANGIOSPERMAE

Plants diverse in habit, structure, form, size, habitat and sexualization; ovules and seeds borne enclosed in carpels that are at the center of flowers and which are interpreted as fertile fronds with megasporangia on the upper surfaces, these fronds are loosely folded along a median zone in such a way that the margins meet to form a more or less firmly sealed ventral (adaxial) suture; carpels either free (constituting a simple pistil) or often several united into a compound pistil; ovule-bearing portion of the pistil (the ovary) maturing into the fruit; gametophytic stage of the plant of very short duration (a matter of only a few hours) as compared to the gymnospermous counterparts, and the male gamete reaching the female gamete (in the ovule) by means of a tube that penetrates the tissues of the carpel; fertilization consisting of a double process: not only does the sperm-nucleus fertilize the egg-nucleus to form a diploid zygote which develops into the embryonic sporophyte in the seed, but another simultaneous fertilization in the same female gametophyte results in a triploid or higher polyploid nucleus which in many members of the class produces a nutritive tissue called endosperm closely associated with the embryonic sporophyte.

A stupendous array of about 200,000 species including all the most important sources of food and fiber, and including all the plants which the man in the street calls flowers.

SUBCLASS 1. MONOCOTYLEDONEAE

Cotyledons usually solitary; embryonic radicle usually developing only to a very limited extent, most of the roots being adventitious on the lower part of the stem, resulting in a so-called fibrous root system; vascular strands of the stem usually not in any cylindrical pattern, the stem-transsection revealing a number of scattered strands; vascular strands (nerves, veins) of the leaves usually not forming a network but parallel for most of their length; sepals, petals, stamens and carpels usually in multiples of three, but many exceptions.

Plants with long, narrow leaves such as grasses, sedges and lilies are characteristic of this subclass; but such bizarre plants as palms, yuccas and century plants also belong here. About 50,000 species, roughly a fourth of all angiosperms, fall into this group.

FAM. 17. TYPHACEAE JUSS.

CAT-TAIL FAMILY

Aquatic or paludal monoecious perennial herbs with a creeping rhizome and distichously arranged erect leaves; leaves sessile, linear, nerved, glabrous, sheathing the base of the simple jointless stems; flowers unisexual, in a long dense cylindrical spike terminating the stem, without proper floral envelopes; staminate flowers forming the upper portion of the spike, consisting of stamens inserted directly on the axis and intermixed

with long hairs or slender bracts; pistillate flowers forming the lower portion of the spike, consisting of stipitate 1-celled fertile or abortive ovaries with their stipes provided with ascending or spreading slenderly clavellate bristles that form the copious down of the fruit; ovary 1-celled and 1-ovuled, with usually persistent linear style and elongated 1-sided linear or linear-lanceolate stigma; fruit a long-stalked minute nutlet; seed suspended, anatropous.

A solitary genus.

1. TYPHA L.⁴ CAT-TAIL

Characters of the family. About 15 species of worldwide distribution.

1. Staminate and pistillate portions of spike usually contiguous; stigmas ligulate to lanceolate; sterile ovary ellipsoid, tipped at the rounded apex by a rudimentary style; leaves flat on back1. *T. latifolia*.
1. Staminate and pistillate portions of spike usually separated by an interval; stigmas linear to fliform; sterile ovary not ellipsoid; leaves commonly convex on back (2)
- 2(1). Leaves 5-8 mm. wide, dark-green; sterile ovary cuneate, with a rudimentary style on the truncate-flattened apex2. *T. angustifolia*.
2. Leaves 7-15 mm. wide, light yellowish-green; sterile ovary obovoid, the rounded apex tipped by a short rudimentary style3. *T. domingensis*.

1. *Typha latifolia* L. COMMON CAT-TAIL, TULE ESPADILLA. Plant coarse and stout, to about 3 m. tall; pith of the stem base white; leaves essentially flat; sheathing, pale- or grayish-green, 6-23 mm. wide, often exceeding the stem; sheaths cylindrical but open to base, the scarious upper margin tapering to blade, rarely truncate or slightly auricled; the staminate and dark-brown pistillate parts of the spike usually contiguous, the staminate portion to 12 cm. long, the pistillate portion to 2 dm. long, when in fruit 15-35 mm. thick, its surface (when magnified) appearing minutely pebbled with crowded persistent stigmas and scarcely bristly; pistillate flowers without bractlets among the bristles; stigma ovate-lanceolate, fleshy, persistent; pollen grains in fours; denuded axis of old spike retaining slender pedicels that are 1-2 mm. long. In marshes or shallow water and along streams throughout most of Tex., Mar.-May; from Nfld. to Alas., through most of the U. S. into Mex.

2. *Typha angustifolia* L. NARROW-LEAVED CAT-TAIL. Plant slender, to about 15 dm. tall, the stem pith white; leaves mostly less than 10, somewhat convex on back, dark-green, 3-7 mm. wide; sheaths appearing cylindrical below but actually open to base, usually conspicuously auriculate above, rarely with some sheaths tapering to the blade, the auricles scariously-margined; pistillate and staminate parts of spike usually separated by a short interval; pistillate portion of spike reddish-brown, in fruit to 15 cm. long and 15 mm. thick, its surface minutely bristly with persistent linear stigmas; staminate portion of spike to 2 dm. long; pollen grains simple; pistillate flowers with a linear fleshy stigma and usually with a hairlike bractlet with dilated blunt tips among the bristles; the denuded old axis covered with stout blunt compound papillate pedicels that are 0.5-0.7 mm. long. In coastal and inland marshes in s. Tex.; from N. S. and s. Me. to s. Que. and Ont., s. to S. C., W. Va., Ky., Mo., Neb. and Tex.; also Calif. and Euras.

3. *Typha domingensis* Pers. TULE. Plant slender, to about 3 m. tall, the stem pith white; leaves 6 to 10, usually flat, yellowish-green, firm or coriaceous, 7-15 mm. wide, usually shorter than the inflorescence; sheaths tapering at throat to the blade, scariously-margined above; staminate portion of spike 2-4 dm. long, more or less separated (sometimes by as much as 6 cm.) from the whitish-brown pistillate portion; surface of spike similar to that of *T. angustifolia*; stigmas linear, interspersed with many apiculate-bladed bractlets, soon deciduous; compound pedicels 0.5-0.8 mm. long. *T. truxillensis* H.B.K. In brackish or fresh marshes and pools throughout most of Tex., Apr.-May; from Fla. to Tex. and s. Calif., n. along the coast to Del. and e. Md. and inland to Kan., Ut., Nev. and n. Calif.; also trop. Am.

⁴ Adapted from Neil Hotchkiss and Herbert L. Dozier in Am. Midl. Nat. 41:237-254. 1949.

FAM. 18. SPARGANIACEAE RUDOLPHI

BUR-REED FAMILY

Perennial marsh or aquatic monoecious plants with horizontal rootstocks and alternate sessile 2-ranked linear leaves on an erect simple or branched stem; flowers in distant somewhat regularly disposed globular sessile or pedunculate heads on the upper part of the stem or its branches; upper heads bearing sessile staminate naked flowers and minute scales irregularly interposed; lower heads composed of numerous sessile or shortly pedicelled pistillate flowers with a calyxlike perianth of 3 to 6 linear to spatulate or obovate-flabellate scales; bracts caducous or the lower ones persisting and leaflike; ovary 1- to 2-celled; achenes suborbicular to obovoid to fusiform, 1- to 2-seeded.

A monotypic family.

1. SPARGANIUM L.

BUR-REED

Characters of the family. Pistillate heads becoming burlike from the divergent beaks but the pistils at maturity falling away separately in summer and autumn.

About 20 species in the temperate and cold regions of both hemispheres.

1. Leaves firm and rigid; inflorescence commonly branched, the branches jointed and bearing 3 or more staminate heads; bracts ascending; fruiting heads 25-35 mm. thick; achenes subsessile, the body usually constricted at middle, the stipe about 1 mm. long, the beak 3-4 mm. long; receptacle fimbriate-alveolate 1. *S. androcladum*.
1. Leaves soft and flaccid; inflorescence simple or the branches strict and bearing no more than 2 staminate heads; bracts mostly spreading; fruiting heads 15-25 mm. thick; achenes stipitate, the body not constricted, the stipe 4-5 mm. long, the beak about 5 mm. long; receptacle scarcely alveolate 2. *S. americanum*.

1. *Sparganium androcladum* (Engelm.) Morong. Plants stout, to 12 dm. tall; leaves stiffish, strongly ascending, elongate, nearly flat but keeled below, to 15 mm. wide; lower bracts similar to the leaves, slightly scarious-margined at base; inflorescence branched or rarely simple, the primary axis with 1 to 4 mostly sessile axillary pistillate heads and 4 to 10 staminate heads, the 1 to 3 filiform strongly arched geniculate branches with 3 to 8 staminate heads and rarely 1 pistillate head; stigma filiform, 2-4 mm. long; achenes lustrous, the body 5-6 mm. long and 2.5-3 mm. thick; anthers 1-1.5 m. long. In swamps and shallow water of streams in e. Tex., Apr.-June; from Que. to Minn., s. to Va., e. Ky., Ill., Mo., Okla. and Tex.

2. *Sparganium americanum* Nutt. Plants stout to slender, to 1 m. tall; leaves soft, thin, flat, translucent, loosely ascending or occasionally floating, to 2 cm. wide; lower bract similar to leaves, spreading-ascending, scarious-margined at base; inflorescence simple or sometimes branched, the heads or branches axillary, the primary axis with 1 to 5 pistillate heads and 5 to 9 staminate heads, the branches (when present) with 1 to 6 staminate heads and 1 to 3 (rarely 0) pistillate heads; stigma linear-oblong to lanceolate, 1-2 mm. long; achenes dull or but slightly lustrous, the body 4-5.5 mm. long and about 2 mm. thick; anthers about 1 mm. long. In shallow water in e. Tex., Apr.-June; from Nfld. to Ont., Wisc., Minn. and N. D., s. to Fla., Ala., Tex. and Mo.

FAM. 19. POTAMOGETONACEAE DUM.⁵

PONDWEED FAMILY

Aquatic herbs of fresh water; leaves alternate or imperfectly opposite, those immersed thin, those above water often leathery, sheathing at the base, the sheath free or partially adnate to the petiole; flowers bisexual, small, arranged in pedunculate axillary spikes; peduncle surrounded by a sheath at the base; bracts absent; perianth comprised of 4 free rounded shortly clawed valvate segments; stamens 4, inserted on the claws of the

⁵ Adapted from Eugene C. Ogden in C. L. Lundell, *Flora of Texas* I: 369-382. 1966.

segments; anthers extrorse, 2-celled, sessile; gynoecium of 4 sessile free 1-celled carpels; stigmas sessile or on short styles; ovule solitary, attached to the adaxial angle of the carpel, campylotropous; fruiting carpels sessile, free, 1-seeded, indehiscent; seeds without endosperm, the embryo with large 'foot', the plumule enclosed by the cotyledon.

A family of two widespread genera, the following and *Groenlandia*.

1. POTAMOGETON L. PONDWEED

Annual or perennial aquatic herbs propagated from seeds, winter-buds (hibernacula) or rhizomes; stems variable in length according to water depth, branched or unbranched, terete or flattened; leaves all submersed or with both submersed and floating blades; submersed leaves usually flaccid, sessile or petioled, linear or orbicular, acute to obtuse at apex, the margins entire to denticulate or serrate, the nerves 1 to 35; stipules fused to form a single structure with 2 midveins, arising from the axil of the stem and leaf, free or adnate to the leaf base, often sheathing the stem and sometimes with the outer margins partially fused (connate); floating leaves usually coriaceous, petioled, elliptic to ovate, cuneate to rounded or cordate at base, the nerves 3 to 51, the margins entire, the stipules like those of submersed leaves but never adnate nor connate; peduncles about same diameter as stem, terete, sometimes clavate at tip; inflorescence a spike with 1 to 20 whorls of flowers, compact or moniliform, with 2 to 4 flowers in each whorl, mostly buoyed above the water surface; flowers bisexual, perianth of 4 free rounded short-clawed greenish segments; stamens 4; anthers sessile on the claws, 2-celled, extrorse; carpels 4, free, sessile; fruits dryish drupelets or achenes with spongy mesocarp and bony endocarp, one-seeded, embryo coiled, cotyledon one, endosperm absent.

A genus of 90 to 100 species found in all parts of the world, except the polar regions, but mostly in the north temperate areas. Nearly 40 species occur in North America, all but one being indigenous; about half of these are widespread, common and often locally abundant. The species are found primarily in shallow ponds and quiet rivers and are important as food for wild waterfowl and cover for fish.

1. Leaf margins finely and irregularly dentate3. *P. crispus*.
1. Leaf margins entire (2)
 - 2(1). Submersed leaves linear, mostly more than 10 times as long as wide (3)
 2. Submersed leaves lanceolate to ovate, mostly less than 10 times as long as broad (11)
 - 3(2). Stipules united with the base of the leaf for a distance of 7 mm. or more; floating leaves absent; embryo coil less than 1 revolution (4)
 3. Stipules free from the leaf or (if united) then for a distance of less than 6 mm. and with embryo coil more than 1 revolution (5)
 - 4(3). Leaves 2-7 mm. wide, the apex rounded to broadly obtuse and apiculate, the veins 3 to 71. *P. latifolius*.
 4. Leaves 0.2-1 (1.5) mm. wide, the apex sharp-pointed, the veins 1 to 32. *P. pectinatus*.
 - 5(3). Floating leaves absent; stipules free from the base of the leaf; seed not coiled more than 1 revolution, the coil not evident through the thick pericarp (6)
 5. Floating leaves often present; stipules free or united with the base of the leaf for a distance of less than 6 mm.; seed coiled more than 1 revolution, the coil evident through the thin pericarp (10)
 - 6(5). Fruits with dorsal keel prominent, thin, alate, undulate or toothed (7)
 6. Fruits with dorsal keel rounded or acute but never thin and alate (8)
 - 7(6). Leaves 1.4-2.7 mm. wide, the veins 3 to 5; fruits 2-2.5 mm. long4. *P. foliosus* var. *foliosus*.
 7. Leaves 0.3-1.5 mm. wide, the veins 1 to 3; fruits 1.8-2.3 mm. long4. *P. foliosus* var. *macellus*.
 - 8(6). Fruits tuberculate, especially at base, 2.5-2.8 mm. long, the lateral keels prominent6. *P. clystocarpus*.
8. Fruits smooth, 2-2.5 mm. long, the lateral keels rounded or obscure (9)

- 9(8). Stipules connate when young; peduncles 1.5-8 cm. long; spikes 6-12 mm. long, of 3 to 5 separated whorls 5. *P. pusillus*.
9. Stipules not connate; peduncles rarely more than 3 cm. long; spikes 2-8 mm. long, of 1 to 3 contiguous whorls 7. *P. Berchtoldii* var. *tenuissimus*.
- 10(5). Submersed leaves 0.4-1.5 mm. wide, the apex subobtuse to acute; stipules 6-30 mm. long; floating leaves 10-40 mm. long, 3-20 mm. wide, with 5 to 15 veins, the apex rounded; submersed peduncles 1-4 mm. long 8. *P. diversifolius* var. *diversifolius*.
10. Submersed leaves 0.1-0.6 mm. wide, the apex setaceous; stipules 3-12 mm. long; floating leaves 7-26 mm. long, 1-15 mm. wide, with 3 to 7 veins, the apex acute to acutish or mucronulate; submersed peduncles 3-13 mm. long 8. *P. diversifolius* var. *trichophyllus*.
- 11(2). Apex of submersed leaves acute to sharp-pointed, sometimes mucronate; stipules of submersed leaves firm and persistent; stem with endodermis cells unevenly thickened, interlacunar bundles present 11. *P. illinoensis*.
11. Apex of submersed leaves acute but not sharp-pointed; stipules of submersed leaves usually delicate and decaying early; stem with endodermis cells evenly thickened, interlacunar bundles absent (12)
- 12(11). Floating leaf blades usually cordate, rarely rounded at base, with 21 to 29 (sometimes more) veins; submersed leaves tapering rather abruptly to a sessile base or short petiole to 1.5 cm. long; mature fruit light-brown to olive-green, 3-3.5 mm. long; stem with stele of the prototype pattern 9. *P. pulcher*.
12. Floating leaf blades cuneate or rounded at base, with 9 to 21 veins; submersed leaves tapering gradually to a petiole 2-13 cm. long; mature fruit usually reddish, 3.5-4 mm. long; stem with stele of the triotype pattern 10. *P. nodosus*.

1. *Potamogeton latifolius* (Robbins) Morong. WESTERN PONDWEED. Rhizome creeping, rooting freely at the nodes; stem whitish, simple below, repeatedly branched above; stele of the one-bundled-type or oblong-type; endodermis of U-cells; interlacunar bundles present in the outer interlacunar circle; subepidermal bundles absent; pseudohypodermis absent or partly 1 cell thick; leaves all submersed, linear, entire, green to bronze, rather opaque, to 7 cm. long and 7 mm. wide, the apex obtuse to rounded or shortly apiculate to acutish on the upper leaves; nerves 3 to 5, with strong crossveins making a rectangular pattern; stipules prominent, 8-12 mm. long, adnate to the base of the leaf to form a broad sheath, hyaline along the margin, the free portion 1-4 mm. long; peduncles 2-25 cm. long; spikes with 4 to 6 whorls, contiguous when young but soon becoming moniliform; basal internodes 5-12 mm. long, the upper shorter, in fruit 2-4 cm. long; flowers sessile; perianth semiorbicular, slightly wider than long, up to 5.2 mm. wide; anthers about 1.8 mm. long; fruits obliquely obovate, the sides convex but somewhat compressed, 3-4 mm. long, 2-4 mm. wide; dorsal keel obscure, lateral keels rounded; beak facial, slightly recurved, about 1 mm. long; exocarp olive-green to fulvous; endocarp loop solid or with a spongy area; apex of seed pointing above the basal end. In quiet or flowing fresh or brackish water, in Tex. collected once at the now defunct Comanche Springs, Ft. Stockton, flowers and mature fruit from June to Sept.; rare in s.w. U.S.

2. *Potamogeton pectinatus* L. SAGO PONDWEED. Rhizome creeping, much-branched, 1-1.5 mm. in diameter, bearing terminal tuberous bulblets; stem terete or slightly compressed, about 1 mm. in diameter, mostly simple near base but abundantly branched near summit; stele with the oblong pattern or one-bundled in slender branches; endodermis of U-cells; interlacunar bundles present; subepidermal bundles present or absent; pseudohypodermis 1 or 2 cells thick; leaves all submersed, filiform to narrowly linear, entire, to 15 cm. long and 1 mm. wide, occasionally wider on robust forms, the apex tapering to a narrowly acute point (sometimes obtuse on young seedlings); nerves 1 to 3, with strong crossveins, the lateral nerve usually marginal; stipules prominent, 2-5 cm.

long, the base adnate to the leaf to form a sheath slightly wider than the stem, greenish or whitish, the free portion less than half the length of the sheath; peduncles 3-25 cm. long, flexuous; spikes with 2 to 5 whorls of flowers, soon becoming widely and unequally spaced (moniliform), in fruit to 5 cm. long; flowers sessile or nearly so; perianth greenish, the blades orbicular to elliptical, 1-2 mm. wide; anthers 0.5-1 mm. long; fruits obliquely obovate, plump, narrow at base, rounded on the dorsal side, 2.5-4 mm. long, 2-3 mm. wide; dorsal keel absent, the lateral keels obscure; beak facial, usually recurved, about 0.6 mm. long; exocarp light tan, yellowish or pale-olive-green; endocarp loop solid, apex of seed pointing toward the basal end or slightly above. In alkaline, brackish or saline water of ponds, quiet rivers, marshes and ocean shores, throughout Tex. except perhaps the e. Timber Belt and Blackland Prairies, mature fruit from May to Oct.; throughout much of e. half of U. S. and Can.

3. *Potamogeton crispus* L. Rhizome buff or reddish, about the same thickness as the stem; stem simple or branched, laterally compressed and somewhat 4-angled with the broader sides furrowed, 0.5-2.5 mm. in greatest diameter; stele of the oblong-type pattern with but 1 central bundle and 1 lateral bundle on each side; endodermis of O-cells; interlacunar bundles absent; subepidermal bundles absent; pseudohypodermis 1 cell thick; leaves all submersed, bright-green to dark-green or occasionally slightly reddish, translucent, linear-oblong to linear-oblongate, up to 1 dm. long and 1 cm. wide, the apex broadly rounded, the base semiclasping; nerves 3 to 7, the laterals close to the margin; lacunae of 1 or 2 rows on each side of midrib; margins finely and irregularly dentate and often undulate; stipules 5-15 mm. long, slightly adnate at base, the upper part fraying early to leave papery or shreddy bases; peduncles 2-7 cm. long; spikes of 3 to 5 whorls of flowers, compact or moniliform, in fruit 1-2 cm. long, 1-1.3 cm. wide; flowers sessile or on very short pedicels; perianth blades orbicular, 1.2-2.1 mm. wide; anthers 0.7-1.3 mm. long; fruits ovate, 2-3.6 mm. long (excluding beak), 1.5-2.8 mm. wide; keels obtuse but prominent, the dorsal one strongly developed below and with a small tooth near the base; beak prominent, straight or incurved, as long as the fruit body; exocarp dark-olive or brownish; endocarp loop solid and near the base; apex of seed pointing toward the basal end; winter-buds burlike, hard and horny, 1-2.5 cm. thick. In ponds and streams, often abundant in quiet muddy calcareous water; seldom found fruiting but does not produce fruits in shallow warm non-fluctuating water, in n.-cen. Tex. (recently reported from Hemphill Co. in the Panhandle). Introd. into N. A. from Eur., it has reached Tex. during the last quarter-century but is still not common. When thoroughly established may become an aggressive weed. Fruiting plants unknown in Tex. but elsewhere the fruits are produced earlier in the growing season than most other species in the genus.

4. *Potamogeton foliosus* Raf. Rhizome freely branching, rooting at the nodes; stem subsimple below, much branched above, filiform, laterally compressed, usually without glands at the nodes; stele of the one-bundled-type; endodermis of O-cells; interlacunar bundles absent; subepidermal bundles present; pseudohypodermis absent; leaves all submersed, narrowly linear, green to bronze, up to 1 dm. long and 2.7 mm. wide, slightly tapering to a sessile base, entire-margined, acute or subacute at apex; nerves 3 to 5, the midrib prominent, without bordering lacunae or with 1 to 3 rows on each side at the base, lateral nerves joining the midrib 1 to 3 leaf-widths below the apex, in broad leaves with 5 nerves the marginal ones may join the laterals farther down; stipules 7-18 mm. long, with connate margins when young to form tubular delicately fibrous blunt sheaths, soon tearing and deciduous; peduncles slightly thickened upward, to 3 cm. long; spikes subcapitate or cylindrical, of 1 to 3 contiguous whorls of 2 flowers each; perianth blades flabellate, brownish, 0.6-1 mm. long; fruits obliquely suborbicular, laterally compressed, 2-2.5 mm. in diameter; dorsal keel with a thin undulate to dentate wing; lateral keels obscure; beak erect, broad at base, 0.2-0.4 mm. long; exocarp fulvous or olive-brown; embryo with apex pointing toward the basal end or slightly above; winter-buds sessile in the axils or on short branches. In fresh (mostly calcareous) or brackish water of ponds and slow or swift streams, common in the Trans-Pecos, occasional elsewhere, n.e. to the Panhandle and e. to e.-cen. Tex., mature fruit from May to Oct.; throughout Can. and the U.S. to Mex. and the W.I.

Var. *macellus* Fern. Similar to var. *foliosus* but smaller and more bushy-branched; leaves bright-green, to 7 cm. long and 1.5 mm wide; nerves 1 to 3; midrib without adjacent lacunae or with a single row on each side below the middle; fruits green,

obliquely obovoid, 1.8-2.3 mm. long, the body longer than broad; beak slender, 0.3-0.8 mm. long; winter-buds terminating elongate branches. Same habitats as var. *foliosus*. This poorly-marked variety that differs only in size is apparently rare in Tex.

5. *Potamogeton pusillus* L. Plants often with winter-bud at base; rhizome absent; stem usually much-branched, slender, terete or slightly compressed, usually with a pair of small translucent glands at the nodes; branches (late in the season) often terminated by winter-buds; stele of the one-bundled-type or oblong-type; endodermis of O-cells; interlacunar bundles absent; subepidermal bundles present; pseudohypodermis absent; leaves all submersed, linear to linear-setaceous, entire, light green, to 7 cm. long and 3 mm. wide, acute to obtuse at apex; nerves 3 to 5, the lateral nerves obscure in narrow extremes, joining the midrib one-half to 2 leaf-widths below the tip; midrib usually not bordered by lacunae but they are sometimes evident on the young uppermost leaves; stipules scarious-membranaceous, 6-17 mm. long, clasping the stem and with margins united at base to above the middle, this union tearing with age; peduncles axillary, filiform, 1.5-8 cm. long; spikes cylindrical, with 3 to 5 separated few-flowered whorls, 6-12 mm. long; flowers with perianth round-flabelliform and with slender claw, 1.2-2 mm. long; anthers 0.5-0.8 mm. long; fruits obliquely obovoid, 1.9-2.8 mm. long, 1-1.8 mm. wide; dorsal keel obscure, very low and broad; lateral keels absent; beak facial, prominent, erect or slightly recurving, 0.2-0.6 mm. long; exocarp olive-green, smooth; endocarp loop solid; apex of seed pointing slightly above the basal end or between the base and the middle of the opposite side. In neutral or slightly alkaline or slightly brackish water of ponds and rivers, throughout Tex., mature fruit from May to Oct.; throughout much of e. U.S. and Can., s. to e. Mex.

6. *Potamogeton clystocarpus* Fern. Stem much-branched, slender, terete or slightly compressed, usually with a pair of small translucent glands at the nodes; stele of the one-bundled-type; endodermis of O-cells; interlacunar bundles absent; subepidermal bundles present; pseudohypodermis absent; leaves all submersed, linear, entire, light-green, translucent to subopaque, to 9 cm. long and 3 mm. wide, the acute apex often with a sharp mucro; nerves 3 (5), often obscure, laterals joining the midrib near the apex or disappearing in the apical area; midrib bordered on each side by one or two rows of lacunae; stipules hyaline to subherbaceous, 0.5-1 mm. long, usually clasping the stem but with margins free, becoming lacerate at the apex; peduncles filiform, 15-65 mm. long; spikes short-cylindric, 8-10 mm. long, with 2 or 3 whorls of flowers; flowers with perianth broad-flabelliform and with slender claw, 2.5-3 mm. long, 1.5-2.5 mm. wide; anthers 0.8-1.2 mm. long; fruits obliquely obovate to suborbicular, with 2 or more verrucose protuberances near the base, 2.5-2.8 mm. long, 1.8-2 mm. wide; dorsal keel rounded to prominently developed and gibbous at base; lateral keels rounded or obscure; beak facial, recurved, 0.2-0.5 mm. long; exocarp dark-olive-green; endocarp loop solid; apex of seed pointing slightly above the basal end or between the base and the middle of the opposite side. In quiet pools and flowing streams, known only from Little Aguja Canyon, Davis Mts. in the Trans-Pecos where it is endemic, in fruit from May to Oct. and perhaps later.

7. *Potamogeton Berchtoldii* Fieb. var. *tenuissimus* (Mert. & Koch) Fern. Plants often with winter-bud at base; rhizome absent; stem usually much-branched, slender, terete or nearly so, usually with a pair of small translucent glands at the nodes; branches (late in the season) often terminated by winter-buds; stele of the one-bundled-type; endodermis of O-cells; interlacunar bundles absent; subepidermal bundles present; pseudohypodermis absent; leaves all submersed, linear to linear-setaceous, acute at apex, entire, light-green to deep-green, translucent and flaccid, up to 85 mm. long and 1 mm. wide; nerves 3, laterals often obscure and (when not evanescent) joining the midrib one-fourth to 2 leaf-widths below the tip; midrib bordered on each side (at least in the lower half) by a single row of lacunae; stipules hyaline to subherbaceous, 3-14 mm. long, usually clasping the stem but with margins free (or adhering because of adhesive materials in the water); peduncles axillary, filiform, to 3 (rarely - 4.5) cm. long; spikes subglobose, with 1 to 3 few-flowered whorls, 2-8 mm. long; flowers with perianth round-flabelliform and with slender claw, 1-2 mm. long; anthers 0.5-0.8 mm. long; fruits obliquely obovoid, 2-2.5 mm. long, 1.2-1.9 mm. wide; dorsal keel obscure, very low and broad; lateral keels absent; beak facial, prominent, erect or slightly recurving, 0.1-0.5 mm. long; exocarp dark-olive-green, smooth

or faintly rugulose when dry; endocarp loop solid; apex of seed pointing slightly above the basal end or between the base and the middle of the opposite side. In neutral to acid water of ponds and rivers, known from one locality in n.e. Tex. (Bowie Co.) but probably elsewhere along the n. border, probably in fruit from May to Oct.; throughout much of N. A.

8. *Potamogeton diversifolius* Raf. var. *diversifolius*. Rhizome freely branching, rooting at the nodes; stem filiform, terete, much-branched; stele of the oblong-type with one or two median bundles; endodermis of O-cells; interlacunar bundles absent; subepidermal bundles absent or occasionally with faint mechanical strands; pseudohypodermis present or absent; submersed leaves narrowly linear, entire, pale-green, mostly 2-6 cm. long, 0.5-1.5 mm. wide, slightly tapering to a sessile base, acute to obtuse at apex; nerves 3, laterals inconspicuous; midrib usually bordered by 1 to 4 rows of lacunae; stipules delicately fibrous, adnate to the base of the leaf blade; floating leaves coriaceous, elliptic to oval or narrowly obovate, rounded at apex, cuneate or rounded at base; petioles usually shorter than the blades; blades to 4 cm. long and 2 cm. wide; nerves 5 to 15; stipules free from the petioles, 6-30 mm. long, delicately fibrous, persistent; peduncles usually slender, often clavate, 1-4 mm. long from the axils of submersed leaves and 2-30 mm. long from the axils of floating leaves, ascending or arching; submersed spikes few-flowered, subglobose; emerged spikes elongate, 5-20 mm. long, in fruit 3-4 mm. wide; flowers sessile or nearly so; perianth suborbicular to broadly rhombic, 0.7-1 mm. long, with a short claw; fruits suborbicular, the sides flattened or slightly concave and often cochleate-sulcate, 1-1.5 mm. in diameter; dorsal keel prominent, alate, 0.2-0.4 mm. wide, undulate or with a few very low teeth; lateral keels low and fine but evident, entire or slightly dentate; beak facial, minute but usually definite; exocarp greenish to brownish, endocarp with loop solid; embryo coil more than one complete revolution; winter-buds may form late in the growing season, being short branches with crowded internodes. In pools, tanks and small streams, common in e. Tex. and in the mts. of the Trans-Pecos, freely fruiting throughout the summer; mostly in s. U.S. and Mex.

Var. *trichophyllus* Morong. Similar to var. *diversifolius* except submersed leaves flaccid, setaceous or setaceous-linear, 0.1-0.6 mm. wide, tapering to an acute apex, the nerves 1 or obscurely 3; stipules delicate, free or partially adnate to the base of the leaf blade, deciduous with age; floating leaves lance-elliptic to oval-elliptic, acutish or (if rounded) at least submucronate at apex; blades 7-26 mm. long, 1-10 mm. wide; nerves 3 to 9; stipules 3-10 mm. long; peduncles 1-4 mm. long from the axils of submersed leaves and 2-30 mm. from the axils of floating leaves; fruits with dorsal keel entire or with 3 to 12 small teeth. Common in e. Tex. in the same habitats as var. *diversifolius*.

9. *Potamogeton pulcher* Tuckerm. Rhizome pale-buff, often with dark-red spots; stem simple, terete, 1-2.5 mm. in diameter, usually conspicuously dark-spotted; stele with the prototype pattern; endodermis of O-cells; interlacunar and subepidermal bundles absent; pseudohypodermis mostly 1 cell thick; submersed leaves of two intergrading types, those of the lower part of the stem semiopaque and oblong with rounded apices, those of the upper part of the stem translucent and lanceolate to lance-linear, with an acutish but not sharp-pointed apex, both types tapering at base to petioles to 35 mm. long; blades entire, to 18 cm. long and 35 mm. wide, usually smaller; nerves 11 to 21, the outer ones marginal; lacunae 4 to 8 rows on each side of midrib; floating leaves coriaceous, ovate to rotund, rounded to bluntly mucronate at apex, cordate or rounded at base; petioles 4-18 cm. long; blades to 11 cm. long and 85 mm. wide, with 19 to 35 nerves; stipules of the submersed leaves decaying early, those of the floating leaves persistent, narrowly triangular, obtuse when young, acutish with age, 2-5 cm. long, 2-keeled; peduncles 5-11 cm. long; spikes with about 10 whorls, in fruit 2-3.5 cm. long, 8-11 mm. thick; flowers sessile or nearly so; perianth greenish, blades orbicular to elliptical and 1.2-3 mm. wide; anthers 0.8-1.4 mm. long; fruits obliquely ovate, rounded or cuneate at base, the sides flat or slightly concave, 2.7-4 mm. long, 2.3-3.4 mm. wide; keels usually prominent, acutish, the dorsal one often strongly developed and sometimes with a basal lobe projecting below the point of attachment; beak often prominent, up to 0.8 mm. long; exocarp light-brown to olive-green; endocarp with 3 prominent acutish and somewhat muricate keels; beak linear, facial, about 1 mm. long; loop solid; apex of seed pointing 0.5-1.2 mm. above the basal end. In muddy pools, boggy streams, lakes and occasionally

in clear water in sandy bottom (Carrizo outcrop), in Tex. only in the Timber Belt, flowers in Apr. and May, mature fruit by mid-May; in the e. half of U.S.

10. *Potamogeton nodosus* Poir. Rhizome white, suffused or spotted with rusty red; stem simple, terete, often pressing very flat, 1-2 mm. in diameter; stele with the triotype pattern, with the phloem on the inner face of the trio-bundle appearing as one patch; endodermis of O-cells; interlacunar and subepidermal bundles absent; pseudohypodermis absent; submersed leaves thin, linear-lanceolate to broadly lance-elliptic, to 2 dm. long and 35 mm. wide, tapering gradually at base into a petiole 2-13 cm. long, tapering gradually to an acutish but not sharp-pointed apex; nerves 7 to 15; lacunae of 2 to 5 rows along the midrib; margin of young blades with fugacious translucent denticles; floating leaves coriaceous, with long petioles; blades lenticular to elliptic, cuneate or somewhat rounded at base, acutish to rounded at apex and sometimes with an obtuse mucro, to 11 cm. long and 45 mm. wide; nerves 9 to 21; lacunae rarely present; stipules of submersed leaves brownish, often delicate and decaying early, linear, acute or obtuse, 3-9 cm. long, those of the floating leaves similar but usually broader at base and more or less 2-keeled; peduncles usually thicker than the stem, 3-15 cm. long; young spikes compact but becoming loose at anthesis, of 10 to 17 whorls of flowers, at maturity usually not densely fruited, 3-7 cm. long, 8-10 mm. thick; flowers sessile; perianth greenish or brownish, orbicular or elliptical, 1.4-2.6 mm. wide; anthers 1-1.4 mm. long; fruits obovate, 3.5-4.3 mm. long, 2.5-3 mm. wide; keels prominent, the dorsal strongly developed (especially upward), the laterals often muricate; beak facial, short; exocarp of mature fruits brownish or reddish; endocarp with keels strongly developed, the dorsal often 0.5 mm. wide, the laterals strongly muricate; beak linear, erect, to 1 mm. long; loop solid; apex of seed pointing a little above the basal end. *P. americanus* Cham. & Schlecht. In streams and lakes throughout Tex., mature fruits in late spring and summer; in much of the U.S., Can. and n. Mex.

11. *Potamogeton illinoensis* Morong. Rhizome buff, spotted or suffused with red; stem simple or branched, terete, 1-5 mm. in diameter; stele with the prototype, triotype or oblong-type pattern; endodermis of U-cells; interlacunar bundles in the outer interlacunar circle, sometimes a few in the next to the outer circle; subepidermal bundles present or absent; pseudohypodermis absent or of 1 cell thick; submersed leaves thin, elliptic to lanceolate, often somewhat arcuate; blades to 2 dm. long and 45 mm. wide, sessile or tapering into a petiole to 4 cm. long, acute and usually somewhat mucronate at apex; nerves 7 to 19; lacunae of 2 to 5 rows along midrib and larger nerves; margin entire or with fugacious 1-celled translucent denticles; floating leaves (often absent) more or less coriaceous, transition to submersed leaves usually gradual; blades elliptic to ovate-elliptic or oblong-elliptic, to 19 cm. long and 65 mm. wide, obtuse-mucronate at apex, cuneate or rounded at base; petioles 2-9 cm. long, shorter than the blade; nerves 13 to 29; lacunae of 2 or 3 rows of cells along midrib, sometimes obscure; stipules persistent, divergent and conspicuous, obtuse, those of the submersed leaves 1-8 cm. long and 3-12 mm. wide at base, prominently 2-keeled, with 15 to 35 finer nerves; those of the floating leaves broader; peduncles as thick as or thicker than the stem, 4-30 cm. long; spikes in anthesis compact, of 8 to 15 whorls of flowers, at maturity cylindrical and crowded, 2.5-7 cm. long, 8-10 mm. thick; flowers sessile or on pedicels up to 0.5 mm. long; perianth orbicular to oval, 1.3-3.2 mm. wide; anthers 0.6-2 mm. long; fruits obovate to orbicular or ovate, 2.5-3.6 mm. long (excluding beak), 2.1-3 mm. wide, the sides flat; keels prominent and acute, the dorsal strongly developed above and below, the laterals less strongly developed but often each with a projecting knob at the base; beak facial, short, erect or curved toward the back; exocarp gray-green to olive-green or brownish, sometimes reddish; endocarp with keels low but prominent or with dorsal keel thin and very weak; beak deltoid and weak, about 0.5 mm. long; loop solid; apex of seed pointing at the middle of the opposite side or between middle and base. *P. lucens* L., *P. angustifolius* Bercht. & Presl. In quiet or flowing water of ponds and rivers in s.-cen. Tex., especially on the Edwards Plateau and in the Guadalupe Mts., fruiting by early May; throughout much of U.S. and Can.

A variable species due, in part, to habitat. Hybrids may occur between this species and *P. nodosus*, especially where the two are found together.

The following species of *Potamogeton* have been reported from Texas, but they are excluded on the basis that no material of any of them has been seen: *P. capillaceus* Poir. (*P. hybridus* of auth., not Michx.), *P. fluitans* Roth, *P. granineus* L. var. *graminifolius* Fries (*P. heterophyllus* Schreb.), *P. natans* L., *P. panormitanus* Biv.

FAM. 20. ZANNICHELLIACEAE DUM. HORNED PONDWEED FAMILY

Submerged aquatic dioecious or monoecious herbs, with a slender creeping rhizome; leaves alternate or opposite or crowded at the nodes, linear, sheathing at the base, the sheaths mostly ligulate at the apex, the floral leaves sometimes reduced to sheaths; flowers minute, bisexual or unisexual, axillary, solitary or in cymes; perianth of 3 small free scales or absent; stamens 1 to 3, the anthers 1- or 2-celled and opening lengthwise; pollen globose or threadlike; gynoeceium of 1 to 9 free carpels; style short or long, simple and with a capitate to peltate or spatulate stigma, sometimes 2- to 4-lobed; ovule solitary, pendulous; fruiting carpels sessile or stipitate, indehiscent; seed pendulous, without endosperm.

Widely distributed, mainly in salt or brackish water; 3 genera and 6 species.

1. Pollen spheroid; carpels several, free; plants of fresh or brackish water; leaves filiform1. *Zannichellia*, p. 93.
1. Pollen threadlike; gynoeceium 1- or 2-carpellate; plants of marine habitats (2)
- 2(1). Leaves flat, tridentate at apex; styles simple; one anther attached higher than the other2. *Halodule*, p. 93.
2. Leaves terete or semiterete, acute or pointed at apex; styles 2- to 4-lobed; anthers at an equal height3. *Cymodocea*, p. 94.

1. ZANNICHELLIA L.

HORNED PONDWEED

A genus of two species, the other in Africa.

1. *Zannichellia palustris* L. COMMON POOLMAT. Submerged aquatic plant, monoecious, rooted on bottom and floating below surface of water; stem simple or much-branched; leaves mostly opposite, linear-filiform, entire, to 1 dm. long, acute or almost pungent at the apex, 1-nerved; stipules scarious, free from the leaf bases, scarcely 2 cm. long; flowers unisexual, sessile, usually both kinds from the same axil, enclosed in a hyaline deciduous spathe, the perianth wanting; staminate flower consisting of a single 2- to 4-celled anther on a slender filament; pistillate flowers sessile at first, often pedicellate after anthesis; carpels 2 to 8, flask-shaped, ribbed or toothed on the margins, or sometimes smooth; style recurved, persistent; mature fruit 2-4 mm. long, rarely pitted, flattened, slightly incurved, smooth or slightly dentate on the convex back, the body 2-3 mm. long, the beak to 1.5 mm. long. In fresh or brackish water in pools, streams and irrigation canals, in Tex. mainly in the Edwards Plateau and in the Trans-Pecos, Apr.-July; nearly throughout N. A., except the extreme n., also S. A., Euras. and Afr.

2. HALODULE ENDL.

Several species of marine waters mainly in tropical regions.

1. *Halodule Beaudettei* (den Hartog) den Hartog. Submerged dioecious perennial, with creeping rootstocks; rootstocks branching, articulated and rooting at the nodes, the roots often terminating in fleshy starchy tuberlike swellings, with a short erect stem at each node; internodes 5-40 mm. long; scales elliptic, 5-10 mm. long; sheaths 1.5-6 cm. long; leaves mostly crowded on short erect lateral branches, all linear, grasslike, more or less narrowed and sheathing at the base, 5-20 cm. long, 0.8-1.2 mm. wide, midrib conspicuous, widening and often furcate near the tip; leaf tip with a very prominent acute median tooth which is 1 to 10 times as long as the narrow linear lateral teeth;

flower unknown. *Diplanthera Beaudettei* den Hartog, *D. Wrightii* of auth., *Halodule Wrightii* of auth. In salt water of bays along the Gulf Coast in Tex., frequent in sea drift; widely distributed in the Carib. and also in the Gulf of Mex., along the Atl. Coast of N.A. n. to N.C.; also along the Pac. Coast of Pan. and Nic.

3. CYMODOCEA KÖNIG

Several species of marine waters mainly in tropical regions. Sometimes placed in a separate family, Cymodoceaceae.

1. *Cymodocea filiformis* (Kütz.) Correll. **MANATEE-GRASS**. Submerged acaulescent dioecious perennial, with creeping rootstocks branching and rooting at the nodes; leaves all submerged, grasslike, terete or semiterete, acute at the apex and sheathing at the base, the sheaths more or less auriculate, to 35 cm. long and 2 mm. wide; stipular sheaths completely surrounding the leaf bases, scarious, to 45 mm. long; flowers unisexual, solitary or in simple or dichotomous cymes; staminate flowers consisting of two anthers on the end of a long pedicel, the anthers equally attached, both the same height, 2-celled; pistillate flower of 2 carpels, without perianth but subtended by a hyaline perianthlike bract; style 2- to 4-lobed; stigmas 2, hairlike; mature fruit 1-seeded, 3 mm. long and beaked by the persistent style. *Cymodocea manatorum* Asch., *Syringodium filiforme* Kütz. In shallow salt water of bays along the Gulf Coast of Tex., frequent in sea drift; from Fla. and Tex. to Berm., Cuba and Martinique.

FAM. 21. RUPPIACEAE HUTCHINS. DITCH-GRASS FAMILY

Aquatic herbs of brackish or saline waters; stems simple or branched, submerged; leaves opposite or alternate, linear or setaceous, with a stipular sheath at the base; flowers perfect, small, few, arranged in terminal spikes that are at first enclosed by the sheathing leaf bases, at length much-elongated to the surface of the water; bracts absent; perianth wanting; stamens 2, opposite each other, with very short broad filaments; anthers extrorse, the 2 cells reniform and separated by the connective; carpels 4, with peltate or umbonate stigmas; ovule solitary, pendulous from the apex of the carpel, campylotropous; nutlets long-stipitate, with spirally twisted stalks, indehiscent; seeds pendulous, without endosperm.

Only one genus distributed throughout temperate and subtropical regions.

1. RUPPIA L.

Characters of the family; 2 species.

1. *Ruppia maritima* L. **WIDGEON-GRASS**. Stem whitish or green, to 1 m. long; leaves all submerged, threadlike, entire, 1-nerved, to 1 dm. long and 0.3 mm. wide, with a sharp pointed or more or less pungent apex; stipular sheath 6-10 mm. long, membranous, the free part very short or wanting; flowers on a short peduncle that elongates after anthesis and ultimately becomes a loosely coiled spiral; stamens without a filament, early deciduous; anthers 2, sessile, 2-celled; mature carpels ovoid, equilateral or gibbous and oblique, about 2 mm. long, long-stipitate; style short and stout or finely attenuate, straight or hooked; pedicellate stipe of the black nutlet to 3 cm. long. On the Gulf Coast and in saline waters of pools, rivers and marshes in the interior, Apr.-July; from Can. s. to Mex.

FAM. 22. NAJADACEAE JUSS. WATER-NYMPH FAMILY

Submerged annual monoecious or dioecious herbs of fresh or brackish waters, with fibrous roots; stems slender, much-branched; internodes spiny or unarmed; leaves small, sessile, subopposite to somewhat alternate or verticillate, with a sheathing base and

linear entire or toothed blade; within the sheath a pair of minute scales; flowers unisexual, very small, borne at the base of the branches; staminate flowers with 1 stamen, mostly subsessile and included in a spathe, the perianth bilabiate at the apex; anther sessile, 1- to 4-celled, opening by slits lengthwise; pistillate flowers without a perianth or this very thin and adhering to the carpel; ovary of 1 carpel, 1-celled, with 2 to 4 linear stigmas; ovule solitary, erect from the base, anatropous; nutlet usually embraced by the leaf sheath, indehiscent, enclosed in a loose and separable membranous coat, smooth and shining or reticulate with angled or roundish areolae.

Contains only the following genus and about 50 species widely distributed in temperate and warm regions. See note regarding *Posidonia* at end of *Najas*.

1. NAJAS L. WATER-NYMPH

Characters of the family.

1. Male and female flowers on different plants; leaves coarsely toothed; internodes and back of the leaf spiny 1. *N. marina*.
1. Male and female flowers on same plant; leaves minutely denticulate; internodes and back of leaf unarmed 2. *N. guadalupensis*.

1. *Najas marina* L. HOLLY-LEAVED WATER-NYMPH. Plants brittle; stems branched, sometimes dichotomously so, armed with brownish spinulose teeth on the internodes; leaves linear, opposite to somewhat alternate, stiffish or recurved, to 45 mm. long and 3 mm. wide, with toothed margins and sometimes dorsally toothed on the midrib, the usually triangular teeth apiculate and 1 mm. long or more; basal leaf sheaths rounded, without teeth or rarely with a few short teeth; male and female flowers on different plants; staminate flowers 3-4 mm. long, the anther 4-celled; pistillate flowers 3-4 mm. long; stigmas 3, sometimes one shorter than the others; mature seeds ovoid, apparently tessellated in dried specimens, smooth when fresh. In lakes and ponds, rare in s. Tex., May-July; from N.Y. to Calif., s. to Fla., Tex., Mex. and Cuba; also Euras. and Austral.

2. *Najas guadalupensis* (Spreng.) Magnus. COMMON WATER-NYMPH. Plants monoecious, flaccid; stems slender, branched, to about 6 dm. long; leaves all submerged, linear, to 25 mm. long and 2 mm. wide, acute to obtuse at apex and usually tipped with 1 or 2 spines, the 20 to 40 marginal teeth inconspicuous or often apparently wanting; basal leaf sheaths sloping or rounded, not auriculate, spinulose; male and female flowers on same plant; staminate flowers 2-3 mm. long, the anthers 4-celled; pistillate flowers 2-3 mm. long; mature fruit crowned with 2 or 3 stigmas and usually with 1 or 2 spiny sterile stigmatic processes; seeds ellipsoid, dull, reticulate with numerous 4-sided areolae. Attached to bottom and floating just below surface of water in ponds, lakes, springs, ditches and streams, often forming large mats, rather common throughout Tex., Apr.-June; from Pa. w. to Ore., s. to Fla., Tex., Mex., C. A., the W.I., Jam. and Guadeloupe.

The Eurasian marine species, *Posidonia oceanica* König, sometimes placed in the Najadaceae or Potamogetonaceae and more recently, and apparently more correctly, in a separate family, the Posidoniaceae, is represented in Texas by plants being washed up on the beaches in the Brownsville area. It is characterized by the rhizome and stem being densely covered with the persistent fibrous leaf bases; leaves linear, rounded at apex, up to 5 dm. long and 7 mm. wide, about 13-nerved; inflorescence a 3-flowered spike, 2 flowers of which are perfect and one staminate; staminal connective broad, abruptly long-aristate; fruit semioval, fleshy, indehiscent.

FAM. 23. ALISMATACEAE VENT.

WATER PLANTAIN FAMILY

Annual or perennial aquatic or marsh plants with fibrous roots from a usually somewhat thickened rootstock and a cluster of basal leaves with their long petioles sheathing a scape; leaves at first typically bladeless but soon developing either a linear or sagittate type of blade with prominent nerves and transverse veinlets; scape erect or arching, with

a simple or branched bracteate inflorescence; flowers perfect or unisexual, regular, borne in verticils; perianth segments imbricate or involute in bud; sepals 3, green, persistent; petals 3, deciduous; stamens 6 to many, included, the filaments distinct, the anthers 2-celled and dehiscing by longitudinal slits; carpels numerous, distinct, 1-celled and mostly 1-ovuled, arranged in a ring or crowded on a receptacle to produce a headlike fruit of flat or turgid achenes.

A family of about 13 genera and 90 species of worldwide distribution.

1. Achenes arranged in a single ring on the receptacle, strongly flattened; stamens 6 1. *Alisma*, p. 96.
1. Achenes densely crowded over the surface of the receptacle; stamens more than 6 (2)
- 2(1). Flowers all perfect; achenes plump; fruiting heads simulating a bur 2. *Echinodorus*, p. 96.
2. Flowers perfect or unisexual, the upper ones mostly staminate; achenes flattened; fruiting heads not burlike 3. *Sagittaria*, p. 97.

1. ALISMA L. WATER PLANTAIN. MUD PLANTAIN

About 10 species mostly in the North Temperate Zone.

1. *Alisma subcordatum* Raf. Erect perennial herb with a basal cluster of erect long-petioled laminated leaves surrounding a scape, essentially glabrous; leaf blades ovate to elliptic, cuneate to cordate at base, abruptly acute at apex, to 12 cm. long and 8 cm. wide, usually shorter than the petioles; scape to 6 dm. tall, with whorled paniced branches of small white or pinkish flowers; bracts lanceolate, acuminate, about 1 cm. long; pedicels filiform; flowers perfect, numerous; sepals broadly ovate to suborbicular, obtuse, up to 2.5 mm. long; petals to 2 mm. long; anthers spherical, 0.3-0.5 mm. long; ovaries many in a simple circle on a small flattened receptacle; style 0.2-0.4 mm. long; fruiting heads 3-4 mm. across; achenes obliquely obovate, 1.5-2 mm. long, dorsally keeled, the minute beak ascending. *A. parviflorum* Pursh, *A. Plantago-aquatica* var. *parviflorum* (Pursh) Farw. Usually in shallow water of marshes, streams and ponds in n.e. Tex. and the Panhandle, June-Sept.; Ont., N.E. and N.Y., w. to Minn. and Neb., s. to Fla. and Tex.

2. ECHINODORUS RICH. BURHEAD

Annuals or short-lived perennials of wet habitats, with basal leaves and naked erect or repent scapes that are sparingly branched or occasionally simple; flowers pedicellate, perfect, usually in remote whorls; sepals 3, persistent; petals 3, imbricated in the bud, white, deciduous; stamens 6 to usually many more; filaments elongate, usually exceeding the anthers in length; achenes forming a head, turgid, ribbed or ridged, beaked or beakless.

A dozen or more species in America, Europe and Africa.

1. Achenes 20 or fewer in a loose head, essentially beakless; stamens 9; anthers basifixed 1. *E. parvulus*.
1. Achenes 30 or more in a dense tight head, prominently beaked; stamens 12 or more; anthers versatile (2)
- 2(1). Sepals with papillose ridges; scape erect when young but soon repent; achenes with summit or keel often crested and the beak ascending; pellucid lines of leaves mostly 1 mm. or more apart and rarely exceeding 1 mm. in length 3. *E. cordifolius*.
2. Sepals with smooth veins; scape rigidly erect at maturity; achenes with keel entire and the beak erect or nearly so; pellucid lines of leaves mostly less than 1 mm. apart and often several mm. long (3)
- 3(2). Plants robust, usually much more than 2 dm. tall; leaves typically broadly ovate, broadly cuneate to cordate at base; beak of achenes 1.2-2 mm. long 2. *E. rostratus*.

3. Plants delicate, rarely more than 2 dm. tall; leaves typically lanceolate, narrowly cuneate to somewhat rounded at base; beak of achenes 0.5-1 mm. long
 2. *E. rostratus* var.

lanceolatus.

1. *Echinodorus parvulus* Engelm. Plants small and delicate, with the shoots often creeping and proliferous; scapes to 1 dm. tall, supporting a single umbellate inflorescence of 2 or more flowers; leaves with a petiole to 5 cm. long, the blade (to 3 cm. long and 8 mm. wide) narrowly elliptic and acutely tapered at both ends; pedicels slender, to 3 cm. long, reflexed in fruit; flowers white, about 6 mm. across; achenes 8-ribbed, reddish-brown, glandless, *E. tenellus* var. *parvulus* (Engelm.) Fassett, *Helianthium parvulum* (Engelm.) Small. Among grasses in wet sandy soils about ponds in s. Tex., Mar.-Sept.; from Fla. and Tex., locally n. to Mass., Ill. and Mo.

2. *Echinodorus rostratus* (Nutt.) Engelm. Plants usually coarse; scapes rigidly erect, to 6 dm. tall, exceeding the leaves; leaves broadly ovate, cordate to broadly rounded-cuneate at base, obtuse at apex, to 15 cm. long, and often as broad; umbels proliferous, in a branched panicle; flowers white, about 1 cm. across; achenes with 2 glands at base of the conspicuous erect beak; seeds brown, obliquely oval, with rows of murications. *E. cordifolius*, misapplied; *E. Berteroi* (Spreng.) Fassett, as to descr. In mud and shallow water about lakes, ponds and along streams mostly in s. Tex. but sparingly throughout most of the state, May-Oct.; from Ont., w. to Calif. and s. to Fla., Tex. and Mex.

Var. *lanceolatus* Engelm. Plants small and delicate, with typically lanceolate leaves. *Echinodorus Berteroi* var. *lanceolatus* (Engelm.) Fassett, as to descr. Habitat and distribution similar to that of var. *rostratus*.

3. *Echinodorus cordifolius* (L.) Griseb. Plants coarse and usually stout; scapes prostrate, arching and creeping, to 12 dm. long, proliferous and bearing numerous whorls of flowers, also sometimes producing leaves with the flowers; leaves with a petiole to 2 dm. or more long, the blade (to 2 dm. long and nearly as broad) broadly ovate and truncately cordate at base and obtuse at apex; flowers white, 12 mm. or more across; achenes with the keeled back denticulate. *E. radicans* (Nutt.) Engelm. In mud and shallow water of ponds and quiet streams in e. Tex., Apr.-June; from s.e. Va., Ill., Mo. and Kan., s. to Fla., Tex. and Mex.

3. SAGITTARIA L.⁶ ARROWHEAD

Paludal or aquatic mostly perennial erect or lax stoloniferous herbs, with milky juice, monoecious or rarely dioecious, sometimes tuber-bearing; leaves submersed or emersed, with long cellular petioles, bladeless (i.e., phylloids) or with unlobed or sagittate blades; scapes erect or laxly ascending, sheathed at base by the bases of the leaf petioles, supporting a narrow verticillate inflorescence that is simple or sparingly branched; flowers produced all summer, pedicellate, in whorls of three, mostly unisexual, subtended by membranous bracts, the staminate flowers typically uppermost in the inflorescence; sepals 3, persistent, in fruit appressed, loosely spreading or reflexed; petals 3, white or rarely pink, imbricated in the bud, usually exceeding the sepals, deciduous; stamens whorled, mostly numerous; carpels numerous, spirally arranged in a crowded spherical head on a dome-shaped receptacle, 1-celled and 1-ovuled; achenes flattened, membranous-winged, more or less beaked.

About 20 species, mostly in America.

1. Pistillate flowers (in fruit) with sepals appressed or spreading and pedicels recurved and noticeably thickened. 1. *S. montevidensis*.
 1. Pistillate flowers (in fruit) with reflexed sepals and pedicels ascending or (if recurved) not noticeably thickened (2)
 2(1). Filaments pubescent or minutely scaly (3)
 2. Filaments smooth (5)

⁶ Adapted from C. Rogin in Mem. N. Y. Bot. Gard. 9(2):179-233. 1955.

- 3(2). Bracts of inflorescence thinly membranous, smooth, more or less connate; filaments dilated (4)
3. Bracts of inflorescence somewhat thickened, papillose or coarsely ridged, nearly free; filaments linear 4. *S. lancifolia*.
- 4(3). Pistillate pedicels ascending, if recurved the achene beak less than 0.3 mm. long; leaves typically narrow 2. *S. graminea*.
4. Pistillate pedicels recurved; subulate beak of mature achenes 0.3 mm. or more long; leaves typically broad 3. *S. platyphylla*.
- 5(2). Bracts of inflorescence papillose; leaves never sagittate 5. *S. papillosa*.
5. Bracts of inflorescence smooth or at most pubescent; leaves sagittate (6)
- 6(5). Achene beak laterally inserted, more or less projecting horizontally (7)
6. Achene beak apically inserted, more or less erect (8)
- 7(6). Bracts of inflorescence almost plane, at least not cymbiform, acuminate or attenuate, membranous, never pubescent; achene beak less than 0.5 mm. long 6. *S. longiloba*.
7. Bracts of inflorescence cymbiform, obtuse or acute, rather firm, sometimes pubescent; achene beak 0.5 mm. or more long 7. *S. latifolia*.
- 8(6). Achene usually with one narrow facial wing or keel, the beak somewhat curved and 0.5 mm. or more long 8. *S. brevirostra*.
8. Achene face wingless, typically with a large resin duct, the minute to obsolescent beak erect 9. *S. cuneata*.

1. *Sagittaria montevidensis* Cham. & Schlecht. Leaves erect-spreading; leaf blades broadly ovate, sagittate, to 2 dm. or more long and wide; scape erect or reflexed, simple or occasionally branched below, with up to 10 whorls; bracts membranous, ovate to ovate-lanceolate, acute to attenuate, connate, about 1 cm. long; pistillate flowers usually with a ring of functional stamens; sepals orbicular-ovate, concave, about 13 mm. long, covering most of the fruiting head; stamens with linear pubescent filaments; heads of carpels to 2 cm. in diameter; achenes cuneate-obovate, to 2.5 mm. long and 1.3 mm. wide, the faces usually with a resin duct, the horizontal or oblique beak about as long as the breadth of the achene and narrowly winged on the margin. *S. calycina* Engelm., *Lophocarpus calycinus* (Engelm.) J. G. Sm. Sloughs, lakes and ponds in e., cen. and w. Tex., June-Oct.; O. and Mich., w. to N.D., Calif. and N.M., s. to Va., Tenn., La. and Tex.

Our plants have been segregated as subsp. *calycina* (Engelm.) Bogin.

2. *Sagittaria graminea* Michx. Leaves erect, either represented by thin broadly linear (strap-shaped) acute to shortly acuminate phyllodia or with the slender petioles bladeless or with narrowly lanceolate tapering blades to 2 dm. long and 25 mm. wide; scape simple, usually surpassed by the leaves, with as many as 10 whorls, the flowers with filiform ascending or spreading pedicels to 3 cm. long, the lower one or two whorls of pistillate flowers or sometimes all staminate; bracts ovate, obtuse to subacute, to 6 mm. long, more or less connate, membranous; sepals ovate, obtuse, to 5 mm. long; petals white or rarely pinkish, to 6 mm. long; stamens with dilated pubescent filaments to 1 mm. long; fruiting heads to 1 cm. in diameter; achenes obovate, to 2 mm. long and 1.2 mm. wide, the narrow-winged back strongly rounded to a high shoulder, the sides plane or with 1 or 2 narrow ridges, the subulate beak to 0.3 mm. long, obliquely inserted below the summit of the achene. *S. cycloptera* (J. G. Sm.) Mohr. Rooted in mud or in shallow water of ditches, ponds, marshes and streams in e. and s.-cen. Tex., flowering throughout the year but mostly Apr.-Nov.; throughout e. N. A., w. to the Great Plains; also Cuba.

3. *Sagittaria platyphylla* Engelm. Leaves erect, overtopping the scape; leaf blades ovate to elliptic or lanceolate, unlobed, to 18 cm. long and 8 cm. wide; scape simple, with as many as 8 whorls, the 1 to 4 lower whorls pistillate and with their thickish pedicels to 25 mm. long and soon recurving; bracts ovate, obtuse, scarious, strongly connate, to 8 mm. long; stamens with dilated pubescent filaments that are mostly longer than the anthers; fruiting heads to 15 mm. in diameter; achenes cuneate-obovate, to 2 mm. long and 1.2 mm. wide, the dorsal keel rounded to the subtruncate summit, the

faces with 1 to 3 narrow ridges; beak subulate, 0.3 mm. or more long, obliquely ascending. *S. graminea* var. *platyphylla* (Engelm.) J. G. Sm. In mud or shallow water of marshes, streams, sloughs, swamps and ponds in e. Tex., Apr.-Oct.; Mo., w. to Kan., s. to Tex. and Ala.; adv. in the Pan. Canal Zone.

4. *Sagittaria lancifolia* L. Leaves erect; leaf blades ovate to elliptic or narrowly lanceolate, unlobed, tapering to both ends, firm, to 4 dm. long and 1 dm. wide; scapes simple or branching at lower nodes, the main axis with as many as 10 whorls, the lower 1 to 4 whorls pistillate with pedicels to 25 mm. long, the staminate pedicels to 35 mm. long; bracts ovate, obtuse, strongly papillose, up to 15 mm. long, connate; sepals more or less papillose; stamens with slender arachnoid filaments that are longer than the anthers; fruiting heads about 15 mm. in diameter; achenes cuneate-oblongate, falcate, to 2.5 mm. long and 1 mm. wide, dorsally narrowly winged, usually with 1 or 2 low facial ridges; beak obliquely inserted; subulate from a thick base, to 0.8 mm. long, ascending. *S. falcata* Pursh. In fresh-water and brackish tidal marshes, swamps, and along streams in s.e. Tex., May-Nov.; Fla. to Tex., n. to Del.; also Mex. and C. A.

Our plants, as described here, have been segregated as subsp. *media* (Mich.) Bogin.

5. *Sagittaria papillosa* Buch. Leaves erect; leaf blades linear to narrowly lanceolate, to 25 cm. long and 5 cm. wide; scapes typically branching from the lowest whorl, the main axis with as many as 10 whorls, the lower 1 to 4 whorls pistillate with pedicels much shorter than those of the staminate; bracts ovate, obtuse, somewhat connate, densely papillose, to 1 cm. long; sepals to 6 mm. long, more or less papillose; petals about twice as long as the sepals; stamens with linear glabrous filaments to 1.6 mm. long; fruiting heads about 1 cm. in diameter; achenes cuneate, to 1.5 mm. long and 1 mm. wide, with the remotely crested dorsal wing about 0.2 mm. wide and the ventral wing somewhat narrower, the faces plane; beak broad-based, laterally inserted above the middle of the achene body, more or less recurving, about 0.2 mm. long. In swamps, marshes, bogs, ditches, small ponds and depressions in prairies in e. and s. Tex., Mar.-Nov.; Ark., La. and Tex.

6. *Sagittaria longiloba* Engelm. FLECHA DE AGUA. Leaves erect or erect-spreading; leaf blades ovate-triangular, acute at apex, sagittate, the portion above the basal lobes to 15 cm. long and 1 dm. wide, the conspicuously long linear to lanceolate basal lobes always longer than and commonly twice as long as the body of the blade; scapes commonly branching at the lowest whorl, the main axis with as many as 12 whorls; pedicels to 35 mm. long, ascending; bracts ovate-lanceolate to narrowly lanceolate, attenuate, to 25 mm. long, connate at base; stamens with glabrous linear filaments to 3 mm. long and exceeding the anthers; fruiting heads to 12 mm. in diameter; achenes obovate, to 2.3 mm. long and 1.3 mm. wide, the narrow dorsal wing to 0.3 mm. wide, the ventral wing nearly obsolete, the faces commonly 1-winged; beak laterally inserted, triangular, to 0.15 mm. long or obsolete. In shallow water of sloughs, ditches, ponds and swamps, especially common in roadside ditches in s. Tex. and extending to n. and w. Tex., Apr.-Nov.; Ariz., Calif., Colo., Kan., Neb., Okla., Tex. and Mex.

7. *Sagittaria latifolia* Willd. WAPATO, DUCK-POTATO. Leaves erect or erect-spreading; leaf blades triangular-ovate, obtuse to acute at apex, sagittate, the portion above the basal lobes to 25 cm. long and wide, the linear to ovate-triangular basal lobes one half as long as or longer than the body of the blade; scapes angled, occasionally branching from the lowest whorls, the main axis with as many as 10 whorls, with one or more of the lower whorls pistillate or all unisexual; pedicels of pistillate flowers typically shorter than those of the staminate flowers; sepals to 1 cm. long, glabrous to densely pubescent; bracts cymbiform, distinctly or only slightly connate, thin, somewhat scarious, obtuse to acute, glabrous to densely pubescent; stamens with slender filaments that are usually longer than the anthers; fruiting heads to 25 mm. in diameter; achenes obovate, to 3.5 mm. long and 3 mm. wide, with broad marginal wings but no facial keels; beak broad-based, subhorizontal to slightly incurved, up to 2 mm. long. Incl. var. *obtusata* (Muhl.) Wieg. In water or wet places from s.e. to n. Tex., May-Aug.; throughout most of the U.S. and much of Latin Am.

Both the entirely glabrous widespread var. *latifolia* and the southern var. *pubescens* (Muhl.) J. G. Sm. (*S. pubescens* Muhl.), with densely pubescent bracts and calyx, are rare in Texas.

8. *Sagittaria brevirostra* Mack. & Bush. Leaves erect; leaf blades broadly ovate to lanceolate, obtuse to acute at apex, sagittate, the portion above the basal lobes to 2 dm. long and usually about as wide, the ovate to ovate-lanceolate and acute basal lobes about equaling the body of the blade; scapes simple or branched at base, the main axis with as many as 12 whorls, the lower 2 to 6 whorls pistillate with pedicels to 2 cm. long, the staminate with slightly longer pedicels; bracts firm, lanceolate, long-attenuate, to 25 mm. long; stamens with slender glabrous filaments about as long as the anthers; fruiting heads depressed, not noticeably echinate, to 2 cm. in diameter; achenes cuneate-obovate to quadrate, to 3 mm. long and 2 mm. wide, with an often dentate or serrate dorsal keel and usually with a narrow facial ridge; beak broad-based, obliquely ascending, to 1.5 mm. long, terminating the straight ventral margin. *S. Engelmanniana* J. G. Sm. subsp. *brevirostra* (Mack. & Bush) Bogin. Along rivers, ditches and sloughs in cen. Tex., June-Aug.; O. and Mich., w. to S.D. and s. to Tex.

9. *Sagittaria cuneata* Sheld. Leaves erect or erect-spreading; leaf blades broadly ovate to ovate-triangular, obtuse to acute at apex, sagittate, the portion above the basal lobes to 15 cm. long and 1 dm. wide, the deltoid basal lobes somewhat smaller than the body of the blade; scapes erect or arching, simple or sometimes branched, the main axis with as many as 7 whorls, the lower 1 or 2 (or sometimes all) whorls pistillate and sessile or on pedicels to 2 cm. long, the staminate pedicels somewhat longer; bracts narrowly ovate to lanceolate, acute to attenuate, usually connate at base, to 2 cm. long; stamens with glabrous subulate filaments that about equal the anthers; fruiting heads to 15 mm. in diameter; achenes obovate, to 2.5 mm. long and 2 mm. wide, the wide dorsal keel rounded, the faces usually with a low narrow ridge; beak subulate, usually recurved, erect to suberect, to 0.4 mm. long, terminating the strongly rounded ventral keel. Along rivers and streams in the High Plains, June-Aug.; n.e. Can., s. to N.E., N.Y., O., Ind., Ill., Ia., Kan., Tex., N.M., Ariz. and Calif.

FAM. 24. BUTOMACEAE RICH.

FLOWERING-RUSH FAMILY

Perennial aquatic or marsh herbs with stout short or elongate rhizomes and usually with milky juice; leaves cauline or basal; flowers perfect, in involucrate umbels or solitary; sepals 3, persistent; petals 3, showy; stamens 6 to many, free, the outer ones usually sterile; anthers basifixed, 2-celled, laterally dehiscent; pistils 4 to 8, free or basally coherent, with numerous ovules attached over the inner surface; fruit a many-seeded follicle, dehiscing on the inner side; seeds without endosperm.

Several genera containing about 10 species, mostly of warm regions.

1. HYDROCLEYS RICH.

Characteristics of family. Four species, all native to Brazil.

1. *Hydrocleys nymphoides* (Willd.) Buch. WATER-POPPY. Rhizomes rooting at the nodes; leaves alternate, long-petioled; leaf blades broadly ovate, cordate at base, rounded at apex, 5 cm. long or more, entire, glossy on upper surface, somewhat spongy along the midrib and sparsely pubescent on lower surface, usually floating; flowers axillary on long peduncles, raised well above the water and lasting only one day; petals light-yellow, obovate, 2-3 cm. long; stamens numerous, the outer ones sterile, fertile stamens purple or violet-color; pistils usually 6, gradually tapering into the style. Cult. in ponds and pools in s. U.S., including e. Tex., and becoming somewhat naturalized, summer; nat. of Braz. Included here on the basis of Muenscher's report of its occurrence in Texas; we have seen no specimens.

FAM. 25. HYDROCHARITACEAE JUSS.* FROG'S-BIT FAMILY

Fresh- or salt-water herbs, partly or wholly submerged, monoecious or dioecious, with terrestrial or floating roots; leaves radical and crowded or dispersed on elongated stems,

* See Appendix.

alternate to opposite or whorled; flowers regular, usually unisexual, arranged in a bifid spathaceous bract or within 2 opposite bracts, the staminate usually more than 1, the pistillate solitary; spathe sessile to long-pedunculate, the peduncle sometimes spirally twisted; perianth segments free to the base, 1- or 2-seriate, 3 or rarely 2 in each series, the outer often green and valvate, the inner imbricate and petaloid; stamens 1 to numerous; anthers with 2 parallel cells that open by longitudinal slits; rudimentary ovary present in the staminate flowers; staminodes sometimes present in the pistillate flower; ovary inferior, sometimes beaked, 1-celled, with 3 to 6 or rarely more parietal placentas that sometimes protrude nearly to the middle of the ovary; styles as many as placentas, entire or 2- or 3-branched; ovules numerous on the placentas; fruit globose to linear, dry or pulpy, rupturing irregularly; seeds numerous, without endosperm; embryo straight, with a thick radicle and usually inconspicuous plumule.

About 16 genera and 80 species, mainly of tropical and warm temperate regions.

1. Fresh-water plants that are pollinated at or above the surface of the water; pollen spheroid (2)
1. Marine plants that are pollinated beneath the surface of the water; pollen confervoid or united in strings (4)
- 2(1). Plant floating; leaves broadly ovate to reniform, distinctly petiolate, emersed or floating; spathe composed of 1 or 2 free bracts1. *Limnobium*, p. 101.
2. Plants attached to bottom; leaves linear or straplike, without a petiole, submersed; spathe composed of 2 bracts connate into a tube (3)
- 3(2). Leaves in approximate whorls on an elongated stem, less than 5 cm. long; petals well-developed and much larger than the sepals . . .2. *Egeria*, p. 101.
3. Leaves clustered at the base, straplike, more than 15 cm. long; petals rudimentary and much smaller than the sepals3. *Vallisneria*, p. 102.
- 4(1). Leaves alternate on a short stout concealed stem, ribbonlike, more than 1 dm. long; spathe composed of 2 bracts connate at the base to form a tube4. *Thalassia*, p. 102.
4. Leaves opposite at summit of slender nearly naked stem, mostly oblong-elliptic, less than 5 cm. long; spathe composed of 2 free bracts . .5. *Halophila*, p. 103.

1. LIMNOBIUM RICH.

AMERICAN FROG'S-BIT

Three species centered in tropical America.

1. *Limnobium Spongia* (Bosc.) Steud. **COMMON FROG'S-BIT.** Floating aquatic with pendent roots and stolons; leaves in a basal rosette, erect or ascending, with petioles to 15 cm. long, ovate to suborbicular or the earlier ones reniform, to 5 cm. broad, obtuse at the apex, truncate to cordate at base, entire, faintly 5-nerved, purplish and spongy beneath; flowers unisexual; staminate scapes to 1 dm. long, producing 3 or more flowers, filiform, the lance-ovoid spathe 3-5 cm. long; pistillate scapes 2-leaved, with 1 or 2 short-pedicelled flowers, about 25 mm. long in flower, stout, strongly recurved and elongated in fruit; sepals 3, 7-10 mm. long; petals 3, 8-10 mm. long; stamens represented by 3 to 6 subulate rudiments; anthers linear, apiculate, 2-4 mm. long; ovary inferior, 6- to 9-celled; stigmas filiform, as many as the cells, deeply 2-parted, 1-1.5 cm. long, papillose-ciliate; berry ovoid, many-seeded, 1-1.5 cm. long, on a stout recurved peduncle. In shallow mostly stagnant water of quiet lakes, ponds, lagoons and ditches in e. Tex., June-Oct.; from Ont. and N.J., s. to Fla., Tex., Mo. and Ill.

2. EGERIA PLANCH.

Two species that are native to South America.

1. *Egeria densa* Planch. Perennial submerged aquatic herb of fresh water, dioecious, rooting on the bottom or drifting when broken loose; stems terete, slender, 2-3 mm.

thick, ascending, simple or sparingly dichotomously branched; lower leaves opposite or in whorls of 3; middle and upper leaves in whorls of 4 to 8, sessile, crowded, pellucid, linear-elliptic to linear-lanceolate, subobtusate to acuminate, serrulate, to 4 cm. long and 5 mm. wide, much longer than the internodes; flowers unisexual; *staminate* spathes funnel-form, sessile, 2- to 4-flowered, borne in the upper axils, to 12 mm. long and 3.5 mm. broad, cleft on one side, the apex bifid; flowers stipitate, borne to the surface of the water on a thread-like hypanthium 3-6 cm. long; sepals 3, herbaceous, elliptic-oblong, 3-4 mm. long; petals 3, white, obovate to suborbicular, membranous, about 1 cm. long and 8 mm. wide; stamens 9, distinct; anthers loculicidal; filaments glandular-papillose above; nectary central, 3-lobed, small; *pistillate* plants not seen. *Elodea densa* (Planch.) Casp., *Anacharis densa* (Planch.) Vict. In lakes, ponds, pools, ditches and quiet streams in cen. and e. Tex., Apr.-June; a nat. of S. A. that has escaped from cult. in various places in the U.S. and Eur.

3. VALLISNERIA L. TAPEGRASS. EELGRASS

Two species, one native to America, another in the Old World.

1. *Vallisneria americana* Michx. WATER-CELERY. Aquatic dioecious submerged plant from perennial stoloniferous rootstocks with fibrous roots and fleshy propagating buds; leaves in basal clusters, linear, obtuse, thin, ribbonlike, flaccid, entirely submerged or with the upper part floating, to about 6 dm. long and 2 cm. wide, somewhat nerved and netted-veined, often minutely denticulate on the margin; staminate spathes 2- or 3-parted, bluntly acuminate, 1-2 cm. long, on thick clavate scapes to 5 cm. long; staminate flowers numerous, crowded on a short-pedunculate spadix, enclosed in the spathe, detached at maturity and floating and expanding on the surface of the water; perianth of 3 sepals; stamens 1 to 3; peduncles of the pistillate plant to 1 m. long, curved but scarcely spirally twisted in fruit; spathe 2-cleft, 2-2.5 cm. long, rather loose; pistillate flowers solitary in the spathe, floating on the water; hypanthium linear-cylindric, in flowers 2.5-3 cm. long, fully 2 mm. thick, in fruit about 1 dm. long; sepals 3, fused to the inferior ovary, oval, 5-6 mm. long, rounded at the apex; petals 3, about 2 mm. long; ovary 1-celled, cylindric; stigmas 3, large, about 5 mm. long, 2-cleft to near the base with each division obliquely obovate and abruptly short-acuminate; fruits cylindric, indehiscent, 8-12 cm. long. *V. spiralis* of auth. In lakes and beds of flowing streams, rare in the e. half of Tex., Apr.-July; from N. B., w. to N.D., s. to Fla. and Tex.

4. THALASSIA SOLAND. TURTLE-GRASS

Several species in marine waters of tropical and warm temperate regions.

1. *Thalassia testudinum* König. PALMAS DEL MAR. Submersed perennial herb with thick creeping scaly rhizome 3-5 mm. thick, dioecious; the short stems covered by the fibrous remains of old leaves; leaves several, 2-ranked, clustered on short erect branches, sheathing at base, linear, to 35 cm. long and 1 cm. wide, glabrous, minutely serrulate at the obtuse-rounded apex, withering-persistent; scapes arising from the leaf axils, bearing a solitary unisexual flower in a 2-cleft tubular spathe whose lobes are elliptic and papillose-dentate on the margins; staminate flowers pedicelled; pistillate flower nearly sessile in the spathe; perianth lobes 6, in both kinds of flowers oblong, rounded above, 1-1.2 cm. long; stamens 9; anthers about 8 mm. long, linear, opening laterally; stigmas 9 to 12, linear-filiform, pilose, grooved on the inside, about 1 cm. long; fruit oval to ellipsoid-fusiform, short-stalked and short-beaked, densely warty-mammillate, opening by valves, 2 cm. or more long. In shallow salt water along the Gulf Coast where it forms dense and extensive marine meadows in bays and about reefs, occasional in beach drift; from Fla. to Tex., s. to n. S. A.

5. HALOPHILA THOU

Several species widespread in marine waters of tropical and warm temperate regions.

1. *Halophila Engelmannii* Asch. Submersed perennial with horizontal slender creeping scaly branching stoloniferous stems 1-1.5 mm. thick that root at the nodes and produce short erect leafy branches; internodes 2-4 cm. long; scales and leaves in pairs, opposite; scales broadly obovate, glabrous, to about 1 cm. long; erect shoots 2-4 cm. long, with 1 pair of scales at the middle and 2 or 3 pairs of leaves clustered at the summit; leaves sessile or with a very short thick petiole 2 mm. long or less, linear-oblong to oblong-elliptic, obtuse to subacute at apex, tapering at base, to 4 cm. long and 8 mm. wide, rather thick, faintly 3-ribbed and with 6 to 8 pairs of lateral veins, reticulate-roughened, finely serrulate on the margins; flowers 1 or 2 enclosed in a bifoliate sheath, both kinds often in the same sheath; *pistillate flowers* sessile in the axils of the leaves; hypanthium ovoid, 3-4 mm. long, its neck about 5 mm. long; sepals 3, minute; stigmas 3, filiform, sessile, channeled and with usually 2 rows of papillae; fruit a membranous capsule with 3 parietal placentae, enclosed in the sheath; seeds numerous; *staminate flowers* not seen. In shallow salt water along the Gulf Coast, occasional in beach drift; from Fla. to Tex., the Bah. I. and W. I.

FAM. 26. GRAMINEAE JUSS.⁷

GRASS FAMILY

Herbs or less commonly woody reedlike plants; roots fibrous; leaves distichous, each with a more or less sheathing lower portion ("sheath") and a terminal usually more or less linear blade, often at the juncture of sheath and blade an adaxial fringe- or scalelike structure ("ligule"); in each axil often a small 2-nerved asymmetric (in transection often H-shaped) structure ("prophyll"); leaves often with a meristem near the ligule that permits continued elongation; flowers (florets) very much reduced, perfect or neuter, less commonly staminate or pistillate, usually aggregated distichously in small clusters known as spikelets, each flower comprising the genitalia (when present) at the base of which are usually 2 minute bulbs or scales ("lodicules"), this floret subtended usually by a minute adaxial prophyll-like bract scale (palea) and a slightly larger abaxial bract scale (lemma); lemmas (when more than one present) distichous on the spikelet axis (rachilla); base of spikelet usually with 2 empty bract scales (glumes), or one of these sometimes obsolete or rarely both glumes absent; perianth absent; stamens 1 to 6 (usually 3); ovary a usually dorsiventrally flattened 1-celled uniovulate structure; style deeply divided into 2 (rarely 3) long feathery stigmas; fruit ("grain," "caryopsis") an achene-like structure but with the ovary wall usually tightly coherent to the solitary endosperm-containing seed (ovary wall apparently not persistently tightly adherent to seed in *Sporobolus*, *Blepharoneuron*, *Calamovilfa*, *Eleusine* and some species of *Muhlenbergia*), or in some genera (e.g., *Stipa*, *Aristida*, *Panicum*, etc.) the word "fruit" is used to refer to the lemma and its contents since in these plants the lemma tightly and persistently clasps the grain and thus constitutes a spurious outer fruit layer. Poaceae Barnh.

One of the largest families of flowering plants, the Gramineae are the most important economically as measured by several criteria. They produce the dietary staples of most of the world's population. One species, rice, is the most important of all the grasses, and probably the single most important plant species in the world.

1. Uppermost lemma of a firmer texture than the bract scales below it, usually cartaceous or thin-cartilaginous or of the texture of finger nails, usually convex and its margins (at least laterally) fitting around the margins of the flattish palea (which usually has the same texture) and enclosing the perfect floret; uppermost lemma subtended by a variable number of bract scales, usually 1 or 2 glumes and a sterile lemma with or without a membranous palea (2)

⁷ Many data have been derived from the work of A. S. Hitchcock, "Manual of the Grasses of the United States," U.S. Dept. Agric. Miscell. Publ. No. 200, 2nd ed. revised by Agnes Chase, 1051 pp. (1950). The arrangement of genera is one designed by Walter V. Brown.

1. Uppermost lemma usually of a texture much like that of the other bract scales or thinner than them and hyaline (17)
- 2(1). Spikelets in 2 rows, appressed and sunken into a niche on one side of an erect, tough, fleshy, articulated rachis53. *Stenotaphrum*, p. 153.
2. Spikelets not sunken in the rachis (3)
- 3(2). Spikelets subtended or surrounded by 1 to many distinct or more or less connate bristles that form an involucre (see also a few species of *Panicum* in which some of the spikelets are subtended by solitary bristles) (4)
3. Spikelets not subtended by bristles (occasionally the pedicels pilose) (5)
- 4(3). Bristles persistent, the spikelets deciduous62. *Setaria*, p. 184.
4. Bristles (burs) falling with the enclosed spikelet(s) at maturity
.....63. *Cenchrus*, p. 187.
- 5(3). Glumes or sterile lemma awned (awn reduced and concealed in the silky hairs of the spikelet in *Rhynchelytrum*, reduced to a mere point in *Echinochloa colonum*) (6)
5. Glume(s) and sterile lemma awnless (8)
- 6(5). Spikelets long-silky-pubescent48. *Rhynchelytrum*, p. 147.
6. Spikelets not long-silky-pubescent (7)
- 7(6). Blades lanceolate, broad; culms creeping60. *Oplismenus*, p. 182.
7. Blades elongate; culms not creeping61. *Echinochloa*, p. 183.
- 8(5). Fertile (uppermost) lemma with thin hyaline margins readily visible over the dorsal side of the palea which they clasp and almost cover; "fruit" (i.e., fertile lemma and its enclosures) usually dark-colored (9)
8. Fertile lemma with margins not readily visible over the dorsum of the palea, seeming to be inrolled or revolute, the apparent margins of the lemma just barely clasping the sides of the palea most of which is therefore exposed; "fruit" usually pallid, often essentially white (12)
- 9(8). Spikelets in racemes, usually short-pedicelled in 2 rows along one side of the raceme rachis (10)
9. Spikelets longer-pedicelled in open panicles (11)
- 10(9). Racemes digitately or subdigitately disposed; spikelets rarely long-silky-pubescent51. *Digitaria*, p. 149.
10. Racemes panicle; spikelets usually silky-pubescent ..50. *Trichachne*, p. 148.
- 11(9). Panicles narrow; upper lemma cymbiform49. *Anthraenantia*, p. 147.
11. Panicles very open and diffuse; upper lemma merely slightly concavo-convex
.....52. *Leptoloma*, p. 152.
- 12(8). Spikelet with the convex dorsum of the uppermost (fertile, firm) lemma turned away from the axis to which it is appressed, the dorsum of the flattish palea (flat side of spikelet) appressed to the axis in most spikelets of the panicle (13)
12. Spikelets turned the other way, with the convex side of spikelet toward the axis, or the panicle so diffuse that this orientation cannot be determined (15)
- 13(12). That portion of the rachilla between the minute first glume and the well-developed second glume swollen into a minute "callus"
.....54. *Eriochloa*, p. 153.
13. Lower rachilla internode not swollen (14)
- 14(13). First glume present (next to the raceme axis); racemes racemously arranged along the main panicle axis55. *Brachiaria*, p. 155.
14. First glume absent; racemes digitate or subdigitate ..56. *Axonopus*, p. 155.
- 15(12). Second glume gibbous basally59. *Sacciolepis*, p. 182.
15. Second glume not gibbous at base (16)
- 16(15). First glume usually absent; spikelets in rows along one side of a raceme axis ..
.....57. *Paspalum*, p. 156.

16. First glume present; spikelets rarely in racemes58. *Panicum*, p. 164.
- 17(1). Uppermost lemma usually minute, flat, often hyaline in texture over most of its area, often awned from the summit, subtended by a similarly small hyaline sterile lemma (both lemmas surpassed by the much larger and firmer usually flattish or concavo-convex awnless glumes); spikelets in pairs along a rachis, the usual arrangement being that one spikelet in the pair is nearly sessile, the other definitely pedicelled (18)
17. Uppermost lemma usually at least slightly laterally compressed or folded along the midrib and usually surpassing the glumes, or if not then the spikelets not arranged in pairs as described above (31)
- 18(17). Spikelets all alike, all perfect (19)
18. Spikelets not all alike, at least some not perfect (21)
- 19(18). Lemma awnless64. *Imperata*, p. 189.
19. Lemma awned (20)
- 20(19). Spikelets paired65. *Erianthus*, p. 190.
20. Spikelets not paired, each subtended by a bristle representing the pedicel of a spikelet that has been wholly reduced71. *Sorghastrum*, p. 200.
- 21(18). All spikelets unisexual (22)
21. At least some (usually the lower spikelet of each pair but the upper in *Trachypogon*) spikelets perfect (23)
- 22(21). Staminate and pistillate spikelets both in the same androgynous terminal spike-like raceme76. *Tripsacum*, p. 203.
22. Staminate spikelets borne at the top of the plant, pistillate ones in lateral cobs77. *Zea*, p. 203.
- 23(21). Each sessile spikelet sunken in a niche at the bottom of a sculptured internode of a much thickened subcylindric rachis75. *Manisuris*, p. 202.
23. Spikelets not sunken in niches in the rachis (24)
- 24(23). Pedicel (of the pedicellate spikelet of the pair) thickened and appressed to the thickened rachis joint74. *Elyonurus*, p. 202.
24. Pedicels and rachis joints not thus thickened (25)
- 25(24). Pedicellate spikelet perfect, the sessile one infertile73. *Trachypogon*, p. 201.
25. Sessile spikelet perfect, the pedicellate one infertile (26)
- 26(25). Lower part of raceme bearing pairs of staminate spikelets and remaining intact, the upper part bearing pairs of spikelets (and the upper part of the raceme rachis eventually disarticulating at the lower part of each internode, the hairy internode thus remaining at the bottom of the spikelet as a hairy "callus")72. *Heteropogon*, p. 201.
26. Racemes uniform through their full length; callus absent (27)
- 27(26). Racemes reduced to one or few joints, these mostly peduncled in a subsimple or compound terminal panicle70. *Sorghum*, p. 199.
27. Racemes of several to many joints, solitary, digitate or aggregated in panicles (28)
- 28(27). Racemes solitary on each peduncle; rachis joints oblique and hollow at the summit66. *Schizachyrium*, p. 191.
28. Racemes 2 to numerous on each peduncle (29)
- 29(28). Racemes 2 to several on each peduncle, digitate; rachis joints slender, sometimes with a shallow groove on one side67. *Andropogon*, p. 192.
29. Racemes few to numerous in a leafless panicle usually on a relatively long axis (several cm. long usually), the rachis joints (and usually the pedicels) flat (30)
- 30(29). Pedicels of pedicellate spikelets with a translucent groove or thin area in the center68. *Bothriochloa*, p. 194.
30. Pedicels without a translucent groove69. *Dichanthium*, p. 198.

- 31(17). Spikelets 5-8 cm. long 1. *Arundinaria*, p. 112.
31. Spikelets (not including awns, if any) considerably less than 5 cm. long (32)
- 32(31). Spikelets in terminal dense ovoid or spikelike panicles, the panicle axis centrally located in the dense mass; spikelets strongly laterally compressed, the plane of the glumes perpendicular or at an angle to the panicle axis, the edge of a spikelet-transsection thus median-tangential to the panicle .. 47. *Phalaris*, p. 146.
32. Spikelets either not in such dense panicles, or not strongly laterally compressed, or not uniformly oriented as in *Phalaris* (33)
- 33(32). Spikelets all unisexual, falling entire, 1-flowered, the pistillate ones terete or nearly so (34)
33. At least some spikelets perfect and/or not falling entire and/or several-flowered or not terete (36)
- 34(33). Terminal panicles with staminate spikelets, subterminal ones with pistillate spikelets 4. *Hydrochloa*, p. 113.
34. Both staminate and pistillate spikelets in the same panicle (35)
- 35(34). Lower part of panicle with spreading branches bearing staminate spikelets, the upper part with ascending or appressed branches bearing pistillate spikelets 2. *Zizania*, p. 112.
35. Staminate and pistillate spikelets intermingled in most parts of the panicle 3. *Zizaniopsis*, p. 112.
- 36(33). Spikelets falling entire, 1-flowered, very flat, the lemma and palea about equal (both keeled); glumes small or absent (37)
36. Glumes either persistent on the pedicels or if the spikelet falling entire then the glumes relatively well-developed (38)
- 37(36). Glumes minute; lemma mucronate or awned 6. *Oryza*, p. 114.
37. Glumes absent; lemma awnless 5. *Leersia*, p. 113.
- 38(36). Spikelets 1-flowered (or the staminate ones 2-flowered), in groups of 2 to 5, these spikelet groups in a spikelike terminal raceme with the groups falling entire as a unit; lemma and palea thinner than the glumes (39)
38. Spikelets not as above (40)
- 39(38). Second glume of lower spikelets of the group bearing hooked spines, the group of spikelets forming a little bur 110. *Tragus*, p. 253.
39. Spikelets not with hooked spines, the second glume mostly cleft and awned 109. *Hilaria*, p. 252.
- 40(38). Spikelets 1-flowered, each sunken in a niche at the bottom of a thick sculptured rachis joint 13. *Parapholis*, p. 118.
40. Spikelets either not sunken in rachis niches or if so (as in *Lolium*) then more than 1-flowered (41)
- 41(40). Low stoloniferous perennials forming mats; flowers and spikelets all unisexual; staminate spikelets and pistillate spikelets borne on separate culms (42)
41. Not as above (43)
- 42(41). Pistillate lemmas each with 3 very long fine awns; staminate panicles 4-6 cm. long, loosely spikelike, not secund 78. *Scleropogon*, p. 203.
42. Pistillate lemmas not awned; staminate panicles about 1 cm. long, comblike, the spikelets secund 104. *Buchloë*, p. 249.
- 43(41). Spikelets 1- to several-flowered, sessile on opposite sides of a jointed or continuous axis forming symmetrical spikes (not 1-sided, but spikelets turned to one side in some species) [*Hordeae*] (44)
43. Spikelets 1- to several-flowered but not arranged in symmetrical spikes as described for the *Hordeae* (50)
- 44(43). Spikelets solitary at each node of the spike (rarely 2 in species of *Agropyron* but never throughout the spike) (45)

44. Spikelets in two's or three's at each node of the spike (solitary at some nodes of some spikes in some species of *Elymus*) (48)
- 45(44). Perennials; natives 29. *Agropyron*, p. 135.
45. Annuals; introduced (46)
- 46(45). Spikelets turgid or cylindric 35. *Aegilops*, p. 139.
46. Spikelets compressed (47)
- 47(46). Glumes ovate, 3-nerved 32. *Triticum*, p. 138.
47. Glumes subulate, 1-nerved 34. *Secale*, p. 139.
- 48(44). Spikelets in three's at each node, the central one largest, the lateral ones in most species reduced 31. *Hordeum*, p. 137.
48. Spikelets paired at each node (49)
- 49(48). Rachis continuous (rarely tardily disarticulating); glumes broad or narrow, entire 30. *Elymus*, p. 136.
49. Rachis readily disarticulating at maturity; glumes extending into long awns, these and the awns of the lemma making the spike very bristly 33. *Sitanion*, p. 138.
- 50(43). Spikelets 1-flowered; lemma indurated and its lower part nearly terete and tightly enveloping the palea (often reduced) and the floret, its apex often extended into one awn or 3 awns (51)
50. Spikelets 1- to several-flowered but when only 1 the lemma not enveloping the floret which is usually not terete (54)
- 51(50). Lemma apex 3-awned (the lateral awns occasionally minute) 115. *Aristida*, p. 255.
51. Lemma apex 1-awned (52)
- 52(51). Lemma awn not twisted but short, fragile and readily deciduous 14. *Oryzopsis*, p. 118.
52. Lemma awn twisted and bent (53)
- 53(52). Edges of lemma meeting or overlapping, thus hiding the dorsum of the palea which is membranous 16. *Stipa*, p. 119.
53. Edges of lemma scarcely meeting, exposing part of the back of the palea which is of the same texture as the lemma 15. *Piptochaetium*, p. 118.
- 54(50). Spikelets usually crowded (not in *Schedonnardus*) and attached in 2 rows along one side of the continuous usually somewhat flattened spike or "raceme" rachises (in *Bouteloua uniflora* the spikelets solitary, cf. also 23. *Catapodium* and 27. *Lamarckia*) (55)
54. Spikelets not so arranged (69)
- 55(54). Panicles diffuse, the spikes 3 to 12, 1-15 cm. long (the lower ones much longer than the upper), the spikelets remote, scarcely or not at all overlapping 98. *Schedonnardus*, p. 237.
55. Panicles not as above; spikelets mostly densely crowded (56)
- 56(55). Spikelets 1-flowered (occasionally the rachilla prolonged above the floret but rudimentary upper florets absent) (57)
56. Spikelets 2- to several-flowered, often the upper ones reduced or rudimentary (59)
- 57(56). Zone of abscission at the base of the spikelet, thus the spikelet falling entire 105. *Spartina*, p. 249.
57. Zone of abscission between the glume node and the lowest lemma node, thus the glumes persistent (58)
- 58(57). Spikes digitate; rachilla prolonged 96. *Cynodon*, p. 237.
58. Spikes racemose along the main axis; rachilla not prolonged 97. *Willkommia*, p. 237.
- 59(56). Spikelets with 2 or more perfect florets (60)
59. Spikelets with one perfect floret plus 1 or more infertile ones above the perfect one (65)

- 60(59). Spikes solitary 93. *Tripogon*, p. 236.
60. Spikes 2 to numerous (occasionally only 1 in depauperate *Eleusine*) (61)
- 61(60). Lemmas long-white-hirsute on the lateral nerves, the hairs as much as 1 mm. long 92. *Trichoneura*, p. 235.
61. Lemmas glabrous or only short-pubescent on the lateral nerves (62)
- 62(61). Each lower lemma with 3 awns, the central awn 5-15 mm. long, the lateral ones less than half as long as the central one 101. *Trichloris (pluriflora)*, p. 243.
62. Lemmas 1-awned or awnless (63)
- 63(62). Spikes 4 to 90, racemose on an elongate axis (except in one species) 91. *Leptochloa*, p. 233.
63. Spikes (1 or) 2 to 7, digitate or nearly so (cf. also *Leptochloa chloridiformis*) (64)
- 64(63). Rachis of spike not extending much if at all beyond the spikelet-bearing zone; the strong 3 nerves of the lemmas close together to form a keel 94. *Eleusine*, p. 236.
64. Rachis of spike extending beyond the spikelets; lateral lemma nerves near the margin and indistinct 95. *Dactyloctenium*, p. 236.
- 65(59). Spikes digitate or nearly so (66)
65. Spikes racemose along the main panicle axis (67)
- 66(65). Lemmas each with 3 awns about 1 cm. long 101. *Trichloris (crinita)*, p. 243.
66. Lemmas 1-awned or awnless 100. *Chloris*, p. 238.
- 67(65). Spikelets appressed, not crowded; spikes slender, elongate 99. *Gymnopogon*, p. 238.
67. Spikelets crowded, not appressed; spikes relatively short and stout (68)
- 68(67). Stoloniferous mat-forming perennials; each spike with 3 spikelets, the terminal spikelet with a basal pistillate floret and above that a rudiment of 2 reduced florets, the other 2 spikelets staminate or neutral; in Trans-Pecos Texas 103. *Cathestecum*, p. 248.
68. Various in habit and spike-makeup but not with the above combination of characters; widespread 102. *Bouteloua*, p. 243.
- 69(54). Floret solitary, the spikelet thus usually with 4 scales (2 glumes, 1 lemma, 1 palea) (cf. also species of *Eragrostis*) (70)
69. Florets 2 to numerous per spikelet (rarely seemingly reduced to 1 floret as in a few species of *Eragrostis*) (80)
- 70(69). Lemma on back (below the middle) bearing a twisted once-geniculate awn .. 45. *Alopecurus*, p. 145.
70. Lemma awned above the middle or awnless (71)
- 71(70). Lemma at base with a callus bearing a beard of soft white hairs 4-5 mm. long 86. *Calamovilfa*, p. 217.
71. Lemma at base not with a long-bearded callus (72)
- 72(71). The three nerves of the lemma and a median band on the palea-dorsum densely short-villous 88. *Blepharoneuron*, p. 223.
72. Bract scales variously glabrous or pubescent but not as described for *Blepharoneuron* (73)
- 73(72). Zone of abscission immediately below the glumes of the individual spikelets causing them to fall individually (see also *Agrostis semiverticillata* in which there are 2 zones of abscission, 1 just above and 1 just below the glume node; and cf. *Lycurus* and 2 species of *Muhlenbergia* whose spikelets fall in pairs) (74)
73. Zone of abscission either above the glume node and below the lemma node or on the branchlet such that 2 spikelets fall together (76)
- 74(73). Glumes coalescent at the base and each awned .. 42. *Polypogon*, p. 144.
74. Glumes free, awnless (75)

- 75(74). Lemma body 3-4 mm. long, bifid, from between the 2 teeth bearing a once-geniculate twisted awn 4-12 mm. long 44. *Limnodea*, p. 145.
75. Lemma body 5.5-6 mm. long, dorsally just below the tip bearing a minute awn (use lens!) 43. *Cinna*, p. 144.
- 76(73). Body of second glume longer than lemma body (77)
76. Lemma body surpassing glume bodies (78)
- 77(76). Glumes equal, each with a firm sharp keel prolonged into a short spreading awn 46. *Phleum*, p. 146.
77. Glumes not as above 41. *Agrostis*, p. 142.
- 78(76). Pedicellary branchlets very short, borne in pairs, unequal, with a zone of abscission at the base of each pair, the spikelet on the shorter pedicel infertile, the other fertile 89. *Lycurus*, p. 224.
78. Pedicellary branchlets not as above, if the spikelets falling in pairs then both of the pair fertile (79)
- 79(78). Grain at maturity falling from the lemma and palea; seed not tightly adherent to the fruit wall which usually opens when ripe or when moistened 87. *Sporobolus*, p. 217.
79. Grain not usually falling from the lemma and palea at maturity; seed closely adherent to fruit wall 90. *Muhlenbergia*, p. 224.
- 80(69). Panicle more or less spikelike with numerous short spreading branches each of which has a secund fascicle of 4 to 5 (rarely 6) appressed spikelets of 2 kinds, in each fascicle one central fertile spikelet (rarely 2) and the rest sterile 27. *Lamarckia*, p. 134.
80. Inflorescence not as described for *Lamarckia* (81)
- 81(80). Spikelets in terminal lax spikes, each in a niche in a thickened sculptured internode; first glume obsolete and adaxial 21. *Lolium*, p. 130.
81. Inflorescence not as described for *Lolium* (82)
- 82(81). Canes or reeds (1-) 2-6 m. tall, with very hairy panicles (83)
82. Grasses less robust or if as robust then the panicles nearly glabrous (84)
- 83(82). Rachilla densely hairy, abscising at the upper part of each node (base of each internode); lemmas glabrous 7. *Phragmites*, p. 114.
83. Rachilla glabrous, abscising at lower part of each node (top of each internode); lemmas long-pilose 8. *Arundo*, p. 115.
- 84(82). Flowers all unisexual, the staminate ones borne on some culms (or plants), the pistillate on others; plants colonial by means of rhizomes and/or stolons (see also *Poa* spp.) (85)
84. Flowers not all unisexual or both kinds borne on the same culm (except in some species of *Poa*); habit various (87)
- 85(84). Low-growing, the mats usually 5-10 (-15) cm. tall; panicles reduced to solitary 3- to 5-flowered spikelets, appearing terminal and embedded in the masses of leaves 113. *Monanthochloë*, p. 254.
85. Usually taller; panicles conspicuous with several to numerous spikelets (86)
- 86(85). Rhizomes absent; long thick stolons present; blades flat, elongate; pistillate spikelets about twice as large as staminate ones 111. *Allolepis*, p. 253.
86. Rhizomes present; stolons rare or absent; blades narrow, involute, pungent; pistillate and staminate spikelets not greatly disparate in size 112. *Distichlis*, p. 254.
- 87(84). Lemmas 1-awned from the back (not from the apical margin); spikelets 2- or 3-flowered (cf. also species of *Bromus* in which the awn is dorsal but the spikelets are several-flowered) (88)
87. Lemmas either awnless or awned from the apex (90)
- 88(87). Glumes about equaling the lowest lemma body in length 38. *Trisetum*, p. 141.
88. Glumes surpassing the bodies of the lemmas (89)

- 89(88). Glumes (spikelets) 20-30 mm. long 40. *Avena*, p. 142.
 89. Glumes only 2-2.5 mm. long 39. *Aira*, p. 141.
- 90(87). Lemmas divided at summit into 9 to 15 awns or awnlike lobes which at the tip are often ciliate or plumose (91)
 90. Lemmas not so divided (93)
- 91(90). Cleistogamous panicles usually present in lower sheaths; rachilla with a zone of abscission just below each lemma node 106. *Cottea*, p. 251.
 91. Cleistogamous panicles absent; rachilla with only one zone of abscission which is just above the glume node (92)
- 92(91). Spikelets 4- or 5-flowered, the lower 1 or 2 (or 3) fertile, the rest reduced; lemma awns 13 or 15, not plumose 107. *Pappophorum*, p. 251.
 92. Spikelets 3-flowered, only the lowest one fertile; lemma awns 9, plumose 108. *Enneapogon*, p. 251.
- 93(90). Lateral 2 nerves of lemma or the zone between the 2 lateral nerves and the margins with some pubescence conspicuous under a lens either near the base or the middle (94)
 93. Lateral veins or marginal zones of lemma essentially glabrous (see also *Tridens albescens*) (100)
- 94(93). Inflorescence a few-flowered head or capitate panicle overtopped or at least partially concealed by the leaves (95)
 94. Inflorescence an exerted open to spike-like panicle (97)
- 95(94). Plants mat-forming annuals; lateral nerves with a tuft of hairs near the middle 84. *Munroa*, p. 216.
 95. Plants perennial; lateral nerves hairy more extensively (not just in the middle) (96)
- 96(95). Plants tufted, 6-18 cm. tall 82. *Blepharidachne*, p. 215.
 96. Plants stoloniferous, mat-forming 83. *Erioneuron (pulchellum)*, p. 215.
- 97(94). Lemmas awnless, rarely emarginate, 5-nerved (but this obscure even under a lens) 24. *Poa*, p. 131.
 97. Lemmas usually either emarginate or rather deeply cleft, the midnerve usually excurrent in the sinus as a point or awn (98)
- 98(97). Palea long-silky-pubescent from the distal margin and in the distal third of the length; annuals 85. *Triplasis*, p. 217.
 98. Palea either glabrous or with a different length or distribution of the pubescence; perennials (99)
- 99(98). Leaves not usually crowded at the base; blades mostly flat, elongate, marginally not white-cartilaginous 81. *Tridens*, p. 213.
 99. Leaves crowded at the base; blades short, folded and keeled, falcate, marginally white-cartilaginous 83. *Erioneuron*, p. 215.
- 100(93). Spikelets 2- or 3- (rarely 4-) flowered, each lemma with a densely silky-pilose callus at base and 3 glabrous nerves; rachilla abscising just above each node 80. *Redfieldia*, p. 213.
 100. Spikelets not as in *Redfieldia* (with a tuft of flexuous hairs basally in some species of *Poa*) (101)
- 101(100). Lemmas apically with 2 setaceous teeth and from between the teeth the midnerve prolonged into a long darkly pigmented basally twisted geniculate awn 9. *Danthonia*, p. 115.
 101. Lemmas from entire to bifid at apex, the awn (if present) not as described for *Danthonia* (102)
- 102(101). Panicle narrow, erect, with few ascending branches each of which bears at apex a very dense aggregation (about 1 cm. thick) of secund nearly sessile fascicles of spikelets 28. *Dactylis*, p. 135.
 102. Inflorescence not as above (103)

- 103(102). Spikelets falling entire (zone of abscission just below the glumes) or entire and in groups (104)
103. Glumes persistent on panicle, the spikelet rachilla in most cases disarticulating at the lemma nodes (105)
- 104(103). Lower panicle branches with all spikelets intact, falling entire (zone of abscission at base of lower panicle branch)22. *Sclerochloa*, p. 130.
104. Spikelets falling entire from a zone of abscission just below the glumes37. *Sphenopholis*, p. 140.
- 105(103). Glumes equal, membranous with narrow white margins, about three fourths to four fifths as long as the remainder of the spikelet10. *Schismus*, p. 116.
105. Glumes not as in *Schismus*, usually proportionately much shorter (longer in *Melica*) or unequal (106)
- 106(105). Lower (1 or) 2 to 6 lemmas empty, the fertile florets thus near the middle (or upper) portions of the spikelet (107)
106. Lower lemma(s) enclosing fertile florets in at least some spikelets (108)
- 107(106). Rhizomatous plants with culms 10-25 dm. tall, growing in coastal loose sand11. *Untola*, p. 116.
107. Plants 3-10 (-15) dm. tall, sometimes rhizomatous but growing in woodlands12. *Chasmanthium*, p. 116.
- 108(106). Spikelets secund on the lower side of the panicle branches, these branches numbering 10 to 20 and (in turn) secund on the flattened and slightly zigzag main axis23. *Catapodium*, p. 130.
108. Panicle branches and spikelets not so disposed (109)
- 109(108). Grain beaked, nearly as long as the lemma at maturity and so large that the spreading floret gapes26. *Diarrhena*, p. 134.
109. Grain proportionately smaller, not beaked (110)
- 110(109). Lemmas 3-nerved, this in most species readily apparent (cf. also species of *Poa* and *Briza* in which some of the nerves are so obscure the lemma appears 3-nerved on cursory examination)79. *Eragrostis*, p. 204.
110. Lemmas 5- to 9-nerved as determined by examination of transection (111)
- 111(110). Lemmas about as broad as long, 1.5-2 mm. long, spreading and with margins outspread, basally auriculate and overlapping each other; spikelets pendulous from the ultimate capillary pedicels at the periphery of the very diffuse panicle25. *Briza*, p. 134.
111. Lemmas longer than broad (except in a few species of *Bromus*) and the lemmas and panicles otherwise (112)
- 112(111). Panicles densely spike-like (either continuous or somewhat interrupted)36. *Koeleria*, p. 139.
112. Panicles more open or diffuse (113)
- 113(112). Lemmas dorsally keeled (somewhat rounded in some species of *Poa*) (114)
113. Lemmas dorsally rounded (somewhat keeled toward the summit in species of *Festuca*, *Vulpia* and *Bromus*) (115)
- 114(113). Lemmas awned from a minutely bifid apex (awnless or nearly so in *B. unioloides*); spikelets large19. *Bromus*, p. 123.
114. Lemmas awnless; spikelets small24. *Poa*, p. 131.
- 115(113). Glumes papery; lemmas firm, strongly nerved, scarious-margined; upper florets sterile, often reduced to a club-shaped rudiment infolded by the broad upper lemmas17. *Melica*, p. 121.
115. Glumes not papery; upper florets not unlike the others (116)
- 116(115). Each lemma long-tapered to a point (in some cases this appearance due to involution of lemma) (117)
116. Lemmas broader, not long-tapered to apex (118)

- 117(116). Perennials 20a. *Festuca*, p. 127.
 117. Annuals 20b. *Vulpia*, p. 128.
 118(116). Perennials with slender fragile short rhizomes and occasionally short fragile stolons (these often with cleistogamous flowers in the lower sheaths); spikelet scarcely compressed laterally, essentially glabrous and unawned 114. *Vaseyochloa*, p. 255.
 118. Annuals or perennials with a combination of characters different from those for *Vaseyochloa* (119)
 119(118). Nerves of lemma parallel, not converging toward summit or but slightly so . . . 18. *Glyceria*, p. 122.
 119. Nerves of lemma converging toward the summit, the lemmas narrowed at apex (120)
 120(119). Lemmas awned or awn-tipped from a minutely bifid apex 19. *Bromus*, p. 123.
 120. Lemmas awnless or if awned the apex not bifid 24. *Poa*, p. 131.

1. ARUNDINARIA MICHX.

About 150 species in warmer parts of the world; one species in Texas.

1. *Arundinaria gigantea* (Walt.) Muhl. GIANT CANE. Mostly glabrous robust rhizomatous cane-grass forming dense brakes; primary aerial culms perennial (not usually freezing back), 2-8 m. tall, 2-20 mm. thick, erect, with some ascending or appressed branches along the length; sheath margins ciliate; small sheath auricles usually with a few spread-and bristles; blades very shortly petiolate, of two size-classes, larger ones on the primary aerial culms 12-20 cm. long and 10-25 mm. broad, smaller ones on the branches; inflorescences narrowly paniculate, the lower pedicels mostly included in the sheath and the upper ones free (most of them nearly as long as their spikelets); spikelets few, 5-8 cm. long, about 8 mm. broad, 9- to 13-flowered, lax enough so that the internodes of rachis are often visible; zone of abscission at lower part of each lemma node; lower lemmas 22-25 mm. long, cymbiform, finely pubescent, obscurely 11-nerved, with fine awnlike tips. Locally forming brakes in low areas near sloughs, bayous and rivers, e. and s.e. Tex., s.w. to Wharton Co., spring; s.e. U. S., n. to N. C., O. and Ind.

Giant cane formerly covered many square miles in east and southeast Texas but with the introduction of domestic stock it has almost disappeared and is now relatively rare.

2. ZIZANIA L. WILDRICE

A genus of 2 species in North America and one in Asia; we have one species.

1. *Zizania texana* Hitchc. TEXAS WILDRICE. Coarse perennial; culms long-decumbent and rooting at nodes, stoloniform, distally ascending, 1-3 m. long, 3-13 mm. thick; ligule a scale 5-15 mm. long; blades 12-110 cm. long, 5-23 mm. broad, flat, forming long streamers beneath surface of water; panicle 2-3 dm. long, the lower portion with spreading branches bearing staminate spikelets, the upper part with ascending or appressed branches bearing pistillate spikelets; zone of abscission below the floret or spikelet; spikelets consisting of a single naked floret (glumes obsolete or absent); *staminate spikelets* pendulous, 7-9 mm. long, 1.5 mm. broad, not indurated nor awned; *pistillate spikelets* erect, about 10 mm. long and 1 mm. broad, terete or at least not laterally compressed, the lemma indurate at maturity and bearing an awn 10-23 mm. long. In clear cool fast-flowing spring-water in the San Marcos River, Hays Co., where it is becoming rare, fall-spring, usually early spring; endemic.

3. ZIZANIOPSIS DOELL & ASCH.

A genus of 4 species in North America and South America; we have one species.

1. *Zizaniopsis miliacea* (Michx.) Doell & Asch. SOUTHERN WILDRICE. Coarse perennial from creeping rhizomes 5-11 mm. thick; culms 9-30 dm. long, 5-15 mm. thick, rooting

at some of the lower nodes, mostly erect and unbranched; ligule a scale 5-15 mm. long; blades 15-100 cm. long, 8-22 mm. broad, flat; panicle 3-6 dm. long, 10-17 cm. broad, the main branches verticillate and ascending, much verticillately rebranched with each branchlet bearing some pistillate spikelets and some staminate ones, both kinds ascending and appressed and superficially similar; zone of abscission below the floret; each spikelet consisting of a single naked floret (glumes obsolete or absent), 6-8 mm. long, ellipsoidal, acuminate, not at all laterally compressed; lemma 7-nerved, mucronate or with an awn 2-3 mm. long. At the edges of streams, s.e., e. and n.-cen. Tex., Edwards Plateau and extreme n. Rio Grande Plains, locally abundant, spring-fall; Coastal States, Md. to Tex., n. to Ky., Ark. and Okla.

4. HYDROCHLOA BEAUV.

A monotypic genus of southern United States.

1. *Hydrochloa caroliniensis* Beauv. Mostly submerged bottom-rooted aquatic perennial; culms 3-10 dm. long, about 0.5 mm. thick, often rooted at most nodes, somewhat branched; ligule a scale of 0.5-1 mm. long; blades floating near surface or usually emergent a few cm., 2-4 (-6) cm. long, 2-3 (-5) mm. broad; panicles 5-20 mm. long, racemiform, few-flowered, the terminal ones with staminate spikelets, the subterminal axillary ones with pistillate spikelets; zone of abscission below the floret; each spikelet consisting of a single naked floret (glumes obsolete or absent), not indurated and scarcely compressed; staminate floret about 4 mm. long, pistillate ones about 2 mm. long. Ponds, lakes and slow-flowing streams in e. Tex., rare, late summer; Coastal States, N. C. to Tex.

This is a very inconspicuous grass and may well be more common than is indicated by the few collections.

5. LEERSIA Sw.

Perennials with few slender wiry culms; inflorescences lax open panicles with capillary branches; zone of abscission at the base of the spikelet; spikelets secund along the abaxial sides of the distal portions of the branchlets, overlapping, each consisting of a solitary naked fertile floret (glumes or sterile florets absent), laterally compressed (both lemma and palea keeled), cartilaginous, with obscure or conspicuous nerves.

About 15 species in warmer regions of the world.

1. Floret only 1 to 1.5 times as long as broad (2)

1. Floret at least twice as long as broad (3)

2(1). Floret 4-5 mm. long, pubescent 1. *L. lenticularis*.

2. Floret 1-1.5 mm. long, essentially glabrous 5. *L. monandra*.

3(1). Spikelets 2.5-3 mm. long, closely imbricate and usually parallel with the branches of the panicle 4. *L. virginica*.

3. Spikelets about 4 mm. long, loosely imbricate and usually pendulous and pectinately arranged at an angle to the branches of the panicle (4)

4(3). Panicles 10-20 cm. long, open, the branches diverging 2. *L. oryzoides*.

4. Panicles 5-10 cm. long, narrow, the branches ascending or appressed 3. *L. hexandra*.

1. *Leersia lenticularis* Michx. CATCHFLY GRASS. Perennial with short scaly rhizomes (these seldom present on prepared specimens); aerial culms 7-15 dm. long, 1-3 mm. thick, erect or often sprawling and distally ascending; ligule a tough scale about 0.5 mm. long; blades 13-40 cm. long, 1-2 cm. broad, flat; panicle 1-2 dm. long, very open and subpyramidal, often nodding, the branches naked about half their length; florets 4-5 mm. long, nearly or quite as broad as long, sparsely pubescent, the keels comb-toothed. Sloughs, bayous and marshy prairies in e. and s.e. Tex., infrequent or locally abundant, late summer-fall; Md. to Minn., s. to the Gulf States.

2. *Leersia oryzoides* (L.) Sw. RICE CUTGRASS. Perennial with short slender scaly rhizomes; culms 7-15 dm. long, 2-3 mm. thick, often decumbent and rooting at the lower nodes or erect, shortly bearded at the nodes; ligule a firm scale about 0.5 mm. long; blades (3-) 7-25 cm. long, 6-11 mm. broad, flat; panicle 1-2 dm. long, open, the branches diverging, naked for less than half their length; florets 3.7-5.5 mm. long, about 2.5 times as long as broad, pubescent, the keels comb-toothed. Near and along creeks in e. and n.-cen. Tex., Edwards Plateau, n.w. part of Rio Grande Plains and Plains Country, infrequent, mostly spring-fall; most of U. S. n. to Que. and B. C. (not known from Mont., Wyo., Nev. or Mex.)

3. *Leersia hexandra* Sw. Perennial with short slender scaly rhizomes; culms 5-10 dm. long, 1.5-3 mm. thick, usually long-decumbent and rooting at the lower nodes, shortly bearded at the nodes; ligule a firm scale about 0.5 mm. long; blades 5-18 cm. long, 3-7 (-10) mm. broad, flat; panicle 5-9 (-12) cm. long, 1-2 cm. broad, the few branches ascending or appressed, naked for less than half their length; florets 3.3-4.5 mm. long, about 2.5 times as long as broad, sparsely pubescent, the keels minutely comb-toothed. Near creeks, rivers and resacas in e. and s.e. Tex. and coastal parts of the Rio Grande Plains, infrequent, spring-fall; widely distributed in warmer parts of the world, in Am. n. to Va. and the Gulf States.

4. *Leersia virginica* Willd. WHITE GRASS. Perennial with short rhizomes 2-4 mm. thick (these seldom present on prepared specimens); culms 25-120 cm. long, 1-1.5 mm. thick, often geniculate and rooting at a few of the lower nodes but mostly ascending or erect, upper nodes minutely bearded; ligule a scale about 1 mm. long; blades 4-10 (-13) cm. long, 3-8 mm. broad, flat; panicle 5-10 (-18) cm. long, the very few branches diverging, naked for more than half their length; florets 2.5-3 mm. long, closely appressed and parallel to the branches, 2 to 3 times as long as broad, microscopically pubescent on sides and keels. Swamps and bogs in e., s.e. and n.-cen. Tex., infrequent to rare, spring-fall; e. U. S. w. to S. D., Neb., Kan., Okla. and Tex.

5. *Leersia monandra* Sw. Tufted perennial; culms 3-10 dm. long, about 1 mm. thick, erect; ligule a hyaline scale 1-3 mm. long; blades 5-15 cm. long, 2-5 mm. broad, flat, tapered to both ends; panicle 6-12 cm. long, open, few-branched, the branches naked for most of their length; florets 1-1.5 mm. long, nearly as broad, essentially glabrous and smooth even on the keel. In well-drained calcareous loam, usually in leaf-mold beneath brush, often in dense shade, Rio Grande Plains, infrequent or rare, late summer-fall; W. I., s. Fla., Tex., Tam. and N. L.

6. ORYZA L.

About 25 species in the Old World tropics and subtropics; we have one.

1. *Oryza sativa* L. RICE. Robust annual; culms 6-20 dm. long, 4-20 mm. thick, erect, often rooting from lower nodes; ligule a firm lacerate scale 2-6 mm. long; blades 1-6 dm. long, 4-14 mm. broad, flat; inflorescence an open branched drooping panicle 15-40 cm. long, each branch bearing a number of large spikelets; zone of abscission below each spikelet; spikelets sessile or usually on very short pedicels, appressed to the branches, slightly laterally compressed; lowermost parts of spikelets (interpreted either as two sterile lemmas or two glumes) small, lance-subulate, scalelike, 2-3 mm. long; fertile floret solitary; lemma and palea fitting closely together, 7-10 mm. long, pubescent, brownish, shining, cartilaginous-indurate, the lemma mucronate (or in some varieties awned). Volunteering in ditches and other muddy and seasonally flooded areas in s.-cen. and s.e. Tex., late summer-fall; warmer parts of the world, indigenous to Old World trop.; in Am. n. to Va. and the Gulf States.

Economically and for the direct use of mankind this is undoubtedly the single most important plant species in the world.

7. PHRAGMITES TRIN.

A genus of 3 species, cosmopolitan; we have one.

1. *Phragmites communis* Trin. COMMON REED. Perennial reed with thick rhizomes; culms 1-3 m. tall, 5-15 mm. thick; ligule a short tough lacerate fringe; blades flat, 1-4

cm. broad; panicle a large terminal plume, many-branched and densely flowered; spikelets few-flowered, the lower flowers empty or merely staminate, the rest perfect; rachilla abscising at the upper part of each node, the fragments thus consisting of one floret with a portion of the densely long-silky-villous rachilla below (not above) the node; glumes lanceolate, shorter than the lowest lemma; lemmas lanceolate, glabrous, about 11 mm. long. Locally abundant in marshes, seeps, along rivers, at streamsides and canal banks, scattered throughout the state, fall; in most of the warmer parts of the world.

8. ARUNDO L.

About 8 species in the Old World tropics; we have one.

1. *Arundo Donax* L. GIANT REED, GEORGIA CANE, CARRIZO. Canelike grass from thick short rhizomes, forming large clumps; aerial culms 2-6 m. long, to 5 cm. thick, erect, rarely branched, perennial or in the northern extremes mostly freezing down annually or every few years; ligule a short scale; blades mostly 3-6 dm. long, 2-5 cm. broad or larger, often glaucous, firm; inflorescence a thick narrowly ellipsoid buffy-white panicle 3-6 dm. long; spikelets 13-15 mm. long, usually 3-flowered; rachilla glabrous, with zones of abscission at lower part of each node; glumes subequal, cymbiform, thin, nearly as long as the spikelet, each 3-nerved; lemmas (including the small calloused base) long-pilose, 3-nerved, thin, cymbiform, obscurely round-keeled, long-attenuate to very fine points. Sand bars and levees of the Rio Grande in Rio Grande Plains, w. to the Trans-Pecos and near rivers and lakes in s.e. and cen. Tex., summer-fall; widespread in warmer areas, nat. to Old World, adv. in Tex.

Planted for erosion control along roads and in dune areas.

9. DANTHONIA LAM. & DC. OATGRASS

Tufted perennials; culms 2-10 dm. long, erect; leaves mostly clustered at the base, the blades mostly folded or involute; panicles erect, few-flowered, 2-13 cm. long, either nearly loosely spikelike or else slightly flabellate with a few somewhat diverging branches, the pedicels short; spikelets appressed, erect, only very slightly laterally compressed, 4- to 10-flowered, all the florets perfect except the uppermost one reduced; rachilla abscising at the lower part of each node; glumes persistent, membranous or papery, lanceolate, acute, not at all keeled, far-surpassing the rest of the spikelet except some of the upper lemma awns; lemmas broadly ovate, slightly convex dorsally, becoming chartaceous medially and papery marginally, obscurely several-nerved, apically bifid (the teeth setaceous) with the midnerve between the teeth prolonged into a long darkly pigmented basally twisted and geniculate awn.

About 10 species in warm regions.

1. Panicles 6-13 cm. long; glumes 15-18 mm. long; lemmas dorsally with a long silky-pilose pubescence that becomes even longer and fuzzier toward the distal margin 1. *D. sericea*.
1. Panicles 2-6 cm. long; glumes 11-15 mm. long; lemmas dorsally with a short even pubescence that becomes shorter and sparser toward the distal margin 2. *D. spicata*.

1. *Danthonia sericea* Nutt. Culms 5-10 dm. long; panicles 6-13 cm. long, often somewhat flabellate; glumes 15-18 mm. long; spikelets 7- to 10-flowered; lemmas dorsally with a long silky pubescence that becomes more dense and longer near the distal margin. Rare in woods in extreme n.e. corner of Tex. (Bowie Co.), spring; Coastal States, Mass. to Tex.; also Ky. and Tenn.

2. *Danthonia spicata* (L.) Beauv. POVERTY OATGRASS. Culms 30-75 cm. long; panicles 2-6 cm. long, usually spikelike; glumes 11-15 mm. long; spikelets mostly 3- to 7-flowered; lemmas dorsally rather shortly and evenly pubescent, the pubescence shortest toward the distal margin. Woods on sandy soils, infrequent in e. Tex., rare in n.-cen. Tex., spring; e. Can. and e. U. S., w. to Minn., Ia., Kan., Okla. and Tex.; also in mts. in Wash., Ore., Ida., Mont., Wyo., S. D., Colo. and N. M.

10. SCHISMUS BEAUV.

About 5 species in warm parts of the Old World; we have one.

1. *Schismus barbatus* (L.) Thell. Densely tufted annual; culms 5-35 cm. long, often slightly geniculate at the nodes, mostly ascending; ligule a fringed scale; blades short and slender, mostly loosely involute; inflorescence a panicle 2-4 cm. long, dense, usually obovoid, with a few very short ascending branches in the lower part (these densely secundly flowered on the abaxial side); lateral spikelets nearly sessile; spikelets 4- to 8-flowered, all but the terminal floret perfect and fertile, scarcely at all laterally compressed; rachilla abscising above the glumes and at the lower part of each node; glumes equal, lanceolate, acute, membranous with narrow white margins, about three fourths to four fifths as long as the remainder of the spikelet, glabrous, prominently 5- to 7-nerved, the nerves acrodrome; lemmas broadly obovate, 1.8-2.4 mm. long, about 9-nerved, membranous, apically notched, the 8 lateral nerves appearing to terminate near the broad white-hyaline distal margin but the midnerve excurrent as a mucro; midnerve, lateralmost nerves and base of lemma minutely ascending-hispidulous. Infrequent or rare in desert flats of the Trans-Pecos, Mar.-Apr.; nat. to Medit. region, now widely introd. in arid parts of the world.

11. UNIOLA L.⁸

A genus of 2 species of seashores in the warmer parts of the Americas; we have one.

1. *Uniola paniculata* L. SEA OATS, ESPIGA DEL MAR. Essentially glabrous strongly rhizomatous perennial; rhizomes stramineous, 3-15 mm. thick; aerial culms in few-culmed tufts at the nodes of the rhizomes, 1-2 m. tall, 5-10 mm. thick, erect; sheaths longer than the internodes, tightly clasping; blades 2-5 dm. long, fairly broad but mostly tightly involute and arcuate; panicles cylindrical to ovoid, terminal, 2-5 cm. long, much-branched (the branches except the lower ones strictly ascending), densely 40- to 200-spikeletted; ultimate branchlets only 5-8 mm. long; spikelets very strongly laterally compressed, 14- to 20-flowered (the lower few florets sterile), 20-37 mm. long, 10-15 mm. broad, the rachis remaining intact (or said by some authors to disarticulate below the glumes); glumes subequal, 5-6 mm. long, 1.5-2 mm. broad, cymbiform, shorter than the lowest lemma; lemma broadly lanceolate to narrowly ovate, 12-14 mm. long, 5-6 mm. broad, unfolded, (7- to) 9- (to 13-) nerved, apically slightly incurved, when unfolded emarginate and mucronate, stramineous, very firm, the keels antrorsely scabrous; palea slightly shorter than the lemma and of the same texture and color, lanceolate, acute, 2-keeled, the keels minutely pectinate-scabrous; flowers perfect, triandrous; lodicules 2, fleshy, cuneate, lobed-truncate; grain linear, 3-5 mm. long, 1-1.5 mm. broad, enclosed between the scarcely changed lemmas and paleas. Frequent in loose sand of coastal dunes all along the coast, July-Aug.; Atl. and Gulf shores; W.I., s. to Tab. and Cuba.

12. CHASMANTHIUM LINK⁹

Tufted or colonial rhizomatous perennials; culms herbaceous, usually simple; blades flat, serrate, long-linear to linear-lanceolate or broadly linear-lanceolate; ligule a fringe of hairs or a hyaline ciliate membrane; spikelets becoming tawny to brown at maturity, 2- to many-flowered, laterally compressed, the rachilla disarticulating above the glumes and between the florets; glumes 2, equal to subequal, shorter than the lemmas, acute to acuminate, 3- to 7-nerved, compressed-keeled, the keel serrate to serrulate; lemmas (lower 1 to 4 empty) acuminate, entire or bifid, 5- to 15-nerved, compressed-keeled, the keels serrate or ciliate; paleas shorter than to exceeding the lemmas, bowed out at the base, 2-keeled, the keel wings serrate; flowers perfect, monandrous, sometimes cleistogamous in *C. latifolium*; lodicules 2, fleshy, cuneate, lobed-truncate, 2- to 4-nerved, the

⁸ Adapted partly from Harris O. Yates, Southwest. Nat. 11: 372-394. 1966.

⁹ Adapted from Harris O. Yates, Southwest. Nat. 11: 415-455. 1966.

nerves unbranched; grain ovate to elliptical, laterally compressed, asymmetrical, reddish brown or black.

A North American genus of 5 species, of which we have 3.

1. Flowers 6 to 26 per spikelet; spikelets ovate to elliptical in overall outline as seen from the side, drooping1. *C. latifolium*.
1. Flowers 2 to 5 (to 7) per spikelet; spikelets flabelliform-cuneate in overall outline as seen from side, not drooping (2)
- 2(1). Culms 1-3 mm. thick; sheaths apically densely pilosulous2. *C. sessiliflorum*.
2. Culms 0.5-1 mm. thick; sheaths essentially glabrous ...3. *C. laxum*.

1. *Chasmanthium latifolium* (Michx.) Yates. INLAND SEA OATS. Essentially glabrous rhizomatous perennial; rhizomes short, indurated, forming mats; culms rising singly from the mats, 5-13 dm. long, 1.5-3 mm. thick, usually purplish, reclining and geniculate below, above erect, simple and stramineous, terete; sheaths considerably shorter than the internodes and tightly clasping them; blades lanceolate, 1-2 dm. long, 8-16 mm. broad, divergent, acute, striate-veined; panicles very lax, 15-30 cm. long, of 10 to 30 (to 50) large spikelets drooping at the ends of mostly naked capillary branches 3-10 cm. long; spikelets very strongly laterally compressed, 12- to 18-flowered, 25-45 mm. long, 13-16 mm. broad; rachis of spikelet with zone of abscission at the lower part of each node; glumes subequal, 5-7 mm. long, about 1 mm. broad, cymbiform, shorter than the lowest lemma; lemmas broadly lanceolate, 9-13 mm. long, 5-7 mm. broad when unfolded, apically slightly incurved and acutish, grayish to bluish-green, firm, marginally very narrowly hyaline with 3 to 6 nerves on each side, minutely scabrellate, on the keels minutely pectinately scabrous; paleas only two thirds as long as the lemmas and of the same texture, doubly strongly keeled (the keels minutely pectinate), falcate; grain laterally compressed, black, rough, about 3 mm. long. *Uniola latifolia* Michx. Locally abundant in moist loamy soils of creek bottoms in e. and s.e. Tex., less common w. to n.-cen. Tex., e. Edwards Plateau and n. part of Rio Grande Plains, summer-fall; most of s.e. U. S., n. to Pa., O., Ill. and Neb.; also N. L.

2. *Chasmanthium sessiliflorum* (Poir.) Yates. Tufted perennial or occasionally bases slightly loosened due to elongation of the rhizomes; culms 70-125 cm. long, 1-3 mm. thick, grayish or yellowish-green; sheaths longer than the internodes and tightly clasping them, usually densely pilosulous apically, more sparsely so dorsally; blades lance-linear, 15-35 cm. long, 4-8 mm. broad, often pilosulous or hirsutulous, ascending; panicles strictly erect, spikelike, 2-5 dm. long, with a few short erect branches in the lower part; spikelets strongly laterally compressed, 3- to 5-flowered (the lowest flower reduced, rudimentary), 5-7 mm. long, 4-6 mm. broad; rachis of spikelet with a zone of abscission at the lower part of each node (except the node of the sterile lemma); first glume about 1 mm. long, the second about 1.5 mm. long, ovate; lowest (sterile) lemma about 2 mm. long, ovate when unfolded; other lemmas about 4 mm. long, broadly lanceolate, acute, firm, striate, often strongly falcate-contorted; palea about 3 mm. long, ovate, 2-keeled, scabrous on the keels and margins; grain laterally compressed, rough, black, about 2 mm. long. *Uniola sessiliflora* Poir. Frequent in sandy woods in e. and s.e. Tex., summer; s.e. U. S., n. to Va., Tenn., Mo. and Okla.

3. *Chasmanthium laxum* (L.) Yates. Essentially glabrous tufted perennial or occasionally the bases slightly loosened due to elongation of the rhizomes; culms 65-100 cm. long, 0.5-1 mm. thick, strictly erect, grayish-green; sheaths longer than their internodes, tightly clasping them; blades linear, 15-40 cm. long, 3-5 mm. broad, ascending; panicles strictly erect, spikelike, 15-25 cm. long, with a few short erect branches near the base; spikelets erect, appressed, strongly laterally compressed, 3- to 4-flowered (the lowest flower reduced, rudimentary), 4-5 mm. long, 3-5 mm. broad, rachis of spikelet with zone of abscission at the lower part of each node (except the node of the sterile lemma); glumes 1.5-2.5 mm. long (the lower one the shortest); lowest (sterile) lemma 2.5-3 mm. long, lanceolate; other lemmas about 4 mm. long, broadly lanceolate, firm, striate, the keels essentially smooth; paleas ovate, 2-keeled, about 2.5 mm. long; grain laterally compressed, black, rough, about 2 mm. long. *Uniola laxa* (L.) B.S.P. Infrequent in e. and s.e. Tex. in moist sandy soil, summer-fall; s.e. U.S., n. to L. I., Ky., Mo. and Okla.

13. PARAPHOLIS C. E. HUBB.

A genus of 4 species in the Old World.

1. *Parapholis incurva* (L.) C. E. Hubb. SICKLEGRASS. Tufted annual; culms 1-3 dm. long, decumbent most of their length, terminally arcuate upward; internodes short; sheaths loose, departing from and revealing the internodes which they only slightly exceed in length; blades of upper leaves shorter than their sheaths; inflorescences not fully exerted, arcuate, terminal, lax, nearly terete or somewhat compressed-cylindrical; spikes 3-10 cm. long and only about 3 mm. thick; rachis of spikes eventually abscising at the lower part of each node, the internodes sculptured, each with a niche for a spikelet; spikelets 2-ranked, solitary at each node, 1-flowered, the only parts visible being the halves of the 2 strongly nerved lanceolate-acute glumes; lemma adaxial, flattened, fitting into the niche of the internode, 4-7 mm. long. *Pholiurus incurvus* (L.) Schinz & Thell. Brackish shores and ditches, coastal s.e. Tex., s.w. to San Patricio Co., spring; nat. of Eur., now established in many coastal areas of N. A.

14. ORYZOPSIS MICHEX.

RICEGRASS

Perennials with paniculate inflorescences; spikelets one-flowered, the rachis disarticulating above the persistent hyaline glumes; lemma indurated, tightly involute, nearly terete, apically with a short fragile readily deciduous awn; palea narrow, indurated, enclosed by and as long as the lemma, the lemma and its enclosures fall together and constitute the "fruit".

About 50 species of North Temperate and subtropical regions. Ricegrasses are grazed but being local and infrequent have only limited forage value.

1. Panicle branches nearly straight 1. *O. micrantha*.

1. Panicle branches curved and flexuous 2. *O. hymenoides*.

1. *Oryzopsis micrantha* (Trin. & Rupr.) Thurb. Tufted perennial; culms erect, 3-7 dm. long, about 1 mm. thick, unbranched; ligule a scale about 1 mm. long; blades few, 10-30 cm. long, basally mostly flat, 1-2 mm. broad, otherwise mostly involute and tapering to a very fine involute point; panicle 15-20 cm. long, erect or commonly weak and nodding, very diffuse when mature, the branches 2-6 cm. long, weak, naked in the lower part, the spikelets crowded toward the tips; glumes 2.5-3 mm. long; lemma 2 mm. long, about 1 mm. thick, glabrous or nearly so; awn 5-11 mm. long, readily deciduous. Canyons in the Plains Country where locally frequent, summer; Sask. and Mont. s. to Nev., Ariz., N. M. and Tex.

2. *Oryzopsis hymenoides* (R. & S.) Ricker. INDIAN RICEGRASS. Tufted perennial; culms erect, not branched, 25-60 cm. long, 1-2 mm. thick; ligule a scale 2-7 mm. long; blades 10-25 cm. long, involute; panicle 5-15 cm. long, very diffuse and open, the branches dichotomous and flexuous, the ultimate branches about 1 cm. long and each bearing a single spikelet; glumes 6-8 mm. long, acuminate and pointed; lemma 3-5 mm. long, elliptical, with long white silky antrorse hairs that equal the glume tips; awn 4-7 mm. long, promptly deciduous. Dry, usually loose sandy soil, infrequent in the w. Plains Country, rare in the Trans-Pecos, summer; all of w. U. S. e. to N. D., S. D., Neb., Kan., Okla. and Tex.

15. PIPTOCHAETIUM J. PRESL.

PINYON RICEGRASS

A genus of 20 species in North America and South America; we have only a single species. The genus should perhaps be considered merely a subgenus of *Stipa*.

1. *Piptochaetium fimbriatum* (H.B.K.) Hitchc. Densely tufted perennial; culms erect, unbranched, 25-75 cm. tall, 1 mm. thick; ligule a scale 1-3 mm. long; blades mostly basally clustered, 5-25 cm. long, mostly closely involute, even when flat less than 1 mm. broad, weak and sprawling; panicle 5-15 cm. long, erect or often weak and nodding, the branches basally naked, few-flowered, weak; glumes about equal, 4-5 mm. long,

elliptical, scarious, persistent; rachis disarticulating above the glumes, liberating the single floret at maturity (the lemma and its enclosures and appendages constituting the fruit); lemma indurate, involute and tightly enveloping the palea and the sex organs, nearly terete, ellipsoidal, 3-4 mm. long, about 2 mm. thick, dark brown and shining at maturity, finely antrorsely sordidly pubescent, apically with a persistent obscurely twice-geniculate awn 9-18 mm. long; palea indurate and brown like the lemma, linear, a little longer than the lemma and protruding as a minute point at the base of the awn. Incl. var. *confine* I. M. Johnst., *Stipa fimbriata* H. B. K. Pine forests on rocky slopes of usually igneous rocks in Trans-Pecos mts., locally abundant, Aug.-Sept.; Colo. to Ariz. and s. to cen. Mex. Said to be a valuable forage species.

16. STIPA L. NEEDLEGRASS. SPEARGRASS

Perennials with paniculate inflorescences; spikelets one-flowered, relatively large; glumes broadly lanceolate to linear, usually very thin, even hyaline in some species; rachis disarticulating above the persistent glumes; lemma indurated, tightly involute, nearly terete, with a basal callus and an apical usually twice-geniculate more or less persistent awn; palea entirely enclosed by and shorter than the lemma, membranous; lemma and its enclosures and appendages fall together and constitute the "fruit."

A genus of 300 species in warm, usually dryish areas of the world. Some of the species have value as forage, especially before heading out; the calluses of the "fruits" cause mouth wounds.

1. Lemma about 2 mm. long. 8. *S. tenuissima*.
1. Lemma much longer than 2 mm. (2)
- 2(1). Lemma longer than 12 mm.; awn longer than 1 dm., often deciduous (3)
2. Lemma shorter than 12 mm.; awn shorter than 1 dm., persistent (4)
- 3(2). Ligule 2-5 mm. long; lemma 13-15 mm. long; awn glabrous or its hairs less than 1 mm. long 10. *S. comata*.
3. Ligule shorter than 1 mm.; lemma 15-18 mm. long; terminal part of awn with silky white hairs more than 1 mm. long 11. *S. neomexicana*.
- 4(2). Apical 1 mm. segment of the lemma cylindrical, cartilaginous, less than 1 mm. thick; leaves densely hairy 9. *S. leucotricha*.
4. Apex of lemma not so differentiated; leaves not densely hairy (5)
- 5(4). Panicle dense and spikelike (6)
5. Panicle diffuse, sometimes narrow but not at all spikelike (9)
- 6(5). Awn 4-5 cm. long 7. *S. arida*.
6. Awn shorter than 4 cm. (7)
- 7(6). Awns 10-20 mm. long; apex of lemma shortly bilobed 3. *S. lobata*.
7. Awns 20-38 mm. long; apex of lemma truncate (8)
- 8(7). Culms 1.5-2.5 mm. thick toward the base of the plant; auricles of sheaths nearly glabrous; ligule less than 1 mm. long 4. *S. columbiana*.
8. Culms 3-6 mm. thick toward the base of the plant; auricles of sheaths pubescent; ligule 1-4 mm. long 5. *S. robusta*.
- 9(5). Awns less than 3 cm. long 2. *S. Pringlei*.
9. Awns more than 3 cm. long (10)
- 10(9). Lemma 4-6 mm. long 6. *S. eminens*.
10. Lemma 8-10 mm. long 1. *S. avenacea*.

1. *Stipa avenacea* L. BLACKSEED NEEDLEGRASS. Softly tufted perennial; culms erect, unbranched, 35-80 cm. long, 1-1.5 mm. thick; ligule a scale 2-4 mm. long; blades mostly basally clustered, 5-30 cm. long, involute or often flat, about 1 mm. broad; panicle 1-2 dm. long, open, erect or often weak and nodding, the branches basally naked, few-flowered, weak; glumes 10-13 mm. long; lemma 8-10 mm. long, dark brown and shining

when mature, with a dense dark antrorse beard near the basal callus, above on the sides nearly glabrous and at the summit with a few short erect dark hairs; awn 35-70 mm. long, obscurely twice-geniculate. *Piptochaetium avenaceum* (L.) Parodi, *Sorghastrum nutans* (L.) Nash. Sandy soils in e. Tex. forests, frequent, Mar.-May; Mass. to Mich. and s.w. to Tex.

2. *Stipa Pringlei* Scribn. Softly tufted perennial; culms erect, unbranched, 5-10 dm. long, 1.5-2 mm. thick; ligule a scale 1-3 mm. long; blades mostly in a basal cluster, 9-30 cm. long, 1.5-2 mm. broad, mostly flat even to the apex; panicle 1-2 dm. long, open, erect, often weak and nodding, the branches naked basally, few-flowered, weak; glumes 9-11 mm. long; lemma 7-8 mm. long, dark brown and shining when mature, laterally with sparse antrorse sordid hairs, apically with a ring of such hairs and an oblique point; awn 20-27 mm. long, obscurely twice-geniculate. *Piptochaetium Pringlei* (Scribn.) Parodi. Rocky slopes and pine woods in the Davis Mts. at 5,000-7,000 ft. elev., infrequent, Aug.-Sept.; N.M. to Ariz. and s. to Chih.

3. *Stipa lobata* Swall. Tufted perennial; culms erect, unbranched, 4-10 dm. long, 1.5-5 mm. thick; ligule a minute scale 0.2-0.5 mm. long; blades 15-50 cm. long, 2-4 mm. broad at the very base, almost as broad as the auriculate sheath, long-tapering to a fine involute point; panicle 15-25 cm. long, narrow, spikelike; glumes 8-13 mm. long; lemma 6-7 mm. long, pubescent with silky-white antrorse hairs about 1 mm. long and with a ring of such hairs (1-2 mm. long) at the summit, the summit prolonged laterally into 2 lobes 0.5-1.5 mm. long; awn from between the lobes 1-2 cm. long, obscurely twice-geniculate. Closely related to *S. columbiana* and *S. robusta*. Rocky grassy slopes in Trans-Pecos mts. at 4,500-7,000 ft. elev., June-Sept.; also N. M.

4. *Stipa columbiana* Macoun. COLUMBIA NEEDLEGRASS. Tufted perennials; culms erect, unbranched, 5-10 dm. long, 1.5-2.5 mm. thick; ligule obsolete or a minute scale 0.5-1 mm. long; blades 1-3 dm. long, 1-3 mm. broad at the very base, considerably narrower than the auriculate sheath, long-tapering to a fine involute point; panicle 15-35 cm. long, narrow, spikelike; glumes 7-13 mm. long; lemma 6-7 mm. long, sparsely covered on the sides with antrorse appressed silky-white hairs and at the summit with a ring of such hairs but not lobed; awns 20-35 mm. long, obscurely twice-geniculate. Reported as being in the Trans-Pecos; nearly throughout w. U.S., e. to w. S.D., Colo. and N.M., chiefly at high alt.; also s.w. Can.

5. *Stipa robusta* (Vasey) Scribn. SLEEPY GRASS. Tufted perennial; culms erect, unbranched, 7-15 dm. tall, 3-6 mm. thick; ligule a scale 1-4 mm. long; blades 25-50 cm. long, 3-8 mm. broad at the very base near the ligule, nearly as broad as the auriculate sheath that bears some soft hairs at the corners; panicles 20-35 cm. long, 1.5-2 cm. thick, dense, spikelike, often interrupted basally; glumes 8-13 mm. long; lemma 6-8 mm. long, sparsely covered laterally with antrorse appressed silky-white hairs and at the summit with a ring of such hairs but not lobed; awn 20-38 mm. long, obscurely twice-geniculate. *S. Vaseyi* Scribn. Reported as being in the Trans-Pecos mts.; Colo., Ariz., N.M. and n. Mex., chiefly at moderate alt., among oaks and pines.

Said to cause narcosis in animals, especially horses, when eaten, hence the common name.

6. *Stipa eminens* Cav. Tufted perennial; culms erect but weak, often growing up through shrubs, unbranched, 6-12 dm. long, 1-1.5 mm. thick; ligule a lacerate scale 2-5 mm. long; blades 1-3 dm. long, the basal portion flat, about 2 mm. broad, the distal portion tapering to a fine involute point; panicle narrow but diffuse and open, not at all spikelike; glumes 7-12 mm. long, with broad hyaline margins; lemma 4-6 mm. long, densely pubescent with very short white antrorse hairs; awns 3-6 cm. long, twisted basally and obscurely twice-geniculate. Rocky slopes, deserts and grassy areas in the Trans-Pecos, locally abundant where not overgrazed, summer-fall; Tex. to Ariz. and s. to Mex.

7. *Stipa arida* M. E. Jones. Tufted perennial; culms stiffly erect, sparingly or not branched, 60-85 cm. long; ligule a lacerate scale 0.5-1 mm. long; blades 8-21 cm. long, involute, curved; panicle 11-25 cm. long, dense and spikelike; glumes 10-12 mm. long, lemma 6 mm. long, toward the base very sparsely pubescent with short white antrorse hairs; awns 4-5 cm. long, barely twisted and obscurely twice-geniculate. Reported to occur on rocky slopes in Tex.; in Colo., Ut., Ariz. and s.e. Calif.

8. *Stipa tenuissima* Trin. Tufted perennial; culms erect, unbranched, 3-7 dm. long, about 1 mm. thick; ligule obsolete or a scale 2-4 mm. long; blades 10-35 cm. long, stiffly erect, involute, about 0.5 mm. thick, very scabrous; panicle 1-3 dm. long, about 1 cm. thick, erect or slightly nodding; glumes 2-5 mm. long; lemma 2 mm. long, ellipsoidal, glabrous except for the bearded callus; awn 35-80 mm. long, about 0.1 mm. thick. Open woods on rocky flats and slopes in Trans-Pecos mts. at 5,000-7,000 ft. elev., locally abundant, June-Sept.; N. M. to cen. Mex.; also Arg.

9. *Stipa leucotricha* Trin. & Rupr. TEXAS SPEARGRASS, TEXAS WINTER-GRASS. Tufted perennial; culms erect or often weak and sprawling, 2-8 dm. long, 0.5-1.5 mm. thick, shortly hairy at the nodes; ligule obsolete or a minute scale shorter than 0.5 mm., rarely longer; blades 5-35 cm. long, straight, involute or usually flat at least basally, 2-4 mm. broad, densely furnished with antrorse and somewhat rough white hairs; panicle 5-20 cm. long, often weak and nodding, the branches usually appressed or eventually somewhat spreading, weak, naked in the basal part; glumes 12-18 mm. long; lemma 9-12 mm. long, linear, glabrous in the upper half, the apical 1 mm. segment formed by a cylindrical white cartilaginous crown 0.5-0.8 mm. thick; awn 45-100 mm. long, obscurely once- or twice-geniculate. Prairies, brushy areas, roadsides and other disturbed areas, usually on fine calcareous soils, abundant in n.-cen. Tex. and Edwards Plateau, infrequent in e. Plains Country and e. and s.e. Tex. and n. Rio Grande Plains; Okla. s. to Coah. and N. L.

The calluses of the "fruits," when the latter are properly thrown, easily penetrate clothing and stick into skin. The plants, therefore, are of considerable recreational value to boys.

10. *Stipa comata* Trin. & Rupr. Tufted perennial; culms erect, unbranched, 5-12 dm. long, 2-3 mm. thick; ligule a scale 3-5 mm. long; panicle erect or commonly somewhat nodding, the lower branches usually erect and appressed, naked in the basal part; glumes 22-32 mm. long, hyaline; lemma 13-15 mm. long, brownish when fully mature, the sides above the bearded callus sparsely covered with short white antrorse hairs; awn 10-18 cm. long, obscurely twice-geniculate, often deciduous. Prairies and grassy dry slopes, locally abundant in the Plains Country, rare in the Trans-Pecos, May-July; w. U. S. e. to Mich., Ia., Kan. and Tex.

11. *Stipa neomexicana* (Thurb.) Scribn. NEW MEXICAN FEATHER GRASS. Tufted perennial; culms erect, 4-8 dm. long, 1-1.5 mm. thick; ligule obsolete or only 0.5 mm. long; blades 15-40 cm. long, involute, erect, very narrow; panicle 1-2 dm. long, the branches erect and appressed, naked in the lower part, few-flowered; glumes 35-55 mm. long, very thin; lemma 15-18 mm. long, brown when mature, linear, the callus bearded and the sides very sparsely pubescent with short sordid antrorse hairs; awns 12-18 cm. long, obscurely twice-geniculate, the terminal half furnished with soft silky-white antrorse hairs more than 1 mm. long, the awn readily deciduous. Rocky usually limestone slopes in the Trans-Pecos and w. Plains Country, infrequent, Apr.-July; Wyo. s. to Ariz. and Coah.

17. MELICA L. MELIC-GRASS

Tufted or shortly rhizomatous perennials, in some species with bulbous enlargements basally; ligule a long erose hyaline scale; blades mostly soft and flat or only the tip loosely involute; panicles terminal, loosely oblong to spikelike, few-flowered; spikelets with 1 to 4 fertile (perfect) florets and in addition a terminal rudiment representing several sterile ones; rachilla tardily disarticulating at the nodes, the spikelets falling entire (except in *M. bulbosa*); glumes 3- to 5-nerved; lemmas several-nerved, usually with hyaline margins.

A genus of 70 species in North and South Temperate regions, excluding Australia.

1. Culms with bulbous basal enlargements; rachilla of spikelet abscising at lower part of each node 1. *M. bulbosa*.
1. Culms sometimes slightly enlarged basally but not bulbous; rachilla not abscising (spikelet falling entire) (2)

- 2(1). Spikelets usually with 4 perfect florets plus a rudiment 2. *M. Porteri*.
 2. Spikelets with 1 to 3 perfect florets plus a rudiment (3)
 3(2). Spikelets with 1 perfect floret; blades mostly involute 5. *M. Montezumae*.
 3. Spikelets with 2 (rarely 3) perfect florets; blades mostly flat (4)
 4(3). Spikelets longer than broad; lemmas not cucullate distally but with broad hyaline margins; rudiment narrowly obovoid, not truncate 3. *M. nitens*.
 4. Spikelets not much longer than broad; lemmas cucullate distally, with narrow hyaline margins; rudiment broadly obovate, truncate 4. *M. mutica*.

1. *Melica bulbosa* Port. & Coult. ONION GRASS. Culms with bulbous enlargements basally, 3-6 dm. long, erect; panicle interrupted, spikelike, 8-20 cm. long, 5-10 mm. thick, with some appressed branches; lateral spikelets on pedicels about 2 mm. long and erect-appressed, 5- to 6-flowered, 7-15 mm. long; rachilla abscising at the nodes. Reported to occur in Jeff Davis Co. in the Trans-Pecos; if present then probably rare at the highest elev., summer; Mont. to B. C., s. to Calif., Nev., Ut. and Colo.

2. *Melica Porteri* Scribn. Culms 4-10 dm. long, often basally decumbent; panicles open with spreading branches 4-9 cm. long; spikelets on pedicels about 1 mm. long, drooping or pendent, with usually 4 perfect florets plus a rudiment, falling entire but the rachilla then tardily abscising at the nodes. Infrequent in higher parts of the Trans-Pecos (Mt. Livermore, Davis Mts.), late summer; Colo., Ariz., N. M. and Tex.

Our plants seem to belong to the var. *laxa* Boyle, with more spreading panicle branches and purple-tinged spikelets.

3. *Melica nitens* (Scribn.) Piper. Culms 45-100 cm. long, usually erect from the base or only very shortly decumbent, 1.5-4 mm. thick; blades 4-7 (-15) mm. broad, flat; panicle open, with spreading branches; spikelets longer than broad, on pedicels about 1 mm. long, drooping or pendent, with 2 (very rarely 3) perfect florets plus a rudiment, falling entire but the rachilla then tardily abscising at the base of the upper fertile floret; lemma elongate with broad hyaline margin, not cucullate; rudiment obovoid. Abundant in calcareous or sandy loam along roads, bluffs, streamsides, often in partial shade, Edwards Plateau and n.-cen. Tex., rare w. to the Trans-Pecos and e. to w. part of e. Tex., spring; interior U.S. from Pa. and Va. w. to Ia. and Kan., thence s. to Coah. and N. L.

In most of its range in the U. S., north and east of Texas, this species is called "Three-flower Melic," but the name is very inappropriate for our plants.

4. *Melica mutica* Walt. Culms 3-7 dm. long, usually rather long-decumbent (sub-rhizomatous) basally, about 1 mm. thick; blades 2-4 mm. broad, flat; panicle usually nearly simple, very few-flowered; spikelets about as broad as long, on pedicels about 1 mm. long, cernuous or pendent, with 2 perfect florets plus a rudiment, falling entire; lemma not elongate, markedly cucullate apically with narrow margin; rudiment broadly obconic, truncate. Infrequent in forests on sandy soil in e. Tex., spring; s.e. U. S. n. to Md., W. Va., Ind., Ill. and Ia., w. to Okla. and Tex.

5. *Melica Montezumae* Piper. Culms 3-7 dm. long, usually erect from the base, about 1.5 mm. thick; blades mostly loosely involute (tightly so near tip); panicle with a few short branches; spikelets longer than broad, on pedicels about 1 mm. long, ascending or merely slightly nodding, with 1 perfect floret plus a rudiment, falling entire; lemma elongate, with very broad hyaline margins; rudiment narrow, inconspicuous. Locally abundant in juniper-pinyon woods or dry limestone slopes in the Trans-Pecos (Pecos and Brewster cos.), spring; also Coah. and Chih.

One collection from Brewster Co. combines the habit of this species with the 2-flowered spikelets of *M. nitens*.

18. GLYCERIA R. BR.

MANNA-GRASS

Perennials, tufted or in one species also subrhizomatous; ligule a hyaline scale; blades flat, thin; panicles open; spikelets turgid or only slightly laterally compressed, 3- to 14-flowered; all flowers perfect or the terminal one usually abortive or rudimentary; glumes scarious to hyaline, the first usually shorter, acutish and 1-nerved, the second obtuse, almost equalling the lowest lemma and obscurely 3-nerved; rachilla eventually abscising

at the lower part of each node; lemmas firm to membranous, green, broadly ovate or obovate, usually blunt and scarious-margined apically, usually awnless, 7-nerved, the nerves not converging to the apex but terminating severally near the distal margin.

About 40 species, cosmopolitan in distribution.

1. Panicle branches weak and flexuous; lemmas 1.5-2.1 mm. long; spikelets 3- to 7-flowered 1. *G. striata*.

1. Panicle branches rather short and rigid; lemmas 2.5-4 mm. long; spikelets 10- to 14-flowered (2)

2(1). Lemmas 2.5-3.5 mm. long 2. *G. arkansana*.

2. Lemmas 3.5-5 mm. long 3. *G. septentrionalis*.

1. *Glyceria striata* (Lam.) Hitchc. FOWL MANNA-GRASS. Perennial forming mats by means of short rhizomes; panicles 1-2 dm. long, with numerous slender ascending-diverging branches about 0.2 mm. thick (in turn bearing even more slender floriferous branchlets); pedicels 0.5-1 mm. long, appressed; spikelets 3- to 7-flowered, ovate in outline; lemmas 1.5-2.1 mm. long. Rare at the margins of clear permanent streams in limestone areas in the Trans-Pecos (Guadalupe Mts). and e. part of Edwards Plateau, spring-summer; most of the temp. parts of N. A.

2. *Glyceria arkansana* Fern. Tufted perennial; culms stout, 10-15 dm. long, erect; panicles 35-50 cm. long, with a number of ascending floriferous branches 0.4-1 mm. thick, rather rigidly straight; spikelets 10- to 14-flowered, nearly sessile, appressed, remote; lemmas 2.5-3.5 mm. long, minutely pubescent. Probably only a form of *G. septentrionalis*. Reported to occur in e. Tex.; if present then rare in marshy areas, roadside ditches, etc., spring-summer; also La. and Ark.

3. *Glyceria septentrionalis* Hitchc. Like *G. arkansana* but lemmas merely minutely scabrous and 3.5-5 mm. long. Reported to occur in marshy areas and roadside ditches in e. and s.e. Tex., spring-summer; e. N. A. w. to Wisc., Ia., Mo., Ark. and Tex.

19. BROMUS L. CHESS. BROME

Plant diverse in habit; inflorescence an open or dense panicle; spikelets diverse, large, either strongly compressed or turgid, several-flowered with all the flowers perfect; rachilla glabrous, abscising above the glumes and below the florets; glumes 1- to 5-nerved, shorter than the lower lemma; lemmas basally not calloused or else with a glabrous callus, 5- to 9-nerved, apically narrowed or bifid, the nerves converging toward the summit, mucronate or awned either between the teeth or from the back shortly below the apex. *Anisantha* C. Koch, *Ceratochloa* Beauv., *Zerna* Panz.

A genus of about 150 species in temperate regions. Some European authors split *Bromus* into several genera, perhaps justly.

1. Lemmas lanceolate, apically bifid, basally calloused (2)

1. Lemmas mostly broader or if lanceolate then either not bifid or not calloused (4)

2(1). Awns 3-5 cm. long 15. *B. rigidus*.

2. Awns shorter (3)

3(2). Awns 12-14 mm. long; panicle open 14. *B. tectorum*.

3. Awns 18-24 mm. long; panicle dense 13. *B. rubens*.

4(1). Lemmas sharply keeled (spikelets strongly laterally compressed) even at maturity (5)

4. Lemmas not keeled or somewhat so only when immature and along part of the length (7)

5(4). Awns absent or to 3 mm. long 12. *B. unioloides*.

5. Awns longer (6)

6(5). Awns 3-6 mm. long; foliage hispidulous; lemmas essentially glabrous 10. *B. polyanthus*.

6. Awns 7-15 mm. long; foliage essentially glabrous; lemmas hirsute toward the margin 11. *B. arizonicus*.

- 7(4). Weedy annuals of disturbed areas with usually turgid spikelets (8)
 7. Tufted perennials of relatively undisturbed places with slightly compressed spikelets (11)
- 8(7). Panicles 4-10 cm. long, 15-30 mm. broad, dense; lemmas densely pilose and hispidulous9. *B. molliformis*.
 8. Panicles mostly more than 10 cm. long, not dense (9)
- 9(8). Panicle branches elongate, drooping; lemmas mostly 5-6 mm. broad, at first membranous, eventually becoming slightly chartaceous and only the lower part of the margin becoming revolute8. *B. japonicus*.
 9. Panicle branches relatively short, ascending; lemmas mostly 6-8 mm. broad, at first membranous, quickly becoming chartaceous and the margin partly revolute (10)
- 10(9). Awns 1-5 mm. long; lemmas early in maturation becoming chartaceous-indurate and the margins totally and broadly revolute around the palea and grain
7. *B. secalinus*.
 10. Awns 5-12 mm. long; lemmas early in maturation becoming chartaceous and the lower two-thirds of the margin narrowly revolute around the palea
6. *B. commutatus*.
- 11(7). Plant of the mountains in Trans-Pecos Texas (12)
 11. Plants in other parts of the state (14)
- 12(11). First glume 1-nerved, the second 3-nerved; lemmas pubescent near the lateral margins but the median portion glabrous5. *B. Richardsonii*.
 12. First glume 3-nerved, the second 5-nerved; lemmas finely pubescent all over the dorsum (use lens) (13)
- 13(12). Body of lemma 7-10 mm. long, the awn 2-3 mm. long
4. *B. anomalus*.
 13. Body of lemma 10-13 mm. long, the awn 3-4 mm. long
3. *B. lanatipes*.
- 14(11). Panicles 15-25 cm. long; blades 5-17 mm. broad ..1. *B. pubescens*.
 14. Panicles 7-14 cm. long; blades 3-6 mm. broad2. *B. texensis*.

1. *Bromus pubescens* Muhl. Tufted perennial; culms 5-12 dm. long, basally decumbent, mostly erect, 2-4 mm. thick; sheaths often densely retrorsely hispidulous; blades 5-17 mm. broad, the lower corners near the ligule with minute round auricles; panicles nodding, 15-25 cm. long, very open, few-flowered; spikelets 5- to 9-flowered; first glume 1-nerved, the second 3-nerved; lemmas not at all keeled, cymbiform with a body 11-14 mm. long and an awn 5-10 mm. long, densely finely pubescent all over the dorsum. Our plants have usually (incorrectly) been called *B. purgans* L. Usually on moist banks in e. and n.-cen. Tex. and e. part of Edwards Plateau, spring-summer; e. U. S. w. to N. D., S. D., Neb., Kan., Okla. and Tex.

2. *Bromus texensis* (Shear) Hitchc. Tufted perennial; culms 4-9 dm. long, erect (or ascending through bushes), about 2 mm. thick; sheaths densely retrorsely hispidulous; blades 3-6 mm. broad; panicles 7-14 cm. long, very open and few-flowered, nearly erect to slightly drooping; spikelets 4- to 8-flowered; first glume 1-nerved, the second 3-nerved; lemmas not at all keeled, cymbiform with a body 8-11 mm. long and an awn 4-8 mm. long, densely finely pubescent all over the dorsum. Probably no more than a variety of *B. pubescens*. Infrequent to rare and local, in n. parts of Rio Grande Plains, w. to s. part of s.e. Tex. and Edwards Plateau, spring; endemic.

3. *Bromus lanatipes* (Shear) Rydb. Tufted perennial; culms 4-9 dm. long, 2-3 mm. thick, erect except shortly decumbent (subrhizomatous) at the base, simple; sheaths usually densely retrorsely grayish-woolly-pubescent; blades 3-8 mm. broad, mostly flat; panicles nodding, 8-17 cm. long, few-flowered; spikelets 5- to 9-flowered; first glume 3-nerved, the second 5-nerved; lemmas not at all keeled (except when very immature), cymbiform with a body 10-13 mm. long and an awn 3-4 mm. long, pubescent all over

the dorsum but the hairs longer toward the lateral margin. *B. anomalus* var. *lanatipes* (Shear) Hitchc. Frequent in mts. of the Trans-Pecos, summer; Colo. to Ariz. and s. to Coah.

4. *Bromus anomalus* Fourn. Tufted perennial; culms 3-9 dm. long, 1-2 mm. thick, erect except shortly decumbent (subrhizomatous) at the very base, simple; sheaths nearly glabrous or very shortly retrorsely woolly-pubescent; blades 2-5 mm. broad, mostly flat; panicles nodding, 8-16 cm. long, few-flowered; spikelets 5- to 9-flowered; first glume 3-nerved, the second 5-nerved; lemmas not at all keeled (except when very immature), cymbiform with a body 7-10 mm. long and an awn 2-3 mm. long, pubescent all over the dorsum but the hairs longer toward the lateral margin. *Zerna anomala* (Fourn.) Henr. Frequent in mts. of the Trans-Pecos, summer; also Mex.

5. *Bromus Richardsonii* Link. Tufted perennial; culms 4-8 dm. long, about 2 mm. thick, often decumbent in the lower part and geniculate; sheaths usually glabrous; blades 5-15 mm. broad, mostly flat, the lower corners (where joining sheath) minutely round-auricled; panicles nodding, 1-2 dm. long, very open and diffuse; spikelets 6- or 7-flowered; first glume 1-nerved, the second 3-nerved; lemmas not at all keeled (except when very immature), cymbiform with a body 10-13 mm. long and an awn 3-5 mm. long, densely pubescent near the lateral margins but the median portion glabrous. *Zerna Richardsonii* (Link) Nevskii. These plants have usually been called *B. ciliatus* L. Infrequent in higher parts of mts. in the Trans-Pecos, summer; Rocky Mts. and s. to Tex.

6. *Bromus commutatus* Schrad. Annual; culm 4-9 dm. long, ascending, mostly 1.5-3 mm. thick; sheaths mostly densely retrorsely hispidulous; blades 4-12 mm. broad, mostly flat, often pilose above; panicles 1-2 dm. long, 3-6 mm. thick, the whole panicle nodding slightly but the individual branches mostly appressed or only divergent at low angles; spikelets rather turgid; lemma with a body 7-9 mm. long and 6-7 mm. broad, the awn 5-12 mm. long, not at all keeled, roundly cymbiform, at first membranous with hyaline margins (broadly overlapping the next lemma), eventually becoming chartaceous and the lower part of the margin revolute around the sides of the palea which is conspicuously shorter; anthers 1.3-1.9 mm. long. Infrequent in e. and n.-cen. Tex., Plains Country and Edwards Plateau, spring; Euras., introd. and a volunteer in scattered parts of N. A.

7. *Bromus secalinus* L. CHESS. Annual; culms 3-6 dm. long, ascending, slender; sheaths and blades glabrous or usually hispidulous; panicle narrowly ovoid, few-flowered, 7-20 cm. long, often 1-sided, the longer ones nodding, with a few ascending few-flowered branches; spikelets 12-20 mm. long (not including awns), ascending, turgid, 7- to 9-flowered, when very immature the lemmas broadly overlapping; lemmas 7-nerved, with a body 6-9 mm. long and an awn 1-5 mm. long, glabrous or pubescent during the maturation of the spikelet, at first cymbiform but very quickly from base to apex becoming revolute and indurate, the margin tightly enclosing the palea which is equal in length; rachilla tardily abscising at the upper part of each node. Infrequent in e. and n.-cen. Tex. and Plains Country, rare in Rio Grande Plains, spring-summer; introd. from Eur., escaping from wheat fields.

Some of our plants show the delayed and less severe induration and rolling of the lemma which characterizes *B. commutatus*, and might better be referred to by that name.

8. *Bromus japonicus* L. JAPANESE CHESS. Annual; culms 3-8 dm. long ascending, slender, sheaths and blades usually shortly pilose; blades mostly 2-5 mm. broad; panicle 1-2 dm. long, 1-sided, (when mature) nodding with several long curved drooping few-flowered branches at the base; spikelets turgid, 7- to 10-flowered; lemmas with awns 5-11 mm. long, (at first straight or eventually slightly curved and spreading) and bodies 7-9 mm. long and 5-6 mm. broad, broadly overlapping, the thin margins conspicuous and eventually (very late in maturation) becoming chartaceous and the margins revolute to clasp the palea which is conspicuously shorter; anthers 0.6-1.2 mm. long. Abundant weed in scattered parts of Tex. (rare in Trans-Pecos), spring; widespread in temp. parts of Euras. and N. A.

9. *Bromus molliformis* Lloyd. Annual; culms 1-3 dm. long, 1-2 mm. thick; sheaths densely retrorsely short-pilose; blades 1-3 mm. broad, flat; panicles 4-10 cm. long, 15-30 mm. broad, few-flowered, with pedicels 2-8 mm. long; spikelets slightly compressed, with 8 to 10 closely imbricated florets; lemmas with awns 3-7 mm. long and bodies

about 8 mm. long, marginally narrowly hyaline, medially green, membranous and densely pilose and hispidulous (use lens). Very likely no more than a form of *B. mollis* L. Rare along roadsides and in gardens, e. and n.-cen. Tex. (Brazos and Limestone cos.), probably not persistent, spring; Euras., introd. in Calif. and Tex.

10. *Bromus polyanthus* Scribn. Tufted perennial; culms 35-60 cm. long, erect, 1-2 mm. thick; sheaths shortly and densely hispidulous at least on the upper part; blades 2-5 mm. broad, pubescent like the upper part of the sheaths at least on the lower part of the blade, panicle 5-20 cm. long, very narrow, few-flowered, with a few mostly ascending branches; spikelets 5- to 6-flowered, strictly ascending, strongly laterally compressed, lemmas strongly sharply keeled, essentially glabrous (or microscopically scabrous), shiny, with a body 10-15 mm. long and an awn 3-6 mm. long. Infrequent in Chisos and Davis mts. in the Trans-Pecos, summer; most of w. U. S. e. to Mont., Wyo., Colo. and N. M.; our race occurs in Tex. and Coah.

Our plants may possibly prove to be an undescribed species or variety; typical *B. polyanthus* of the Rocky Mts. comprises more robust plants with nearly glabrous foliage.

11. *Bromus arizonicus* (Shear) Steb. Ephemeral annual; culms 3-6 dm. long; foliage essentially glabrous; panicle stiffly erect, narrow; spikelets 5- to 7-flowered, strongly laterally compressed; lemmas strongly sharply keeled, mostly glabrous but hirsute toward the margin, with an awn 7-15 mm. long. Reported to occur in w. Tex.; if present very rare, spring; Ariz., Calif. and Baja Calif.

12. *Bromus unioloides* H.B.K. RESCUE GRASS. Annual; culms 5-40 cm. long, simple, erect or slightly geniculate basally and ascending; sheaths glabrous to densely retrorsely hispidulous; blades highly variable, 2-10 mm. broad, flat; panicle 3-25 cm. long, usually eventually inclined or nodding with a very few spreading-ascending mostly naked branches at the base bearing a very few spikelets; spikelets strongly laterally compressed, ascending, mostly 8- to 10-flowered, elongate-ovate in outline; first glume about 5-nerved, second glume 7- to 9-nerved; lemmas very broad, compressed-keeled, 7- to 11-nerved, with narrow chartaceous margins, 9-15 mm. long, glabrous to usually minutely scabrous in lines to minutely strigose (especially in the internerve stripes), mucronate or with an awn to 3 mm. long. *Ceratochloa Haenkeana* Presl. Our plants for a long time passed under the name *B. catharticus*. Throughout the state, spring-summer; nat. of S. A., now common in the U.S.

A valuable forage grass, but now also a weed and pest along roadsides and in lawns and gardens.

13. *Bromus rubens* L. FOXTAIL CHESS. Annual; culms 15-40 cm. long; sheaths and blades minutely pubescent; panicle erect, obovoid, rather dense (spikelets touching), 3-7 cm. long (including awns) with an axis only half as long, usually purplish; spikelets 4- to 11-flowered, erect; lemmas with awns 18-24 mm. long and elongate lanceolate bodies 12-16 mm. long, bifid apically, basally calloused. *Anisantha rubens* (L.) Nevskii. Infrequent to rare along roads and in draws in the Trans-Pecos and w. part of Edwards Plateau, spring; Eur., introd. widely in w. U.S.

14. *Bromus tectorum* L. DOWNY CHESS. Annual; culms 15-50 cm. long, erect or ascending; sheaths and blades minutely pubescent; panicle 4-15 cm. long, usually slightly one-sided and nodding, rather dense (but the spikelets not in close contact); spikelets 4- to 6-flowered, more or less drooping; lemmas elongate-lanceolate, densely pubescent (or rarely glabrous) with an awn 12-14 mm. long, with an apically bifid and basally calloused body 10-12 mm. long. Incl. var. *glabratus* Spenner, *Anisantha tectorum* (L.) Nevskii. Infrequent to rare along roadsides and in pastures in the Trans-Pecos, Plains Country, Edwards Plateau and e. to n.-cen. Tex.; frequent on Pac. coast, scattered throughout rest of U.S., s. to Va., Miss. and Tex.

15. *Bromus rigidus* Roth. RIPCUT. Annual; culms 3-7 dm. long, erect; sheaths and blades pilose; panicle 1-2 dm. long, usually slightly nodding, the lower branches 3-7 cm. long or less; spikelets 3- to 6-flowered; lemmas with awns 3-5 cm. long and scabrous, with apically bifid and basally calloused bodies 25-33 mm. long. *Anisantha rigida* (Roth) Hylander. Rare and not persistent in e. Tex. and the Edwards Plateau (one record for each area), spring; Euras., introd. in N.A.

The east Texas plants belong to the var. *Gussonei* (Parl.) Coss. & Dur., characterized by having more open panicles and stiffer, more spreading lower branches as much as 10-12 cm. long.

20a. FESTUCA L. PERENNIAL FESCUE

Tufted perennials 1-11 dm. tall; spikelets very slightly if at all laterally compressed, 2- to 8-flowered, most of the flowers perfect and chasmogamous but the uppermost staminate or rudimentary; lower glume usually well-developed, 1-nerved; upper glume usually merely pointed though less commonly awned, usually 3-nerved (but the lateral nerves obscure); spikelet rachilla disarticulating at the lower part of each node (i.e., top of each internode); lemmas usually ovate or elliptic, blunt to acute, awned or awnless, cymbiform and/or convex, not keeled (except slightly in *F. rubra*), revolute, 5-nerved (lateral nerves obscured); anthers 3, free, exerted; grains ellipsoid or ovoid.

A moderately large genus of temperate regions of the world.

1. Ligule a scale 3-3.5 mm. long5. *F. ligulata*.
1. Ligule shorter or obsolete (2)
- 2(1). Blades involute; lemmas lanceolate, with awns 1-4 mm. long (3)
2. Blades flat for at least a part of their length; lemmas elliptical, awnless or with awns shorter than 1 mm. (4)
- 3(2). Culms about 1.5 mm. thick6. *F. arizonica*.
3. Culms 0.5-1 mm. thick7. *F. rubra*.
- 4(2). Spikelets 5- to 8-flowered; lower panicle branches floriferous nearly to their bases4. *F. elatior*.
4. Spikelets 2- to 4-flowered (rarely 5-flowered); lower panicle branches naked in the basal half (5)
- 5(4). Lemmas 5-7 mm. long3. *F. versuta*.
5. Lemmas 3.5-5 mm. long (6)
- 6(5). Lower panicle branches naked for at least the basal two-thirds to three-fourths their length1. *F. obtusa*.
6. Lower panicle branches naked only for about the basal half2. *F. paradoxa*.

1. *Festuca obtusa* Biehler. NODDING FESCUE. Tufted perennial; culms 5-11 dm. long, 1-2 mm. thick, basally shortly decumbent, usually geniculate at the lower nodes; blades 3-8 mm. broad, flat at least part of their length; panicles 12-25 cm. long, usually less than half as thick, more or less open, nodding, with several branches, the long lower ones naked in at least the basal two-thirds to three-fourths their lengths; pedicels 2-4 mm. long, appressed; spikelets turgid, 2- to 5-flowered; lemmas elliptical, not at all keeled, convex, marginally thin, eventually revolute, the lowest lemmas 3.5-4.5 mm. long, awnless, apically acute (the angle broad, blunt), eventually turning greenish-stramineous, the lateral nerves very obscure. Scarce in woods, e. Tex., spring; e. U.S., w. to N.D., S.D., Neb., Kan., Okla. and Tex.

2. *Festuca paradoxa* Desv. Tufted perennial; culms 5-11 dm. long, 1-2 mm. thick, basally shortly decumbent, usually geniculate at the lower nodes; blades 3-9 mm. broad, flat at least part of their length; panicles 8-15 cm. long, usually about half as broad, open, drooping, with several branches, the lower ones longest and naked in the basal half, the upper ones shorter and floriferous nearly to the base; pedicels 2-4 mm. long, appressed; spikelets very slightly laterally compressed, 2- or 3-flowered; lemmas narrowly elliptical, not at all keeled, convex, marginally thin, revolute, the lowest lemmas 4-5 mm. long, awnless, rounded apically, eventually chartaceous and brownish, 1-nerved. Perhaps only a form of *F. obtusa*. Rare in e. Tex., summer; most of e. U.S. w. to Wisc., Ia., Kan., Okla. and Tex.

3. *Festuca versuta* Beal. Tufted perennial; culms 5-10 dm. long, 1-2 mm. thick, basally very shortly decumbent, otherwise erect; blades 2-7 mm. broad, flat at least part of their length; panicles 8-25 cm. long, usually less than half as thick, open, nodding, with several branches, the longer lower ones naked for at least the basal half to two-thirds their length; pedicels 3-20 mm. long, appressed or usually slightly divergent; spikelets slightly laterally compressed, 2- to 4-flowered (rarely 5-flowered); lemmas elliptical, not at all keeled, convex, marginally thin, revolute, the lowest ones 5-7 mm. long, awnless but

apically very shortly acuminate, acute and rarely mucronate, eventually turning brownish, the lateral nerves obscure. Infrequent along creeks and in rich woods of river bottoms, s.e. margin of Edwards Plateau (Bexar to Travis cos.), spring; Ark., Okla. and Tex.

4. *Festuca elatior* L. MEADOW FESCUE. Tufted perennial; culms 5-11 dm. long, often basally shortly decumbent or even subrhizomatous, otherwise erect, 1-2 mm. thick; blades 3-9 mm. broad, flat at least part of their length; panicles 12-30 cm. long, usually only 2-4 cm. broad, with a few short branches floriferous nearly to the base; pedicels 2-4 mm. long, mostly appressed; spikelets turgid or only very slightly laterally compressed, 5- to 8-flowered; lemmas elliptical, not at all keeled, convex, marginally thin, revolute, the lowest ones mucronate or with awns to 1 mm. long and apically acute bodies 6-7 mm. long, eventually becoming papery. Incl. var. *arundinacea* (Schreb.) Wimm., *F. arundinacea* Schreb. Infrequent to rare in e. and s.e. Tex., and cult. elsewhere (tending to volunteer along roads), spring; nat. of Euras., now widely escaped in temp. N. A.

5. *Festuca ligulata* Swall. Tufted perennial; culms 5-8 dm. long, 1-2 mm. thick, basally very shortly decumbent or even subrhizomatous, otherwise erect; blades involute, terminally subspinose; ligule a hyaline scale 3-3.5 mm. long; panicle 6-16 cm. long, narrow, with a very few branches in the lower part that are ascending and basally naked; pedicels 1-2 mm. long, appressed; spikelets turgid, 2- or 3-flowered; lemmas elliptical, not at all keeled, convex, marginally thin, revolute, apically acute (the angle blunt), awnless, the lowest ones 5-6 mm. long, slightly exceeded by the palea, eventually becoming thin-chartaceous. Grassy slopes in the higher parts of the Trans-Pecos mts., summer; endemic.

6. *Festuca arizonica* Vasey. Tufted perennial; culms 5-8 dm. long, about 1.5 mm. thick, erect; ligule a thin scale 1-1.5 mm. long; blades each 1 mm. broad, closely involute; panicle usually interrupted-spikeletlike, occasionally more lax, with some ascending or appressed branches in the lower part floriferous nearly to the base; pedicels about 2 mm. long, appressed; spikelets somewhat laterally compressed, 5- to 7-flowered; lemmas lanceolate, not at all keeled, cymbiform, marginally thin, revolute, apically long-tapered, acute, mucronate or with an awn about 1 mm. long, the lowest ones with bodies 6-7 mm. long, eventually becoming chartaceous. Higher parts of mts. in the Trans-Pecos, summer; Colo. to Tex. and w. to Nev. and Ariz.

7. *Festuca rubra* L. RED FESCUE. Tufted perennial; culms 1-5 dm. long, 0.5-1 mm. thick, usually decumbent at the base, reddish-fibrillose and subrhizomatous, otherwise erect; ligules extremely short to obsolete; panicles interrupted-spikeletlike (or more lax with a few very short ascending branches in the lower part floriferous nearly to their bases), 4-12 cm. long; pedicels 1-2 mm. long, appressed; spikelets laterally compressed, 3- to 5-flowered; lemmas lanceolate, very slightly (if at all) keeled near the apex, marginally thin and revolute, apically long-tapered, acute with an awn 1-4 mm. long, the lowest with bodies 5-7 mm. long. Rare in highest parts of Madera Canyon, Davis Mts. in the Trans-Pecos, summer; widespread in the cooler parts of the N. Hemis., in Am. s. in the mts. to S.C., Ala. and Mex.

20b. VULPIA C. C. GMEL.

ANNUAL FESCUE

Spring annuals; spikelets slightly laterally compressed, 4- to 13-flowered, most of the flowers perfect and cleistogamous but the uppermost staminate or rudimentary; lower glume 1-nerved, often greatly reduced, the upper one usually 3-nerved (but the lateral nerves very obscure), frequently awned; spikelet rachilla disarticulating at the lower part of each node (top of each internode); lemmas slender, long-attenuate to long-awned, cymbiform and/or convex but not keeled, revolute, 5-nerved (but the lateral nerves very obscure); anther usually solitary, appressed to the lemma or the included stigmas; grains linear-cylindric, attenuate to top and to base.

A small genus of Europe, North Africa, Southwestern Asia and temperate North and South America, weakly distinguished from the perennial fescues (*Festuca*).

1. Lowest lemmas with bodies 2.8-3.5 mm. long and awns 6-11 mm. long
- 2. *V. Elliotea*.
1. Lowest lemmas with bodies more than 3.5 mm. long (2)

- 2(1). Body of lemma with a few minute cilia on the upper margin (use strong lens) 3. *V. megalura*.
 2. Body of lemma not marginally ciliate (3)
 3(2). Awns 0.3-7 mm. long 1. *V. octoflora*.
 3. Awns 7-22 mm. long (4)
 4(3). First glume less than half as long as the second . . . 4. *V. myuros*.
 4. First glume more than half as long as the second 5. *V. dertonensis*.

1. *Vulpia octoflora* (Walt.) Rydb. SIX-WEEKS FESCUE. Tufted annual; culms 5-30 cm. long, 0.2-0.6 mm. thick, numerous, simple, often geniculate at the lower nodes, otherwise erect; blades 0.5-1 mm. broad, usually involute; panicles interrupted-spikelike or rarely looser; spikelets laterally compressed, 5- to 13-flowered; lemmas not at all keeled, cymbiform, with capillary awns 0.3-7 mm. long and lanceolate bodies 3.6-5.5 mm. long, either glabrous, scabrous or minutely pubescent dorsally, marginally membranous, quickly becoming revolute, eventually the whole becoming chartaceous. Incl. the trivial forms which have been called var. *tenella* (Willd.) Fern., var. *glauca* (Nutt.) Fern. and var. *hirtella* (Piper) Henr., *Festuca octoflora* Walt. Nearly throughout Tex. (rare in Rio Grande Plains), spring; temp. N.A.

2. *Vulpia Elliptea* (Raf.) Fern. Tufted annual; culms 1-5 dm. long, 0.5-1.2 mm. thick, few, simple, slightly geniculate at the lower nodes, mostly erect; leaves mostly crowded at the very base of the plant; blades 0.3-0.9 mm. broad, mostly involute, filiform; panicles interrupted-spikelike; spikelets laterally compressed, 4- to 6-flowered; lemmas not at all keeled, cymbiform, the lowest ones with capillary awns 6-11 mm. long and lanceolate bodies 2.8-3.5 mm. long, usually minutely scabrous toward the tip and marginally very thin, almost hyaline, becoming revolute and eventually slightly chartaceous. *Festuca sciurea* Nutt. Infrequent in open woods on sandy soil, e. Tex. and n. parts of Rio Grande Plains, spring; Coastal States, N.J. to Tex., inland to Mo. and Okla.

3. *Vulpia megalura* (Nutt.) Rydb. FOXTAIL FESCUE. Tufted annual; culms 15-60 cm. long, often shortly decumbent at the base and geniculate at the lower nodes, otherwise erect, simple, 1-2 mm. thick; blades 1-2.5 mm. broad, mostly involute; panicles interrupted-spikelike; spikelets laterally compressed, 4- to 6-flowered; first glume less than half as long as second glume; lemmas not at all keeled, cymbiform, the lowest ones with awns 14-17 mm. long and lanceolate bodies 5-8 mm. long, dorsally scabrous and marginally revolute and hyaline and near the apex with a few longer cilia (use lens!), becoming chartaceous. *Festuca megalura* Nutt. Probably only a form of *V. myuros*. Rare in disturbed roadsides in sandy soil, e. Tex., spring; Wash. and Ida., s. to Calif. and Ariz.; Tex., Ark., N.J., Me., Guat. and S. A.

4. *Vulpia myuros* (L.) C. C. Gmel. Tufted annual; culms 15-45 mm. long, often shortly decumbent basally and geniculate at the lower nodes, otherwise erect, simple, about 1 mm. thick; blades 1-2.5 mm. broad, mostly involute; panicles interrupted-spikelike; spikelets laterally compressed, 4- to 6-flowered; first glumes less than half as long as second; lemmas not at all keeled, cymbiform, the lowest ones with awns 7-22 mm. long and lanceolate bodies 4-7 mm. long, dorsally scabrous and marginally revolute, hyaline (not ciliate), becoming chartaceous. *Festuca myuros* L. Rare and probably not persistent in disturbed soil, n.-cen. Tex. and n. part of Rio Grande Plains, spring; Atl. and Pac. Coastal States, Wisc., O., La., Tex., Ariz., and Nev.; Mex. and S. A.; introd. from Eur.

5. *Vulpia dertonensis* (All.) Volk. Loosely tufted annual; culms 1-8 dm. long, 0.2-2 mm. thick, shortly decumbent basally and geniculate at the lower nodes, otherwise erect, simple; blades 0.3-2 mm. broad, mostly involute; panicles either shortly interrupted-spikelike or often with a few stout branches at the base diverging at low angles; spikelets laterally compressed, 4- to 6-flowered; first glume more than half as long as second; lemmas not at all keeled, cymbiform, the lowest ones with awns 9-13 mm. long and lanceolate bodies 5-8 mm. long, dorsally scabrous toward the apex and marginally revolute and hyaline (not ciliate), becoming chartaceous. *Festuca dertonensis* (All.) Asch. & Graebn. Reported to have been introd. in n.-cen. Tex.; if so rare and probably not persistent, spring; nat. of Eur., adv. in Pac. States.

21. LOLIUM L.

Inflorescences elongate, terminal, lax spikes; axis sculptured with a niche for a spikelet on one side of each internode, the axis remaining intact; spikelets 2-ranked, solitary, each fitting within the niche of the internode, slightly if at all laterally compressed, 5- to 20-flowered, all the florets perfect except the terminal one; rachilla eventually abscising above the glume(s) and at the lower part of each node; first glume obsolete or much-reduced, adaxial when present (thus hidden except on terminal spikelet), 3- to 5-nerved; second glume abaxial, strongly 5- to 7-nerved, membranous, obtuse; lemmas broadly ovate, 5- to 7-nerved, eventually marginally revolute.

A genus of perhaps 12 species in temperate Eurasia.

1. Glume shorter than the rest of the spikelet or if nearly as long then only 6-10 mm. long; plant perennial 1. *L. perenne*.
1. Glume equaling or exceeding the rest of the spikelet, 10-20 mm. long; plant annual ..
..... 2. *L. temulentum*.

1. *Lolium perenne* L. RYEGRASS. Tufted perennial; culms 3-10 dm. long, mostly erect; spikes 7-25 cm. long, compressed; spikelets 4- to 20-flowered; second (only) glume 6-10 (-14) mm. long, from less than a third to nearly as long as the rest of the spikelet; lemmas awnless or short-awned. *L. multiflorum* Lam. Scattered in lawns and other disturbed areas over most of the state except the Rio Grande Plains, spring; nat. of Eur., now widely introd. in temp. parts of N. A. and S. A.

2. *Lolium temulentum* L. DARNEL. Annual; culms 4-10 dm. long, mostly erect; spikes 1-3 dm. long; spikelets 5- to 8-flowered; second (or only) glume 1-2 cm. long, equaling or exceeding the remainder of the spikelet; lemmas short-awned. Weed in lawns in n.-cen. Tex., apparently a repeated waif but not persistent, spring; nat. of Eur., now widely introd. in temp. N. A.

22. SCLEROCHLOA BEAUV.

A monotypic Eurasian genus.

1. *Sclerochloa dura* (L.) Beauv. Densely tufted annual; culms very numerous, 2-8 cm. long, ascending, simple, the sheaths loose; ligule an acute hyaline scale; blades short, flat or folded, apically bluntly pointed; panicles dense, secund, ovate in outline, with a flattened zigzag axis 1-2 cm. long; the upper of the attached ascending branches 1 mm. long (bearing only solitary spikelets), the lower again branched, with glomerules of 2 to 5 nearly sessile spikelets; each of these branches eventually abscising at the juncture to the main axis, falling entire with the 1 to 5 spikelets still attached; spikelets 3-flowered (upper floret sterile), moderately laterally compressed, about 7 mm. long; rachilla remaining intact; glumes unequal, both firm medially and hyaline marginally, the first 3- to 5-nerved, the second 5- to 7-nerved, larger and not equaling the lowest lemma; lower lemma about 5 mm. long, firm and green medially, hyaline marginally, blunt and awnless, with 5 prominent nerves and often other obscure intermediate nerves, these not or only slightly converging apically, appearing to terminate severally near the distal margin. Rare in disturbed areas near roads in n.-cen. Tex. and the Edwards Plateau, spring; Eur., now introd. and scattered over parts of the U.S.

23. CATAPODIUM LINK

A genus of 2 species in Europe and the Mediterranean region.

1. *Catapodium rigidum* (L.) C. E. Hubb. Loosely tufted annual; culms 5-20 cm. long, 0.6-1 mm. thick, usually shortly decumbent basally, mostly ascending; sheaths shorter than their internodes; ligule a hyaline scale; blades short, flat or usually mostly involute-falcate; panicles 2-9 cm. long, 5-19 mm. broad, of 10 to 20 ascending branches, secund on the flattened and slightly zigzag axis, each 4-17 mm. long and floriferous to the base; pedicels 1 mm. long, appressed; spikelets secund on the lower side of the branches, 4- to 10-flowered, linear; florets all perfect except the terminal 1 or 2 which are staminate or rudimentary; rachilla very tardily breaking at the lower part of each node (not the

upper part as stated in manuals); first glume about 1 mm. long, 1-nerved, acutish; second glume about 2 mm. long, 3-nerved, acutish; lemmas elliptic, not at all keeled, convex, apically acute, 5-nerved (but all the nerves extremely obscure), marginally revolute, the lower ones about 2 mm. long; palea equaling lemma. *Scleropoa rigida* (L.) Griseb., *Demazeria rigida* (L.) Tutin. Local in disturbed areas, e., s.e. and n.-cen. Tex. and e. part of Edwards Plateau, spring; introd. from Euras., now scattered in N. A.

24. POA L. BLUEGRASS

Inflorescence paniculate; spikelets 2- to several-flowered, laterally compressed, all the flowers functional except usually the terminal one reduced, in some species the flowers unisexual and in some the male and female flowers on separate plants (at least in some populations); rachilla abscising above the glumes and at the lower part of each node; glumes usually shorter than first lemma, thin (marginally often hyaline), keeled, the first usually 1-nerved, the second 3-nerved; lemmas keeled, ovate-lanceolate, awnless, thin (marginally often hyaline), 5-nerved (or often appearing only 3-nerved, one pair of nerves being obscure).

A genus of about 300 species in cool and temperate regions of the world.

1. Lowest node of panicle with a whorl of 5 to 7 branches (2)
1. Lowest node of panicle with 1 to 3 (rarely 4) branches (3)
- 2(1). Creeping rhizomes 1-2 mm. thick; panicles 5-13 cm. long; lowest lemma 3-4 mm. long 4. *P. pratensis*.
2. Rhizomes absent; panicles more than 10 cm. long; lowest lemma 2.5-3 mm. long 8. *P. sylvestris*.
- 3(1). Lemmas merely microscopically scabrous, with no pubescence 6. *P. involuta*.
3. Lemmas pubescent at least minutely on some of the nerves (4)
- 4(3). Culms basally long-decumbent, stoloniform or subrhizomatous, strongly compressed and with 2 longitudinal keels 5. *P. compressa*.
4. Culms sometimes slightly compressed but never 2-keeled (5)
- 5(4). Keel of lemma basally with a tuft of flexuous silky white hair (6)
5. Lemma not tufted (sometimes weakly so in *P. annua*) (9)
- 6(5). Lowest lemmas 5-6 mm. long; fragile rhizomes 1-2 mm. thick 2. *P. arachnifera*.
6. Lowest lemmas 3-4 mm. long; rhizomes absent (7)
- 7(6). Tufted summer perennial; lemmas firm, buffy-stramineous 9. *P. interior*.
7. Tufted spring annual; lemmas thin, greenish with white margin (8)
- 8(7). Panicles about 1 cm. thick, 5-15 cm. long, interrupted-spike-like 10. *P. Bigelovii*.
8. Panicles broader, more open, 1-7 cm. long 12. *P. Chapmaniana*.
- 9(5). Nonrhizomatous plants of east, southeast and north-central Texas, rarely to Edwards Plateau (10)
9. Rhizomatous or subrhizomatous plants of Trans-Pecos Texas and the Plains Country (11)
- 10(9). Annual 3-30 cm. tall; lowest lemmas 3-3.5 mm. long; panicle 1-7 cm. long 11. *P. annua*.
10. Perennial 30-60 cm. tall; lowest lemmas 3.5-5 mm. long; panicle 7-20 cm. long 7. *P. autumnalis*.
- 11(9). Lower part of the internerve area of the lemma finely pubescent (use strong lens!); lower panicle branches naked in the lower quarter to a third their length; Plains Country 3. *P. arida*.
11. Lower part of the internerve area of the lemma glabrous; lower panicle branches floriferous nearly to the base; Trans-Pecos mountains 1. *P. Fendleriana*.

1. *Poa Fendleriana* (Steud.) Vasey. MUTTON-GRASS. Tufted perennial with fragile whitish rhizomes 1-2 mm. thick and 5-15 cm. long (these usually detached during collecting); culms 1-4 dm. long, mostly erect; lower sheaths white-stramineous; blades of midculm often equaling or exceeding the panicle, folded and marginally very narrowly involute or rarely partially flat, apically subspinulose; upper blades greatly reduced; panicles 2-10 cm. long, narrowly ovoid to interrupted-spikelike, rather dense with a few short ascending branches floriferous nearly to the base; lowest node with 2 or 3 branches; pedicels about 1 mm. long; spikelets laterally compressed, 4- to 7-flowered, whitish-stramineous, the florets perfect or unisexual with male and female flowers on separate plants; lemmas dorsally keeled, very thin, almost hyaline, minutely appressed-pubescent on the lower part of the midnerve and marginal nerves, the intermediate nerves obscure, the internerve area glabrous even at the base; basal flexuous coma absent; lower lemmas 4-5 mm. long, apically blunt; palea narrow, acute, nearly equaling the lemma. Rocky slopes in Trans-Pecos mts., infrequent, spring (rarely again in late summer-fall); most of w. U.S. e. to N.D., S.D., Neb., Colo., N.M. and Tex.; also n. Mex.

2. *Poa arachnifera* Torr. TEXAS BLUEGRASS. Tufted perennial with fragile rhizomes 1-2 mm. thick and 5-20 cm. long, staminate or pistillate; aerial culms 30-75 cm. long, mostly erect; blades rarely equaling the panicle, mostly much shorter, 2-4 mm. broad, flat or less commonly folded; panicles 5-16 cm. long, 15-50 mm. thick, occasionally interrupted-spikelike or usually broader, ellipsoid or ovoid, usually dense; lowest node with (2) 3 or 4 branches floriferous nearly to the base; spikelets unisexual, nearly sessile, 5- to 9-flowered, laterally compressed; lemmas acute, very thin, nearly hyaline, apically short-pointed, 5-nerved, dorsally keeled; lemmas of *pistillate plants* about 6 mm. long, the midnerve and marginal nerves pubescent in the lower part and basally with a tuft of flexuous silky-white hairs as long as the lemma or longer, the internerves glabrous even at the base; lemma of the *staminate plants* about 5 mm. long, the nerves glabrous and the base with only a weakly developed short tuft. Plains Country, n.-cen. Tex. and Edwards Plateau, parts of e. Tex. and the Trans-Pecos, occurring only on relatively undisturbed prairies, thus now very rare and local, spring; Kan., Okla. and Tex.; introd. elsewhere in the Gulf States.

3. *Poa arida* Vasey. PLAINS BLUEGRASS. Tufted perennial with rhizomes 0.6-2 mm. thick and to 15 cm. long; aerial culms 2-6 dm. long, mostly erect; ligule a thin pointed scale; blades 2-3 mm. broad, usually folded and marginally very narrowly involute, rarely partially flat, sharp-pointed; panicles 5-12 cm. long, very narrow or somewhat open-conical, the lower whorls of branches remote, ascending, usually naked in the lower one-fourth to one-third the length; lowest node usually with 2 or 3 branches; pedicels 1-3 mm. long; spikelets only slightly laterally compressed, 4- to 8-flowered, the flowers perfect; lemmas 3-4 mm. long, the midnerve and marginal nerves minutely pubescent in the lower part, the intermediate nerves obscure, the internerve areas basally finely pubescent; tuft absent. Prairies in Plains Country, infrequent, spring; N.D. to Mont., s. to Tex. and N.M.

4. *Poa pratensis* L. KENTUCKY BLUEGRASS. Tufted perennial with fragile rhizomes 1-2 mm. thick and to 2 dm. long; aerial culms 3-6 dm. long, mostly erect, slightly flattened but not two-keeled; ligule a short usually erose scale; blades thin, 2-4 mm. broad, flat or folded, basally not markedly broader than the top of the sheath; panicles 5-13 cm. long, conical, usually open and with a whorl of 5 flexuous basally naked branches at the lowest node, the successively higher nodes with fewer branches; pedicels 0.5-1.5 mm. long; spikelets somewhat laterally compressed, crowded, 4- to 6-flowered; lowest lemma 3-4 mm. long, green with a broad thin whitish margin, dorsally keeled, 5-nerved, the lower part of the midnerve and marginal nerves pubescent, the intermediate nerves and internerve area glabrous, basally with a long tuft of flexuous silky hairs. Meadows and tame pastures, n.-cen., e. and Trans-Pecos Tex., infrequent and probably not persistent, spring; nat. of Euras., now widely introd. in moist temp. areas of N. A. and S. A.

5. *Poa compressa* L. CANADA BLUEGRASS. Perennial; culms basally long-decumbent, stoloniform or subrhizomatous, strongly compressed, 1-2.5 mm. broad, with 2 longitudinal keels; aerial culms ascending, somewhat geniculate; lower sheaths shorter than the internodes; blades 3-12 cm. long, 1-3 mm. broad, flat or folded; panicles conic-cylindric, 3-10 cm. long, open, with few short branches per whorl rather strikingly

ascending; pedicels 5-10 mm. long; spikelets crowded, laterally compressed, 3- to 6-flowered; lowest lemma 2-3 mm. long, firm, green-stramineous, keeled, 5-nerved, the lower part of the midnerve and marginal nerves minutely pubescent, the very obscure intermediate nerves and internerve areas glabrous, basally with very short scant tuft of silky hair or this absent. Tame pastures, n.-cen. Tex. and the Rio Grande Plains, probably elsewhere, not persistent but repeatedly introd., spring; nat. of Eur., now widely introd. in Am.

6. *Poa involuta* Hitchc. Tufted perennial; culms basally shortly decumbent and sub-rhizomatous or rarely stoloniform, otherwise erect, 0.5-1 mm. thick; blades 1-2 mm. broad, tightly involute for most of the length, ascending; panicles open, 1-2 dm. long, 3-8 cm. broad, usually with 2 basally naked branches at each node; pedicels 5-10 mm. long; spikelets 3- to 5-flowered, laterally compressed; lowest lemmas 2.3-3.5 mm. long, green with broad thin white margins, 5-nerved, merely microscopically scabrous (with no other pubescence); tuft absent. Grassy slopes in Chisos Mts. of the Trans-Pecos, at elev. above 6,000 ft., summer; endemic.

7. *Poa autumnalis* Ell. Tufted perennial; culms 3-6 dm. long, 1-2 mm. thick, erect; blades 1-4.5 mm. broad, mostly flat; panicles open, 7-20 cm. long, 3-9 cm. broad, the lowest node with usually 2 long branches that are naked for two-thirds to four-fifths their length; spikelets 4- to 6-flowered, laterally compressed; lowest lemmas 3.5-5 mm. long, green, with broad thin white margins, keeled, 5-nerved, the midnerves and marginal nerves pubescent at least in the lower part, the intermediate nerves glabrous, the internerve areas glabrous or minutely pubescent; basal tuft completely absent. Rich woods, e. and s.e. Tex., infrequent, spring; e. and s. U.S., n. to Pa. and Mich., w. to Ill., Ark. and Tex.

8. *Poa sylvestris* Gray. Tufted perennial; culms 3-60 cm. long, 1-2 mm. thick, erect; blades 2-5 mm. broad, flat; panicles open, 10-15 cm. or more long, conical, the lowest node with 5 to 7 spreading branches that are naked a little more than half their lengths; spikelets laterally compressed, 2- to 4-flowered; lowest lemmas 2.5-3 mm. long, green with narrow thin white margins, keeled, 5-nerved, the midnerves and marginal nerves pubescent at least in the lower part, the intermediate nerves glabrous, the internerve areas glabrous or minutely pubescent, the base with a long tuft of silky white flexuous hair. Reported to occur in e. Tex.; if present then rare in rich woods, spring; most of e. U.S. w. to Neb., Kan. and Okla.

9. *Poa interior* Rydb. Tightly tufted perennial; culms numerous, 2-5 dm. long, about 1 mm. thick, strictly erect; blades short, about 1 mm. broad, flat, erect; panicles 4-8 cm. long, 1-2 cm. broad, rather dense, almost spiciform, strictly erect, the lower node with 2 (rarely 3) strictly erect basally naked branches; spikelets crowded, laterally compressed, 2- to 4-flowered; lowest lemmas 3-4 mm. long, keeled, stramineous, firm, 5-nerved, the midnerve and marginal nerves pubescent at least in the lower part, the intermediate nerves very obscure, the internerve areas glabrous, the base with a weak tuft of long flexuous silky white hair. Reported to occur in Tex.; if present then rare at highest elev. in the Trans-Pecos mts., summer; forested mt. slopes, Que. to B. C. and s. in the mts. to Ariz. and N.M.

10. *Poa Bigelovii* Vasey & Scribn. Tufted annual; culms 6-35 cm. long, about 1 mm. thick, mostly erect (slightly geniculate below); blades thin, 2-5 mm. broad, flat; panicles 5-15 cm. long, about 1 cm. thick, interrupted-spiciform or slightly looser, the lower branches floriferous most of the length; spikelets laterally compressed, 3- to 5-flowered; lowest lemmas 3-4 mm. long, stramineous-green with white-hyaline margins, 5-nerved, the midnerves and lower part of marginal nerve minutely pubescent, the intermediate nerves obscure and glabrous, the internerve areas minutely pubescent or glabrous, basally with a tuft of silky white flexuous hairs. Common in crevices and under shrubbery on north-facing slopes in the Trans-Pecos, rare e. to n.-cen. Tex. (waif), spring; Nev., Ut., Colo. and Okla. s. to Chih. and Coah.

11. *Poa annua* L. Tufted annual; culms 3-30 cm. long, 0.5-1 mm. thick, mainly erect (slightly geniculate below); blades 1.5-4 mm. broad, flat, thin; panicles 1-7 cm. long, conical, open, the branches spreading, the lowest node with 1 or usually 2 basally naked branches; spikelets laterally compressed, 3- to 6-flowered; lowest lemmas 3-3.5 mm. long, keeled, greenish with broad white-hyaline margins, 5-nerved, minutely pubescent on the

lower part of all 5 nerves, the internerve areas glabrous, the keel basally with a few slightly long hairs but lacking a long flexuous tuft. Crevices of sidewalks and flagstone patios, flower-beds, lawns and rich woods, e., s.e. and n.-cen. Tex. and Edwards Plateau, spring; nat. of Eur., now widely established in temp. N. A. and S. A.

12. *Poa Chapmaniana* Scribn. Tufted annual; culms 3-30 cm. long, 0.5-1 mm. thick, mostly erect (slightly geniculate below); blades 1.5-4 mm. broad, flat, thin; panicles 1-7 cm. long, conical, open, the branches spreading, the lowest node with 1 or usually 2 basally naked branches; spikelets laterally compressed, 3- to 5-flowered; lowest lemmas about 3 mm. long, keeled, greenish with narrow white-hyaline margins, 3-nerved, minutely pubescent on the 3 nerves, the keel also basally with a short tuft of silky flexuous hairs. Said by some authors to be merely a form of *P. annua*. Rare in e. and n.-cen. Tex., spring; most of e. U.S. w. to Neb., Kan., Okla. and Tex.

25. BRIZA L. QUAKING GRASS

A genus of 20 species in temperate North America and South America; we have only a single species. Another species, *B. maxima* L., the big quaking grass, is occasionally cultivated but does not persist or escape.

1. *Briza minor* L. LITTLE QUAKING GRASS. Annual; culms 1-4 dm. long, erect or at the very base shortly decumbent; ligule a long hyaline scale; sheaths shorter than the internodes, having an inverted V-shaped juncture to the blade; blades 5-10 mm. broad, flat; panicle broadly ovoid, 5-12 cm. long, about as broad, open, diffuse, with ascending-spreading branches that are twice trichotomous and naked; spikelets pendulous from the ultimate capillary pedicels at the periphery of the panicle, 3-5 mm. long, 6- to 8-flowered, broader than long, markedly tapered, only very slightly laterally compressed; glumes 2, very broad, spreading, 3-nerved, with broad hyaline margins; lemmas 1.5-2 mm. long, spreading, cymbiform, 5-nerved, marginally broadly hyaline, basally auriculate and thus basally overlapping each other; rachilla abscising above the glumes and at the lower part of each node. Infrequent in swales and in woods or open sandy soil in e. and s.e. Tex., spring; nat. of Eur., widely introd. in the U.S.

26. DIARRHENA BEAUV.

A monotypic genus.

1. *Diarrhena americana* Beauv. Perennial from short slender scaly rhizomes; aerial culms erect, 45-130 cm. long, simple, slender; ligule a short scale; blades soft, 8-18 mm. broad, flat; panicle terminal, long-exserted, 9-25 cm. long, mostly narrowly interrupted-spike-like or with a few weak drooping branches toward the base, few-flowered; spikelets appressed to the axis and branches, 3- or 4-flowered, 8-15 mm. long, glabrous, all flowers perfect or the pistil of the terminal one often abortive; glumes very short, much shorter than the lowest lemma; rachilla abscising above the glumes and at the lower part of each lemma node; lemmas ovate, 7-10 mm. long, abruptly acuminate and apiculate, chartaceous, 3-nerved, the nerves converging to the apex of the subulate or awnlike apex; grain large, beaked, at maturity forcing open the floret. Rare in deep mature beech-maple woods, n. part of e. Tex., summer-fall; Va. to Mich. and S.D., s. to Tenn. and Tex.

27. LAMARCKIA MOENCH

A monotypic genus; originally spelled *Lamarkia*.

1. *Lamarckia aurea* (L.) Moench. GOLDENTOP. Densely tufted annual; culms 1-4 dm. long; foliage soft; ligule a pointed hyaline scale; panicles erect, thickly spike-like, 2-7 cm. long, 1-2 cm. thick, consisting of numerous short spreading secund branches (each having a fascicle of 4 to 5 (rarely 6) appressed spikelets of 2 kinds); each fascicle with one (rarely 2) central fertile spikelet and the rest sterile; fascicles falling entire; fertile spikelet short, consisting of one stalked fertile floret and one minute stalked sterile floret, the lemma of each with a capillary awn from just below the apex; sterile spikelets

elongate, linear, with numerous unawned lemmas. Rare in desert areas in the Trans-Pecos, spring; a Medit. species, introd. and escaped in Calif., Ariz., Tex. and n. Mex.

28. DACTYLIS L.

A genus of 5 species indigenous to temperate Eurasia.

1. *Dactylis glomerata* L. ORCHARD GRASS. Densely tufted perennial; culms geniculate, ascending, 6-10 dm. long; ligule a lacerate hyaline scale; sheaths and blades soft, the blades flat and mostly aggregated toward the base; panicles long-exserted, mostly narrow, erect, with few mostly ascending branches, each of which bears apically a very dense aggregation (about 1 cm. thick) of secund nearly sessile fascicles of spikelets; spikelets few-flowered, laterally compressed; rachilla abscising at the lower part of each node; glumes and lemmas keeled, the keels hispid; lemmas 5-nerved, about 7 mm. long, narrowly lanceolate, mucronate. Rare in farm pastures and roadsides in Plains Country (Lubbock Co.), spring-summer; widespread in temp. areas, nat. to Euras.

29. AGROPYRON GAERTN.

WHEATGRASS

Perennials; corners of base of blades discolored and minutely auriculate or pointed; inflorescences spikelike, the axis usually slightly zigzag, unbranched, remaining intact; spikelets several-flowered, solitary (rarely in pairs) at each node, sessile, laterally compressed, turned with one side appressed to the rachis (or to the next spikelet above when crowded); all florets perfect or usually the terminal 1 or 2 reduced; rachilla abscising above the glume and at the lower part of each node; glumes lanceolate, acute, persistent, roundly keeled, equal, firm, several-nerved (the nerves obscure in some species); lemmas roundly keeled, 5- to 7-nerved (nerves obscure in some species at some stages of maturity), firm to subindurate, lanceolate, acute or in some species awned, eventually the lateral margins revolute.

A genus of about 100 or more species in temperate regions.

1. Internodes of spike about 1 mm. long 1. *A. cristatum*.
1. Internodes longer (2)
- 2(1). Lower lemmas with outwardly-curved awns 12-20 mm. long 2. *A. arizonicum*.
- 2. Lower lemmas awnless or with awns only 1-3 mm. long (3)
- 3(2). Bases of the aerial culms clumped, erect; slender rhizomes present (but fragile and easily detached); spikes densely flowered (spikelets often overlapping more than half their lengths) 3. *A. Smithii*.
3. Rhizomes very rarely developed but bases of culms always shortly decumbent; spikes 10-22 cm. long, the spikelets overlapping for less than half their lengths (4)
- 4(3). Glumes about 2.5 mm. broad, about two thirds as long as the spikelet at maturity 4. *A. trachycaulum*.
4. Glumes about 2 mm. broad, about half as long as the spikelet at maturity (or less) ..
..... 5. *A. inerme*.

1. *Agropyron cristatum* (L.) Gaertn. CRESTED WHEATGRASS. Rhizomes absent; culms geniculate; spikes short and very dense, the internodes only about 1 mm. long; lemma with short awns. Rarely or infrequently planted in the Plains Country, persisting but not spreading, summer; introd. from Russ., widely but sparingly scattered in N. A.

Very similar and to be expected also is *A. desertorum* (Fisch.) Schult., in which the plants are slightly more robust and the awns of the lemma average shorter.

2. *Agropyron arizonicum* Scribn. & Sm. Culms decumbent at the base but creeping rhizomes in the usual sense absent; spikes often nodding, the axis flexuous and the internodes increasing in length from bottom to top (rather than decreasing as in the other species); spikelets remote; lower lemma with outcurving awns 12-20 mm. long. *Elymus arizonicus* (Scribn. & Sm.) Gould. Frequent in higher parts of mts. in the Trans-Pecos, summer; Calif., Nev., Ariz. to Tex. and n. Mex.

The typical populations in Arizona have lemmas with longer awns than ours.

3. *Agropyron Smithii* Rydb. WESTERN WHEATGRASS. Forming large colonies by means of slender fragile easily detached rhizomes, the aerial culms erect even at the base; spikes strictly erect, rather dense, the spikelets overlapping usually more than half their lengths. *Elymus Smithii* (Rydb.) Gould. Abundant (formerly) in the prairies of the higher parts of the Plains Country, infrequent e. to n.-cen. Tex. and w. to the Trans-Pecos, late spring-summer; w. U.S. e. to O., Ky., Tenn., Ark. and Tex.

This species apparently tends to disappear under grazing.

4. *Agropyron trachycaulum* (Link) Malte. SLENDER WHEATGRASS. Rhizomes absent but basal parts of aerial culms shortly decumbent; spikes long and slender, the spikelets overlapping less than half their lengths; glumes lance-ovate, broader than the spikelet is thick at maturity, prominently veined when immature, about two thirds as long or as long as the spikelet at maturity. *Elymus trachycaulus* (Link) Shinnars. Reported to occur in the Plains Country; if present then exceedingly rare, summer; s. Can. and n. U.S. s. to W.Va., O., Ind., Ill., Mo., Kan., N.M., Ariz. and Calif.

5. *Agropyron inerme* (Scribn. & Sm.) Rydb. Rhizomes absent but basal parts of aerial culms shortly decumbent; spikes long and slender, the spikelets not or only shortly overlapping; glumes narrowly lanceolate, about half as long as the spikelet at maturity. Frequent in mts. in the Trans-Pecos, summer; B. C. and n.w. U.S. s. to Nev., Ut., Colo. and Tex.

Our plants are tentatively referred to by this name.

30. ELYMUS L. WILD-RYE.

Perennials; culms slender; minute pointed auricles present at juncture of blade and sheath; inflorescence a terminal spike, the axis slender with short internodes, remaining intact; spikelets collaterally paired at each node, each basally only slightly laterally compressed and with one side toward the axis but each distally (due to contortion of rachilla) with 1 keel toward the axis; spikelets 2- to 6-flowered, all the flowers perfect except the terminal 1 or 2; glumes equal, firm to subindurate, lanceolate to subulate, 1- to several-nerved; lemmas lanceolate, cymbiform, not keeled, eventually subindurate, obscurely 5-nerved, awned from the tip in most species.

A genus of about 70 species in temperate North America and South America.

1. Rhizomes present; awns of lemmas 0-2 mm. long 1. *E. triticoides*.
1. Rhizomes absent but base of culm usually decumbent; awns of lemmas 5-45 mm. long (2)
- 2(1). Glumes basally discolored, indurate, roundish in transection and diverging from the axis at a large angle, becoming broader and flatter toward the middle and then tapering to the awn 4. *E. virginicus*.
2. Glumes basally flat, neither discolored, indurate nor rounded, diverging at a low angle, broadest near the base and tapering the full length to the awn (3)
- 3(2). Glumes basally 0.2-0.5 (-0.7) mm. broad 2. *E. interruptus*.
3. Glumes basally 0.7-1.4 mm. broad 3. *E. canadensis*.

1. *Elymus triticoides* Buckl. Perennial from creeping rhizomes; aerial culms erect, 6-12 dm. long; spikes erect, 7-20 cm. long, slender, the spikelets of successive nodes overlapping only a sixth to a half their lengths; spikelets paired; glumes subulate, much shorter than the body of the lemma; lemma tapering into a mucro or awn only 1-2 mm. long. Reported to occur in the Plains Country and Trans-Pecos; if present exceedingly rare and probably not nat., spring; abundant in Pac. States, less frequent e. to the mts. of Mont., Wyo., Colo. and N.M.

This species is apparently more closely related to species included in the genus *Agropyron* than it is to the other 3 species of *Elymus* below.

2. *Elymus interruptus* Buckl. Perennial; culms basally decumbent, mostly ascending, 6-10 dm. long; peduncles typically 2-3 dm. long (that is, the length from the uppermost culm node to the lowermost spike node); spikes 5-12 (-15) cm. long, mostly erect, less commonly nodding; internodes 10-12 mm. long except the lowermost which is 15-20 mm.

long; glumes basally 0.2-0.5 (0.7) mm. broad, ridge-keeled to flat abaxially, straight and diverging at a low angle, produced into a scabrous awn, never becoming indurate; lemmas glabrous, with scabrous awns mostly 15-22 mm. long and bowed outward slightly. Rare or infrequent in creek canyons on the Edwards Plateau and in the Trans-Pecos, spring; Tex., Ark. and N.M.

Some plants appear to combine characters of this species and of *E. canadensis* and/or *E. virginicus*, apparently as a result of past and perhaps continuing crossing.

3. *Elymus canadensis* L. CANADA WILD-RYE. Perennial; culms basally decumbent, mostly ascending, 8-15 dm. long; peduncles (at maturity of the spike!) typically 25-45 cm. long, spikes 8-15 cm. long, nodding; spikelets usually paired or less commonly in threes at each node; glumes basally 0.7-1.2 (-1.4) mm. broad, ridge-keeled and fairly straight and diverging at a low angle, tapering into a slender scabrous outbowed awn, never becoming completely indurate but remaining flexible; lemmas glabrous to pubescent, with awns mostly 20-35 (-45) mm. long that diverge or curve away from the axis slightly or greatly. Incl. forms that have been called var. *brachystachys* (Scribn. & Ball) Farw., var. *robustus* (Scribn. & Sm.) Mack. & Bush and var. *villosus* (Muhl.) Shinnars (*E. villosus* Muhl.). Nearly throughout the state except s. part of Rio Grande Plains, commonest on wooded slopes near streams, spring (less commonly summer); nearly throughout temp. N. A. (except Ala., Ga., Fla. and S.C.).

This species is somewhat variable and grades into both *E. virginicus* and *E. interruptus*.

4. *Elymus virginicus* L. Perennial; culms basally erect or very shortly decumbent, mostly erect, 6-12 dm. long, peduncles (at maturity of the spike!) 7-30 cm. long; spikes 3-12 cm. long, mostly erect or at least ascending; spikelets paired; glumes linear-elliptic, at the very base discolored, tending to be terete in transection, strongly indurate and diverging at a large angle from the axis but upward broader, flatter and less thoroughly indurate, 1.2-2.2 mm. broad near the middle and becoming more erect, tapered upward to a straightish ascending or slightly divergent awn 5-25 mm. long. Incl. forms that have been called var. *australis* (Scribn. & Ball) Hitchc., var. *glabriflorus* (Vasey) Bush and var. *intermedius* (Vasey) Bush. Frequent in e., s.e. and n.-cen. Tex., less abundant in n. parts of Rio Grande Plains, Edwards Plateau and Plains Country, spring-summer; e. U.S. w. to Wash., Ida., Ut. and n. N.M., rare to n. Ariz.

This species is highly variable. Many plants referred here show some characters of *E. canadensis*, with which this species undoubtedly intergrades.

31. HORDEUM L. BARLEY

Tufted annuals (1 species a weak perennial); inflorescences dense terminal spikes; rachis abscising at the lower part of each node except in *H. vulgare*; spikelets in threes at each node, the central one largest, the lateral ones reduced except in *H. vulgare* and *H. leporinum* and pedicellate except in *H. vulgare* and some specimens of *H. pusillum*, 1-flowered; lemma contorted so that its back is abaxial; rachilla produced beyond the lemma node as a point; glumes setaceous, produced into awns; lemmas cymbiform or flatter, not keeled, obscurely 5-nerved, tapering into an awn.

A genus of about 20 species of temperate regions.

1. All 3 spikelets at each node sessile and perfect; axis of spike remaining intact; lemmas 4-6 mm. broad across the dorsum4. *H. vulgare*.
1. Lateral spikelets shortly pedicelled, staminate or rudimentary; axis of spike abscising at the lower part of each node (2)
 - 2(1). Lemmas of lateral spikelets longer than those of the central spikelet3. *H. leporinum*.
 2. Lemmas of lateral spikelets reduced (3)
 - 3(2). Awns of glumes and lemmas 5-15 mm. long2. *H. pusillum*.
 3. Awns of glumes and lemmas 25-60 mm. long1. *H. jubatum*.

1. *Hordeum jubatum* L. FOXTAIL BARLEY. Short-lived perennial or often behaving as a spring annual; culms basally decumbent, mostly ascending, 30-65 cm. long; spikes 2-11

cm. long (not including awns) and about 1 cm. thick (not including awns), nodding, dense, the rachis abscising at the lower part of each node; spikelets in threes at each node, the lateral ones pedicelled and with slightly smaller lemmas than the central one and merely staminate; awns of the various glumes and lemmas not curved at maturity, 25-60 mm. long. Infrequent weed in Plains Country and Trans-Pecos, spring; w. U.S. e. to Plains States and as a weed e. to N. E.

2. *Hordeum pusillum* Nutt. LITTLE BARLEY. Annual; culms 1-4 dm. long, geniculate in the lower part, mostly ascending; spikes 2-9 cm. long, 7-8 mm. thick, dense, the rachis eventually abscising at the lower part of each node; size-reduction and degree of pedicellation of lateral spikelets only slight; awns of lemmas (etc.) only 5-15 mm. long, ascending. Abundant weed in n.-cen. Tex. and the Plains Country, less abundant in e., s.e. and Trans-Pecos Tex. and the Rio Grande Plains, spring; nearly all states except N. E.

3. *Hordeum leporinum* Link. Tufted annual; culms 12-60 cm. long, geniculate in lower part, mostly ascending; spikes 3-10 cm. long, 10-15 mm. thick, dense, the axis eventually abscising at the lower part of each node; lemmas of pedicellate lateral spikelets nearly half again as big as those of the fertile sessile central spikelet; awns of lemmas (etc.) 10-35 mm. long, ascending. Infrequent weed in the Plains Country, Edwards Plateau and Trans-Pecos, spring; nat. of Eur., now widespread in scattered parts of N. A.

4. *Hordeum vulgare* L. BARLEY. Annual; culms 5-10 dm. long, mostly ascending; pointed auricles conspicuous at juncture of blade and sheath; spikes 5-10 cm. long (not including awns) and about 1 cm. thick, dense, the axis remaining intact; all 3 spikelets at each node sessile and fertile, nearly equal in size; bodies of the lemmas broadly ovate, eventually indurate, passing into stiffly ascending stout awns 8-15 cm. long. A few plants have been collected at scattered points as waifs near barley fields, not persistent; introd. from the Old World.

32. TRITICUM L.

A genus of about 20 species in Eurasia and the Mediterranean region.

1. *Triticum aestivum* L. WHEAT. Tufted annual; culms 3-10 dm. long, usually shortly decumbent basally; sheaths loose; blade with minute pointed auricles at the lower corners; inflorescence a terminal erect dense spike 5-12 cm. long, about 1 cm. thick; axis unbranched, slender, with internodes 2-4 mm. long, remaining intact; spikelets solitary at each node, 2-ranked, laterally compressed with 1 side appressed to the axis, eventually indurate, 2- to 5-flowered (only the lower 2 or 3 flowers perfect); glumes broadly ovate, equal, keeled, 3-nerved, in some varieties awned; lemma keeled, lopsided, acute or in some varieties awned. Wheat occurs as a waif along roads in wheat-growing areas but apparently does not persist, spring; introd. from the Old World.

33. SITANION RAF.¹⁰

SQUIRREL-TAIL

A genus of 4 species in temperate western North America, very weakly distinguished from *Elymus*; we have one species.

1. *Sitanion longifolium* J. G. Sm. Tufted short-lived perennial; culms 1-5 dm. long, ascending; minute pointed auricles present at the juncture of the sheath and blade; blades slender, flat or loosely involute, ascending; inflorescence a spike 3-9 cm. long (excluding awns), about 1 cm. thick (excluding awns), the rachis slightly flexuous, eventually abscising at the lower part of each node; spikelets paired at each node, 2- or 3-flowered, the upper florets reduced; glumes about 0.5 mm. broad basally, each slightly tapered upward into a long outcurved awn; lemmas cymbiform, not or obscurely keeled, at length the margins strongly revolute, obscurely 5-nerved, tapered upward into a scabrous eventually outcurved awn 2-10 cm. long. Abundant in disturbed areas in the Trans-Pecos and Plains Country, less frequent e. to Edwards Plateau, spring-summer; w. U. S. e. to S. D., Neb., Kan., Okla. and Tex. s. to Mex.

¹⁰ Adapted from F. Douglas Wilson in *Brittonia* 15: 303-323. 1963.

34. SECALE L.

A genus of 4 species in Eurasia and Africa.

1. *Secale cereale* L. RYE. Tufted annual; culms 5-10 dm. long, erect; blades not noticeably auricled basally; inflorescence a terminal dense spike 5-12 cm. long and about 1 cm. thick; axis unbranched, with slender internodes 2-4 mm. long, remaining intact; spikelets solitary at each node, 2-ranked, laterally compressed, with 1 side appressed to the axis, eventually chartaceous, usually 2-flowered (both flowers perfect); glumes equal, keeled, narrowly lanceolate with a subulate awnlike tip and only a solitary median nerve; lemma lance-ovate, keeled, 5-nerved, shortly and finely pectinate-ciliate at the exposed margins, with a scabrous awn 5-60 mm. long. A waif along roadsides and in disturbed areas, especially near rye fields, not persistent, spring; introd. from the Old World.

35. AEGILOPS L.

A genus of 25 species in western Asia.

1. *Aegilops cylindrica* Host. GOATGRASS. Tufted annual; culms 3-5 dm. long, erect; blades with minute pointed auricles at the lower corners; inflorescence a terminal rigidly erect dense nearly cylindrical spike 5-10 cm. long (not including awns) and about 3 mm. thick; axis unbranched, with thick sculptured internodes 7-10 mm. long, each with a niche to accommodate the spikelet of the subtending node, the axis eventually abscising at the lower part of each node; spikelets solitary at each node, fitting in the niche of the internode, only very slightly laterally compressed (one side being exposed), eventually subcoriaceous, 2- to 5-flowered (upper florets reduced); glumes lanceolate, equal, keeled, several-nerved, those of the uppermost spikelets awned; lemmas several-nerved, keeled, lopsided, acute or those of the uppermost spikelets with scabrous awns 3-6 cm. long. Roadsides and other disturbed areas, n.-cen. Tex. and the Plains Country, spring-early summer; introd. from Euras., now rather widespread in N. A.

36. KOELERIA PERS.

Tufted annuals or perennials; inflorescence a terminal erect dense or interrupted spiciform panicle; spikelets sessile, laterally compressed, 3- to 6-flowered, the terminal 1 or 2 flowers reduced, the lower ones perfect; rachilla abscising above the glumes and at the lower part of each node, extending beyond the uppermost lemma node as a bristle; glumes persistent, the first slightly shorter and much narrower than the second, 1-nerved; second glume obscurely 3-nerved, nearly equaling the lowermost lemma in length, with broad thin margins; lemmas ovate, very obscurely 5-nerved, awnless or short-awned from the apex, with broad subhyaline margins.

About 55 species in temperate regions in the world.

1. Perennial of grassy uplands; spikelets merely scaberulous, not pubescent 1. *K. pyramidata*.
 1. Annual of disturbed areas near the coast; spikelets with some pubescence (use lens) 2. *K. Gerardi*.

1. *Koeleria pyramidata* (Lam.) Beauv. JUNEGRASS. Tufted perennial; culms 25-60 cm. long, erect; leaves mostly clustered at the base of the tuft; panicle 5-15 cm. long, 6-20 mm. thick, often tapered above; spikelets mostly 2- to 4-flowered, nearly glabrous or merely minutely scaberulous; second glumes and lowest lemmas 3-6 mm. long, the lemmas acute but rarely awned. *K. macrantha* (Ledeb.) Spreng., *K. gracilis* Pers., *K. cristata* Pers. (Persoon's names are illegit.) Infrequent in grassland at considerable elev. in the Trans-Pecos, rare in grasslands in the Plains Country and n.-cen. Tex., summer; widespread in temp. areas of the N. Hemis.

2. *Koeleria Gerardi* (Vill.) Shinners. Tufted annual; culms 8-30 cm. long, slightly geniculate and somewhat branched in the lower part, mostly simple and erect; panicle 2-7 cm. long, 5-8 mm. thick, slightly tapered above; spikelets mostly 4- to 6-flowered, with some pubescence on the glume and lemmas; second glumes and lowest lemmas 2.5-3

mm. long, the lemmas shortly awned from the bifid apex. *K. phleoides* (Vill.) Pers. (an illegit. name), *Lophochloa cristata* (L.) Hylander. Rare waif in coastal areas near Galveston, probably not persistent, spring; nat. of Eur., introd. in various temp. areas.

37. SPHENOPHOLIS SCRIBN.

WEDGEGRASS

Soft tufted perennials; culms ascending; inflorescence a terminal panicle with much-branched main branches, these usually appressed or at least ascending; pedicels abscising just below the spikelets; spikelets slightly laterally compressed, 2- or 3-flowered, all flowers perfect (?); rachilla extended beyond the last lemmas as a bristle; first glume linear-filiform, green; second glume usually slightly exceeding the first in length, broadly obovate, truncate to slightly acute apically, marginally broadly hyaline or at least thin, medially trunc and obscurely 3- to 5-nerved, the median nervate portion in some species coriaceous or even thickly verrucose and scabrous along the veins, clasping the second lemma; first lemma lanceolate, thin-chartaceous or marginally hyaline, shiny, in almost all species perfectly glabrous; second lemma shorter than the first, similar in texture but in several species scabrous (at least toward the tip), often cellulose under high magnification; paleae hyaline, as long as the lemmas, shiny.

A North American genus of about a dozen species.

1. Lowest lemma 3.5-3.8 mm. long 1. *S. longiflora*.
1. Lowest lemma 1.9-3.3 mm. long (2)
- 2(1). Leaves crowded toward the base of the plant; blades only 1-2 mm. broad, loosely involute 3. *S. filiformis*.
2. Leaves broader, mostly flat (3)
- 3(2). Panicle very open and relatively few-flowered, 10-50 mm. broad, a 1-cm. transection near the middle enclosing 8 to 15 spikelets; first glume 2.2-3 mm. long 2. *S. nitida*.
3. Panicle somewhat open to dense, 5-20 mm. broad, a 1-cm. transection near the middle enclosing 15 to 75 spikelets; first glume 1.3-2.4 mm. long (4)
- 4(3). Lowest lemma 2.7-3.2 mm. long; a 1-cm. transection near the middle of the panicle enclosing 15 to 30 spikelets 4. *S. intermedia*.
4. Lowest lemma 1.9-2.7 mm. long; a 1-cm. transection near the middle of the panicle enclosing (20-) 30 to 75 spikelets, the panicle so dense as to be nearly spikelike .
..... 5. *S. obtusata*.

1. *Sphenopholis longiflora* (Vasey) Hitchc. Perennial; culms 50-75 cm. long, basally about 2 mm. thick, shortly decumbent, geniculate at the lowest nodes, mostly erect; blades 8-18 cm. long, 3-8 mm. broad, flat; panicles 15-20 cm. long, 15-25 mm. thick, rather open, the pedicels flexuous and 2-4 mm. long, a 1-cm. transection near the middle enclosing about 15 to 30 spikelets; spikelets mostly widely gaping, entirely glabrous and shining, remaining soft even at maturity; first glume 3-3.5 mm. long; second glume 3.2-3.5 mm. long, blunt or very slightly pointed; lowest lemma 3.5-3.8 mm. long. *S. obtusata* var. *major* Gray. Infrequent or rare in streamside forests on sandy soil in e. and s.e. Tex., spring; also Ark. and probably La.

2. *Sphenopholis nitida* (Biehler) Scribn. Perennial; culms 35-65 cm. long, basally about 1.5 mm. thick and very shortly decumbent, mostly erect; leaves mostly aggregated toward the base; sheaths usually softly and minutely pubescent; blades 2-4 mm. broad, flat; panicles 9-21 cm. long, 1-5 cm. broad, very open, the pedicels flexuous and 1-2 mm. long, a 1-cm. transection near the middle enclosing about 8 to 15 spikelets; spikelets gaping, shining; glumes mostly quite smooth and thin, the first 2.2-3 mm. long, the second blunt and 2.5-3.2 mm. long; lowest lemma becoming chartaceous, microscopically pustulate-roughened, 2.6-3.3 mm. long; second lemma rougher than the first, toward the apex the pustules with microscopic antrorse-appressed hairs. Infrequent to rare in deep forests on sandy soil in e. Tex., spring; e. U.S. w. to Mich., Mo., Ark. and Tex.

3. *Sphenopholis filiformis* (Chapm.) Hitchc. Perennial; culms 20-55 cm. long, erect, about 1 mm. thick basally; leaves crowded at the very base of the plant, with only 1 or 2 of them along the main length of the culm; blades 1-2 mm. broad, mostly involute,

stiffly ascending; panicles 5-15 cm. long, 5-10 (-20) mm. broad, the pedicels 0.2-0.5 (-1) mm. long, a 1-cm. transection near the middle of the panicle enclosing about 6 to 13 spikelets; spikelets gaping, shining; glumes smooth, the first 1.5-2.3 mm. long, the second blunt and 1.8-2.5 mm. long; lowest lemma becoming very thin-chartaceous, microscopically smooth or pustulate-cellulose, 2.2-2.6 mm. long, mostly minutely pustulate-roughened, toward the apex with microscopic antrorse-appressed hairs. Infrequent to rare in pine woods on sandy soil in e. and s.e. Tex., spring; Coastal States, Va. to Tex.; also Ark. and Tenn.

4. *Sphenopholis intermedia* (Rydb.) Rydb. Perennial; culms leafy, 3-10 dm. long, basally 1-2 mm. thick, very shortly decumbent basally, slightly geniculate at the lower nodes, mostly erect; blades 2-7 mm. broad, flat; panicles 8-20 cm. long, 1-2 cm. thick, with pedicels 0.5-2 mm. long, fairly open, a 1-cm. transection near the middle enclosing about 15 to 30 spikelets; spikelets only narrowly gaping, shining; first glume 1.7-2.4 mm. long; second glume subacute to acute, neither verrucose nor chartaceous medially but only firm and subchartaceous, 2.3-3 mm. long; lowest lemma smooth or microscopically cellulose-pustulate, 2.7-3.2 mm. long. Reported to occur in extreme e. Tex.; if present rare on heavily wooded moist banks, spring; most of U. S.

5. *Sphenopholis obtusata* (Michx.) Scribn. PRAIRIE WEDGESCALE. Perennial; culms leafy, 1-10 dm. long, basally 1-2.5 mm. thick, shortly decumbent, geniculate at the lower nodes, mostly ascending or erect; blades 3-12 mm. broad, flat; panicle dense, usually interrupted-spiciform or slightly more open, 3-18 cm. long, 5-20 mm. broad, with pedicels about 0.5 mm. long, a 1-cm. transection through the middle enclosing about (20) 30 to 75 spikelets; spikelets rarely gaping, usually yellowish; first glume 1.3-2.3 mm. long; second glume very blunt, almost cucullate, with a distinct line separating the chartaceous to subcoriaceous convex median portion from the flat thin margins, 1.7-2.4 mm. long; lowest lemma usually microscopically cellulose-pustulate or scaberulous toward the apex, 1.9-2.7 mm. long; second lemma often more scabrous than the first. Essentially all parts of the state, in moist swales, spring; s. Can. and nearly all of U. S. and higher parts of Mex.

38. TRISETUM PERS.

A genus of 75 species on temperate regions.

1. *Trisetum interruptum* Buckl. Tufted annual; culms 7-60 cm. long, erect, simple; blades mostly rather short, subensiform to erect, mostly flat basally, folded above; panicle interrupted-spikelike, 2-15 cm. long, 3-15 mm. thick, tapered toward the tip, with numerous very short branches, the spikelets at each node often paired with one nearly sessile and one short-pedicelled, each pedicel eventually abscising just below the glumes (this occurring in nature usually after the abscission at the nodes of the spikelet); spikelets about 5 mm. long (not including the awn), slightly laterally compressed, 2- to 3-flowered, the upper (third) floret often rudimentary; rachilla abscising at the lower part of each node, pubescent and prolonged as a point above the uppermost lemma-node; glumes subequal, about equaling the lowest lemma, the first narrower than the second and obscurely 3-nerved, the second 5-nerved, both with a firm green median portion and thin pale margins; lemmas obscurely 5-nerved, minutely pustulate-cellular to pustulate-scabrous, apically bifid (the teeth acute) and bearing on the back shortly below the notch a geniculate awn 4-8 mm. long. Infrequent nearly throughout the state except in extreme e. parts of e. and s.e. Tex. and extreme s. part of Rio Grande Plains, spring; Ariz., Colo., N. M. and Tex.

39. AIRA L.

A genus of about 12 species in temperate regions; some widely scattered as weeds.

1. *Aira elegans* Gaud. Tufted annual; culms 10-35 cm. long, slender, simple, erect; blades very narrow, usually involute-filiform, erect; panicles much-branched, very open and diffuse, ovoid, 5-10 cm. long, 3-10 cm. broad; spikelets 2-2.5 mm. long, 2-flowered, both flowers perfect, the lemma eventually abscising at the lower parts of both nodes; glumes subequal, ovate, acute, hyaline, apparently each with a single median nerve,

slightly surpassing the bodies of the lemma; lemmas minutely pustulate-scaberulous in the small median-basal green-membranous areas, marginally broadly white-hyaline, bifid, the lower one essentially awnless, the second one bearing from near the middle of the back a geniculate awn barely exerted from the spikelet. Infrequent in e. Tex., spring; Coastal States, Md. to Tex.; also Ark., Calif. and Ore.

40. AVENA L.

A genus of about 70 species in temperate regions of the Old World.

1. *Avena fatua* L. OATS. Tufted annual; culms 40-75 cm. long, often geniculate at some lower nodes, mostly ascending; panicles open and diffuse, 15-25 cm. long, 3-10 cm. broad, few-flowered, the capillary branches weak and sharply flexuous; spikelets slightly laterally compressed, with 2 perfect florets and in some plants a third rudimentary one; rachilla pubescent, abscising just below the lowest lemma node but usually not or only tardily at second lemma node; glumes 2-3 cm. long, surpassing the bodies of the lemmas, broadly lanceolate, attenuate, acute, cymbiform (not keeled), white-membranous, with 7 to 9 green nerves terminating severally near the distal margin; lemmas firm to indurate, lanceolate, 5- to 9-nerved, bifid, the lateral margins revolute, bearing from near the middle of the back either a short relatively straight awn or a very long geniculate darkly-pigmented one. Disturbed areas in e., s.e. and n.-cen. Tex. and the Edwards Plateau, locally abundant, spring; nat. to Eur., now widely introd.

The so-called wild oats (var. *fatua*) has long awns; the usual cultivated plant [subsp. *sativa* (L.). Thell.] has short awns, hairy lemmas and usually lacks the rudimentary third floret.

41. AGROSTIS L. BENTGRASS

Blades flat; inflorescences paniculate; spikelets one-flowered, very slightly laterally compressed; zone of abscission between the glumes and the lemma (in *A. semiverticillata* a zone of abscission also in the pedicel below the glumes); lemma shorter than the glumes, awned or awnless.

A genus of 150 to 200 species, chiefly in the North Temperate Zone.

- 1. Lemma awned (2)
- 1. Lemma not awned (3)
- 2(1). Glumes 3-4 mm. long 1. *A. avenacea*.
- 2. Glumes 1.2-2.2 mm. long 2. *A. Elliottiana*.
- 3(1). Longest glume shorter than 2 mm. (4)
- 3. Longest glume longer than 2 mm. (5)
- 4(3). Panicle very dense with short scabrous branchlets that are many-flowered nearly to the base; stolons present 9. *A. semiverticillata*.
- 4. Panicle very diffuse; branchlets long and naked most of their length, the spikelets crowded toward the tips; stolons absent 3. *A. hyemalis*.
- 5(3). Tufted perennials without rhizomes or stolons; panicles open and diffuse, the branches mostly naked (6)
- 5. Perennials with stolons or rhizomes or the lower internodes reclining and sub-rhizomatous; panicles sometimes open but not diffuse, the branches bearing flowers for at least half their length (7)
- 6(5). Panicle at maturity irregularly rounded, the main branches branched above the middle, the pedicels short, the spikelets crowded and appressed near the ends of the branches 4. *A. scabra*.
- 6. Panicles at maturity subpyramidal, the main branches branched near the middle or slightly above, the ultimate pedicellary branchlets divaricate, the spikelets not crowded; plants of east Texas, flowering mainly in October 5. *A. perennans*.

- 7(5). Panicles more than 25 mm. broad, the branches spreading; rhizomes present, 2-3 mm. thick6. *A. stolonifera*.
7. Panicles less than 25 mm. broad, the branches ascending or appressed; rhizomes absent but stolons often present (8)
- 8(7). Palea present; plants of southeast Texas, near the coast7. *A. palustris*.
8. Palea absent; plants of Trans-Pecos mountains8. *A. exarata*.

1. *Agrostis avenacea* J. F. Gmel. Tufted perennial; culms 2-6 dm. long, 1-2 mm. thick, erect or the lowest internodes reclining, leafy; ligule a scale 2-5 mm. long; blades 5-15 cm. long, 1-2.5 mm. broad, flat; panicle 15-30 cm. long, diffuse, open; glumes 3-4 mm. long; lemma and palea 0.5-2 mm. long, the former minutely pubescent, with a mid-dorsal once-geniculate awn 3-5 mm. long. Collected May, 1902 at Kent, Culberson Co. in the Trans-Pecos as a waif near the railroad, probably no longer a member of our flora; introd. in scattered parts of the U.S.; Pac. Is.

2. *Agrostis Elliottiana* Schult. Annual; culm 1-3 (-4) dm. long, 0.3-1 mm. thick, erect, leafy; ligule a scale 1.5-3 mm. long; blades 2-6 cm. long, about 1 mm. broad, flat; panicle 6-22 cm. long, very open and diffuse at maturity, the branches capillary, mostly naked; spikelets crowded toward the ends of the branchlets; glumes 1.2-2.2 mm. long; lemma 1.1-2 mm. long, usually bearing dorsally just below the tip a fragile flexuous curly white awn 4-8 mm. long; palea absent. Sandy soils, fields, roadsides and other openings in forested areas in e. Tex. and the granitic flatrocks of Llano and Burnet cos. in cen. Tex., locally abundant, Mar.-Apr.; s.e. U.S. n.e. to Me., s.w. to Tex.; also Yuc.

3. *Agrostis hyemalis* (Walt.) B.S.P. SPRING BENTGRASS. Tufted perennial; culms 1-6 dm. long, 0.5-1 mm. thick, leafy, erect or the lowermost internodes reclining; ligule a thin scale 1-4 mm. long; blades 3-9 cm. long, 1-2 mm. broad, flat; panicle 5-30 cm. long, at least half as broad at maturity, open and very diffuse, the long branches capillary and mostly naked, branched in the outer third; spikelets crowded at the ends of the branchlets, appressed; glumes 1.5-2.1 mm. long, subequal; lemma 1-1.3 (-1.5) mm. long, awnless; palea absent. Usually moist sandy soil, roadsides and other open places in most of Tex. except w. Plains Country, scattered, Mar.-May, rarely to June; e. U.S. w. to Kan., Okla. and Tex.

4. *Agrostis scabra* Willd. Similar to *A. hyemalis* but the glumes 2-2.6 mm. long, some of them on any plant at least 2.2 mm. long; lemma 1.3-1.6 mm. long, rarely as short as 1.2 mm.; palea absent. *A. hyemalis* var. *tenuis* (Tuckerm.) Gl. Moist soil, openings in forests, at elev. of 6,000-8,300 ft. in the Trans-Pecos mts. where probably nat., also scattered in other parts of the state (Dallas, Hardin and Harris cos., etc.) where introd., July-Sept. in the mts., Apr.-May elsewhere; most of cool temp. N. A.

5. *Agrostis perennans* (Walt.) Tuckerm. AUTUMN BENTGRASS. Tufted perennial; culms 25-100 cm. long, 0.5-2.5 mm. thick, leafy, erect or the lowest internodes reclining; ligule a scale 1-3 mm. long; blades 5-22 cm. long, 1-6 mm. broad, flat; panicle 1-3 dm. long, about half as broad, often subpyramidal, very diffuse, open, some of the main branches branched near the middle or slightly above, the pedicellary branchlets appressed or often more divaricate; glumes 2-3.2 mm. long; lemma shorter, awnless (in ours, elsewhere rarely awned); palea absent. Moist sandy soils along streams in e. Tex., infrequent, Oct.; Que. and e. U. S. w. to Neb., Kan., Okla. and Tex.; also Mex.

6. *Agrostis stolonifera* L. REDTOP BENTGRASS. Perennial from rhizomes 2-3 mm. thick; aerial culms 35-100 cm. long, 1.5-2.5 mm. thick, the lower internodes usually decumbent, leafy; ligule a thin scale 4-8 mm. long; blades 6-20 cm. long, 3-8 mm. broad, flat; panicle 12-25 cm. long, less than half as broad, the branches spreading; glumes equal, 2-3 mm. long, gaping; lemma nearly as long as the glumes, not awned; palea about two thirds as long as lemma. Often called *A. alba* L. but that name pertains to a species of *Poa*. *A. gigantea* Roth. Wet meadows and stream banks, e. and n.-cen. Tex., the Plains Country and Trans-Pecos mts., scattered, mostly in tame pastures, summer; widespread in temp. N. A., introd. from Euras.

7. *Agrostis palustris* Huds. CREEPING BENTGRASS. Perennial; culms decumbent, often long-stoloniferous, the aerial ones erect, 3-5 dm. long, 1-2 mm. thick, leafy; ligule a thin scale 2-4 mm. long; blades 4-10 cm. long, 1-3.5 mm. broad, flat; panicles 5-15 cm. long,

1-2 cm. thick, the short branches ascending; glumes 2-3 mm. long; lemma about two thirds as long as the glumes, not awned; palea about two thirds as long as the lemma. Fresh-water shores, s.e. Tex., scattered or rare, summer; widely introd. in temp. N. A. from Euras.

8. *Agrostis exarata* Trin. SPIKE BENTGRASS. Tufted perennial; culms 3-9 dm. long, 1-2 mm. thick (in ours; more robust elsewhere), leafy, mostly erect or the lower internodes reclining and substoloniferous; ligule a scale 3-5 mm. long; blades 4-20 cm. long, 2-8 mm. broad, flat; panicle 1-3 dm. long, 10-25 mm. thick, rather lax and often somewhat interrupted toward the base, the branches many-flowered, appressed; glumes 2.5-3 mm. long, narrowly acuminate; lemma 1.7-2.3 mm. long, not awned (in ours; elsewhere apically awned); palea absent. Wet places at high elev. in Trans-Pecos mts., rare, late summer; w. Can. and w. U. S. (including Alas.), e. to S. D., Neb. and in the mts. to w. Mex.

9. *Agrostis semiverticillata* (Forsk.) Christ. WATER BENTGRASS. Stoloniferous perennial freely rooting at the nodes; aerial culms 2-5 dm. long, 1-2 mm. thick, leafy; ligule a thin scale 2-7 mm. long; blades 4-14 cm. long, 2-7 mm. broad, flat; panicle 3-10 cm. long, 1-3 cm. thick, ellipsoidal, very dense; swollen zone of abscission present on the scabrous pedicellary branchlets below the spikelets; glumes 1.3-2 mm. long, scabrous; lemma about 1 mm. long or shorter, truncate; palea narrow, as long as lemma. *Polypogon semiverticillatus* (Forsk.) Hylander. At the edges of streams in calcareous mud, n.-cen. Tex., Edwards Plateau, Plains Country and Trans-Pecos, locally abundant, Apr.-June and continuing now and then into Nov.; warmer parts of the world, in N. A. n. to Wash., Nev., Ut., Colo., and Tex., introd. from the Old World.

42. POLYPOGON DESF.

Lower internodes reclining on mud, the nodes with adventitious roots; panicles dense; zone of abscission below the glumes; glumes nearly equal, both persistent, awned, united at the very base, scabrous or pubescent; lemma much shorter than glumes, involute, ellipsoidal, with a dorsal readily deciduous awn; palea membranous, enclosed by the lemma.

A genus of about 15 species in warm regions of the world.

1. Awns of glumes more than 4 mm. long 1. *P. monspeliensis*.
 1. Awns of glumes less than 4 mm. long 2. *P. interruptus*.

1. *Polypogon monspeliensis* (L.) Desf. RABBITFOOT GRASS. Annual; culms often rooting at the lower nodes or less commonly totally erect, 1-7 dm. long, 1-3 mm. thick; ligule a scale 3-10 mm. long; blades 4-16 cm. long, 2.5-11 mm. broad, flat; panicle 2-15 cm. long, 1-2 cm. thick, either narrow and spikelike or broader and ellipsoidal and somewhat interrupted, stramineous at maturity; glumes 2 mm. long, apically notched and in the notch each bearing an awn 5-9 mm. long; lemma less than 1 mm. long, with a deciduous awn less than 1 mm. long. Moist soil near fresh water, all parts of the state except the Rio Grande Plains, scattered and local, Mar.-July; Eur., introd. and now widespread in temp. N. A.; of local forage value.

2. *Polypogon interruptus* H.B.K. Perennial; culms rooting at the lower nodes, 2-10 dm. long, 1-4 mm. thick; ligule a scale 4-10 mm. long; blades 4-22 cm. long, 2-12 mm. broad; panicle 3-20 cm. long, 1-5 cm. thick, occasionally narrowed and somewhat spikelike but usually broad, interrupted, with whorled branches 1-5 cm. long; glumes 2 mm. long, apically entire, each bearing an awn about 2 mm. long; lemma a little longer than 1 mm. with a deciduous awn 2-3 mm. long. Calcareous mud on Edwards Plateau, rare (known only from Val Verde Co.), Apr.; widespread in temp. N. A. and S. A., n. to B. C. and Neb.

43. CINNA L. WOODREED

A genus of 4 species in Eurasia, North America and South America; we have one species.

1. *Cinna arundinacea* L. STOUT WOODREED. Clumped perennial with short thick rhizomes; aerial culms erect, 7-15 dm. tall, 2-5 mm. thick, leafy; ligule a stramineous

scale 2-3 mm. long centrally and with long auricles laterally; blades 15-37 cm. long, 7-14 mm. broad near the middle, tapering to both ends, flat; panicles 15-32 cm. long, ellipsoidal, the numerous branches ascending or rarely spreading, densely-flowered; zone of abscission just below the glumes; spikelets one-flowered, falling as a unit, strongly laterally compressed, with keeled scales; first glume 4-4.5 mm. long; second glume 5-5.5 mm. long; lemma 5.5-6 mm. long, bearing dorsally just below the tip a minute awn equaling the tip of the lemma (use lens). Moist usually sandy soil, floodplains and stream banks in forests of e. Tex., infrequent, Aug.-Sept.; all of e. U. S. w. to S. D., Neb., Kan., Okla. and Tex.

44. LIMNODEA L. H. DEWEY

A monotypic genus.

1. *Limnodea arkansana* (Nutt.) L. H. Dewey. Annual; lowermost internodes often prostrate; otherwise culms erect, not or rarely branched, 15-60 cm. long, 0.5-2 mm. thick; ligule a scale about 1 mm. long; blades 2-12 cm. long, 1.5-8 mm. broad, flat; panicles 4-20 cm. long, often weak and slightly nodding, usually about 1 cm. thick and dense, less commonly the branches weak and lax and panicles broader and more diffuse, branches 5-50 mm. long, naked in the lower part; spikelets 1-flowered, deciduous as a unit by an abscission layer just below the glumes; glumes firm or almost indurate, 3-4 mm. long, lanceolate, involute, acute, scabrous or hirsute; lemma as long as the glumes, not as firm, apically shortly bifid, bearing an awn from between the 2 teeth; awn once-geniculate, twisted in the lower portion, 4-12 mm. long. Loamy usually very sandy soils in prairies and disturbed areas, common in n.-cen. and e. Tex., less common to e. Plains Country, n. Rio Grande Plains and s.e. Tex., Mar-May; Okla. and Ark. s. to Tex. and La.; adv. in Ala. and Fla.

45. ALOPECURUS L. FOXTAIL

Annuals; blades flat; panicles dense, straight, spikelike; zone of abscission just below the glumes; spikelets falling as a unit, one-flowered, strongly laterally compressed; glumes equal, united by the margins basally, keeled dorsally; lemma about as long as glumes, the margins united to each other basally, bearing an awn dorsally below the middle, this once-geniculate, the lower portion twisted; palea absent.

About 50 species in temperate Eurasia, North America and South America.

1. Glumes 6-7 mm. long, not ciliate on the keel except basally . . . 1. *A. myosuroides*.
 1. Glumes 2-2.5 mm. long, ciliate on the keel 2. *A. carolinianus*.

1. *Alopecurus myosuroides* Huds. Tufted annual; culms 2-7 dm. long, 1.5-3 mm. thick, erect or the lower few internodes reclining; ligule a scale 2-4 mm. long; blades 5-30 cm. long, 3-7 mm. broad, flat; spike 5-11 cm. long, 5-10 mm. thick; glumes 6-7 mm. long, the keel merely scabrous, not ciliate except basally; awn of lemma 5-8 mm. long. Moist meadows in e. Tex., occurring only as a waif brought in with hay, May; Euras., adv. and widespread in n.e. U. S.; also Wash. and Ore.

Other European species are to be expected in the state as introductions, notably *A. pratensis* L., the meadow foxtail, rather similar to *A. myosuroides* but perennial and the keels of the glumes ciliate.

2. *Alopecurus carolinianus* Walt. Tufted annual; culm 1-5 dm. long, 1-2 mm. thick, the lower internodes commonly not erect, the remainder erect; ligule a scale 1-3 mm. long; blades 2-15 cm. long, 1.5-5 mm. broad, flat; spikes 2-5 cm. long, 4-6 mm. thick; glumes 2-2.5 mm. long, densely ciliate on the keels; awn of lemma 3-5 mm. long. Moist soil near ponds and streams, wet meadows, e., s.e. and n.-cen. Tex., infrequent and rare w. to Bexar, Burnet, Llano and Wichita cos, Mar-May; B. C. and practically throughout the U. S. except n. N. E.

46. PHLEUM L.

A genus of 15 species in temperate Eurasia, North America and South America; probably all Eurasian in origin.

1. *Phleum pratense* L. ТИМОТНУ. Perennial from very short bulbously thickened rhizomes; aerial culms 5-10 dm. long, 2-3 mm. thick, the lowest internodes often reclining, otherwise erect, leafy; ligule a thin scale 2-4 mm. long; blades 6-26 cm. long, 5-10 mm. broad, tapered to a long point, flat; panicle 5-20 cm. long, 5-8 mm. thick, terete, spike-like; spikelets 1-flowered, strongly laterally compressed; glumes equal, 3-3.5 mm. long, oblong, hyaline but each with a firm keel prolonged into a short spreading awn, the keel ciliate; zone of abscission between the glumes and the lemma; lemma and palea about half as long as the glumes, hyaline, the palea very narrow. Occasional as a waif in the e. half of Tex., not persisting, brought in with hay, summer; widespread in moist temp. parts of N. A., introd. from Euras.

47. PHALARIS L. CANARY GRASS

Soft tufted annuals with broad flat blades and large hyaline scalelike ligules; inflorescences terminal dense capitate ovoid or spikelike panicles; spikelets sessile, 90 to 800 per panicle, strongly laterally compressed (the plane of the glumes perpendicular or at an angle to the axis of the panicle, in transection tangential to the panicle); glumes nearly equal, large, cymbiform, enclosing and hiding the rest of the spikelet, strongly keeled and usually with wings on the upper part of the keels, usually with a strong lateral nerve on each side; zone of abscission just above the glumes; fertile floret solitary (persistently subtended at the base by 2 awns or scales or glandlike structures representing the remains of reduced sterile florets); lemma compressed-ovoid, cartilaginous, nerveless, enclosing and falling with the palea and caryopsis (grain), usually antrorsely strigose.

About 20 species in temperate regions.

- 1. Grain 3.5-4.2 mm. long; fertile florets 4.4-6.8 mm. long; glumes 6.3-9 mm. long, broadly winged, as viewed from the side (when folded) 2 or 3 times as long as broad; panicles usually 1 or 2 times as long as broad (2)
- 1. Grain 1.4-2.3 mm. long; fertile florets 2.1-4.7 mm. long; glumes 3-6.7 mm. long, narrowly winged, as viewed from the side (when folded) 3 or 4 times as long as broad (3)
- 2(1). Sterile florets 2.5-4.5 mm. long, scalelike; grain 3.9-4.2 mm. long 1. *P. canariensis*.
- 2. Sterile florets 0.5-1.2 mm. long, minute, swollen and glandlike at the base of the fertile floret; grain 3.5-3.9 mm. long 2. *P. brachystachys*.
- 3(1). Grain 2-2.3 mm. long; lateral nerves of glumes essentially smooth; panicle ovoid to elongate-ovoid, usually 2 to 4 times as long as broad 3. *P. caroliniana*.
- 3. Grain 1.4-1.6 mm. long; lateral nerves of glumes with remote microscopic teeth or scabrous projections; panicle narrow, cylindrical, usually at least 5 times as long as broad 4. *P. angusta*.

1. *Phalaris canariensis* L. Tufted annual; culms 3-10 dm. long, 2-4 mm. thick, erect, sparingly branched; ligule a hyaline scale 2-5 mm. long; blades 10-25 cm. long, 3-10 mm. broad, flat; panicle 15-20 (-40) mm. long, 15-20 mm. thick; glumes 7-9 mm. long, broadly winged, as viewed from the side 2 or 3 times as long as broad; "sterile florets" merely scales 2.5-4.5 mm. long; fertile floret 4.8-6.8 mm. long; grain 3.9-4.2 mm. long. Loamy garden soil, repeatedly introd. into or a waif in cen. and e. Tex., rare and not persistent, spring-summer; nat. to Medit. region, widely introd. and naturalized in cool-temp. parts of Am.

2. *Phalaris brachystachys* Link. Tufted annual; culms 3-9 dm. long, 2-3 mm. thick, erect, sparingly branched; ligule a hyaline scale 1-4 mm. long; blades 8-25 cm. long, 3-10 mm. broad, flat; panicle 15-30 (-40) mm. long, 8-18 mm. thick; glumes 6.3-8.5 mm. long, broadly winged, as viewed from the side 2 or 3 times as long as broad; "sterile florets" reduced to glandlike nubbins 0.6-1.2 mm. long; fertile floret 4.4-5.5 mm. long;

grain 3.5-3.9 mm. long. Rare in sandy loam along a road near Asherton, Dimmit Co., in the Rio Grande Plains, where deliberately sown or a waif and not persistent, spring; nat. to Medit. region, infrequently introd. at scattered points in N. A.

3. *Phalaris caroliniana* Walt. Tufted annual; culms 23-100 cm. long, 1-4 mm. thick, erect, sparingly branched in the lower part; ligule a hyaline scale 1-5 mm. long; blades 5-12 (-20) cm. long, 2-9 (-13) mm. broad, flat; panicle 1-6 (-9) cm. long, 8-20 mm. thick, ovoid to subcylindric, glumes 4.2-6.7 mm. long, narrowly winged, as viewed from the side 3 or 4 times as long as broad; "sterile florets" subulate, 1.5-2.5 mm. long; fertile floret 3-4.7 mm. long; grain 2-2.3 mm. long. Abundant in loamy usually alluvial soils near creeks, in disturbed soils along roadsides and in fallow fields and pastures throughout Tex., common toward the coast, rare in the Trans-Pecos and w. Plains Country, spring; Va. to Okla. and s. to the Gulf States; also Ore., Calif., s. Nev., Ariz. and N. M., s. to Son., Chih. and Coah.

4. *Phalaris angusta* Trin. Tufted annual; culms 55-150 cm. long, 2-6 mm. thick, erect, sparingly branched in the lower part; ligule a hyaline scale 1-3 mm. long; blades 2-25 cm. long, 3-10 mm. broad, flat; panicle 2.5-17 cm. long, 6-15 mm. broad, cylindrical; glumes 3-5.5 mm. long, narrowly winged, as viewed from the side nearly 4 times as long as broad; "sterile florets" subulate, 0.7-1.5 mm. long; fertile floret 2.1-3.8 mm. long; grain 1.4-1.6 mm. long. Locally abundant in moist loamy soil near ditches, creeks and bayous in s.e. Tex., Mar.-Apr.; Ga. to Tex., w. Ariz., Calif., S. A.; introd. into S. Afr.

48. RHYNCHELYTRUM NEES NATALGRASS

A genus of 37 species in warm parts of the Old World; one species now widely distributed.

1. *Rhynchelytrum repens* (Willd.) C. E. Hubb. Perennial; culms 5-13 dm. long, usually decumbent basally and rooting at the lower nodes, otherwise ascending, the nodes usually villous; panicles ovoid or narrower, 8-15 cm. long, 3-7 cm. broad, rather open, with some long ascending branches near the base (these with capillary-flexuous branchlets and pedicels); pedicel with a zone of abscission just below the glumes and just below the zone of abscission with a few long ascending white hairs; spikelets 2-flowered (the lower floret merely staminate), mostly drooping in the direction away from the prevailing wind, eventually falling entire, slightly laterally compressed, ringent; first glume minute, linear-subulate, long silky-villous; second glume chartaceous, cymbiform, obscurely 3-nerved, 3-4 mm. long, apically acuminate and very slightly notched, recurved outward, short-awned but the awn and nerves obscured by the long dense ascending white or rosy silky-pubescence; lower lemma like the second glume but enclosing a well-developed palea and 3 functional stamens; fertile lemma much shorter than the "sterile" one, glabrous, thin-chartaceous, the margins clasping the palea of the same texture. *R. roseum* (Nees) Stapf & Hubb., *Tricholaena rosea* Nees. Locally abundant along highway and railroad right-of-way, Rio Grande Plains, spring-fall; nat. of Afr., introd. and now widespread in the warmer parts of Am.

A grass with a beautiful feathery, rosy inflorescence used for home decorations but lasting only a short while before the spikelets fall.

49. ANTHAENANTIA BEAUV.

Erect perennials with short creeping rhizomes; blades narrow, firm, flat, the uppermost much-reduced; panicles terminal, narrow, the slender branches ascending or appressed; spikelets obovoid, 2-flowered, the lower flower reduced; first glume absent; second glume and sterile lemma about equal, 5-nerved, the broad internerves infolded, densely villous; sterile lemma with a small palea and sometimes with a staminate flower; fertile lemma cartilaginous, brown, with narrow pale hyaline margins, cymbiform, 3-nerved, subacute.

An American genus of 2 species.

1. Blades erect or spreading, rather blunt or rounded at apex, linear, folded at base; panicle usually purple 1. *A. rufa*.
1. Blades ascending or spreading (on the average shorter and broader than in *A. rufa*), tapering to apex, rounded at base; panicle usually pale 2. *A. villosa*.

1. *Anthraenantia rufa* (Ell.) Schult. Culms slender, 6-12 dm. tall; blades elongate, 3-5 mm. broad, often scabrous; panicle 8-15 cm. long, usually purple; spikelets 3-4 mm. long. Infrequent in savannahs and sandy woodlands, e. and s.e. Tex., summer-fall; Coastal States, N. C. to Tex.

2. *Anthraenantia villosa* (Michx.) Beauv. Differing from *A. rufa* in the broader, mostly shorter, spreading blades and in the usually pale panicles. Rare in sandy woodlands and savannahs, s.e. and e. Tex., summer-fall; Coastal States, N.C. to Tex.

50. TRICHACHNE NEES

Wiry-stemmed perennials from knotty usually pubescent bases; panicles of several racemes, attached at several levels along the axis; spikelets paired, lanceolate, attached in 2 rows on 1 side of the rachis of the raceme, rather remote but usually overlapping, the members of each pair on unequal pedicels; zone of abscission below the glumes; first glume glabrous, minute, noticeable only under a lens; second glume and sterile lemma about as long as the fruit or often longer, the former 3-nerved, the latter 5-nerved, both with abundant long antrorse silky hairs; "fruit" plano-convex, lanceolate, often vaguely prolonged basally into a very short "stipe", apically acuminate.

About 15 species of Australia and warmer parts of America. By some authors, *Trichachne* is submerged in the large genus *Digitaria*.

1. Internerves of the sterile lemma all pubescent; spikelets 2.5-3.8 mm. long; blades 2-6 cm. long 4. *T. Hitchcockii*.
1. Internerves of the sterile lemma adjacent to the midnerve glabrous, the more marginal ones pubescent (2)
- 2(1). Glabrous median stripe of the sterile lemma narrow, less than half the total breadth of the lemma; fruit 3.8-4.2 mm. long 1. *T. nutans*.
2. Glabrous median stripe or portion of the sterile lemma at least half as broad as the sterile lemma; fruit 3-3.5 mm. long (3)
- 3(2). Racemes of panicle few, spreading 2. *T. patens*.
3. Racemes of panicle numerous, ascending or appressed . 3. *T. californica*.

1. *Trichachne nutans* (L.) Baum. SOURGRASS. Tufted perennial from tough hairy knotty or cormlike bases; culms 35-100 cm. long, 1-2 mm. thick, erect, essentially unbranched; ligule a hyaline scale 2-3 mm. long; blades 7-17 cm. long, 3-6 mm. broad, flat or folded; sheaths usually pubescent; panicles 11-20 cm. long, 1-2 cm. broad; racemes few, 4-12 cm. long and erect and appressed; spikelets (not including the apical hairs) 3.9-5.3 mm. long; first glume minute; second glume 3-nerved, with dense antrorse appressed silky white somewhat tawny or buffy-white hairs much-exceeding the apex; sterile lemma 5-nerved, pubescent like the second glume but with a very narrow median stripe (between the midnerve and the nearest laterals) glabrous, less than half as broad as the sterile lemma; fruit 3.8-4.2 mm. long. *Trichachne insularis* (L.) Nees, *Digitaria insularis* (L.) Mez. Among brush on tight loamy well-drained soils in Rio Grande Plains, n. to Bexar and Wilson cos., locally frequent, spring-fall; widespread in warmer parts of the New World n. to Fla., Tex. and Ariz.

In most of tropical America sourgrass has a more robust habit than in our area, with blades as much as 15 mm. broad and panicles to 30 cm. long. The name sourgrass alludes to the unpleasant odor of the bases of the plants when bruised, reminiscent of rotting lemons. The color of the spikelet-pubescence varies from pure-white to tawny.

2. *Trichachne patens* Swall. Tufted perennial from pubescent knotty bases; culms 35-90 cm. long, 1-2 mm. thick, erect, essentially unbranched, the lower nodes slightly geniculate; ligule a hyaline scale 1-4 mm. long; blades 4-12 cm. long, 2-3 mm. broad, flat, sheaths usually pubescent; panicles 10-18 cm. long, (2-) 4-15 cm. broad, very open; racemes few, 4-15 cm. long, laxly flowered, spreading; spikelets (not including hairs) 3.2-4.3 mm. long; first glume minute; second glume 3-nerved, densely covered with silky-white or tawny or purplish hairs that are antrorse at first but when dry widely spreading; sterile lemma 3-nerved (actually 5-nerved, another indistinct pair of nerves

sometimes discernible very near the margin), pubescent like the second glume but with a glabrous median stripe between the midnerve and the nearest laterals, this about half as broad as the lemma; fruit 3-3.5 mm. long. *Digitaria patens* (Swall.) Henr. Among brush and in pastures on tight well-drained loam in Rio Grande Plains, n. to s. part of n.-cen. Tex. and e. Edwards Plateau (Llano Co.), infrequent, spring-fall; endemic.

The color of the spikelet-pubescence is very variable.

3. *Trichachne californica* (Benth.) Chase. ARIZONA COTTONTOP. Tufted perennial from pubescent knotty bases; culms 35-110 cm. long, 1-2 mm. thick, erect, sometimes slightly geniculate at the lower nodes, essentially unbranched; ligule a hyaline scale 1-3 mm. long; blades 5-18 cm. long, 2-5 (-7) mm. broad, usually flat or (when very dry) involute; sheaths sparsely to densely pilose; panicle 5-16 cm. long, 4-16 (-20) mm. thick, usually dense; racemes numerous, 3-7 cm. long, ascending or usually appressed; spikelets (not including hairs) 3-4.2 mm. long; first glume minute; second glume 3-nerved, densely covered with long silky whitish or purplish hairs that before drying are antrorse and much-exceed the spikelet but after drying are widely spreading and fluffy; sterile lemma 3-nerved (actually 5-nerved, another faint pair of nerves discernible along the margins), pubescent like the second glume but with a broad glabrous median stripe between the midnerve and the nearest lateral, this stripe more than half the total breadth of the lemma; fruit 3-3.5 mm. long. *Digitaria californica* (Benth.) Henr. Prairies, brush and rocky slopes in the Plains Country, Trans-Pecos, Edwards Plateau and Rio Grande Plains, frequent, infrequent and locally e. to n.-cen. Tex., spring-fall; Okla. and Colo. to Ariz. and s. to s. Mex.; also s. S. A.

The color of the spikelet-pubescence is very variable. The plants of low, coastal areas in the Rio Grande Plains have usually broader leaves and more densely pilose sheaths, on the average, than the plants of west Texas.

4. *Trichachne Hitchcockii* (Chase) Chase. Tufted perennial from pubescent slightly knotty bases; culms 20-55 cm. long, 0.5-1 mm. thick, erect, slightly geniculate at the lower nodes, sparingly branched; ligule a hyaline scale 1-2 mm. long; blades 2-6 cm. long, 2-3 mm. broad, flat, the margins usually crisped; panicles 5-11 cm. long, 5-10 cm. broad; racemes 1-3 (-8) cm. long, spreading or rarely ascending or erect; spikelets 2.5-3.8 mm. long; first glume 0.3-1 mm. long; second glume 3-nerved, densely silky-pubescent on the internerves with the hairs rather short; sterile lemma 5-nerved, densely silky-pubescent on all the internerves; fruit 2.1-3.5 mm. long. *Digitaria Hitchcockii* (Chase) Stuck. Rocky usually calcareous slopes, Trans-Pecos and w. Edwards Plateau, infrequent to rare, summer-fall; Tex. to Tam. and S. L. P.

51. DIGITARIA FABR. CRABGRASS

Panicles of several long linear spikelike racemes either in one whorl or attached to the short axis at more than one level; spikelets with a single perfect floret [and the remains (sterile lemma) below the perfect floret and above the glumes of a sterile floret], very slightly dorsally compressed, appressed in 2 rows along 1 side of the flattened and/or winged rachis of the raceme, paired, 1 spikelet of each pair on a minute pedicel, the other nearly sessile; zone of abscission at the base of the spikelet; first glume abaxial (away from the rachis), minute or obsolete; second glume appressed to the rachis and to the convex fertile lemma, minute or as large as the spikelet, usually several-nerved and with some pubescence on the internerves; sterile lemma (when the first glume obsolete this appearing as the second glume) abaxial, appressed to the flat back of the palea ("fruit"), usually several-nerved and pubescent on the internerves, as large as the spikelet; lemma convex, thin-cartilaginous but not indurate, white to brown or gray or black, usually shiny and glabrous, usually minutely rugose or punctulate, lance-elliptic, pointed, the edges revolute and enclosing the margin of the palea; palea flat, similar in texture to the lemma and held closely by its margins; the lemma and its enclosures constitute the "fruit" although the true fruit is the caryopsis or grain within.

A genus of several hundred species in warm regions, sometimes made to include the related genera *Trichachne* and *Leptoloma*. The introduced annual crabgrasses, *D. sanguinalis*, and the more abundant native *D. adscendens* and *D. diversiflora* are persistent and pernicious weeds in the loamy soil of plowed fields, lawns and flowerbeds.

1. Glume (i.e., the "second" glume, the first being obsolete) equaling or slightly surpassing the fruit, pilose when mature; stoloniferous or often subrhizomatous perennial of sandy soils of southern Texas7. *D. texana*.
1. Glume (true second glume of *D. sanguinalis*, *D. adscendens* and *D. diversiflora*) slightly or greatly shorter than the fruit, if nearly as long then the plants annual and/or the fruit darkly pigmented (2)
- 2(1). First glume present, i.e., a minute scale present on the flat abaxial side of the spikelet at the base of the sterile lemma (3)
2. First glume absent, i.e., only 2 scales subtending the fruit, namely the "second" (actually first) glume on the convex side toward the rachis and the sterile lemma on the flat side (5)
- 3(2). Sterile lemma of lower spikelet of a pair with 5 equidistant nerves, glabrous or minutely pubescent on 2 of the lateral internerve spaces; first glume of lower spikelet round or truncate, 0.3 mm. long or less; sterile lemma of upper spikelet of a pair densely ciliate-fimbriate on 2 of the lateral internerve spaces, this fringe conspicuous after anthesis at which time it is widely spreading
.....3. *D. diversiflora*.
3. Sterile lemma of lower spikelet of a pair with the internerve spaces next the midnerve noticeably wider than those nearer the sides; sterile lemma of both spikelets of a pair glabrous or variously pubescent in some of the lateral internerve spaces (4)
- 4(3). Spikelet 2.3-3.2 mm. long; second glume 1-1.9 mm. long, thus a third to three fifths as long as spikelet; the 4 lateral nerves of the sterile lemma nearest the midnerve (as seen under a strong lens) scabrous with a row of minute pointed cilia; blades usually densely papillose-pilose like the sheaths1. *D. sanguinalis*.
4. Spikelet 2.6-3.5 mm. long; second glume (1.5-) 1.8-2.3 mm. long, thus half to four fifths as long as the spikelet; the 4 lateral nerves of the sterile lemma nearest the midnerve (as seen under a strong lens) usually perfectly smooth; blades essentially glabrous or sparsely papillose-pilose (especially near the ligule) in contrast to the almost always papillose-pilose sheaths
.....2. *D. adscendens*.
- 5(2). Rachis of raceme broadly triangular in transection, the margin (if any) much narrower than the central rib; plants perennial but flowering the first year
.....6. *D. filiformis*.
5. Rachis of raceme with thin margins or wings as broad as the central rib or a little broader; plants annual (6)
- 6(5). Sheaths pilose; "second" glume a fourth to a sixth as long as the spikelet
.....4. *D. serotina*.
6. Sheaths not pilose or very sparsely so; "second" glume at least two thirds as long as the spikelet5. *D. violascens*.

1. *Digitaria sanguinalis* (L.) Scop. NORTHERN CRABGRASS. Tufted and/or usually stoloniferous annual freely rooting at the nodes; culms 15-90 cm. long, 1-3 mm. thick, usually long-decumbent, ascending only at the ends; ligule a thin scale 1-2 mm. long; blades 2-7 cm. long, 3-10 mm. broad, flat, usually crisped, sparsely or usually densely papillose-pilose; sheaths papillose-pilose; panicle axis 1-15 (-30) mm. long; racemes 2 to 11, 4-12 cm. long, 1-2 mm. thick, often purplish, the wing of the rachis as broad as the central rib; spikelet 2.3-3.2 mm. long; first glume present but minute; second glume 1-1.9 mm. long, narrow, a third to three fifths (usually half) as long as the spikelet; sterile lemma as long as the spikelet, usually with a sparse short antrorse-appressed silky fringe on the margins and the 2 to 4 lateral nerves usually with minute inflexible pointed cilia (as seen under a powerful lens); "fruit" often pale-plumbeous. Disturbed soil along roads, in fields and gardens, frequent in the Plains Country and infrequent to Trans-Pecos, n.-cen. and e. Tex., s. as far as Travis and Gonzales cos., summer-fall; s. Can., N. E. s. to Va., w. and s.w. to Wash., Calif. and Tex.; scattered in U.S.; also Son., Chih. and Dgo.; introd. from n. Eur., now widespread in temp. areas.

2. *Digitaria adscendens* (H.B.K.) Henr. SOUTHERN CRABGRASS. Tufted annual and/or usually stoloniferous, freely rooting at the lower nodes; culms 2-6 dm. long, 1-3 mm. thick; blades 2-10 (-20) cm. long, 3-10 mm. broad, flat, usually crisped, glabrous or occasionally sparsely papillose-pilose; sheaths nearly glabrous to usually papillose-pilose; panicle axis 1-15 (-30) mm. long; racemes 3 to 5 (to 10), 3-10 (-16) cm. long, 1-2 mm. thick, the wing of the rachis as broad as the central rib; spikelets 2.6-3.5 mm. long; first glume of lower spikelet of the pair obtuse or acute, about 0.3 mm. long; second glume (1.5-) 1.8-2.3 mm. long, half to four fifths (usually two thirds) as long as the spikelet; sterile lemma of both spikelets of a pair as long as the spikelet, with inconspicuous antrorse appressed fringes laterally and 5 to 7 smooth nerves, the 2 internerve spaces nearest the midnerve glabrous and noticeably wider than the spaces nearer the margin. *D. marginata* Link, *D. fimbriata* Link, *D. Nealleyi* Henr. (*fide* Swallen). Disturbed loamy soils along roads, in fields and gardens, frequent in n.-cen., e. and s.e. Tex., infrequent w. to the Trans-Pecos and rare in the Rio Grande Plains, summer-fall; warm-temp. areas, perhaps introd. in the New World, now common n. to Va. and the Gulf States, Ark. and Tenn., casual n. to N. E., Mo., Neb. and Ut.; s. in the highlands to cen. and s. Mex.; also S. A. and W. I.

Some few specimens of southern crabgrass recombine the species-characters of leaf pubescence, ciliation of sterile lemma and relative length of second glume that usually distinguish this species from *D. sanguinalis*. These plants may be interpreted as the products of past hybridization.

3. *Digitaria diversiflora* Swall. TROPICAL CRABGRASS. Tufted annual and/or usually stoloniferous, freely rooting at the nodes; culms 3-10 dm. long, 1-3 mm. thick, usually long-decumbent, ascending only at the ends; ligule a thin scale 1-3 mm. long; blades 2-12 (-25) cm. long, 3-6 (-10) mm. broad, flat, usually crisped, glabrous or occasionally sparsely papillose-pilose; sheaths nearly glabrous or papillose-pilose; panicle axis 1-15 (-45) mm. long; racemes 2 to 5 (to rarely 9), 3-10 (-16) cm. long, 1-2 mm. thick, usually stramineous, the wing of the rachis as broad as the central rib; spikelets 2.5-3.1 mm. long; first glume of lower spikelet of the pair round or truncate, 0.3 mm. long or less; second glume 1.8-2.3 mm. long, narrow, half to four fifths (usually two thirds) as long as the spikelet; sterile lemma as long as the spikelet, that of the lower spikelet of the pair with 5 conspicuous strong glabrous or nearly glabrous nerves that are nearly equidistant from each other (the lateral internerve spaces occasionally with some antrorse hairs); sterile lemma of the pedicelled spikelet with coarse ciliate fringes in the lateral internerve spaces, the cilia antrorse-appressed at anthesis, eventually on drying spreading at right angles, comblike; "fruit" usually stramineous. Disturbed usually loose sandy soils along roads, in fields and gardens, and in overgrazed prairies, abundant in Rio Grande Plains, summer-fall; trop. Am. lowlands n. to Cuba, Tex. and Son., probably indigenous.

4. *Digitaria serotina* (Walt.) Michx. DWARF CRABGRASS. Loosely tufted or usually stoloniferous annual freely rooting at the nodes; culms 3-10 dm. long, about 1 mm. thick, long-decumbent, ascending only at the ends; ligule a thin scale 1-2 mm. long; blades 1-3 (-5) (-8?) cm. long, 2-5 (-7) mm. broad, flat, papillose-pilose; sheaths densely pilose; panicle axis 1-5 (-9) mm. long; racemes 3 to 5, 4-7 cm. long, about 1 mm. thick, pale-stramineous, the narrow wings of the rachis as broad as the central rib; spikelets about 1.7 mm. long; first glumes absent; second glume about 0.3 mm. long, a fourth to a sixth as long as the spikelet; sterile lemma as long as spikelet, very finely pubescent on the internerves; "fruit" very pale. Rare and local in sandy soils, e. Tex. (Brazos Co.), fall; Coastal States, Pa. to Tex.; also Cuba.

5. *Digitaria violascens* Link. Tufted annual, rarely shortly stoloniferous at the base; culms 25-70 cm. long, 1-2 mm. thick, basally somewhat genuflexed; ligule a thin scale 1-2 mm. long; blades aggregated toward the base of the plant, 2-6 (-12) cm. long, 3-6 mm. broad, flat, these and the sheaths very sparsely pilose or essentially glabrous; panicle axis 1-9 (-15) mm. long; racemes 2 to 6, 3-5 (-9) cm. long, 1 mm. thick, the wings of the rachis as broad as the central rib; spikelets 1.5-1.7 mm. long; first glume absent; second glume (1-) 1.2-1.5 mm. long, at least two thirds as long as spikelet, very finely pubescent on the internerves; sterile lemma as long as spikelet, very finely pubescent on the internerves; "fruit" purplish-black, very finely punctulate and shiny. *D. floridana* Hitchc. Disturbed openings in pine forest, e. and s.e. Tex., infrequent, summer-fall; warm

parts of the world, nat. to s.e. Asia, in Am. n. to the Gulf States; casual in Ark. and Ky.

6. *Digitaria filiformis* (L.) Koel. Tufted perennial but flowering the first year; culms 1-15 dm. long, 1-3 mm. thick, stramineous, usually erect, less commonly very shortly genuflexed basally, essentially unbranched; ligule a thin scale 1-2 mm. long; blades 10-25 cm. long, 2-6 mm. broad, flat, the lower ones softly pilose as are the sheaths but not so densely as the sheaths and (like the sheaths) commonly turning purplish; panicle axis 2-8 cm. long; racemes (2 to) 4 to 8, (4-) 6-20 (-25) cm. long, about 1.5 mm. thick, the rachis broadly triangular and commonly somewhat arcuate-zigzag; spikelets 1.8-2.8 mm. long; first glume absent; second glume 1.3-2.6 mm. long, about five sixths the length of the spikelet, villosulous on the internerves, some of the white hairs thicker apically than basally or even capitellate; sterile lemma as long as the spikelet, pubescent like the second glume; "fruit" purplish-brown or purplish-black, punctulate and shiny. Incl. var. *villosa* (Walt.) Fern. (this being the name given to the more robust plants with larger panicles and spikelets 2.3-2.8 mm. long), *D. villosa* (Walt.) Pers. Frequent in forest-openings on sandy soil, e. and s.e. Tex., summer-fall; Gulf States and n. to Ia., Mich. and Vt. (behaving mostly as an annual n. of Okla., Ky. and Va.); Cuba; Mex.

7. *Digitaria texana* Hitchc. Long-stoloniferous or long-subrhizomatous perennial (?); culms 5-10 dm. long, 2-3.5 mm. thick, the part that creeps on or is slightly beneath the surface of the sand more slender and ascending toward the end; ligule a thin scale 1-3 mm. long; blades 4-20 cm. long, 2.5-6 mm. broad, flat, pointed, nearly glabrous or the lower ones somewhat pilose; lower sheaths usually densely pilose (eventually glabrate), the upper ones less pilose or even glabrous; panicle axis 6-76 mm. long; racemes 4 to 15 per panicle, 4-15 cm. long, about 1 mm. thick, the rachis very narrow and somewhat curviflexuous; spikelets 2.2-3.4 mm. long; first glume absent or vestigial; second glume 2.2-3.5 mm. long, completely covering the convex side of the fruit and equaling or barely surpassing it in length, pilose on the internerves when quite dry and mature but before maturity the hairs appressed-antrorse and inconspicuous; sterile lemma equaling second glume and similarly pubescent (except the 2 internerves nearest the midnerve glabrous); fruit plumbeous to stramineous. *D. Runyonii* Hitchc. Sandy prairies near the coast, Rio Grande Plains n.e. to s. part of s.e. Tex. (Calhoun Co.), infrequent, fall, winter and early spring; endemic.

The plants from farthest inland (Brooks and Kenedy cos.) have spikelets averaging only 2.2-2.4 mm. long; those from near the coast (*D. Runyonii*) have spikelets averaging larger, but there are no other correlated differentiating characters.

52. LEPTOLOMA CHASE

About 5 species, one in North America, the rest in Australia.

1. *Leptoloma cognatum* (Schult.) Chase. FALL WITCHGRASS. Perennial from pubescent knotty bases, the lower parts of the culms either erect or commonly briefly or lengthily rhizomatous; aerial culms 2-5 dm. long, 1-2 mm. thick, ascending, not or sparingly branched; ligule a scale 1-2 mm. long; blades 2-8 (-16) cm. long, 2-6 mm. broad, mostly flat, nearly glabrous like the upper sheaths (or, in Rusk and Nacogdoches cos. in e. Tex. populations densely pilose on blades and sheaths); panicle when mature 12-20 cm. long, 12-25 cm. broad, the branches widely divaricate but at anthesis much smaller and partially included in the uppermost sheath, after anthesis the much-elongating culm drying and breaking, the mature panicle blowing before the wind as a "tumbleweed"; principal panicle branches numerous, distally broadly triangular and rachislike, terminating in a spikelet and bearing along the length from the abaxial side in two rows 1 to several pedicelled solitary spikelets; pedicels capillary, divaricate; zone of abscission at the base of the spikelet; spikelets 2.3-3.6 (-4.3) mm. long, about 1 mm. broad, plano-convex; first glume minute, nearly obsolete; second glume and sterile lemma equaling fruit, several-nerved, the internerves pubescent, the pubescence antrorse-appressed before maturity but upon drying spreading and fluffy; "fruit" lanceolate, consisting of a glabrous shiny cartilaginous but not indurate convex lemma whose edges clasp the margins of the palea which has the same texture, the fruit pale or in some populations turning brown or blackish. *L. arenicola* Swall., *Digitaria cognata* (Schult.) Pilg., *D. arenicola* (Swall.)

Beetle. Nearly throughout Tex., most abundant in loose sandy prairies on the Coastal Plain and in n.-cen. Tex., frequent elsewhere; N.H. to Minn., s. to Fla. and Tex., w. to Ariz.

In tight soil the rhizomes are short or are not noticeable; they become well-developed in loose sand.

53. STENOTAPHRUM TRIN.

About 7 species in warm regions, possibly all South American in origin.

1. *Stenotaphrum secundatum* (Walt.) O. Ktze. ST. AUGUSTINE GRASS. Perennial, long-creeping and stoloniferous, the stolons 1-10 dm. long; floriferous culms 1-4 dm. long, compressed, about 2 mm. thick on the long axis, erect, unbranched; ligule a fringe 0.2-0.3 mm. long; blades 2-10 cm. long, 4-10 mm. broad, flat or folded, blunt; inflorescence a solitary erect terminal raceme 5-10 cm. long, with a tough fleshy articulated rachis 3-5 mm. broad, the usually paired spikelets in 2 rows, appressed and sunken into 1 side of the rachis, 1 member of each pair sessile, the other (often obsolete or absent) on a short pedicel along the margin of the rachis; spikelets persistent in the articles of the rachis (that abscises tardily near the base of each pair of spikelets), strongly dorsally compressed, 4-5 mm. long, with a single fertile floret, subtended by the remains of a reduced floret (a sterile lemma) and 2 glumes; first glume minute, abaxial; second glume as large as the "fruit" and adaxial, hidden between the fruit and the rachis; sterile lemma as large as the fruit and abaxial; fruit consisting of the slightly cartilaginous broadly lanceolate lemma with revolute margins clasping the palea of the same texture. Widely cult. for lawns in Tex., with slight tendency to escape though commonly not persistent outside of cult.; trop. Am., n. to S.C. and the Gulf States, especially near the coast.

This lawn grass is commonly but mistakenly called "carpet grass," a name best reserved for *Axonopus*.

54. ERIOCHLOA H. B. K. CUPGRASS

Tufted annuals or perennials; inflorescence an elongate panicle of racemes attached in 2 rows along 1 side of a more or less flattened axis (or on 2 sides when the axis is vaguely broadly triangular in transection); racemes with more or less flattened (or in transection broadly triangular) rachises; zone of abscission at the base of the spikelet below the callus; spikelets attached in 2 rows abaxially on the rachis, strongly dorsally compressed, each with one perfect floret, solitary or paired or at the bases of the raceme in racemelets of 3 (in extralimital species the basal racemelets have up to 15 spikelets in 2 rows along the abaxial side of a flattened rachilla, the "raceme" then being a small panicle), commonly the uppermost spikelets solitary even when the lower ones are paired and the pedicelled one slightly larger than the sterile one of the same pair; first glume truncate, about 0.1 mm. long, discolored, closely investing the minute swollen portion of the rachilla below the second glume, the swelling and the glume constituting the "callus"; second glume as large as the spikelet, abaxial, marginally often revolute; sterile lemma toward the rachis, nearly as large as the second glume; fertile lemma abaxial, thin-cartilaginous but not indurate, stramineous, elliptic-oblong, shorter than the second glume, marginally revolute and clasping the palea of the same texture, superficially with microscopic transverse rugae or punctulate and apically mucronate or with an antrorsely scabrous awn.

About 20 species in warm regions. The spikelet measurements given below do not include the "callus".

1. Spikelets all solitary, never paired; racemes few, remote on the panicle axis, scarcely overlapping; leaves distinctly involute 4. *E. sericea*.
1. Spikelets paired or in triplets on at least the lower parts of some racemes; racemes overlapping; leaves flat or eventually loosely involute (2)

- 2(1). Fertile lemma with a mucro 0.05-0.1 (-0.2) mm. long; spikelets abruptly acuminate to a short point; blades usually glabrous 3. *E. gracilis*.
2. Fertile lemma with an awn 0.3-1.5 mm. long; spikelets sharp-pointed or long-acuminate; blades glabrous or pubescent (3)
- 3(2). Plant annual; foliage finely pubescent (as seen under a lens), rarely glabrate; spikelets distinctly acuminate to a very fine point, usually greenish; fertile lemma with an awn 0.3-0.8 (-1) mm. long 2. *E. contracta*.
3. Plant perennial (but flowering the first year); foliage essentially glabrous; spikelets slightly acuminate or usually merely tapered to a point, usually with a purplish tinge; fertile lemma with an awn 0.9-1.5 mm. long . . 1. *E. punctata*.

1. *Eriochloa punctata* (L.) Desv. Tufted weak perennial but flowering the first year; culms 3-10 dm. long, 2-5 mm. thick, commonly geniculate and stoloniform basally, distally ascending, leafy; ligule a fringe about 1 mm. long; blades (3-) 10-27 cm. long, 3-10 mm. broad, mostly flat or folded, essentially glabrous; panicle dense and elongate with numerous broadly overlapping ascending racemes; pedicels merely scabrous, without any longer hairs; spikelets solitary or paired or in threes, 4-6 mm. long, tapered to the slightly or not acuminate apex, purplish when mature; fertile lemma with an awn 0.9-1.5 mm. long. Tight loamy moist soil near ponds or seasonally muddy areas, s.e. Tex. and coastal parts of the Rio Grande Plains, frequent, spring-fall; warmer parts of Am., n. to La. and Tex.

Some plants seem intermediate between this species and *E. contracta*.

2. *Eriochloa contracta* Hitchc. PRAIRIE CUPCRASS. Tufted annual; culms 2-8 dm. long, 1-4 mm. thick, geniculate and infrequently shortly stoloniform basally, mostly ascending, leafy; ligule a fringe 1-2 mm. long; blades 3-20 cm. long, 2-6 mm. broad, mostly flat or folded, or eventually involute, shortly pubescent (like the sheaths); panicle narrow, with overlapping erect racemes; pedicels scabrous and also apically with some long erect cilia a third to half as long as the spikelet; spikelets solitary or paired, (3.1-) 3.7-4 (-5) mm. long, somewhat shaggy-pubescent, acuminate to a long fine point, greenish to stramineous at maturity; fertile lemma with an awn 0.3-0.8 (-1) mm. long. Tight loamy usually seasonally moist soil near swales in prairies and at edges of fields and roadsides and lawns, frequent, s.e. Tex. and Rio Grande Plains n. to n.-cen. Tex., infrequent w. to e. Plains Country, spring-fall; Neb. s. to Tex. and La., w. to Colo. and Ariz.; adv. in Mo. and Va.

Some plants seem intermediate between this species and *E. gracilis*.

3. *Eriochloa gracilis* (Fourn.) Hitchc. Tufted annual; culms 2-8 dm. long, 1-4 mm. thick, often geniculate and rarely shortly stoloniform basally, mostly ascending, leafy; ligule a fringe 1-2 mm. long; blades 3-20 cm. long, 3-13 mm. broad, mostly flat, usually glabrous, less commonly finely pubescent; panicle narrow, with overlapping ascending racemes; pedicels scabrous and also with longer arcuate-erect hairs about half as long as the spikelet; spikelets solitary or paired, 3-4.3 mm. long, somewhat shaggy-pubescent, abruptly acuminate to a very short point (the angle below the point being blunt), greenish to stramineous; fertile lemma with a mucro 0.05-0.1 (-0.2) mm. long. Incl. var. *minor* (Vasey) Hitchc., *E. Lemmonii* var. *gracilis* (Fourn.) Gould. Disturbed areas in seasonally moist gravelly loam in the Trans-Pecos; w. Okla. and Calif. s. to cen. Mex.

4. *Eriochloa sericea* (Scheele) Munro. Tufted perennial; culms 4-8 dm. long, 1-2 mm. thick, erect, leafy; ligule a fringe about 1 mm. long; blades 1-3 dm. long, 1.5-3.5 mm. broad, flat at first but soon involute, mostly erect or ascending, with dense short soft pubescence; panicle very narrow, with few erect remote short racemes rarely overlapping; pedicels scabrous and also with many arcuate-erect soft hairs half to three fourths as long as the spikelets; spikelets always solitary, 3.5-5 mm. long, shaggy-pubescent, acute, whitish; fertile lemma with a mucro 0.05-0.1 mm. long. Well-drained prairies and brushy rocky slopes of tight loamy soil, n.-cen. Tex. and e. Plains Country, s. to Rio Grande Plains and e. Edwards Plateau, infrequent, also in pockets of prairie in e. Tex. (Leon Co.), rare, spring-fall; also Okla.

55. BRACHIARIA GRISEB.

Leaves broad and flat; inflorescence a panicle of spiciform racemes that are subsecund on a flattened twisted axis; racemes with flattened and (in some species) more or less winged rachises; zone of abscission at the base of the spikelet; spikelets solitary (in extralimital species rarely in pairs or racemes even with secondary racemelets basally) in 2 rows on the abaxial side of the rachis, plano-convex (*B. ciliatissima*) or dorsally much-compressed (*B. platyphylla*); first glume smaller than the spikelet but present, turned toward the rachis; second glume as long as the spikelet and with the same shape, abaxial; sterile lemma adaxial, as large as the spikelet, with a membranous palea in the axil, this lower floret either neutral (*B. platyphylla*) or bearing the 3 stamens (*B. ciliatissima*); fertile lemma abaxial, cartilaginous-indurate, marginally revolute and enclosing the palea of the same texture, surficially with irregular microscopic transverse rugae.

A genus of perhaps 50 species in warm regions. The species included here are very dissimilar and are perhaps severally more closely related to species here included in *Panicum* (near *P. fasciculatum*) than they are to each other. Certain species of *Panicum* (*P. reptans*, *P. purpurascens*, *P. obtusum*) have been referred to *Brachiaria* by some authors. The single character of the orientation of the spikelets, with the fertile lemma abaxial as in *Eriochloa*, is the only character separating the genus from *Panicum*, although our two species are remarkable also in having only solitary spikelets.

1. Spikelets pubescent, not much-compressed; lower floret staminate; first glume more than half as long as the spikelet; long-stoloniferous perennial; racemes very short, few-flowered, erect 1. *B. ciliatissima*.
1. Spikelets glabrous, dorsally much-compressed; first glume less than half as long as the spikelet; tufted annual; racemes elongate, several-flowered, mostly not erect ..
..... 2. *B. platyphylla*.

1. *Brachiaria ciliatissima* (Buckl.) Chase. Long-stoloniferous perennial; culms 3-20 dm. long, 1-2 mm. thick, decumbent, branched, freely rooting at the bearded nodes, ascending only shortly at the floriferous ends; ligule a fringe about 0.5 mm. long; blades 2-5 (-9) cm. long, 2-5 mm. broad, flat, pointed, white-margined, marginally pilose; sheaths pilose; panicles 2-6 cm. long, 3-5 mm. broad; racemes 3 to 8, short and few-flowered, ascending or usually erect, with narrow rachises that are triangular in trans-section; spikelets not much-compressed, usually appearing turgid, 3-4 mm. long; first glume three fourths the length of the spikelet, glabrous; second glume with dense soft white spreading pubescence; "sterile" (lower) lemma with such pubescence only marginally and enclosing 3 stamens between it and the "sterile" palea; fruit 2.5-3 mm. long. Sandy prairies, abundant in Rio Grande Plains, s. part of s.e. Tex. and Plains Country, less frequent in parts of e. and n.-cen. Tex., Edwards Plateau and n. Plains Country, spring-fall; s.-cen. Okla. and Tex.; Benton Co., Ark.

This is one of the nondescript ground-cover grasses commonly and mistakenly lumped under the name "mesquite" grass or "buffalo" grass in parts of Texas.

2. *Brachiaria platyphylla* (Griseb.) Nash. Tufted annual; culms 25-90 cm. long, 1-2.5 mm. thick, commonly genuflexed and stoloniferous basally but mostly ascending; ligule a fringe about 0.5 mm. long; blades 5-12 cm. long, 6-12 mm. broad, flat, glabrous; panicles 8-30 cm. long; racemes 3 to 7, long and many-flowered, usually somewhat spreading, with flat rachises about 2 mm. broad; spikelets compressed, appearing flattish, 4-4.5 mm. long; first glume about a third the length of the spikelet; second glume and sterile lemma as long as the spikelet, exceeding the fruit by 1-1.5 mm., glabrous, the portions extending beyond the fruit usually slightly wrinkled to reveal the transverse venation. Usually disturbed loamy soils in fields, gardens, along roads and in ditches, e. and s.e. Tex. and coastal parts of the Rio Grande Plains, infrequent, spring-fall; Ga., Fla., Mo., Ark., La., Okla. and Tex.; Cuba.

56. AXONOPUS BEAUV.

Tufted and usually stoloniferous perennials; blades broad and flat; floriferous culm at anthesis short, after anthesis greatly elongating, filiform; panicle a terminal pair of

ascending divergent linear spikes, with or without another 1 or 2 spikes attached to the axis subterminally; spikes with flattened or even narrowly winged rachises; zone of abscission at the base of the spikelet; spikelets solitary, in 2 rows on the abaxial side of (and appressed to) the rachis, considerably dorsally compressed; first glume absent; "second" (or only) glume abaxial (away from the rachis), as large as the spikelet; sterile lemma appressed to the rachis (sterile palea absent); fertile lemma oblong, abaxial, thin-cartilaginous but not indurate, the margins revolute and clasping the palea of the same texture; fertile floret perfect.

A genus of warm parts of America, with perhaps as many as 75 species. They are of considerable importance in pastures near the coast in east and southeast Texas.

- 1. Spikelets 4.5-6 mm. long; spikes about 2 mm. thick . . . 1. *A. furcatus*.
- 1. Spikelets 1.7-3 mm. long; spikes about 1 mm. thick (2)
- 2(1). Spikelets (2.3-) 2.5-3 mm. long 2. *A. compressus*.
- 2. Spikelets 1.7-2.2 mm. long 3. *A. affinis*.

1. *Axonopus furcatus* (Flügge) Hitchc. Stoloniferous perennial with floriferous tufts at the nodes; culms 4-10 dm. long, compressed, 2-4 mm. wide on the broad axis; ligule a minute firm scale or obsolete; blades 5-15 (-25) cm. long, 5-10 (-13) mm. broad, blunt; spikes 2, digitate, 4-10 cm. long, about 2 mm. thick; spikelets 4.5-6 mm. long, glabrous, apically pointed. Moist sand, e. and s.e. Tex., infrequent, summer-fall; Coastal States, Va. to Tex.; also Ark.

2. *Axonopus compressus* (Sw.) Beauv. Tufted perennial; culms 20-75 cm. long, compressed, about 2 mm. broad on the long axis, often rather long-stoloniferous basally, the tufted floriferous culms erect and unbranched; ligule a scale about 0.5 mm. long; blades 8-25 cm. long (shorter on stolons), 5-7 (-10) mm. broad; spikes 2 to 4, 4-10 cm. long, 1 mm. thick; spikelets (2.3-) 2.5-3 mm. long, minutely pubescent basally, apically pointed, the point prolonged beyond the blunt end of the fruit. Moist sand, s.e. Tex., rare (near Anahuac, Chambers Co.), mostly in the fall; widespread in warmer parts of Am., n. to Fla., La. and Tex.

3. *Axonopus affinis* Chase. CARPET GRASS. Tufted perennial; culms 20-75 cm. long, compressed, about 2 mm. broad on the long axis, often rather long-stoloniferous basally, forming carpets but the tufted floriferous culms erect and unbranched; ligule a scale about 0.3 mm. long; blades 6-17 (-28) cm. long, shorter on the stolons, 3-6 (-9) mm. broad, flat, blunt; sheaths keeled; spikes 2 to 4, 2-10 cm. long, about 1 mm. broad; spikelets 1.7-2.2 mm. long, very minutely pubescent around the edges, apically rather blunt, the "second" glume not much if any prolonged beyond the fruit. Moist sand, openings in forests, roadsides, etc., e. and s.e. Tex., very frequent, spring-fall (in Calhoun, Jackson and Aransas cos. even as late as Dec. and as early as Feb.); widespread in warmer parts of Am. n. to N.C. and Gulf States, Ark. and Okla.

57. PASPALUM L. PASPALUM

Ligule a scale; inflorescence a panicle of 1 to several racemes on the common axis; raceme with a more or less flattened rachis; the numerous spikelets borne in pairs or singly in 2 rows on the abaxial side of the rachis, the pedicels of the pairs short and unequal in length; zone of abscission at the base of the spikelet at the end of the pedicel; spikelets each with a single perfect floret subtended by 2 or 3 scales, when 3 then the lowest one being a minute abaxial first glume; next highest one the adaxial second glume as large or nearly as large as the spikelet; the abaxial sterile lemma representing the sole remains of a neutral lower floret; fertile lemma adaxial, chartaceous-indurate, convex, the margins revolute, clasping the fertile palea of similar texture, the fertile lemma and palea and their enclosures and appendages constituting the "fruit."

A genus of about 250 species in warm regions. Most Paspalums are of great economic importance as forage plants.

- 1. Racemes 20 to 50 per panicle, eventually deciduous from the panicle axis; attached and floating aquatics; spikelets solitary, 1.2-1.7 mm. long, pubescent
- 22. *P. fluitans*.

1. Racemes fewer, persistent (2)
- 2(1). "Second" (only) glume and sterile lemma abruptly pointed beyond the blunt fruit (3)
2. Second (only) glume and sterile lemma not abruptly pointed beyond the fruit (5)
- 3(2). Spikelets solitary (that is, not paired) and glabrous; fruit with microscopic cilia apically20. *P. acuminatum*.
3. Spikelets paired and silky-fringed (4)
- 4(3). Racemes (8 to) 12 to 22 per panicle; spikelets 2-3 mm. long 11. *P. Urvillei*.
4. Racemes 3 to 6 (to 11) per panicle; spikelets 2.8-4.1 mm. long 12. *P. dilatatum*.
- 5(2). Spikelets 3.6-5 mm. long (6)
5. Spikelets less than 3.6 mm. long (9)
- 6(5). Spikelets solitary (7)
6. Spikelets paired; fruit brown (8)
- 7(6). Nonrhizomatous (but culms long-decumbent); spikelets stramineous, pointed; plants of moist saline to brackish sands at edge of lagoons, bays and river mouths 19. *P. vaginatum*.
7. Sod-formers with masses of thick short branching rhizomes; spikelets greenish-stramineous, usually blunt; plants of sandy openings in forests or upland roadsides 23. *P. notatum*.
- 8(6). Spikelet pairs remote, usually not overlapping; first glume present on at least some of the spikelets; rachis of raceme 0.5-0.8 mm. broad 5. *P. bifidum*.
8. Spikelet pairs approximate, overlapping; first glume absent; rachis 1-1.5 mm. broad 6. *P. floridanum*.
- 9(5). All the spikelets solitary, never paired (10)
9. Some and usually nearly all the spikelets paired (17)
- 10(9). Spikelets 1.4-2.3 mm. long (11)
10. Spikelets 2.4-3.6 mm. long (13)
- 11(10). Panicle axis 30-80 mm. long; rachis 1.8-3 mm. broad, broadly winged 21. *P. dissectum*.
11. Panicle axis very short, to 2 mm. long; rachis 0.7-0.8 mm. broad, triangular in cross section (12)
- 12(11). Spikelets 1.9-2.3 mm. long, glabrous; raceme 2.5-7 cm. long 25. *P. minus*.
12. Spikelets 1.4-1.8 mm. long, pubescent; racemes 4-15 cm. long 26. *P. conjugatum*.
- 13(10). Panicle axis 3-10 (-19) cm. long; racemes 2 to 9 per panicle 13. *P. laeve*.
13. Panicle axis obsolete or only to 2.5 cm. long; racemes 1 to 3 per panicle (14)
- 14(13). Plants sod-forming or densely tufted from short branched rhizomes; rachis about 1 mm. broad; racemes nearly always 2, arched so that the spikelets are on the concave side of the arc (15)
14. Plants spreading, the culms long-decumbent and rooting at the nodes; racemes either spreading and straight or else reflex-arched so that the spikelets are on the convex side of the arc (16)
- 15(14). Sod-forming perennial from a mass of short thick branching rhizomes; blades mostly aggregated at ground level; spikelets broadly ovate to broadly obovate 23. *P. notatum*.
15. Densely tufted perennial shortly and slenderly subrhizomatous basally; culms leafy in the lower half 24. *P. alnum*.

- 16(14). Spikelets 2.5-3.2 mm. long; second glume minutely pubescent; first glume usually present 18. *P. distichum*.
16. Spikelets 3.1-4.5 mm. long; second glume nearly glabrous; first glume usually absent 19. *P. vaginatum*.
- 17(9). Fruits (fertile lemmas) brown or brownish-olive at maturity (18)
17. Fruits (fertile lemmas) whitish or stramineous at maturity (21)
- 18(17). Panicle axis 12-25 cm. long; racemes 7 to 25 per panicle; spikelets conspicuously pubescent; fruits pale-brown 10. *P. virgatum*.
18. Panicle axis to 13 cm. long; racemes 1 to 15 per panicle; spikelets essentially glabrous or minutely pubescent; fruits quite brown (19)
- 19(18). Perennial with long to very short rhizomes; rachis of raceme 0.5-1 mm. broad, broadly triangular in transection 7. *P. plicatulum*.
19. Annuals without rhizomes; rachis of raceme 1-2.5 mm. broad, with margins more or less winglike (20)
- 20(19). Rachis 2-2.5 mm. broad, remarkably winged; spikelets 2-2.3 mm. long 8. *P. Boscianum*.
20. Rachis 1-2 mm. broad, the winglike margins relatively narrow and interrupted by the zigzag central spikelet-bearing rib; spikelets 2.2-3 mm. long 9. *P. convexum*.
- 21(17). Rachis 0.4-1 mm. broad, triangular to broadly triangular in transection; first glume usually present (except in *P. setaceum*); axillary panicles often present in the uppermost sheaths in addition to the exerted terminal panicles (22)
21. Rachis 1.3-2.5 mm. broad, broadly triangular in transection or usually with narrow to broad winglike margins; first glume usually absent; axillary panicles absent (25)
- 22(21). Blades involute and the margins coalescent toward the tips 1. *P. monostachyum*.
22. Blades flat, the margins separate (23)
- 23(22). Spikelets 2.9-3.4 mm. long; racemes solitary, very rarely 2 per panicle 2. *P. unispicatum*.
23. Spikelets 1.5-2.8 mm. long; racemes often not solitary (24)
- 24(23). First glume usually present on at least one spikelet of every pair; spikelets with large sordid-brownish splotches all over 3. *P. Langei*.
24. First glume very rarely present; spikelets smooth or with merely small scattered brown points, mostly whitish or stramineous 4. *P. setaceum*.
- 25(21). Spikelets orbicular or suborbicular, glabrous 14. *P. praecox*.
25. Spikelets longer than broad (26)
- 26(25). Spikelets thickly turgidly plano-convex, usually pubescent; rachis rarely with purplish coloration; racemes only 1 to 6 per panicle . 17. *P. pubiflorum*.
26. Spikelets flatly compressed plano-convex; rachis usually with a distinct purplish color; racemes usually more numerous, 3 to 15 per panicle (27)
- 27(26). Spikelets (2.1-) 2.3-2.7 (-2.9) mm. long, glabrous 15. *P. lividum*.
27. Spikelets (2.2-) 2.5-2.9 (-3.2) mm. long, pubescent .. 16. *P. Hartwegianum*.

1. *Paspalum monostachyum* Vasey. Perennial from scaly creeping rhizomes 2-5 mm. thick; aerial culms 4-10 dm. long, 2-3 mm. thick, erect; ligule a scale about 2 mm. long (base of blade next to it with a fringe of long cilia); blades 15-60 cm. long, 1-2 mm. thick, strongly involute (the upper part with the two edges coalescent), tough and wiry; panicles terminal (rarely a short axillary one present from the same sheath as the primary terminal one); panicle axis (when the racemes not solitary) 10-35 (-95) mm. long, tough; racemes 1 or 2 (to 4), 8-30 cm. long; rachis about 0.8 mm. broad, triangular in transection; spikelets paired, 2.7-3.3 mm. long, usually obovate, plano-convex, apically blunt, stramineous, glabrous, on minutely pubescent pedicels; first glume usually present, small, triangular. Sandy prairies, s.e. Tex. and coastal parts of Rio Grande Plains, frequent, summer-fall; Fla., La. and Tex.

2. *Paspalum unispicatum* (Scribn. & Merr.) Nash. Perennial from short scaly rhizomes 2-4 mm. thick; aerial culms 2-8 dm. long, 1-2.5 mm. thick, erect; ligule a scale 1-3 mm. long (immediately juxtaposed portion of blade hirsute); blades 10-25 cm. long, 8-15 mm. broad, mostly flat or folded, sparsely to densely papillose-hirsute; panicles terminal and axillary; panicle axis (when (rarely) the racemes are not solitary) 1-2 cm. long; racemes solitary, very rarely 2 per culm, 6-20 cm. long; rachis about 1 mm. broad, triangular in transection; spikelets paired, 2.9-3.4 mm. long, obovate, plano-convex or somewhat concavo-convex, apically acute, stramineous, glabrous; first glume usually present, small, triangular. Sandy or loamy prairies, Rio Grande Plains (rare, Kleberg Co.), perhaps no longer a member of our flora, not collected since 1906, summer; Venez., Parag., Arg.; Cuba; e. Mex.

3. *Paspalum Langei* (Fourn.) Nash. Tufted perennial; culms 3-10 dm. long, about 1 mm. thick, erect, unbranched; ligule a sordid scale about 1 mm. long; blades 9-40 cm. long, 6-15 mm. broad, flat, pointed, marginally often crisped, nearly glabrous or (like the sheaths) with a few papillose cilia near the ligule, or minutely appressed-pubescent; panicles terminal and often in the same sheath a nearly hidden axillary one; panicle axis (when racemes not solitary) 3-8 (-12) cm. long; racemes 1 to 4 (or 5), 3-11 cm. long; rachis 0.4-0.6 mm. broad, triangular in transection; spikelets paired, rarely by abortion a few solitary in the same raceme, 2.1-2.6 (-2.8) mm. long, usually narrowly obovate, plano-convex, apically blunt, dark-stramineous with sordid-brown glandular splotches; first glume about a fourth as long as the spikelet, always present on at least one (usually both) spikelets of each pair, pubescent at least marginally and apically; second glume with minute spreading pubescence; sterile lemma usually pubescent like the second glume. Loamy soils, often in shaded areas, woods in stream bottoms, s.e. Tex., Rio Grande Plains and s. parts of e. Tex., frequent, spring-fall; widespread in trop. Am. n. to Fla., La. and Tex.

4. *Paspalum setaceum* Michx. Perennial from tufted knotty and shortly subrhizomatous branched bases; flowering culms 20-65 (-100) cm. long, 1-2.5 mm. thick, erect, unbranched; ligule a scale 0.2-0.3 mm. long (base of blade next to it usually pilose); blades 5-35 cm. long, 2-20 mm. broad, varying from very sparsely papillose-pilose along the margins to densely softly pubescent all over both surfaces, mostly flat or loosely folded; sheaths varying in pubescence like the blades; panicles axillary as well as terminal, the axillary ones often short and hidden in the sheaths; panicle axis (when racemes more than one) 10-65 mm. long; racemes 1 to 3 (or 4), 4-10 (-17) cm. long, often with long hairs in the axils, often weak and arcuate-nodding; rachis 0.5-1 mm. broad, triangular in transection; spikelets paired, (1.5-) 1.8-2.1 (-2.7) mm. long, ovate to obovate or usually suborbicular, turgidly plano-convex to plano-hemispheric, blunt apically, white to stramineous; first glume very rarely developed, when present narrowly triangular; second glume and sterile lemma glabrous to usually minutely pubescent all over. *P. ciliatifolium* Michx., *P. debile* Michx., *P. ciliatifolium* var. *Muhlenbergii* (Nash) Fern., *P. pubescens* Muhl., an illegit. name, *P. stramineum* Nash (*P. ciliatifolium* var. *stramineum* (Nash) Fern.), *P. rigidifolium* Nash, *P. separatum* Shinnars. Usually in sandy soil throughout the state except rare in Edwards Plateau and Trans-Pecos, most abundant in e. and s.e. Tex. and coastal parts of Rio Grande Plains, spring-fall; e. U.S. w. to Wisc., Neb., Kan., Okla. and Tex.; also Colo., N.M., Ariz., Son., Chih. and e. Mex.; C. A., W. I.

A common plant [var. *Muhlenbergii* (Nash) D. Banks] in east Texas combines some or all of the characters of robust habit, highly pubescent foliage, long racemes with little or no axillary hair and large, glabrous, orbicular spikelets. Other plants completely connect this variant with the average *P. setaceum* through recombination of characters. Nearly all of our plants are the var. *stramineum* (Nash) D. Banks.

5. *Paspalum bifidum* (Bert.) Nash. Perennial from rhizomes 3-4 mm. thick with pubescent scales; aerial culms 5-12 dm. long, 2-3 mm. thick, erect, unbranched; ligule a thin brownish scale 1-5 mm. long; blades 1-5 dm. long, 3-14 mm. broad, flat or folded, densely pilose at least near the ligule and often on both surfaces; sheaths pilose; panicle axis 12-20 cm. long; racemes 2 to 6, 4-16 cm. long, ascending or somewhat spreading; rachis 0.5-0.8 mm. broad, triangular in transection, often markedly zigzag; spikelets paired or by abortion a few solitary in the same raceme (the pairs remote from each other and not much if at all overlapping), 3.6-4.2 mm. long, ovate to obovate, brownish, turgidly plano-convex, glabrous; first glume present as a minute triangle at the base of

the sterile lemma; second glume and sterile lemma firm-membranous; fruit brownish-green or olivaceous. Incl. var. *projectum* Fern. In moist acid sand near bogs and open woods, infrequent or rare in e. Tex., Sept.-Oct.; Coastal States, from Va. to Tex. and inland to Ark. and Okla.

6. *Paspalum floridanum* Michx. Robust perennial from short rhizomes 3-6 mm. thick with pubescent scales; aerial culms (5-) 8-15 (-20) dm. long, 2-5 mm. thick, erect, unbranched; ligule a brownish scale 1-2 mm. long; blades 1-5 dm. long, 4-13 mm. broad, firm, flat or folded, glabrous to pilose; sheaths keeled, glabrous to pilose; panicle axis (when racemes not solitary) 4-13 (-20) cm. long; racemes (1 or) 2 to 4 (to 6), 4-15 cm. long, ascending or somewhat spreading; rachis 1-1.5 mm. broad, usually strongly zigzag, the central rib to which the pedicels are attached even more markedly zigzag, the very narrow margins thus interrupted; spikelets paired or by abortion some solitary on the same raceme, 3.6-5 mm. long, ovate to obovate, usually broadly so, brownish, turgidly plano-convex, glabrous; first glume always absent or present as a mere minute line at the base of the sterile lemma; second glume and sterile lemma firm-membranous, sometimes the latter slightly wrinkled; fruit pale-brownish. Incl. var. *glabratum* Engelm. Permanently or seasonally moist clay or sandy loam, e., s.e. and n.-cen. Tex. and extreme n.e. Rio Grande Plains, frequent, summer-fall; N.J. to Ill., Mo. and Kan., s. to the Gulf States.

7. *Paspalum plicatum* Michx. BROWNSEED PASPALUM. Tufted perennial with very short to rather elongate rhizomes basally; culms 3-8 dm. long, 1-2 mm. thick, unbranched; erect or occasionally basally decumbent and rooting at the nodes; ligule a thin brownish scale 2-3 mm. long; blades 1-4 dm. long, 2-4 (-6) mm. broad, flat or usually folded, or on drying loosely involute, usually pilose near the ligule; sheaths loosely keeled; panicle axis 5-13 cm. long, slender; racemes (2 or) 3 to 5 (to 8), 2-5 (-8) cm. long, arcuate, commonly spreading; rachis 0.5-1 mm. broad, triangular in transsection, olivaceous; spikelets paired or by abortion a few solitary in the same raceme, (2-) 2.3-2.9 (-3.1) mm. long, obovate, olive-brown, plano-convex; first glume always absent; second glume glabrous or microscopically pubescent; sterile lemma glabrous, often with several transverse wrinkles; fruit brown at maturity. *P. texanum* Swall. Sandy loam prairies and open woods, common in s.e. and e. Tex. and coastal part of Rio Grande Plains, infrequent w. to n.-cen. Tex. and n. Rio Grande Plains, spring-fall; widespread in warmer parts of Am., n. to Ga. and the Gulf States.

The elongation of the rhizomes is more pronounced in some populations (*P. texanum*) of moist, sandy soils in southeast Texas.

8. *Paspalum Boscianum* Flügge. BULL PASPALUM. Tufted annual; culms 3-10 dm. long, 2-7 mm. thick, ascending, often prostrate basally, rooting and genuflexed at the nodes, purple; ligule a brown scale 2-4 mm. long; blades 1-4 dm. long, 5-13 mm. broad, flat or folded, pilose near the ligule; lowermost sheaths inconspicuously pilose; axis of panicle 5-10 cm. long; racemes (2 to) 4 to 11 (to 15), 2-9 cm. long, ascending, arcuate, pilose in the axils; rachis 2-2.5 mm. broad, olivaceous, the pedicels attached in a narrow central rib, the marginal winglike portions mostly broader than the rib; spikelets paired or by abortion a few in the same raceme solitary, 2-2.3 mm. long, plano-convex, brownish, obovate-orbicular, glabrous; first glume always absent; second glume and sterile lemma thin; fruit brown and shining at maturity. Reported to occur in e. Tex., summer-fall; Coastal States, Va. to Tex. and inland to Tenn. and Ark.; W. I.

9. *Paspalum convexum* H.&B. Tufted annual; culms 10-75 cm. long, 1-2.5 mm. thick, mostly ascending, often the lower nodes geniculate; ligule a thin brownish scale about 2 mm. long; blades 5-23 cm. long, 3-11 mm. broad, flat, pilose at least on part of the upper surface; panicle axis (when racemes not solitary) 2-8 cm. long; racemes 1 to 4, 1-7 cm. long, spreading, pilose in the axils; rachis 1-2 mm. broad, the pedicel-bearing central rib zigzag from side to side, marginal winglike portions thus interrupted; spikelets paired, 2.2-3 mm. long, plano-convex, obovate-suborbicular, olive-brownish; first glume always absent; second glume and sterile lemma membranous, the former minutely pubescent; fruit brown at maturity. Disturbed sandy soil near roads, e. Tex., rare (Jasper Co.), summer-fall; widespread in Am. tropics n. to n. Mex.; introd. and probably not persistent in Tex.

10. *Paspalum virgatum* L. Robust tufted perennial; culms 1-2 m. long, 2-8 mm. thick, erect, unbranched; ligule a scale 0.5-2.5 mm. long; blades 30-75 cm. long, 10-25 mm.

broad, firm, flat, marginally serrulate, pilose near the ligule; sheaths pilose at the summit; axis of panicle 12-25 cm. long; racemes 7 to 25, 3-15 cm. long, ascending; rachis 1-1.5 mm. broad, purplish-olive or olive-purple, the central rib (to which the pedicels are attached) narrow, the winglike margins slightly broader than the rib, commonly with some few scattered cilia; spikelets paired, 2.5-3.2 mm. long, brownish or purplish-brown, elliptic to narrowly obovate, much-compressed, plano-convex; first glume always absent; second glume softly spreading pubescent, the hairs longer near the margin; sterile lemma often nearly glabrous; fruit pale-brownish. Moist clay loam, disturbed places, s. Rio Grande Plains, rare (Cameron Co.); widespread in trop. Am. n. to Tex. and Cuba.

11. *Paspalum Urvillei* Steud. VASEY GRASS. Tufted perennial, often shortly subrhizomatous basally; culms 7-20 dm. long, 2.5-8 mm. thick, mostly strictly erect; ligule a scale 3-6 mm. long (base of blade pilose); blades 1-4 dm. long, 4-13 mm. broad, flat, essentially glabrous except near the ligule; lowermost sheaths densely pilose; panicle axis 8-25 cm. long; racemes (8 to) 12 to 22, 2-13 cm. long, pilose at the axils; rachis about 1 mm. broad, greenish or purplish, flattened, the pedicels attached at the central rib, the marginal portions about as broad as the rib; spikelets paired, (2-) 2.2-2.7 (-3) mm. long, broadly obovate, greenish-stramineous, much-flattened, plano-convex, extended in the broad triangular point beyond the fruit; first glume always absent; second glume softly silky-pubescent, this pubescence much longer near the margins than in the center; sterile lemma nearly glabrous at the center; fruit elliptic-oblong, slightly obovate. Loamy disturbed usually very moist soil, e., s.e. and n.-cen. Tex., rare w. to Edwards Plateau, spring-fall; nat. of S. A., now distributed in N. A., n. to N.C., the Gulf States and Ark.; Calif.

12. *Paspalum dilatatum* Poir. DALLIS GRASS. Tufted perennial; shortly subrhizomatous basally; culms 3-15 dm. long, 2-6 mm. thick, erect or somewhat sprawling and slightly genuflexed and rarely rooting at the lower 1 or 2 nodes; ligule a scale 2-5 mm. long (base of blade pilose); blades 7-36 cm. long, 4-12 mm. broad, flat, essentially glabrous except near the ligule; lowermost sheaths pilose; panicle axis (3-) 5-10 (-15) cm. long; racemes 3 to 6 (to 11), 4-12 cm. long, pilose at the axils; rachis 0.8-1.7 mm. broad, greenish or purplish-olive, flattened, the pedicels attached at the narrow central rib, the marginal portions winglike and at least as broad as the rib; spikelets paired, (2.8-) 3.2-3.5 (-4.1) mm. long, basally obovate, greenish-stramineous, very flattened, compressed plano-convex, extended in a broad triangular point beyond the fruit; first glume always absent; second glume softly pubescent, shortly so in the middle but near the margins with a long silky fringe; sterile lemma softly pubescent; fruit nearly orbicular. Loamy disturbed soils, abundant in e., s.e. and n.-cen. Tex., infrequent in Rio Grande Plains, Edwards Plateau and Trans-Pecos, spring-fall; nat. of S. A., now rather widely distributed in warm-temp. areas n. to N.J., Tenn., Ark., Okla. and Ore.

A persistent weed in lawns, almost impossible to eradicate once it has become established.

13. *Paspalum laeve* Michx. Tufted perennial, very shortly subrhizomatous basally; culms 3-9 dm. long, about 2 mm. thick, erect, unbranched; ligule a brown scale 1-2 mm. long; blades 6-40 cm. long, 3-10 mm. broad, flat or folded, glabrous or pilose; sheaths somewhat keeled, glabrous or pilose; panicle axis 3-10 (-19) cm. long; racemes (2 to) 3 to 6 (to 9), 3-11 cm. long, spreading, pilose in the axils; rachis about 1 mm. broad, dark-olive-green, with a zigzag central rib, the pedicels attached on this rib where it is nearest the margin, the narrow winglike margins interrupted; spikelets solitary, 2.4-3.1 mm. long, very broadly obovate to orbicular, pale or stramineous-olive, plano-convex, blunt; first glume always absent; second glume and sterile lemma firm-membranous, glabrous. *P. longipilum* Nash, *P. circulare* Nash. Sandy loam, prairies and open forests, e. and s.e. Tex. and extreme n.e. Rio Grande Plains (Nueces Co.), infrequent, summer-fall; Coastal States, Mass. to Tex. and inland to O., Ind., Ill., Mo., Kan. and Okla.

14. *Paspalum praecox* Walt. Tufted perennial, very shortly rhizomatous basally, culms 5-15 dm. long, 1-3 mm. thick, erect, unbranched; ligule a brown scale 1-3 mm. long; blades 1-3 (-4) dm. long, 3-10 mm. broad, flat or usually folded, glabrous to pilose; sheaths glabrous to pilose, keeled; panicle axis 5-17 cm. long; racemes (2 to) 4 to 6 (to 9), 2-7 (-9) cm. long, arcuate, ascending or spreading, shortly bearded and sometimes also pilose at the axils; rachis 1.3-2 mm. broad, purplish-olive, with a broad central rib to which the pedicels are attached, the marginal winglike portions firm and narrower

than the central rib; spikelets paired or a few by abortion solitary on the same raceme, 2.2-3.2 mm. long, orbicular to suborbicular, yellowish-green, occasionally with a purplish-tinge, highly compressed plano-convex; first glume always absent; second glume and sterile lemma membranous, glabrous. *P. lentiferum* Lam. Sandy loam, open pine flats, s.e. Tex., infrequent, summer-fall; Coastal States, Va. to Tex.

15. *Paspalum lividum* Trin. LONGTOM. Tufted perennial; culms 50-175 cm. long, compressed, 2-4 mm. thick on the long axis, often basally decumbent and freely rooting for up to 1 m., then ascending at the floriferous ends; ligule a scale 1-3 mm. long; blades 10-23 cm. long, 3-5 mm. broad, flat or folded; panicle axis 3-12 cm. long, curviflexuous; racemes 3 to 8, 15-50 mm. long, ascending and curved, floriferous to the base, the lower racemes with a few hairs in the axils; rachises 1.5-2.5 mm. broad, thin, purplish-olive to olive-purple, rather elongate, spreading, the rather elongate spreading pedicels attached along a very narrow central rib, the lateral portions of the rachis foliaceous and winglike and usually sparsely papillose-pilose marginally; spikelets paired or rarely a few also solitary in the same raceme, (2.1-) 2.3-2.7 (-2.9) mm. long, obovate, bluntly pointed, with nearly parallel plane surfaces or at least very compressed plano-convex, yellowish-green or occasionally with a purplish cast; first glume always absent; second glume and sterile lemma essentially glabrous. Moist tight clay loam in ditches, tanks, resacas and shallow lakes, s.e. Tex. and coastal parts of Rio Grande Plains, frequent, spring-fall; widespread in warmer parts of Am., n. to Ala., La. and Tex.

16. *Paspalum Hartwegianum* Fourn. Tufted stoloniferous perennial; floriferous culms 5-15 dm. long, slightly compressed, 2-5 mm. thick on the long axis; ligule a scale 1-3 mm. long; blades 10-35 cm. long, 2-6 mm. broad, flat or folded; sheaths keeled; panicle axis 5-15 cm. long, mostly straight and slender; racemes (3 or) 4 to 8, 2-9 cm. long, ascending or somewhat spreading, often slightly curved, floriferous to the base, the lower ones usually with a few long hairs in the axils; rachises 1.5-2 mm. broad, thin, olive or purplish-olive, the rather elongate spreading pedicels attached along a very narrow central rib, the lateral portions of the rachis foliaceous and winglike; spikelets paired, rarely also a few in the same raceme solitary, (2.2-) 2.5-2.9 (-3.2) mm. long, obovate, slightly pointed, with nearly parallel plane surfaces or at least very compressed plano-convex, yellowish-green; first glume always absent; second glume and sterile lemma shortly and uniformly pubescent. Moist tight soil, Rio Grande Plains, frequent, spring-fall; much of Mex. n.w. to Son.; Tex.

17. *Paspalum pubiflorum* Fourn. Loosely tufted perennial; culms 3-15 dm. long, compressed, 2-3 mm. thick on the long axis, decumbent and freely rooting in the basal third to half the length but usually mostly ascending; ligule a scale 1-3 mm. long; blades 6-30 cm. long, 5-13 mm. broad, mostly flat, marginally crisped and basally papillose-pilose; lower sheaths usually papillose-pilose; panicle axis 8-62 mm. long; racemes 2 to 4 (to 6), 2-10 cm. long, ascending or spreading, floriferous to the base or infrequently with a naked basal portion 1-3 mm. long and a few long hairs in the axil; rachises 1.5-2 mm. broad, broadly triangular, olive-green; spikelets attached even along the margins, paired or rarely in the same raceme a few of them solitary, (2.3-) 2.7-2.9 (-3.2) mm. long, obovate, turgidly plano-convex, greenish to stramineous or with a purplish cast, blunt to very slightly pointed; first glume small, triangular, usually absent or much-reduced; second glume and sterile lemma microscopically pubescent to rarely glabrate. Incl. var. *glabrum* Scribn. Moist garden loam and moist usually calcareous soil at edges of streams and lakes, throughout the state (but rare in Plains Country), spring-fall; lowlands of s.e. U.S. n. to N.C., O., Ind., Ill., Mo. and Kan.; much of Mex.; Cuba.

18. *Paspalum distichum* L. KNOTGRASS. Long-decumbent perennial; culms 5-15 dm. long, compressed, 2-3 mm. thick on the long axis, extensively creeping, freely rooting, somewhat branched, ascending at the simple floriferous ends; ligule a scale 0.5-1 mm. long; blades 3-12 cm. long, 2-6 mm. broad, membranous and usually flat or folded, or the tip on drying loosely involute, basally broader than the summit of the sheath; sheaths slightly keeled at summit, the corner with a few soft hairs and often the lower sheaths (when emergent) visibly pubescent ("var. *indutum*") but these usually lost in specimens; racemes usually 2, rarely 1 or 3, 15-70 mm. long, erect or somewhat spreading, often arcuate, floriferous essentially to the base; rachises broadly triangular in transection, 1-1.5 (-2) mm. broad; spikelets attached nearly at the margin by the short pedicels, solitary, elliptic, (2.5-) 2.7-3 (-3.2) mm. long, greenish to stramineous, blunt to somewhat

pointed; first glume usually present, minute, triangular; second glume microscopically pubescent; sterile lemma glabrous or rarely with a few microscopic hairs near midrib. Incl. var. *indutum* Shinn. Margins of fresh ponds, streams and lakes, frequent in e., s.e. and n.-cen. Tex., Edwards Plateau and Trans-Pecos, infrequent in Rio Grande Plains and Plains Country, summer-fall; widespread in the warmer parts of the world, in Am. n. to N.J., Tenn., Ark., Okla., Ut., Ida. and Wash.

Some coastal specimens seem intermediate between *P. distichum* and *P. vaginatum*; some specimens from central Texas seem to combine characters of *P. distichum* and *P. pubiflorum*.

19. *Paspalum vaginatum* Sw. Long-decumbent perennial; culms 5-25 dm. long, compressed, 3-4 mm. thick on the long axis, extensively creeping and freely rooting, branched, ascending only at the simple floriferous ends; ligule a scale about 1 mm. long; blades 2.5-15 cm. long, 3-8 mm. broad, firm and stiffly straight, basally narrower than the summit of the sheath and folded, tapering to a long-involute tip (occasionally near semi-brackish water the blades persistently flat); sheaths keeled, the corners ciliate; panicle axis 1-10 (-15) mm. long; racemes 1 or 2 (or 3), 2-8 cm. long, divaricate; rachises often naked for the basal 2-5 mm., 1-2 mm. broad, broadly triangular or occasionally very narrowly winged; spikelets attached nearly at the margin by the broad short pedicels, solitary, ovate-elliptical, 3.1-4.2 (-4.5) mm. long, glabrous, stramineous, pointed; first glume very rarely present; sterile lemma thin and often transversely wrinkled; fruit pointed, nearly as long as spikelet, apically glabrous. Moist saline to brackish sands at edges of lagoons, bays and river-mouths, rarely in sub-brackish ponds near the coast, s.e. Tex. and Rio Grande Plains, frequent, summer-fall-early winter; widespread in warm coastal areas of the world, in Am., n. to N.C. and the Gulf States.

20. *Paspalum acuminatum* Raddi. Long-decumbent aquatic or subaquatic perennial; culms 3-10 dm. long, 1-3.5 mm. thick, soft, freely rooting and rather freely branching, ascending and emergent only at the end; ligule a membranous scale 1-3 mm. long; blades 3-20 cm. long, 2-12 mm. broad, flat, thin; panicle axis 1-3 cm. long; racemes 2 or 3 (to 5?), 3-7 cm. long, ascending, usually somewhat arcuate; rachis 3-3.5 mm. broad, with the spikelets borne in a very narrow central rib, the remainder of the rachis forming foliaceous wings; spikelets solitary, elliptic, 3.3-3.5 mm. long, glabrous, greenish, apically abruptly pointed beyond the fruit; first glume absent; fruit blunt, apically with some minute cilia. In fresh water ponds, Rio Grande Plains, rare (Cameron and Brooks cos.), spring-fall; lowlands, widespread but scattered in trop. Am., n. to s. La. and s. Tex.

21. *Paspalum dissectum* (L.) L. Long-decumbent mat-forming perennial; culms 20-75 cm. long, compressed, 1.5-2 mm. thick on the long axis, freely rooting in the mud, rather freely branched; ligule a membranous scale 1-2 mm. long; blades 2-9 (-12) cm. long, 2-5 mm. broad, thin, flat or folded; panicle axis 3-8 cm. long, slender and grooved, 0.2-0.4 mm. thick; racemes 2 to 4, 1-5 cm. long, ascending and slightly arcuate; rachis 1.8-3 mm. broad, with the spikelets borne on a very narrow central rib, the remainder of the rachis forming foliaceous wings; spikelets solitary, broadly elliptic, 1.7-2 mm. long, 1-1.2 mm. broad, essentially glabrous, greenish to stramineous, apically blunt; first glume absent; fruit blunt. Forming mats in moist sand at the margins of seeps, bogs and lakes, e. Tex., infrequent, summer-fall; lowlands of s. U.S., n. to N.J. and Ill.; Cuba.

22. *Paspalum fluitans* (Ell.) Kunth. Long-decumbent or floating aquatic grasses said to be annual; culms 3-10 dm. long, 2-5 mm. thick, soft (with much gas-holding tissue), mostly submerged, only the floriferous ends emergent; ligule a membranous scale 2-4 mm. long; aerial blades 10-25 cm. long, 9-20 mm. broad, very thin and flat; sheaths pubescent, their corners triangular-auricled; panicle axis 6-16 cm. long, 0.5-1 mm. thick; racemes (20 to) 30 to 50, 25-75 mm. long, ascending or usually arcuate-spreading, at maturity deciduous from the axis; rachis 1-1.7 mm. broad, the spikelets borne on a very narrow central rib, the remainder of the rachis forming thin foliaceous wings; spikelets solitary, 1.2-1.7 mm. long, only about 0.7-0.9 mm. broad, pubescent, pale-stramineous, often with a discolored or stained spot at the base of the sterile lemma and apically acute; first glume absent. *P. repens* Berg. Forming colonies in fresh water, s.e. Tex., infrequent, summer-fall; widespread in trop. Am., n. to N.C., Ill., Ind., Mo. and Neb.

23. *Paspalum notatum* Flüggé. BAHIA GRASS. Sod-forming perennial from a mass of thick short branching rhizomes; aerial culms numerous, 2-5 dm. long, compressed, 1.5-3 mm. thick on the long axis, erect; ligule a fragile scale 0.2-0.3 mm. long (the base of the

blade next to the ligule pilose); blades aggregated in tufts at ground level, 7-20 cm. long, 3-6 mm. broad, mostly flat or folded, rather stiffly straight; panicle axis 1-2 mm. long or rarely 5-10 mm.; racemes 2, emerging at the same level or rarely a third raceme present a short distance below, 3-12 cm. long; rachis about 1 mm. broad, triangular in transection, the marginal portions narrower than the central spikelet-bearing rib; spikelets solitary, (2.5-) 2.8-3.5 (-4) mm. long, broadly ovate to broadly obovate, greenish-stramineous, very compressed, plano-convex; first glume always absent; second glume and sterile lemma glabrous, shiny. Sandy loam, openings in forest, usually on roadsides, e. Tex., late spring-fall; warmer parts of Am., indigenous n. to Cuba and Mex.; introd. and persistent in the Gulf States.

A more robust plant, var. *Saurae* Parodi, has been introduced but it neither spreads nor persists.

24. *Paspalum alnum* Chase. COMB'S PASPALUM. Densely tufted perennial, shortly and slenderly subrhizomatous basally at the margins of the tuft; culms 20-35 cm. long, slightly compressed, 1-2 mm. thick, erect; ligule a scale about 1 mm. long; blades 8-28 cm. long, 3-5 mm. broad, mostly flat, straightish, papillose-pilose near the ligule and on the margin basally; panicle axis 1-5 mm. long, rarely to 25 mm.; racemes 2, emerging at nearly the same level, less commonly a third one present below, 5-9 cm. long; rachis about 1 mm. broad, triangular in transection, the marginal portions narrower than the central spikelet-bearing rib; spikelets solitary, 3-3.3 (-3.5) mm. long, ovate, 1.8-2 mm. broad, stramineous, very much-compressed, plano-convex; first glume always absent; second glume and sterile lemma glabrous. Rare in e. Tex. (Jefferson Co.), summer-fall; Braz., Parag. and Arg.; introd. and persistent in s.e. Tex.

25. *Paspalum minus* Fourm. Sod-forming perennial from a mass of slender short branching rhizomes aerial culms 20-35 cm. long, compressed, 1.5-2 mm. thick on the long axis, erect; ligule a fragile scale 0.2-0.3 mm. long (base of blade near the ligule pilose, ligulelike); blades aggregated at ground level, 5-13 cm. long, 3-7 mm. broad, flat, mostly erect; panicle axis 0-2 mm. long; racemes 2, emerging at nearly the same level (very rarely a third present below), 25-70 mm. long; rachis about 0.8 mm. broad, triangular in transection, the marginal portions very narrow; spikelets solitary, 1.9-2.3 mm. long, ovate to obovate, stramineous, very compressed, plano-convex; first glume always absent; second glume and sterile lemma glabrous. Loamy soil in coastal prairies, s.e. Tex., rare (Chambers and Jefferson cos.) where probably introd., summer-fall; widespread in trop. Am. grasslands, n. to Mex. and W. I.

26. *Paspalum conjugatum* Berg. Loosely tufted perennial with long leafy stolons 3-20 dm. long, bearded at the nodes; flowering culms 2-5 dm. long, 1-1.5 mm. thick, erect; ligule a scale 0.3-1 mm. long (base of blade hirsute and pilose next to it); blades 5-22 cm. long, 5-15 mm. broad, flat or folded; panicle axis 1 mm. long, rarely 15-30 mm.; racemes 2, emerging at nearly the same level, very rarely with a third one below, 4-15 cm. long, densely short-pubescent in the axils; rachis 0.7-0.8 mm. broad, triangular in transection, the thin marginal portions very narrow; spikelets solitary, 1.4-1.8 mm. long, very broadly ovate, strongly compressed concavo-convex, stramineous, acute or abruptly acuminate; first glume always absent; second glume glabrous except for a marginal fringe of long papillose-cilia; sterile lemma glabrous. Moist loam in disturbed areas near the Rio Grande, s. Rio Grande Plains, infrequent or rare (Cameron Co.), summer-fall; widespread in warmer parts of the world, in Am. n. to Fla. and Tex.

An unpalatable "sour" grass.

58. PANICUM L. PANIC GRASSES

Widely diverse in habit; spikelets in panicles or less commonly in racemes (rarely in spikelike panicles and then sometimes with a bristlelike sterile branch subtending some spikelets); pedicels usually present; each spikelet falling as a unit, 2-flowered, the lower floret staminate or completely reduced, the upper perfect; first glume much shorter than the spikelet, several-nerved, membranous; second glume as long as the spikelet or nearly as long; lower "sterile" lemma several-nerved, membranous, usually as long as the spikelet or essentially so; sterile palea usually obsolete but occasionally (as in *P. hians*) very strongly developed and cupped and/or hooded; fertile lemma usually somewhat indurate, strongly convex, the margins revolute and clasping the palea of the same

texture, usually smooth and shining like white cartilage, rarely transversely rugose.

A large genus (perhaps 500 species) of warm parts of the world, made particularly difficult in North America because of the occurrence of cleistogamy and occasional wide outcrossing among the "Dichantheleiums" or dichotomous panic grasses (see key below). The taxonomy of *Dichantheleium* has consisted mainly of arbitrary pigeonholing on highly technical and equally highly superficial "key" characters of a mass of populations varying and intergrading chaotically in nearly every character. The admirable work of A. S. Hitchcock and Agnes Chase in reducing hundreds of names to synonymy has been a great step forward, but it was not carried quite far enough.

1. Axis of panicle branchlets extending beyond the base of the uppermost spikelet as a point or bristle 1-6 mm. long (occasionally such bristles are seen in *P. rigidulum* but it has an open panicle); panicle slender, often spikelike (2)
 1. Axis of panicle branchlets not so extended or if so panicle not spikelike (4)
- 2(1). Blades 4-7 mm. broad, about 10 times as long as broad 68. *P. firmulum*.
2. Blades 2-4 mm. broad, often 25 to 50 times as long as broad (3)
- 3(2). Spikelet 2.4-3(-3.2) mm. long 66. *P. ramisetum*.
3. Spikelet (2.6-) 3-4 mm. long 67. *P. Reverchonii*.
- 4(1). Basal leaves usually distinctly different from those of the culm, forming a winter rosette (not very marked in species 1 through 3 or in No. 21); plants perennial, in spring producing simple culms with mostly narrowly lanceolate blades and terminal panicles with numerous spikelets (in most species these not producing viable seeds); later culms often much-reduced and much-branched, producing an autumnal phase usually quite different from the vernal phase and with reduced axillary panicles (*Dichantheleium*) (5)
4. Basal leaves similar to though usually smaller than those of the stem leaves; winter rosette absent; plants annual or perennial; spikelets usually nearly all fertile (30)
- 5(4). Vernal blades elongate, not more than 5 mm. broad, 20 to 50 times as long as broad; autumnal phase branching from the base only (6)
5. Vernal blades either not so elongate or if so then more than 5 mm. broad or the autumnal phase not branching from the base (7)
- 6(5). Spikelets 3.2-4.2 mm. long 1. *P. depauperatum*.
6. Spikelets 2.2-3.2 mm. long 2. *P. linearifolium*.
- 7(5). Plants branching from the base, finally forming rosettes or cushions, the foliage soft and lax 3. *P. laxiflorum*.
7. Plants branching from the culm nodes or rarely remaining simple (8)
- 8(7). Blades long, stiff; autumnal phase bushy-branched above (9)
8. Blades not long and stiff except in some species; not bushy-branched (11)
- 9(8). Spikelets subsessile and more or less secund along the panicle branches 5. *P. neuranthum*.
9. Spikelets not as above (10)
- 10(9). Vernal blades 4-6 cm. long; autumnal blades involute, sharp-pointed, usually arcuate 6. *P. aciculare*.
10. Vernal blades (5-) 7-15 cm. long; autumnal blades flat or mostly involute, not remarkably sharp-pointed 4. *P. angustifolium*.
- 11(8). Plants not forming a distinct winter rosette; spikelets attenuate at base, 3.5-4.3 mm. long (12)
11. Plants forming a distinct winter rosette; spikelets not usually markedly attenuate at base, 0.9-4.7 mm. long (13)
- 12(11). Blades mostly 5-9 mm. broad and mostly 6 to 10 times as long as broad; plants of sandy soil in south Texas 20. *P. nodatum*.
12. Blades mostly 3-6 mm. broad and mostly much more than 10 times as long as broad; plants of Edwards Plateau and other limestone uplands 21. *P. pedicellatum*.

- 13(11). Spikelets blunt and strongly nerved; blades rarely as much as 15 mm. broad (sometimes 20 mm. broad in *P. Ravenelii*) (14)
13. Spikelets rarely both blunt and strongly nerved (17)
- 14(13). Spikelets 1.5-2.4 mm. long; culms erect, wiry with few short stiff divergent blades 13. *P. portoricense*.
14. Spikelets 2.6-4.3 mm. long; culms spreading to erect, not wiry, usually with well-developed ascending blades (15)
- 15(14). Spikelets 2.6-3 mm. long 18. *P. malacophyllum*.
15. Spikelets (2.9-) 3-4.3 mm. long (16)
- 16(15). Blades of vernal culms 10-20 mm. broad, densely velvety hirsute beneath; spikelets 3.7-4.3 mm. long 22. *P. Ravenelii*.
16. Blades of vernal culms 5-12 mm. broad, pubescent to glabrous beneath; spikelets 2.9-4 mm. long 19. *P. oligosanthos*.
- 17(13). Ligule (or at least a ligulelike tuft at the extreme base of the blade) of conspicuous hairs usually (2-) 3-5 mm. long (18)
17. Ligule less than 2 mm. long to obsolete (22)
- 18(17). Spikelets 0.9-1.3 mm. long; "ligule" 2-3 mm. long 8. *P. leucothrix*.
18. Spikelets 1.3-2.9 mm. long; "ligule" (2-) 3-5 mm. long (19)
- 19(18). Sheaths glabrous or sparingly pubescent; spikelets 1.3-1.7 mm. long 9. *P. Lindheimeri*.
19. Sheaths pubescent; spikelets 1.6-2.9 mm. long (20)
- 20(19). Spikelets 1.6-2.1 mm. long; pubescence various but rarely copiously pilose 10. *P. lanuginosum*.
20. Spikelets 1.8-2.9 mm. long; sheaths pilose (21)
- 21(20). Spikelet 1.8-2.8 mm. long; tuft of hairs at base of blade (2-) 4-5 mm. long; sheaths copiously and usually retrorsely pilose 11. *P. villosissimum*.
21. Spikelet 2.7-2.9 mm. long; tuft of hairs at base of blade 2-3 mm. long; sheaths ascending-pilose 12. *P. ovale*.
- 22(17). Spikelets nearly spherical at maturity; blades glabrous, firm, cordate; ligule obsolete (23)
22. Spikelets usually obovoid or ellipsoid; ligule usually developed (obsolete in *P. commutatum* and allies) (24)
- 23(22). Panicle nearly as broad as long 16. *P. sphaerocarpon*.
23. Panicle at least twice as long as broad 17. *P. polyanthes*.
- 24(22). Spikelets 3.6-4.7 mm. long 23. *P. latifolium*.
24. Spikelets 1.2-3.2 mm. long (25)
- 25(24). Spikelets 2.3-3.2 mm. long (26)
25. Spikelets 1.2-2.2 mm. long (28)
- 26(25). Ligule obsolete; blades only 5-10 (-15) cm. long, 8-25 mm. broad, glabrous, at base cordate and ciliate; spikelets slenderly ellipsoid, 2.4-3.1 mm. long, never turgid 25. *P. commutatum*.
26. Ligule a muticous scale or a short fringe; blades 10-23 cm. long, 9-30 mm. broad, glabrous or scabrous, at base only slightly if at all cordate; spikelet turgidly ellipsoid to obovoid or ovoid, 2.3-3.2 mm. long (27)
- 27(26). Spikelets 2.7-3.2 mm. long 26. *P. clandestinum*.
27. Spikelets 2.3-2.6 mm. long 24. *P. scoparium*.
- 28(25). Culms delicate, usually less than 30 (rarely to 40) cm. tall; blades filmy, usually only 1-3 cm. long and 1-3 mm. broad, often reflexed 14. *P. ensifolium*.
28. Culms delicate or usually not so delicate, (15-) 20-100 cm. tall; blades firmer (membranous, or firmer), 3-12 cm. long, 3-15 mm. broad, reflexed or ascending (29)

- 29(28). Blades soft, never cartilage-margined; panicle 5-12 cm. long; spikelets 1.4-2.2 mm. long 7. *P. dichotomum*.
29. Blades rather firm and stiff, tending to become cartilaginous at the margin; panicle 3-6 cm. long; spikelets 1.3-1.8 mm. long 15. *P. tenue*.
- 30(4). Plants annual (Doubtful cases should be keyed under both alternatives) (31)
30. Plants perennial (45)
- 31(30). Inflorescence consisting of several more or less secund spikelike racemes; fertile lemma transversely rugose (32)
31. Inflorescence a more or less diffuse panicle (35)
- 32(31). Spikelets 5-6 mm. long 63. *P. texanum*.
32. Spikelets 1.9-3.8 mm. long (33)
- 33(32). Spikelets 3.5-3.8 mm. long 64. *P. arizonicum*.
33. Spikelets 3 mm. long or less (34)
- 34(33). Spikelets strongly reticulate-veined (i.e., longitudinal nerves connected by random transverse connections) 65. *P. fasciculatum*.
34. Spikelets never reticulate-nerved 30. *P. reptans*.
- 35(31). Spikelets microscopically tuberculate (36)
35. Spikelets not tuberculate (37)
- 36(35). Spikelets 1.8-2.6 mm. long, glabrous 35. *P. verrucosum*.
36. Spikelets 3.2-3.6 mm. long, pubescent 34. *P. brachyanthum*.
- 37(35). First glume about a fourth as long as the spikelet 62. *P. dichotomiflorum*.
37. First glume usually proportionately longer (38)
- 38(37). Spikelets about 1.3 mm. long 48. *P. trichoides*.
38. Spikelets 1.7-5 mm. long (39)
- 39(38). Spikelets 4.5-5 mm. long 55. *P. miliaceum*.
39. Spikelets 1.7-4.2 mm. long (40)
- 40(39). Panicles about half the length of the entire plant (41)
40. Panicles a third the total length of plant or less (43)
- 41(40). Panicles narrow, usually less than half as broad as long 60. *P. flexile*.
41. Panicles as broad as long or nearly so (42)
- 42(41). Fertile lemma with a prominent lunate scar or discolored area at base 58. *P. Hillmanii*.
42. Fertile lemma not scarred or discolored at base 59. *P. capillare*.
- 43(40). Spikelets 1.7-2.2 mm. long 61. *P. philadelphicum*.
43. Spikelets 2.7-4.2 mm. long (44)
- 44(43). First glume half to two thirds the length of the spikelet; spikelets 2.7-3.3 mm. long 56. *P. hirticaule*.
44. First glume more than three fourths the length of the spikelet; spikelets 3.8-4.2 mm. long 57. *P. pampinosum*.
- 45(30). Spikelets short-pedicelled along one side of the rachises, forming spikelike racemes; fertile lemma transversely rugose (except in *P. hemitomom*) (46)
45. Spikelets in open or sometimes contracted or congested panicles (somewhat 1-sided in *P. anceps* and *P. rigidulum*) (51)
- 46(45). First glume nearly equaling the sterile lemma (47)
46. First glume much shorter than the sterile lemma (48)
- 47(46). Racemes spreading; fertile lemma not more than one third the total length of the spikelet 31. *P. gymnocarpon*.
47. Racemes appressed; fertile lemma nearly as long as spikelet 33. *P. obtusum*.

- 48(46). Fertile lemma not transversely rugose 32. *P. hemitomon*.
 48. Fertile lemma transversely rugose (49)
- 49(48). Nodes bearded 29. *P. purpurascens*.
 49. Nodes not bearded (50)
- 50(49). Spikelets 2.2-2.4 mm. long 27. *P. geminatum*.
 50. Spikelets 2.5-3 mm. long 28. *P. paludivagum*.
- 51(45). Fertile lemma transversely rugose (52)
 51. Fertile lemma not transversely rugose (53)
- 52(51). Blades (10-) 17-35 mm. broad; nodes usually densely hirsute; rare in extreme south Texas 47. *P. maximum*.
 52. Blades usually 3-17 mm. broad; nodes not bearded; uplands and mountains in west Texas 46. *P. bulbosum*.
- 53(51). Sterile palea enlarged and indurate at maturity, expanding the spikelet; blades scarcely broader than their sheaths; spikelets about 2.3 mm. long, borne toward the ends of the few slender branches 36. *P. hians*.
 53. Sterile palea usually absent or (if present) minute (54)
- 54(53). Plants with conspicuous creeping scaly rhizomes (55)
 54. Plants without creeping scaly rhizomes (59)
- 55(54). Spikelets short-pedicelled, more or less secund along the nearly simple panicle branches 37. *P. anceps*.
 55. Spikelets long-pedicelled, not secund, arranged in an open or contracted panicle (56)
- 56(55). Spikelets 2.2-2.5 mm. long 45. *P. repens*.
 56. Spikelets 2.8-8 mm. long (57)
- 57(56). Panicle compact, strongly contracted, elongate and nodding; plants of coastal sands 42. *P. amarulum*.
 57. Panicle diffuse or only slightly contracted (58)
- 58(57). Spikelets 2.8-5 mm. long 44. *P. virgatum*.
 58. Spikelet usually 6-8 mm. long 43. *P. Havardii*.
- 59(54). Panicles narrow and few-flowered; culms erect and wiry; blades drying involute 41. *P. tenerum*.
 59. Panicles open or contracted, many-flowered (60)
- 60(59). Spikelets 5-6 mm. long, the fertile lemma only 1.6-1.8 mm. long 54. *P. capillarioides*.
 60. Spikelets 1.8-3.7 mm. long (61)
- 61(60). Spikelets short-pedicelled along the nearly simple panicle branches; plants usually of low moist ground (62)
 61. Spikelets either long-pedicelled in open panicles or if very short-pedicelled then the panicle open and its branches branching and plants not confined to low moist ground (63)
- 62(61). Ligule fimbriate-ciliate, 2-3 mm. long 40. *P. longifolium*.
 62. Ligule membranous, about 1 mm. long or less 39. *P. rigidulum*.
- 63(61). Culm (at least the lower part) knotty, the nodes as much as twice as thick as the middle of the internodes 38. *P. antidotale*.
 63. Culm not so knotty (64)
- 64(63). Blades (larger ones) 20-35 mm. broad 49. *P. hirsutum*.
 64. Blades 2-12 mm. broad (65)
- 65(64). Blades hirsute on both surfaces (glabrescent in some specimens) 50. *P. Ghiesbreghtii*.
 65. Blades glabrous or essentially so (at least above) (66)
- 66(65). Culms 70-100 cm. tall, at least the lower nodes with a ring of erect hairs; panicle often nearly half the height of the plant ... 53. *P. pilcomayense*.
 66. Culms 15-80 cm. tall, the lower nodes nearly glabrous; panicle 6-25 cm. long (67)

- 67(66). Spikelets 3-3.7 mm. long 51. *P. Hallii*.
 67. Spikelets 2-3 mm. long 52. *P. filipes*.

1. *Panicum depauperatum* Muhl. Perennial; elongate *vernal phase* differing slightly from the compact autumnal phase; bases firm crowns; vernal phase with culms several to many in a tuft, slender but rather stiff, erect or nearly so; sheaths glabrous or papillose-pilose; ligule less than 1 mm. long; blades 6-15 cm. long, 2-5 mm. broad, often involute in drying, 20 or more times as long as broad; panicle exserted but usually not much exceeding the leaves, 4-8 cm. long, few-flowered; spikelets 3.2-3.8 (-4.2) mm. long, elliptic, pointed, glabrous or sparsely pubescent; second glume and sterile lemma extending beyond the fruit to form a beak, the sterile lemma 7- to 9-nerved; *autumnal phase* similar, the reduced panicles partly concealed in the basal leaves. Rare on gravelly slopes in pine-oak woodlands, e. Tex., very rare w. to n.-cen. Tex., spring-fall; Que. and N.S. to Minn., s. to Ga. and Tex.

2. *Panicum linearifolium* Scribn. Perennial; *vernal phase* in dense tufts; culms slender, erect, 20-45 cm. tall, often pilose; sheaths papillose-pilose; ligule a fringe 0.6-1.5 mm. long; blades erect, usually nearly as long as the panicles, 2-4 mm. broad, 20 or more times as long as broad; panicle long-exserted, 5-10 cm. long, the flexuous branches ascending; spikelets 2.2-3.2 mm. long, oblong-elliptic, obtuse, sparsely pilose; glume and sterile lemma not extending beyond the fruit, the sterile lemma 7- to 9-nerved; *autumnal phase* similar, the reduced panicles hidden among the basal leaves. *P. perlongum* Nash. Frequent in dry sterile gravel or sandy slopes, e. Tex. and isolated in the Llano region, spring(-fall); Que. and Me. to Man. and N.D., s. to Ga., Tex. and Colo.

A form known as "*P. Werneri* Scribn.," probably not specifically distinct, with blades 15 cm. long or shorter, nodes usually sparingly pilose, sheaths glabrous, spikelets nearly glabrous, has been reported to occur at Dallas. *P. linearifolium* is probably merely the small-spikeletted extreme of a continuously intergrading series of forms, all of which should probably be referred to *P. depauperatum*.

3. *Panicum laxiflorum* Lam. Perennial, tufts loose or compact; *vernal culms* (1) 2-4 dm. tall, erect or geniculate below, branching from the base; nodes bearded with reflexed hairs; sheaths retrorsely pilose; foliage soft, lax, aggregated toward the base, the basal leaves not in distinct rosettes in autumn; ligule nearly obsolete; blades 5-15 (-20) cm. long, 7-12 mm. broad, glabrous or sparsely ciliate, or pilose on 1 or both surfaces; panicle long-exserted, 8-12 cm. long, lax, few-flowered, the lower branches often reflexed; spikelets 1.7-2.3 mm. long, obovate, obtuse, turgid, 5- to 7-nerved; *autumnal phase* branching near the base, forming a close flat tuft; blades scarcely reduced or shorter, often much-exceeding the much-reduced secondary panicles, often in dense tufts. *P. xalapense* H.B.K. and var. *strictirameum* Hitchc. & Chase. Frequent in sandy woodlands, e., s.e. and n.-cen. Tex., spring-fall; Md. to Ill. and Mo., s. to Gulf States; Mex., Guat., Hisp.

A very depressed, depauperate form from a few boggy areas in east Texas has been referred to "*P. ciliatum* Ell." but does not appear to be specifically distinct in any critical way. A form known as *P. strigosum* Muhl. with glabrous spikelets 1.3-1.7 mm. long has been reported to occur in east Texas. It is very closely related to *P. laxiflorum* and probably not specifically distinguishable; we have seen no Texas material.

4. *Panicum angustifolium* Ell. Perennial; densely tufted *vernal culms* ascending or spreading 3-5 dm. tall, the lowermost or all the internodes gray crisp-villous or often all internodes nearly glabrous; nodes sometimes bearded, sometimes not; sheaths villous or glabrous, or the lower villous and the upper glabrous; ligules not more than 1 mm. long; blades stiff, ascending, (5-) 7-15 cm. long, 3-8 mm. broad, long-acuminate, glabrous or villous on both surfaces, with usually fairly conspicuous principal nerves, often ciliate at base; panicle long-exserted, 4-10 cm. long, loosely flowered, the branches widely spreading at anthesis, the lower branches often reflexed or ascending; spikelets 2-3 mm. long, elliptic-obovate, papillose-pubescent, attenuate at base, rather strongly 7-nerved; first glume narrow and sheathing at base; *autumnal phase* ascending, repeatedly branching, often somewhat top-heavy and reclining, or spreading or decumbent or mat-like; blades much reduced, very numerous, flat or involute, appressed, falcate or straight, rather thin and papery. *P. consanguineum* Kunth, *P. ovinum* Scribn. & Sm., *P. arenicoloides* Ashe, *P. chrysopsidifolium* Nash. Sandy woodlands, e. and s.e. Tex., s. to Nueces Co., spring-fall; s.e. U.S., W.I., Guat., Nic. and n. S.A.

This is a fairly variable species, as species of *Panicum* go, but the variation is too chaotic to permit recognition of more than one species. The more glabrous phase, *P. ovinum*, grades completely into the rest, although the extremes may be recognized on ultra-technical characters. There is complete intergradation also to *P. portoricense* through the plant known as "*P. aciculare*."

5. *Panicum neuranthum* Griseb. Perennial; rather like the glabrous phase of *P. angustifolium* but the short-pedicelled spikelets more or less secund along the panicle-branches. Reported to occur in Tex., apparently on the basis of a misdetermined specimen of the glabrous phase of *P. angustifolium*, from which it is doubtfully distinct, spring-fall; savannahs and open ground, s. Fla.; Miss.; Br. Hond.; Cuba.

6. *Panicum aciculare* Poir. Perennial, densely tufted; *vernal culms* ascending from a spreading base, 2-5 dm. tall, appressed-pubescent below; lower sheaths villous; ligules not more than 1 mm. long; blades spreading or ascending, stiff, narrowed to an involute point, glabrous or the lower sparsely pilose, the middle-culm blades 4-6 cm. long and 2-5 mm. broad; panicle 3-7 cm. long, the flexuous branches spreading at maturity; spikelets 1.8-2.2 mm. long, obovate, pubescent, attenuate at base, rather strongly 7-nerved; first glume narrow and sheathing at base; *autumnal phase* bushy-branched; culms 1 (-3) dm. long, spreading, forming dense cushions; blades involute, sharp-pointed, usually arcuate, mostly 1-3 cm. long. Scattered in e. and s.e. Tex. on sandy soil, spring-fall; N.J., Va. to n. Fla., Ark., Okla. and Tex.; W.I.; n. S.A.

This is closely related to both the *P. angustifolium* complex and to the *P. portoricense*-*P. lancearium* complex, probably representing a selection of intermediate specimens of hybrid origin and is of negligible taxonomic value.

7. *Panicum dichotomum* L. Perennial; *vernal phase* (Apr.-Aug.) culms tufted, erect or ascending from a knotted or loose crown, 3-5 (-10) dm. tall, glabrous but the nodes very often with a grayish retrorse beard about 1 (-2) mm. long and often the lower nodes geniculate; sheaths essentially glabrous; ligules minute; blades usually spreading, the upper often reflexed, 3-12 cm. long, 4-15 mm. broad, glabrous or sparsely papillose-ciliate at base, green (often bright, rarely olivaceous) and thin, quite flat; panicle usually elongate-ovoid, usually many-spikeletted, 5-12 cm. long, with the slightly spreading very slender and often flexuous branches usually copiously branched; spikelets 1.4-2.2 mm. long, elliptic, glabrous or pubescent, 5- to 7-nerved; second glume usually shorter than fertile lemma; *autumnal phase* (June-Dec.) much-reduced, much-branched at some nodes, the lower part usually ascending (or reclining from the heavy weight of the top) and bladeless like a slender tree-trunk, the upper part copiously bushy-branched with numerous small blades 2-4 cm. long and 1-3 mm. broad (thin, green, flat or often involute). *P. nitidum* Lam., *P. barbulatum* Michx., *P. microcarpon* Muhl., *P. lucidum* Ashe, *P. roanokense* Ashe, *P. yadkinense* Ashe. Frequent in moist sandy woodlands, e. and s.e. Tex., rare w. to n.-cen. Tex., spring-fall; s.e. Can., e. U.S., Bah. I., Cuba.

A slightly variable species represented with us mostly by the trivial forms known as "*P. barbulatum*" and "*P. microcarpon*." In some parts of the range it is apparently often contaminated genetically by the "*P. Lindheimeri*" form of the *P. spretum* complex. Apparently the more glabrous forms of *P. dichotomum* pass (through large-leaved plants known as *P. cryptanthum*) to the *P. scoparium* alliance.

8. *Panicum leucothrix* Nash. Perennial; *vernal phase* light olive-green to dark-green; culms 1-5 (-7) dm. tall, ascending (often decumbent at base and somewhat geniculate), weak, slender, glabrous or appressed papillose-pilose, the nodes pubescent or glabrous; sheaths papillose-pilose to puberulent or glabrous; ligule minute but blade at base with a ligulelike tuft of hairs 2-3 mm. long; blades 3-8 mm. broad, about 2-5 cm. long, glabrous or sparsely villous above, puberulent or glabrous beneath, or even velvety-puberulent beneath; panicle 3-8 cm. long, rather densely flowered; spikelets 0.9-1.3 mm. long, pubescent, elliptic; *autumnal phase*: stems reclining or decumbent-spreading, occasionally the culms at first sending out from lower and middle nodes long branches similar to primary culms, later producing more or less fascicled branches, or usually the culms with crowded branchlets, the whole somewhat bushy-branched; blades flat or subinvolute. *P. Wrightianum* Scribn., *P. longiligulatum* Nash. Infrequent in sandy woodlands, often in boggy or moist low places, e. and s.e. Tex., spring-fall; Coastal States, Mass. to Tex.; also Tenn.; W.I., C.A., Col.

Closely related to the *P. spretum*-*P. Lindheimeri* complex, and grading into the smaller-spikeletted forms of *P. Lindheimeri*.

9. *Panicum Lindheimeri* Nash. *Vernal culms* 3-9 dm. long, tufted, ascending or spreading; lower internodes often pubescent; sheaths glabrous or pubescent; ligule minute but blade at base with a ligulelike tuft of hairs 2-5 mm. long; blades firm, ascending to reflexed, 4-8 mm. broad, sparingly ciliate around the base, otherwise glabrous; panicle 4-8 (-12) cm. long, usually nearly as broad, the branches ascending or appressed or usually spreading; spikelets 1.3-1.7 mm. long, elliptic to obovate, pubescent (rarely nearly glabrous), 5- to 7-nerved; *autumnal phase* mostly reclining or stiffly spreading, the early branches elongate, the subsequent branches in short fascicles or in tufts of short appressed branches; blades involute at least at the tip, greatly reduced and often appressed or ascending, often ciliate basally. *P. lanuginosum* var. *Lindheimeri* (Nash) Fern. Widespread often in calcareous soils in e. half of Texas, w. over the Edwards Plateau and even to Brewster Co. in the Trans-Pecos, spring-fall; N.S., Que., e. U.S., N.M., Calif., Coah.

P. Lindheimeri freely grades into the phases of the *P. lanuginosum* complex which have small spikelets and sparse pubescence. Closely related and reportedly occurring in the moist coastal areas of the state is *P. spretum* Schult. with large, narrow panicles; we have seen no Texas material of this species.

10. *Panicum lanuginosum* Ell. Perennial; *vernal phase* (usually grayish) olive-green or bluish-green, velvety-villous to densely spreading-villous throughout or the upper parts of the culm or the various parts of the leaves glabrate; culms usually in large clumps, 2-7 dm. tall, spreading, often with a glabrous ring below the nodes, the nodes themselves usually with a retrorse gray beard; sheaths like the midstems in pubescence; ligule a short fringe but blade at base with a ligulelike tuft of hair 3-5 mm. long; blades thickish, sometimes stiff, often somewhat incurved or spoon-shaped (when fresh), from nearly glabrous to densely velvety or densely villous, 4-10 cm. long, 5-12 mm. broad, sometimes with a very thin firm margin; panicle (4-) 6-12 cm. long, the axis and also often the branches pubescent; spikelets 1.6-2.1 mm. long, pubescent, 5- to 9-nerved; *autumnal culms* widely spreading to matted-decumbent or ascending or rarely erect, freely branching from the middle nodes, the branches repeatedly branching and much-exceeding the internodes, the ultimate branchlets forming flabellate fascicles; blades much-reduced, 2-3 cm. long, usually much-exceeding the panicles. *P. Thurowii* Scribn. & Sm. Frequent in sandy woodlands and prairies, e. half of state, spring-fall; N.S. and Que. to Mont., s. to Gulf States, N.M., Ariz. and Calif. (rare w. of the 100th meridian).

This species in its typical form looks like a small edition of *P. scoparium*. *P. lanuginosum* grades into the *P. spretum*-*P. Lindheimeri* alliance through such forms as have been called *P. huachucae* Ashe [incl. var. *fasciculatum* (Torr.) F. T. Hubb. and *P. tennesseense* Ashe]. One form, "*P. auburne* Ashe," recombines the small spikelets of *P. Lindheimeri* and the pubescence of *P. lanuginosum*. *P. lanuginosum* passes into the shaggier *P. villosissimum* through forms called "*P. praecocius* Hitchc. & Chase." There seems to be little merit in recognizing all these "species," which are arbitrary selections of specimens showing various recombinations of characters. See remark under *P. villosissimum*.

11. *Panicum villosissimum* Nash. Perennial; *vernal phase* light olive-green; culms 25-45 cm. tall, erect or ascending, pilose with spreading hairs 3 mm. long; sheaths pilose; ligule a minute fringe but blade at base with a ligulelike tuft of hairs (2-) 4-5 mm. long; blades rather firm, 6-10 cm. long, 5-10 mm. broad, pilose on both surfaces or occasionally nearly glabrous above; panicle 4-8 cm. long, the branches stiffly ascending or spreading; spikelets 1.8-2.8 mm. long, pilose, 5- to 9-nerved; *autumnal culms* stiffly spreading, finally prostrate, often sparingly branched from the middle and lower nodes, the leaves of the fascicled branches appressed to give the cluster or mat a "combed-out" appearance. *P. pseudopubescens* Nash. Infrequent or locally abundant in sandy woodlands, e., s.e. and n.-cen. Tex., spring-fall; Mass. to Wisc. and Kan., s. to Fla. and Tex.; Mex., Guat.

The merits of recognizing this as distinct from the *P. lanuginosum* complex will have to be the subject of investigation. Only the arbitrary-spikelet-size character can be used to separate *P. villosissimum* from some of the shaggier forms of *P. lanuginosum*.

12. *Panicum ovale* Ell. Perennial; *vernal culms* 2-5 dm. tall, erect or ascending, rather stout, long-pilose below with ascending or appressed hairs, often nearly glabrous above, the nodes bearded; sheaths ascending-pilose; ligule a minute fringe, the blade at base with a ligulelike tuft 2-3 mm. long and rather sparse; blades 5-10 mm. broad, the upper surface nearly glabrous except for long hairs near the base and margins, the lower surface appressed-pubescent; panicle 5-9 cm. long; spikelets 2.7-2.9 mm. long, 5- to 9-nerved, pubescent; *autumnal phase* spreading-decumbent, the stiff culms rather loosely branching from the middle and upper nodes, the leaves and panicles greatly reduced. Reported to occur in Waller Co., s.e. Tex., where it supposedly was collected once in 1906; we have not seen any Tex. collections that fit the description; N.C. to Fla.; Ind.; Ill.; Tex. (?)

13. *Panicum portoricense* Hamilt. Perennial, olive-green; *vernal culms* 15-50 cm. long, wiry, slender minutely grayish crisp-puberulent to nearly glabrous, often somewhat geniculate at the lower nodes; sheaths glabrous or crisp-puberulent; ligule a very minute ciliate fringe or obsolete; blades firm, 2-6 cm. long, 3-7 mm. broad, glabrous to puberulent; panicle 2-4 (-6) cm. long, the branches spreading, with few spikelets; spikelets (1.5-) 1.7-2.4 mm. long, puberulent or rarely nearly glabrous, asymmetrically pyriform, strongly 7- to 9-nerved, markedly turgid; *autumnal culms* spreading, branching from all but the uppermost node, the reduced blades involute-pointed. *P. lancearium* Trin., *P. pauciciliatum* Ashe. Rare in e. and s.e. Tex. (locally common in Aransas Co.) in sandy woodlands, spring-fall; Coastal States, Va. to Tex.; Br. Hond.; Gr. Ant.

This species grades into the widespread *P. angustifolium* through the plant known as *P. "aciculare."*

14. *Panicum ensifolium* Ell. Perennial, glabrous throughout; *vernal culms* 2-4 dm. tall, erect or reclining; ligule a very minute fringe or obsolete; blades distant, often reflexed, 1-3 cm. long, 1.5-3 mm. broad, puberulent beneath (at least toward the tip); panicle 15-40 mm. long; spikelets 1.2-1.7 mm. long, glabrous or puberulent, 5- to 7-nerved; *autumnal culms* spreading or reclining, sparingly branching from the middle nodes, the branches mostly simple. Rare in moist sand, e. Tex. (Nacogdoches and Newton cos.), spring-fall; Coastal States, N.J. to Tex.

"*P. curtifolium* Nash," reported to occur in e. Tex., is basically *P. ensifolium* as to genetic constitution, but contaminated by something like the *P. spretum*-*P. Lindheimeri* complex.

15. *Panicum tenue* Muhl. Perennial; *vernal phase* green to olive-green; culms 15-55 cm. tall, tufted, often slightly geniculate at the lower nodes, ascending or erect, sometimes sparsely appressed-pubescent below, the leaves rather crowded near the base, sheaths puberulent between the nerves or sparsely appressed-pilose or nearly glabrous; ligule a very minute dense fringe; blades rather firm and stiff, tending to becoming minutely cartilaginous at the margin, the lower ones 3-5 (-7) cm. long and 3-6 mm. broad, rather much-reduced upward along the stem and distant, glabrous on both sides or puberulent beneath; panicle 3-6 cm. long; spikelets 1.3-1.8 mm. long, puberulent, 5- to 7-nerved; *autumnal culms* erect, leaning or spreading, usually much-branched, the branches bushy or fascicled. *P. albomarginatum* Nash, *P. trifolium* Nash. Infrequently or locally abundant in sandy soil, e. and s.e. Tex., spring-fall; s.e. U.S. and along the coast n. to N.J.; Cuba; Guat.

This is fairly closely related to *P. sphaerocarpon*.

16. *Panicum sphaerocarpon* Ell. Perennial, except for spikelets completely glabrous (except when genetically contaminated); *vernal phase* light-green; culms few in a tuft, 2-8 dm. long, radiate-spreading, sometimes nearly erect, the nodes appressed-pubescent; ligule absent (except a minute scale in contaminated genotypes); blades 7-14 mm. broad, thick, cartilaginous-margined, at base cordate and ciliate; panicle 5-10 cm. long, about as broad as long, the branches often viscid; spikelets 1.3-2 mm. long, obovoid-spherical when fully mature, ellipsoid when young, 5- to 7-nerved, puberulent to essentially glabrous; *autumnal phase* prostrate-spreading, remaining simple or sparingly branched late in the season from the lower and middle nodes, the short branches mostly simple, the thick white-margined blades of the winter rosette conspicuous. Frequent, sandy or gravelly soil, e., s.e. and n.-cen. Tex. and Rio Grande Plains (coastal part), isolated in dunes in Winkler and Ward cos., spring-fall; Vt. to Kan., s. to n. Fla. and Tex.; Mex. to Venez.

Miscellaneous genetically contaminated plants with minute ligules have been designated as var. *inflatum* (Scribn. & Sm.) Hitchc. & Chase.

17. *Panicum polyanthes* Schult. Perennial, completely glabrous (except spikelets); *vernal culms* erect, 3-9 dm. tall, the nodes glabrous or nearly so; ligules absent or a minute fringe in genetically contaminated plants; blades 12-33 cm. long, 15-25 mm. broad, firm, cartilage-margined, at base cordate and ciliate, the upper scarcely reduced; panicle 8-25 cm. long, a fourth to half as wide as long, densely flowered, the branches mostly viscid; spikelets 1.3-1.8 mm. long, minutely puberulent, obovoid-spherical at maturity, broadly ellipsoid when young, 5- to 7-nerved; *autumnal phase* remaining erect, producing simple branches from the lower and middle nodes, the thick white-margined blades of the winter rosette conspicuous. Infrequent in sandy woodlands, e. Tex., spring-fall; s.e. U.S. n. to Conn., Pa., Ill., Mo. and Okla.

18. *Panicum malacophyllum* Nash. Perennial; *vernal phase* velvety or minutely velvety-pilose throughout; culms slender, 25-70 cm. long, erect or ascending, rarely spreading, the nodes retrorsely bearded; sheaths with retrorse hairs; ligule a fringe 1-1.5 mm. long (actually the true ligule minute, the fringe attached at the very base of the blade); blades 7-10 cm. long, 5-12 mm. broad; panicle 3-7 cm. long; spikelets 2.6-3 mm. long, papillose-pilose, strongly 7- to 9-nerved; *autumnal phase* spreading, forming bushy top-heavy clumps with reduced blades. Infrequent in sandy woodlands, n.-cen. Tex., spring-fall; Tenn., Mo., Kan., Ark., Okla. and Tex.

This neatly combines characters of the *P. oligosanthos*-*P. lanuginosum* complex, indicating its probable origin.

19. *Panicum oligosanthos* Schult. Perennial; *vernal culms* 2-6 dm. tall, glabrous or variously pubescent; sheaths often papillose-pubescent; ligules less than 1 mm. long; blades 5-15 cm. long, 5-12 mm. broad, rather firm, variously pubescent, usually ascending, at base often short-ciliate, at apex usually sharply acute; panicle 4-12 cm. long; spikelets pedicelled, 2.9-4 mm. long, usually turgid-obovoid, pubescent to nearly glabrous, usually quite blunt, strongly 7- to 9-nerved, at base somewhat attenuate; sterile lemma often with a dark spot at the base; *autumnal phase* much-branched most of the length, especially in the upper part. *P. Helleri* Nash, *P. Scribnerianum* Nash. Practically all over Tex., spring-fall; most of the U.S.; Coah.

An attempt has been made to recognize several taxa in this rather variable one but the intergrading series is so complete from one sort to another that nothing is thereby gained. The "true" *P. oligosanthos*, with rather stiff blades which have some harsh pubescence beneath, is confined to the sandy soils of east Texas (in our range), whereas the "*Helleri*" and "*Scribnerianum*" segregates are more generally distributed and weedy, but every conceivable intermediate type can be found. There is also intergradation through such forms as "*P. malacon* Nash" and *P. malacophyllum* to the *P. lanuginosum* complex; and through *P. Ravenelii* to the *P. scoparium* complex.

20. *Panicum nodatum* Hitchc. & Chase. Perennial; *vernal culms* ascending or spreading, hard and wiry, 25-35 (-65) cm. tall, finely papillose, crisp-puberulent; blades firm, ascending, 3-5 (-9) cm. long, 5-9 mm. broad, puberulent on both surfaces, rather abruptly narrowed at apex; panicle 4-5 cm. long, few-flowered; spikelets 3.5-4.3 mm. long, slightly pyriform, rather long-attenuate basally, 7- to 9-nerved, pubescent; *autumnal culms* widely geniculate-decumbent, branching from all but the uppermost node, the branches somewhat divaricate, the nodes of the main culm swollen, no distinct winter rosette formed. Sandy prairies, Rio Grande Plains and the s. extremes of e. and s.e. Tex., grading into forms of *P. oligosanthos* on a broad scale, the basal attenuation of the spikelets being the sole technical character permitting determination in many instances, spring-fall; endemic.

21. *Panicum pedicellatum* Vasey. Perennial; *vernal culms* erect or ascending, 2-5 dm. tall, usually ascending-hirsute, at least below; blades 5-9 cm. long, 3-6 mm. broad, mostly linear, often narrowed toward base, glabrous or sometimes minutely hispid; panicle 3-6 (-10) cm. long; spikelets about 3.5-3.7 mm. long, pubescent, narrowly obovoid, attenuate and often discolored at base, 7- to 9-nerved; first glume about half as long as the spikelet, acute, the second glume slightly shorter than the fertile lemma; *autumnal culms* erect or leaning, freely branching from all but the uppermost nodes, the branches spreading, no distinct winter rosette formed. Frequent in limestone uplands, Edwards Plateau and nearby limestone areas, spring-fall; Tex., Coah.

Closely related to *P. transiens* Swall., and both are related to the *P. oligosanthos* alliance.

22. *Panicum Ravenelii* Scribn. & Merr. Perennial; *vernal culms* fairly stout and erect, 3-7 dm. tall, densely papillose-hirsute with ascending hairs, the nodes short-bearded;

sheaths hirsute like the culms; ligule a fringe or tuft 3-4 mm. long, on the larger leaves grading into additional tuft at blade base; blades thick and firm, 8-15 cm. long, 1-2 cm. broad, glabrous above, densely velvety-hirsute beneath; panicle 7-12 cm. long; spikelets 3.7-4.3 mm. long, sparsely papillose-pubescent, strongly 7- to 9-nerved; *autumnal phase* more or less spreading, branching from the middle and upper nodes, the short branches crowded at the summit. Sandy woodlands, e. and s.e. Tex., spring-fall; Del. to Mo., s. to Fla. and Tex.

This species combines the spikelet characters of *P. latifolium*, the pubescence of some other species, such as *P. scoparium* or typical *P. oligoanthes*, and the "ligule" of *P. lanuginosum*. The blades are not as cordate as those of *P. latifolium*. Reports of the occurrence in Texas of *P. Leibergii* (Vasey) Scribn. are based on specimens referable to *P. Ravenelii*.

23. *Panicum latifolium* L. Perennial; *vernal culms* from a knotted crown, suberect, 4-7 dm. long, glabrous to downy-villous, the nodes retrorsely bearded; sheaths glabrous to downy-villous; ligule a fringe about 0.5 mm. long; blades spreading, 7-12 cm. long, 15-30 mm. broad, sparsely ciliate at the cordate base, glabrous to velvety; panicle 6-12 cm. long; spikelets 3.6-4.7 mm. long, about half as broad, ellipsoidal, pubescent, 7- to 9-nerved; *autumnal phase* more or less spreading, branching from the middle nodes, finally top-heavy and reclining, the upper leaves of the branches crowded and spreading, not much reduced. *P. Boscii* Poir. var. *molle* (Vasey) Hitchc. & Chase. Infrequent in sandy woodlands, e. and s.e. Tex., spring-fall; e. U.S.

Doubtfully distinct from *P. macrocarpon* Le Conte (*P. "latifolium"* of older manuals) (with usually nonbearded nodes and spikelets averaging smaller, and occurring s.w. to Ark.). *P. latifolium* is closely related to the *P. oligoanthes*-*P. Ravenelii* alliance, having the large spikelets precisely like those of *P. Ravenelii* but the herbage more like that of *P. commutatum* (or *P. clandestinum*).

24. *Panicum scoparium* Lam. Perennial; *vernal phase* grayish-olive-green, velvety-pubescent throughout except on a viscid ring below the nodes and at the summit of the sheath; culms 8-15 dm. long, stout, usually 2-3 (-4) mm. thick, erect or ascending, usually geniculate basally, sometimes scabrous below the nodes, sometimes puberulent; sheaths glabrous or hispid, often mottled or white-spotted, commonly swollen basally and contracted upward; ligule a fringe 0.5-1.3 (-1.4) mm. long (more than 1 mm. long only in the best-developed leaves); blades rather thick, 12-25 cm. long, 9-18 mm. broad, often stiffish, ascending or spreading, glabrous or scabrous, sometimes more or less pubescent beneath; panicle 8-20 cm. long, the axis and branches with viscid blotches or these absent; spikelets 2.3-2.6 mm. long, ovate to obovate, turgid, papillose-pubescent to obscurely puberulent to glabrous, pointed (not sharply), 7- to 9-nerved; *autumnal phase* erect, leaning or spreading, freely branching from the middle and upper nodes, forming flabellate fascicles. *P. scabriusculum* Ell. Sandy woodlands, usually in moist or even boggy areas, e. and s.e. Tex., spring-fall; Mass. to Fla. w. through Ky. to Mo., Okla. and Tex.; Cuba.

Apparently grading through glabrous forms known as "*P. cryptanthum* Ashe" to *P. dichotomum*.

25. *Panicum commutatum* Schult. Perennial; *vernal culms* erect or decumbent often from somewhat knotty bases, 25-75 cm. long, sometimes purplish-tinged; nodes never bearded; sheaths glabrous or nearly so; ligule a minute scale or usually essentially absent; blades 5-10 (-15) cm. long, (6-) 8-25 mm. broad, glabrous on both surfaces but often slightly cordate and marginally ciliate near base; panicle 5-12 cm. long, loosely flowered, not much or often incompletely exerted from the upper sheath; spikelets 2.4-3.1 mm. long, 7- to 9-nerved, pubescent, ellipsoid, not very turgid; *autumnal culms* erect or leaning, often widely spreading, not much-branched, the winter rosette leaves often with a minute cartilaginous margin. *P. Joorii* Vasey, *P. Ashei* Pearson. E. U.S. w. to Mo., Okla. and Tex.; Mex.

Some populations seem to show some introgressive influence of the *P. oligoanthes* complex. This species is rather like a version of *P. clandestinum* (or *P. latifolium*), contaminated by *P. dichotomum* genes.

26. *Panicum clandestinum* L. Perennial; *vernal culms* in large dense clumps, sometimes with strong rhizomes, 5-10 cm. long; culms 7-15 dm. tall, scabrous to papillose-hispid at least below the nodes; sheaths strongly papillose-hispid to nearly glabrous; ligule a

muticous scale, very short; blades spreading or finally reflexed, 10-23 cm. long, 12-30 mm. broad, scabrous on both surfaces (at least toward the end), usually ciliate and slightly cordate at base, sharply acute; panicle 8-15 cm. long; spikelets 2.7-3.2 mm. long, pubescent, 7- to 9-nerved; *autumnal culms* erect or leaning, the branches leafy, the swollen bristly sheaths overlapping and wholly or partly enclosing the panicles, usually rather sparingly branched. Rare in extreme n.e. Tex. (Bowie Co.), reported also from Dallas Co. in last century, spring-fall; N.S., Que. and Me. to Kan., s. to Gulf States.

27. *Panicum geminatum* Forsk. Perennial, glabrous; culms terete, tufted, 25-80 cm. long, rarely decumbent basally and rooting at the nodes, usually slightly geniculate basally and essentially erect; blades 1-2 dm. long, 3-6 mm. broad, flat or toward the apex involute; panicle 12-30 cm. long, extremely narrow; appressed spikelike racemes (3 to) 8 to 18, lower racemes 25-30 mm. long, upper gradually shorter; raceme rachis ending in a short naked point; spikelets 2.2-2.4 mm. long, 5-nerved, subsessile, abruptly pointed, glabrous, the first glume truncate; fertile lemma and palea transversely rugose. *Paspalidium geminatum* (Forsk.) Stapf. Moist ground or shallow water, e. half of Tex., frequent nearest the coast, summer-fall; Fla., La., Tex., Okla. and warmer regions of the world.

28. *Panicum paludivagum* Hitchc. & Chase. Perennial, glabrous, resembling *P. geminatum* but the culms at base elongate, creeping, rooting, rather succulent, as much as 2 mm. long, the lower part often submerged, loosely branching; blades 15-40 cm. long, scabrous on the upper surface; spikelets 2.5-3 mm. long, faintly 3-nerved; fertile lemma obscurely to obsoletely transversely rugose. *Paspalidium paludivagum* (Hitchc. & Chase) Parodi. Scattered in wet places, s. Tex. (Cameron, Hidalgo and San Patricio cos.), summer-fall; Fla., Tex; Mex.; Guat.

This is not adequately separable from *P. geminatum*, being scarcely more than a form of that species.

29. *Panicum purpurascens* Raddi. Robust stoloniferous perennial; culms decumbent and rooting at the base, 2-5 m. long, the nodes densely villous; sheaths villous or the upper glabrous, densely pubescent on the collar; blades 1-3 dm. long, 10-15 mm. broad, flat, glabrous; panicle 12-20 cm. long, the rather distant subracemose densely flowered branches ascending or spreading; spikelets subsessile, 3 mm. long, elliptic, 5-nerved, glabrous; fertile lemma and palea minutely transversely rugose. *Brachiaria purpurascens* (Raddi) Henr. Abundant along canals and resacas in the Rio Grande delta, Brownsville region, late summer-fall; Tex., Fla. and Ala.; throughout trop. Am. at low alt.; commonly cult. in trop. Am. as a forage grass, being cut for green feed; probably introd. into Braz. at an early date from Afr., where it was perhaps indigenous.

30. *Panicum reptans* L. Branching annual; culms ascending 1-3 dm. above the creeping base (rooting at the lower nodes); ligules less than 1 mm. long; blades 15-60 mm. long, 4-12 mm. broad, flat, cordate basally, usually glabrous, ciliate on the undulate margin near base; panicles of ascending spikelike racemes along an angled axis, 2-6 cm. long; the 3 to 12 ascending or spreading racemes 2-3 cm. long, aggregated, the rachis usually pilose with long weak hairs; spikelets secund along the raceme, about 2 mm. long, glabrous, abruptly pointed, strongly 5-nerved, on pubescent or pilose pedicels about 1 mm. long; first glume very short, truncate or rounded. Infrequent, s.e., e. and n.-cen. Tex. and Rio Grande Plains, usually in flowerbeds or other disturbed ground, summer-fall; Fla. to Tex.; trop. regions of the world, probably introd. in Tex. at an early date.

31. *Panicum gymnocarpon* Ell. Perennial, rooting at the lower nodes; culms basally prostrate, terminally ascending, 3-7 mm. thick; blades 14-25 mm. broad, basally with pronounced corners, marginally finely serrate; ligule a thin scale 1 mm. long; inflorescence paniculoid, 12-40 cm. long, 7-25 cm. broad, of 14 to 35 loosely ascending remote or remotely whorled branches ("racemes" of some descriptions) with each secondly bearing a number of closely set appressed nearly sessile spikelets or (toward the base) usually compound with short appressed secondary branchlets (each bearing several appressed sessile spikelets); spikelets 5.5-7 mm. long, narrow; first glume nearly as long as the sterile lemma, the second glume strongly 3- to 5-nerved and surpassing the sterile lemma, both of them acuminate and glabrous; fertile lemma 2 mm. long, smooth, shiny. Local in wet sand along streams, e. and s.e. Tex. (w. to Anderson and Colorado cos.), fall; Coastal States, S.C. to Tex. and inland to Ark.

32. *Panicum hemitomon* Schult. MAIDENCANE. Aquatic or subaquatic perennial from extensively creeping rhizomes, often producing numerous sterile shoots with overlapping sometimes densely hirsute sheaths; culms 5-15 dm. tall, usually hard; sheaths of fertile culms usually glabrous; blades 10-25 cm. long, 7-15 mm. broad, usually scabrous on the upper surface and smooth beneath; panicles elongate, very narrow, 15-30 cm. long, the branches erect, the lower branches distant, the upper ones approximate, 2-10 cm. long; spikelets subsessile, 2.4-2.7 mm. long, lanceolate, acute, 3- to 5-nerved, glabrous; first glume about half the length of the spikelet; fertile lemma less indurate than usual in *Panicum*; apex of fertile palea scarcely enclosed by the margin of the fertile lemma. Frequent (rarely flowering) on margin of lakes, ponds and stream, e. and s.e. Tex., spring (usually May); Coastal States, N.J. to Tex.; also Tenn.; Braz.

33. *Panicum obtusum* H.B.K. VINE-MESQUITE. Perennial forming large colonies from extensive stolons; culms in tufts from a knotty base at intervals along the stolon, wiry, compressed, 2-8 dm. tall; ligules about 1 mm. long; blades mostly elongate, 2-7 mm. broad, glabrous or nearly so; panicles narrow, 3-12 cm. long, about 1 cm. broad, the few appressed branches densely flowered, the short pedicels secund; spikelets 3-3.8 mm. long, obovoid, brownish, blunt, scabrous; first glume nearly as long as the spikelet; fertile lemma smooth and shiny. Frequent, forming large colonies near water or in sporadic overflow areas, w. half of Tex., e. to n.-cen. Tex. and the Coastal Bend area, spring-fall; Mo. to Colo., s. to Ark. and cen. Mex.

34. *Panicum brachyanthum* Steud. Glabrous branching annual; culms slender, weak, decumbent at base, 3-10 dm. long; ligules minute; blades 5-15 cm. long, 2-3 mm. broad; panicle 5-15 dm. long, diffuse, the few branches divaricate and capillary, spikelet-bearing toward the ends; spikelets mostly in twos, 3.2-3.6 mm. long, fusiform, acute, obscurely nerved, roughened with small warts each of which is furnished with a short stiff hair; first glume minute; fertile lemma minutely papillose, the margin inrolled only in the lower part. Frequent in sandy woodlands, e. and s.e. Tex. (s. to Aransas Co.), late summer-fall; Ark., La., Tex. and Okla.

35. *Panicum verrucosum* Muhl. Glabrous branching annual, bright green, at first erect (or erect when growing up through thick vegetation), later widely spreading when not crowded; culms slender, weak, 2-15 dm. long, decumbent at base, usually with prop-roots; ligules minute; blades thin, flat, lax, 5-20 cm. long, 4-10 mm. broad; panicles 5-30 cm. long, about as wide, diffuse, with divaricate capillary branches that are spikelet-bearing toward the ends; small panicles often produced at the lower nodes; spikelets mostly in twos, 1.8-2.1 (-2.6) mm. long, elliptic-obovate, subacute, roughened with small warts, the nerves obscure or obsolete; first glume minute; fertile lemma minutely papillose, the margin inrolled only in the lower part. Sandy woodlands, e., s.e. and n.-cen. Tex., frequent, late summer-fall; Mass. to Fla., w. to Mich., Ky., Ark. and Tex.

36. *Panicum hians* Ell. Tufted perennial; culms compressed, 2-6 dm. tall, mostly erect, sometimes more or less decumbent or prostrate with erect branches; ligules minute; blades 5-15 cm. long, 1-5 mm. broad, flat or folded, pilose on the upper surface near base; panicles 5-20 cm. long, usually loose and open, the primary branches few, slender, distant, spreading or drooping, the branchlets borne on the upper half or toward the ends only; spikelets in more or less secund clusters, short-pedicelled, 2.2-2.4 mm. long, 5-nerved, glabrous; palea of the sterile floret becoming enlarged and indurate, expanding the spikelet to twice as thick as wide at maturity; fertile lemma minutely papillose-roughened, relatively thin for this genus. Usually in low places, damp soil, e., s.e. and n.-cen. Tex. and Rio Grande Plains, rare w. to Llano region, spring-fall; Coastal States, Va. to Tex.; also Mo., Ark., Okla. and N.M.; Mex.

Some of the denser-spikeletted forms bear a strong superficial resemblance to *Sphenopholis obtusata*.

37. *Panicum anceps* Michx. Perennial from branching scaly rhizomes 2-4 mm. thick; culms 3-10 dm. long, erect, compressed; sheaths keeled, glabrous to pilose or densely to sparsely villous (especially at summit); ligule a scale 0.2-0.6 mm. long, firm; blades elongate, 4-12 mm. broad, pilose near base or often pubescent on both surfaces; panicles 15-40 cm. long, the branches ascending or spreading, slender, remote, bearing short mostly appressed rather densely flowered branchlets; spikelets slightly oblique to the pedicels, 2.4-3.8 mm. long, short-pedicelled, lanceolate, pointed, glabrous, often gaping; sterile lemma 5- to 7-nerved; glumes and sterile lemma mostly keeled; fertile lemma

smooth and shiny and with a very minute tuft of thickish hairs at apex. *P. rhizomatum* Hitchc. & Chase. Abundant in sandy well-drained usually forested uplands, e. and s.e. Tex., infrequent w. to n.-cen. Tex., late summer-fall; s.e. U.S., w. to Kan., Okla. and Tex.

38. *Panicum antidotale* Retz. Perennial from short knotty subrhizomatous base; culms 5-20 (-30) dm. long, mostly erect, sparingly branched, robust, glabrous, compressed, mostly exposed (the sheaths shorter than and often diverging from the internodes), the swollen nodes as much as twice as thick as the middle of the internodes; sheaths nearly glabrous or the lowest ones minutely pubescent; ligule 0.3-0.8 mm. long, a fimbriate scale; blades elongate, flat, 5-12 mm. broad; panicle 15-30 dm. long, the many-flowered branches ascending; spikelets 2.5-3 mm. long, strongly nerved, pointed, the first glume a third to two thirds as long as the spikelet; sterile lemma 7-nerved; fertile lemma smooth and shining, acute. Local in roadsides and other disturbed areas, Rio Grande Plains, spring-fall; nat. of India, introd. and naturalized in Tex. and Ariz., perhaps elsewhere.

39. *Panicum rigidulum* Nees. Tufted perennial in dense clumps from a short multi-noded crown, with numerous short-leaved innovations at base; culms 5-10 dm. tall, erect, compressed; sheaths keeled; ligules membranous, about 1 mm. long or less; blades erect, folded basally, flat distally, 2-5 dm. long, 5-12 mm. broad, glabrous or sparsely pilose on the upper side at the folded base; panicles terminal and axillary, 1-3 dm. long, a fifth to nearly as broad as long, the long branches erect or spreading, naked at base, the appressed to spreading densely flowered branchlets mostly borne on the underside of the branches, the pedicels glabrous or bearing near the summit 1 or several hairs; spikelets 1.8-2.8 mm. long, short-pedicelled, lanceolate, pointed, glabrous; sterile lemma 5- to 7-nerved; glumes and sterile lemma mostly keeled; fertile lemma and palea smooth and shiny, the fertile lemma sessile or rarely with a very minute stipe and with a minute tuft of thickish hairs at apex. *P. agrostoides* Spreng. and var. *ramosius* (Mohr) Fern., *P. condensum* Nash, *P. stipitatum* Nash. Abundant in moist or poorly drained areas, e. and s.e. Tex., infrequent w. to n.-cen. Tex., late summer-fall; most of e. U.S.; W.I.; Coah.

40. *Panicum longifolium* Torr. Perennial; culms erect, 35-80 cm. tall, in dense tufts, compressed, usually surrounded by basal leaves nearly half as long; sheaths usually villous near summit; ligule membranous, fimbriate-ciliate, 2-3 mm. long; blades elongate, 2-5 mm. or more broad, pilose on the upper surface near the base; lateral panicles few or none, the terminal ones 10-25 cm. long, the branches slender and ascending; spikelets 2.4-2.7 mm. long, short-pedicelled (the pedicel often with a delicate hair near the tip), lanceolate, pointed, glabrous; sterile lemma 5- to 7-nerved; glumes and sterile lemma mostly keeled; fertile lemma smooth and shiny, with a minute tuft of thickish hairs at apex. Reported to occur in e. Tex.; Mass. to Fla. and Tex., to Ind. and Tenn.

Extremely similar to *P. rigidulum*; the merits of recognizing the 2 as separate species should be carefully re-evaluated.

41. *Panicum tenerum* Beyr. Perennial from knotty crowns; culms several, sub-compressed, wiry, erect, 4-9 dm. tall; lower sheaths pubescent toward the summit, with spreading hairs; ligule minute; blades 4-15 cm. long, 2-4 mm. broad, erect, firm, sub-involute, pilose on upper surfaces toward the base; panicle 3-8 cm. long, very slender, terminal and axillary; spikelets short-pedicelled (the pedicel usually with a few long hairs), 2.2-2.8 mm. long, pointed, glabrous; fertile lemma and palea smooth and shiny. Rare in wet places in s.e. Tex., rarer still in e. Tex., summer-fall; Coastal States, N.C. to Tex.; W.I.

42. *Panicum amarulum* Hitchc. & Chase. BEACH PANIC. Perennial from extensive decumbent subrhizomatous to rhizomatous bases, forming clumps as much as 3 m. across; ascending aerial portions of the numerous culms to 1 m. long and 1 cm. thick, glaucous, glabrous throughout; ligule a fringe about 2 mm. long or at the extreme base of the fringe a firm minute scale; blades linear, firm, 2-5 dm. long, 5-12 mm. broad, involute near the tip, pilose on the upper surface near the base; panicle large, rather compact, 3-10 cm. broad, slightly nodding, densely flowered; spikelets 4.3-5.5 mm. long, acuminate-pointed, glabrous; sterile lemma strongly 5- to 9-nerved; lower floret staminate; fertile lemma and palea smooth and shiny. All along the Gulf beaches in loose dune sand, fall; beaches, N.I. to Mex.; W.I.

Very doubtfully distinct from *P. amarum* Ell., which occurs on beaches from Connecticut to Georgia, and has been reported to occur in Texas. *P. amarum* supposedly

differs in more definitely rhizomatous habit, with culms rising singly at intervals, panicle a fourth to a third the entire height of the plant and not more than 3 cm. broad and spikelets 5-6.5 mm. long. *P. amarulum* intergrades with *P. virgatum* inland.

43. *Panicum Havardii* Vasey. Perennial from extensively creeping scaly rhizomes to 1 cm. thick; culms robust, about 1 m. tall, rising solitary and erect at intervals from the rhizomes, stout, glaucous, pale green, glabrous; sheaths glabrous; ligule membranous, ciliate; blades firm, 5-10 mm. broad, tapering into long setaceous-involute tips; panicle to 4 dm. long, diffuse; spikelets usually 6-8 mm. long, turgid, usually gaping, strongly 5- to 9-nerved, glabrous, pointed; lower floret usually staminate; fertile lemma and palea smooth and shiny. Sandhills, usually in deep loose blowing sand, w. half of Tex., especially abundant in the sandy South Plains, late summer-fall; Tex., N.M. and Chih.

Perhaps no more than a dune ecotype of *P. virgatum*.

44. *Panicum virgatum* L. SWITCHGRASS. Perennial from strong branching scaly horizontal rhizomes; culms stout, robust, in large bunches, green or glaucous, tough, 1-2 (-3) m. tall; sheaths glabrous; ligule membranous, ciliate; blades 1-6 dm. long, 3-15 mm. broad, flat, glabrous or sometimes pilose above near base, rarely pilose all over; panicle 15-50 cm. long, open and diffuse; spikelets turgid, often gaping, glabrous, (2.8-) 3.5-5 mm. long, acuminate-pointed; first glume clasping, two thirds to three fourths as long as the spikelet, acuminate or cuspidate; sterile lemma 5- to 9-nerved; lower floret usually staminate; fertile lemma narrowly ovate, smooth and shiny, the margins inrolled only in the lower part. In moist or seasonally moist open places nearly throughout the state but infrequent or rare in the Trans-Pecos, late summer-fall; N.S. and Ont. to N.D. and Wyo., s. to Gulf States; Cuba; reported in Jal. and Gro. but perhaps based on mis-determinations; reports of its occurrence in Coah. and Chih. are based on specimens of *P. bulbosum*.

45. *Panicum repens* L. Perennial with strong horizontal often extensively creeping rhizomes which are clothed basally with bladeless sheaths; culms stout, rigid, 3-8 dm. long, erect; sheaths more or less pilose; ligule membranous, ciliate; blades flat or folded, linear, mostly firm, 2-5 mm. broad, sparsely pilose to glabrous; panicle open, 7-12 cm. long, the somewhat distant branches stiffly ascending; spikelets turgid, usually gaping, strongly 5- to 9-nerved, glabrous, pointed, 2.2-2.5 mm. long, ovate; first glume about a fifth as long as the spikelets, loose, truncate; lower floret usually staminate; fertile lemma smooth and shining. Rare in beach sand, Chambers and Galveston cos., probably not persistent, summer; Fla. to Tex.; trop. and subtrop. coasts of the world, possibly adv. in Am.

46. *Panicum bulbosum* H.B.K. Perennial from knotty subrhizomatous bases, the knots roundish and as much as 1-2 cm. thick in some populations; culms robust and knotty, (5-) 8-20 dm. tall, the bases sometimes shortly decumbent but the culms mostly erect, slightly compressed; sheaths glabrous to pilose toward the summit; ligule membranous, ciliate; blades 2-6 dm. long, 3-17 mm. broad, scabrous or glabrous above, glabrous beneath, flat; panicle 2-5 cm. long, diffuse or open; spikelets 2.8-4.2 mm. long, ellipsoid, faintly nerved, glabrous; first glume about half the total length of the spikelet or a little less, usually rather blunt; fertile lemma transversely rugose. Incl. var. *minus* Vasey, *P. plenum* Hitchc. & Chase. Frequent in higher parts of Trans-Pecos Tex., mostly more than 4,500 ft. elev., late summer-fall; Tex., N.M. and Ariz., s.e. to Oax.

47. *Panicum maximum* Jacq. GUINEA GRASS. Robust perennial (often lasting only one season in our range because not frost-hardy), light-green, from short stout rhizomes; culms mostly erect, usually 1-2 m. tall, the nodes usually densely hirsute; sheaths papillose-hirsute to glabrous, usually densely pubescent on the collar; ligule 4-6 mm. long, membranous, ciliate; blades flat, 30-75 cm. long, to 35 mm. broad, glabrous, very scabrous on the margins, sometimes hirsute on the upper surface near base; panicles many-flowered, 2-5 dm. long and about a third as broad, the long rather stiff branches ascending, naked at base, the lower in whorls, the axils pilose, the short branchlets appressed and bearing more or less clustered short-pedicelled spikelets; spikelets 3-3.3 mm. long, ellipsoid, faintly nerved, glabrous; first glume about a third the length of the spikelet; fertile lemma transversely rugose. Repeatedly introd. and as a waif in s. Tex. but not hardy; s. Fla.; trop. regions of the world, probably originally from Afr.

This is one of the most highly esteemed forage grasses in the world, hence the repeated attempts to establish it in southern Texas, but the winters are too severe.

48. *Panicum trichoides* Sw. Annual; culms widely creeping and spreading, freely branching; sheaths mostly longer than the internodes, pilose; blades 4-7 cm. long, 8-15 mm. broad, thin, ovate-lanceolate, asymmetrical, ciliate at base; panicle 8-15 cm. long, very diffuse, the branches capillary, ascending to spreading, the branchlets even thinner, spreading, few-flowered; spikelets about 1.3 mm. long, acute, sparsely pubescent. Exceedingly rare and probably not persistent, Brownsville region of s. Tex.; Mex.; W.I., s. to Peru and Braz.; s.e. Asia and Phil.

49. *Panicum hirsutum* Sw. Perennial; culms tufted, robust, erect, to 15 dm. tall and 1 cm. thick, simple or branched at base only; nodes appressed-pubescent; sheaths papillose-hirsute, the hairs stiff, spreading, fragile, causing mechanical irritation to the skin when handled; ligule membranous, ciliate; blades flat, to 6 dm. long, 20-35 mm. broad, glabrous; panicle 20-35 cm. long, at first condensed, finally open, the branches ascending; spikelets pointed, 7- to 9-nerved, glabrous, 2-2.2 mm. long; fertile lemma smooth and shiny. Rare in thickets, Rio Grande delta (Brownsville region) in extreme s. Tex., June-Dec.; Tex. and trop. Am.

50. *Panicum Ghiesbreghtii* Fourn. Perennial; culms tufted, stiff, erect, rather robust, ascending-hirsute, 6-8 dm. tall, the nodes densely hirsute; sheaths mostly hirsute; ligule membranous, ciliate; blades to 6 dm. long and 12 mm. broad, flat, papillose-hirsute to glabrescent; panicles 2-3 dm. long, usually less than half as broad as long, the branches ascending, naked at base, the branchlets more or less appressed; spikelets pointed, 7- to 9-nerved, glabrous, 3 mm. long, 1 mm. broad; fertile lemma smooth and shiny. Infrequent in low moist ground and dense thickets, s. Tex. (Calhoun, Cameron and Hidalgo cos.), late summer-fall, rarely spring; Tex. and trop. Am.

51. *Panicum Hallii* Vasey. Perennial, erect, 15-60 cm. tall, somewhat glaucous; leaves usually crowded toward the base; sheaths sparsely papillose-hispid to glabrous; blades ascending, flat, curling with age, 4-15 cm. long, 2-6 mm. broad, sparsely ciliate toward the base, otherwise glabrous or nearly so; panicle 6-20 cm. long, the few branches stiffly ascending; spikelets 3-3.7 mm. long, 7- to 9-nerved, glabrous; fertile lemma smooth and shining. Frequent in rocky open dry uplands, w. two thirds of the state, intergrading on a broad scale with *P. filipes* and probably not specifically distinct from it, (spring-) summer-fall; Okla., Colo. and Ariz., s. to n. Mex.

52. *Panicum filipes* Scribn. Perennial, tufted; culms 3-8 dm. tall, erect or ascending, stiff; sheaths rarely pubescent; ligule membranous, ciliate; blades laxly ascending or spreading, 10-25 cm. long, 3-8 mm. broad, flat, glaucous, glabrous or sometimes sparsely hirsute beneath; panicles 7-25 cm. long, usually equaled or exceeded by the upper blades, the distal branches spreading; spikelets about 3 mm. long, pointed, 7- to 9-nerved, glabrous; fertile lemma smooth and shiny. Common in Rio Grande Plains and Coastal Bend region, frequent elsewhere in cen. Tex., becoming infrequent inland to w. Tex.; La., Tex., Coah., N.L., Tam. and S.L.P.

Supposedly distinguished from *P. Hallii* by the longer blades, looser panicle and smaller spikelets, but actually intergrading with that species on a broad scale. Closely related also to what we call *P. pilcomayense*.

53. *Panicum pilcomayense* Hack. Perennial; culms stiff, robust, few together, 7-10 dm. tall, at least the lower nodes with a ring of erect hairs; sheaths mostly hirsute; ligule membranous, ciliate; blades flat, elongate, 4-8 mm. broad, essentially glabrous; panicle very diffuse, nearly half the height of the plant, the branches to 3 dm. long, in fascicles of 2 to 4 or solitary, scabrous, naked below, loosely branched toward the ends, at least the lower axils pilose; spikelets pointed, 2.2-3 mm. long, 7- to 9-nerved, glabrous, on appressed pedicels; fertile lemma smooth and shiny. Local in s.e. Tex. and s. in coastal areas to Rio Grande delta, rare inland to Brazos Co., spring-fall; Tex.; Parag.

Apparently introduced, though perhaps bicentric in distribution. We are including here a few plants which have been referred to *P. Bergii* Arech. Some of the plants have a great resemblance to *P. filipes*.

54. *Panicum capillarioides* Vasey. Perennial from a knotty base; culms stiff, erect or ascending, 30-55 cm. tall, appressed-pubescent or glabrate, the nodes densely ascending-pubescent; sheaths mostly hirsute; ligule membranous, ciliate; blades rather stiff, 1-3 dm. long, 2-10 mm. broad, flat, harshly papillose-pubescent; panicle diffuse, few-flowered, 1-2 dm. long, the capillary branches stiffly spreading at maturity; spikelets pointed, 7- to

9-nerved, 5-6 mm. long, lanceolate, long-acuminate, glabrous; fertile lemma 1.6-1.8 mm. long. Frequent usually in sandy soil, Rio Grande Plains, spring-fall; Tex.; Tam.

This species is readily distinguished from all others by the peculiar elongated second glume and sterile lemma.

55. *Panicum miliaceum* L. BROOMCORN MILLET, HOG MILLET, PROSO. Branching annual; culms stout, erect or decumbent basally, 2-10 dm. long; ligule 1-3 mm. long; blades more or less pilose on both surfaces or glabrate, to 3 dm. long and 2 cm. broad, rounded at base; panicles usually more or less included at base, 1-3 dm. long, usually nodding, rather compactly diffuse, the numerous branches ascending, very scabrous, spikelet-bearing toward the ends; spikelets 4.5-5 mm. long, ovate, acuminate, strongly 9- to 11-nerved, pointed, glabrous; first glume large and clasping; fertile lemma smooth and shining, stramineous to reddish-brown. Occasional in disturbed places, Plains Country and n.-cen. Tex. and probably elsewhere as an escape, summer-fall; waste places, introd. or escaped from cult., n.e. U.S. and occasionally in other parts of the U.S.; temp. part of the Old World.

Cultivated in the cooler parts of the United States to a limited extent for forage and occasionally for feed for hogs.

56. *Panicum hirticaule* J. Presl. Annual; culms simple or nearly so, usually 15-70 cm. tall, papillose-hispid to nearly glabrous; ligule 1-3 mm. long; blades 5-15 cm. long, 4-13 mm. broad, often cordate basally, sparsely hispid to nearly glabrous, ciliate toward base; panicles 5-15 cm. long, scarcely a third the entire height of the plant, diffuse; spikelets 2.7-3.3 mm. long, lanceolate-fusiform, acuminate, usually reddish-brown, pointed, 7- to 9-nerved; first glume half to three fourths the length of the spikelet, clasping; fertile lemma 2 mm. long, smooth and shining, usually olive-brown at maturity. Infrequent in the Trans-Pecos, usually in seasonally moist alluvial flats and fans, summer-fall; Tex. to Calif. s. to Arg.

57. *Panicum pampinosum* Hitchc. & Chase. Annual much like *P. hirticaule* but freely branching and nearly glabrous throughout; blades longer; spikelets more turgid, about 4 mm. long; first glume more than three fourths the length of the spikelets; second glume and sterile lemma equal in length; fertile lemma 2.2 mm. long. Allegedly occurring in w. Tex., summer-fall; Tex. to Ariz.; Mex.

58. *Panicum Hillmanii* Chase. Resembling *P. capillare* (below) especially the larger-fruited forms, differing in having no short flowering branches at the base, stouter culms, firmer foliage, stiffer panicle branches with the lateral spikelets on shorter more appressed pedicels, well-developed sterile palea and especially in the larger darker fertile lemma (to 2 mm. long) with a prominent lunate scar at its base. Local in the Trans-Pecos and Plains Country, intergrading on a broad scale with *P. capillare*; plants showing combination of characteristics of the 2 "species" being common, summer-fall; Kan. to Tex.; Calif. Probably a mere form of *P. capillare*.

59. *Panicum capillare* L. WITCHGRASS. Annual, freely branched from the base; culms usually somewhat spreading from the base, 2-8 dm. long, papillose-hispid to rarely nearly glabrous; sheaths hispid; ligule 1-3 mm. long; blades 10-25 cm. long, 5-15 mm. broad, hispid on both surfaces; panicles many-flowered, diffuse, often making up half the total length of the plant, included at base until maturity, the branches finally divaricately spreading, the whole panicle breaking away and rolling before the wind; spikelets 2-3.3 mm. long, pointed or attenuate at the tip, 7- to 9-nerved, glabrous; first glume large, clasping; fertile lemma and palea smooth and shining, usually olive-brown at maturity. Incl. var. *occidentale* Rydb. Frequent in the Trans-Pecos and Plains Country, infrequent e. to n.-cen. Tex., often in disturbed ground, summer-fall; most of N. A.

60. *Panicum flexile* (Gatt.) Scribn. Branching tufted annual, erect, much-branched from the base, 2-7 dm. tall, somewhat hispid or papillose-hispid below and on the sheaths, the nodes pubescent; ligule 1-3 mm. long; blades erect but not stiff, glabrous or sparsely hispid, to 3 dm. long, 2-6 mm. broad; panicles oblong, narrow, 1-2 dm. long, about a third as wide as long, diffuse; spikelets 3.1-3.5 mm. long, pointed, 7- to 9-nerved, glabrous; first glume large, clasping; fertile lemma and palea smooth and shining, usually olive-brown at maturity. Exceedingly rare, in extreme n.e. Tex. (Clarksville, Red River Co. where collected once in the 19th century), fall (?); sandy mostly damp soil, meadows and open woods, e. Can. and N.Y. to N.D., s. to Fla. and Tex.; introd. in Ut.

61. *Panicum philadelphicum* Trin. Branching tufted annual, light-yellowish-green; culms slender, usually erect, 15-50 cm. tall, papillose-hispid to glabrous, more or less zigzag at base; sheaths papillose-hispid to nearly glabrous; ligule a fringed scale about 1 mm. long; blades usually erect, 5-15 cm. long, 2-6 mm. broad, rather sparsely hirsute; panicles 1-2 dm. long, diffuse, the branches solitary, rather stiffly ascending, the axillary pulvini hispid; spikelets 1.7-2.2 mm. long, pointed, 7- to 9-nerved, glabrous; fertile lemma and palea smooth and shining. Rare in sandy gravelly soil, e. and n.-cen. Tex., Oct.; Conn. to Minn., s. to Ga., Ala. and Tex.

62. *Panicum dichotomiflorum* Michx. FALL PANIC. Somewhat succulent branching annual; culms ascending or spreading from a geniculate base, 5-10 dm. tall or in robust specimens to 2 m. long; ligule a dense ring of white hairs 1-2 mm. long; blades flat, scaberulous and sometimes sparsely pilose on the upper surface, 1-5 dm. long, 3-20 mm. broad, the white midrib usually prominent; panicles many-flowered, terminal and axillary, mostly included in the upper sheath at the base, 1-4 dm. long or more, the main branches rather stiff, ascending, the branchlets short and appressed along the main branches; spikelets short-pedicelled, narrowly oblong-ovate, 2-3 mm. long, acute, 7-nerved, glabrous; first glume only about a fourth as long as the spikelet; fertile lemma smooth and shining. Moist ground along streams and in disturbed soil, e. half of Tex., more common in low areas near the coast such as rice fields, rare in e. part of Plains Country, late summer-fall; N.S. and Me. to Minn., s. to Fla. and Tex., occasionally introd. farther w.; W.I.

63. *Panicum texanum* Buckl. TEXAS MILLET. Annual, robust, much-branched; culms erect or ascending or decumbent and rooting at the lower nodes, 5-15 dm. or even to 3 m. long, softly pubescent at least below the nodes and below the panicles; sheaths softly pubescent, often papillose; ligule 1 mm. long or shorter; blades flat, 8-20 cm. long, 7-15 mm. broad, softly pubescent; panicle 8-20 cm. long, of ascending spikelike racemes along an angled axis, the racemes short, appressed and loosely flowered, the axis and rachises pubescent, with long hairs intermixed; spikelets 5-6 mm. long, fusiform, sessile, abruptly pointed, strongly 5- to 7-nerved, pilose, often obscurely reticulate. Frequent in disturbed usually sandy ground, e. two thirds of the state, summer-fall; Tex., Okla., Miss., Fla., Tam., N.L. and Chih.

64. *Panicum arizonicum* Scribn. & Merr. Annual, branching; culms erect or often decumbent at base, 2-6 dm. tall; sheaths glabrous to papillose-hispid; ligule a fringe about 1 mm. long; blades 5-15 cm. long, 6-12 mm. broad, glabrous or papillose-hispid beneath, ciliate near base; panicle of ascending spikelike racemes along an angled axis, 7-20 cm. long, the racemes rather loosely flowered, finely pubescent and papillose-hirsute; spikelets 3.5-3.8 mm. long, obovate-elliptic, densely hirsute to glabrous, sessile, abruptly pointed; sterile lemma strongly 5-nerved; fertile lemma and palea very minutely transversely rugose. Locally abundant in disturbed soil, Trans-Pecos deserts, (June-) Sept.-Oct.; Tex., N.M., Ariz., Calif., s.e. to Oax.

65. *Panicum fasciculatum* Sw. BROWNTOP PANIC GRASS. Much-branched annual; culms erect or spreading from a decumbent base (much-rooting at the nodes), 3-10 dm. tall, sometimes pubescent below the panicle or hispid below the appressed-pubescent nodes, the more robust freely branched from the lower nodes; sheaths glabrous to papillose-hispid; blades 4-30 cm. long, 6-20 mm. broad, glabrous, flat; ligule not more than 1 mm. long; panicle of ascending spikelike racemes along an angled axis, 5-15 cm. long, the racemes 5-10 cm. long; spikelets yellow or bronze-brown, 2.1-3 mm. long, obovate, turgid, glabrous, sessile, abruptly pointed, strongly 5-nerved and transversely wrinkled; fertile lemma and palea transversely rugose. Incl. var. *reticulatum* (Torr.) Beal. Frequent in disturbed ground, nearly throughout (rare in the Trans-Pecos and higher parts of the Plains Country), summer-fall; warmer parts of Am, n. to Fla. and Tex.

66. *Panicum ramisetum* Scribn. Perennial from knotty subrhizomatous bases; culms tufted, erect or ascending, 25-60 cm. tall; blades 5-12 cm. long, 2-4 mm. broad; panicle 5-20 cm. long, very slender and spikelike, the branches short, appressed, the ultimate branchlets bearing 1 to several spikelets, produced beyond the uppermost spikelet as a bristle 1-6 mm. long, bristles not exceeding the spikelets; spikelets about 2.4-3 (-3.2) mm. long, obovate, much-swollen on the face, glabrous, strongly nerved; first glume about half as long as the spikelet; fertile lemma transversely rugose, apiculate. *Setaria ramiseta* (Scribn.) Pilg. Frequent in caliche-sand loam and dry uplands in Rio Grande Plains, infrequent n. to Stonewall, Callahan and Ector cos., spring-fall; Tex., Coah., N.L. and Tam.

Intergrades with *P. Reverchonii* and to a lesser extent with *P. firmulum*.

67. *Panicum Reverchonii* Vasey. Perennial from knotty subrhizomatous bases; culms tufted, stiffly erect, 3-7 dm. tall; blades erect, stiff, 5-20 cm. long, 2-3 mm. broad; panicle 5-20 cm. long, very slender and spikelike, the branches short, appressed, the ultimate branchlets bearing 1 to several spikelets, produced beyond the uppermost spikelet as a bristle 1-6 mm. long; bristles equaling or exceeding the spikelet; spikelet 1 to 4 to a branchlet, (2.6-) 3-4 mm. long, elliptic, much-swollen on the face, glabrous, strongly nerved; first glume about half as long as the spikelet; fertile lemma transversely rugose, acute. *Setaria Reverchonii* (Vasey) Pilg. Frequent in the Edwards Plateau, less frequent in the limey areas of the Plains Country and Rio Grande Plains, rare to n.-cen. Tex., spring-fall; Tex., Okla. (Harmon Co.) and presumably also Coah.

Intergrading toward the south with *P. ramisetum*.

68. *Panicum firmulum* Hitchc. & Chase. Perennial from knotty rhizomatous bases forming stools; culms tufted, ascending or decumbent at base, 3-4 dm. tall, rather loosely tufted from creeping knotty rhizomes to 5 cm. long; blades ascending or spreading, firm, 4-10 cm. long, 4-7 mm. broad; panicles very slender, spikelike, the branches short, appressed, the ultimate branchlets bearing 1 to several spikelets, produced beyond the uppermost spikelet as a bristle 1 to 2 times as long as the spikelet; spikelet 2.8-3.5 (-3.7) mm. long, obovate, much-swollen on the face, glabrous, strongly nerved; first glume half as long as the spikelet; fertile lemma transversely rugose, apiculate. *Setaria firmula* (Hitchc. & Chase) Pilg. Open sandy ground, Rio Grande Plains, spring-fall; endemic.

Intergrading with *P. ramisetum*, but the relatively short, broad blades, and large spikelets mark *P. firmulum* rather well.

59. SACCIOLEPIS NASH

A genus of about 30 species in warm regions.

1. *Sacciolepis striata* (L.) Nash. Perennial; culms extensively creeping, the lower internodes 2-4 mm. thick; sheaths usually shortly papillose-pilose; ligule obsolete; blades with conspicuous nervature; panicles terminal, not much-exserted, spiciform, 6-15 (-25) cm. long, about 1 cm. thick, with numerous appressed branches, the minute ultimate pedicels abscising just below the glumes; spikelets not much-compressed, 2-flowered, the lower floret staminiferous, the upper perfect; rachilla abscising just below the fertile lemma; first glume minute, triangular, 3- to 5-nerved; second glume lanceolate, gibbous basally, 4-5 mm. long, strongly several-nerved; lower lemma as long as the second glume, with obscure nerves and a well-developed palea and 3 stamens; fertile lemma about half as long as the spikelet, very thin-cartilaginous, oblong, blunt, the margins revolute, enclosing the palea of the same texture. In moist sands near streams, marshes and bogs, infrequent to rare in e. and s.e. Tex., late summer-fall; Coastal States, N.J. to Tex.; Okla. and Tenn.

60. OPLISMENUS BEAUV.

A genus of about a dozen species of warm regions.

1. *Oplismenus hirtellus* (L.) Beauv. Perennial; culms creeping and rooting at the nodes, about 1 mm. thick; ligule a fringed scale; blades 2-7 cm. long, 5-15 mm. broad; panicles 2-12 cm. long, slender, of a few short remote spiciform racemes (racemes often falling from the axis as a unit); racemes 3-20 mm. long, divergent-ascending, with (1 or) 2 to 10 nodes, from the adaxial side of which in 2 rows are attached the pairs of spikelets; the minute pedicels abscising just below the first glume; spikelets not compressed, 2-flowered, the lower floret empty, the upper perfect; rachilla abscising just below the fertile lemma; glumes only a little more than half as long as the spikelet, several-nerved, hispidulous, awned; awn of the first glume longer than that of the second; sterile lemma as long as the spikelet, several-nerved, hispidulous, mucronate or short-awned; fertile lemma lanceolate, thin-cartilaginous, acute, the lateral margin revolute, enclosing the lanceolate acute palea of the same texture. Scattered in e. and s.e. Tex. and Rio Grande Plains, in shady usually moist loam near streams, summer-fall; warmer parts of Am., n. to N.C., Ark. and the Gulf States.

Our plants are nearly all of the subsp. *setarius* (Lam.) Mez [*O. setarius* (Lam.) R. & S.], marked by the very short leaves, panicles and racemes. A very few of our specimens (from Cameron Co.) have slightly longer leaves (4-6 cm.), panicles (6-12 cm.) and racemes (8-17 mm.), and thus tend toward the subsp. *hirtellus*.

61. ECHINOCHLOA BEAUV.

Culms rarely erect, often rooting at the nodes; leaves membranous, flat; ligule absent in most species; inflorescence an elongate terminal panicle of numerous ascending spike-like branchlets that are secundly flowered on the abaxial side; spikelets paired in the upper nodes of the spikelike branchlets and in several-flowered secondary panicles in the lower part, not at all compressed, 2-flowered (the lower floret usually completely reduced, rarely stamiferous), turgidly plano-convex; first glume about half as long as the spikelet, acute; second glume and sterile lemma membranous, equal, about as long as the spikelet, usually stiffly hispidulous along the several nerves, acute; glume usually coarsely mucronate or awned (if awned, the awn of the second glume much longer than that of the first); sterile lemma enclosing a thin palea and rarely 3 stamens and often awned; fertile lemma broadly elliptical, cartilaginous-indurate, acuminate, the lateral margins revolute, clasping the lateral margins of the similarly textured palea but not its acute free tip.

A genus of perhaps 25 species of warm regions. They are excluded from *Panicum* on the bases of the form of the inflorescence, the usually very coarsely pubescent spikelets and the coarsely mucronate or awned glumes. Probably they represent merely a part of the very diverse genus *Panicum*, and should be placed therein. These plants are commonly found in muddy places and provide good forage locally.

1. Ligule a row of stiff yellowish hairs; body of sterile lemma 4-5 mm. long 5. *E. polystachya*.
1. Ligule obsolete or absent; body of sterile lemma 2.5-4 mm. long (2)
- 2(1). "Spikes" of inflorescence 3-20 (-40) mm. long, ascending, often diverging from the axis at angles of 20-45°, only shortly if at all overlapping; blades 3-6 mm. broad 1. *E. colonum*.
2. "Spikes" of inflorescence 10-100 mm. long, ascending or slightly diverging, often overlapping a considerable portion of their lengths; blades mostly broader than 5 mm. (3)
- 3(2). Inflorescence thick, if slender then erect; sterile lemmas unawned or with awns to 10 mm. long 2. *E. crusgalli*.
3. Inflorescence slender, nodding, dense; sterile lemmas with awns 4-43 mm. long (4)
- 4(3). Sheaths usually papillose-pilose or papillose-hispid; spinulose cilia of the nerves of the second glume and sterile lemma conspicuously papillose 4. *E. Walteri*.
4. Sheaths glabrous; spinulose cilia of the nerves of the second glume and sterile lemma not conspicuously papillose 3. *E. cruspavonis*.

1. *Echinochloa colonum* (L.) Link. JUNGLE-RICE. Diffuse annual; culms 1-2 (-3) mm. thick basally; ligule obsolete; "spikes" 3-20 (-40) mm. long, ascending, appressed or often diverging from the axis at angles of 20-45°, remote on the axis, only shortly if at all overlapping; second glume and sterile lemma simply strongly acuminate, not awned, hispid along the nerves (use lens), about 3 mm. long. *Panicum colonum* L. Nearly throughout the state (infrequent in Plains Country) in moist loamy often disturbed soil, summer-fall; nat. to the Old World trop., now widespread in warm regions of the world.

2. *Echinochloa crusgalli* (L.) Beauv. BARNYARD GRASS. Erect or diffuse annual; culms 2.5-10 mm. thick basally; sheaths smooth; ligule obsolete; panicle erect or slightly nodding; "spikes" 1-10 cm. long, ascending, lengthily overlapping, often with stiff bristlelike hairs; second glume and sterile lemma mucronate or awned, the nerves hispid or spinose-hirsute, 2.5-4 mm. long. *Panicum crusgalli* L. Nearly throughout the state in moist often disturbed loamy soil, summer-fall; widespread in temp. and trop. areas of the world.

Variable species; we have two fairly well-marked but intergrading varieties:

Var. *crusgalli*, commonest in the e. and cen. parts of Tex., with long, somewhat spreading, papillose cilia at the summits of the internodes and bases of the branches in the inflorescence, and short, very thick, papillose cilia along the lateral nerves of the second glume and sterile lemma, and somewhat spreading "spikes", and sterile lemmas with awns 0-10 mm. long; synonyms include *E. crusgalli* subsp. *muricata* (Michx.) Shinnery, var. *muricata* (Michx.) Shinnery and var. *microstachya* (Wieg.) Shinnery, and perhaps var. *mitis* (Pursh) Peterm.

Var. *zelayensis* (H.B.K.) Hitchc., commonest in the w. and s. parts of the state, with non-papillate ascending cilia in the inflorescence or these absent, and short, thinner, not-so-markedly papillose cilia along the nerves of the second glume and sterile lemma, usually strictly ascending "spikes", and sterile lemma rarely short-awned; synonyms include *E. crusgalli* subsp. *zelayensis* (H.B.K.) Shinnery and var. *macera* (Wieg.) Shinnery.

Japanese millet is planted in places and occasionally escapes; it is usually called *E. crusgalli* var. *frumentacea* (Link) W. Wight but is no doubt merely a cultivar of var. *crusgalli*.

One specimen from near Brownsville, Cameron Co., Rio Grande Valley, has stamiferous lower florets and therefore corresponds to *E. paludigena* Wieg., which is otherwise identical to, and is to be referred to, *E. crusgalli* var. *crusgalli*.

3. *Echinochloa crusgalli* (H.B.K.) Schult. Diffuse annual, the lower parts of the culms long-trailing in water and mud and rooting at the nodes, the lower internodes 4-12 mm. thick; sheaths smooth; ligule obsolete; panicles long, slender, conspicuously nodding; "spikes" ascending or appressed, 1-4 cm. long, lengthily overlapping, often with stiff bristlelike hairs; second glume and sterile lemma with bodies 3-4 mm. long and awns, the awn of the lemma 4-29 mm. long, the nerves with spinulose cilia but these not conspicuously papillose. *Panicum crusgalli* (H.B.K.) Nees, *E. crusgalli* var. *crusgalli* (H.B.K.) Nees. Marshy margins of streams and lakes, infrequent in s.e. Tex. and n. parts of Rio Grande Plains, rare in the Trans-Pecos, summer-fall; trop. areas of Afr. and Am., n. to Ala., La. and Tex.; also rare in Va.

4. *Echinochloa Walteri* (Pursh) Heller. Mostly erect annual; culms 4-17 mm. thick basally; sheaths papillose-pilose or papillose-hispid at least part of the length or rarely wholly glabrous; ligule obsolete; panicles elongate, nodding; "spikes" 2-10 cm. long, ascending or spreading, lengthily overlapping, often with stiff bristlelike hairs; second glume and sterile lemma with bodies 3-4 mm. long and awns, the awns of the lemma 10-43 mm. long, the nerves (especially the lateral) with conspicuously papillose-spinulose cilia. *Panicum Walteri* Pursh. Margins of streams, extreme n. edge of Rio Grande Plains, s. parts of n.-cen. Tex. and e. Tex., infrequent, summer; Wisc., Va., S.C., Ark., La., Tex. and Coah.

5. *Echinochloa polystachya* (H.B.K.) Hitchc. Long-creeping perennial, some of the lower internodes 3-6 mm. thick; nodes villous; sheaths smooth; ligule a row of stiff yellowish hairs (use lens); panicles slender and usually nodding; "spikes" 2-5 mm. long, strictly ascending and appressed, the lower ones only slightly overlapping, often with stiff bristlelike hairs; second glume and sterile lemma with bodies 4-5 mm. long and awns, the awn of the lemma 4-18 mm. long, the nerves (especially the lateral ones) with spinulose cilia but these not conspicuously pilose. *Panicum polystachyum* H.B.K. Infrequent in moist clay loam, coastal parts of Rio Grande Plains and s. part of s.e. Tex., Mar.-Nov.; warm-temp. and trop. parts of Am. n. to Cuba and Tex.

62. SETARIA BEAUV.

Panicles with many nodes and short branches, each branch system exhibiting numerous reduced sterile branchlets which are seen as bristles subtending the spikelets; spikelets essentially sessile, each falling as a unit, 2-flowered, the lower floret staminate or completely reduced, the upper perfect; first glume much shorter than the spikelet, several-nerved, membranous; second glume nearly as long as the spikelet, several-nerved, membranous; lower ("sterile") lemma several-nerved, membranous, usually not quite as long as the fertile lemma; sterile palea nearly obsolete to well-developed and as long

as the sterile lemma; fertile lemma indurate, strongly convex, the margins revolute and clasping the palea of the same texture, smooth or usually faintly to strongly transversely rugose.

A genus of about 140 species in the warmer parts of the world; closely related to certain species of *Panicum* and probably best treated as a subgenus of that genus.

1. Bristles 4 to 12 below each spikelet; panicles spiciform, not tapering nor interrupted; lower floret usually staminate (2)
1. Bristles 1 to 3 below each spikelet; panicles tapering or if spiciform then usually interrupted in the lower part (except in *S. magna*, *S. viridis* and *S. corrugata*); lower floret rarely staminate (except in *S. magna*) (3)
- 2(1). Plants perennial, from hard knotty subrhizomatous bases; spikelets mostly 1.2-1.6 mm. broad, elliptic 11. *S. geniculata*.
2. Plants annual, from bases that are not hard knotty or subrhizomatous; spikelets mostly 1.5-1.9 mm. broad, turgid 12. *S. glauca*.
- 3(1). Bristles retrorsely scabrous 10. *S. adhaerens*.
3. Bristles antrorsely scabrous only (4)
- 4(3). Fertile lemma smooth and shiny; lower floret often staminate 8. *S. magna*.
4. Fertile lemma finely to coarsely transversely rugose; lower floret rarely staminate (5)
- 5(4). Panicle densely flowered, spiciform, minutely interrupted in the lower part where the axis can be seen with difficulty (6)
5. Panicle more open, the axis readily visible for most of the length (7)
- 6(5). Sterile palea about three fourths the length of its lemma 7. *S. corrugata*.
6. Sterile palea about a third the length of its lemma 9. *S. viridis*.
- 7(5). Annual; sterile palea only about a third as long as the fertile palea; spikelets 1.5-2.2 mm. long 6. *S. Grisebachii*.
7. Perennials; sterile palea at least two fifths as long as the fertile one; spikelets 1.9-3.4 mm. long (8)
- 8(7). Spikelets 2.9-3.4 mm. long 5. *S. villosissima*.
8. Spikelets 1.9-2.6 mm. long (9)
- 9(8). Panicles 2-6 cm. long, about 5 mm. thick; spikelets 1.9-2.1 mm. long; culms usually moderately bushy-branched 2. *S. texana*.
9. Panicles 6-30 cm. long, 10-70 mm. thick; spikelets 2-2.6 mm. long; culms usually simple above the base (10)
- 10(9). Sterile palea essentially as long as the fertile palea which is slightly convex; spikelets extremely turgid basally 1. *S. macrostachya*.
10. Sterile palea two fifths to three fourths as long as the fertile palea which is nearly flat; spikelets simply turgid basally (11)
- 11(10). Blades 2-5 mm. broad; panicles usually cylindric, 6-15 cm. long; culms mostly tightly tufted and erect 3. *S. leucopila*
11. Blades 5-18 mm. broad; panicles usually strongly tapered, (7-) 11-25 cm. long; culms mostly loosely tufted and basally reclining ... 4. *S. Scheelei*.

1. *Setaria macrostachya* H.B.K. Tufted perennial; culms 2-10 dm. long, with a few branches in the lower part, mostly simple, often geniculate at the lower 1 or 2 nodes (the lowest internodes thus often decumbent and 2-4 mm. thick), mostly ascending or erect; sheaths mostly glabrous or the uppermost margin usually pilose; blades 7-15 mm. broad, glabrous or very sparsely pilose near the base; panicles 1-3 dm. long, 1-2 cm. thick, nearly cylindric (some of the longer ascending bristles 9-20 mm. long, flexuous); spikelets 2-2.3 mm. long; second glume two thirds to three fourths as long as the fertile lemma whose tip is thus considerably exposed; sterile palea as long as the convex fertile palea; fertile lemma extremely turgid basally. Rio Grande Plains and extreme s. part of s.e. Tex., infrequent, summer-fall; Cto. and Qro. n. to Tex. and n.w. to s. Ariz.

This species, *S. texana* and *S. leucopila* are closely related and have been known collectively by the vernacular name "plains bristlegrass."

2. *Setaria texana* W. H. P. Emery. Tufted perennial; culms 1-7 dm. long, moderately bushy-branched, erect or ascending, the lowest internodes 0.9-1.5 mm. thick; sheaths glabrous except very shortly pilose on the upper part of the margin; blades 2-5 mm. wide, glabrous; panicles 2-6 cm. long, about 5 mm. thick, nearly cylindrical (some of the longer ascending bristles 3-7 mm. long, flexuous); spikelets 1.9-2.1 mm. long, second glume about three fourths as long as the fertile lemma whose tip is thus considerably exposed; sterile palea rudimentary or to half as long as the slightly convex fertile palea. Brush-covered plains and low foothills in Rio Grande Plains, rarely w. to s.w. parts of Edwards Plateau and the extreme e. Trans-Pecos, summer-fall; also N. L. and Tam.

3. *Setaria leucopila* (Scribn. & Merr.) K. Schum. Tufted perennial; culms 2-10 dm. long, mostly simple or rarely branched, occasionally geniculate at the lowest nodes (the lowest internodes usually erect and 1-2.5 mm. thick), mostly erect; sheaths mostly glabrous but short-pilose usually on the upper part of the margin; blades 2-5 mm. broad, rarely pubescent, marginally straight (not plicatulate or very rarely so in a few spots); panicles 6-15 cm. long, about 1 cm. thick, nearly cylindrical (some of the longer of the ascending bristles 5-12 mm. long, flexuous); spikelets 2.1-2.5 mm. long; second glume not quite as long as the fertile lemma whose tip is thus exposed; sterile palea lanceolate, a half to three fourths the length of the nearly flat fertile palea. Dry plains and upland slopes, Rio Grande Plains, Trans-Pecos and Plains Country, abundant in some areas, especially along stream-beds, summer-fall; Colo. and Ariz. s. to S.L.P., Gto. and Zac.

4. *Setaria Scheelei* (Steud.) Hitchc. Loosely tufted perennial; culms (3-) 6-12 dm. long, nearly simple, usually geniculate at a few of the lowest nodes but not rooting (the lowest internodes usually decumbent, purplish-olive, 1.5-3.5 mm. thick), distally ascending; sheaths glabrous or usually densely to sparsely pilose at least apically and near the upper margins; blades 5-18 mm. broad, tapering only slightly to the base, long-tapering to the apex, usually minutely plicatulate marginally in spots; panicles (7-) 11-25 cm. long, 1-7 cm. thick, usually rather open basally, mostly long-tapered (some of the longer spreading bristles near the base 8-18 mm. long, flexuous); spikelets 2.2-2.6 mm. long; second glume not quite as long as the fertile lemma whose tip is thus exposed; sterile palea lanceolate, about two fifths to three fifths as long as the flat fertile palea. Abundant in n.-cen. Tex., Rio Grande Plains and Edwards Plateau, less abundant to rare in s. part of e. and s.e. Tex., the Trans-Pecos and s. Plains Country, found chiefly in shaded stream-canyons, spring-fall; Tex. s. to Coah., N. L., Tam. and S.L.P.

5. *Setaria villosissima* (Scribn. & Merr.) K. Schum. Loosely-tufted perennial; culms 5-10 dm. long, simple, slightly geniculate at a few of the lowest nodes but not rooting (the lowest internodes 2.5-3 mm. thick, purplish-glaucous and decumbent), distally ascending; blades 6-14 mm. broad, tapering very gently to the base and apex, only very slightly and sparsely transversely plicatulate marginally, usually sparsely to densely short-pilose above and below; panicles 7-22 cm. long, 13-35 mm. thick, rather open basally, mostly long-tapered (some of the longer spreading bristles near the base 13-23 mm. long, flexuous); spikelets 2.9-3.4 mm. long; second glume not quite as long as the fertile lemma whose tip is thus exposed; sterile palea lanceolate, long-attenuate, acute, half to two thirds as long as the flat fertile palea. Rare (very locally common) in soils derived from igneous rocks, Edwards Plateau and Trans-Pecos, summer-fall; Tex., Coah., Ariz. and Son.

6. *Setaria Grisebachii* Fourn. Loosely tufted annual; culms 15-100 cm. long, mostly simple, the lower internodes very short and 1-2 mm. thick, sometimes geniculate and rarely rooting at the lowest node, distally ascending; sheaths sparsely short-pilose in the upper part and along the upper margins; blades 5-13 mm. broad, sparsely short-pilose on both surfaces; panicles 3-18 cm. long, 4-15 mm. thick, nearly cylindrical (some of the longer ascending bristles 5-15 mm. long); spikelets 1.5-2.2 mm. long; second glume about four fifths as long as the fertile lemma whose tip is thus exposed; sterile palea about a third the length of the fertile palea. Infrequent in mts. of the Trans-Pecos, rare e. to w. part of Edwards Plateau, summer-fall; highlands of Mex., s. to Oax. and n. to Ariz., N.M. and Tex.

7. *Setaria corrugata* (Ell.) Schult. Tufted annual; culms 3-10 dm. long, branched only at the base which is decumbent and rooting at the lowest nodes; sheaths usually

wholly glabrous; blades 4-9 mm. broad; panicles very dense (axis usually wholly hidden), cylindric, often slightly curviflexuous, 3-10 cm. long, 10-15 mm. thick; spikelets 2.1-2.7 mm. long; sterile palea about three fourths the length of the sterile lemma; fertile lemma coarsely transversely rugose, each ruga about 0.2 mm. broad. Rare along streams, s.e. Tex. (Harris Co.), summer; Coastal States, N.C. to Tex.; Cuba; Hisp.

8. *Setaria magna* Griseb. Robust annual; culms 1-4 m. tall, 5-20 mm. thick basally, prop-rooting from the lower nodes but erect and simple; panicles 25-60 cm. long, 2-3 cm. thick, dense (the axis mostly hidden); spikelets very numerous, about 2 mm. long; fertile lemma smooth, shiny. Infrequent in moist ditches, bayous, etc., s.e. Tex., summer-fall; Coastal States, N.J. to Tex.; W. I., Yuc., C. R.

9. *Setaria viridis* (L.) Beauv. Tufted annual; culms 1-10 dm. long, mostly ascending, slightly geniculate and sparsely branched at the lower nodes; blades 4-8 (-14) mm. broad; panicles 2-8 cm. long, 6-10 mm. thick, cylindric, often curviflexuous, densely flowered (axis nearly wholly hidden); spikelets 2.2-2.8 mm. long; sterile palea about a third as long as the sterile lemma; fertile lemma finely and faintly transversely rugose (each ruga 0.03-0.1 mm. broad) or nearly smooth. Disturbed areas, frequent in Trans-Pecos and n.-cen. Tex. and the Plains Country, rare elsewhere, summer; temp. regions of the world, rare in warmer areas.

The related foxtail millet, *S. italica* (L.) Beauv., is occasionally planted in Texas but does not persist; it has 2 features of *S. magna*, namely the smooth fertile lemma and abscission of the rachilla above the node of the sterile floret; the spikelets are about 3 mm. long, the sterile palea is about half as long as the sterile lemma.

10. *Setaria adhaerens* (Forsk.) Chiov. Tufted annual; culms 15-60 cm. long, usually decumbent basally (the lower nodes occasionally rooting and geniculate), sparsely to moderately branched, distally ascending; sheaths glabrous with narrow hyaline margins toward the summit; blades 5-11 mm. broad, shortly and sparsely papillose-pilose on both surfaces; panicles 2-6 (-8) cm. long, cylindric, the axis retrorsely scabrous-hispid on the angles but mostly hidden in the dense mass of flowers, the bristles short and retrorsely scabrous; spikelets 1.5-2 mm. long. Rare in disturbed areas, Rio Grande Plains, Edwards Plateau and Trans-Pecos, spring-summer; trop. areas of the world, in Am. n. to the Gulf States and n. Mex.

Our plants have for a long time passed under the name of the closely related species *S. verticillata* (L.) Beauv. which shares with *S. adhaerens* the character of retrorsely scabrous bristles. In *S. verticillata* the upper sheath margins are pilose and not hyaline, the blades not papillose-pilose on both surfaces, and the spikelets 2-2.2 mm. long. It is known in cool-temperate areas of North America, and may yet be found in Texas; it is most likely to occur in the Plains Country or Trans-Pecos.

11. *Setaria geniculata* (Lam.) Beauv. Perennial from hard knotty subrhizomatous bases; aerial culms 2-10 dm. long, geniculate at the lower nodes, mostly erect; blades 3-8 mm. broad, mostly rather strictly erect; panicles 1-8 cm. long, cylindric, about 15 mm. thick, dense, a 1-cm. transection including 13 to 25 spikelets; spikelets subtended by numerous stiff bristles, mostly 2.5-3 mm. long, 1.2-1.6 mm. broad, elliptic to elliptic-ovate; lower (sterile) floret usually staminiferous with a well-developed palea. Throughout the state, most common in disturbed moist areas, spring-fall; in warmer parts of Am. n. to Calif., Ariz., N.M., Kan., Ia., W.Va. and Mass.

12. *Setaria glauca* (L.) Beauv. YELLOW FOXTAIL. Loosely-tufted annual; culms 2-10 dm. long, often geniculate and decumbent basally, ascending distally; blades 4-10 mm. broad, ascending; panicles 1-8 cm. long, cylindric, about 1 cm. thick, fairly dense, a 1-cm. transection near the middle including 11 to 20 spikelets; each spikelet subtended by numerous bristles, mostly 2.5-3.2 mm. long, 1.4-2.1 mm. broad, rotundly ovate, turgid; lower (sterile) floret usually staminiferous with a well-developed palea. *S. lutescens* (Weig.) F.T. Hubb. Nearly throughout, absent from Rio Grande Plains and Plains Country, rare in the Trans-Pecos, summer-fall; nearly throughout the temp. and trop. areas of the world, introd. from Eur.

63. CENCHRUS L.

Sheaths compressed-keeled (internodes slightly compressed in the same plane); inflorescence a terminal spiciform determinate panicle (terminal or middle flowers maturing

first), the angled axis prolonged beyond the uppermost node as a bristle or terminating as a reduced bur, bearing in about 5 ranks the sessile few-flowered usually bristly glomerules (burs), each with a zone of abscission at the base and consisting of a more or less basally fused and cuplike or urceolate mass of aceriform bristles surrounding as an "involucre" a fascicle of 1 to 4 nearly sessile spikelets; spikelets persistent in the bur, not compressed but turgid, 2-flowered, the lower flower usually staminate, the upper perfect; the rachilla remaining intact; first glume minute, membranous, 1- to 3-nerved; second glume 3- to 7-nerved, membranous, nearly as long as the remainder of the spikelet; first (lower) lemma membranous, 3- to 7-nerved, as long as the spikelet; fertile lemma convex dorsally, slightly indurate or simply chartaceous, acuminate apically, marginally revolute, enclosing a plane palea. *Pennisetum* Rich.

About 160 species in warmer parts of the world. Individuals of this genus are exceedingly abundant, perhaps the most abundant grasses in Texas, especially so in disturbed, sandy, non-forested areas and at elevations below 4,000 feet. Several species have been introduced, including Pearl Millet and Napier Grass. Some authors segregate the genus into two genera on trivial technical grounds. The spiny burs cause pain and sometimes infection when they penetrate the skin, and they are noxious to animals when mixed with hay.

1. Bristles united only into a shallow cup, the body of which is much shorter than the spikelets (2)
 1. Longer bristles united into a somewhat urceolate structure (bur), the body of which nearly equals the spikelets (5)
 - 2(1). Longer bristles 3-5 cm. long 1. *C. longisetus*.
 2. Longer bristles much shorter (3)
 - 3(2). Longer bristles rigid, none of them plumose 4. *C. myosuroides*.
 3. Longer bristles flexible (4)
 - 4(3). Bristles all scabrous 2. *C. nervosus*.
 4. Inner bristles plumose 3. *C. ciliaris*.
 - 5(1). Lateral spinous bristles confined to the lower part of the bur; a 1-cm. transection near the middle of the panicle including 4 to 7 burs 5. *C. echinatus*.
 5. Lateral spinous bristles not confined to the lower part, a minority of them spreading from the upper part of the bur; a 1-cm. transection of the panicle including only 2 to 4 burs (6)
 - 6(5). Lateral bristles 50 to 75 per bur, the bases of the larger ones about 0.4-1 mm. broad; spikelets 5.8-7.6 mm. long 6. *C. longispinus*.
 6. Lateral bristles 8 to 40 (to 50) per bur, the bases of the larger ones 0.7-1.5 mm. broad; spikelets 3.4-5.8 mm. long 7. *C. incertus*.

1. *Cenchrus longisetus* M. C. Johnst. FEATHERTOP. Perennial from subrhizomatous matted bases; nodes not swollen; blades 3-5 mm. broad, mostly folded; panicles 6-11 cm. long, several cm. thick, softly fuzzy and pale-buffy- or tawny-white, the longer bristles of the burs 3-5 cm. long. *Pennisetum villosum* R. Br. Cult. in various areas and infrequently escaped, summer-fall; nat. of Afr., widely introd.

2. *Cenchrus nervosus* (Nees) O. Ktze. Perennial from knotty bases; nodes swollen; blades 8-12 mm. broad, mostly flat; panicles 1-2 dm. long, about 14 mm. thick, not soft, the scabrous bristles usually purple distally and about 1 cm. long. *Pennisetum nervosum* (Nees) Trin. Escaped in extreme s. part of Rio Grande Plains near Brownsville, summer-fall; S.A.; elsewhere introd.

3. *Cenchrus ciliaris* L. BUFFELGRASS. Tufted perennial from hard knotty bases; culms 25-60 (-100) cm. long, often spreading and geniculate basally, distally ascending; panicle 2-10 (-12) cm. long, 1-2 cm. thick, dense, a 1-cm. transection near the middle containing 7 to 14 burs; internodes of axis about 1 mm. long; burs 2-3.5 mm. thick basally, the bristles numerous (about 50 per bur), united only in the short cup which does not equal the spikelets, greatly unequal, the outer ones shorter than the inner, ascending, usually purplish, some of the inner ones elongate, flexible, appearing double and plumose.

Pennisetum ciliare (L.) Link. Frequent along roadsides and edges of fields, Rio Grande Plains, spring-fall; nat. of India, now widely introd. as a forage grass in the warmer, drier parts of the world.

4. *Cenchrus myosuroides* H.B.K. Perennial from hard knotty subrhizomatous bases; culms 6-20 dm. long, erect; panicle (6-) 10-23 cm. long, 6-12 mm. thick, interrupted at the very base, otherwise rather dense, a 1-cm. transection near the middle containing 7 to 10 burs; internodes of axis about 1-1.5 mm. long; burs about 3 mm. thick basally, the bristles numerous (about 35 to 60 per bur), united only basally in the short cup which does not equal the spikelets, greatly unequal (outer ones shortest), spreading (outer) or ascending (inner ones), the inner ones stiff, none plumose. In ditches and near creeks or springs, infrequent in Rio Grande Plains, rare in the Trans-Pecos, summer-fall; Col., Ecu., Bol., Chile, Parag., Arg. and extreme s. Braz.; also W.I. n. to Fla. Keys; Mex.; Tex.

5. *Cenchrus echinatus* L. CADILLO. Loose annual; culms 15-85 cm long, widely spreading and geniculate, distally ascending; panicle 2-10 cm. long, 10-17 mm. thick, relatively lax, a 1-cm. transection near the middle containing 4 to 7 burs; internodes of axis 1.5-3 mm. long; burs about 4-6 mm. thick basally, the longer bristles united into an urceolate shortly-pubescent body which equals the spikelets and which is ringed below the middle by a zone of about 50 relatively short spreading stiff spinous bristles; none of the bristles plumose but some of them shortly pubescent. Infrequent weed in disturbed areas in Rio Grande Plains, rare in s.e. Tex., spring-fall; Coastal States, N.C. to Tex.; also Ariz., Calif., Mex., and C.A.; W.I.; n. coasts of S.A., and scattered in w. and s. temp. parts of S.A.; H.I.; introd. in Pac. Is., Austral.; Isr.

6. *Cenchrus longispinus* (Hack.) Fern. Loosely tufted annual; culms 1-9 dm. long, usually decumbent basally and at the lower nodes rooting and slightly geniculate, ascending above; panicle 4-10 cm. long, 1-2 cm. thick, relatively lax, a 1-cm. transection near the middle including 2 to 4 burs; internodes of axis 2-5 mm. long; burs about 4-6 mm. thick basally (not including the bristles), the longer bristles united into an urceolate pubescent body equaling the spikelets, with spinous bristles emerging at various levels from this body (not confined to below the middle although more numerous there), the bases of these slightly flattened and 0.4-1 mm. broad, the bristles stiff, usually purplish and numbering about 50 to 75 per bur, some of the longer ones near the base retrorsely pubescent. Disturbed areas of sandy soils, frequent in Plains Country, infrequent to rare e. to e. Tex. and s. to Trans-Pecos and Rio Grande Plains, spring-fall; mostly midwest. U.S. and the Plains States, less abundant w. to Calif. and e. to e. seaboard, rare in n.w. and s.e. U.S.

7. *Cenchrus incertus* M. A. Curtis. GRASSBUR, COAST SANDBUR. Perennial or often behaving as annual; culms 5-80 cm. long, usually decumbent basally and at the lower nodes rooting and slightly geniculate, ascending distally; panicle 15-50 (-90) mm. long, 8-18 mm. thick, relatively lax, a 1-cm. transection near the middle including 3 or 4 burs; internodes of axis 2-5 mm. long; burs about 2.5-5 mm. thick basally (not including the bristles), the longer bristles united into an urceolate very shortly pubescent body equaling the spikelets, with spinous bristles emerging at various levels from this body (not confined to below the middle, although more numerous there), the bases of these being slightly flattened and 0.7-1.5 mm. broad, the bristles stiff, spinous, usually purplish and numbering 8 to 40 (to 50) per bur. *C. pauciflorus* Benth., *C. parviceps* Shinnery. Sandy or tighter soils, especially in disturbed areas, throughout the state but most abundant in n.-cen. and s.e. Tex. and Rio Grande Plains, spring-fall; Coastal States, Va. to Tex. and inland to Ark. and Okla.; N.M., Ariz., Calif.; nearly throughout Mex., C.A. and W.I.; also warm-temp. and subtrop. parts of S.A.; Phil.; S.Afr.

64. IMPERATA Cyr.

A genus of about 10 species in warm parts of the world.

1. *Imperata brevifolia* Vasey. SATINTAIL. Perennial with short hard scaly rhizomes; culms erect, 10-15 dm. tall, leafy at least in lower part; leaves elongate; panicle terminal, narrow, silky, 15-30 cm. long; spikelets all alike, somewhat dorsally compressed, awnless, in pairs, about 3 mm. long, unequally pedicellate on a slender continuous rachis, sur-

rounded by long silky hairs 3 times as long as the spikelet; glumes about equal, membranous; sterile lemma, fertile lemma and palea thin and hyaline. Rare in mts., s. part of Brewster and Hudspeth cos. in the Trans-Pecos, summer-fall; Tex., N.M., Ariz., Ut., Nev. and Calif.; probably Chih.

Another grass with technical spikelet details similar to this species with a flaring or fanlike panicle is *Miscanthus sinensis* Anderss., called "Eulalia," a native of eastern Asia infrequently cultivated in east Texas and elsewhere in eastern United States.

65. ERIANTHUS MICHX.¹¹

PLUMEGRASS

Perennials, 1-3 m. tall, forming robust clumps; leaves elongate: ligules narrow, usually hippocrepiform; panicle 1-9 dm. long, terminal, often pyramidal to clavate or even slender; spikelets in pairs, one of each pair sessile, one pedicelled, both perfect, usually 4-6 mm. long (not including awn), typically membranous to coriaceous, usually dorsally villous with long hairs; sterile lemma hyaline, shorter, with usually 1 median nerve; fertile lemma narrow, ovate-lanceolate, hyaline, with usually a prominent straight or twisted exerted awn 4-20 mm. long; palea (if present) hyaline.

A genus of 28 species of southeast Asia to southeast Europe, Madagascar, and the warmer parts of America.

1. Culm appressed-hairy below the panicle (2)

1. Culm glabrous below the panicle (3)

2(1). Awn straight or slightly flexuous4. *E. giganteus*.

2. Awn loosely twisted3. *E. alopecuroides*.

3(1). Hairs subtending the spikelet few and short or absent; panicle nearly completely glabrous; awn straight1. *E. strictus*.

3. Hairs subtending the spikelet as long as or longer than the spikelet; panicle very hairy; awn 2 cm. long, coiled2. *E. contortus*.

1. *Erianthus strictus* Baldw. NARROW PLUMEGRASS. Perennial; culms 1-2 m. tall, relatively slender, glabrous; nodes sometimes hirsute with stiff erect deciduous hairs; internode below the panicle glabrous; foliage glabrous; lower sheaths narrow and crowded; blades mostly 4-12 mm. broad; panicle 2-4 dm. (rarely 8 dm.) long, strict (about 1-2 cm. thick), the branches closely appressed; spikelets brown, about 8-11 mm. long (not including awn), scabrous, nearly naked to sparsely short-hairy at base; awn straight, 15-20 mm. long; rachis joint and pedicel scabrous. Rare in moist sandy places, e. and s.e. Tex., fall; Va. to Fla. and Tex., n. to Tenn. and Mo.

2. *Erianthus contortus* Baldw. BENT-AWN PLUMEGRASS. Perennial; culms 1-2 m. tall, glabrous or sometimes sparsely appressed-pilose below the panicle; nodes glabrous or pubescent with erect deciduous hairs; internodes below the panicle glabrous; sheaths sparsely pilose at summit or glabrous; blades 10-15 mm. broad, scabrous; panicle 15-30 cm. long, narrow, the branches ascending but not closely appressed; spikelets 6-8 mm. (excluding awn) long, brownish, the basal hairs nearly or about as long as the spikelet; awn about 2 cm. long, spirally coiled at base; rachis joint and pedicel villous. Rare in moist sandy places, e. and s.e. Tex., fall; Md. to Fla. and Tex., n. to Tenn. and Okla.

3. *Erianthus alopecuroides* (L.) Ell. SILVER PLUMEGRASS. Perennial; culms robust, 15-30 dm. tall, appressed-villous below the panicle and usually on the nodes; sheaths pilose at the summit; blades 12-20 mm. wide, scabrous, pilose on upper surface toward base; panicle 2-3 dm. long, silvery to tawny or purplish; spikelets 5-6 mm. long, pale, sparsely villous, shorter than the copious basal hairs; awn 10-15 mm. long, flat, loosely twisted; rachis joint and pedicel long-villous. *E. divaricatus* Hitchc. Infrequent in sandy woodlands, usually near water in e. and s.e. Tex., fall; N.J. to Ill., s. Mo. and Okla., s. to Gulf States.

¹¹ Adapted from the treatment by Sunil Kumar Mukherjee in *Lloydia* 21:157-188. 1959 ("1958").

4. *Erianthus giganteus* (Walt.) Muhl. SUGARCANE PLUMEGRASS. Perennial; culms 1-3 m. tall, appressed-villous below the panicle, the nodes appressed-hispid, the hairs deciduous; sheaths and blades from nearly glabrous to shaggy appressed-villous; blades 4-15 mm. broad; panicle 10-15 (-40) cm. long, oblong or ovoid, tawny to purplish; spikelets 5-6 (-7) mm. long, sparsely long-villous on the upper part, shorter than the copious basal hairs; awn 10-25 mm. long, terete, straight or rarely slightly flexuous; rachis joint and pedicel long-pilose. *E. saccharoides* Michx., *E. Tracyi* Nash, *E. laxis* Nash, *E. compactus* Nash. Infrequent in sandy soil, usually near moisture, e. and s.e. Tex., fall; N.Y. to Tex., n. to Ky.; Cuba; probably elsewhere in trop. Am.

Mukherjee breaks this down into as many as 4 "species," mainly on the basis of panicle shape. The variability in all these characters does not support his treatment.

66. SCHIZACHYRIUM NEES¹² LITTLE BLUESTEM

Cespitose or rhizomatous perennials with rounded or compressed and keeled sheaths and flat or folded infrequently terete blades; flowering culms usually much-branched, each branch or branchlet terminating in a single pedunculate raceme; spikelets numerous on the raceme, appressed to the axis or divergent at maturity, in pairs, one spikelet of each pair sessile; perfect and fertile, the other pedicellate, smaller and often rudimentary or absent; sessile spikelet falling attached to the rachis joint and associated pedicel; rachis joint oblique and hollow at summit; spikelets somewhat dorsiventrally compressed; glumes 2, flat or slightly concavo-convex, coriaceous, narrow, the second sometimes slightly keeled; pits absent; lemma of sterile floret shorter than the glumes, hyaline; lemma of fertile floret hyaline, narrow, entire or bifid, bearing a bent and twisted awn from the apex or from between the lobes; palea hyaline, small or absent. *Andropogon* Sect. *Schizachyrium* (Nees) Trin.

A relatively large genus, well-represented in grasslands of the warmer regions of the world. It is segregated from *Andropogon* mainly on the basis of the single raceme per inflorescence.

1. First glume of sessile spikelet minutely papillose, slightly pubescent 2. *S. Feense*.
1. First glume of sessile spikelet glabrous (2)
- 2(1). Internode of rachis relatively slender, hairy throughout its length or nearly so .. 4. *S. scoparium*.
2. Internode of rachis relatively thick, glabrous or ciliate only at apex (3)
- 3(2). Sessile spikelet about 4 mm. long; blades about 1 mm. broad 1. *S. tenerum*.
3. Sessile spikelet 8-9 mm. long; blades 1-4 mm. broad .. 3. *S. cirratum*.

1. *Schizachyrium tenerum* Nees. Perennial; culms slender, tufted, sometimes reclining or decumbent, 6-10 dm. long, the upper half rather sparingly branching; blades scarcely 1 mm. wide, flat or loosely involute, often sparingly long-pilose on upper surface near base; raceme finally long-exserted, slender, subterete, glabrous, 2-6 cm. long; rachis joint ciliate only at apex; sessile spikelet about 4 mm. long, its glume glabrous, the awn 7-10 mm. long. *Andropogon tener* (Nees) Kunth. Rare in woodlands, e. Tex., summer-fall; Gulf States, Ga. and Okla.

2. *Schizachyrium Feense* (Fourn.) A. Camus. Perennial; culms tufted, 6-12 dm. tall, erect, reddish, the upper half sparingly branching; foliage often glaucous, the blades scabrous, 2-4 mm. wide; raceme 6-10 cm. long, the base often included in the somewhat dilated sheath, the rachis joints, pedicels and first glume of sessile spikelet at least minutely pubescent; sessile spikelet 5-9 mm. long, the awn 10-15 mm. long; pedicellate spikelets much-reduced, short-awned. *Andropogon hirtiflorus* (Nees) Kunth. var. *Feensis* (Fourn.) Hack. Rare in Trans-Pecos mts., summer-fall; Tex., N.M., Ariz., s.e. to Oax.

¹² Frank W. Gould kindly supplied helpful suggestions on the treatment of genera 66, 67, 68 and 69.

3. *Schizachyrium cirratum* (Hack.) Woot. & Standl. TEXAS BEARDGRASS. Perennial; plants pale, glaucous to purplish; culms slender, tufted, 3-7 dm. tall, erect, the upper half sparingly branched; blades flat, 1-4 mm. wide, usually scabrous; raceme exserted, 3-6 cm. long; rachis joint ciliate only at the apex; sessile spikelet glabrous, 8-9 mm. long, the awn 5-10 mm. long; pedicellate spikelet scarcely reduced, awnless, the pedicel stiffly ciliate on one side near summit. *Andropogon cirratus* Hack. Infrequent in Trans-Pecos mts., summer-fall; Tex., N.M., Ariz., Chih., Son. and Calif.

4. *Schizachyrium scoparium* (Michx.) Nash. LITTLE BLUESTEM. Rather variable perennial, usually tufted and sometimes with short rhizomes; culms erect, (2-) 3-10 (-15) dm. tall; sheaths sometimes laterally compressed and keeled; blades numerous, either crowded at base or well-distributed, usually 3-6 mm. broad; branching often copious; rachis joints and usually pedicels hairy throughout their full length, slender; first glume of sessile spikelet glabrous. *Andropogon scoparius* Michx. Growing essentially all over the state, though rare in extreme w., summer-fall; represented with us by several completely intergrading varieties as follows from west to east:

Var. *neomexicanum* (Nash) Gould. Glabrous, usually glaucous; at maturity the pedicels are only slightly if at all spreading and the rachis very slightly if at all zigzag; rachis and pedicels copiously villous. *Andropogon scoparius* var. *neomexicanus* (Nash) Hitchc. Frequent in Plains Country, infrequent in Trans-Pecos mts.; Tex. to Ariz. and s. to Coah., N.L. and S.L.P.

Var. *frequens* (F. T. Hubb.) Gould. LITTLE BLUESTEM. Glabrous and often glaucous (green and glaucous plants are often mixed in the same populations); pedicellate spikelet 1.5-5 mm. long (excluding awn), consisting of a single empty glume. *Andropogon scoparius* var. *frequens* F. T. Hubb. Very abundant in a north-south zone through cen. Tex., intergrading in the plains with var. *neomexicanum* and in e. Tex. with var. *virile*; widespread in cen. U.S.

Var. *virile* (Shinners) Gould. Usually somewhat pubescent; the pedicellate spikelets 4.5-7 mm. long (excluding awns), many or most pedicellate spikelets in each inflorescence with 2 glumes and commonly lemma and stamens. E. Tex., in sandy woodlands, w. on sandy soils to n.-cen. Tex. These populations actually represent broad-scale intergradation between var. *frequens* and var. *divergens*. Ark., Okla., Tex.

Var. *divergens* (Hack.) Gould. Robust plants with villous sheaths; pedicellate spikelet well-developed and its glume often with a short awn. Common in s.e. Tex. and s. part of e. Tex.; Tex., La., Ark. and Miss.

Var. *littoralis* (Nash) Gould. SEACOAST BLUESTEM. Rhizomes often developed; lower sheaths often strongly laterally compressed and keeled, often bluish-glaucous; rachis joints and pedicels copiously long-villous. *Andropogon scoparius* var. *littoralis* (Nash) Hitchc. Frequent in coastal sands especially on the barrier islands all along the coast in extreme s. Tex., inland as far as Jim Hogg Co., very late summer and fall; along Atl. and Gulf coasts s. to Ver.

67. ANDROPOGON L. BLUESTEM

Cespitose branching perennials with usually stiffly erect culms, rounded or flattened and keeled sheaths and flat or folded blades; inflorescence various, the flowering culm much-branched above and terminating in numerous branchlets bearing 2 to several pedunculate flower clusters or the flowering culm little-branched and terminating in a stiffly erect panicle of 2 (rarely 1) to few spicate branches; rachis joints slender, mostly pubescent, the rachis articulated at base; spikelets in pairs, one of each pair sessile, fertile and awned, the other pedicelled, smaller and often rudimentary or absent; sessile spikelets falling attached to the rachis joint and associated pedicel; spikelets somewhat dorsiventrally compressed; glumes 2, flat or slightly concavo-convex, coriaceous, narrow, the second sometimes slightly keeled; sterile lemma shorter than the glumes, hyaline; fertile lemma hyaline, narrow, entire or bifid, that of the sessile spikelet bearing a bent and twisted awn from the apex or from between the lobes; palea hyaline, small or absent.

This genus is sometimes enlarged to include the very closely related genera *Bothriochloa*, *Dichanthium*, and *Schizachyrium*. In the present strict sense it is a genus of some few dozens of species of the temperate and subtropical areas of the Old World and New World.

1. Pedicellate spikelet staminate, similar to the sessile spikelet but awnless (2)
1. Pedicellate spikelet much-reduced or obsolete and represented by the pedicel only; racemes silky-villous (3)
- 2(1). Rhizomes short or absent; rachis joint and sterile pedicel ciliate, the joints short-hispid at base; awn of sessile spikelet 10-20 mm. long 1. *A. Gerardi*.
2. Rhizomes well-developed; rachis joint and sterile pedicel densely long-villous; awn of sessile spikelet rarely more than 5 mm. long, often obsolete 2. *A. Hallii*.
- 3(1). Inflorescence very decompound, the profuse pairs of racemes aggregated in an elongate or corymbose mass; spathes (i.e., partially sheathing uppermost leaves) rarely more than 2 mm. broad; pedicellate spikelet obsolete (see also forms of *A. virginicus*) 6. *A. glomeratus*.
3. Inflorescence not conspicuously decompound nor dense (except in forms of *A. virginicus*) (4)
- 4(3). Peduncle not more than 1 cm. long, the dilated spathes exceeding the 2 (rarely 3 or 4) racemes (5)
4. Peduncles 2 cm. long or longer (6)
- 5(4). Upper sheaths inflated-spathelike, aggregate, the late inflorescence a flabellate tuft 4. *A. Elliottii*.
5. Upper sheaths not inflated and aggregate 5. *A. virginicus*.
- 6(4). Upper sheaths inflated, overlapping, conspicuous ... 4. *A. Elliottii*.
6. Upper sheaths not inflated, overlapping nor conspicuous 3. *A. ternarius*.

1. *Andropogon Gerardi* Vitman. BIG BLUESTEM. Perennial; plants often glaucous; culms robust, often in large tufts, sometimes with short rhizomes, 1-2 m. tall, usually sparingly branching toward the summit; lower sheaths and blades sometimes villous, occasionally densely so; blades flat, elongate, mostly 5-10 mm. broad, the margins very scabrous; racemes on the long-exserted terminal peduncle mostly 3 to 6, fewer on the branches, 5-10 cm. long, usually purplish, sometimes yellowish; rachis straight, the joints and pedicels stiffly ciliate on one or both margins, the joints hispid at base; sessile spikelet 7-10 mm. long, the first glume slightly sulcate, usually scabrous, the awn geniculate and tightly twisted below, 1-2 cm. long; pedicellate spikelet not reduced or but slightly so, awnless, staminate. *A. provincialis* Lam. not Retz., *A. furcatus* Muhl. Locally abundant nearly throughout the state, usually in low meadows and prairies but rare in extreme w., late summer-fall; Que. and Me. to Sask. and Mont., s. to Gulf States and cen. Mex.

An important forage grass in the prairie states of the Mississippi Valley, and a constituent of prairie hay, but less important in Texas.

2. *Andropogon Hallii* Hack. SAND BLUESTEM. Perennial, resembling *A. Gerardi* but with creeping rhizomes; racemes conspicuously villous, the hairs grayish to pale-golden; awn of sessile spikelet rarely more than 5 mm. long, often obsolete. Local in areas of deep loose quartz sand in the w. half of Tex., late summer-fall; N.D. and Mont. s. to Chih. and Ariz.

A form with yellow villous racemes and awns 5-10 mm. long has been segregated as *A. chrysocomus* Nash. *A. Hallii* intergrades completely with *A. Gerardi* in zones of intermediate soil-texture, and its recognition as a separate "species" is of dubious merit.

3. *Andropogon ternarius* Michx. SPLITBEARD BLUESTEM. Perennial; culms tufted, erect, 8-12 dm. tall, the upper half to two-thirds branching, the branches usually long, slender and erect; leaves often purplish-glaucous, glabrous or the lower loosely villous, the blades 2-4 mm. wide; inflorescence elongate, loose, of few to many pairs of silvery to creamy or grayish feathery racemes, usually on long-exserted peduncles from slender inconspicuous spathes, some of the lateral peduncles often short, from dilated spathes, rarely most of them so; racemes 3-6 cm. long, with mostly less than 12 joints, the rachis not flexuous, the joints shorter than the spikelets, copiously long-villous; sessile spikelets 5-7 mm. long, glabrous and nerveless between the keels, the awn twisted below, 15-20 mm. long;

stamens 3; pedicel long-villous, the spikelet obsolete or nearly so. Frequently in sandy usually wooded areas, e. half of state, late summer-fall; Del. to Ky. s. to Gulf States.

Variable in the density and length of pubescence on the rachis and pedicels, the less hairy specimens verging toward the Floridian *A. arctatus* Chapm.

4. *Andropogon Elliottii* Chapm. Perennial; culms tufted, erect, 3-8 dm. tall, at first nearly simple, later branching toward the summit; lower sheaths keeled, rather narrow, commonly loosely pilose, those near the summit inflated and spathe-like, crowded, the very short internodes densely bearded; blades flat, 3-4 mm. wide; primary inflorescence of few to several racemes, mostly in pairs, rarely threes or fours, on filiform often strongly flexuous peduncles, long-exserted from inconspicuous spathes, these on slender branchlets borne in the axils of the broad spathe-like sheaths of the main culm; secondary inflorescence of numerous pairs of racemes on short peduncles subtended by broad spathes, these on short bearded often fasciated branchlets borne in the axils of the spathe-like sheaths of the main culm and short primary branches, the whole forming a series of flabellate tufts with conspicuous purplish to copper-brown spathes 5-10 mm. wide, much-exceeding the feathery racemes; racemes flexuous, 3-4 (-5) cm. long, the slender rachis joints and pedicels long-villous; sessile spikelets 4-5 mm. long, those of the late enclosed racemes cleistogamous, the awn loosely twisted, 10-15 mm. long; pedicellate spikelets obsolete or nearly so. *A. gracilior* (Hack.) Nash. Rare in sandy wooded areas, e. and s.e. Tex., late summer-fall; Gulf States n. to Mo., Ill., Ind., O. and N.J.; also Br. Hond.

Intergrading to *A. virginicus*. The flattened ferruginous upper sheaths are conspicuous in winter. The characteristic plant is very striking, but occasional individuals occur with less aggregate upper sheaths, and others with scarcely dilated sheaths, aggregate or scarcely aggregate. This form, which has been distinguished as *A. Elliottii* var. *gracilior* Hack., appears to merge into *A. subtenuis* Nash, of Mississippi eastward.

5. *Andropogon virginicus* L. BROOMSEDEGE. Perennial; culms erect, 5-10 dm. tall, usually in rather small tufts, the upper two-thirds mostly freely branching; lower sheaths compressed, keeled, equitant; sheaths glabrous to villous; ligule strongly ciliate; blades flat or folded, 2-5 mm. wide, pilose on the upper surface toward base; inflorescence elongate, narrow or thick, simple to much-branched, the 2 to numerous racemes 2-3 cm. long, partly included and shorter than the inflated tawny to bronze spathes; rachis very slender, flexuous, long-villous; sessile spikelet about 3 mm. long, the delicate straight awn 1-2 cm. long; pedicel long-villous, its spikelet obsolete or nearly so. Frequent in sandy woodlands or less frequent in calcareous soil, e. half of state w. to n.-cen. Tex., rare w. to Edwards Plateau and s. to Rio Grande Plains, late summer-fall; nearly all of e. U.S.; Calif., Mex., C.A., W.I.

Grading through the moist-ground forms with dense inflorescences, known as var. *hirsutior* (Hack.) Hitchc., into *A. glomeratus*.

6. *Andropogon glomeratus* (Walt.) B.S.P. BUSHY BEARDGRASS. Perennial; culms erect, 5-15 dm. tall, compressed, with broad keeled overlapping lower sheaths, the flat tufts often forming dense usually glaucous clumps, the culms from freely to bushy-branching toward the summit; sheaths occasionally villous; blades elongate, 3-8 mm. wide; inflorescence dense, feathery, from flabellate to oblong, the paired racemes 1-3 cm. long, about equaling the slightly dilated spathes, the enclosed peduncle and ultimate branchlets long-villous, the peduncle at least 5 mm. long or often longer; rachis very slender, flexuous, long-villous; sessile spikelets 3-4 mm. long, the awn straight, 10-15 mm. long; sterile spikelet reduced to a subulate glume or wanting, the slender pedicel long-villous. *A. virginicus* var. *abbreviatus* (Hack.) Fern. & Griseb. Frequent in moist areas, e. half of Tex., rare westw., late summer-fall; s.e. U.S. n. to N.E., Ky., Okla.; also N.M., Ariz., Nev., Calif., Mex., W.I. and C.A.

Grading into *A. virginicus* and probably correctly considered no more than a variety of it.

68. BOTHRIOCHLOA O. KTZE.¹³

BEARDGRASS

Cespitose perennials with erect or decumbent-spreading culms, rounded sheaths and flat blades; inflorescence a terminal panicle, the spikelets on few to several spicate primary

¹³ Adapted from the work of Frank W. Gould in Madroño 14: 18-29. 1957.

branches, these moderately rebranched in New World species with large panicles; pedicels and upper rachis joints with a central groove or membranous area, this most strikingly developed in New World species; rachis articulated at base; spikelets in pairs, one of each pair sessile, fertile and awned, more or less triangular in outline, the first glume dorsally flattened, the second glume with a medial keel; sterile lemma shorter than the glumes, hyaline; fertile lemma hyaline, narrow, entire or bifid, bearing a bent or twisted awn from the apex or from between the lobes (awns absent or nearly so in *B. exaristata*); palea small, hyaline or absent; the other spikelet of the pair pedicellate, staminate or neuter, usually well-developed but tending to be more reduced in New World species, not awned; sessile spikelets falling attached to the rachis joint and associated pedicel. *Amphilophis* Nash; *Andropogon* Subg. *Amphilophis* Trin.

A genus of about 40 species distributed through the warmer regions of all continents, weakly segregated from *Andropogon* and even more weakly from *Dichanthium*.

1. All or some sessile spikelets pitless (that is, the first glumes of at least some of the sessile spikelets without any small circular, median glandular depression) (2)
1. First glumes of *all* sessile spikelets pitted, i.e., each with one small circular (or nearly circular) glandular depression near the median line and usually just distal from the middle (9)
- 2(1). Pedicelled spikelets about as large and broad as the sessile ones (3)
2. Pedicelled spikelets much narrower and usually shorter than the sessile ones (5)
- 3(2). Sessile spikelets more than 5 mm. long 7. *B. Wrightii*.
3. Sessile spikelets less than 5 mm. long (4)
- 4(3). Panicle axis shorter than the branches; sessile spikelets never pitted 9. *B. Ischaemum*.
4. Panicle axis longer than the branches; sessile spikelets without pits or only some of them pitted 11. *B. intermedia*.
- 5(2). Sessile spikelets less than 4.5 mm. long (not including awn); awn of lemma less than 19 mm. long; spikelets never pitted (6)
5. Sessile spikelets 4.5-7.3 mm. long; awns 20-33 mm. long; spikelets pitless or panicle with both pitless and pitted spikelets on same individual (7)
- 6(5). Awns absent or not more than 6 mm. long 1. *B. exaristata*.
6. Awns present, 8-18 mm. long 2. *B. saccharoides*.
- 7(5). Panicle axis less than 5 cm. long; panicle-branches 2 to 8; rachis joints and pedicels densely white-villous; culms slender, not more than 1 m. tall and usually much shorter; leaf blades rarely more than 4 mm. broad 6. *B. Springfieldii*.
7. Panicle axis typically 5-15 cm. or more long; panicle branches typically numerous; rachis joint and pedicels villous but not densely so; culms typically stout, often more than 1 m. tall; leaf blades (at least some) often 5-8 mm. broad (8)
- 8(7). Panicles of the larger culms 14-25 cm. long; culms very stout, stiffly erect, 12-25 dm. tall, bluish-glaucous below the nodes; culm nodes bearded with spreading hairs 3-6 mm. long. 5. *B. alta*.
8. Panicles mostly 7-13 cm. long; culms curving-erect, tending to become decumbent and much-branched below in age, mostly 7-11 dm. tall, not bluish-glaucous below the nodes or not conspicuously so; culm nodes bearded with appressed hairs less than 3 mm. long 8. *B. barbinodis*.
- 9(1). Pedicelled spikelets about as large and broad as the sessile ones (10)
9. Pedicelled spikelets much narrower and usually shorter than the sessile ones (12)
- 10(9). Sessile spikelets more than 5 mm. long 7. *B. Wrightii*.
10. Sessile spikelets less than 5 mm. long (11)
- 11(10). Panicle axis shorter than the lower branches 10. *B. pertusa*.
11. Panicle axis longer than the lower branches 11. *B. intermedia*.
- 12(9). Panicle axis less than 5 cm. long; primary panicle branches mostly 2 to 7, rarely more than 8; culm nodes glabrous or minutely pubescent (13)
12. Panicle axis typically 5-15 cm. long or longer; panicle branches numerous (14)

- 13(12). Upper culm nodes glabrous; primary panicle branches never rebranched; first glume of sessile spikelet 5.5-7 mm. long, glabrous dorsally, with a relatively large and deep glandular pit; leaves mostly in dense basal tufts, the culm leaves reduced; blades rarely more than 2 mm. broad 3. *B. edwardsiana*.
13. Upper culm nodes glabrous or puberulent; lower 1 or 2 panicle branches frequently rebranched; first glume of sessile spikelet 4.5-5.7 mm. long, usually sparsely hispid dorsally at base; glume pit relatively small and shallow; culm leaves well-developed; blades 2-5 mm. broad 4. *B. hybrida*.
- 14(12). Panicles of the larger culms 14-25 cm. long; culms very stout, stiffly erect, 12-25 dm. tall, bluish-glaucous below the nodes; culm nodes bearded with spreading hairs 3-6 mm. long; panicle axis and branches often remaining "kinked" from compression in the sheath 5. *B. alta*.
14. Panicles mostly 7-13 cm. long; culms curving-erect, tending to become decumbent and much-branched below in age, mostly 7-11 dm. tall, not or scarcely bluish-glaucous below the nodes; culm nodes bearded with appressed hairs less than 3 mm. long; panicle axis and branches not "kinked" 8. *B. barbinodis* var. *perforata*.

1. *Bothriochloa exaristata* (Nash) Henr. Perennial, resembling *B. saccharoides*; panicle slender; spikelets slightly smaller, awnless or nearly so. *Andropogon exaristatus* (Nash) Hitchc. Rare in low open ground, s.e. Tex., summer-fall; also La.

2. *Bothriochloa saccharoides* (Sw.) Rydb. SILVER BEARDGRASS, SILVER BLUESTEM. Perennial; culms tufted, (2-) 4-13 dm. tall, erect or ascending, often branching below, the nodes from appressed-hispid to glabrous; foliage commonly glaucous, glabrous or nearly so, the blades 3-6 mm. wide; panicle long-exserted or those of the branches short-exserted, silvery white, silky, dense, oblong, 6-22 cm. long; racemes 2-4 cm. long, the common axis mostly at least twice as long but readily breaking; rachis joints and pedicels long-villous; spikelets never pitted, about 4 mm. long, the delicate awn twisted below, geniculate, 10-17 mm. long; pedicellate spikelet reduced. *Andropogon saccharoides* Sw. A species widespread in the Americas, represented with us by 2 varieties as follows:

Var. *Torreyana* (Steud.) Gould. Panicles relatively small, 6-10 (-13) cm. long; spikelets broad, blunt and usually glabrous; plants usually glaucous, with leaves predominantly in a basal tuft. *Andropogon saccharoides* var. *Torreyanus* (Steud.) Hack. Frequent in dryish open places essentially throughout the state, spring-fall; Ala., Mo. and Colo. to Mex.

Var. *longipaniculata* (Gould) Gould. Plants large and coarse; culms stout, the nodes glabrous or short-bearded; panicle large, dense, on vigorous plants 13-22 cm. long; panicle branches stiffly erect-appressed, the lower branches freely rebranched; spikelets narrow, shiny-green, narrowly pointed, 3.5-4.5 mm. long, awn 11-17 mm. long. *Andropogon saccharoides* var. *longipaniculatus* Gould. Frequent locally in open places, e., s.e. and n.-cen. Tex. and Rio Grande Plains, spring-fall; also N.L.

3. *Bothriochloa edwardsiana* (Gould) Parodi. Culms mostly 3-7 dm. tall, densely tufted, slender, stiffly erect, geniculate-spreading only at margins of large clumps, unbranched above or with lateral panicles sparingly produced after development of terminal panicle; upper culm nodes glabrous or glabrate, the lower glabrous to densely short-hairy, the hairs not more than 1 mm. long; leaves mostly in a basal tuft, with a waxy bloom; blades filiform, mostly 1-2 (rarely -3.5) mm. broad, those of the basal tuft 10-25 cm. long, ciliate on the margins below the middle with hairs 4-7 mm. long; panicle of 3 to 6 simple racemes, these mostly 6-10 cm. long; panicle axis not more than 18 mm. long, with 1 to 3 nodes; sessile spikelet perfect, fertile, 5-8 mm. long (excluding awn); first glume relatively narrow, gradually tapering to an acute or slightly bifid apex, glabrous and shiny dorsally, always with a deep cylindrical glandular pit 2-2.5 mm. from the apex; lemma reduced, membranous, with a geniculate awn 20-28 mm. long; rachis node at base of sessile spikelet with a dense tuft of hairs 1-2 mm. long; pedicellate spikelet sterile, awnless, glabrous or scabrous, slender, about 3 mm. long; pedicel averaging 4.7-5 mm. long, with a deep medial groove and densely long-ciliate margins,

the hairs near apex longer than those below. *Andropogon edwardsianus* Gould. Rare in Edwards Plateau (Edwards Co.) in dry calcareous soil, late summer-fall; Tex.; Arg. and Urug.

4. *Bothriochloa hybrida* (Gould) Gould. Perennial, with strictly erect culms in small to medium-sized tufts; culms 3-8 dm. tall, moderately branched and leafy above the base; culm nodes glabrous or minutely puberulent; sheaths green or glaucous, glabrous; blades mostly 2-4 (-5) mm. broad, usually sparsely ciliate with long hairs near the base, often with a few hairs on the surfaces; panicles hairy but not densely so, 6-11 cm. long, usually with 3 to 8 primary branches on an axis 6-35 (-45) mm. long, the lower branches often simply rebranched; rachis joints and pedicels about equal, with a broad membranous often dark central groove and thickened hairy margins, the hairs mostly 5-7 mm. long near the apex; sessile spikelet 4.5-6.5 mm. long, with an awn 18-25 mm. long; first glume of sessile spikelet shiny, yellowish-green, with usually 5 greenish nerves on upper half, with a moderately deep glandular pit above the middle and usually with a few stiff hairs on the lower third or half of the back; pedicelled spikelets highly reduced, sterile, mostly 2.2-3.6 mm. long and shorter than the supporting pedicel. *Andropogon hybridus* Gould. Frequent in open calcareous areas, Rio Grande Plains, Edwards Plateau and s.e. Tex., spring-fall; Tex. and Coah.

Bothriochloa hybrida is intermediate between *B. edwardsiana* and *B. barbinodis*, but is probably an allotetraploid arising from hybridization between *B. edwardsiana* and *B. saccharoides* var. *Torreyana* and subsequent doubling of chromosome number. Rare plants have been found which appear to be hybrids of *B. hybrida* and *B. saccharoides* var. *longipaniculata*.

5. *Bothriochloa alta* (Hitchc.) Henr. Robust tufted perennial; culms stiffly erect, 12-25 dm. tall, green and glabrous but a zone just below each node is markedly blue-glaucous; nodes bearded with spreading hairs 3-6 mm. long; sheaths glabrous; ligule membranous, 3-4 mm. long; blades glabrous or scabrous, with a few long hairs on the upper surface near the base, 2-3 dm. long, 5-10 mm. broad; panicle long-exserted, oblong, dense, 1-2 dm. long, the branches numerous, appressed, the axis 5-15 cm. or more long; panicle axis and branches often remaining "kinked" from compression in the sheath; racemes 2-3 cm. long, clustered on the upper parts of the branches, the hairs at the top 5-8 mm. long; sessile spikelets about 5-6 mm. long, many or all of them pitted; awn of fertile lemma about 2 cm. long. *Andropogon altus* Hitchc. Infrequent in high dry grassy plains in the Trans-Pecos (Davis Mts. area, Jeff Davis, Brewster and Presidio cos.), summer; Tex., N.M., s. to Jal., S.L.P. and Qro.; Bol., Arg. and Urug.

6. *Bothriochloa Springfieldii* (Gould) Parodi. Tufted perennial with culms 3-8 dm. tall; culm nodes densely bearded with spreading hairs, these usually 3-7 mm. long; blades 2-3 (-5) mm. broad, glabrous or sparsely papillose-hispid on the adaxial surface and with tufts of hair on each side of the ligule; panicle densely white-villous, with 2 to 8 racemose branches, these infrequently rebranched; rachis joints and pedicels about equal, with thickened densely villous margins and a broad thin-membranous central area; hairs of the inflorescence 5-10 mm. long; sessile spikelets mostly 5.5-7.3 (-8.5) mm. long; first glume acute and minutely bifid at apex, hairy on the lower third or half the dorsal surface, occasionally with a faint glandular pit or depression above the middle; awn of the lemma 20-26 mm. long; pedicelled spikelet sterile, narrow, averaging 4-5 mm. long, 1-2 mm. longer than the pedicel. *Andropogon Springfieldii* Gould. Local in grassy or desert plains and in mts. in the Trans-Pecos and higher parts of the Plains Country, spring-fall; Tex., N.M., Ariz.; Arg.

7. *Bothriochloa Wrightii* (Hack.) Henr. Perennial, somewhat glaucous; culms tufted, 5-10 dm. tall, simple, the nodes usually hispid; blades flat, 3-5 mm. wide, tapering to a fine point; racemes 3 to 7, suberect, mostly 3-6 cm. long, green or tawny, not conspicuously woolly, the hairs of rachis joints and pedicels much shorter than the spikelets; peduncle usually long-exserted; sessile spikelet about 6 mm. long, short-pilose at base, the first glume several-nerved toward the summit, stiffly short-ciliate on the keels above, with or without a pit; awn twisted below, geniculate, 10-15 mm. long; pedicellate spikelet about as large as the sessile one, awnless. *Andropogon Wrightii* Hack. Reported to occur in s. N.M. and to be expected in westernmost Tex. although no specimens have been seen from Tex.; N.M., Chih.

8. *Bothriochloa barbinodis* (Lag.) Herter. Perennial; culms densely tufted, usually 7-11 dm. tall, spreading to ascending, often branching or even geniculate and decumbent below, the nodes bearded with short usually appressed hairs less than 3 mm. long; sheaths sparsely hairy in the throat, foliage otherwise glabrous or nearly so; blades 2-7 mm. wide, scabrous; panicles from rather long-exserted to included at base, those of the branches often partly included in dilated sheaths, silvery to creamy-white, silky, sub-flabellate, mostly 7-13 cm. long; racemes several to many or sometimes few on the branches, 2-7 cm. long, the common axis 5-15 cm. long or longer; rachis joints and pedicels copiously long-villous, the hairs on the average longer than in *B. saccharoides*; spikelets 4.5-7.3 mm. long; awn twisted below, geniculate, 20-25 mm. long; pedicellate spikelet reduced. *Andropogon barbinodis* Lag. Widespread in w. half of Tex., spring-fall; s.w. U.S., Mex., Arg., Urug.; represented with us by two forms or "varieties", as follows:

Var. *barbinodis*. Most sessile spikelets not pitted. Locally abundant in w. Tex., spring-fall; Tex., Colo., Ut., Calif. s. to s. Mex.; Arg., and Urug.

Var. *perforata* (Fourn.) Gould. Most of the sessile spikelets pitted. *Andropogon barbinodis* var. *perforatus* (Fourn.) Gould. Locally abundant in w. half of Tex., e. to Brown and Aransas cos., spring-fall; Tex., Ariz., Chih., Coah., Dgo., Hgo., Mex., S.L.P., Ver., Zac.; Arg., Urug.

9. *Bothriochloa Ischaemum* (L.) Keng var. *songarica* (Fisch. & Mey.) Celarier & Harlan. Perennial; culms ascending, 7-10 dm. tall; nodes variously pubescent; panicle-axis shorter than the branches; racemes nodding, few to several, on slender peduncles aggregate or somewhat distant on a slender axis 3-5 cm. long, the sterile (pedicellate) spikelets as large and broad as the fertile (sessile) ones, the rachis and pedicels silky-ciliate; sessile spikelets never pitted; awns slender, twisted and bent, about 15 mm. long. *Andropogon Ischaemum* L. var. *songaricus* Fisch. & Mey. Widespread along roadsides, where sown by highway department, spring-fall; introd. from the steppes of n. Asia; reportedly a promising pasture grass in s. Tex. but not persisting except in cult. or along roadsides.

10. *Bothriochloa pertusa* (L.) A. Camus. Perennial; culms ascending, branching; panicle axis shorter than the lower branches; racemes few to several, sparsely villous; first glumes of sessile spikelets always pitted; awn of sessile spikelet geniculate, 10-15 mm. long; pedicellate spikelet about as large and broad as the sessile ones. *Andropogon pertusus* (L.) Willd. Rare in disturbed areas, especially road-shoulders where sown, summer-fall; nat. of Old World, introd. as an experimental forage grass at various localities.

11. *Bothriochloa intermedia* (R. Br.) A. Camus. Similar to *B. Ischaemum* var. *songarica* but with a panicle axis longer than the lower panicle-branches and at least some of the sessile spikelets with pitted first glumes. *Andropogon intermedius* R. Br. In disturbed ground near roads where sown, summer; very widespread in trop. and subtrop. areas of the Old World, introd. as an experimental forage-grass in Tex. but apparently not persistent except along roadways.

Natural introgression of this species and *B. Ischaemum* has been reported in West Pakistan. Plants called *Bothriochloa caucasica* (Trin.) C. E. Hubb. [*Andropogon caucasicus* Trin. and *A. intermedius* var. *caucasicus* (Trin.) Hack.] are referred here; they differ somewhat from typical *B. intermedia* in a slightly more branched panicle.

69. DICHANTHIUM WILLEM.¹⁴

Low to moderately tall perennials, mostly caespitose but some with extensive creeping stolons; inflorescence and spikelets as in *Bothriochloa* but pedicels and rachis joints flat or rounded without a groove or membranous central area and lower pair of spikelets of the inflorescence branches usually both sterile and awnless.

A small genus of Asiatic, Australian and African species, exceedingly closely related to *Bothriochloa* and differing mainly in the rounded rather than grooved pedicel and rachis joints. Three species have been introduced in Texas and at other locations in the

¹⁴ Adapted in part from the work of Robert P. Celarier and Jack R. Harlan in Okla. A. & M. Coll. Expt. Sta. Tech. Bull. T-58. 1955.

South and Southwest and persist as casual weeds in some areas where they have been seeded.

1. Rachis joints and pedicels with long white hairs; lower glume densely covered and with an arc of extremely long hairs at the tip 1. *D. sericeum*.
1. Rachis joint hairs short; glume without arc of long hairs (2)
- 2(1). Stem nodes with conspicuous collar of long hairs; ligule well-developed
 2. *D. annulatum*.
2. Stem nodes glabrous or with a band of short velvety hairs; ligule absent or very small 3. *D. aristatum*.

1. *Dichanthium sericeum* (R.Br.) A. Camus. Perennial; culms slender, leafy, 5-8 dm. tall, branching; nodes bearded; racemes 2 to 7, aggregate, 3-5 cm. long, nodding from a very slender peduncle, conspicuously silky; rachis joints and pedicels with long white hairs; sessile and pedicellate spikelets about equal, the first glume strongly several-nerved; pits absent; awn of sessile spikelet twisted, geniculate, 2-3 cm. long. *Andropogon sericeus* R. Br. Apparently established at a few points in s. Tex. where sown, summer-fall; Austral. and Pac. I., now widely introd.

2. *Dichanthium annulatum* Stapf. Perennial; culms erect to decumbent or procumbent, some strains creeping by stolons; nodes with a conspicuous ring of long white hairs; leaves broad, usually light-green, glabrous to sparsely papillose-pubescent on upper or lower or both surfaces; ligule conspicuous, well-developed; peduncle usually glabrous; primary panicle axis very short, the racemes usually short; rachis joints and pedicels with very few hairs and these short; glumes of sessile spikelets broad, truncate at tip, often obovate, densely covered with long papillose hairs; pits absent; awn of lemma much longer and more conspicuous than in *Bothriochloa Ischaemum*. Widespread in drier warmer parts of Old World and introd. at scattered points in e. half of Tex. as an experimental forage grass.

D. annulatum is reported to hybridize naturally with *Bothriochloa intermedia* in the Old World.

3. *Dichanthium aristatum* (Poir.) C. E. Hubb. Perennial; culms finally ascending from a decumbent often creeping base, freely rooting at the lower nodes; nodes usually glabrous or with a narrow velvety band of hairs but never bearded; leaves green to pink or purple, glabrous or with varying papillose-pubescent; ligule absent or very small; peduncle glabrous below the panicle; racemes solitary to several (to numerous), approximate and subdigitately arranged; rachis joints and pedicels sparsely hairy on one margin with short hairs; pedicellate spikelets as large and broad as the fertile sessile ones; first glume of the sessile spikelet either glabrous or with scattered long white papillose-hairs; pits absent; awns long, similar to those of *D. annulatum* and usually but not always with the lowermost sessile spikelets awnless. *Andropogon caricosus* L., *A. aristatus* Poir., *A. nodosus* (Willem.) Nash. Apparently established at a few scattered points in s. Tex. where sown as an experimental forage introd., summer-fall; s.e. Asia, Polyn., Afr., Madag., now widely introd. for experimental purposes.

70. SORGHUM MOENCH

Robust annuals or perennials; spikelets in terminal panicles of several to numerous racemes, tardily disarticulating just below each sessile spikelet; spikelets in pairs, one sessile and fertile, the other pedicellate and sterile (but well-developed), usually staminate; spikelets somewhat dorsiventrally compressed, with 2 flattish-indurated glumes; sterile and fertile lemmas and palea hyaline, the fertile lemmas awned.

A large genus centered in the Near East; at least 2 species are cultivated and escaped in Texas.

1. Plants perennial from creeping rhizomes 1. *S. halepense*.
1. Plants annual 2. *S. bicolor*.

1. *Sorghum halepense* (L.) Pers. JOHNSON GRASS. Perennial; culms 5-15 dm. tall, from extensively creeping scaly rhizomes; blades mostly less than 2 cm. wide; panicle open,

15-50 cm. long; sessile spikelet 4.5-5.5 mm. long, ovate, appressed-silky, the readily deciduous awn 10-15 mm. long, geniculate, twisted below; pedicellate spikelet 5-7 mm. long, lanceolate. Open ground, fields and waste places, Mass. to Ia. and Kan., s. to Fla. and Tex., w. to s. Calif.; nat. of the Medit. region but in the trop. and warmer regions of both hemispheres.

Cultivated for forage, but because of the difficulty of eradication it becomes a troublesome weed.

2. *Sorghum bicolor* (L.) Moench. SORGHUM. Annual; differing from *S. halepense* in being annual and more robust. *Holcus Sorghum* L., *Sorghum vulgare* Pers., *Panicum frumentaceum* Salisb. This species has been cultivated in warmer regions since prehistoric times for the seed, which has been used for food, for its sweet juice, and for forage. In the U.S. it is cult. under the general name of "sorghum."

There are many varieties or races of cultivated sorghums, all of which have the same chromosome number (10) and which fall naturally into distinct groups, the chief of which (in the United States) are sorgo, kafir, durra, milo, feterita, shallu, kaoliang, and broomcorn. Sorgo includes the varieties known collectively as sweet or saccharine sorghums, in which the juice in the stems is abundant and very sweet. In this country sorgo is cultivated chiefly in the region from Kansas and Texas to North Carolina for forage and for the juice which is made into syrup. The differences between most of the varieties are so indistinct and so unstable because of intercrossing as to make it very difficult to assign descriptive limits. The application of botanical names is uncertain, and it seems best, therefore, not to assign to them definite varietal or specific Latin names.

71. SORGHASTRUM NASH

Tufted perennials, rather robust, with or without rhizomes; blades flat, often somewhat bluish-green; panicles terminal, long-exserted, with few to many raceme-branches; the racemes 1- to few-spikeletted; spikelets all alike, perfect, fertile, sessile on the rachis (which disarticulates at the base of each spikelet) and each subtended by a hairy stalk about as long as itself and representing the vestigial pedicel of a spikelet which has been completely reduced; spikelets dorsiventrally flattened, with 2 narrowly elliptical coriaceous or indurate glumes; sterile lemma, fertile lemma (which is awned) and palea all reduced and hyaline.

About 12 species in warm America and tropical Africa.

1. Awns usually 15 mm. long or shorter; panicle rather dense and with many branches, golden brown or golden 1. *S. avenaceum*.
1. Awns 25-35 mm. long; panicles loose and not golden .. 2. *S. Elliottii*.

1. *Sorghastrum avenaceum* (Michx.) Nash. INDIAN GRASS. Perennial; culms 10-25 dm. tall from short scaly rhizomes; blades elongate, flat, mostly 5-10 mm. wide, tapering to a narrow base, scabrous; panicle narrow, yellowish, rather dense, 15-30 cm. long, contracted and darker at maturity; summit of branchlets, rachis joints and pedicels grayish-hirsute; spikelets 6-8 mm. long, lanceolate, hirsute, the awn 10-15 mm. long. *S. "nutans"* of many auth. Frequent in n.-cen. Tex., Edwards Plateau and Plains Country, infrequent in e., s.e. and Trans-Pecos Tex., late summer-fall; Que. and Me. to Man. and N.D., s. to Gulf States and cen. Mex.

One of our most beautiful fall-flowering grasses, and one of the most desirable for forage purposes; a high-yielding genotype known as Tejas Indian grass has been selected for planting in field trials in north-central Texas.

2. *Sorghastrum Elliottii* (Mohr) Nash. Perennial; culms 10-15 m. long, more slender and weaker than in *S. avenaceum*; rhizomes absent; the base comparatively delicate, smooth or nearly so; blades on the average narrower; panicle loose, 15-30 cm. long, nodding, the filiform branchlets and pedicels flexuous but not recurved, with a few long hairs at the tip; spikelets 6-7 mm. long, chestnut-brown at maturity, with a short blunt bearded callus; first glume hirsute or glabrescent on the back; awn 25-35 mm. long. Locally abundant in sandy woodlands, e. and s.e. Tex., summer-fall; Md. to Tenn., s. to Gulf States.

Reports of the occurrence of *S. secundum* (Ell.) Nash in Texas are based on mis-determined specimens of *S. Elliottii*.

72. HETEROPOGON PERS.

Tufted annuals or perennials with flat blades; spikelets in dense solitary terminal racemes, in pairs, one of each pair sessile or nearly so, the other pedicellate; raceme in lower part remaining intact, in upper part disarticulating at the base of each hairy internode (just above each node); in the lower part of the raceme both spikelets of each pair staminate or neuter, in the upper part the sessile spikelets perfect, the pedicellate ones staminate; perfect spikelets with equal coriaceous concavo-convex glumes, the first glume brown-hirsute, infolding the second; lemma thin and hyaline, the fertile one narrow, extending into a strong bent and twisted brown awn; palea absent; pedicellate staminate spikelets flat, conspicuous, awnless; glumes membranous, the first green, faintly many-nerved, asymmetric, one submarginal keel rather broadly winged, the other wingless, the margins inflexed, the second glume narrower, symmetric; lemmas hyaline; palea absent.

A genus of half a dozen species of the warmer parts of the globe, probably originally restricted to the Old World; adventive in America since the time of Columbus.

1. Plants perennial, less than 1 m. tall; first glume of staminate spikelet usually papillose-hispid 1. *H. contortus*.
1. Plants annual, usually more than 1 m. tall; first glume of staminate spikelet with a row of glands along the back, glabrous 2. *H. melanocarpus*.

1. *Heteropogon contortus* (L.) R. & S. TANGLEHEAD. Perennial, tufted; culms 2-8 dm. tall, branched above, the branches erect; sheaths smooth, compressed-keeled; blades flat or folded, 3-7 mm. wide; raceme 4-7 cm. long, 1-sided; sessile spikelets about 7 mm. long, slender, nearly hidden by the imbricate pedicellate spikelets; awns 5-12 cm. long, bent and flexuous, commonly tangled; pedicellate spikelet about 1 cm. long; first glume papillose-hispid toward the tip and margins, sometimes nearly glabrous. Local in sandy prairies of extreme s. Tex. and in Trans-Pecos mts., summer-fall; warm regions n. to Ariz. and Tex.

2. *Heteropogon melanocarpus* (Ell.) Benth. SWEET TANGLEHEAD. Annual, 1-2 m. tall, freely branching; sheaths smooth, the upper part of the keel (especially of the upper sheaths) with a row of concave glands; blades 5-10 mm. wide; raceme 3-6 cm. long, looser than in *H. contortus*; sessile spikelets 9-10 mm. long, relatively thick, the awns 10-15 cm. long; pedicellate spikelet 15-25 mm. long, the first glume with a line of punctate glands along the middle. Very rare and probably not persistent in s.e. Tex., summer-fall; scattered and local, Ga., Gulf States and Ariz.; trop. regions of the world.

The plant when fresh emits an odor like that of citronella oil.

73. TRACHYPOGON NEES CRINKLE-AWN

A genus of about 10 species of warmer parts of America, Africa and Madagascar.

1. *Trachypogon secundus* (Presl) Scribn. Tufted perennial 6-12 dm. tall, the nodes appressed-hirsute; sheaths with erect auricles 2-5 mm. long; blades flat to subinvolute, 3-8 mm. broad; raceme spikelike, solitary, terminal, dense, 10-18 cm. long, the rachis glabrous, remaining intact; spikelets in pairs, 6-8 mm. long, one spikelet of each pair nearly sessile, staminate, awnless, the other pedicellate, perfect, the pedicel disarticulating near its base and constituting a sharp-barbed callus below the detached spikelet; first glume firm-membranous, rounded dorsally, several-nerved, obtuse; second glume firm, obscurely nerved; fertile lemma narrow, extending into a stout twisted and bent or flexuous awn 4-6 cm. long, short-plumose below and nearly glabrous toward the tip; palea obsolete. Infrequent in sandy prairies and woodlands, s. and s.e. Tex., summer-fall; warmer parts of Am., n. to Tex., s. Ariz. and s.w. N.M.

74. ELYONURUS WILLD.

BALSAMSCALE

Rather robust tufted perennials, often with rhizomes; blades flat or usually at least partially involute; racemes spike-like, terminal, solitary, 5-15 cm. long, somewhat flattened but roughly oval in transection, the rachis thick but not noticeably sculptured, tardily disarticulating at the base of each internode and woolly, the joints not much thicker at the summit than at the middle; spikelets in pairs, one of each pair sessile, perfect, fertile, appressed to the concave side of the rachis joint, the other pedicellate (the pedicel appressed), staminate but otherwise similar to the sessile one, neither awned; first glume firm, somewhat coriaceous, dorsally flattened, the margins inflexed around the second glume, a line of balsam-scented glands on the marginal nerves, the apex entire and acute or acuminate, or bifid with aristate teeth; second glume similar to the first; sterile and fertile lemmas thin and hyaline; palea obsolete.

A genus of about 20 species in warmer regions, only weakly distinguished from *Manisuris*. The name is sometimes spelled "Elionurus."

1. Rhizomes absent; culms hirsute below the nodes; racemes conspicuously woolly
 1. *E. barbiculmis*.
1. Rhizomes present; culms glabrous; racemes slightly pubescent; first glume glabrous or nearly so dorsally 2. *E. tripsacoides*.

1. *Elyonurus barbiculmis* Hack. Perennial; culms tufted, erect, simple or sparingly branching, 4-6 dm. tall, pubescent below the nodes; blades involute, striate, about 1 mm. thick as rolled, the upper surface usually long-pilose; raceme mostly 5-10 cm. long, pale; rachis joints, pedicels and spikelets densely woolly; spikelets 6-8 mm. long; first glume acuminate. Local in the Trans-Pecos, summer-fall; Tex., N.M. and Ariz., s. to Dgo.

2. *Elyonurus tripsacoides* Willd. Perennial; culms 6-12 dm. tall, glabrous, rather freely branching and with short rhizomes; blades flat or involute, 2-4 mm. wide, slightly pilose on the upper surface near the base; raceme 7-15 cm. long; rachis joints ciliate, the pedicels pilose; spikelets 6-8 mm. long; first glume ciliate toward the acuminate 2-toothed apex, usually glabrous on the back. Locally abundant on the Coastal Plain in woodlands and prairies, usually in sandy soil, summer-fall; warmer parts of Am. n. to Gulf States and Ga.

75. MANISURIS L.

JOINT-TAIL

Rather similar to *Elyonurus* but the racemes nearly cylindrical, their rachises glabrous or nearly so and quite thick, the base of each internode on one side sculptured with a niche into which the spikelets fit closely; pedicellate spikelets much more reduced than in *Elyonurus*, often rudimentary.

A small genus of the warmer parts of the world.

1. Racemes flattened, tardily disarticulating; first glume of sessile spikelet smooth
 1. *M. altissima*.
1. Racemes nearly cylindrical, readily disarticulating at maturity; first glume of sessile spikelet marked with pits or wrinkles (2)
- 2(1). Sheaths not compressed-keeled; first glume more or less pitted 2. *M. cylindrica*.
2. Sheaths compressed-keeled; first glume with prominent transverse wrinkles 3. *M. rugosa*.

1. *Manisuris altissima* (Poir.) Hitchc. Perennial; culms ascending from a long creeping base, compressed and 2-edged, 4-8 dm. long, freely branching toward the ends; blades flat, 3-8 mm. wide; flowering branches often short and fascicled; racemes 3-5 cm. or sometimes 1 dm. long, compressed; pedicel free or partly adnate to the rachis joint; sessile spikelet 5-7 mm. long, the keels of the first glume very narrowly winged toward the apex; pedicellate spikelet 5-6 mm. long, acute. Rare in coastal s. Tex., where repeatedly introd., spring-fall; warmer parts of the world, introd. in Am.

2. *Manisuris cylindrica* (Michx.) O. Ktze. Perennial; culms tufted, with short rhizomes, erect, rather slender, 3-10 dm. tall, simple or curved; sessile spikelet 4-5 mm. long, the first glume pitted along the nerves. Infrequent in open areas, e., s.e. and n.-cen. Tex., usually in sandy soil, spring-fall; Coastal States, N.C. to Tex.; also Okla., Ark., Mo.

3. *Manisuris rugosa* (Nutt.) O. Ktze. Perennial; culms mostly rather stout, 7-12 dm. tall, freely branching; sheaths compressed-keeled; blades commonly folded, 3-8 mm. wide; flowering branches often numerous; racemes 4-8 cm. long, partly included in brownish sheaths; rachis joint and pedicel contracted in the middle; sessile spikelet 3.5-5 mm. long, the first glume strongly and irregularly transversely ridged, the keels narrowly winged toward the summit. Infrequent in open woodlands on low often moist sandy loam, e. and s.e. Tex., summer-fall; Coastal States, Va. to Tex.; Ark.

76. TRIPSACUM L.

A small American genus of which we have one species.

1. *Tripsacum dactyloides* (L.) L. EASTERN GAMAGRASS. Very robust perennial, usually 15-30 dm. tall, often with rhizomes, glabrous throughout; blades elongate, 1-2 cm. broad, flat; inflorescence 15-25 cm. long, terminal, subdigitate group of a few androgynous spikelike racemes, each with a few lower solitary pistillate fertile spikelets at the base and many paired staminate spikelets above; pistillate spikelets 7-10 mm. long, occasionally subtended by a rudimentary pedicel, arranged on opposite sides at each joint of the thick hard articulate lower part of the rachis, sunken in niches of the sculptured rachis, consisting of one perfect floret and a sterile lemma; first glume coriaceous, nearly infolding the spikelet, fitting into and closing the hollow of the rachis; second glume similar to the first but smaller, infolding the remainder of the spikelet; sterile and fertile lemmas and palea very thin and hyaline; staminate spikelets 7-11 mm. long, paired and 2-flowered; glumes firm, acute; lemma and palea hyaline. Incl. var. *occidentale* Cutler & Anders. Frequent in scattered parts of the state, more common in the e. half, very rare in the Plains Country, summer-fall; W.I.; e. U.S., Coah., N.L., Tam., S.L.P.

77. ZEA L. MAIZE. (INDIAN) CORN

An American monotype, not known and incapable of survival outside of cultivation, very rarely waifed at the edges of cornfields.

1. *Zea Mays* L. Robust annual with broad flat leaves; pistillate spikelets somewhat like those of *Tripsacum* or usually with much-reduced glumes, borne in several rows on a much-thickened cylindrical rachis ("cob") terminal on short axillary branches, the whole inflorescence covered with usually modified leaves (shucks) and the entire "ear" marked at the end by the termini of the enormously elongated styles ("silk"); staminate spikelets much like those of *Tripsacum*, borne in pairs on a branched panicle of spikelike racemes at the top of the plant. Widely introd., probably originally from cen. and s. Mex. (s. Pue.). The name "maize" is often used in Texas for races of *Sorghum bicolor*, but should be restricted to *Zea*, to which the name "corn" is almost universally applied.

78. SCLEROPOGON PHIL.

An American monotypic genus.

1. *Scleropogon brevifolius* Phil. BURRO GRASS. Perennial forming extensive colonies; stolons numerous, long, slender, conspicuous; culms numerous from the tight tufts, 1-2 dm. long, erect, unbranched; leaves crowded near the base; blades 15-70 mm. long, 1.5-2.5 mm. broad, folded usually, strict or the fine tip arcuate-divergent; staminate panicles on separate culms from the pistillate (usually in different tufts), 4-6 cm. long, 10-15 mm. broad, loosely spikelike, few-flowered, stramineous; staminate spikelets about 2 cm. long, 10- to 14-flowered, slightly laterally compressed, the rachilla not abscising; glumes shorter than the lowest lemma; lemmas keeled; pistillate panicles with axes 1-3 cm. long, few-flowered, stramineous or purplish; spikelets erect, appressed, 8-12 cm. long (including awns), few-flowered, only the lowest floret fertile, the rest reduced, the

rachilla with one zone of abscission above the glumes; each lemma with 3 very long fine awns, the lower part with a pubescent basal callus. Abundant on desert alluvial flats and fans in the Trans-Pecos and w. Edwards Plateau, rare in Plains Country, May-Oct.; Colo. to Nev. and s.e. to Pue.; also Arg. and Chile.

79. ERAGROSTIS BEAUV. LOVEGRASS

Variable in habit and foliage; panicles usually much-branched (the branches in some species very short and closely appressed); spikelets usually somewhat laterally compressed, several-flowered; glumes shorter than the lowest lemma, 1-nerved; lemmas 3-nerved (lateral nerves sometimes obscure); rachilla either remaining intact (lemmas then deciduous) or abscising above the glumes and either at the upper part or lower part of each lemma-node or breaking irregularly between the florets under mechanical pressure during tumbling of the panicle.

A genus of about 300 species widely distributed in warm regions. Some lovegrasses are difficult to determine, the characters useful in distinguishing them being subtle, quantitative ones which tend to grade from one species to another. This probably is evidence of past hybridization and genetic contamination of many species.

- 1. Mat-forming annuals creeping by stolons (2)
- 1. Not mat-forming (3)
- 2(1). Flowers unisexual, staminate ones on some plants, pistillate on others; lemmas about 3 mm. long, persistent on the rachilla 1. *E. reptans*.
- 2. Flowers perfect; lemmas 1.5-2 mm. long, falling individually from the rachilla to expose the minute paleas which persist on the rachilla 2. *E. hypnoides*.
- 3(1). Panicles spikelike and 3-10 mm. thick (4)
- 3. Panicles more open, thicker than 10 mm. (5)
- 4(3). Delicate annual 15-35 cm. tall; panicle 3-12 cm. long 29. *E. ciliaris*.
- 4. Coarse perennial bunchgrass; panicle 15-35 cm. long .. 14. *E. spicata*.
- 5(3). Keels of paleas long-ciliate 30. *E. amabilis*.
- 5. Keels of paleas not long-ciliate (6)
- 6(5). Spikelets (the lateral ones, not those terminal on the panicle branches) sessile, their pedicels averaging less than 1 mm. long (cf. also *E. Barrelieri* and *E. refracta*) (7)
- 6. Spikelets (the lateral ones) with pedicels averaging more than 1 mm. long, often much more (13)
- 7(6). Lemmas about 1 mm. long (8)
- 7. Lemmas 1.5-5.5 mm. long (9)
- 8(7). Annual; spikelet 2-3 mm. long; panicle 5-50 cm. long, only 1-4 cm. broad, with numerous long main branches and these in turn further branched, all the branches strictly ascending 28. *E. glomerata*.
- 8. Perennial; spikelets 3-12 mm. long; panicle open, 8-15 cm. long, 3-7 cm. broad, with few ascending branches 31. *E. Lehmanniana*.
- 9(7). Lemmas 1.5-2 mm. long 25. *E. curtipedicellata*.
- 9. Lemmas 2-5.5 mm. long (10)
- 10(9). Annuals; lemmas with a few glands on the keel near the tip 4. *E. cilianensis*.
- 10. Perennials; lemmas not glandular (11)
- 11(10). Spikelets remote and appressed on very stiff straight branches 26. *E. sessilispica*.
- 11. Spikelets not appressed or if so not remote from each other (12)

- 12(11). Panicles open with numerous ascending weak branches; spikelets 7- to 11-flowered, plumbeous20. *E. curvula*.
12. Panicles with few erect or spreading branches, the terminal axis and each branch toward the tip interrupted-spike-like, with glomerules of spikelets; spikelets 10- to 50-flowered, stramineous or often with a buffy or rufous tinge27. *E. oxylepis*.
- 13(6). Pedicels of individual spikelets 1-3 cm. long, averaging about 15-20 mm. long, rather stiff and straight21. *E. Elliottii*.
13. Pedicels of individual spikelets 1-18 cm. long, averaging usually less than 10 mm. long, stiffish to weak and flexible (14)
- 14(13). Each pedicel with a yellowish glandular (sticky) band completely around it or on one side of it near the middle (15)
14. Most pedicels lacking glandular bands (glandular depressions occasionally present) (16)
- 15(14). Perennial; panicle usually broader than 6 cm.; pedicels 3-10 mm. long 7. *E. Swallenii*.
15. Annuals; panicle 1-6 cm. broad; pedicels 0.5-4 mm. long (15a)
- 15a(15). Lemma keel glandular 5. *E. poaeoides*.
- 15a. Lemma keel never glandular 6. *E. Barrelieri*.
- 16(14). Annuals (see also *E. lugens* which sometimes simulates annual habit) (17)
16. Perennials (24)
- 17(16). Spikelets with 2 to 4 lemmas13. *E. capillaris*.
17. Spikelets with (3 to) 5 to 40 lemmas, averaging at least 5 per spikelet on any plant (18)
- 18(17). Lemmas about 1 mm. long 3. *E. pilosa*.
18. Lemmas 1.5-2.5 mm. long (19)
- 19(18). Lower lemmas 2-2.5 mm. long (20)
19. Lower lemmas 1.5-2 mm. long (21)
- 20(19). Culms mostly diffuse and spreading, sparingly branched and geniculate at base, often with a ring of yellow glands shortly below the nodes; sheaths often with rows of minute glandular depressions on the keel and near the nerves 8. *E. neomexicana*.
20. Culms erect or ascending; nodes and sheaths not glandular12. *E. mexicana*.
- 21(19). Pedicels appressed, flexuous, 1-5 mm. long, averaging less than 4 (or 5) mm. long 9. *E. pectinacea*.
21. Pedicels not appressed, 3-10 mm. long, averaging longer than 4 mm. (22)
- 22(21). Culms often with a ring of yellow glands shortly below the nodes; sheaths often with rows of minute glandular depressions on the keel and near the nerves 8. *E. neomexicana*.
22. Culms and sheaths never glandular (23)
- 23(22). Culms mostly spreading; blades 2-5 mm. broad; spikelets 8- to 15-flowered 10. *E. arida*.
23. Culms ascending; blades 2-4 mm. broad; spikelets 6- to 14-flowered11. *E. tephrosanthos*.
- 24(16). Lemmas not falling individually but the spikelet rachilla eventually breaking from external mechanical forces; panicles with numerous long stiff antrorsely scabrous branches which in turn bear secondary branches mostly deflexed secundly from their lower side (25)
24. Lemmas eventually falling individually from the spikelet axis; panicles usually not so formed except in *E. Silveana* (27)

- 25(24). Culms not knotty at base; lateral spikelets appressed to the secondary branchlets 22. *E. refracta*.
25. Culms from hard knotty bases; lateral spikelets not appressed (26)
- 26(25). Lateral spikelets on pedicels 3-5 mm. long 23. *E. spectabilis*.
26. Lateral spikelets on pedicels 1-3 mm. long 24. *E. Silveana*.
- 27(24). Panicles with numerous long stiff somewhat viscid antrorsely scabrous main branches which in turn bear some short stiff branches usually secundly reflexed below the lower side of the main branches 24. *E. Silveana*.
27. Secondary branches of panicle usually not uniformly stiffly secundly deflexed from the main branches (28)
- 28(27). Spikelets (1- to) 3- to 26-flowered; lower lemmas 2.4-3.8 mm. long, with prominent lateral nerves; panicles often weak and nodding 19. *E. trichodes*.
28. Spikelets (1- to) 2- to 12-flowered; lower lemmas 1.3-3 mm. long, with weak obscure lateral nerves when mature (29)
- 29(28). Spikelets 2-4 mm. long, markedly tapered to apex, (1- to) 2- to 4-flowered, the lemmas 1.7-2.2 mm. long; sheaths much longer than their internodes, shortly ascending-pilose in the upper part and long erect-pilose at the apex dorsally (or rarely nearly glabrous); eastern half of Texas 15. *E. hirsuta*.
29. Spikelets 3-10 mm. long, the lemmas 1.3-3 mm. long; sheaths about as long as to longer than their internodes, either glabrous or pilose at the summit (30)
- 30(29). Lemmas 1.3-2 mm. long, variously colored but usually slightly dull-purplish, with a golden tinge only in genetically contaminated plants; lower axils of panicle pilose 16. *E. lugens*.
30. Lemmas 1.8-3 mm. long, golden-green to bronzy or golden-stramineous to golden-plumbeous; lower axils of panicle glabrous or nearly so (31)
- 31(30). Panicles 5-13 cm. broad; pedicels 3-9 mm. long; Trans-Pecos Texas and Edwards Plateau 17. *E. erosa*.
31. Panicles 3-5 cm. broad; pedicels 2-5 mm. long; extreme south Texas, where very rare 18. *E. Palmeri*.

1. *Eragrostis reptans* (Michx.) Nees. Mat-forming annual, extensively creeping by stolons, rooting at the numerous nodes; sheaths about 5 mm. long; blades 1-4 cm. long; panicles 1-3 cm. long, about as thick, of several glomerules of spikelets, often subcapitate, of 2 sexes, the staminate panicles on some plants, the pistillate on others; spikelets laterally compressed, curvilinear, 4-17 mm. long, 6- to 32-flowered, the rachilla remaining intact; lemmas often pubescent, about 3 mm. long, not falling individually from the rachilla. *Neeragrostis reptans* (Michx.) Nicora. Locally abundant in swales and lake- and river-beds, usually in tight clay-loam soil, n.-cen., e. and s.e. Tex. and Rio Grande Plains, spring-fall; cen. U.S. from S.D. e. to Ill. and Ky. and s. to Coah. and Tam.; also Fla.

2. *Eragrostis hypnoides* (Lam.) B.S.P. Annual, creeping over small areas by short stolons; culms very slender and short; sheaths and blades very short as in *E. reptans*; panicles often subcapitate or occasionally elongate to interrupted-spike-like or even more open, diffusely oblong, with short branches; pedicels 1-3 mm. long, capillary, somewhat flexuous; spikelets approximate or even glomerulate, linear, 2-20 mm. long, 4- to 44-flowered, the flowers all perfect, the rachilla remaining intact; lemmas lance-ovate, 1.5-2 mm. long, falling individually (starting at the bottom of the spikelet) to liberate the grains and to leave the minute paleas persistent on the rachilla. Locally abundant in swales, barrow ditches, streambars and banks, e. and s.e. Tex., rare in coastal parts of Rio Grande Plains (Cameron Co.), spring-fall; widespread from s. Can. nearly throughout the U.S. to Mex. and W.I.; Arg.

3. *Eragrostis pilosa* (L.) Beauv. INDIA LOVEGRASS. Loosely tufted annual; culms 1-5 dm. long, very slender, pronouncedly geniculate and sparingly or not branched near the base; sheaths much shorter than the internodes, mostly glabrous except at the corners; blades short, 1-3 mm. broad, often flat; panicles mostly pyramidal, long-exserted, very

diffuse, 5-20 cm. long, with a few widely spreading capillary branches which in turn bear the capillary pedicellary branchlets that are mostly deflexed and 3-8 mm. long; spikelets linear, 3-6 mm. long, about 1 mm. broad, 3- to 10-flowered; lemmas about 1 mm. long, gray with dark purple tip, falling individually from the slightly zigzag intact rachilla. Rare weeds, n.-cen. and e. Tex., summer; nat. of s. Eur., now scattered in warmer parts of the New World.

4. *Eragrostis cilianensis* (All.) E. Mosher. STINKGRASS. Loosely tufted annual, odoriferous when fresh; culms 5-50 cm. long, mostly decumbent and geniculate basally, ascending distally, rarely branched, with an obscure yellow glandular (often broken) ring shortly below each node; sheaths mostly shorter than their internodes and often pilose on the corners, with microscopic glands along the keel and near the base also along the nerves; blades 3-7 mm. broad, mostly flat, often papillose-pilose along the margins basally; panicles 3-20 cm. long, 1-7 cm. broad, narrowly oblong or ovoid, rather dense (spikelets touching), with a number of short ascending branches (glabrous in the axils) bearing in turn the glomerules of spikelets on individual pedicels 0.5-1 mm. long, the branches and pedicels often gland-dotted; spikelets 8- to 40-flowered, 5-15 mm. long, slightly tapering; lemmas 2-2.8 mm. long, membranous, suborbicular, with conspicuous lateral veins and rounded apex, falling individually from the intact rachilla, the keel scabrous and with a few glands toward the apex. *E. megastachya* (Koel.) Link. Frequent weed in the Trans-Pecos and Plains Country, infrequent e. to n.-cen. Tex. and Rio Grande Plains, rare in s.e. Tex., spring-fall; nearly throughout the warmer parts of the world, introd. from the Old World.

5. *Eragrostis poaeoides* Beauv. Resembling *E. Barrelieri* but the lemmas with a few glands as in *E. cilianensis* (use strong lens). *E. minor* Host. Reported to occur in Tex.; if present then vary rare; a Euras. weed sparingly adv. in temp. N. A.

6. *Eragrostis Barrelieri* Daveau. Tufted annual; culms 7-50 cm. long, mostly erect, somewhat geniculate basally, nearly simple, usually with a yellowish glandular band shortly below each node; sheaths mostly shorter than their internodes, not glandular, pilose at the summit; blades short, 2-5 mm. broad, flat or (upon drying) involute; panicle 2-15 cm. long, 1-6 cm. broad, open, with a few stiff slightly ascending branches in the lower part, these bearing the pedicels that are 0.5-4 mm. long and each often with a yellow glandular band around it or on one side near the middle; spikelets 4-18 mm. long, 6- to 30-flowered, linear, ascending-divaricate; lemmas 1.8-2.4 mm. long, blunt (emarginate usually), often darkly pigmented, falling individually from the intact rachilla, the keel scabrous but never glandular. Abundant especially along roads and other disturbed areas, Plains Country, Trans-Pecos and Rio Grande Plains, infrequent e. to n.-cen. Tex., spring-fall; Kan. to Calif. and s. into Mex., introd. from s. Eur.

7. *Eragrostis Swallenii* Hitchc. SWALLEN'S LOVEGRASS. Tufted perennial; culms 2-6 dm. long, often diffuse and spreading, rarely erect, often with an incomplete yellow glandular annulus shortly below each node; leaves mostly crowded toward the base; sheaths nearly glabrous or with a few hairs at the corners; blades mostly quickly becoming involute, diverging at an angle from the sheaths, arcuate, firm; panicle 1-2 dm. long, almost as broad, with a few remote rather stiffly spreading branches (glabrous in the axils) bearing some slightly spreading stiff secondary branches that in turn bear the flexuous pedicels (each of which is 3-10 mm. long and bears near the middle a minute annular gland); spikelets mostly linear, 5-23 mm. long, 6- to 38-flowered, mostly stramineous; lemmas ovate, subacute, 1.8-2.3 mm. long, falling individually from the intact rachilla. Frequent in sandy prairies, coastal parts of Rio Grande Plains (Brooks, Kenedy and Kleberg cos.), summer-fall; endemic.

8. *Eragrostis neomexicana* Vasey. Loosely tufted annual; culms 25-100 cm. long, mostly diffuse and spreading, sparingly branched and geniculate in the lower part, often with a ring of yellow glands shortly below the nodes; sheaths sparingly papillose-pilose or glabrous and often with rows of minute glandular depressions on the keel and near the nerves; blades 2-10 mm. broad, mostly flat; panicle 9-40 cm. long, ascending or more often inclined or at least nodding, with numerous ascending branches that in turn bear the secondary branches which in turn bear the pedicellary ones that are flexuous, mostly appressed (rarely slightly spreading) and 3-10 mm. long; spikelets mostly appressed or nearly so, slightly tapered, plumbeous, 4-10 mm. long, mostly 6- to 16-flowered; lemma

ovate, blunt, plumbeous, the lower ones 1.6-2.5 mm. long, falling individually from the intact rachilla, the lower ones falling first. Frequent on roadsides and mt. slopes in the Trans-Pecos, summer-fall; Colo. to Ariz. and Calif. s. to cen. Mex. (adv. in cen. U.S.).

This species, in Texas, intergrades completely with *E. pectinacea* which has generally lesser stature, narrower leaves and spikelets, and shorter pedicels and panicle branches. In *E. pectinacea*, glandular sheaths are rare, whereas they are common in *E. neomexicana*. *E. neomexicana* also passes freely into *E. mexicana*, which is distinguished mostly by the more divaricate pedicels and lesser stature.

9. *Eragrostis pectinacea* (Michx.) Nees. Loosely tufted diffuse annual; culms numerous, 15-60 cm. long, ascending or usually spreading and geniculate in the lower part where also sparingly branched; sheaths usually folded, softly keeled, pilose at the corners; blades 2-5 mm. broad, mostly flat; panicles ascending or often nodding or even altogether inclined, obovoid, usually open and diffuse when mature, 5-40 cm. long, with numerous ascending branches bearing along the distal two-thirds of their length the appressed flexuous pedicellary branchlets (1-5 mm. long) or in larger specimens the lower main branches with ascending secondary branchlets that in turn bear the appressed pedicellary branchlets; spikelets mostly appressed or nearly so, slightly tapered, plumbeous, 3-10 mm. long; lemmas 1.5-2 mm. long, blunt, all plumbeous, eventually falling from the intact rachilla (the lowest lemma falling first). *E. diffusa* Buckl., *E. perplexa* L. H. Harvey. Frequent in a variety of habitats, most abundant in disturbed loamy soil near roads, fields and streams, in all regions of the state, spring-fall; essentially throughout the U.S. and s. into Mex.

This species tends to be more robust in the western and southern parts of the state (*E. diffusa*) and intergrades in the Trans-Pecos with *E. neomexicana* (which has longer pedicels) and elsewhere with *E. arida* (which has longer, divaricate pedicels).

10. *Eragrostis arida* Hitchc. Loosely-tufted annual; culms 2-4 dm. long, mostly spreading, rarely branched and often slightly geniculate in the lower part; sheaths not glandular, pilose on the corners; blades 2-5 mm. broad, mostly flat; panicle 1-2 dm. long, mostly ovoid, open, rather diffuse, with numerous spreading branches bearing numerous spreading branchlets that bear the stiffly spreading capillary pedicels (3-7 mm. long); spikelets usually somewhat tapered, stramineous, 5-10 mm. long, 8- to 15-flowered; lemmas ovate, obtuse, the lower ones 1.5-2 mm. long, falling individually from the intact rachilla, the lower ones first. Infrequent in Trans-Pecos, Plains Country and w. part of Edwards Plateau, summer; Tex. to Calif., s. to Son., Dgo. and Nay.

This species passes into *E. pectinacea*. It is not too definitely separable from *E. tephrosanthos* of southern Texas.

11. *Eragrostis tephrosanthos* Schult. Tufted annual; culms 5-60 cm. long, ascending, sparingly branched and markedly geniculate in the lower part; sheaths not glandular, pilose at the corners; blades 2-4 mm. broad, mostly flat; panicle 1-2 dm. long, mostly ovoid, open, rather diffuse, with numerous spreading branches bearing spreading branchlets that bear the slightly spreading pedicels (3-7 mm. long); spikelets slightly tapered, stramineous to dark-plumbeous, 3-10 mm. long, 6- to 14-flowered; lemmas ovate, obtuse, the lower ones 1.5-2 mm. long, falling individually from the intact rachilla, the lower ones first. Infrequent in Rio Grande Plains and rare in s. part of n.-cen. Tex., summer-fall; Gulf States s. through trop. Am.

This is not too well separated from *E. arida* from farther inland.

12. *Eragrostis mexicana* (Hornem.) Link. Weakly tufted annual; culms 15-75 cm. long, erect or ascending, slender; sheaths not glandular, pilose at the corners; blades 3-6 mm. broad, flat; panicle 5-30 cm. long, ovoid, open and diffuse, with numerous spreading branches bearing spreading branchlets that bear the spreading pedicels (4-15 mm. long); spikelets markedly tapering, mostly purplish-green to stramineous-green, 4-9 mm. long, about 2 mm. broad, 6- to 10-flowered; lemmas ovate, obtuse, the lower ones 2-2.5 mm. long, falling individually from the intact rachilla, the lowest first. Infrequent to rare in the Trans-Pecos, summer-fall; Tex. to Calif. and s. to C. A.; Venez.; Braz.

13. *Eragrostis capillaris* (L.) Nees. LACEGRASS. Loosely tufted annual; culms 2-5 dm. long, numerous, ascending, moderately branched from nodes crowded in the lower fourth of the plant; sheaths keeled, mostly short and spreading from the contained branches (exposing the conspicuously discolored nodes), usually pilose along the

margins and at the corners; blades strictly ascending into and around the panicle, elongate, 1-3 mm. broad, mostly flat; panicle about two thirds or more as long as the plant (the lower part usually included in the upper sheath), obovoid, with numerous approximate somewhat ascending capillary-flexuous branches which in turn bear the capillary-flexuous pedicels (4-12 mm. long); spikelets 2- to 4-flowered; lemmas 1-1.5 mm. long, eventually falling individually. Rare weed, n.-cen. Tex. (Tarrant Co.), summer; e. U.S. w. to Wisc., Ia., Kan., Okla. and Tex.

14. *Eragrostis spicata* Vasey. Coarse bunchgrass; tufts as much as 6 dm. thick basally; culms terete, 5-10 dm. long, 2-3 mm. thick, stiffly erect; ligule a short fringed scale; blades 3-7 mm. broad basally but involute most of the length, ascending; panicles dense, narrow, spikelike, terete, 15-35 cm. long, 4-5 mm. thick, stiffly erect, the lower part usually included in the upper sheath, actually with numerous extremely short few-flowered branchlets tightly appressed to the main axis; spikelets laterally compressed, glabrous, with 2 or 3 perfect flowers and another terminal one in which the genitalia abort; rachilla eventually abscising above the glumes and between the florets (this abscission beginning in the uppermost spikelets of the panicle and gradually proceeding to lower and lower levels); lemmas 1.3-1.7 mm. thick, membranous except for the veins, perfectly glabrous. Infrequent or locally abundant, Rio Grande Plains, spring-fall; Tex.; Tam.; Baja Calif.; Parag.; Arg.

15. *Eragrostis hirsuta* (Michx.) Nees. Tightly tufted perennial; culms 4-10 dm. long, erect, unbranched; sheaths much longer than their internodes, shortly ascending-pilose in the upper part and long erect-pilose at the apex dorsally, or rarely nearly glabrous; blades elongate-arcuate, the upper ones nearly surpassing the panicle, folded or eventually involute, 5-10 mm. broad when flattened; panicle 2-6 dm. long, 8-30 cm. broad, open and diffuse, of numerous usually slightly to markedly ascending branches bearing several secondary branches (these often deflexed) which in turn bear the long capillary spreading pedicels (8-18 mm. long); spikelets 2-4 mm. long, markedly tapered, (1- or) 2- to 4-flowered; lemmas 1.7-2.2 mm. long, ovate, blunt, with obscure lateral nerves, falling individually from the intact rachilla. Frequent in open sandy woods, e. and s.e. Tex., s.w. to San Patricio Co., summer-fall; Coastal States, Me. to Tex. and inland to Tenn., Ark. and Okla.; Br. Hond.

Some Texas specimens in which the sheaths are relatively short and crowded basally have been called *E. trichocolea* Hack. & Arech.; these are apparently plants showing intergradation to *E. lugens*.

16. *Eragrostis lugens* Nees. Tightly tufted perennial (occasionally simulating the annual habit); culms 12-80 cm. long, erect or ascending or spreading, occasionally geniculate, unbranched; leaves often crowded toward the lower part; sheaths about as long as their internodes, either glabrous or pilose near the apex; blades short or elongate, flat or usually folded or involute; panicle 1-3 dm. long, nearly as broad, erect, open, diffuse, with numerous spreading or somewhat ascending branches (the lower axils pilose), bearing spreading branchlets that in turn bear deflexed pedicels 4-13 mm. long; spikelets 3-8 mm. long, linear to strongly tapering, mostly 3- to 9-flowered, variously colored but usually slightly purplish; lemmas 1.3-2 mm. long, ovate, with only an extremely narrow distal hyaline margin or none at all, with very obscure lateral nerves, ovate, blunt, falling individually from the intact rachilla. *E. intermedia* Hitchc. Frequent nearly throughout the state (absent in Plains Country), most abundant in Rio Grande Plains, spring-fall; Fla., Mo. to La. and w. to Ariz., s. to C. A. and S. A.

This is an exceedingly variable species, grading in east Texas into *E. hirsuta* (specimens have been called *E. trichocolea*), and on a much broader scale intergrading in the Edwards Plateau, Rio Grande Plains and Trans-Pecos Texas, and Mexico into *E. erosa*, as represented by the frequent strong perennial plant with long-sheathed leaves not crowded below, larger stature, large panicle with nearly glabrous axils and ascending branches, several-flowered spikelets, longer, hyaline-tipped, golden-stramineous lemmas. These intermediate plants are usually called *E. intermedia* Hitchc. Arbitrarily those plants with lemmas more than 2 mm. long are placed in *E. erosa*, although the combination of characters is completely scrambled in certain Trans-Pecos populations.

17. *Eragrostis erosa* Scribn. Strongly tufted perennial; culms 5-9 dm. long, erect, unbranched; sheaths nearly glabrous or usually pilose at the summit; blades mostly

ascending, usually closely-involute; panicles 15-40 cm. long, 5-13 cm. broad, erect, open, diffuse, with numerous mostly ascending branches (these glabrous in the axils) with each bearing several secondary branches diverging at a low angle and in turn bearing the pedicels (also diverging at a low angle and 3-9 mm. long), capillary and flexuous; spikelets 3- to 12-flowered, 3-10 mm. long, mostly linear or slightly tapering, often appressed to the branchlets or nearly so; lemmas ovate, subacute, with broad hyaline distal margins, golden-stramineous or golden-plumbeous, 2-3 mm. long, with obscure lateral nerves, falling individually from the intact rachis, the lower first. Infrequent in mts. of the Trans-Pecos and rare e. to s.w. part of Edwards Plateau, summer-fall; w. Tex., N.M., Chih. and Coah. Intergrading with *E. lugens* (see remarks under that species).

18. *Eragrostis Palmeri* Wats. Closely tufted perennial; culms slender, erect and unbranched, 6-10 dm. long; sheaths minutely pilose toward the summit, glabrate, longer than the internodes; blades ascending, eventually mostly closely involute; panicles 10-35 cm. long, only 3-5 cm. thick, rather open, with numerous sharply ascending branches (these glabrous or nearly so in the axils), each in turn bearing several secondary branchlets each with a few capillary flexuous pedicels (2-5 mm. long) either divaricate or nearly appressed; spikelets 3- to 6- (to 8-) flowered, slightly tapered, mostly golden-green or bronze-stramineous; lemmas 1.8-2.9 mm. long, with obscure lateral nerves when mature, with narrow hyaline margins, narrowly ovate, subacute, falling individually from the intact rachilla. Rare, Rio Grande Plains (near Harlingen, Cameron Co.), fall; Tex., Coah., N. L. and Tam.

19. *Eragrostis trichodes* (Nutt.) Wood. Tufted perennial; culms 5-13 dm. long, erect or ascending, unbranched; sheaths pilose at the corners and in some populations (especially in e. Tex.) on the upper part as in *E. hirsuta*; blades elongate-arcuate, often quickly involute; panicles 25-70 cm. long, 6-25 cm. broad, often weak and nodding, open, diffuse, with numerous spreading-ascending branches (glabrous in the axils) each bearing several diverging usually weak flexuous secondary branchlets that in turn bear the capillary pedicels (3-10 mm. long); spikelets 5-20 mm. long, linear or oblong, (1- to) 3- to 26-flowered, usually bronzy or purplish, occasionally stramineous; lemmas narrowly ovate, acute, the lowest ones 2.4-3.8 mm. long, with prominent lateral nerves, falling individually from the intact rachilla, the lowest ones first. Incl. var. *pilifera* (Scheele) Fern., *E. pilifera* Scheele. Infrequent in open woods and brush, usually in somewhat sandy soil, e. and n.-cen. Tex., Plains Country, n. parts of Rio Grande Plains and rare in parts of Edwards Plateau, summer-fall; Ill. to Colo. and s. to Tex.

20. *Eragrostis curvula* (Schrad.) Nees. WEEPING LOVEGRASS. Tufted perennial; culms 6-12 dm. long, erect, simple; sheaths keeled and densely to sparsely hispidulous basally (use lens); blades ascending, involute, attenuate to a fine point, arcuate-spreading; panicles 15-40 cm. long, 5-10 cm. broad, open, with numerous ascending branches (the lower ones pilose in the axils), bearing numerous ascending secondary branchlets that bear the sessile spikelets; spikelets appressed, 8-10 mm. long, 7- to 11-flowered, plumbeous; lemmas about 2.5 mm. long, falling individually. Infrequent in Plains Country, summer; nat. of S. Afr., introd. and now spontaneous in s. parts of U.S.

21. *Eragrostis Elliottii* Wats. Tufted perennial (not knotty basally); culms 4-8 dm. long, erect; ligule a minute lacerate-fringed scale; sheaths long, shortly pilose at the corners, otherwise glabrous; blades rolled up marginally, stiffly ascending to a very slender tip; panicles erect, 25-50 cm. long, nearly as broad as long, very diffuse, with numerous long stiff antrorsely scabrous capillary branches that in turn bear long straight mostly deflexed capillary pedicellary branchlets 1-3 cm. long (these bearing spikelets only at the end, not along the length); part of the panicle often included in the uppermost sheath; spikelets strongly laterally compressed, remote, linear, 5-12 mm. long, mostly 8- to 15-flowered, about 1.5 mm. broad; lemmas ovate, about 1.5 mm. long, not falling away individually but the rachilla of the spikelet eventually breaking up by mechanical action. Rare in wet sandy open woods, extreme s.e. Tex. near the coast, summer-fall; Coastal States, from N.C. to Tex.; W. I.; Mex.; Br. Hond.

22. *Eragrostis refracta* (Muhl.) Scribn. Tufted perennial (not knotty basally); culms 4-8 dm. long, erect; ligule a minute fringed scale; sheaths short; blades elongate, mostly rather stiffly ascending to a fine point, glabrous or often densely pilose above; panicles

erect, 25-50 cm. long, nearly as broad as long, diffuse, with numerous long stiff antrorsely scabrous capillary branches that in turn bear elongate straight capillary mostly deflexed secondary branchlets, part of the panicle often included in the uppermost sheath; pedicels short, appressed, 1-3 mm. long; spikelets strongly laterally compressed, linear, 5-15 mm. long, about 2 mm. broad, the lateral ones nearly sessile on and appressed to the secondary branchlets, not quite or barely overlapping; lemmas ovate, acute, 1.7-2.2 mm. long, not falling individually but the rachilla of the spikelets eventually breaking from external mechanical forces. Infrequent in open sandy woods and along roadsides, e. and s.e. Tex., summer-fall; Coastal States, Del. to Tex.

23. *Eragrostis spectabilis* (Pursh) Steud. Loosely tufted perennial from hard knotty bases; culms 2-6 dm. long, erect; ligule a dense silky fringe; sheaths long, mostly densely pilose, rarely nearly glabrous; blades rolled up marginally or flat, mostly rather stiffly straight, ascending or slightly spreading; panicles erect, 15-40 cm. long, nearly as broad, diffuse, with numerous long stiff antrorsely scabrous branches that are pilose in the axils and in turn bear rather long stiff branches usually secundly reflexed from the lower side of the main branches, part of the panicle often included in the uppermost sheaths when submature and later breaking away and tumbling before the wind; spikelets strongly laterally compressed, numerous but not overlapping, the lateral ones on stiff pedicels 3-5 mm. long, usually reflexed slightly, linear, 3-10 mm. long, 1.5-2 mm. broad, 4- to 12-flowered; lemmas ovate, 1.4-2.1 mm. long, not falling away individually from the rachilla to liberate the grains; rachilla breaking irregularly under mechanical pressure during tumbling. Infrequent in open woods and prairies mostly in loose sandy soil, Plains Country, n.-cen. and e. Tex., in s. part of range grading into *E. Silveana*, summer-fall; e. U.S. w. to Minn., Neb., Colo. and n. Ariz.

24. *Eragrostis Silveana* Swall. Loosely tufted perennial from hard knotty bases; culms 2-6 dm. long, erect; ligule a dense silky fringe; sheaths long, glabrous to densely softly hirsute; blades rolled up from the margins or flat, mostly rather stiffly straight, ascending or spreading; panicles erect, 15-40 cm. long, about two thirds as broad, diffuse, with numerous long stiff somewhat viscid antrorsely scabrous branches that are often shortly pilose in the axils and in turn bear some short stiff branches usually secundly reflexed below the lower side of the main branches, part of the panicle usually included in the uppermost sheath when submature and later elongating and breaking away and tumbling before the wind; spikelets laterally compressed, numerous but not overlapping, the lateral ones on short capillary flexuous pedicels 1-3 mm. long, either appressed or usually reflexed slightly, linear, 2-6 mm. long, about 1 mm. broad, 4- to 12-flowered; lemmas ovate, 1.1-1.6 mm. long, often falling individually from the rachilla to liberate the grains and/or in many specimens the rachilla tending to break irregularly between the florets when the panicle is mature and tumbling. Frequent in loamy soil, s.e. Tex. and coastal parts of Rio Grande Plains, summer-fall; Tex. to Tam. and N. L.

Intergrading with *E. spectabilis* of the interior and rarely with *E. curtipedicellata*.

25. *Eragrostis curtipedicellata* Buckl. GUMMY LOVEGRASS. Tufted perennial from hard knotty bases; culms 7-60 cm. long, erect or ascending; ligule a dense silky fringe; sheaths silky at the corner and in some specimens villous all over; blades mostly involute (at least when dry), stiffly ascending; panicles erect, 3-25 cm. long, nearly as broad, with numerous long stiff somewhat viscid antrorsely scabrous branches that are eventually widely spreading and in turn bear some short stiff branches usually secundly spreading from the lower side of the main branch, at first the lower part of the panicle partly included in uppermost sheath, eventually all or nearly all exerted, breaking away and tumbling before the wind; spikelets mostly close enough to overlap, the lateral ones nearly sessile and appressed along the branches (but absent in the immediate vicinity of the axils), linear, 6- to 20-flowered; rachilla breaking irregularly between the florets under mechanical pressure, not regularly abscising, the grains usually liberated by the spreading of the lemma and palea; lemmas elongate-ovate, 1.5-2 mm. long. Prairies and open woods on sandy loam in all regions of the state but abundant only in the lower Plains Country and Rio Grande Plains, spring-fall; s.e. Colo. and Kan. s. to Coah. and N. L.

Apparently some populations show some gradation toward *E. spectabilis* and/or *E. Silveana*.

26. *Eragrostis sessilispica* Buckl. Densely tufted perennial from hard knotty bases; culms 2-7 dm. long, at first erect, gradually arching over; ligule a dense fringe; sheaths silky at the corners; blades mostly involute (at least when dry); panicles arched, 1-5 dm. long, with remote long rigidly divaricate few-flowered branches pilose in the lower axils, at length the whole breaking away and tumbling before the wind; spikelets terminal on (also sessile and appressed in axils of) and sessile and remote and appressed along the branches, linear, 6- to 12-flowered, 6-15 mm. long; rachilla abscising tardily if at all (in some specimens remaining intact) just above each node so that each internode-fragment adheres to the floret just above it; lemmas lanceolate, acute, 3-3.5 mm. long, drying chartaceous; palea nearly as long as the lemma, also chartaceous. Frequent in prairies on sandy loam, Plains Country and Rio Grande Plains, less frequent e. to s. parts of s.e. and n.-cen. Tex. and n. part of Edwards Plateau, spring-fall; Kan. to Tam. and w. to N.M. and Chih.

27. *Eragrostis oxylepis* (Torr.) Torr. RED LOVEGRASS. Loosely tufted perennial; culms 1-7 dm. long, often diffuse or decumbent below, geniculate, terminally ascending; ligule a short fringed scale; sheaths pilose at the corners; blades mostly 2-5 mm. broad, at first flat, later involute, rather firm and stiff, spreading or erect; panicles mostly well-exserted, erect or often weak and nodding, 3-37 cm. long, with few (or no) erect or spreading branches, the terminal axis and each branch toward the tip interrupted-spike-like with glomerules of nearly sessile spikelets (rarely a few spikelets scattered singly on the branches); spikelets generally glabrous, 10- to 50-flowered, 5-25 mm. long; lemmas 2.3-5.5 mm. long, those about a third the distance from the end of the spikelet longest, lanceolate, acuminate to acute, not falling individually from the rachilla; rachilla eventually abscising at the lower part of each node. Incl. var. *Beyrichii* (J. G. Sm.) Shinnery, *E. Beyrichii* J. G. Sm. Frequent in prairies and openings in woods and brush on sandy soils throughout Tex. (except the Trans-Pecos), somewhat weedy, spring-fall; s. Calif.; Colo. to Tenn. and s. to N.M. and the Gulf States of the U.S. and Mex.

28. *Eragrostis glomerata* (Walt.) L. H. Dewey. Annual; culms 2-10 dm. long, erect, sparingly branched and geniculate in the lower third; panicles erect or slightly nodding, 5-50 cm. long, only 1-4 cm. broad, with numerous long main branches and these in turn further branched, all the branches strictly ascending; spikelets nearly sessile, 2-3 mm. long, 6- to 8-flowered; lemmas about 1 mm. long; palea glabrous or merely scabrous on the keels; rachilla eventually abscising above the glumes and between the florets. Rare in roadside ditches, e. Tex., summer-fall; widespread in warmer parts of the New World n. to S.C. and the Gulf States; also waifed n. to Mo.

29. *Eragrostis ciliaris* (L.) R. Br. Tufted annual; culms few, slender, 15-35 cm. long; panicles interrupted-spike-like, 3-12 cm. long, 3-10 mm. thick, erect; spikelets sessile, 2-4 mm. long, 6- to 12-flowered; lemmas about 1 mm. long; keels of palea long-ciliate; rachilla eventually abscising above the glumes and between the florets. Rare, waifed in gardens and along roads, e. Tex., fall; widespread in the warmer parts of the world, in the New World n. to S.C. and the Gulf States.

30. *Eragrostis amabilis* (L.) Nees. Tufted annual; culms few; slender, 15-45 cm. long; panicles 4-15 cm. long, 15-180 mm. broad, diffuse, oblong, with numerous slender spreading branches in turn bearing branched capillary flexuous branchlets; ultimate pedicels 2-6 mm. long; spikelets 1-2 mm. long, about as broad, 4- to 8-flowered; lemmas about 1 mm. long; keels of palea long-ciliate; rachilla eventually abscising above the glumes and between the florets. Rare waifs near the coast and in gardens, not persistent, spring-fall; nat. of Old World, widely adv. in warmer parts of the New World, n. to the Gulf States.

31. *Eragrostis Lehmanniana* Nees. Tufted perennial; culms strongly geniculate basally and frequently rooting at the lower nodes, sparingly branched, distally ascending; sheaths much shorter than the internodes, pilose at the corners; blades only 2-5 cm. long, mostly loosely involute; panicles open, obovoid, 8-15 cm. long, 3-7 cm. broad, with few ascending branches (glabrous in the axils) bearing few short ascending branchlets that bear pedicels only 0.5-1 mm. long; spikelets linear, 3-12 mm. long, about 1 mm. broad, 6- to 12-flowered; rachilla at maturity abscising at the lower part of each node and eventually even below the small pointed glumes; lemmas about 1 mm. long, dark-plumbeous, blunt, falling individually from the node usually at about the same time the rachilla breaks;

paleas slightly surpassing the lemmas. Rare near highways, Trans-Pecos and Rio Grande Plains, summer; nat. of Afr., introd. and spontaneous in Ariz., Okla. and Tex.

80. REDFIELDIA VASEY

A monotypic genus in the United States.

1. *Redfieldia flexuosa* (Thurb.) Vasey. BLOWOUT GRASS. Perennial from elongate slender rhizomes; aerial culms solitary and simple, 5-10 dm. long, ascending; ligule a short fringed scale; blades firm, loosely involute; panicle terminal, erect, narrowly conical, not much-surpassing the leaves, very diffuse, 20-45 cm. long, the ultimate branchlets elongate, capillary, divaricate and flexuous; spikelets 2- or 3- (rarely to 4-) flowered, 5-6 mm. long, all the florets perfect; glumes lanceolate, about half as long as the spikelet; rachilla abscising above the glumes and at the upper part of each node (the glabrous segment of the rachilla thus extending below each detached floret); lemmas lanceolate, with a densely silky-pilose callus and 3 glabrous nerves, the lateral nerves attaining the distal margin very near the apex and often minutely excurrent therefrom; palea nearly as long as lemma. Rare in loose sandy soils, Plains Country (Lipscomb Co.), late summer; N.D., s. to Tex. and w. Ut. and Ariz.

The species is of great economic importance as a sand-binder in the states north and west of Texas.

81. TRIDENS R. & S. TRIDENS

Tufted or rarely shortly rhizomatous perennials; culms erect (or in one species scandent); ligule a white fringe or short fringed scale; blades mostly flat, elongate; panicles terminal, diffuse or spikelike; spikelets not much laterally compressed, several-flowered, all the florets perfect or the pistil of the uppermost usually abortive; rachilla abscising just below the lemma nodes; lemmas broad, mostly apically obtuse, emarginate and/or very shallowly cleft, 3-nerved (the midnerve and/or the laterals in some species minutely excurrent), usually pubescent on the lower half to two-thirds of the nerves (glabrous in *T. albescens*); paleas either glabrous or short silky-hairy on the nerves and dorsally.

A North American genus of about a dozen species, in some works enlarged to include the related genus *Erioneuron*.

1. Glumes as long as the spikelets or nearly so7. *T. strictus*.
1. Glumes about equaling the lowest lemma (2)
- 2(1). Lemmas essentially glabrous (hair, if present, only at the basal callus of the lemma); panicles spikelike, 8-23 cm. long9. *T. albescens*.
2. Lemmas pubescent, at least at the base of the lateral nerves (3)
- 3(2). Lemmas about 2 mm. long; culms near the base of the plant only about 1 mm. thick8. *T. eragrostoides*.
3. Lemmas longer; culms thicker (4)
- 4(3). Lateral nerves of most lemmas stopping well short of the distal margin, never excurrent; palea silky-pubescent on the keels and often very short-pubescent elsewhere (5)
4. Lateral nerves reaching the distal margins and mostly very shortly excurrent; paleas essentially glabrous (6)
- 5(4). Panicle-branches long, spreading (see also *T. muticus* f. *effusus*)6. *T. Buckleyanus*.
5. Panicle-branches short, strictly erect and appressed (except in f. *effusus*)5. *T. muticus*.
- 6(4). Panicle thickly spikelike, 5-10 cm. long; lemmas nearly as broad as long4. *T. congestus*.
6. Panicle more diffuse and larger (7)

- 7(6). Plants 1-6 dm. tall at anthesis; blades mostly 1-3 mm. broad
3. *T. texanus*.
7. Plants 6-16 dm. tall at anthesis; blades mostly more than 3 mm. broad (8)
- 8(7). Subterminal spikelets on pedicels about 1 mm. long, erect and appressed to the
 stiffly ascending panicle branches, nearly as broad as long
2. *T. ambiguus*.
8. Subterminal spikelets (most of them) on pedicels more than 1 mm. long, mostly
 drooping from the usually spreading panicle branches, longer than broad
1. *T. flavus*.

1. *Tridens flavus* (L.) Hitchc. PURPLETOP. Tufted and with very short rhizomes developed in sandy soil; culms 6-16 dm. long, erect; basal sheaths keeled; panicle large and diffuse, often appearing purplish, the branches usually spreading and terminally drooping, most pedicels more than 2 mm. long; spikelets mostly diverging or drooping from the branches; lemmas 4-5 mm. long, the 3 nerves usually minutely excurrent and pubescent in the lower two-thirds the length. Abundant in sandy loam soils, open forests, prairies and roadsides, e., s.e. and n.-cen. Tex. and n. Plains Country, abundant, late summer-fall; e. U.S. w. to Neb., Kan., Okla. and Tex.

In east and north-central Texas some of the populations show stiffer panicle-branches which at the base have larger, hairier buttresses, and the spikelets are on longer, more noticeably divergent pedicels. These are var. *Chapmanii* (Small) Shinnery [*T. Chapmanii* (Small) Chase].

2. *Tridens ambiguus* (Ell.) Schult. Tufted; culms 6-10 dm. long, erect; basal sheaths keeled; panicle broadly to narrowly obovoid, 8-15 cm. long, the branches stiffly ascending; most pedicels (of lateral spikelets) about 1 mm. long; spikelets erect, appressed to the branches; lemmas 3-4 mm. long, the 3 nerves usually minutely excurrent and pubescent in the lower two-thirds the length, or the lateral nerves scarcely excurrent in many specimens. Infrequent to rare, wet pinelands, extreme e. Tex., late summer-fall; Coastal States, S.C. to Tex.

3. *Tridens texanus* (Wats.) Nash. Tufts 1-6 dm. tall at anthesis; sheaths of lowest leaves inconspicuously keeled; panicle 5-15 cm. long, often appearing purplish, few-flowered, the branches spreading and flexuous; pedicels of subterminal spikelets 1-5 mm. long; lemmas 4-4.5 mm. long, the 3 nerves usually minutely excurrent and pubescent in the lower half of the length. Brush, Rio Grande Plains and Edwards Plateau, abundant, late spring-fall; Tex. to S.L.P. and Coah.

4. *Tridens congestus* (L. H. Dewey) Nash. Tufts very robust basally (very short rhizomes sometimes present); culms 30-65 cm. tall, often geniculate, stout; sheaths apically round-keeled; blades usually flat, 2-4 mm. broad, with involute tips (the rest involute on drying); panicle long-exserted, thickly spikelike, 5-10 cm. long, 15-25 mm. thick, often pinkish; lemmas 3-4 mm. long, nearly as broad as long, the 2 lateral nerves and midnerve reaching the distal margin and in some lemmas minutely excurrent and pubescent on the lower third of their length. Infrequent in low-lying prairies of black clay loam, s.e. and n.-cen. Tex., spring-fall; endemic.

5. *Tridens muticus* (Torr.) Nash. SLIM TRIDENS. Densely tufted; culms 15-80 cm. long, erect, slender; sheaths pubescent to glabrous, not keeled, often somewhat glaucous; blades mostly involute, 1-3 mm. broad when flat; panicles interrupted-spikelike, 7-25 cm. long, 3-10 mm. thick, very slightly pinkish, usually with some short appressed branches near the base; lemmas about 5 mm. long, 3-nerved, the lateral nerves seeming to end well within the distal margin, all 3 nerves hairy on the lower two-thirds the length; palea silky-pubescent on the keels and the lower part of the internerves. Incl. var. *elongatus* (Buckl.) Shinnery, *T. elongatus* (Buckl.) Nash. Abundant on dry exposed flats and hills in the Trans-Pecos, Plains Country, Edwards Plateau, Rio Grande Plains, infrequent e. to n.-cen. and s.e. Tex.; Ark. and Tex., w. to s.e. Calif., n. to Nev., Ut. and Colo.; n. Mex.

On the Edwards Plateau and in north-central Texas occur populations in which the lower appressed branches on the panicle are more elongate, the glumes somewhat more pointed, the lateral nerves of the second glume somewhat more conspicuous and the panicles longer on the average; these are the var. *elongatus*. In a local area 20-21 miles

south of Marathon, Brewster Co., in the Trans-Pecos, occur populations in which the panicle-branches are widely spreading; these are the f. *effusus* M. C. Johnst.

6. *Tridens Buckleyanus* (L. H. Dewey) Nash. Culms 4-8 dm. long, erect; sheaths not keeled; blades 1-3 mm. broad, flat or usually dried-involute; panicle 1-2 dm. long, the branches few, remote, the upper ones erect and appressed, the lower ones 5-10 cm. long and spreading, few-flowered, some of them again branched; lemmas 4-5 mm. long, 3-nerved, the lateral nerves appearing to end well within the distal margin, all 3 nerves pubescent on the lower two-thirds the length; palea silky-pubescent on the lower half of the 2 keels. Rare on shaded banks, s.e. margin of Edwards Plateau (Bexar, Comal, Travis and Hays cos.), late summer-fall; endemic.

7. *Tridens strictus* (Nutt.) Nash. Culms 8-17 dm. long, erect; sheaths not keeled; blades 3-8 mm. broad; panicle spike-like, 1-3 dm. long, 9-15 mm. thick, with a few short appressed branches near the base; glumes as long as to longer than the rest of the spikelet, viscid, acuminate to a fine point, conspicuous in the panicle; lemmas about 3 mm. long, the lateral nerves reaching the distal margin and in some specimens excurrent, all 3 nerves hairy in the distal two-thirds the length. Infrequent in open forests on sandy soil, e., s.e. and n.-cen. Tex., summer-fall; s.e. U.S. n. to N.C., Tenn., Ill. and Mo., w. to Kan., Okla. and Tex.

8. *Tridens eragrostoides* (Vasey & Scribn.) Nash. Culms densely tufted but very slender and usually scandent in bushes, 1-10 dm. long; lower sheaths keeled; blades 1-4 mm. broad, usually flat; panicle 5-30 cm. long, diffuse, few-branched and usually few-flowered, the branches capillary, flexuous; spikelets darkly-pigmented, often pendulous or nearly so on their pedicels; lemmas about 2 mm. long, 3-nerved, the lateral nerves reaching the margin but rarely microscopically excurrent, all 3 nerves shortly pubescent on the lower half. Frequent in brush, Rio Grande Plains and infrequent in s.e. Tex. and s. part of n.-cen. Tex., s. Edwards Plateau and the extreme e. Trans-Pecos, spring-fall; Ariz., Fla., Cuba, Tex., Tam., N.L. and Coah.

9. *Tridens albescens* (Vasey) Woot. & Standl. WHITE TRIDENS. Tufts robust; culms 3-10 dm. long, erect; basal sheaths not or obscurely keeled; panicle spike-like, 8-25 cm. long, 5-13 mm. broad, very pale in color; lemmas about 3 mm. long, 3-nerved, the nerves ending well within the distal margin and glabrous (hair, if present, confined to the basal callus of the lemma). Abundant in roadside ditches, streamsides, overflows, draws and low-lying prairies throughout, summer-fall; Okla. and Colo., s. to Tam., N.L. and Coah.

82. BLEPHARIDACHNE HACK.

A genus of two species in western North America.

1. *Blepharidachne Bigelovii* (Wats.) Hack. Densely tufted perennial; culms bushy-branched, arcuate-ascending, 6-18 cm. long; ligule a minute white fringe; leaves crowded; blades 8-20 mm. long, closely involute, arcuate, rigid, aculeate-mucronate, superficially densely canescent with microscopic whitish subpaleiform hairs; panicles narrowly oblong, 2-3 cm. long, the lower partly included in the uppermost sheaths; spikelets 5 to 10 per panicle, 5-7 mm. long, scarcely laterally compressed, uniformly 4-flowered, the lower 2 lemmas and paleas empty, the third floret perfect, the fourth a vestigial rudiment; rachilla with zone of abscission just above the glumes but not at the other nodes; glumes cymbiform, nearly as long as the spikelet, membranous, with scabrous midveins; lemmas 3-nerved (each nerve excurrent as a short awn) and cleft about half the length along the side of the midvein, densely pubescent especially along the lateral nerves and the central lobe. On interbedded yellow marl and limestone desert flats and low hills in the Trans-Pecos, restricted but locally abundant, spring-summer; also Coah.

83. ERIONEURON NASH

Densely tufted low perennials, rarely stoloniferous; culms numerous, erect, unbranched; leaves mostly crowded at the base, the sheaths and blades folded and keeled (or the latter involute); blades short, falcate and with white-cartilaginous margins; panicles

short, compact, stramineous; pedicels very short; spikelets 4- to 12-flowered, laterally compressed, nearly all the flowers fertile; rachilla abscising above the glumes and at each node; lemmas keeled, 3-nerved, the midnerve hairy basally and excurrent as a long or short awn, the lateral nerves with long hairs on the lower part and shorter hairs above; paleas with long hairs on the lower part of the adaxial surface and near the lateral margins and ciliate on the 2 nerves.

A very small American genus, formerly included in *Tridens*.

1. Panicles included in and surpassed by a fascicle of leaves at the top of a naked culm; stolons abundant 1. *E. pulchellum*.
1. Panicles long-exserted; stolons rare (2)
- 2(1). Lemmas entire or merely minutely retuse; flowering culms scapose 3. *E. pilosum*.
2. Lemmas shallowly 3-lobed, the central lobe subulate and awned; flowering culms with a few leaves 2. *E. grandiflorum*.

1. *Erioneuron pulchellum* (H.B.K.) Tateoka. FLUFFGRASS. Strongly stoloniferous mat-formers, the tuft forming as floriferous fascicles at the ends of ascending stolons while gradually bending to the ground permitting rooting; leaves crowded, 1-5 cm. long, about 1 mm. broad, the blades folded or usually involute; panicle included in the fascicle of leaves; lemmas 3-lobed about half the total length. *Tridens pulchellus* (H.B.K.) Hitchc. Desert flats and hills, abundant in the Trans-Pecos and less frequent in w. Edwards Plateau, summer-fall; Tex. to Nev. and Calif., s.e. to Mexico City.

2. *Erioneuron grandiflorum* (Vasey) Tateoka. Culms 1-6 dm. long; most leaves crowded basally but a few scattered on the long flowering culm, 2-12 cm. long, 2-3 mm. broad, folded, with conspicuous cartilaginous margins; panicles elongate, usually conspicuously longer than broad, often 2 to 3 times as long; lemmas 3-lobed about a fourth the total length. *Tridens grandiflorus* (Vasey) Woot. & Standl., *T. Nealleyi* (Vasey) Woot. & Standl., *Erioneuron Nealleyi* (Vasey) Tateoka. Some plants (i.e., *E. Nealleyi*) seem intermediate between this species and *E. pilosum*. Infrequent in the Trans-Pecos, summer-fall; Ariz. to N.M., s. to Dgo. and Coah.

3. *Erioneuron pilosum* (Buckl.) Nash. Culms 1-3 dm. long; nearly all leaves basal, very short ones rare on the scapelike flowering culm, the lower ones 2-10 cm. long and about 2 mm. broad; lemmas merely acute at the apex or only microscopically notched on each side of the very short awn, not lobed. *Tridens pilosus* (Buckl.) Hitchc. Very abundant in the Trans-Pecos and Edwards Plateau, less so in Rio Grande Plains and n.-cen. Tex., rare in s. part of s.e. Tex., spring-fall; Kan. to Nev. s. to S.L.P.

84. MUNROA TORR.

FALSE BUFFALO GRASS

A small genus of dry regions of North America and South America.

1. *Munroa squarrosa* (Nutt.) Torr. Annual, forming mats as much as 1 m. across by means of stolons, the lower internodes long and horizontal with leafy flowering clusters at the more or less remote node; sheaths short and often purplish- or whitish-discolored; blades pale green, flat, stiff, pungent, only 1-3 cm. long, 1-3 mm. broad; fascicles of spikelets borne among the leaves, about 7 mm. long; spikelets in twos or threes along a short rachis, the lower 1 or 2 larger, 3- or 4-flowered, the group (reduced spike) enclosed in the broad sheaths of short leaves, usually about 3 in a fascicle, forming a cluster or head at the ends of the short branches; rachilla disarticulating above the glumes and between the florets; glumes of the lower 1 or 2 spikelets equal, 1-nerved, narrow, acute, a little shorter than the lemmas, those of the upper spikelet unequal, the first much shorter or obsolete; lemmas 3-nerved, with a tuft of hairs on the margin about the middle, those of the lower spikelet coriaceous, acuminate, the points spreading, the midnerve extended into a mucro, those of the upper spikelet membranous; palea narrow, enclosing the elliptic dorsally compressed grain. Infrequent in sandy and gravelly plains in the Trans-Pecos and Plains Country, summer-fall; N.D. and Mont. s. to Tex., Chih. and Ariz.

The leafy flowering tufts readily separate from the main part of the mat and are blown about, facilitating dissemination.

85. **TRIPLASIS BEAUV.**

A genus of two species mainly in eastern North America.

1. *Triplasis purpurea* (Walt.) Chapm. **PURPLE SANDGRASS.** Tufted annual; culms 4-10 dm. long, 0.6-2 mm. thick, numerous, spreading, multinoded and geniculate basally, terminally ascending, essentially simple; ligule a short white-fringed scale; sheaths shorter than the internodes (the lower ones often swollen and containing cleistogenes); blades mostly flat; aerial panicles partly or mostly included, flabellate, few-branched, the branches capillary, curviflexuous or straight; spikelets 7-11 mm. long, 3- or 4-flowered, usually purple; flowers perfect (or the pistil of the uppermost one abortive); rachilla abscising at the nodes; lemmas 3-nerved, deeply 3-parted (the middle lobe consisting merely of the excurrent awnlike midnerve), short, silky-pubescent on all 3 nerves; palea long silky-pubescent from the distal margin and the distal third of the length. Open areas of loose sand, Plains Country, n.-cen., e. and s.e. Tex., and Rio Grande Plains, late summer-fall; c. Can. and e. U.S. w. to Minn., Neb. and Colo.

86. **CALAMOVILFA HACK.**

A North American genus of about 4 species.

1. *Calamovilfa gigantea* (Nutt.) Scribn. & Merr. **BIG SANDREED.** Rhizomatous perennial; aerial culms erect, 9-22 dm. long, 4-12 mm. thick, leafy; ligule a ciliate fringe 1-2 mm. long; blades firm to subcoriaceous, 2-6 dm. long, 5-12 mm. broad toward the base where flat, tapering to an involute point; panicle 3-6 dm. long, diffuse, pyramidal, the branches spreading and naked toward the base; spikelets 1-flowered, somewhat laterally compressed, appressed to the branches; glumes firm, persistent, keeled, acute, the first 5-7 mm. long, the second 7-9 mm. long; zone of abscission between the second glume and the lemma; lemma about as long as second glume, glabrous but with a callus bearing a beard of white soft hairs 4-5 mm. long; palea about as long as lemma. Loose sand hills and active dunes, Plains Country and n.e. Trans-Pecos (Ward, Winkler and Crane cos.), abundant, summer-fall; Kan. to Ut., Tex. and Ariz.

87. **SPOROBOLUS R. BR. DROPSEED**

Perennials (except in 1 species); inflorescences paniculate, either open and diffuse or spiciform; spikelets 1-flowered, slightly laterally compressed, with membranous to scarious parts; peduncles with zone of abscission just below the glumes in *S. Tharpii*, *S. airoides* and *S. Wrightii*; rachilla with zone of abscission just above the glume node and below the lemma nodes in most species; palea often splitting at maturity; grain usually falling readily, often reddish, with a coat (ovary wall) that imbibes water, becoming loose and easily detached from the remainder of the grain.

A genus of about 150 species of the warmer regions of the world. Sand dropseed (*Sporobolus cryptandrus*) vies with *Cenchrus incertus* for the title of most abundant Texas grass species. By virtue of sheer abundance it has a small amount of economic value as a forage grass, though it is stemmy, fibrous and unpalatable in the extreme.

1. Mature panicles more than 9 cm. broad (2)

1. Mature panicles less than 9 cm. broad (7)

2(1). Lemma more than 4 mm. long 18. *S. Silveanus*.

2. Lemma less than 4 mm. long (3)

3(2). Sheaths sharply keeled 11. *S. Buckleyi*.

3. Sheaths not sharply keeled (4)

4(3). Spikelets so closely spaced in panicle that they mostly are in contact with adjacent spikelets (5)

4. Spikelets more remotely disposed so that they rarely touch each other (6)

- 5(4). First glume 0.5-1 mm. long; second glume 0.8-1.8 mm. long; lemma 1.2-2.1 mm. long 2. *S. Wrightii*.
5. First glume 1-2 mm. long; second glume 2-2.9 mm. long; lemma 2.3-3.5 mm. long 3. *S. Tharpaii*.
- 6(4). Ligule less than 1 mm. long; pedicellary branchlets 5-20 mm. long 1. *S. texanus*.
6. Ligule commonly 2-5 mm. long; pedicellary branchlets 0.5-2 mm. long 4. *S. airoides*.
- 7(1). Collar of sheath (dorsal summit where it joins the blade) abundantly furnished with soft white hairs (8)
7. Collars of sheath glabrous (but the corners commonly pilose) (15)
- 8(7). Panicles 3-9 cm. long; lemma about 2 mm. long .. 8. *S. Nealleyi*.
8. Panicles longer than 12 cm. or if shorter the lemma longer than 3 mm. (9)
- 9(8). Mature panicles 5-15 cm. broad (10)
9. Mature panicles less than 5 cm. broad (11)
- 10(9). Lemma 4.5-6.1 mm. long 18. *S. Silveanus*.
10. Lemma 1.9-2.3 mm. long 9. *S. flexuosus*.
- 11(9). First glume more than 1.7 mm. long 20. *S. asper*.
11. First glume less than 1.5 mm. long (12)
- 12(11). At least part of mature panicle exerted from the sheath and less than 27 mm. broad (13)
12. Mature panicles either all enclosed in sheath or else exerted and more than 27 mm. broad (14)
- 13(12). Exserted portion of mature panicle 8-25 mm. thick 5. *S. giganteus*.
13. Exserted portion of mature panicle 4-7 mm. thick 6. *S. contractus*.
- 14(12). Main panicle branches spreading, nearly straight; spikelets on very short pedicels; mature panicles 5 to 8 times as long as broad 7. *S. cryptandrus*.
14. Main panicle branches divaricate or deflexed and arcuately reflexed; pedicels about 1 mm. long; panicles about 3 times as long as broad 9. *S. flexuosus*.
- 15(7). Mature panicles at least 5 cm. broad (16)
15. Mature panicles less than 5 cm. broad (18)
- 16(15). Lemma more than 4 mm. long; sheaths not keeled . 18. *S. Silveanus*.
16. Lemma less than 4 mm. long; sheaths keeled (17)
- 17(16). Keels of sheaths sharp; panicle branches not whorled; panicle 7-17 cm. broad 11. *S. Buckleyi*.
17. Keels of sheaths rounded; main panicle branches whorled; panicle 5-8 cm. broad .. 12. *S. pyramidatus*.
- 18(15). Mature panicles less than 5 cm. long (19)
18. Mature panicles more than 5 cm. long (21)
- 19(18). Panicles open, not at all spikelike; desert annual .. 10. *S. patens*.
19. Panicles dense or somewhat spikelike (20)
- 20(19). Panicles dense, 6-10 mm. broad, exerted, terminal; rhizomatous coastal perennial 14. *S. virginicus*.
20. Panicle somewhat spikelike, 2-3 mm. broad, often partly or entirely hidden in sheath, mostly axillary; tufted annual 21. *S. vaginaeflorus*.
- 21(18). Panicle very open and diffuse; first glume less than 1 mm. long 12. *S. pyramidatus*.
21. Panicle narrow or dense, or if slightly open then the first glume more than 1 mm. long (22)

- 22(21). First glume 0.4-0.9 mm. long (23)
 22. First glume at least 1.2 mm. long (24)
 23(22). Panicle only 5-10 mm. thick, 20 to 40 times as long; second glume 0.8-1.3 mm. long15. *S. indicus*.
 23. Panicle 12-20 mm. thick, 6 to 10 times as long; second glume 1.2-2.1 mm. long ...
13. *S. domingensis*.
 24(22). Second glume slightly shorter than lemma; panicle 4-12 (-18) mm. thick, commonly at least partly included in the uppermost sheath
20. *S. asper*.
 24. Second glume about equaling or usually slightly surpassing lemma, or if shorter then the panicle 15-30 mm. thick and exerted (25)
 25(24). Blades closely involute nearly their entire length, only 1-2 mm. broad when unrolled17. *S. junceus*.
 25. Blades flat or merely folded at least in the basal third of their length, mostly broader than 2 mm. (26)
 26(25). Panicle 6-16 mm. thick, spikelike; grain prolate, minute
16. *S. purpurascens*.
 26. Panicle 15-30 mm. broad, more open; grain globose ...19. *S. heterolepis*.

1. *Sporobolus texanus* Vasey. Tufted perennial from short very firm rhizomes 1.5-2 mm. thick, or these often apparently absent; aerial culms numerous, 3-7 dm. long, 1-2 mm. thick, leafy; ligule a very dense line of cilia about 0.5 mm. long; blades 1-12 (-20) cm. long, 2-4 mm. broad near the base, flat or drying involute, pointed; summit of sheath glabrous but the corners and margins often sparsely long-pilose; panicle 15-30 cm. long, 1-2 dm. broad, vaguely obovoid, open and diffuse, the branches not whorled but bearing numerous somewhat flexuous capillary ultimate branchlets 5-20 mm. long, each terminating in a single spikelet; first glume 0.7-1.5 mm. long; second glume 2.1-2.8 mm. long; lemma 2.3-2.9 mm. long; palea about equaling lemma. Seasonally moist and often subsaline low areas, Plains Country and Trans-Pecos, infrequent or rare, summer-fall; w. Kan. to Tex. and w. to Ariz.

2. *Sporobolus Wrightii* Scribn. SACATON. Tufted perennial; culms numerous, 9-25 dm. long, 2-9 mm. thick, unbranched, erect; ligule a fringe of cilia 2-10 mm. long; blades 2-7 dm. long, 3-10 mm. broad, flat or eventually drying involute; summit of sheath glabrous; panicles 2-6 dm. long, 12-26 cm. broad, open, more or less pyramidal when mature, the branches not whorled, spreading or slightly ascending, with short densely flowered secondary branchlets bearing subsecundly on the underside the pedicellary tertiary branchlets mostly less than 0.5 mm. long, the spikelets touching; first glume 0.5-1 mm. long; second glume 0.8-1.8 mm. long; lemma 1.2-2.1 mm. long; palea about as long as lemma. *S. airoides* var. *Wrightii* (Scribn.) Gould. Hard-packed clay loam, often subsaline, mostly near the Rio Grande or near the coast, Rio Grande Plains, s.w. Edwards Plateau and Tran-Pecos, rare except near the coast in extreme s. Tex., spring-summer; Tex. to s. Calif., s. to n. Mex.

3. *Sporobolus Tharp* Hitchc. COASTAL SACATON. Tufted perennial; culms numerous, 6-17 dm. tall, 2-5 mm. thick, unbranched, erect or the lowermost internodes shortly rhizomatous; ligule a fringe of cilia 4-10 mm. long; blades 2-6 dm. long, 3-6 mm. broad but closely involute and arcuate most of the length; summit of sheath glabrous; panicles 20-45 cm. long, vaguely ellipsoidal, open, the main branches not whorled nor much-spreading but diverging only at angles of 10° to 60° from the main axis and again much-branched, the secondary branches 1-4 cm. long, the tertiary pedicellary branchlets very shortly subsecund on the lower (abaxial) sides, the spikelets close so that they commonly touch each other; first glume 1-2 mm. long; second glume 2-2.9 mm. long; lemma 2.3-3.5 mm. long; palea about equaling lemma. Sand and calcareous shell debris (hash) near the coast, s.e. Tex. and Rio Grande Plains (Aransas, Calhoun, Cameron, Kenedy and Nueces cos.), infrequent, summer-fall; endemic (probably continuing south into Tam.)

4. *Sporobolus airoides* (Torr.) Torr. ALKALI SACATON. Tufted perennial; culms numerous, 5-15 dm. long, 1-2 mm. thick, unbranched, erect or the lowermost internodes occasionally shortly subrhizomatous; ligule a fringe of cilia 2-5 mm. long; blades 15-45 cm. long, 2-6 mm. broad, flat or soon closely involute and distally arcuate; the sheaths

marginally and at the summit dorsally essentially glabrous or rarely on the corners with very few hairs 2-4 mm. long; panicles 20-45 cm. long, 15-25 cm. broad, open and diffuse, subpyramidal, the long branches not widely spreading and not whorled, the pedicellary branchlets subsecund on the lower side of the branches, mostly 0.5-2 mm. long, the spikelets few and borne remotely so that they often do not touch each other; first glume 0.4-1.8 (-2) mm. long; second glume 1-2.2 (-2.8) mm. long; lemma 1.3-2.5 (-2.8) mm. long; palea about equaling lemma. Open ground, prairies or sandflats or occasionally alkali or subsaline playas or gravelly and rocky slopes, Plains Country and Trans-Pecos, often very abundant, rare e. to w. Edwards Plateau, spring-fall; w. U.S. e. to S.D., Neb., Kan., Okla. and Tex.

Very variable, probably hybridizing with and intergrading with *S. Wrightii*. Plants of the El Paso area often have spikelets with the larger measurements approaching the maxima given above.

5. *Sporobolus giganteus* Nash. GIANT DROPSEED. Tufted perennial; culms 7-20 dm. long, 2-7 mm. thick, unbranched, erect; ligule a dense ciliate fringe 1-1.5 mm. long; blades 1-7 dm. long, 3-13 mm. broad, flat or drying involute; corners and dorsal summit of sheaths with abundant soft white hairs 2-6 mm. long; panicle 20-65 cm. long, 8-25 mm. broad, spikelike or with some of the longer branches less strictly appressed than in *S. contractus*, the lower portion included in the uppermost sheath; first glume 1-2 mm. long; second glume 2.6-3.2 mm. long; lemma 2.5-3.1 mm. long; palea about equaling lemma. Loose sandy soil in blowing dune areas, common in the Plains Country s. to Ward, Winkler and Crane cos., infrequent in the w. Trans-Pecos, summer-fall; Colo. and w. Okla. s.w. to Ariz. and s. to n. Chih.

6. *Sporobolus contractus* Hitchc. SPIKE DROPSEED. Tufted perennial; culms 35-115 cm. long, 1.5-3 mm. thick, unbranched, erect; ligule a dense ciliate fringe 0.5-1 mm. long; blades 4-35 cm. long, 3-8 mm. broad, flat or drying mostly involute; corners and dorsal summit of sheath with abundant soft white hairs 2-4 mm. long; panicle 15-50 cm. long, 4-7 mm. thick, dense and spikelike even in the upper portion where not included in the uppermost sheath; first glume 1-2 mm. long; second glume (1.8-) 2-2.7 mm. long; lemma (2.2-) 2.4-3.2 mm. long; palea usually slightly shorter than the lemma. Loose, gravelly and sandy soils, less commonly on rocky hillsides in the Trans-Pecos, late summer-Sept.; Colo. to Nev. and s. to Tex., Chih. and Son.; waived in Ark.

7. *Sporobolus cryptandrus* (Torr.) Gray. SAND DROPSEED. Tufted perennial; culms 3-11 dm. long, 1-3 mm. thick, unbranched, erect; ligule a dense ciliate fringe 0.5-1 mm. long; blades 3-35 cm. long, 2-6 mm. broad, flat or on drying mostly involute; corners and dorsal summit of sheath with abundant soft white hairs 2-4 mm. long, the summit of the sheath often obscurely round-keeled dorsally; panicle 15-40 cm. long, when not included 3-15 cm. broad, open or often partly or entirely included in the uppermost sheath and then linear and spikelike; branches of panicle not verticelled, spreading, the spikelets densely subsecund on the lower (abaxial) sides of the branchlets; first glume 0.5-1.1 (-1.5) mm. long; second glume 1.2-2.1 (-2.7) mm. long; lemma 1.3-2.3 (-2.7) mm. long; palea about as long as lemma. Weedy; abundant in all parts of the state in sandy soil and less abundant in tighter finer disturbed soils, spring-summer-fall; s. Can. and almost all the U.S. except extreme s.e. states (Fla., Ga., Ala., Miss); n. Mex.

Perhaps this species is the most abundant of all our grasses, vying for this position with *Cenchrus incertus*. Because of this abundance, and not because of its food quality, sand dropseed is an important forage grass.

8. *Sporobolus Nealleyi* Vasey. Tufted perennial; culms 15-40 cm. long, 0.5-1 mm. thick, unbranched, erect except the shortly subrhizomatous lower internodes; ligule a very dense ciliate fringe about 0.5 mm. long; blades 2-7 cm. long, 1-1.5 mm. broad when flat and straight but soon closely involute and arcuate, widely spreading from the stem; sheaths at the dorsal summit with a dense zone of short soft white hairs, longer at the corners; panicle 3-9 cm. long, 10-35 mm. broad, open, the basal part occasionally enclosed by the uppermost sheath; first glume 0.5-1.2 mm. long; second glume 1.5-2.2 mm. long; lemma 1.8-2 mm. long; palea about equaling lemma. Sandy, gypsiferous and/or alkaline soil, and blowing gypsum sands in the Trans-Pecos (Crane, Ward, Culberson and Hudspeth cos.), locally abundant, spring-late summer-fall; locally in Nev., Ariz., N.M., Tex. and Coah.

9. *Sporobolus flexuosus* (Thurb.) Rydb. MESA DROPSEED. Tufted perennial; culms 3-10 dm. long, 1-2 mm. thick, erect, unbranched; ligule a ciliate fringe 0.3-0.5 mm. long; blades 5-23 cm. long, 2.4 mm. broad at the base where flat but usually soon involute; sheaths obscurely round-keeled apically, the corners with some soft white hairs but the dorsal summit or collar glabrous or only very sparsely furnished with hairs 1-1.5 mm. long; panicles 12-30 cm. long, 4-9 cm. broad, basally sometimes partially included in the uppermost sheath, open, the branches not whorled, divaricate or even somewhat deflexed and then arcuately reflexed distally, the floriferous branchlets subsecund on the lower side of the branches, mostly widely divergent from the branches, the spikelets borne on tertiary pedicellary branchlets about 1 mm. long which are subsecund along the proximal side of the secondary branchlets; first glume 1-1.3 mm. long; second glume 1.9-2.5 mm. long; lemma 1.9-2.3 mm. long; palea about equaling lemma. Loose usually blowing sand in dune areas in the Trans-Pecos, locally frequent, Sept.-Nov., rarely also in spring; w. Tex. to s. Ut., Nev., s. Calif. and n. Mex.

10. *Sporobolus patens* Swall. Tufted annual; culms 10-25 cm. long, 0.5-1 mm. thick, erect, unbranched; ligule a ciliate fringe about 0.4 mm. long; blades aggregated toward the base of the plant, 5-35 mm. long, 1-2 mm. broad, flat or folded, basally the midrib forming an obscure keel; sheaths obscurely keeled at top and at the corners shortly pilose; panicle 25-50 mm. long, 3-4 cm. broad, subpyramidal, open, the branches in whorls, spreading, flexuous, naked basally, in turn bearing the widely divergent pedicellary branchlets; first glume about 0.3 mm. long; second glume 1.7-1.9 mm. long; lemma 1.8-2 mm. long; palea a little shorter than the lemma. Sandy, gravelly deserts near El Paso in the Trans-Pecos, rare, Sept.; also s. Ariz.

Resembles a small annual version of *S. flexuosus* but the panicle-branches are verticillate as in *S. pyramidatus*.

11. *Sporobolus Buckleyi* Vasey. Tufted perennial; culms 3-10 dm. long, 0.7-2 mm. thick, erect, unbranched; ligule a ciliate-fringed scale 0.2-0.4 mm. long; blades rather few, the basal ones very short, the cauline ones 12-30 cm. long, mostly flat or sharply folded, 3-12 mm. broad about a third the length from the base, gently tapered to the base and to the usually involute point; sheaths very sharply and remarkably folded and keeled, at their margins and corners shortly and inconspicuously pubescent; panicle 11-34 cm. long, 7-17 cm. broad, vaguely pyramidal, very open and diffuse, the numerous branches spreading, not whorled; first glume 0.6-1 mm. long; second glume 0.9-1.3 mm. long; lemma 1.2-1.7 mm. long; palea almost equaling lemma. Deep shade of brush on well-drained calcareous loam, extreme s. Rio Grande Plains (Cameron Co.), Sept.-Nov.; Tex. to n. Ver. and s.e. S.L.P.

12. *Sporobolus pyramidatus* (Lam.) Hitchc. Tufted perennial (flowering first year and often behaving as an annual); culms 1-7 dm. long, 1-2 mm. thick, reclining or usually ascending; ligule a ciliate-fringed scale about 0.5 mm. long; blades aggregated toward the base of the plant, 3-20 cm. long, usually flat for most of the length, somewhat keeled basally, 2-4 mm. broad, the point often loosely involute; corners of sheaths sparsely pilose and upper part of sheaths dorsally keeled; panicle (2-) 3-10 (-20) cm. long, when young loosely ellipsoidal, when mature elegantly pyramidal, diffuse, 15-55 (-80) mm. broad, the branches in definite verticels and widely spreading, naked basally; first glume 0.3-1 mm. long; second glume 1.2-1.9 mm. long; lemma 1.2-2 mm. long; palea about equaling lemma. *S. pulvinatus* Swall. Clay or packed loam, often alkaline or subsaline soil in open disturbed areas, abundant in s.e. Tex. and Rio Grande Plains near the coast, scattered or rare inland to the s. Trans-Pecos, Plains Country and n.-cen. Tex., all year but usually summer-fall; widespread in the warmer parts of Am., n. to Ariz., Colo. and Kan.; also Fla.

13. *Sporobolus domingensis* (Trin.) Kunth. Tufted perennial; culms 2-10 dm. tall, 1-3 mm. thick, erect, leafy; ligule a ciliate-fringed scale 0.5-1 mm. long; blades 5-25 cm. long, usually flat basally or round-keeled, 3-8 mm. broad, tapering to an involute point; corners of sheaths sparsely pilose and upper part of sheath keeled; panicle 8-20 cm. long, 12-20 mm. broad, dense, narrowly ellipsoidal; first glume 0.6-0.9 mm. long; second glume 1.2-2.1 mm. long; lemma 1.5-2 mm. long; palea about equaling lemma. Packed shell or debris (hash) near coast, waived at least once in Nueces Co. (causeway e. to Aransas Pass), probably not persistent in our flora, spring-summer-fall; limey coasts, s. Fla.; W.I.

14. *Sporobolus virginicus* (L.) Kunth. COASTAL DROPSEED. Perennial from scaly creeping stramineous rhizomes 1-3 mm. thick; aerial culms mostly ascending or the lowermost internodes stoloniform, 7-40 cm. long, 1-3 mm. thick, leafy; ligule a ciliate scale 0.2-0.4 mm. long; blades 3-20 cm. long, usually flat at the very base or rounded-keeled and 2.5-4 mm. broad, tapering to an involute point; corners of sheaths sparsely pilose and upper part of sheath dorsally keeled; panicle 25-80 mm. long, 6-10 mm. broad, dense, spikelike or usually narrowly ellipsoidal or oblong-ellipsoidal; first glume 1.3-2.8 mm. long; second glume 1.8-3 mm. long; lemma 2.1-3 mm. long; palea about as long as lemma. Packed loamy somewhat saline soil all along the Tex. coast, common, summer-fall; warmer Atl. and Carib. coasts, s. to Braz. and n. to Va.

15. *Sporobolus indicus* (L.) R. Br. SMUTGRASS. Tufted perennial; culms 3-11 dm. long, 1-3 mm. thick, erect, unbranched; ligule obsolete or only a scale 0.1 mm. long; blades aggregated at the base of the plant, 15-25 (-50) cm. long, at the base usually flat or sharply folded, 3-5 mm. broad, tapering to a long involute arcuate tip; upper part of the sheaths usually dorsally keeled; panicles 1-4 dm. long, 5-10 mm. thick, dense, spikelike, often somewhat interrupted in the lower part; first glume 0.4-0.9 mm. long; second glume 0.8-1.3 mm. long; lemma 1.4-2 mm. long; palea 1.2-1.8 mm. long; pericarp mucilaginous, the grain often sticking persistently instead of falling readily as in many dropseeds. In some works erroneously called *S. Poiretii*. Mud and moist loam, low prairies and swales, e. and s.e. Tex., s.w. to Bexar, DeWitt, Goliad and Aransas cos., frequent, late spring-Nov.; widely distributed in the warmer parts of the world, nat. to the Old World; in Am. occurring n. to Va., Tenn., Ark. and Okla.

16. *Sporobolus purpurascens* (Sw.) Hamilt. Tufted perennial; culms 25-90 cm. long, 1-2 mm. thick, erect, unbranched; ligule an erose scale about 0.2 mm. long; blades aggregated at the base of the plant, mostly straight and often sparsely pilose, 3-15 (-22) cm. long, at least the basal part flat and 2-5 mm. broad, usually tapering to an involute tip; panicles 7-30 cm. long, 6-16 mm. broad, often like a much-interrupted spike, the numerous short branches in dense whorls, appressed, floriferous nearly to the base; first glume 1.6-2.5 mm. long; second glume 3.2-4.5 mm. long; lemma 3-4 mm. long, usually rufescent-purple; palea 3.2-4 mm. long. Prairies and brush on loose sandy soil, Rio Grande Plains n. to s. Bexar Co., infrequent, summer-fall; Tex. to Mex.; W.I.; Braz.

17. *Sporobolus junceus* (Michx.) Kunth. Tufted perennial; culms 5-10 dm. long, 1-2 mm. thick, erect, unbranched; ligule a minute fringed scale 0.1-0.2 mm. long; blades aggregated toward the base of the plant, 1-3 dm. long, 1-2 mm. broad when flat but soon involute and irregularly arcuate; panicles 9-25 cm. long, 9-40 mm. broad, interrupted, occasionally somewhat spikelike but usually rather open, the branches in whorls, spreading, naked in the lower half; first glume 1.2-3 mm. long; second glume 3-3.8 mm. long; lemma 2.8-3.7 mm. long, usually rufescent-purple; palea 2.8-3.5 mm. long. Loose sandy soil, open forests and forest openings, e. and s.e. Tex., s.w. to Atascosa and San Patricio cos., infrequent; Coastal States, Va. to Tex.

In the southwest extremity of its distribution this approaches *S. purpurascens* in the form of the panicle.

18. *Sporobolus Silveanus* Swall. Tufted perennial from slightly swollen bases; culms 50-115 cm. long, 1-2 mm. thick, erect, unbranched; ligule a dense line of minute cilia or a minute lacerate-ciliate scale about 0.1 mm. long; blades aggregated toward the base of the plant, 15-50 cm. long, 1-2 mm. broad, flat or soon involute; sheaths at the summit dorsally with some soft hairs 1-2 mm. long; panicles 15-50 cm. long, 5-15 cm. broad, open, the branches stiffly ascending, not whorled, naked at base; pedicels 3-12 mm. long, the spikelets remote; first glume 3-4.5 mm. long; second glume 4.5-6 mm. long; lemma 4.5-6.1 mm. long, dark-purple; palea about as long as lemma, often a little longer, also purple. Sandy soils, meadows and openings in forests, e. Tex., rare, fall; also w. La.

19. *Sporobolus heterolepis* (Gray) Gray. PRAIRIE DROPSEED. Tufted perennial; culms 30-75 cm. long, 1-2 mm. thick, erect, unbranched; ligule a lacerate scale about 0.2 mm. long; blades aggregated toward the base of the plant, 8-36 cm. long, 1-2 mm. broad, usually folded basally and involute-arcuate distally; sheaths essentially glabrous except occasionally at the corners; panicles 5-20 cm. long, 15-30 mm. broad, fairly open but the whorled basally naked branches ascending; pedicels 1-3 mm. long; first glume 1.9-3 (rarely to 4) mm. long; second glume 3.5-4.5 (rarely to 6) mm. long; lemma 3-5 (rarely

to 6) mm. long; palea about equaling lemma; caryopsis nearly globose. Sandy soil, e. Tex., rare, Sept.-Oct.; Que. to Sas k.s. to N.E., O., Ind., Ill., Ark. and Tex.

20. *Sporobolus asper* (Michx.) Kunth. TALL DROPSEED. Tufted perennial (but sometimes flowering the first year), often with shortly subrhizomatous lowermost internodes or these elongated into creeping rhizomes in loose sandy soils; ligule a minute ciliate-fringed scale 0.1-0.2 mm. long or nearly obsolete; culms 4-12 dm. long, 1-4 mm. thick, leafy, erect or ascending and slightly geniculate at the lower nodes; blades of the lower half of the plant 15-40 cm. long, 1-3.5 mm. broad at base, quickly and very closely involute into a filiform arcuate distal portion, glabrous or pilose near the ligule or more extensively; sheaths glabrous or on the corners and occasionally at the summit dorsally somewhat pilose; panicles 5-24 cm. long, 4-12 (-18) mm. thick, spike-like but often interrupted, terminal, rarely axillary, often some or all included in the sheath; first glume (1.7-) 2-3.2 (-4.5) mm. long; second glume (2-) 3-4 (-5) mm. long; lemma (3-) 4-5 (-6) mm. long, glabrous or minutely pubescent; palea usually a little shorter than the lemma, occasionally a little longer, the cleistogamous spikelets of the enclosed inflorescences usually approaching the lower extremes of the measurements given above. Incl. var. *clandestinus* (Biehler) Shinnars and var. *canovirens* (Nash) Shinnars, *S. clandestinus* (Biehler) Hitchc., *S. canovirens* Nash. Often weedy, in a variety of circumstances, e. and s.e. Tex., w. to e. Plains Country and n.e. Rio Grande Plains, common, Sept.-Dec.; e. U.S. w. to N.D., S.D., Neb., Kan., Okla. and e. Tex.; also scattered to Mont., Wash., Colo., Ut., N.M. and Ariz.

The plants with rhizomes of loose, sandy soil are called *S. asper* var. *macer* (Trin.) Shinnars or *S. macer* (Trin.) Hitchc. but they are otherwise inseparable from the typical *S. asper*. Some plants have various combinations of the characteristics of more diffuse, less strongly perennial, less robust habit, more geniculate stems, shorter leaves, shorter and more numerous and usually more hidden and axillary panicles, and small spikelets, showing intergradation to *S. vaginaeflorus*; these plants are called *S. asper* var. *Hookeri* (Trin.) Vasey or *S. asper* var. *pilosus* (Vasey) Hitchc., the latter name applying to the plants in which the basal parts of the blades and the upper parts of the sheaths are pilose. Certain plants are so nearly intermediate that they cannot be referred with certainty to either *S. asper* or *S. vaginaeflorus*.

21. *Sporobolus vaginaeflorus* (Torr.) Wood. Tufted annual; culms 15-55 cm. long, 0.5-1 mm. thick, leafy, usually reclining in the lower part, distally ascending, geniculate; ligule a minute ciliate-fringed scale 0.1-0.2 mm. long; blades of the lower part of the plant 3-5 cm. long (or those at the very base to 13 cm. long), 1-2 mm. broad at the base, flat or soon tightly involute-filiform, often pilose near the ligule and on the margins; sheaths often pilose at the corners; panicles mostly axillary (usually each culm with one terminal and 2 to 4 axillary), 1-3 (-4.5) cm. long, 2-3 mm. thick, spike-like, partly or all hidden in the sheaths; first glume (1.5-) 2-3.5 (-4.5) mm. long; second glume (1.5-) 3-4 (-4.5) mm. long; lemma (1.7-) 3-4 (-4.5) mm. long, pubescent or glabrous; palea about as long as lemma or longer or shorter. E. and n.-cen. Tex., w. to e. Edwards Plateau and e. Plains Country, common, fall (rarely late summer); e. U.S. w. to the Dakotas, Neb., Kan., Okla. and Tex.; also scattered to N.M., Ariz., Colo. and Wash.

The names *S. neglectus* Nash or *S. vaginaeflorus* var. *neglectus* (Nash.) Scribn. apply especially to those plants with more glabrous, mostly cleistogamous, enclosed spikelets. *S. vaginaeflorus* var. *inequalis* Fern. is the name applied to the scattered form in which the palea is apically prolonged. Some of the pilose plants, mostly in limestone hills on the eastern edge of the Edwards Plateau, are of the form known as *S. vaginaeflorus* var. *ozarkanus* (Fern.) Shinnars. They belong mostly among the common plants showing intergradation to *S. asper* var. *pilosus*.

88. BLEPHARONEURON NASH

A monotypic genus.

1. *Blepharoneuron tricholepis* (Torr.) Nash. HAIRY DROPSEED. Tufted perennial; culms 2-6 dm. tall, about 1 mm. thick, unbranched, erect; ligule a membranous scale 2-5 mm. long; blades aggregated toward the base of the plant, 3-15 cm. long, 1-1.5 mm. broad when flat but mostly folded or tightly involute, arched; panicles 5-20 cm. long,

1-7 cm. thick, diffuse, the branches ascending, few-flowered; pedicellary branchlets very slender, flexuous; spikelets 1-flowered, not markedly compressed, plumbeous, awnless; first glume 2-2.5 mm. long; second glume 2.3-3 mm. long; zone of abscission between the glumes and the floret; lemma a little longer than second glume, the 3 nerves dorsally densely villous; palea slightly longer than lemma, with a median dorsal band densely villous like the nerves of the lemma. Open pine woods on rocky slopes at elev. greater than 5,000 ft., Trans-Pecos mts., locally abundant, Aug.-Sept.; Colo. to Ut. and s. to Dgo.

89. LYCURUS H.B.K.

A genus of 3 species occurring from southwestern United States to northern tropical South America.

1. *Lycurus phleoides* H.B.K. WOLFTAIL. Tufted perennial; culms erect, rarely branched, 15-60 cm. long, 1 mm. thick, sparsely leafy; ligule a pointed scale 3-9 mm. long; blades aggregated toward the base of the plant, 4-15 cm. long, tightly folded, the white midrib forming a dorsal keel, 1.5-2.5 mm. broad when unfolded; panicle spike-like, 5-9 cm. long, 5-7 mm. thick, the pedicellary branchlets very short, borne in pairs, unequal, with a zone of abscission at the base of each pair, the 2 spikelets and their pedicels then falling together as a unit; spikelet on shorter pedicel sterile; first glume bicuspid, 1-1.5 mm. long, bearing on each tooth a persistent awn much longer than the body of the glume; lemma firm, folded or involute, 2-4 mm. long, lanceolate, acute, bearing a persistent awn shorter than the lemma; palea about as long as lemma. Grasslands and semidesert scrub on rocky slopes, common in the Trans-Pecos, less common in w. Edwards Plateau and w. Plains Country, summer; Okla., Colo. and Ut. to s. Mex.

Wolftail has considerable forage value.

90. MUHLENBERGIA SCHREB. MUHLY

Spikelets small, one-flowered (rarely 2-flowered in *M. arenacea* and *M. asperifolia*); glumes usually shorter than (or in *M. rigens*, *M. Lindheimeri*, and *M. Emersleyi* equaling or in *M. andina* surpassing) the lemma, in *M. Schreberi* the first glume nearly obsolete; zone of abscission between the glumes and lemma (another zone of abscission sometimes present below the spikelets, and in 2 species, *M. depauperata* and *M. brevis*, a zone of abscission at the base of each 2-flowered branchlet); lemma 3-nerved (nerves commonly inconspicuous), basally with a minute callus and awnless or with a mucro or a short or long awn. *Epicampes* J. & C. Presl.

A genus of more than 100 species that occur from the Himalaya Mts. to Japan, and from North America to the Andes. The genus, as now interpreted, is very diverse, being a taxonomic dumping ground. Some of the muhlys are quite abundant and are valuable forage.

1. Both glumes and lemmas shorter than 2 mm. or barely attaining 2 mm. in length (2)
1. Either glumes or lemmas or both longer than 2 mm. (7)
- 2(1). Panicles spike-like; leaves all involute and of 2 size-classes 4. *M. utilis*.
2. Panicles not spike-like, open and mostly diffuse; leaves various but not obviously of 2 size-classes (3)
- 3(2). Rhizomatous perennials (4)
3. Tufted annuals (5)
- 4(3). Lemma 1.5-2 mm. long; lateral portions of ligule elongated over corners of sheaths into pointed auricles 33. *M. arenacea*.
4. Lemma 1.2-1.5 mm. long; auricles absent 34. *M. asperifolia*.
- 5(3). Glumes 1-1.5 mm. long; lemma with a deciduous awn 1-2 mm. long 37. *M. eludens*.
5. Glumes 0.6-1 mm. long; lemma awnless or with an awn to 1 mm. long (6)

- 6(5). Glumes pubescent (use lens); main panicle branches often flexuous, ascending35. *M. minutissima*.
6. Glumes glabrous; main panicle branches diverging at right angles, nearly straight36. *M. fragilis*.
- 7(1). Annuals; panicles spikelike, each branchlet of panicle short, appressed, with one basal spikelet and one terminal spikelet, and a zone of abscission at base of each branchlet, the spikelets thus falling in pairs (8)
7. Perennials; panicles not so composed (9)
- 8(7). Glumes and lemma about 3 mm. long, the latter with an awn 1.5-11 mm. long 1. *M. depauperata*.
8. First glume 1.5-2 mm. long, the second one 2-3 mm. long; lemma about 5 mm. long, with an awn 9-20 mm. long 2. *M. brevis*.
- 9(7). Glumes 3-4 mm. long but lemma 2-3 mm. long, the callus of the lemma bearing hairs as long as the body of the lemma12. *M. andina*.
9. Lemma equaling or surpassing glumes and hairs of the lemma proportionately much shorter (10)
- 10(9). Second glume a fourth to a tenth as long as the lemma (excluding awn) (11)
10. Second glume at least a third as long as the lemma (13)
- 11(10). Glumes 0.1-0.3 mm. long; lemma about 2 mm. long; plants stoloniferous19. *M. Schreberi*.
11. Glumes at least 0.5 mm. long; lemma at least 3 mm. long; stolons absent (12)
- 12(11). Glumes 0.5-1 mm. long; lemma 3-4 mm. long; awn 19-37 mm. long; culms geniculately branched in the lower part; panicle about 1 cm. thick18. *M. parviglumis*.
12. Glumes 1-1.3 mm. long; lemma 4-5 mm. long; awn 10-22 mm. long; culms essentially unbranched above the base; panicle at least 2 cm. broad, usually much broader20. *M. rigida*.
- 13(10). Mature panicles less than 11 mm. thick and less than 17 cm. long (14)
13. Mature panicles more than 11 mm. thick or more than 17 cm. long, or both (29)
- 14(13). Sheaths sharply keeled (15)
14. Sheaths not sharply keeled (16)
- 15(14). Lemmas glabrous or minutely pubescent29. *M. Lindheimeri*.
15. Lemmas villous on the lower half30. *M. Emersleyi*.
- 16(14). Lemmas (including callus) glabrous (17)
16. Lemmas with some pubescence (20)
- 17(16). Awn 5-20 mm. long15. *M. pauciflora*.
17. Lemma awnless, mucronate or with an awnlike tip less than 5 mm. long (18)
- 18(17). Panicles 3-10 cm. long; leaf blades not distinctly falling into 2 size-classes, flat; plants of moist places, north-central Texas 9. *M. glabriflora*.
18. Panicles 1-4 cm. long; leaf blades of 2 size-classes, those of the innovations from the rhizome larger than those of the floriferous branches, the latter sort involute (19)
- 19(18). Lemma 2.5-4 mm. long including the mucro or short awn 3. *M. repens*.
19. Lemma 1.6-2 mm. long 4. *M. utilis*.
- 20(16). Lemma mucronate or with an awn 3 mm. long or shorter (21)
20. Lemma with an awn more than 3 mm. long (26)
- 21(20). Blades 15-30 mm. long, about 1 mm. thick (as rolled), involute 5. *M. villosa*.
21. Blades mostly more than 30 mm. long, flat at least in the lower half (22)

- 22(21). Spikelets (excluding awns) about twice as long as broad; plants of Trans-Pecos mountains 13. *M. glauca*.
22. Spikelets (excluding awns) more than twice as long as broad; plants not occurring in Trans-Pecos mountains (23)
- 23(22). Glumes with stiff awn tips 2-5 mm. long, much-exceeding the lemma; blades stiffly appressed or ascending 11. *M. racemosa*.
23. Glumes with or without awnlike tips but shorter than the body of the lemma or else exceeding it by only about 0.5 mm. (24)
- 24(23). Glumes 2.5-3.5 mm. long including short awnlike tips; lemma about 3 mm. long including the awnlike tip; leaves soft and neither stiffly appressed nor divergent; panicles dense 8. *M. frondosa*.
24. Glumes 1-2.5 mm. long including the mucro; lemma 2-3 mm. long, awnless or with a mucro or short awn to 3 mm. long; blades markedly divaricate from the culm (25)
- 25(24). Panicles 1-2 mm. thick; lemma about 3 mm. long and with a mucro or short awn to 1 mm. long 7. *M. brachyphylla*.
25. Panicles 2-3 mm. thick; lemma 2-2.5 mm. long and with a mucro or a short awn 1-3 mm. long 6. *M. sobolifera*.
- 26(20). Awn 3-10 mm. long; rhizomes whitish, conspicuous; plants of shady woods, eastern Edwards Plateau and north-central Texas .. 10. *M. sylvatica*.
26. Awn 9-25 mm. long; rhizomes sordid, inconspicuous or absent; plants of dry slopes, Trans-Pecos Texas and western Edwards Plateau (27)
- 27(26). Panicle 9-20 mm. thick; second glume 3-toothed; rhizomes absent; old sheaths usually drying curled up like wood-shavings 16. *M. montana*.
27. Panicles less than 9 mm. thick; second glume not 3-toothed (28)
- 28(27). Rhizomes present (but often broken off the dried specimens); lower portions of culms not markedly geniculate; lower half of lemma usually densely pubescent; glumes with awns 0.5-3 mm. long, equaling the lemma 14. *M. polycaulis*.
28. Rhizomes absent; lower part of plant geniculate and much-branched; pubescence of lemma usually confined to callus and basal margins; glumes not awned, only about two thirds as long as lemma 17. *M. monticola*.
- 29(13). Mature panicles 2 cm. or less thick, mostly spikelike (30)
29. Mature panicles 2 cm. thick or mostly much thicker, often open and not at all spikelike (35)
- 30(29). Sheaths sharply keeled (31)
30. Sheaths not sharply keeled (32)
- 31(30). Lemmas glabrous or very finely pubescent 29. *M. Lindheimeri*.
31. Lemmas densely villous in the lower part 30. *M. Emersleyi*.
- 32(30). Second glume 3-toothed 16. *M. montana*.
32. Second glume not distinctly 3-toothed (33)
- 33(32). Culms 1 mm. or less thick, much-geniculately-branched in the lower part
..... 17. *M. monticola*.
33. Culms more than 1 mm. thick, essentially unbranched above the base (34)
- 34(33). Glumes about as long as lemma; lemma about 3 mm. long
..... 31. *M. rigens*.
34. Glumes about half as long as lemma; lemma 3.5-4.5 mm. long
..... 32. *M. dubia*.
- 35(29). Glumes less than half as long as lemma (36)
35. Glumes more than half as long as lemma (37)
- 36(35). Awn 10-28 mm. long 21. *M. setifolia*.
36. Awn 0.5-7 mm. long 27. *M. Reverchonii*.
- 37(35). Blades mostly less than 4 cm. long (38)

37. Blades mostly more than 4 cm. long (40)
 38(37). Awn 5-13 mm. long; nodes swollen24. *M. Porteri*.
 38. Awn shorter than 5 mm. long (39)
 39(38). Ligule about 1 mm. long; blades sharp-pointed, not confined to the base of the plant25. *M. pungens*.
 39. Ligule 3-10 mm. long; blades markedly arcuate, curled almost into ringlets, confined to the base of the plant23. *M. Torreyi*.
 40(37). Sheaths not keeled, the old ones commonly frayed into a fibrous mass at the base of the plant; panicles very open and diffuse ..26. *M. capillaris*.
 40. Sheaths keeled, sometimes somewhat rounded (41)
 41(40). Mature panicles 5-13 cm. broad; blades when unrolled only 1-2 mm. broad ..
22. *M. arenicola*.
 41. Mature panicles less than 5 cm. broad; blades 2-5 mm. broad (42)
 42(41). Lemma minutely pubescent all over or glabrous ..29. *M. Lindheimeri*.
 42. Lemma densely pubescent in the lower part at least on the margins (43)
 43(42). Blades involute; pubescence of the lemma nearly confined to the margins
28. *M. involuta*.
 43. Blades folded at least near the base, involute near the tip; pubescence of lemma well-distributed on the lower part30. *M. Emersleyi*.

1. *Muhlenbergia depauperata* Scribn. Tufted annual; culms 2-15 cm. long, about 0.5 mm. thick, geniculately branched in the lower half, erect; ligule a dissected hyaline scale 2 mm. long, the lateral "auricles" simply continuations of the hyaline sheath margins; blades 9-25 mm. long, 1-1.5 mm. broad, flat or often folded and arcuate, the white midrib forming a keel; panicles 1-6 cm. long, about 2 mm. thick, spike-like but interrupted; spikelets all perfect but borne in pairs on the branchlets, one appearing sessile at the base of each branchlet, the other terminal, the zone of abscission at the base of the branchlet, the spikelets thus falling in pairs (cf. *Lycurus*); first glume about 3 mm. long, shallowly and often unequally bicuspid, each tooth mucronate; second glume about 3 mm. long, acuminate; lemma about 3 mm. long, very minutely bifid, with an awn 1.5-11 mm. long; palea equaling lemma. Grassy slopes of dark volcanic rock, Trans-Pecos mts. (Davis and Chisos) at elev. of about 5,000 ft., rare, Aug.-Oct.; N.M. to Ariz. and s. to cen. Mex.

Perhaps to be referred to the genus *Lycurus* but differing essentially in that both spikelets of each pair are fertile.

2. *Muhlenbergia brevis* C. Goodd. Like *M. depauperata* but first glume 1.5-2 mm. long; second glume 2-3 mm. long; lemma about 5 mm. long, with an awn 9-20 mm. long. Grassy slopes of dark volcanic rock, Trans-Pecos mts. at elev. of about 8,000 ft., rare (Mt. Livermore), Aug.; Colo. to Ariz. and s. to Mex.

3. *Muhlenbergia repens* (Presl) Hitchc. CREEPING MUHLY. Perennial from firm creeping rhizomes 1-2 mm. thick; aerial culms 10-35 cm. long, 1-1.5 mm. thick, stramineous, mostly reclining, only the last few cm. erect, leafy, bearing numerous short floriferous branches; ligule a scale 0.5-1 mm. long, not auricled; blades of 2 classes, those of the long innovations from the rhizome large (3-9 cm. long), flat, about 2 mm. broad basally and tapering to an involute point, those of the short erect floriferous branches 5-30 mm. long and mostly closely involute and arcuate; panicles 1-4 cm. long, 2-3 mm. thick, much-interrupted, the spikelets remote; glumes 1.5-3 mm. long, ovate, often mucronate; lemma 2.5-4 mm. long including a mucro or short awn; palea almost as long as lemma. *M. abata* I. M. Johnst. Rocky slopes and gravelly flats in the Trans-Pecos and s. Plains Country, locally abundant, usually Oct.-Nov., rarely spring-summer; Tex. to Ariz. and s. to s. Mex.

4. *Muhlenbergia utilis* (Torr.) Hitchc. APAREJO MUHLY. Like *M. repens* but the larger blades 15-35 mm. long, about 1 mm. broad and mostly involute, the smaller blades 5-20 mm. long and closely involute and arcuate, 0.2-0.4 mm. thick as rolled; glumes 0.6-1.5 mm. long; lemma 1.6-2 mm. long, scarcely mucronate. Calcareous seasonally muddy soil along streams, Edwards Plateau, locally abundant, usually fall-early winter, occasionally spring-summer; Tex. and n.e. Mex.; also Calif. and Nev.

5. *Muhlenbergia villosa* Swall. Perennial from long firm rhizomes 1-3 mm. thick; aerial culms 4-26 cm. long, 0.5-1 mm. thick, leafy, profusely branched near the ground, ascending; ligule an erose scale 0.5-1.7 mm. long; blades 15-30 mm. long, less than 1 mm. thick, closely involute and reflex-arcuate; panicles 1-4 cm. long, 1-2 mm. thick, spikelike but interrupted; glumes 1-1.5 mm. long, ovate, awnless; lemma 2.2-2.7 mm. long, copiously pubescent on the lower half, lanceolate, mucronate; palea about as long as lemma. Alkaline desert flats in the Trans-Pecos and w. Edwards Plateau, rare, July-Aug.; endemic.

6. *Muhlenbergia sobolifera* (Muhl.) Trin. Perennial from scaly white rhizomes 1-2 mm. thick; aerial culms 4-10 dm. tall, about 1 mm. thick, erect, sparingly branched, leafy but the upper 5-15 cm. of the culm naked and pedunculiform; ligule a scale 0.3-1 mm. long, not auricled; blades 4-16 cm. long, 1.5-8 mm. broad, flat, divergent, the lower older ones falling readily; panicles 5-17 cm. long, 2-3 mm. thick, weak and nodding, usually interrupted near the base; glumes 1-2.2 mm. long, usually merely acute but sometimes acuminate or mucronate; lemma 2-2.5 mm. long including the mucro or the mucro absent, or occasionally with an awn 1-3 mm. long, pubescent on the lower part. Incl. var. *setigera* Scribn. Dry rocky woods, n.-cen. Tex., rare (Dallas), also recently reported from the Panhandle (Hemphill Co.), Sept.-Oct.; N.H. to Va. and w. to Neb., Kan., Okla. and Tex.

7. *Muhlenbergia brachyphylla* Bush. Perennial from scaly white rhizomes 1-2 mm. thick; aerial culms 3-10 dm. long, 0.5-1.3 mm. thick, erect, moderately geniculately branched near the middle, leafy but the upper 1-10 cm. of the culm usually naked and pedunculiform; ligule a scale about 0.5 mm. long; blades 3-7 cm. long, 2-5 mm. broad, flat, divergent, the older ones falling readily; panicles 3-13 cm. long, 1-2 mm. thick, weak and nodding, usually interrupted in the lower part; glumes 1.2-2.5 mm. long, usually mucronate, the first one conspicuously shorter than the second; lemma about 3 mm. long and with a mucro or short awn usually less than 1 mm. long, pubescent on the lower part; palea about 3 mm. long. Woods near streams, n.-cen. Tex., infrequent, Oct.; Md., Va., and N.C.; also Ind. and Mich. s.w. to Tex.

Perhaps conspecific with *M. sobolifera*.

8. *Muhlenbergia frondosa* (Poir.) Fern. WIRESTEM MUHLY. Perennial from scaly white rhizomes 1-2 mm. thick; aerial culms 3-10 dm. long, 1-2 mm. thick, leafy, profusely geniculately branched near the middle, top-heavy and falling over (then often rooting at the nodes), the naked pedunculiform terminal internodes only 1-4 cm. long or absent; ligule an erose scale 0.5-1 mm. long, not auricled; blades 4-11 cm. long, 1.5-5 mm. broad, flat, ascending or appressed; panicles 3-10 cm. long, when only 1-2 mm. thick then linear but when 3-6 mm. thick tapered to both ends, loose and interrupted; glumes 2.5-3.5 mm. long including the awnlike tip, linear-lanceolate; lemma about 3 mm. long, awnless, pubescent on the lower part; palea about 3 mm. long. Woods, n.-cen. Tex., rare (Dallas and Grayson cos.), Oct.; e. Can. s. to n. Ala. and Tex.

9. *Muhlenbergia glabriflora* Scribn. Like *M. frondosa* but the lemma glabrous and the internodes minutely strigose in a zone just below the nodes (use a strong lens). Woods, n.-cen. Tex., rare (Dallas Co.), late Sept.; Va. s. to N.C.; also Ind. and Ill. s.w. to Tex. No doubt merely a form of *M. frondosa*.

10. *Muhlenbergia sylvatica* (Torr.) Torr. Perennial from scaly rhizomes 1-2.5 mm. thick; aerial culms 4-10 dm. long, 1-3 mm. thick, leafy, moderately branched near the middle, weak and often reclining, the lower nodes rooting, the internodes minutely strigose in a zone just below the nodes (use lens), the terminal internodes short and not pedunculiform; ligule an erose scale 0.5-1.2 mm. long; blades 6-18 cm. long, 2-7 mm. broad, flat, ascending; panicles 4-10 cm. long, 3-5 mm. thick, somewhat spikelike, interrupted, nodding; glumes about 2 mm. long, awnless or with an awnlike tip 0.1-1 mm. long; lemma about 3 mm. long, pubescent in the lower part, with an awn 3-10 mm. long; palea about 3 mm. long. Dense woods, n.-cen. Tex. and e. Edwards Plateau, rare, Aug.-Sept.; s.e. Can. s. to n. Ala. and Tex.

11. *Muhlenbergia racemosa* (Michx.) B.S.P. Perennial from scaly white rhizomes 1-2 mm. thick; aerial culms 3-7 dm. long, 0.5-2.5 mm. thick, erect, leafy, sparingly branched; ligule an erose scale 0.5-1 mm. long, without auricles; blades 4-16 cm. long, 1-7 mm. broad, flat, rather stiffly erect; panicles 2-14 cm. long, 4-11 mm. thick, spikelike but usually interrupted; glumes 1.5-2 mm. long, lanceolate, apically with a stiff awn

2-5 mm. long; lemma 2.5-3.5 mm. long, short-pilose on the lower half, acuminate or the apical portion awnlike; palea nearly equaling lemma. Moist ground, Plains Country, rare (one collection from Perryton, Ochiltree Co.), Sept.-Oct.; most of U.S. w. of Miss. River.

12. *Muhlenbergia andina* (Nutt.) Hitchc. FOXTAIL MUILLY. Perennial from scaly white rhizomes 1-2 mm. thick; aerial culms 25-80 cm. long, 1-1.5 mm. thick, erect, leafy, sparingly branched; ligule a scale about 1 mm. long, laterally with very short auricular points; blades 5-18 cm. long, 1-3 mm. broad (rarely to 5 mm.), flat; panicle 4-12 cm. long, 6-15 mm. thick, spikelike but usually interrupted; glumes 3-4 mm. long, shining, grayish, keeled, awnless; lemma 2-3 mm. long, linear, grayish, glabrous but with a basal callus bearing a beard of hairs 2-3 mm. long and an apical awn 4-8 mm. long; palea nearly equaling lemma. Trans-Pecos, rare (one collection from "Sierra Blanca" suspected of being mislabeled), otherwise known from moist ground at high elev.; w. U.S. e. to Wyo., Colo. and N.M.

13. *Muhlenbergia glauca* (Nees) Mez. Perennial from firm rhizomes 1-2 mm. thick; aerial culms 2-5 dm. long, 1-2 mm. thick, leafy, branched near the ground, stiffly erect; ligule a scale 0.5-1 mm. long, not auricled; blades 2-11 cm. long, 1-3 mm. broad, ascending or usually stiffly appressed, flat, narrowed to a short involute tip; panicles 4-12 cm. long, 3-6 mm. thick, much-interrupted but somewhat spikelike; glumes 1.3-2.5 mm. long, ovate, acute, with a mucro or awn 0.2-1.5 mm. long, occasionally the tip minutely bifid and the awn or mucro borne between the teeth; lemma 2.5-3.5 mm. long, lanceolate, copiously pubescent in the lower part, with an awn 0.5-3 mm. long; palea about as long as lemma. Rocky slopes, usually under shrubbery, at elev. of 4,500-7,000 ft., Trans-Pecos mts., infrequent, July-Oct.; Tex. to s. Calif. and s. to cen. Mex.

14. *Muhlenbergia polycaulis* Scribn. Perennial from numerous short firm rhizomes 1-2 mm. thick; aerial culms 25-40 cm. long, about 1 mm. thick, leafy, profusely branched near the ground, ascending; ligule an erose scale 0.5-1 mm. long, not auricled; blades 3-8 cm. long, about 1 mm. broad, ascending, flat, tapering to an involute point; panicles 3-9 cm. long, 3-6 mm. thick, greatly interrupted, spiciform or the branches occasionally slightly divergent; glumes 1.5-2.3 mm. long, ovate, acute, with an awn 0.5-3 mm. long, occasionally 1 or both minutely bifid, the awn then emerging between the two lobes; lemma 2.2-3.5 mm. long, lanceolate, copiously pubescent in the lower part, with an awn 9-25 mm. long; palea about as long as lemma. Rocky grassy slopes at elev. of 5,500-8,000 ft., Trans-Pecos mts., infrequent, Aug.-Oct.; Tex. to s. Ariz. and s. to cen. Mex.

15. *Muhlenbergia pauciflora* Buckl. Perennial from very short firm rhizomes 1-2 mm. thick or these absent in many prepared specimens; aerial culms 22-60 cm. long, 1-2 mm. thick, often glaucous, leafy, sparingly branched in the lower part, erect or occasionally the lowermost internodes reclining (the nodes then rooting); ligule a lacerate-ciliate scale about 1 mm. long, with slightly longer auricles as extensions of the corners of the sheath; old sheaths becoming flat and often corkscrewlike with age; blades 4-11 mm. long, filiform-involute, deciduous from the sheaths; panicles 4-12 cm. long, 3-15 mm. thick, with short ascending densely-flowered branches; glumes 1.3-3 mm. long, ovate, often mucronate; lemma 3-4.5 mm. long, linear-lanceolate, essentially glabrous (including the callus) or rarely minutely strigose (use lens), with an awn 5-20 mm. long; palea about as long as lemma. Rocky slopes, Trans-Pecos mts. at elev. of 4,500-7,000 ft., infrequent, June-Oct. (usually Aug.-Sept.); Colo. and Ut., s. to Baja Calif., Son. and Chih.

16. *Muhlenbergia montana* (Nutt.) Hitchc. MOUNTAIN MUHLY. Tufted perennial; culms 3-8 dm. long, 0.7-1.7 mm. thick, erect, unbranched; ligule a fragile hyaline scale 3-11 mm. long; blades 1-2 dm. long, about 2 mm. broad, soon involute and arcuate; old sheaths persistent and becoming flat, stramineous and taking on a corkscrewlike twist; panicles 8-25 cm. long, 9-20 mm. broad, much-interrupted and open (or when immature somewhat spikelike); first glume 0.5-1.5 mm. long, elliptic, usually mucronate; second glume 1-2.2 mm. long, with three mucronate teeth; lemma 3-4.5 mm. long, linear-lanceolate, scaberulous in upper half, usually discolored or splotched, the awn 1-2 cm. long. Forested slopes of igneous rocks at elev. of 7,500-8,300 ft., Trans-Pecos mts. (Davis), infrequent, Sept.; Rocky Mts. and Sierra Madre from w. Mont. and Calif. s. to s. Mex.

17. *Muhlenbergia monticola* Buckl. MESA MUHLY. Tufted perennial; culms 13-70 cm. long, 0.5-1 mm. thick, ascending, leafy, densely geniculately branched in the lower part, the sheaths separating from the internodes and exposing the well-developed prophylls; ligule a lacerate-ciliate scale 0.5-2 mm. long; blades 2-11 cm. long, about 1 mm. broad, flat but soon involute; panicle 2-22 (usually 5-10) cm. long, 3-6 mm. thick, spikelike but lax and interrupted, the branches appressed; glumes acute, the first 1.3-1.9 mm. long, the second 1.8-2.3 mm. long; lemma lanceolate, 2.5-3 mm. long, the callus and also usually the lower half pubescent, the awn 10-23 mm. long. Rocky slopes in the Trans-Pecos and w. Edwards Plateau, frequent, summer-fall; Tex. and N.M. to Ariz. s. to cen. Mex.

18. *Muhlenbergia parviglumis* Vasey. Tufted perennial; culms 3-8 dm. long, about 1 mm. thick, ascending, leafy, geniculately branched in the lower part, the sheaths spreading from the internodes and exposing the well-developed prophylls, occasionally the lowest nodes rooting; ligule a lacerate-ciliate scale 1-2 mm. long; blades 4-15 cm. long, 1-2.5 mm. broad, flat or soon involute; panicle 5-22 (usually 8-12) cm. long, 3-10 mm. thick, spikelike but lax and interrupted, the branches appressed; glumes 0.5-1 mm. long, the first slightly shorter than the second; lemma 3-4 mm. long, linear-lanceolate, the callus and occasionally the lower half pubescent, the awn 19-37 mm. long. Rocky slopes, Trans-Pecos mts., infrequent, summer-fall; Tex. and N.M., s.e. to n.e. Mex.

19. *Muhlenbergia Schreberi* J. F. Gmel. NIMBLEWILL MUHLY. Perennial with stolons about 1 mm. thick, freely rooting; flowering culms 1-4 dm. long, 0.5-1 mm. thick, weak, ascending; ligule an erose scale about 0.5 mm. long, not auricled; blades 3-8 cm. long, 1-4 mm. broad, weak, flat, diverging from culm at right angles; panicles 5-12 cm. long, 1-3 mm. thick, spikelike but lax and interrupted, weak and nodding; glumes minute, 0.1-0.3 mm. long, muticous; lemma about 2 mm. long, linear-lanceolate, with an awn 1.5-6 mm. long; palea about 2 mm. long. Moist usually shaded ground near streams and marshy areas, e., s.e. and n.-cen. Tex. and e. Edwards Plateau and n. Rio Grande Plains, scattered but locally abundant, spring-fall; e. U.S., w. to Neb., Kan., Okla. and Tex.

20. *Muhlenbergia rigida* (H.B.K.) Kunth. PURPLE MUHLY. Tufted perennial; culms 5-10 dm. long, 1-2 mm. thick (thicker at the very base), erect, unbranched; ligule a lacerate stiff scale 3-15 mm. long, splitting in age and then resembling auricles on the sheaths; blades mostly in the lower half of the plant, mostly 15-35 cm. long, flat and 1.5-3 mm. broad or usually involute; old sheaths occasionally flattened and assuming a corkscrew twist; panicles 15-40 cm. long, either 2-4 cm. thick or usually at length broader and subpyramidal, diffuse and open; glumes 1-1.3 mm. long, ovate; lemma 4-5 mm. long, linear-lanceolate, dark-purple, essentially glabrous, with an awn 10-22 mm. long; palea slightly shorter than lemma. Sunny rocky slopes usually in soil derived from dark igneous rocks, at elev. of 5,000-7,500 ft., Trans-Pecos mts., frequent, late Aug.-early Nov.; Tex. to Ariz. and s. to s. Mex.

21. *Muhlenbergia setifolia* Vasey. Tufted perennial; culms 2-8 dm. long, about 1 mm. thick, erect, unbranched; ligule a lacerate stiff scale 2-7 mm. long, in age splitting and resembling auricles on the sheath; blades mostly crowded in the lower half of the plant, mostly 5-17 (rarely to 25) cm. long, about 1 mm. broad but usually closely involute, very fine and irregularly arcuate (the old sheaths occasionally becoming flattened and assuming a corkscrew twist); panicles 7-20 cm. long, usually 2-3 cm. thick, with ascending branches but occasionally open and subpyramidal, diffuse glumes 1.5-2.1 (rarely to 2.5) mm. long, ovate; lemma 3.5-5 mm. long, linear-lanceolate, stramineous, essentially glabrous except on the callus, with an awn 10-28 mm. long; palea slightly shorter than lemma. Sunny rocky slopes usually in shallow soil derived from limestone, at elev. of 3,500-7,000 ft., frequent in the Trans-Pecos, rare to w. Edwards Plateau, summer-fall; Tex. and N.M. s. to Coah.

22. *Muhlenbergia arenicola* Buckl. SAND MUHLY. Tufted perennial, the innovations at the crown short and subrhizomatously spreading; culms 15-65 cm. long, 0.5-1 mm. thick, erect, unbranched, with few remote leaves; ligule a hyaline delicate scale 3-10 mm. long, often splitting and the parts resembling auricles on the corners of the sheaths; sheaths often inconspicuously keeled; blades mostly aggregated at the base of the plant, 4-14 cm. long, 1-2 mm. broad, usually folded or sometimes involute and irregularly arcuate; panicles 10-25 cm. long at maturity, 5-13 cm. broad and subpyramidal, very

open and diffuse; glumes 1.7-3 mm. long, lanceolate, acuminate, often mucronate; lemma 2.5-3.5 mm. long, linear-lanceolate, glabrous, with an awn 0.5-3.5 mm. long; palea about as long as lemma. Dry grassy hills and alluvial flats in the Trans-Pecos, w. Edwards Plateau and Plains Country, abundant, summer-fall; Kan. to Ariz. and s. to n. Mex.

Intergrading with *M. Torreyi* and perhaps not separable from it.

23. *Muhlenbergia Torreyi* (Kunth) Hitchc. RINGGRASS MUHLY. Much like *M. arenicola* but the blades only 2-4 cm. long and 0.3-0.5 mm. broad when unfolded, mostly involute-filiform and distinctly regularly arcuate to form a compact curly mass at the base of the plant. Arid limestone slopes, Trans-Pecos (Hueco and Delaware) mts., apparently infrequent, summer-fall; Wyo. s. to Ariz. and e. to Kan. and Tex.

24. *Muhlenbergia Porteri* Scribn. BUSH MUHLY. Perennial from hard but rather loose knotty bases; culms 3-11 dm. long, 0.5-1 mm. thick, very weak, growing up through shrubbery, much-geniculate bushy-branched; sheaths often separating from the internodes revealing the well-developed prophylls; nodes commonly swollen; ligule a lacerate-ciliate hyaline scale 1-2 mm. long; blades 1-4 (-8) cm. long, 1-2 mm. broad, flat or soon involute; panicle 5-10 cm. long, 4-8 cm. broad, ovoid, very open, diffuse, few-flowered; glumes 1.8-3 mm. long, linear, often very attenuate apically; lemma about 3 mm. long, purple, linear-lanceolate, glabrous, with an awn 5-13 mm. long. Among desert shrubs on loamy soil or rocky slopes, common in the Trans-Pecos, infrequent in Edwards Plateau and s. Plains Country, summer-fall; Colo. to Nev. and s. to n. Mex.

25. *Muhlenbergia pungens* Thurb. Loosely tufted perennial; culms 15-50 cm. long, rhizomatously spreading and rooting at the base, then ascending, 1.5-3 mm. thick below, the erect flowering culms less than 1 mm. thick; ligule a lacerate-ciliate scale about 1 mm. long; blades 2-4 cm. long, narrow, closely involute, firm and stiff-pointed; panicles 5-15 cm. long, 3-7 cm. broad, very open, diffuse, peculiarly interrupted, consisting of 2 to 8 main branches (each of these paniculate-branched and few-flowered); first glume 2-2.5 mm. long, ovate, stramineous, acute, entire or 3-toothed; second glume 2.5-3 mm. long, broadly ovate, stramineous, acute, entire or 3-toothed; lemma 3-4 mm. long, linear-lanceolate, purple, with an awn about 1 mm. long; palea 3-4 mm. long, slightly surpassing the body of the lemma, apically minutely bidentate by the excurrence of the 2 nerves. Loose sandy soil, dune areas and sandy-clay hills in Plains Country, rare, late summer; w. S.D., to Ut. and s. to Tex., N.M. and Ariz.

26. *Muhlenbergia capillaris* (Lam.) Trin. GULF MUHLY. Tufted perennial; culms 6-11 dm. long, 1-2 mm. thick, erect, leafy, unbranched; ligule a firm scale 3-7 mm. long, lacerate with age, not auricled; blades 1-4 dm. long, 1.5-3 mm. broad when flat but soon closely involute, ascending; old sheaths at base of plant (especially after fire or severe grazing) persisting and tending to fray into a fibrous mass; panicles 20-35 cm. long, ovoid to subpyramidal, very open and diffuse, the branches numerous and spreading; glumes 1.5-3 mm. long, lanceolate, acuminate or irregular apically, the second glume with a mucro or short awn; lemma 3.5-5 mm. long, linear-lanceolate, purple, often bifid apically, with an awn 5-15 mm. long; palea as long as lemma, apically often minutely bifid. Incl. var. *filipes* (M. A. Curtis) Beal and var. *trichopodes* (Ell.) Vasey, *M. expansa* (DC.) Trin. Sandy prairies and openings in pine forests, e. and s.e. Tex., infrequent, late summer-fall; Mass. to Ind. and Kan., s. throughout s.e. U.S.; W. I.; s.e. Mex.

27. *Muhlenbergia Reverchonii* Vasey & Scribn. Tufted perennial; culms 35-80 cm. long, about 1 mm. thick, erect, unbranched; ligule a firm scale 3-7 mm. long, lacerate with age, not auricled; blades 7-35 cm. long, 1-2 mm. broad when flat but soon closely involute, arcuate toward the fine point, aggregated in the lower half of the plant; panicles 2-3 dm. long, oblong to subpyramidal, very open and diffuse, the branches numerous and spreading; glumes 1-2.5 mm. (rarely to 3 mm.) long, lanceolate, usually acute; lemma 3.5-5 mm. long, linear-lanceolate, apically rarely minutely bifid, with an awn 0.5-7 mm. long; palea as long as lemma, occasionally minutely bifid. Grassy limestone slopes, e. Edwards Plateau and n.-cen. Tex., frequent, often abundant, summer-fall; also Okla.

28. *Muhlenbergia involuta* Swall. Tufted perennial; culms 6-15 dm. long, 1.5-2 mm. thick, erect, unbranched; ligule a scale 3-11 mm. long, lacerate with age, not auricled;

blades 10-45 cm. long, 2-5 mm. broad when flat but soon closely involute and arcuate, the sheaths folded and often roundly or somewhat obscurely keeled; panicles 17-45 cm. long, 2-5 cm. broad, open and loose, the branches ascending and with only very short naked portions basally; glumes 1.8-3 mm. long, usually acute; lemma 3.5-4 mm. long, lanceolate, usually very minutely bifid apically, with an awn from between the teeth 0.5-2 mm. long; palea as long as lemma. Rocky prairies and uplands, usually near small streams, e. Edwards Plateau, frequent, fall; endemic.

Perhaps not distinct from *M. Lindheimeri* or perhaps representing the products of ancient hybridization between *M. Lindheimeri* and *M. Reverchonii*.

29. *Muhlenbergia Lindheimeri* Hitchc. Tufted perennial; culms 7-15 dm. long, 1.5-3 mm. thick, erect, unbranched; ligule a thin pointed scale 8-15 mm. long, lacerate with age, not auricled; blades 15-50 cm. long, 2.8-5 mm. broad when flat but usually sharply folded or soon closely involute and arcuate; sheaths folded and sharply keeled; panicles 15-45 cm. long, 1-2 (-3) cm. thick, nearly spikelike but much-interrupted, the branches 1-4 cm. long, appressed, floriferous to the base; glumes 2-4 mm. long, linear, acute; lemma 2.7-4 mm. long, acute, glabrous or only minutely pubescent, awnless or with an awn to 3 mm. long. Limestone uplands, usually near small streams, Edwards Plateau, infrequent, fall; endemic.

30. *Muhlenbergia Emersleyi* Vasey. BULL MUHLY. Tufted perennial; culms 5-10 dm. long, 2-3 mm. thick, erect (except at the very base shortly subrhizomatous), leafy; ligule a thin soon lacerate scale 10-25 mm. long; blades 1-3 (-5) dm. long, 2-5 mm. broad when flat, soon folded and sharply keeled; sheaths folded and sharply keeled; panicles 12-40 cm. long, 1-4 cm. broad, rather densely flowered; much-interrupted, the branches 3-10 cm. long, mostly appressed, the basal third of each branch naked; glumes 2-3.5 mm. long, linear, acute or obtuse; lemma 2.3-4 mm. long, dark-gray or purplish-gray, lanceolate, acute, shortly villous in the lower part, awnless or with an awn to 15 mm. long. Rocky grassy slopes in the Trans-Pecos, abundant, late summer-fall; Tex. and N.M. to Ariz. and s.e. to Guat.

31. *Muhlenbergia rigens* (Benth.) Hitchc. DEERGRASS. Coarse tufted perennial; culms 10-15 dm. long, 1.5-4 mm. thick, erect, unbranched; ligule a firm mucicous scale 1-2 mm. long; blades very firm, 2-5 dm. long, 3-4 mm. broad at the very base where flat but mostly firmly involute, nearly straight; panicle 2-6 dm. long, 4-13 mm. thick, dense and spikelike, rarely branched and interrupted in the lower part; glumes about 3 mm. long, rarely as short as 2 mm., usually mucronate or with a minute awn; lemma about 3 mm. long, often with a mucro or minute awn, often surpassed by the glumes; palea almost equaling lemma. *M. Marshii* I. M. Johnst. Loamy flats, usually along small streams, Trans-Pecos mts., locally abundant, July-Oct.; Tex. and N.M. to Calif. and s. to n. Mex.

32. *Muhlenbergia dubia* Fourn. PINE MUHLY. Tufted perennial; culms 5-10 dm. long, 1-2 mm. thick, erect, unbranched; ligule a firm scale 3-15 mm. long; blades mostly aggregated toward the lower part of the plant, 1-4 dm. long, closely involute and irregularly arcuate; panicles 15-30 (-40) cm. long, 5-10 mm. thick, spikelike, the slender branches appressed, naked basally; glumes 1.2-2.3 mm. long, oval; lemma (3.5-) 4-5 mm. long, linear-lanceolate, stramineous to purpurescent, essentially glabrous, with a mucro or an awn 0.2-6 (or rarely to 15) mm. long. *M. acuminata* Vasey, *M. Metcalfei* M.E. Jones. Rocky slopes, Trans-Pecos mts. at elev. of 5,000-7,000 ft., infrequent, Aug.-Oct.; Tex. and N.M. to S. L. P.; Pue.

33. *Muhlenbergia arenacea* Buckl. EAR MUHLY. Perennial with creeping scaly much-branched rhizomes 1-2 mm. thick; aerial culms 10-35 cm. long, 0.5-1 mm. thick, ascending, bushy-branched at the base and leafy in the lower half with numerous short internodes; ligule a thin often lacerate white scale about 0.5 mm. long, with longer points or acute auricles over the corners of the sheaths; blades 1-2 (rarely to 4) cm. long, about 1 mm. broad, flat or folded, the whitish midrib forming a keel; panicles 7-15 cm. long, 5-12 cm. broad, ovoid-acute to subpyramidal, very open and diffuse; glumes 0.9-1.3 mm. long, narrowly ovate, acute; lemma 1.5-2 mm. long, usually dark-brown, linear-lanceolate, awnless but occasionally mucronate, glabrous; palea about equaling lemma. Alluvial sandy or loamy soil in desert flats and stream valleys in the Trans-Pecos, Edwards Plateau and s. Plains Country, locally forming nearly pure cover over acres of ground, summer-fall; Colo. and Ariz. s. to Zac.

34. *Muhlenbergia asperifolia* (Nees & Mey.) Parodi. SCRATCHGRASS MUHLY. Perennial from elongate scaly rhizomes 1.5-2 mm. thick; aerial culms 1-6 dm. long, about 1 mm. thick, mostly weak and reclining, ascending only at the floriferous ends, sparsely branched; ligule a mucous scale about 0.5 mm. long, not auricled; blades 2-7 (-14) cm. long, 1-3 mm. broad, flat or folded, mostly rapidly ascending; panicle 5-18 cm. long, 4-15 cm. broad, ovoid, very open, diffuse, few-flowered; glumes 0.6-1 (rarely to 1.5) mm. long, acute; lemma 1.2-1.5 mm. long, dark, awnless; palea about equaling lemma. Moist alluvial soil near streams and ditches, Plains Country and Trans-Pecos, infrequent, late summer-fall; w. N. A. e. to Ill., Okla. and Tex.; s. S. A.

35. *Muhlenbergia minutissima* (Steud.) Swall. Tufted annual; culms 10-35 cm. long, 0.4-1 mm. thick, geniculately branched near the base; ligule a hyaline soon lacerate scale about 2 mm. long, not auricled; blades 3-10 cm. long, 1-2 mm. broad, usually flat, folded or involute on drying, minutely pubescent; panicles 1-2 dm. long, 2-3 cm. broad, open and diffuse, the numerous main branches often flexuous, ascending, much-branched secondarily; glumes 0.6-1 mm. long, minutely pubescent (use strong lens); lemma 1.2-2 mm. long, very finely pubescent, broadly elliptical, blunt or apically minutely bifid, awnless or with an awn to about 1 mm. long; palea about equaling lemma. *M. texana* Buckl., *M. sinuosa* Swall. Rocky grassy slopes at high elev. of about 8,000 ft., Trans-Pecos (Davis Mts.), rare, late summer-fall; Mont. to Wash. and s. to Mex.

36. *Muhlenbergia fragilis* Swall. Tufted annual; culms 10-35 cm. long, 0.4-1 mm. thick, remarkably geniculately branched near the base; ligule a hyaline soon lacerate scale about 2 mm. long, not auricled; blades 3-10 cm. long, 1-2 mm. broad, minutely pubescent, flat or folded; panicles 7-20 cm. long, 3-7 cm. broad, open and diffuse, the numerous main branches diverging at nearly right angles, nearly straight, much-branched secondarily, the branchlets also divaricate, nearly straight; glumes 0.6-0.7 mm. long, glabrous; lemma 1-1.3 mm. long, glabrous or very finely pubescent, broadly elliptical, blunt or minutely apically bifid, awnless; palea about equaling lemma. Rocky grassy slopes at elev. of 4,000-7,000 ft., Trans-Pecos mts., infrequent, late summer-fall; Tex. and N.M. to Ariz., s. to s. Mex.

37. *Muhlenbergia eludens* C. G. Reeder. Tufted annual; culms 10-35 cm. long, 0.5-1 mm. thick, sparsely and slightly geniculately branched near the base; ligule a hyaline scale about 2 mm. long, not auricled; blades 3-8 cm. long, 1-2 mm. broad, minutely pubescent, flat or soon involute; panicles 7-22 cm. long, 2-5 cm. broad, open and diffuse, the numerous main branches arcuately ascending, weak, with short mostly appressed secondary branchlets; glumes 1-1.5 mm. long, minutely pubescent (use strong lens); lemma 1.5-2 mm. long, lance-elliptic, very finely pubescent, apically minutely bifid and with a readily deciduous awn 1-2 mm. long; palea about equaling lemma. Rocky slopes, Trans-Pecos mts., rare, fall; Tex. and N.M. to Ariz. and s. to Baja Calif., Son. and Dgo.

91. LEPTOCHLOA BEAUV.

SPRANGLETOP

Spikelets 3- to 12-flowered, the lower 1 or 2 florets perfect, the rest staminate or neutral; spikelets sessile and overlapping, appressed in two rows along one side of a nearly terete rachis (the rachis with its two rows of spikelets being called a "raceme," the total inflorescence being a panicle of 4 to 90 of these racemes attached along an axis, the axis being elongate, or in *L. chloridiformis* reduced and subdigitate, much as in *Chloris*); zone of abscission just below each lemma, the marginal basal portion of the lemma pubescent or (in *L. dubia*) nearly glabrous.

A genus of about 27 species in the warmer parts of the world.

1. Racemes subdigitate8. *L. chloridiformis*.
1. Raceme attachments more remote, scattered along at least several cm. of the panicle axis (2)
- 2(1). Lemma 1-1.5 mm. long (3)
2. Lemma at least 1.8 mm. long (5)
- 3(2). Panicles more than 10 times as long as broad; racemes stiffly ascending or appressed5. *L. Nealleyi*.
3. Panicles much less than 10 times as long as broad (4)

- 4(3). Sheaths papillose-pilose; lemma blunt; plants annual
7. *L. filiformis*.
4. Sheaths glabrous or if pilose not papillose; lemma acute; plants perennial
6. *L. virgata*.
- 5(2). Glumes 3-5 mm. long; lemma emarginate; plant perennial
1. *L. dubia*.
5. Glumes shorter; lemma sometimes minutely bifid but not emarginate; plants annual
 (6)
- 6(5). Racemes usually more than 40 per panicle; spikelets 3.5-4.5 mm. long; lemmas
 about 2 mm. long, acute4. *L. panicoides*.
6. Racemes usually fewer than 40 per panicle; spikelets 4-10 mm. long; lemmas 1.8-4
 mm. long (7)
- 7(6). Lemmas lance-elliptic, acute and acuminate, 2.5-4 mm. long
2. *L. fascicularis*.
7. Lemmas obovate, blunt, 1.8-3 mm. long3. *L. uninervia*.

1. *Leptochloa dubia* (H.B.K.) Nees. GREEN SPRANGLETOP. Tufted perennial; culms 25-115 cm. long, 1-4 mm. thick, erect, leafy, unbranched; ligule a dense row of cilia 0.3-1.2 mm. long; blades 5-30 cm. long, 1-10 mm. broad, flat or soon involute; sheath keeled and corner of sheath (and also less commonly the entire summit dorsally) pilose; panicles 5-20 cm. long; racemes 3 to 13, remote, ascending, 2-15 cm. long, 3-6 mm. thick; spikelets not laterally compressed, overlapping, 5-10 mm. long, 3- to 9-flowered; glumes 3-5 mm. long, acute; lemma oblong, emarginate, sometimes mucronate, glabrous except commonly minutely appressed-strigose near the margins on the lower half. Rocky slopes and alluvial loams in the Trans-Pecos, Plains Country, Edwards Plateau and Rio Grande Plains, abundant, spring-fall; w. Okla. to Ariz. and s.e. to s. Mex.; also s. Fla. and Arg.

Green sprangletop is locally abundant enough to have considerable forage value.

2. *Leptochloa fascicularis* (Lam.) Gray. Tufted annual; culms 2-9 dm. long, 2-3 mm. thick, erect or geniculately ascending, sparingly branched, leafy, soft; ligule a hyaline scale 2.5-6 mm. long, usually lacerate into several strap-shaped parts, the lateral portions resembling auricles on the sheaths; blades 5-35 cm. long, 2-10 mm. broad, flat or soon involute; panicles 15-30 cm. long, 2-5 cm. broad, usually partly included in the sheath; racemes 14 to 35, widely spaced on the panicle axis but appressed or ascending and overlapping, 3-11 cm. long, 3-5 mm. thick; spikelets scarcely laterally compressed, overlapping, 5-10 mm. long, 6- to 12-flowered; glumes 1.5-3.5 mm. long, acute; lemma lance-elliptic, 2.5-4 mm. long, acute or acuminate to mucronate or short-awned, pubescent near the margin in the lower half, the hairs conspicuous from the side of the spikelet under a lens. Muddy areas, sometimes alkaline or subsaline mud, Plains Country, Trans-Pecos, Rio Grande Plains, and n.-cen. and s.e. Tex., scattered but locally abundant, summer-fall; widespread in the warmer parts of the New World n. to N. E., N.D. and Wash. (See remark under *L. uninervia*.)

3. *Leptochloa uninervia* (Presl) Hitchc. & Chase. Much like *L. fascicularis*, identical in habit; racemes 20 to 40, 2-8 cm. long; spikelets 4-9 mm. long; glumes and lemmas much less acute, the latter 1.8-3 mm. long, obovate and obtuse or mucronate, sometimes mucronate, the pubescence inconspicuous or hidden when spikelet is viewed from the side. Mud, sometimes alkaline or subsaline mud, Edwards Plateau, Rio Grande Plains, s.e. and Trans-Pecos Tex., to be expected in n.-cen. Tex. and the Plains Country, scattered, spring-summer, rarely into fall; widespread but scattered in the warmer parts of the New World n. to N. E., Okla., Colo., Ut. and Ore. Perhaps only a form of *L. fascicularis*.

4. *Leptochloa panicoides* (Presl) Hitchc. Tufted annual; culms 5-10 dm. long, 2-6 mm. thick, erect, sparingly or not branched, leafy, soft; ligule a hyaline usually lacerate scale 2-4 mm. long; blades 2-5 dm. long, 3-10 mm. broad, folded or drying involute; sheaths sharply keeled; panicles 1-2 dm. long, 3-6 cm. wide; racemes 40 to 90, crowded, ascending, 2-5 cm. long, 2-3 mm. thick; spikelets laterally compressed, closely overlapping, 5- to 7-flowered, 3.5-4.5 mm. long; glumes and lemma acute, about 2 mm. long, mucronate, pubescent laterally on the lower part. Mud, e. and s.e. Tex., rare, spring-fall; nat. of Braz.; Mo. to Miss., Ark. and Tex.; adv. in India.

5. *Leptochloa Nealleyi* Vasey. Tufted annual; culms 5-15 dm. long, 1.5-6 mm. thick, erect, unbranched, leafy; ligule a somewhat lacerate scale 1-3 mm. long; blades 1-4 dm. long, 2-7 mm. broad, flat or basally folded or drying involute; sheaths sharply keeled; panicles 2-5 dm. long, 1-3 cm. broad; racemes 25 to 85, overlapping, 1-10 cm. long, about 2 mm. thick, stiffly ascending or appressed; spikelets laterally compressed, closely overlapping, 3- or 4-flowered, 2-3 mm. long; glumes and lemmas about 1 mm. long, the former acute, the latter blunt and awnless with slightly pubescent nerves. Mud, near the coast, s.e. Tex. and Rio Grande Plains, scattered, spring-fall; coastal areas, Tam. to La.

6. *Leptochloa virgata* (L.) Beauv. Tufted perennial (sometimes flowering the first year); culms 25-90 cm. tall, 1-2 (-3) mm. thick, erect, sparingly geniculately branched in the lower part; ligule a lacerate-ciliate scale 0.3-0.5 mm. long, usually with longer cilia to 2 mm. long; blades 3-25 cm. long, 1.5-7 mm. broad, flat or quickly involute, glabrous or somewhat pilose basally; sheaths glabrous or pilose; panicles 4-20 cm. long; racemes 4 to 14, remote, ascending, 2-12 cm. long, 2-3 mm. thick; spikelets strongly laterally compressed, 2-4 mm. long, 3- to 8-flowered; lemma about 1.5 mm. long, acute, awnless or the lower ones with awns to 3 mm. long, pubescent near the margins, apically minutely bifid. *L. domingensis* (Jacq.) Trin. Loamy soil, Rio Grande Plains, locally common, summer-early winter; widespread in the warmer parts of the New World n. to s. Fla. and Tex.

7. *Leptochloa filiformis* (Lam.) Beauv. RED SPRANGLETOP. Tufted annual; culms 2-9 dm. long, 1-3 mm. thick, geniculate and occasionally rooting at lower nodes, sparingly branched, ascending, leafy, soft; ligule a hyaline somewhat lacerate scale about 1 mm. long; blades 2-20 cm. long, 1.5-10 mm. broad, flat; sheaths papillose-pilose; panicles 7-35 cm. long, 2-21 cm. broad; racemes 7 to 70, remote, 1-15 cm. long, 1-2 mm. thick, diverging from axis at angles of 40°-90°; spikelets not much-compressed laterally, 1.4-2.6 mm. long, 3- or 4-flowered, barely overlapping; glumes lanceolate, acute, the second one surpassing the lowest lemma; lemma blunt, 1-1.5 mm. long, awnless, pubescent on the nerves. Moist soil and mud, e., s.e. and n.-cen. Tex., Rio Grande Plains and rarely w. to e. Plains Country, scattered, late spring-fall; widely distributed in the warmer parts of the New World n. to Va., Ind., Ill., Mo., Kan., N.M., Ariz. and Calif.

8. *Leptochloa chloridiformis* (Hack.) Parodi. Tufted perennial; culms 5-15 dm. long, 1.5-5 mm. thick, erect, unbranched; ligule a lacerate-ciliate scale about 1 mm. long and sometimes also a loose fringe of cilia 5-10 mm. long; blades 25-70 cm. long, 2-7 mm. broad, pilose near the ligule, flat or soon involute; panicles 10-17 cm. long, flabellate; racemes 5 to 20, originating at near the same level (subdigitate), 10-15 cm. long, 2-3 mm. thick; spikelets strongly laterally compressed, about 4 mm. long, mostly 3-flowered; lemma about 3 mm. long, acute, pubescent near the margins, minutely apically bifid and with a mucro between the teeth. Disturbed clay-loam soil, extreme s. Rio Grande Plains (Cameron Co.), rare, introd. and not persistent; Parag., Arg.; Tex.

92. TRICHONEURA ANDERSS.

A genus of 9 species, 6 in Africa, 1 in Peru, 1 in the Galapagos Islands and our species.

1. *Trichoneura elegans* Swall. SILVEUS-CRASS. Tufted annual; culms 3-11 dm. long, 1-3 mm. thick; markedly geniculate in basal half, reclining and occasionally rooting at lowermost nodes and somewhat branched, ascending in the distal half; ligule a hyaline scale 1-3 mm. long; blades of midculm 7-35 cm. long, 4-8 mm. broad, flat or eventually drying loosely involute, appressed or ascending; sheaths with a very slight auricular point at the corner; panicle 6-22 cm. long, 2-8 cm. broad, vaguely ovoid, the axis viscid; racemes 5 to 23 per panicle, 1-6 cm. long, 3-7 mm. thick, ascending or at length deflexed and arcuate-reflexed; spikelets nearly sessile, broadly overlapping, yellowish green, 5- to 8-flowered, 7-10 mm. long, laterally somewhat compressed, subsecund in 2 rows along the abaxial side of the rachis; glumes about equal, lanceolate, 7-10 mm. long including a long almost awnlike acumination, surpassing most or all the lemmas, persistent; rachilla long-hirsute near the florets; zone of abscission just below the florets; lemmas strongly nerved, long white-hirsute on the lateral nerves, apically minutely notched; florets mostly perfect, only the upper 1 to 3 of them neutral or merely staminate.

Dry loose sandy soil, often in dune areas, Rio Grande Plains, locally abundant, fall, rarely also early spring; also Tam.

93. TRIPOGON R.&S.

A genus of 20 species of tropical Africa and Asia; one in the Western Hemisphere.

1. *Tripogon spicatus* (Nees) Ekman. Densely tufted perennial; culms 10-25 cm. long, 0.2-0.3 mm. thick, erect, unbranched; ligule a ciliate fringe about 0.3 mm. long; blades aggregated toward the base of the plant, 2-6 cm. long, about 0.5 mm. broad when flat but soon involute-filiform, erect; corners of sheaths with a minute tuft of white hairs; spike solitary, erect or slightly nodding, interrupted, 2-9 cm. long, about 2 mm. thick; spikelets slightly overlapping or at the base of the spike so remote as not to overlap, 8- or 12-flowered, 5-10 mm. long, about 1 mm. broad, sessile, attached in 2 rows along one side of the spike, slightly laterally compressed, usually plumbeous; first glume about 1 mm. long; second glume about 2 mm. long; both glumes narrow, elongate, acuminate, persistent; zone of abscission below each lemma; lemma strongly 3-nerved, about 2 mm. long, apically notched and with a very short awn, basally tufted; most of the florets perfect, only the upper 1 to 3 neutral or merely staminate. In crevices of granite and on slopes among granite boulders, e. part of Edwards Plateau, locally frequent, also rare in sandy soil in s. part of n.-cen. Tex., spring-fall, after rains; Tex.; Mex.; Cuba; S. A.

94. ELEUSINE GAERTN.

A genus of about 9 species of warmer parts of the Old World; one adventive in Texas.

1. *Eleusine indica* (L.) Gaertn. GOOSEGRASS. Tufted annual; culms 2-10 dm. long, 1.5-5 mm. thick, the lower few internodes commonly reclining and stoloniform, rooting at the nodes, the rest ascending, leafy, sparingly branched; ligule a lacerate scale 0.1-1 mm. long or nearly obsolete; blades 7-38 cm. long, 2-8 mm. broad, ascending, often pilose near the ligule; sheaths often pilose on the corners; panicle flabellate, the axis only 5-40 cm. long, usually with most of the spikes digitate and terminal but often with 1 or 2 spikes attached at a lower level; spikes (1 or) 2 to 6 per panicle; (1-) 3-9 (-16) cm. long, 3-5 mm. thick, ascending; spikelets nearly sessile, very crowded, 4- to 7-flowered, 3-7 mm. long, strongly laterally compressed, arranged in 2 rows along one side of the narrow flattened rachis; glumes unequal, usually shorter than the lowermost lemma, persistent; zone of abscission below each lemma; lemmas essentially glabrous, the strong 3 nerves close together, forming a keel; most of the florets perfect. Weed in disturbed areas, especially in gardens, yards and around farm houses, common in Rio Grande Plains and s.e. Tex., less abundant in e. and n.-cen. Tex., e. Plains Country and Edwards Plateau, summer-fall; nat. of Euras., adv. and widespread in the warmer parts of Am., n. to N. E., Mich., Wisc., S.D., Colo., Ut. and Ore.

95. DACTYLOCTENIUM WILLD.

A genus of 10 species of the warmer parts of the Old World; at least one of them now widely adventive in the New World.

1. *Dactyloctenium aegyptium* (L.) Beauv. CROWFOOT. Annual; culms (3-) 15-40 (-100) cm. long, 1-3 mm. thick, stoloniferous below and rooting at the nodes, distally ascending, leafy; ligule a lacerate scale 0.1-0.4 mm. long or obsolete; blades 2-20 cm. long, 2-9 mm. broad, flat or folded, papillose-pilose on the margins and upper surface; sheaths loose, roundly keeled at dorsal summit; panicles flabellate, of digitately arranged spikes (rarely 1 spike attached at a lower level than the rest); spikes (1 or) 2 to 7 per panicle; 1-6 cm. long, 3-7 mm. thick, divergent-ascending; spikelets sessile, very crowded, 3- to 5-flowered, 2-4 mm. long, strongly laterally compressed, arranged in 2 rows along one side of the narrow flattened rachis; glumes shorter than the lowermost lemma, about 2 mm. long, the first one acute and awnless, persistent; second glume blunt but with a

hooked awn about 1 mm. long and deciduous; zones of abscission between the first and second glumes and below each lemma; lemmas 3-nerved (the lateral nerves near the margin and indistinct), about 2 mm. long, with an awn or narrow acuminate awnlike tip about 1 mm. long; all but the terminal floret perfect. Weedy sandy soil or moist garden loam, disturbed areas, common in Rio Grande Plains and s.e. Tex., less common n. to e. and n.-cen. Tex. and Edwards Plateau, summer-fall; nat. of Old World trop., introd. and widespread in Am., n. to N. E., Ill., Colo. and Calif. (persistent n. only to Va., the Gulf States, Ariz. and Calif.).

96. CYNODON RICH.

A genus of perhaps 10 species of the warmer parts of the Old World; one species now nearly ubiquitous in warmer parts of the whole world.

1. *Cynodon Dactylon* (L.) Pers. BERMUDA GRASS, PATA DE GALLO. Rhizomatous and stoloniferous perennial; aerial culms 1-4 (-10) dm. long, 1-2 mm. thick, the lower portions stoloniferous and much-branched, distal portions ascending; ligule a double fringe of cilia, a shorter denser fringe about 0.5 mm. long and sparser hairs 1-2 mm. long; blades 1-8 (-13) cm. long, 1-4 mm. broad, mostly flat or folded, ascending; sheaths pilose at the corners; panicles flabellate, of digitate spikes; spikes 3 to 7 (usually 4 or 5) per panicle, 1-6 cm. long, about 1 mm. thick, ascending; spikelets sessile, very crowded, 1-flowered, 1.5-2 (-2.5) mm. long, strongly compressed, arranged in 2 rows along and appressed to one side of the very narrow rachis; glumes 1-1.5 mm. long, narrow, acute, persistent, the single nerve forming a keel; zone of abscission below the lemma; lemma 1.5-2 mm. long, awnless, slightly cartilaginous, pubescent on the dorsal keel, with lateral nerves very near the margin. *C. maritimus* H.B.K. Loamy, usually alluvial, seasonally moist, sometimes alkaline or subsaline, soils, nearly throughout the state, most abundant in the coastal areas of s.e. Tex. and Rio Grande Plains, spring-summer-fall and in the extreme s. in winter; nat. of Euras., introd. and ubiquitous in disturbed areas, warmer parts of Am. n. to N.E., Mich., Ia., Colo., Ut., Nev. and Ore.

Very important as a forage in tame pastures, and as a lawn grass.

97. WILLKOMMIA HACK.

A genus with 3 species in Africa, one in temperate South America and one in Texas.

1. *Willkommia texana* Hitchc. Tufted perennial; culms 2-4 dm. long, 0.5-1 mm. thick, erect, unbranched; ligule obsolete or a fringe of cilia 0.1-0.6 mm. long; blades mostly crowded toward the base of the tuft, 3-11 cm. long, 1-3 mm. broad, flat or round-keeled or usually involute at least distally and in age; panicles almost spikeletlike, 8-18 cm. long, 3-7 mm. broad, often partially included in the uppermost sheath; spikes 6 to 20 per panicle, 2-4 cm. long, about 1 mm. thick, strictly ascending or usually appressed; spikelets sessile, very crowded, 1-flowered, 3.1-4.6 mm. long, not much-compressed, arranged in 2 rows along and appressed to one side of the narrow flattened rachis; first glume about two thirds as long as the spikelet, obtuse; second glume acute, 1-nerved, surpassing the lemma; zone of abscission just below the lemma; lemma awnless, densely pubescent dorsally, 3-nerved, the lateral nerves near the margins. Bare tight calcareous clay-loam, s.e. Tex. and n. Rio Grande Plains, rare, also said to occur in n.-cen. Tex., Apr.-May; endemic.

98. SCHEDONNARDUS STEUD.

TUMBLEGRASS

A monotypic genus in Canada and the United States.

1. *Schedonnardus paniculatus* (Nutt.) Trel. Tufted perennial (flowering first year); culms 7-50 cm. long, 0.5-1.5 mm. thick, much-geniculate and -branched in the lower half, ascending; ligule a pointed eventually lacerate scale 1-3.5 mm. long; blades 1-7 (-13) cm. long, 0.6-3 mm. broad, ascending, mostly folded, eventually drying wavy and taking on a corkscrewlike twist; upper part of sheath keeled; panicles very diffuse, at anthesis 1-2 dm. long, eventually elongating to 2-4 dm. long, the axis taking on a

loose helical curve, breaking basally and the whole panicle rolling before the wind as a tumbleweed; spikes 3 to 12 per panicle, 1-15 cm. long (the lower ones much longer than the upper), about 1 mm. thick, spreading or divaricate, straight and stiff; spikelets sessile, remote and scarcely or not overlapping, 1-flowered, 3-4 mm. long, very narrow, compressed, arranged in 2 rows along and appressed to one side of the narrow flattened rachis; glumes somewhat unequal, narrowly acute, the single nerve forming a dorsal keel, the second glume equaling or surpassing the lemma; zone of abscission below the lemma; lemma very narrow, acute, 3-nerved. Prairies and somewhat disturbed openings on tight usually clayey loam, nearly throughout the state, most common in the prairies of the Plains Country and in n.-cen. Tex., rare in the Trans-Pecos, Edwards Plateau, e. Tex. and s. Rio Grande Plains, spring-fall; in a cen. zone in N. A. e. to Wisc., Ill., Mo. and La., w. to Sask., Mont., Wyo., Ut. and Ariz.; not yet collected in Mex.

99. GYMNOPOGON BEAUV.

Clumped perennials from short scaly rhizomes; culms short; leaves short, crowded, with flat divergent sharp-pointed deciduous blades, the lower corner of blades and upper corners of sheaths separated by a sinus; ligule a fringed scale about 0.2 mm. long; inflorescence a panicle of numerous long spreading lax linear spikes; spikelets arranged in 2 rows along one side of the slender slightly flattened rachis of the spike, remote, appressed, with one perfect floret; glumes lance-linear, with awnlike tips, surpassing the body of the lemma, 1-nerved; zone of abscission at base of lemma; lemma 3-nerved, apically bifid and with a short awn; rachilla prolonged beyond the perfect floret a little more than half the length of the body of the lemma and bearing a very minute rudiment of a reduced floret, this awned or awnless; lemma with some pubescence.

A genus of about 10 species in the warmer parts of America.

1. Spikes floriferous to the base, at the base bearing a spikelet and a slight beard; rudiment awned 1. *G. ambiguus*.
1. Spikes naked in the basal part, at the very base naked and nearly beardless; rudiment awnless 2. *G. brevifolius*.

1. *Gymnopogon ambiguus* (Michx.) B.S.P. Rhizomes 2-3 mm. thick, very short; aerial culms 25-60 cm. long, 1-2 mm. thick, erect, leafy; blades 3-10 cm. long, 4-13 mm. broad; spikes 12 to 35 per panicle, 10-25 cm. long, about 2 mm. thick, much-interrupted, at the base with a spikelet and a very short beard; first glume 3-6 mm. long; second glume 5-7 mm. long; lemma 3-4 mm. long, with an awn 4-11 mm. long; awn of rudiment 1-6 mm. long. Loose sandy podsol, open woods, infrequent in e. Tex. and rare w. to n.-cen. Tex., Aug.-early Nov.; N.J. to Fla. and w. to Neb., Kan. and Tex.

2. *Gymnopogon brevifolius* Trin. Rhizomes 1-2 mm. thick; aerial culms 25-60 cm. long, 0.5-1 mm. thick, erect, leafy; blades 2-7 cm. long, 2-7 mm. broad; spikes 6-21 cm. long, 1-2 mm. thick, much-interrupted, at the basal third naked, at the very base (axil) essentially naked; first glume 2-4 mm. long; second glume 3-6 mm. long; lemma 1.5-3 mm. long, with an awn 0.5-7 mm. long; rudiment awnless. Loose sandy soil, open woods and savannahs, e. Tex., uncommon; Coastal States, N.J. to Tex.; also Ark.

100. CHLORIS Sw. FINGERGRASS

Sheaths commonly keeled; spikes elongate, commonly in one or several whorls on the panicle axis, thus nearly digitate; spikelets arranged in 2 rows along one side of the rachis of the spike, either laterally compressed or not noticeably compressed, with one perfect floret (or occasionally 2 in *C. Gayana*) and a floret or 2 above the perfect floret either staminate or neutral (everything above the fertile floret being called the "rudiment"); zone of abscission at the base of the fertile floret; lemma 3-nerved, usually apically bifid and mucronate or awned, the nerves variously glabrous or pubescent.

A genus of perhaps 40 species in the warmer parts of the world. Many specimens of fingergrass, especially those related to *C. verticillata*, *C. andropogonoides* and *C. cucullata*, show combinations of characters of more than one species. They are interpreted as intermediate or genetically contaminated. These specimens will not "key out" satis-

factorily, nor can they be determined to "species". A perusal of the key and descriptions will usually reveal which species they most closely resemble.

1. Panicle axis 12-100 mm. long, the spikes thus attached at more than one level, usually in 2 to 4 whorls (2)
1. Spikes in one whorl or if in 2 whorls then the panicle axis 10 mm. long or shorter (3)
 - 2(1). Lemma 6-7 mm. long, with an awn 8-20 mm. long . 2. *C. chloridea*.
 2. Lemma 2-3 mm. long, with an awn 4-7 mm. long 5. *C. verticillata*.
 - 3(1). Awn of lemma less than 2 mm. long or absent (4)
 3. Awn of lemma more than 1.8 mm. long (8)
 - 4(3). Spikes 2-5 cm. long, flexuous; lemma reniform when spread out, 1.3-2 mm. long, with an awn 0.3-1.1 mm. long and nearly glabrous lateral nerves 6. *C. cucullata*.
 4. Spikes 5-15 cm. long or if shorter than 5 cm. then the lemma not reniform and its lateral nerves ciliate (5)
 - 5(4). Spikes numbering 16 to 32 per panicle 11. *C. distichophylla*.
 5. Spikes numbering 2 to 11 per panicle (6)
 - 6(5). Lemma and rudiment with awns 0.5-1 mm. long . . 10. *C. ciliata*.
 6. Lemma and rudiment awnless (7)
 - 7(6). Spikes 5 to 11 per panicle, 4-15 cm. long; lemma yellowish-brown at maturity, its lateral nerves with cilia 0.5-1.1 mm. long 12. *C. argentina*.
 7. Spikes 2 to 6 per panicle, 3-8 cm. long; lemma brownish-black at maturity, its lateral nerves with cilia only 0.1-0.3 mm. long 13. *C. petraea*.
 - 8(3). Lateral nerves of lemma with cilia at least 1 mm. long (9)
 8. Lateral nerves of lemma with cilia less than 1 mm. long or not ciliate (11)
 - 9(8). Awn of lemma 2.5-3 mm. long; plants perennial . . 9. *C. Canterai*.
 9. Awn of lemma 5-9 mm. long; plants annual (10)
 - 10(9). Sterile florets usually solitary; cilia at summit of lateral nerves of fertile lemma more than 1.5 mm. long; fertile lemmas more than 3 mm. long, each with a prominent bulge on the keel 7. *C. virgata*.
 10. Sterile florets usually 2; cilia at summit of lateral nerves of fertile lemma usually less than 1.5 mm. long; fertile lemmas usually less than 3 mm. long; lemma keel without a prominent bulge 8. *C. inflata*.
 - 11(8). Awn of lemma 9-10 mm. long; awn of rudiment 4-6 mm. long; spikes 5 or 6 per panicle, 10-18 cm. long 3. *C. texensis*.
 11. Awn of lemma 1.8-3 mm. long; awn of rudiment 1-3 mm. long; spikes 6 to 23 per panicle, 3-12 cm. long (12)
 - 12(11). Principal culms (not stolons) 60-150 cm. long, 2-3 mm. thick; blades 3-6 mm. broad, usually flat 1. *C. Gayana*.
 12. Principal culms 15-40 cm. long, 1-1.5 mm. thick; blades 1-2.3 mm. broad, usually folded 4. *C. andropogonoides*.

1. *Chloris Gayana* Kunth. RHODES GRASS. Tufted perennial; some of the culms commonly stoloniform and much-geniculate, others 6-15 dm. long and 2-5 mm. thick, compressed, erect, sparingly branched; ligule a scale about 0.5 mm. long; blades 5-35 cm. long, 3-6 mm. broad, usually flat, ascending; the lower corner and a line at the ligule pilose; sheath obscurely keeled; panicle axis usually 1 mm. long, rarely to 1 cm.; spikes mostly in one whorl, rarely 2, totalling 6 to 23 per panicle, 6-12 cm. long, 3-5 mm. thick, nearly straight, ascending; spikelets laterally compressed, crowded, not appressed; first glume 1-1.5 mm. long, lanceolate; second glume 2-3 mm. long, lanceolate, mucronate; lemma about 3 mm. long, obovate-oblong, apically bifid, with an awn 2-5 mm. long, the lateral nerves with appressed stiff hairs 0.5-1 mm. long; rudiment commonly of 2 florets, these usually staminate or the lower occasionally perfect and with an awn 1-3 mm. long. Disturbed loamy soil in fields and along roads, common in Rio Grande

Plains, infrequent n. to s. part of s.e. and e. Tex., spring-fall; nat. to Afr., introd. and well-naturalized in scattered warmer parts of N. A.

A very important forage in south Texas, often planted in large acreages.

2. *Chloris chloridea* (Presl) Hitchc. Tufted perennial; some culms from the base slender, rhizomatiform, bearing cleistogamous subterranean spikelets; serial culms 35-100 cm. long, 1-3 mm. thick, erect, sparingly branched, leafy; ligule a fringed scale about 0.5 mm. long; blades 5-35 cm. long, 3-7 mm. broad, flat or upon drying loosely involute, on the corner and near the ligule pilose with hairs 3-5 mm. long; sheaths obscurely keeled; panicle axis 2-10 cm. long, bearded in the axils; spikes attached in 2 or 3 whorls or individually attached and not whorled, pubescent at the axils, totaling 3 to 11 per panicle, 6-16 cm. long, 2-4 mm. thick, straight or nearly so, ascending or widely spreading, floriferous nearly to the base; spikelets not laterally compressed, somewhat overlapping but not crowded, appressed to the rachis; first glume 1-2 mm. long, lanceolate; second glume 3-5 mm. long, lanceolate; lemma 6-7 mm. long, lanceolate, apically minutely bifid, with an awn 8-20 mm. long, the lateral nerves toward the summit glabrous or with some very short stiff hairs about 0.2 mm. long; rudiment much shorter than the lemma, linear, with an awn 3-10 mm. long. Heavy clay soil near the coast, Rio Grande Plains and s.w. part of s.e. Tex., infrequent, fall (rarely late summer); warm parts of N.A. n. to s. Ariz. and Tex.

3. *Chloris texensis* Nash. Tufted perennial, occasionally stoloniferous basally; culms 25-50 cm. or more tall, about 2-3 mm. thick, compressed, mostly erect, sparingly geniculate and branched in the lower part; ligule a minute fringed scale or obsolete; blades 3-30 cm. long, 4-6 mm. broad, flat or usually folded, ascending; sheath keeled; culms below the panicle much elongating after anthesis; spikes in one whorl, pubescent near the axils, about 5 or 6 per panicle, 10-18 cm. long, about 3 mm. thick, naked in the lower 1-4 cm., weak and spreading; spikelets laterally compressed, slightly overlapping, appressed; first glume 2-3 mm. long, lanceolate; second glume about 4 mm. long, lanceolate; lemma about 4 mm. long, elliptic-oblong or as viewed from the side narrowly elliptical, apically bifid with an awn about 9-10 mm. long, the lateral nerves toward the summit with some stiff hairs about 0.4-0.5 mm. long; rudiment about equaling lemma, very narrow, with an awn 4-6 mm. long. Silty loam, coastal prairies, s.e. Tex. and n.e. Rio Grande Plain, rare, fall; endemic.

4. *Chloris andropogonoides* Fourn. Tufted perennial, commonly shortly substoloniferous basally; culms 15-40 cm. long, 1-1.5 mm. thick, compressed, mostly erect, sparingly geniculate and branched in the lower part, the culm below the panicle much-elongating after anthesis, fragile; ligule a fringed scale 0.5-1 mm. long; blades 3-12 (-17) cm. long, 1.3-2.3 mm. broad, flat or usually folded, glabrous or with a few hairs scattered on the underside; sheaths keeled; panicle axis 2-4 (-10) mm. long, slightly pubescent at the axils; spikes in one whorl or less commonly 2 whorls (often the panicle axis elongates above the spikes but fails to bear a second whorl) or rarely 3 whorls, totalling 6 to 11 (to 14) per panicle, 3-10 cm. long, 1.5-2 mm. thick, straight or nearly so, eventually spreading at nearly right angles, floriferous usually to the base; spikelets laterally compressed, somewhat overlapping but not crowded, appressed; first glume 1-2 mm. long, narrowly lanceolate; second glume 2-2.5 (-3) mm. long, including an awnlike tip; lemma 1.8-2.3 mm. long, elliptical or from the side lanceolate, apically bifid with an awn 3-5 mm. long, the lateral nerves glabrous or with a few appressed hairs about 0.2 mm. long; rudiment slightly shorter than to equaling the lemma, obovate, with an awn 1.5-3 mm. long. *C. tenuispica* Nash. Tight black clay soil or less commonly tight sandy loam, prairies and openings in brush, frequent in Rio Grande Plains and s. part of s.e. Tex., rare n. to s. part of n.-cen. Tex. and e. Edwards Plateau, spring-fall; Tex. to Coah., N.L. and Tam.

The type of *C. andropogonoides* was from S. L. P., but the species here described is not known from that state; perhaps ours should go by the name *C. tenuispica*. In the northwest part of the range and farther northwest in west Texas occur plants intermediate between this and *C. verticillata*; and in the Rio Grande Plains and southeast Texas occur plants intermediate between this and *C. cucullata*. Plants which appear to be of hybrid origin between *C. andropogonoides* and those genetically contaminated plants called "*C. latisquamea*" (see remarks under *C. cucullata*) have been given the name *C. subdolichostachya* C. Muell.

5. *Chloris verticillata* Nutt. WINDMILL FINGERGRASS, TUMBLE WINDMILL GRASS. Densely tufted perennial, commonly shortly stoloniferous basally; culms 15-30 cm. long, 1-2 mm. thick, compressed, mostly erect, somewhat geniculate and sparingly branched in the lower part; ligule a fringed scale 0.5-1 mm. long, often apparently with some cilia 3-5 mm. long (these actually attached to the base of the blade); blades 2-14 (-20) cm. long, 2.5-4 mm. broad, flat or usually folded, ascending, the lower corner and a line at the ligule glabrous or usually with a few hairs 2-5 mm. long; sheaths keeled; culm below the panicle much-elongating after anthesis, weak and breaking off, the entire panicle blowing before the wind as a tumbleweed; panicle axis 12-52 mm. long, densely bearded in the axils; spikes attached in (2 or) 3 or 4 (or 5) whorls (the lowest whorl usually with more spikes than the other whorls), totalling (9 to) 14 to 20 (to 24) per panicle, 6-12 (-15) cm. long, 2-4 mm. thick, straight or nearly so, eventually spreading at right angles or even deflexed, floriferous usually to the base; spikelets laterally compressed, relatively remote, appressed to the rachis; first glume 1.5-2 mm. long, lanceolate; second glume 2.5-3.8 mm. long, including an awnlike tip; lemma 2.2-2.6 mm. long, broadly elliptical or as viewed from the side narrowly elliptical, apically bifid and with an awn 4-7 mm. long, the lateral nerves glabrous or with a few appressed hairs 0.1-0.2 mm. long; rudiment about equaling lemma, elliptical and acute to narrowly obdeltoid and truncate, with an awn 3-5 mm. long. Packed rocky or calcareous gravelly and sandy loam, disturbed areas, roadsides and eroded plains, somewhat weedy, in the Trans-Pecos, Plains Country and Edwards Plateau, rare e. to n.-cen. Tex. and n. Rio Grande Plains, late spring-summer; Neb. and Colo. s. to Tex. and N.M. and s.w. to Ariz. and s. Calif., also adv. and not persistent farther e.

The description and geography given above apply to the typical windmill fingergrass. For a discussion of the plants intermediate to *C. cucullata* and *C. andropogonoides* see the remarks under those species.

6. *Chloris cucullata* Bisch. HOODED FINGERGRASS, HOODED WINDMILL GRASS. Tufted perennial; lower internodes often stoloniferous and the nodes rooting; culms 1-9 dm. long, 1.5-3 mm. thick, compressed, erect except the stolons, somewhat geniculate and sparingly branched in the lower part; ligule a scale 0.3-0.9 mm. long; blades 3-15 (-22) cm. long, 2-4 mm. broad, flat or usually folded, ascending; sheaths keeled; spikes digitate (rarely distributed over the axis for a distance of 2-5 mm.), 6 to 16 (usually 8 to 12) per panicle, 2-4 (-5) cm. long, about 2 mm. thick, distinctly curviflexuous, ascending or usually diverging at angles of 10°-45° (-90°); spikelets very crowded, in intimate contact, spreading from the rachis, not at all appressed, scarcely laterally compressed; first glume 0.6-1 mm. long, acute; second glume 1-1.8 mm. long, obovate, often mucronate; lemma 1.3-2 mm. long, broadly reniform or as viewed from the side obdeltoid and truncate and about as broad as long, with an awn 0.3-1.1 mm. long, the lateral nerves glabrous or with a few appressed hairs 0.1-0.4 mm. long; rudiment about equaling lemma, also broadly obdeltoid and truncate, with an awn 0.2-0.9 mm. long. Prairies, sandy and gravelly soils, less commonly on clayey soils, practically throughout the state but rare in w. Plains Country and Trans-Pecos, e. and s.e. Tex., most abundant in the Rio Grande Plains, spring-fall; s.-cen. Okla. and s.e. N.M., s.e. to N. L. and Tam.

Throughout the distribution of this species, but especially common in the Rio Grande Plains, occur plants with various character combinations showing intermediacy to *C. cucullata*-*C. verticillata*. The plants ordinarily are in stature more like *C. cucullata* but have various of the panicle and spikelet characters of *C. verticillata*, such as beards in the axils, elongate axes with more than one whorl, numerous fairly long straight spreading spikes on which the spikelets are less crowded and more appressed, the scales longer and narrower and the awns longer, etc. These plants have in recent treatments mostly passed under the name *C. latisquamea* Nash. They probably represent backcross types produced after ancient hybridization between the 2 species. In tight soil, disturbed habitats in the Rio Grande Plains, "*C. latisquamea*" is often more abundant than the "pure" *C. cucullata*.

7. *Chloris virgata* Sw. FEATHER FINGERGRASS. Tufted annual; lowermost internodes occasionally stoloniferous, the lower nodes then rooting; culms 25-90 cm. long, 1.5-5 mm. thick, compressed, mostly ascending, leafy, geniculate and sparingly branched in the lower part; ligule a scale 0.1-0.9 mm. long; blades 3-20 cm. long, 3-7 mm. broad, flat or usually folded, long-attenuate into a fine involute point; sheaths keeled, the margins of

the base of blade and corner of sheath glabrous or often sparsely pilose; spikes digitate, 5 to 16 per panicle, 2-10 cm. long, 3-4 mm. thick, straight or flexuous, ascending; glumes lanceolate, the first glume 1.5-2 mm. long, the second about 3-4 mm. long, the tip weakly awnlike; lemma about 3 mm. long, abruptly narrowed and acute apically, with an awn 5-9 mm. long, the dorsal keel and lateral nerves with abundant cilia, those cilia of the summits of the lateral nerves 2-3 mm. long, the lemma keel with a prominent bulge; rudiment about equaling lemma, truncate, with an awn 2-7 mm. long. Usually disturbed areas, prairies, roadsides and streambeds, Plains Country, Trans-Pecos and Edwards Plateau, frequent, weedy, rare farther e., summer-fall; widespread in the warmer parts of Am., n. to N.E., O., Ind., Mo., Neb., Colo., Ut. and Nev.

8. *Chloris inflata* Link. Very similar in character to *C. virgata* but sterile florets 2; cilia at the summits of lateral nerves of the lemma usually less than 1.5 mm. long; fertile lemma usually less than 3 mm. long; lemma keel without a prominent bulge. Very rare in extreme s. Tex. (Cameron Co.), Oct.; widespread in warmer parts of Am.

9. *Chloris Canterai* Arech. Tufted perennial, occasionally the lower internodes stoloniferous and lower nodes rooting; culms 50-145 cm. long, 1.5-3 mm. thick, somewhat geniculate and sparingly branched, erect; ligule a scale 0.1-0.2 mm. long; blades 1-4 dm. long, 2-7 mm. broad, flat, the tips sharply attenuate and involute or the whole blades involute on drying; margin of base of blade and corner of sheath ciliate, the sheath obscurely keeled; spikes digitate, 3 to 6 per panicle, 6-12 cm. long, 3-5 mm. thick, flexuous, ascending; first glume 1.5-2 mm. long; second glume 2.5-3.5 mm. long, narrow; lemma 3-3.5 mm. long, acute, apically bidentate and with an awn 2.5-3 mm. long, the dorsal keel and lateral nerves with abundant white cilia 1-2 mm. long; rudiment slightly shorter than the lemma and broadly truncate and with an awn 1.5-2.5 mm. long. Tight often moist clayey loamy soil, s.e. and s. part of e. Tex. and n. part of Rio Grande Plains (Atascosa, Bexar, Jackson, Milam and Wharton cos.), spring-fall; Parag.; Tex. (where introd.).

Reports of *C. polydactyla* (L.) Sw. in Texas are based on misdetermined specimens of *C. Canterai*.

10. *Chloris ciliata* Sw. Tufted perennial; culms 25-100 cm. long, 1-2.5 mm. thick, slightly geniculate at the lower nodes, erect, sparingly branched; ligule a scale 0.1-0.3 mm. long; blades 7-35 cm. long, 2-7 mm. broad, flat, the tip sharply attenuate and involute or the whole blade involute on drying; sheath obscurely if at all keeled; spikes digitate, 3 to 6 per panicle, 4-9 cm. long, 2-3 mm. thick, flexuous, ascending; first glume 1-2 mm. long; second glume 2-3 mm. long, narrow, the tip awnlike; lemma 2-2.5 mm. long, acute, apically bidentate and with an awn 0.5-1 mm. long, the dorsal keel and lateral nerves with abundant white cilia 0.5-1.3 mm. long; rudiment about equaling lemma and broadly truncate, with an awn 0.5-1 mm. long. Tight calcareous loam, frequent in Rio Grande Plains and infrequent in s.e. Tex., rare to s. part of n.-cen. Tex., spring-fall; also Mex.

11. *Chloris distichophylla* Lag. Tufted perennial; culms compressed, about 1 m. tall, erect; blades 7-15 cm. long, 7-10 mm. broad, very numerous and crowded at the base of the plant; sheaths keeled; spikes digitate, 16 to 32 per panicle, 8-15 cm. long, 2-3 mm. thick; first glume about 1-1.3 mm. long; second glume about 2 mm. long, emarginate, with an awn 0.3-0.5 mm. long; lemmas 2.5-3 mm. long, tawny or chestnut-brown at maturity, awnless, with cilia on the nerves and keel 0.9-1.5 mm. long. Sandy soil, disturbed areas, rarely cult. and even more rarely escaped in s. part of e. Tex., (?) said to have escaped near Bastrop, Tex.; nat. of temp. S. A., cult. and escaped in Calif. and perhaps in Tex.

12. *Chloris argentina* (Hack.) Lillo & Parodi. Tufted perennial; culms compressed, 3-10 dm. long, 1.5-4 mm. broad on the broad axis, sparingly or not geniculate at the lower nodes, erect; ligule a scale about 0.5 mm. long; blades 5-25 cm. long, 4-7 mm. broad, flat or usually folded; sheaths keeled; spikes digitate, 5 to 11 per panicle, 4-15 cm. long, 2-3 mm. thick; first glume 1-1.3 mm. long; second glume 1.3-1.7 mm. long, emarginate, with an awn 0.1-1 mm. long; lemma 1.8-2.2 mm. long, tawny or yellowish-brown at maturity, awnless, with cilia on the nerves and keel 0.5-1.1 mm. long. Disturbed shady loam along roadsides, s. part of n.-cen. Tex., infrequent, spring-summer; nat. of Arg., introd.

13. *Chloris petraea* Sw. Tufted perennial; culms compressed, 2-9 dm. long, 2-4 mm. broad on the broad axis, the lower internodes shortly stoloniferous and nodally geniculate, the rest erect; ligule a scale 0.2-0.3 mm. long; blades 3-25 cm. long, 2-5 (-8) mm. broad, flat or folded; sheaths keeled; spikes digitate, 2 to 6 per panicle, 3-8 cm. long, 1-2 mm. thick; first glume about 1 mm. long; second glume 1.3-1.5 mm. long, emarginate, with an awn about 0.5 mm. long; lemma 1.5-2 mm. long, dark-brown or almost black at maturity, awnless, with cilia on the nerves and keel 0.1-0.3 mm. long. Seasonally moist sandy soil near the coast, s.e. Tex. and Rio Grande Plains, frequent, spring-fall; widely distributed near warm coasts of Am. n. to N.C. and the Gulf States.

101. TRICHLORIS FOURN.

Coarse densely tufted perennials; spikes elongate, numerous, either digitate or attached to the panicle axis at more than one level; spikelets crowded in 2 rows along one side of the rachis of the spike, scarcely laterally compressed, either with a single perfect flower and an additional rudimentary floret ("rudiment") or with 1 to 3 perfect lower florets and 1 to 3 staminate or neuter florets; zone of abscission at the base of each staminate or perfect floret; lemmas 3-nerved, either both the lemmas with 3 equal awns or all the lemmas 3-awned but the lateral awns reduced.

A very small American genus, included by some authors in *Chloris*.

1. Spikes nearly digitate, strictly ascending; each spikelet with one fertile floret and one staminate or neutral one, both the fertile and the other lemma with 3 awns of nearly equal length1. *T. crinita*.
1. Panicle axis 15-70 mm. long, the spikes attached at more than one level and often spreading; each spikelet with a total of 3 to 5 lemmas, the lower 1 to 3 fertile, the upper 3 or 2 staminate or neutral, the central awn of each lemma more than twice as long as the laterals2. *T. pluriflora*.

1. *Trichloris crinita* (Lag.) Parodi. Tufted perennial; culms 4-12 dm. long; blades elongate, 2-4 mm. broad, pilose near the ligule; spikes digitate, 8 to 25 per panicle, 5-12 cm. long, feathery, nearly straight, strictly ascending; spikelets each with one fertile floret and one staminate or neutral; fertile lemma about 3 mm. long, both lemmas with 3 awns about 1 cm. long. Deep alluvial silty soil along or near intermittent creeks and along ditches, infrequent in the Trans-Pecos and rare in w. Rio Grande Plains, spring-fall; Tex. to Ariz. and s. to Dgo. and Coah.; also arid-temp. areas in s. S. A.

2. *Trichloris pluriflora* Fourn. Tufted perennial; culms 4-15 dm. long; blades elongate, (2-) 3-12 mm. broad; panicle axis 15-70 mm. long; spikes 6 to 20 per panicle, 6-15 cm. long, nearly straight, ascending or somewhat spreading; spikelets each with 1 to 3 lower fertile flowers and 3 or 2 staminate or neutral; lowest lemma the longest, about 4 mm. long, the central awn of each lemma 5-15 mm. long, the lateral ones less than half as long as the central. Deep silty and clayey soil, less commonly sandy loam, low areas in brush, common in the Rio Grande Plains and rare n.w. to the s. Edwards Plateau (to the Terrell-Brewster county line), summer-fall; Tex. to Coah., N. L. and Tam.; also dry temp. parts of s. S. A.

102. BOUTELOUA LAG. GRAMA

Inflorescence a panicle of (1 or) 2 to 50 spikes, these often subsecund or in 2 rows on one side of the panicle axis, either persistent and many-spikeletted or deciduous and few-spikeletted; rachis often prolonged beyond the most distal fertile spikelet into a needle or this often bearing terminally a reduced or rudimentary sterile floret; spikelets either solitary or numbering 2 to 130 per spike, when more than one attached in 2 rows along one side of the usually somewhat flattened rachis, each with a single fertile floret and often a rudiment of 1 or 2 reduced sterile or staminate florets above; glumes 1-nerved, the second glume visible from the side of the spike; zone of abscission in those species with persistent spikes and numerous spikelets at base of fertile floret; lemma 3-nerved, the nerves commonly prolonged into awns. *Chondrosium* Desv.

About 40 species in North America and South America. Then generic name originally

was spelled *Botelua*, and possibly we should revert to that spelling. Some of our most valuable forage grasses belong to this genus, especially such species as *B. gracilis* and *B. curtipendula*. Various grasses of other genera are also often referred to as "grama," this being a Spanish word for grass. On the other hand, some of our short gramas are often indiscriminately and incorrectly referred to as "mesquite grasses."

1. Lower internodes covered with dense white wool or a white waxy bloom obscuring the epidermis (2)
1. Epidermis of lower internodes visible, the pubescence or bloom (if any) not thick enough to obscure the epidermis (3)
- 2(1). Lower internodes covered by a waxy bloom; spikelets 30 to 40 per spike 7. *B. breviseta*.
2. Lower internodes woolly; spikelets 9 to 20 per spike .. 9. *B. eriopoda*.
- 3(1). Low annual with solitary spikes 6. *B. simplex*.
3. Spikes more than one or if solitary on some culms then plants obviously perennial (4)
- 4(3). Spikelets more than 13 per spike or if fewer then spikes and glumes obviously persistent (5)
4. Spikelets fewer than 13 per spike, each spike deciduous as a unit (10)
- 5(4). Perennial; base of plants knotty; culms remarkably branched in the lower third; second glumes more or less smooth 8. *B. ramosa*.
5. Base of plants not hard and knotty; culms essentially unbranched or if branched then second glume tuberculate under a lens (6)
- 6(5). Spikes 1 to 3 per culm, the rachis terminally bearing a rudimentary spikelet; second glume not tuberculate-roughened or only microscopically so; spikelets 40 to 130 per spike 1. *B. gracilis*.
6. Spikes more than 3 per culm or if only 2 or 3 then rachis merely needlelike and not rudiment-tipped or else the second glumes tuberculate or the spikelets fewer than 40 (7)
- 7(6). Second glumes tuberculate 2. *B. hirsuta*.
7. Second glumes not tuberculate (8)
- 8(7). Rachis terminating in a rudimentary spikelet; spikelets (22 to) 30 to 52 per spike 5. *B. barbata*.
8. Rachis not terminating in a rudimentary spikelet; spikelets 8 to 23 (to 32) per spike (9)
- 9(8). Spikes 2 to 7 per culm 3. *B. trifida*.
9. Spikes 5 to 7 (or 8, to 20?) per culm 4. *B. Kayi*.
- 10(4). Spikelets 2 to 4 per spike; spike 12-20 mm. long; annual with geniculate culms 13. *B. aristidoides*.
10. Spikelets more than 4 or if only 2 or 3 then plants obviously perennial or spikes shorter than 12 mm. (11)
- 11(10). Rachis densely raised-pubescent, the pubescence visible without a lens 10. *B. chondrosioides*.
11. Rachis glabrous or only microscopically appressed-pubescent (12)
- 12(11). Panicle mostly 3-8 cm. long; spikes 5 to 14 in number; spikelets always more than 1 per spike (13)
12. Panicles mostly 8-30 cm. long; spikes 10 to 50 in number or if the panicles shorter and spikes fewer then most spikes with solitary spikelets (14)
- 13(12). Spikelets 2 to 5 per spike; second glumes appressed-pubescent; rachis apically appearing trifurcate 11. *B. rigidiseta*.
13. Spikelets 5 to 8 per spike; second glume essentially glabrous; rachis merely needle-like 12. *B. repens*.
- 14(12). Spikes mostly 20 to 40 (to 50) per panicle; panicles mostly 13-30 cm. long; blades mostly broader than 2 mm. 14. *B. curtipendula*.

14. Spikes 10 to 30 per panicle; panicles mostly less than 15 cm. long; blades only about 2 mm. broad or narrower (15)

15(14). Anthers dark-purple; stolons absent; spikelets 2 to 6 per spike
.....15. *B. Warnockii*.

15. Anthers yellow; stolons usually abundant; spikelets 1 (to 3) per spike
.....16. *B. uniflora*.

1. *Bouteloua gracilis* (H.B.K.) Griffiths. BLUE GRAMA. Tufted perennial, base often very shortly subrhizomatous; culms 15-60 cm. long, 0.5-1 mm. thick, very slightly geniculate at some nodes, essentially unbranched above the base; ligule a scale 0.2-0.3 mm. long; blades mostly crowded at the base of the tuft, 5-18 cm. long, 1-2.3 mm. broad, flat basally, passing into a closely involute arcuate tip, usually pilose near the ligule; spikes persistent, 1 to 3, usually 2, rarely 4 to 6 (if 2 or 3 then distributed over a panicle axis 2-4 (-7) cm. long), 15-60 mm. long, 3-7 mm. thick, the rachis slightly prolonged beyond the most distal fertile spikelets and terminating in a rudimentary sterile spikelet; second glume glabrous or usually sparingly pilose or papillose-pilose or occasionally even with low tubercles (invisible without a lens), usually purplish at maturity; spikelets 40 to 100 per spike (usually 50 to 70) in our area or up to 130 per spike in parts of n. Mex. Prairies and open low scrub on plains, usually in gravelly or sandy loam, very abundant in the w. Plains Country and Trans-Pecos, rare e. to e. Plains Country and w. Edwards Plateau, summer-fall; plains and foothills of cen. N. A. from s. Can. to s. Mex. and e. to Wisc., Ill. and Okla., w. to Mont., Nev. and s. Calif.; also adv. in O., S.C. and N.E.

Blue grama is one of the most important forage grasses in native ranges of west Texas. The occurrence of tubercles on the second glumes in scattered clones of this species apparently evinces genetic contaminations through ancient hybridization with the very closely related *B. hirsuta* var. *pectinata*. *B. gracilis* var. *stricta* (Vasey) Hitchc. is the name of the rare form that possesses more than 3 spikes on a single culm.

2. *Bouteloua hirsuta* Lag. HAIRY GRAMA. Tufted perennial (but flowering the first year); culms numerous, 10-75 cm. long, 0.5-2 mm. thick, slightly geniculate at the lower nodes, essentially unbranched above the base; ligule a scale 0.1-0.3 mm. long; blades occurring mostly in the lower half of the plant, 5-12 (-20) cm. long, 1-2.2 mm. broad, flat basally, passing into a closely involute arcuate tip, usually pilose near the ligule and on the lower margins; spikes persistent, (1 or) 2 to 4 (to 6) per culm, 10-35 (-60) mm. long, 3-6 mm. thick, distributed over a panicle axis 1-8 (-19) cm. long, the rachis apically subspinose, i.e., prolonged beyond the most distal fertile spikelet into a semirigid needle 3-11 mm. long (in one variety the needle terminating in a rudimentary spikelet); second glume on and near the keel, with tubercles (at maturity of the spikelet these black and usually visible to the unaided eye) and these with long white whiskers, rarely only short-pilose; spikelets 18 to 50 (to 70) per spike. Frequent practically throughout Tex. but rare in e. Tex., late spring-fall; Great Plains e. to Wisc., Ill., Okla. and Tex., w. to Colo. and N.M., and in the Mex. highlands from Oax. n. to s. Nev. and Ariz. (The var. *pectinata* in Okla. and Tex. only).

In the Edwards Plateau and similar dry limestone uplands in the Plains Country and Trans-Pecos Texas many of the plants exhibit a combination of characters including robust stemmy habit with leaves restricted to the base of the plant, more extensively involute leaves (flat only at the very base), spikes 3 to 6 on a prolonged axis, and spikelets usually 50 to 70 per spike, and the rachis terminating in a rudimentary sterile spikelet (this appearing as a continuation of the "needle"); these plants are called *B. hirsuta* var. *pectinata* (Featherly) Cory (*B. pectinata* Featherly), but the recombination of these characteristics with more typical hairy grama characteristics is so complete that the "variety" is a weak one, impossible to delineate precisely.

3. *Bouteloua trifida* Thurb. RED GRAMA. Densely tufted perennial; at the very base of old plants the culms very shortly subrhizomatous, otherwise culms (5-) 10-20 (-40) cm. long, 0.5-1 mm. thick, erect (occasionally slightly geniculate at lower nodes), essentially unbranched; ligule a line of cilia 0.2-0.5 mm. long; blades 7-50 (-90) mm. long, 0.7-1.3 mm. broad, flat or folded or involute; spikes persistent, (2 or) 3 to 7, 7-25 (-40) mm. long, distributed over a panicle axis 1-5 (-8) cm. long, the rachis not prolonged

beyond the most distal fertile spikelet; second glume smooth and glabrous, often purplish-red; spikelets 8 to 23 (to 32) per spike. Abundant on dry calcareous slopes among scrubby vegetation, Rio Grande Plains, Edwards Plateau and the Trans-Pecos n. to Plains Country and s. part of n.-cen. Tex., spring-fall; Tex. to s. Ut., s. Nev. and s. Calif., s.e. to S. L. P.

4. *Bouteloua Kayi* Warnock. Densely tufted perennial, rather like *B. trifida*; culms 1-5 dm. long, erect, essentially unbranched; ligule a fringe about 0.5 mm. long; blades 2-10 cm. long, 1-1.5 mm. broad, involute at least after drying; spikes persistent, 5 to 7 (or 8, or 20?), 8-40 mm. long, distributed over a panicle axis 3-8 cm. long; second glume smooth; spikelets about 18 to 20 per spike; rachis not prolonged beyond the most distal fertile spikelet. Crevices, limestone ledges, in the Trans-Pecos (s.e. Brewster Co. only), rare, late summer.

Probably only a form of *B. trifida*, the type collection being very dry, well past anthesis and very difficult to interpret.

5. *Bouteloua barbata* Lag. SIXWEEKS GRAMA. Tufted annual; culms 8-41 cm. long, 0.5-1 mm. thick, markedly geniculate, sprawling or less commonly erect; ligule a fringe about 0.5 mm. long; blades 1-5 (-10) cm. long, 1-2 mm. broad, mostly flat with an involute tip; spikes persistent, (2 to) 4 to 6 (to 10), 8-26 mm. long, distributed over a panicle axis (3-) 6-12 cm. long, the rachis not prolonged beyond the most distal fertile spikelet; second glume smooth and glabrous, often dull-purplish; spikelets (22 to) 30 to 52 per spike. Abundant on alluvial flats and hillsides, Trans-Pecos and Plains Country, infrequent e. to Rio Grande Plains and n.-cen. Tex. where repeatedly introd. but not persistent, late spring-early fall; Tex. to s. Ut. and Calif.; Mex.

The awns of the rudiment and lemma are shortest on the plants with the greatest number of spikelets (34 to 52), and longest on the plants with the lower spikelet counts (22 to 34); the latter plants greatly resemble first-year plants of *B. trifida* but can be identified by the more geniculate culms and longer panicle axes.

6. *Bouteloua simplex* Lag. MAT GRAMA. Tufted annual; culms numerous, 7-23 cm. long, about 0.5 mm. thick, markedly geniculate and sparingly branched in lower part, usually decumbent, ascending only at the ends; ligule a fringe 0.1-0.2 mm. long; blades 2-4 (-7) cm. long, 0.5-1.1 mm. broad, basally flat, distally involute; spikes persistent, solitary, 10-25 mm. long, at maturity strongly arcuate, the rachis very slightly prolonged beyond the most distal fertile spikelet and terminating in a rudimentary sterile spikelet so reduced that it often appears as merely a continuation of the rachis; second glume smooth; spikelets (10 to) 20 to 40 (to 62) per spike. Grasslands on slopes of volcanic rock at elev. of 6,000-8,000 ft., Davis Mts. in the Trans-Pecos, locally frequent, late summer-fall; Colo. and Ut. s. to cen. Mex.; also Andean S. A.

7. *Bouteloua breviseta* Vasey. GYP GRAMA. Tufted perennial, with tough creeping scaly short or elongate rhizomes 1-3 mm. thick; aerial culms numerous, firm, 2-4 dm. long, branched near the base, otherwise strictly erect, not geniculate, very leafy, the upper parts of the lower internodes covered with a white waxy bloom; ligule a scale 0.1-0.2 mm. long; blades 1-4 cm. long, 1-2 mm. broad, very shortly flat basally, the rest closely involute and reflex-arcuate; spikes persistent, 1 to 3, usually 2, 15-36 mm. long, distributed over a panicle axis 2-4 cm. long, the rachis prolonged beyond the most distal fertile spikelet into a semirigid needle 2-5 mm. long (the terminal portion of this distinctly constituting a rudimentary spikelet); second glume essentially smooth; spikelets 30 to 40 per spike. Trans-Pecos, locally abundant in areas of gypsum sands at the leeward sides of gypsum lake-beds, summer-fall; also s. N.M.

8. *Bouteloua ramosa* Vasey. CHINO GRAMA, CHINOGRASS. Tufted perennial from hard knotty bases; culms numerous, 25-60 cm. long, 0.5-1 mm. thick, geniculate and abundantly bushy-branched in the lower third, ascending, leafy; ligule a scale 0.1-0.2 mm. long; blades 2-5 (-7) cm. long, 1-2 mm. broad, mostly flat with an involute tip; spikes persistent, 1 to 3, mostly 2, very rarely 4, 10-25 (-35) mm. long, 2-4 (-5) mm. thick, distributed over a panicle axis 1-3 (-5) cm. long, the rachis slightly prolonged beyond the most distal fertile spikelet and bearing the remains of a sterile rudimentary spikelet resembling an extension of the rachis; second glume essentially smooth or with sparse microscopic pubescence near the keel; spikelets 24 to 45 (to 64) per spike. Trans-Pecos and w. Edwards Plateau, locally frequent on rocky desertic slopes among shrubbery and lechuguilla, summer-fall; Tex. and s. N.M. s. to Chih., Coah. and Zac.

This is perhaps the best forage grass in the true desert areas. The plants of Val Verde and Terrell counties tend to have longer spikes and more spikelets than those from farther west.

9. *Bouteloua eriopoda* (Torr.) Torr. BLACK GRAMA, WOOLLYFOOT GRAMA. Tufted perennial from hard knotty bases; culms sprawling, strongly genuflexed and occasionally rooting at the nodes, ascending only at the floriferous ends, essentially unbranched above the base, 25-60 cm. long, about 1 mm. thick, the internodes densely white-woolly; ligule a fringe 0.2-0.5 mm. long; blades 2-10 (-14) cm. long, 1-2 mm. broad, flat or usually mostly involute-filiform; spikes persistent, 3 to 8, 1-5 cm. long, distributed over a panicle axis 3-10 (-18) cm. long, the axils bearded, the rachis slightly prolonged beyond the most distal fertile spikelet into a needle, this not readily perceptible because of the appression of the spikelets, not bearing any trace of a rudimentary spikelet; second glume essentially glabrous, stramineous or often a dark-dull-purple; spikelets 9 to 20 per spike, not crowded, often somewhat appressed to the rachis. Abundant on arid rocky slopes, Trans-Pecos and Plains Country, summer-fall; w. Okla. to s. Ut. and s. to Coah., Chih. and Son.

10. *Bouteloua chondrosioides* (H.B.K.) Wats. Tufted perennial; culms 2-5 dm. long, 1-2 mm. thick, somewhat geniculate at the nodes, essentially unbranched; ligule a fringe 0.2-0.3 mm. long; blades mostly aggregated at the base of the plant, 3-10 (-18) cm. long, 2-3 mm. broad, mostly flat, marginally papillose-pilose; spikes 3 to 8, 9-20 mm. long, distributed over a panicle axis 3-6 cm. long, at length each deciduous as a unit, the rachis densely pubescent and prolonged beyond the most distal fertile spikelet as a needle; glumes densely pubescent; spikelets 8 to 12 per spike, at maturity the largest of them about as long as the rachis of the spike. Grasslands on rocky slopes and flats at elev. usually greater than 4,000 ft., Trans-Pecos, summer-fall; Tex. to Ariz., s.e. to Guat.

11. *Bouteloua rigidiseta* (Steud.) Hitchc. TEXAS GRAMA. Tufted perennial; culms numerous, 15-40 cm. long, 0.5-1 mm. thick, erect, very sparingly branched in lower part; ligule a fringe about 0.1 mm. long; blades 3-10 (-17) cm. long, 1-2 mm. broad, flat with involute-filiform tip, on drying mostly involute, sparingly papillose-pilose; spikes 5 to 14, 7-13 mm. long, distributed in 2 rows along one side of a panicle axis 3-6 cm. long, mostly spreading or slightly pendulous, at length each spike deciduous as a unit, the rachis prolonged beyond the most distal spikelet, apically trifurcate, basally and laterally with much pubescence; glumes appressed-pubescent near the midnerve; spikelets (2 or) 3 to 5 per spike, at maturity the longest of them much longer than the rachis. Brush and overgrazed prairies and other disturbed areas such as roadsides, Rio Grande Plains, Edwards Plateau, e. Plains Country, s. and w. parts of e. Tex. and n.-cen. Tex., frequent, spring-fall; Okla. s. to e. Coah. and N. L.

12. *Bouteloua repens* (H.B.K.) Scribn. & Merr. SLENDER GRAMA. Tufted perennial (flowering first year and often behaving as annual); culms 15-40 cm. long, 0.4-1 mm. thick, mostly erect, very slightly geniculate and sparingly branched at the lower nodes; ligule a scale, sometimes fringed, about 0.2 mm. long; blades 3-18 cm. long, 1-3 mm. broad, mostly flat, marginally sparsely papillose-pilose; spikes 5 to 9, 9-16 (-20) mm. long, distributed over a panicle axis 3-8 cm. long, at length each deciduous as a unit, the rachis smooth, prolonged beyond the most distal fertile spikelet as a needle; glumes essentially smooth and glabrous; spikelets 5 to 8 per spike, at maturity the longest of them about as long as the rachis. *B. filiformis* (Fourn.) Griffiths. Grasslands and open brush on sandy or gravelly loam, Rio Grande Plains, infrequent, spring-fall; Tex. to Ariz. and s.e. to s. Mex. and C. A.

13. *Bouteloua aristidoides* (H.B.K.) Griseb. NEEDLE GRAMA. Tufted annual; culms 1-5 dm. long, 0.5-1 mm. thick, geniculate and somewhat branched at the lower nodes, often mostly decumbent, distally ascending; ligule a fringe 0.2-0.5 mm. long; blades 2-5 (-9) cm. long, 0.7-1.7 mm. broad, basally flat, mostly involute; spikes 6 to 16, 12-20 mm. long, in 2 rows along one side of a panicle axis 4-15 cm. long, spreading or slightly pendulous, at length each deciduous as a unit, the rachis densely short-pubescent basally and prolonged beyond the most distal spikelet as a needle; glumes scabrous, appressed-strigulose near the midrib; spikelets 2 to 4, closely appressed to the rachis, at maturity the longest of them about equaling the rachis needle. Loamy usually alluvial soils in creek beds and along roadsides, frequent in the Trans-Pecos, infrequent in s. Edwards

Plateau and Rio Grande Plains, summer-fall; Tex. to s. Nev. and s. to cen. Mex.; also Arg.

14. *Bouteloua curtipendula* (Michx.) Torr. **SIDE-OATS GRAMA**. Tufted perennial, often with rhizomes basally by means of which the tufts expand peripherally and rarely with a few stoloniform culms; most aerial culms (3-) 6-9 (-11) dm. long, 1-2 mm. thick, erect, essentially unbranched; ligule a fringe or fringed scale 0.5-1 mm. long; blades 5-20 (-35) cm. long, (2-) 3-6 mm. broad, usually flat with an involute tip or more extensively involute; spikes (20 to) 30 to 40 (to 50), 6-20 (-40) mm. long, in 2 rows on one side of a panicle axis 13-30 cm. long, somewhat pendulous, at length each deciduous as a unit, the rachis prolonged beyond the most distal spikelet as a needle, sparsely appressed-strigose or glabrous; glumes sparsely appressed-strigose or glabrous; spikelets (3 to) 5 to 8 (to 13), at maturity the longest of them much exceeding the rachis needle; anthers red, orange or yellow. Prairies and grasslands or open brush or forest-openings on alluvial loam or among rocks on steep slopes, nearly throughout Texas except the extreme e. forests and s.e. Rio Grande Plains, often abundant (especially in cen. and w. Tex.), exceedingly variable, late spring-fall; s.e. Can., nearly throughout U.S. (except extreme s.e. and extreme n.w. portions) and s.e. to C. A.; Andean S. A. from Ecu. to Arg.

An important forage species. The forms with narrow tufts connected by rhizomes constitute var. *curtipendula*; those with large thick tufts and very short rhizomes or none are var. *caespitosa* Gould & Kapadia.

15. *Bouteloua Warnockii* Gould & Kapadia. Tufted perennial, some with a few very short rhizomes; most culms 20-35 (-50) cm. long, about 0.5 mm. thick, erect, unbranched; ligule a fringe 0.5-1.5 mm. long; blades 5-15 (-25) cm. long, 1-1.5 (-2.5) mm. broad when flat but mostly tightly involute and arcuate; spikes 9 to 25 (to 35), usually 7-9 mm. long, in 2 rows along one side of a panicle axis 5-12 cm. long, spreading, at length each deciduous as a unit, the rachis prolonged beyond the most distal spikelet as a needle, sparsely and minutely appressed-strigose or scabrous; glumes appressed-strigose; spikelets 2 to 6, slightly exceeding the rachis needle; anthers dark-purple. Rocky limestone slopes in the Trans-Pecos (Culberson, Hudspeth and El Paso cos.), infrequent to rare, summer-fall; Tex. and s. N.M. s. to Coah.

16. *Bouteloua uniflora* Vasey. Tufted perennial, rarely with a few short rhizomes but prolifically stoloniferous, thereby forming large colonies; most culms (15-) 45-60 cm. long, 0.5-1 mm. thick, erect, unbranched; ligule a short fringe; blades 3-20 (-30) cm. long, about 2 mm. broad, mostly subinvolute, the tip closely involute; spikes 10 to 30, usually 7-9 mm. long, in 2 rows along one side of a panicle axis (5-) 10-15 cm. long, somewhat pendulous, at length each deciduous as a unit, the rachis prolonged beyond the most distal spikelet as a conspicuous needle, sparsely appressed-strigose or merely scabrous; glumes sparsely appressed-strigose or glabrous; spikelets solitary or in the lowest spikes occasionally 2 or 3, slightly exceeding the rachis needle; anthers yellow. Rocky limestone slopes and flats, Edwards Plateau and s.c. Trans-Pecos, infrequent to rare, summer-fall; Tex. to Coah. and N. L.

103. CATHESTECUM J. PRESL

A genus of perhaps 6 species in southwestern United States and Mexico; much in need of a revision.

1. *Cathestecum erectum* Vasey & Hack. **FALSE GRAMA**. Colonial, remarkably stoloniferous perennial, the slender stolons naked and 1-3 dm. long; erect culms in small tufts, 12-28 cm. long, 0.5-1 mm. thick, essentially unbranched; ligule a fringe about 0.5 mm. long; blades mostly aggregated at the base of the tuft, 2-10 cm. long, about 1 mm. broad, flat or often mostly involute; spikes 4 to 8, 4-6 mm. long, subsecund in 2 rows on one side of a panicle axis only 2-3 cm. long, each spike eventually deciduous as a unit, the rachis of each very short, densely short-pubescent, supporting laterally and subterminally 2 staminate or neutral spikelets and 1 terminal spikelet consisting of a basal pistillate floret and above that a rudiment of 2 reduced florets, one or both of which may be staminate; glumes one-nerved, the first short and mucous, the second (external) lanceolate and pubescent; lemma 3-nerved, the nerves produced into lobes. Locally frequent in gravelly soil in deserts, s. Trans-Pecos, summer; cen. Mex. n. to s. Ariz. and Tex.

104. BUCHLOË ENGELM.

A monotypic genus.

1. *Buchloë dactyloides* (Nutt.) Engelm. BUFFALO GRASS. Colonial, remarkably stoloniferous perennial, the slender stolons 3-15 cm. long; erect culms in small subrhizomatous tufts, 4-30 cm. long, 0.5-1 mm. thick, essentially unbranched; ligule a fringe about 0.5 mm. long; blades 2-10 (-21) cm. long, 1-2 mm. broad, mostly flat with an involute-filiform tip, marginally papillose-pilose; panicles of 2 quite different sorts, staminate and pistillate, these on separate plants or on separate tufts of the same clone; *staminate panicle* on an elongate culm and elevated above the leaves, comprising (1 or) 2 to 4 spikes on an axis about 1 cm. long, each spike 5-13 mm. long, consisting of 7 to 12 spikelets attached in 2 rows along the abaxial side of a smooth somewhat flattened rachis, the latter not at all prolonged beyond the most distal spikelet, the spike eventually falling as a unit, the spikelets 2-flowered, rather smooth, stramineous; *pistillate panicles* burlike on much-abbreviated culms and hidden among the sheaths, comprising (1 or) 2 or 3 spikes on an axis only 1-8 mm. long, each spike 3-7 mm. long, eventually falling as a unit, consisting of 3 to 7 spikelets in 2 rows along one side of a short rachis, nutlike, urceolate by virtue of the thickening and induration of the rachis and second (outer) glumes and burlike by virtue of the spinescent apexes of the second glumes; each spikelet one-flowered. Abundant in fine black calcareous clay loam, in prairies and along roadsides, nearly throughout the state except w. Trans-Pecos and e. Tex., spring-summer-fall; cen. N. A. from Minn. to Mont. and s. through e. Mex. to Pue.

Buffalo grass is sometimes confused with curly mesquite grass (*Hilaria Belangeri*) which also forms close sod in calcareous prairies. Curly mesquite grass has auricled ligules and its blades are usually not papillose-pilose. Buffalo grass is an extremely valuable forage on the Texas plains.

105. SPARTINA SCHREB. CORDGRASS

Perennials; ligule a fringe of cilia; panicle of several spikes; zone of abscission at the base of the spikelet; spikelets strongly laterally compressed, very closely imbricate, arranged in 2 rows on the abaxial side of the flattened rachis of the spike, 1-flowered, firm; glumes very unequal, the first shorter than the lemma, the second longer than the lemma; palea often longer than the lemma but shorter than the second glume.

A genus of about 16 species, mostly American but a few on the coasts of Europe and Africa.

1. Spikelets 15-25 mm. long, including the awn; second glume with an awnlike tip a third to a half its entire length; keels of second glume and lemma with bristles 0.2-0.4 mm. long5. *S. pectinata*.
1. Spikelets 5-15 mm. long, awnless; keel of second glume and lemma often minutely pubescent but not pectinate (2)
- 2(1). Spikes numbering only 2 to 7 (to 10) per panicle, remote (the panicle axis being 9-20 cm. long); culms only 2-4 mm. thick and rhizomes present4. *S. patens*.
2. Spikes more numerous per panicle and more crowded or if few then culms thicker and/or rhizomes absent (3)
- 3(2). Spikes 1-3.5 cm. long; panicle spikelike, 5-10 mm. thick; rhizomes absent; leaf blades nearly wholly involute, 2-5 mm. broad at base1. *S. spartinae*.
3. Spikes 4-15 cm. long; panicles 7-70 mm. broad; rhizomes present; leaf blades 4-25 mm. broad at base, mostly flat (4)
- 4(3). Panicle mostly less than 3 cm. broad; spikes only 5 to 30 per panicle; rhizomes soft; culms 6-15 dm. long2. *S. alterniflora*.
4. Panicle mostly more than 3 cm. broad; spikes usually 25 to 45 per panicle; rhizomes firm; culm firm and tough, 9-30 dm. long3. *S. cynosuroides*.

1. *Spartina spartinae* (Trin.) Hitchc. SACAHUISTA, GULF CORDGRASS. Tufted perennial; lowermost internodes occasionally shortly subrhizomatous toward the outside of the large tuft but true rhizomes absent; culms numerous, 5-20 dm. long, 2.4 mm. thick, erect, unbranched; ligule 1-2 mm. long; blades 2-7 dm. long, 2-5 mm. broad at the base, closely involute essentially the entire length, the tips sharp and spinelike; panicle spike-like, 6-40 cm. long, 5-9 mm. thick, usually tapered to both ends; spikes 10 to 75 per panicle, 10-35 mm. long, 3-4 mm. thick, closely appressed and overlapping; spikelets 16 to 40 per spike, 5-8 mm. long; first glume 2-6 mm. long; second glume 4-8 mm. long; lemma about equaling second glume; keels of glumes and lemma minutely hispid. Abundant in tight loamy somewhat saline poorly drained flats, s.e. Tex. and Rio Grande Plains, extremely abundant near the coast, rare and scattered inland (e.g., Gonzales Co.), spring-summer, rarely fall; Gulf and Carib. shores, U.S., Mex. and C.A.; also inland in S.L.P., Coah. and N.L.; also inland in Arg. and Parag.

The young shoots emerging after fires are good forage but the older shoots are much too tough even for horses. Formerly vast acreage of sacahuista were therefore burned over purposely in the ranches of southern Texas; the practice is less common now.

2. *Spartina alterniflora* Lois. SMOOTH CORDGRASS. Perennial from relatively soft deeply buried (and seldom collected) branched rhizomes 4-7 mm. thick; aerial culms 6-15 dm. long, 3-14 mm. thick, erect, unbranched, leafy; ligule 1-2 mm. long; blades 20-55 cm. long, 4-16 (-25) mm. broad at the very base, flat, distally involute and wholly involute on drying; panicle 1-4 dm. long, 7-22 mm. thick, tapered to both ends, somewhat spike-like but lax; spikes 5 to 30 per panicle, 4-10 cm. long, 3-5 mm. thick, appressed or usually diverging at angles of 10°-20°, closely overlapping; spikelets 10 to 40 per spike, 8-14 mm. long; first glume 4-10 mm. long; second glume as long as spikelet, the lemma a little shorter; keels of glumes and lemma with some minute pubescence. Abundant in colonies at the tidally-inundated shores of brackish to hypersaline bays and river-mouths, along the Tex. coast, locally common, summer-fall; nat. to the e. coast of N.A. from the Maritime Provinces to Tex., and also S.A. from Gui. to Arg.; introd. in Wash., and in Fr. and Eng.

3. *Spartina cynosuroides* (L.) Roth. BIG CORDGRASS. Perennial from deeply buried (rarely collected) rhizomes 7-15 mm. thick; aerial culms 9-30 dm. long, 4-25 mm. thick, erect, unbranched, leafy; ligule 1-3 mm. long; blades 25-70 cm. long, 10-22 mm. broad at base, flat, at the tip involute; panicle 15-30 cm. long, 4-7 cm. broad, more or less ellipsoidal; spikes 5 to 67 (usually 25 to 45) per panicle, 5-15 cm. long, 3-6 cm. thick, basally shortly naked, usually diverging at angles of 20°-30°, overlapping; spikelets 30 to 70 per spike, 9-14 mm. long; first glume 3-7 mm. long; second glume as long as spikelets, the lemma a little shorter; glumes and lemmas minutely pubescent on the keels or wholly glabrous. Locally abundant in colonies in muck at tidally submerged shores of brackish bays and river-mouths, s.e. Tex. (Chambers, Galveston and Harris cos.), summer; coasts from Mass. to Tex.

4. *Spartina patens* (Ait.) Muhl. SALTMEADOW CORDGRASS. Perennial from creeping rhizomes 2-4 mm. thick; aerial culms 25-90 cm. long, 1-3 mm. thick, erect, unbranched; ligule about 0.5 mm. long; blades 15-40 cm. long, 1.5-3 mm. broad, mostly involute, the tip subspinose; panicle 9-20 cm. long, about 1 cm. broad; spikes 2 to 7 per panicle, 1-7 cm. long, 2-3 mm. thick, usually diverging at angles of 5°-45°, remote; spikelets 24 to 50 per spike, 7-12 mm. long; first glume 3-8 mm. long; second glume 7-12 mm. long; lemma shorter than second glume; glumes and lemma hispid on keel, at least distally. Sandy seasonally moist soil near the coast, s.c. Tex. and Rio Grande Plains, common, summer-fall; shores of Great Lakes, Atl. and Gulf coasts, cont. N.A. and W.I.; also s. Fr., Corsica and It.

5. *Spartina pectinata* Link. PRAIRIE CORDGRASS. Perennial from firm creeping rhizomes 3-8 mm. thick; aerial culms 75-200 cm. long, 3-10 mm. thick, erect, unbranched, leafy; ligule 1-3 mm. long; blades 2-6 dm. long, 5-10 mm. broad at base and flat, involute toward the tip and more extensively involute on drying; panicle 1-3 dm. long, 2-6 cm. broad; spikes 5 to 20 (rarely more) per panicle, 2-15 cm. long, 3-7 mm. thick, appressed or usually diverging at angles of 10°-20°, overlapping; spikelets 40 to 80 (rarely fewer) per spike; first glume 5-10 mm. long including an awnlike tip, the keel minutely hispid; second glume 15-25 mm. long including an awn-tip about a third to half the entire length, the keel pectinate with erect bristles 0.2-0.4 mm. long; lemma much shorter than the second glume, apically narrowed and bidentate, on the upper half of the dorsal keel

pectinate. N.-cen. and e. Tex., Plains Country and Trans-Pecos, scattered or rare, summer; s. Can. s. to N.C., Tenn., Ark., Tex., N.M., Ut. and Ore.

106. COTTEA KUNTH

A monotypic genus.

1. *Cottea pappophoroides* Kunth. Tufted annual or short-lived perennial; culms 35-60 cm. long, weak, often sprawling, geniculate at the nodes and terminally ascending, finely viscid-pubescent; blades ascending, 10-15 cm. long, 3-6 mm. broad, flat or when droughty folded; exerted panicles (not the cleistogamous ones in the lower sheath) 10-18 cm. long, conical or elongate-ovoid, loosely-flowered, sometimes nodding; spikelets oblong, 7-10 mm. long, about 6 mm. broad, slightly laterally compressed, mostly 8- to 10-flowered (the uppermost 1 or 2 flowers sometimes sterile); rachilla with a zone of abscission at each node; glumes slightly shorter than lowermost lemmas; lemmas 9- to 11-nerved; dissected into awned ciliate lobes almost half the length, densely pubescent along the nerves below with especially long hairs along the nerves nearest the lateral margin. Infrequent on desert flats and in rock crevices in the Trans-Pecos, summer-fall; Tex. to Ariz. and s. to cen. Mex.; also Andean S.A.

107. PAPPOPHORUM SCHREB.

PAPPUS GRASS

Tufted perennials; culms slender, 3-10 dm. long, erect, not or rarely branched; ligule an irregular fringe; blades 15-30 cm. long, 3-5 mm. broad basally, the tip long-attenuate and involute; panicle spikelike or nearly so, 8-20 cm. long, many-flowered; spikelets not compressed, 4- or 5-flowered, the lower 1 or 2 (or 3) fertile, the rest reduced to a rudiment; rachilla with a zone of abscission above the glumes; lemmas 13- to 15-nerved (nerves obscure in the body of the lemma), dissected more than half the length into numerous awns, pubescent near the base.

About 7 species in North America and South America.

1. Body of spikelets (not including awns) 3-4 mm. long, about equaling the awns; fertile florets at least 2 in number, usually 3 1. *P. bicolor*.
1. Body of spikelet 2-2.5 mm. long, shorter than the awns; fertile florets solitary (rarely 2) per spikelet 2. *P. mucronulatum*.

1. *Pappophorum bicolor* Fourn. Panicles rather loosely spikelike, with some branches 1-3 cm. long and sometimes not strictly appressed; pedicels 1-5 mm. long; spikelets with 2 or 3 fertile flowers, relatively large, usually pinkish-purple in the distal half. Brush-covered Rio Grande Plains, Edwards Plateau and streamsides and wastes in s.e. part of the Trans-Pecos, spring-summer; Tam. to Dgo., n. to Ariz. and Tex.

2. *Pappophorum mucronulatum* Nees. Panicles strict; pedicels 1 mm. long or less; spikelets with 1 fertile floret (rarely 2), small, whitish or buffy-white. Rio Grande Plains and Trans-Pecos, infrequent, spring-fall; Tam., S.L.P., to Dgo. and Son., n. to Ariz. and Tex.; s. Braz. to Arg.

108. ENNEAPOGON BEAUV.

A genus of about 30 species in warm regions.

1. *Enneapogon Desvauxii* Beauv. SPIKE PAPPUS GRASS. Tufted perennial (but flowering first year); culms numerous from the base, 15-45 cm. long, 0.5-1 mm. thick, spreading below and geniculate, ascending terminally, sparingly branched, minutely pilose; ligule a minute fringe; leaves finely pilose; blades 3-12 mm. long, 1.5-2 mm. broad, mostly loosely involute; panicles spikelike, 2-9 cm. long, 6-10 mm. thick, grayish; spikelets of the panicle about 5 mm. long, with a single basal fertile floret and a rudiment of 2 sterile florets; rachilla with zone of abscission at base of fertile lemma; glumes equal and nearly equaling spikelets, cymbiform, membranous, strongly 7-nerved near the middle, minutely pilose; fertile lemma with 9 strong nerves extended with 9 strong plumose awns longer

than the body; cleistogamous inflorescences often produced in the lower sheaths (culms breaking easily at the lower nodes). *Pappophorum Wrightii* Wats. Desert flats and hills, common in the Trans-Pecos, infrequent in w. Edwards Plateau and w. Plains Country, summer-fall; Tex. to Ut. and s.e. to Oax.; also Peru, Bol. and Arg.

109. HILARIA H.B.K.

Perennials, either rhizomatous or stoloniferous; culms 1-6 cm. tall; blades narrow; spikelets in groups of 3, the groups nearly sessile in a spikelike terminal panicle a few cm. long and less than 1 cm. thick; spikelet groups falling as units from the axis, the central spikelet (next the axis) fertile and 1-flowered (occasionally 2-flowered), the 2 lateral spikelets of the group staminate and 2-flowered (occasionally 3-flowered); glumes coriaceous, those of the 3 spikelets forming a false involucre, in some species connate at base, more or less asymmetric, usually bearing an awn on one side from about the middle (representing the extension of the midnerve of the asymmetric glume); lemma and palea hyaline, about equal in length.

A small American genus of dry areas.

1. Glumes at summit subhyaline and fimbriate; plants rhizomatous, forming colonies1. *H. mutica*.
1. Glumes at summit firm, not fimbriate; plants forming mats by stolons (2)
- 2(1). Glumes of lateral spikelets much shorter than the florets, pale; groups of 3 spikelets mostly 5 mm. long2. *H. Belangeri*.
2. Glumes of lateral spikelets about equaling the florets, very darkly pigmented; group of spikelets 7-8 mm. long3. *H. Swallenii*.

1. *Hilaria mutica* (Buckl.) Benth. TOBOSA. Rhizomes present; culms 3-6 dm. tall, glabrous, the nodes pubescent; blades flat or somewhat involute, rather rigid, 2-3 mm. broad; spikes 4-6 cm. long; group of 3 spikelets about 7 mm. long, bearded at base; glumes of lateral spikelets very asymmetric, widened toward the ciliate summit, the nerves flabellate, not excurrent or barely so; fertile spikelet about equaling the lateral one, its glumes strongly keeled, cleft into few to several narrow ciliate lobes and slender awns; lemma exceeding the glumes, mucronate between the 2 rounded lobes. Abundant in alluvial flats, w. half of Tex., summer-fall; Tex., Okla., N.M., Ariz., Chih., Coah. and Dgo.

Reports of *H. Jamesii* (Torr.) Benth. from Texas are apparently based on misdetermined specimens of *H. mutica*, but it is not impossible that *H. Jamesii*, the so-called "galleta," may occur in the higher parts of the plains or in the Trans-Pecos; it may be recognized by the glumes of the lateral spikelets narrowed toward the summit.

2. *Hilaria Belangeri* (Steud.) Nash. CURLY MESQUITE. Plants in tufts, sending out slender stolons that produce new tufts, the internodes of the stolons wiry, 5-20 cm. long; culms erect, slender, 1-3 cm. tall, villous at nodes; blades flat, 1-2 mm. broad, scabrous, more or less pilose, usually short, crowded at base, often forming a curly tuft but sometimes longer and erect; spike usually 2-3 cm. long, with mostly 4 to 8 clusters of spikelets, the axis flat, the internodes alternately curved, 3-5 mm. long; groups of spikelets 5-6 mm. long; lateral spikelets attenuate at base; glumes united below, firm, scabrous, the outer lobe broadened upward, 2- or 3-nerved, the inner much-reduced, the midnerve of both glumes extending into short awns, the first glume smaller, the lateral nerves sometimes excurrent into awns or teeth (the glumes variable in a single spike); fertile spikelet usually shorter than the sterile, rounded at base; glumes firm with deeply lobed thinner upper parts, the midnerves extending into awns mostly exceeding the staminate spikelets; lemma compressed, narrowed above, awnless. Common in the w. half of Tex. in open plains and brushlands on calcareous soils, summer-fall; Tex., N.M., Ariz., Chih., Coah., N.L. and Tam.

3. *Hilaria Swallenii* Cory. Resembling *H. Belangeri*; culms to 35 cm. tall; blades usually 2 mm. broad, scarcely curled; spike 20-45 mm. long, with 3 to 8 clusters of spikelets, the internodes of the flat axis 4-6 mm. long; glumes of lateral spikelets similar, oblong, narrowed at base, about equaling the florets, firm and strongly pigmented except toward the summit, the nerves often rather obscure; awns of all glumes slightly longer

than those of *H. Belangeri*; fertile spikelet about equaling the sterile one, the fertile floret slightly larger than that of *H. Belangeri*. Davis Mts. area and plains about their base, in Brewster, Presidio and Jeff Davis cos. in the Trans-Pecos, locally abundant, summer-fall; also Coah.

110. TRAGUS HALL.

Annuals 1-4 dm. tall; blades firm, flat, mostly less than 5 cm. long, 2-4 mm. broad, the cartilaginous margin bearing stiff white hairs or short slender teeth; spikelets borne in groups of 2 to 5 in "burs", with many burs arranged in an erect terminal spike-like raceme 4-10 cm. long; spikelets 1-flowered, 2-4.5 mm. long, sessile on a very short zigzag rachis in the bur; first glumes small, thin or absent, appressed to the rachis; second glumes of the 2 lower spikelets strongly convex with 3 thick nerves bearing a row of squarrose stout hooked prickles along each side, the 2 second glumes forming the halves of a little bur, the upper 1 to 3 spikelets reduced and sterile; lemma and palea thin, the lemmas flat, the palea strongly convex.

A small Old World genus, of which 2 species are introduced in Texas.

1. Spikelets 2-3 mm. long, the apex scarcely projecting beyond the spines, the bur nearly sessile1. *T. Berteronianus*.
1. Spikelets 4-4.5 mm. long, the acuminate apex projecting beyond the spines, the bur pedicelled2. *T. racemosus*.

1. *Tragus Berteronianus* Schult. Characters as in the key. Loamy soil in disturbed dry soil, w. half of Tex., e. to Cameron, Kenedy, Kleberg and Travis cos., summer-fall; warmer parts of the world.

2. *Tragus racemosus* (L.) All. Characters as in the key. Rare and local in dry disturbed soil near the coast, summer-fall; warmer parts of the world.

111. ALLOLEPIS SODERSTROM & DECKER¹⁵

A monotypic North American genus.

1. *Allolepis texana* (Vasey) Soderstrom & Decker. Perennial, stoloniferous, the strongly ribbed stolons to 25 cm. long and 1-4 mm. broad, forming extensive colonies to 20 m. across; culms loosely ascending or spreading, 1-7 dm. long (from point of rooting to base of inflorescence); lower sheaths shorter than the internodes; blades flat when dry, sometimes involute toward the tip, to 3 dm. or more long, 2.5-6 mm. broad; ligule short-ciliate, 0.5-1.4 mm. long; panicle 3-23 cm. long, 1-6 cm. thick, consisting of stiffly appressed or ascending branches 3-6 cm. long, usually floriferous to the base, the panicles containing as many as 70 spikelets; male and female flowers borne on separate plants; *male spikelets* ovate-lanceolate to linear, stramineous, 9-23 mm. long, 3-8 mm. broad, with up to 20 florets per spikelet, apparently not disarticulating; glumes broad, ovate, hyaline; first glume about 4-5 mm. long, 1-nerved; second glume about 1 mm. longer than the first, 1- (to 3-) nerved; lemmas of lower florets 5-5.5 mm. long, strongly 3-nerved; palea equal to or a little longer than the lemma, linear; *female spikelets* ovate-lanceolate, terete or only slightly compressed, stramineous, 1-2 cm. long, 2.5-3 mm. broad, with up to 8 or 9 closely imbricate florets, apparently not disarticulating; glumes broadly ovate, coriaceous with broad scarious margins; first glume a little shorter and narrower than the second, about 7-9 mm. long, strongly 1-nerved (up to 4 or 5 additional faint nerves may be present); second glume 3-nerved, with an additional 1 or 2 pairs of faint nerves sometimes present; lemmas of the lower florets 7.5-10 mm. long, strongly 3-nerved, broadly ovate, coriaceous with irregular scarious margins; palea a little shorter than the lemma, narrow above and strongly bowed out below, the margins overlapping. *Poa texana* Vasey. Local in alluvial soil in the Trans-Pecos at elev. of 3,000-5,000 ft., summer-fall; Tex., Chih., Coah. and Dgo.

¹⁵ Adapted from Thomas R. Soderstrom and Henry F. Decker in *Madroño* 18: 33-39. 1965.

112. *DISTICHLIS* RAF.¹⁶

A small American genus of perhaps 3 or 4 species.

1. *Distichlis spicata* (L.) Greene. SALTCRASS. Perennial, rarely more than 3 dm. tall, forming tight colonies in saline mud by means of very tough slender whitish scaly rhizomes; culms erect, 1-3 (-5) dm. tall, tough and wiry; leaves usually noticeably 2-ranked, narrow (1-3 mm. broad), usually mostly involute, tough, pungent, only 2-6 (-10) cm. long, ascending; male and female flowers on separate plants; spikelets rather similar on both kinds of plants, in terminal erect spikes or spike-like racemes; pistillate racemes often shorter than staminate (the staminate ones often overtopping the foliage); spikelets 5- to 15-flowered, usually 6-10 mm. long; rachilla of the pistillate spikelets disarticulating above the glumes and between the florets; glumes unequal, broad, acute, keeled, 3- to 7-nerved, the lateral nerves sometimes faint; lemmas closely imbricate, firm, the coriaceous pistillate ones acute or subacute and 3-6 mm. long, the pistillate ones more coriaceous and more closely imbricate than the staminate, with 9 to 11 mostly faint nerves; palea as long as the lemma or shorter, the margins bowed out near the base, rather soft, narrow, the keels narrowly winged, the pistillate lemmas coriaceous and enclosing the grain which is brown.

Represented with us by two varieties as follows:

Var. *spicata*. Culms 1-6 dm. tall, slender, erect; blades erect, to 15 cm. long, 10-25 mm. apart on the culm, equaling or exceeding the pistillate spikes and rarely exceeded by the staminate spikes; *pistillate spikes* pale green, 1-6 cm. long, of 8 to 36 congested spikelets that are 5- to 9-flowered, up to but not exceeding 1 cm. long, 4 mm. broad; first glume 3 mm. long; second glume 4 mm. long; lemmas 6- to 10-nerved, 3.5-4 mm. long, closely imbricate; palea keels minutely evenly serrate, the 4 nerves often excurrent; grain about 2 mm. long, somewhat truncate at the tip; *staminate spikes* pale green, 1-6 cm. long, of 6 to 30 congested spikelets that are 7- to 10-flowered, about 1 cm. long, 4 mm. broad; first glume to 3 mm. long; second glume to 4 mm. long; lemmas 6- to 10-nerved, 3 mm. long; palea 2-keeled but otherwise nerveless, about 3 mm. long. Salt marshes near the coast, very abundant, rare in salt marshy areas inland in e. Tex., summer-fall; Can. to Mex. along the coast; also W.I.

Var. *stricta* (Torr.) Beetle. Culms 10-35 cm. tall, erect or rarely decumbent; blades to 2 dm. long, the upper equaling or exceeding the pistillate spikes but exceeded by the staminate ones; *pistillate spike* green drying stramineous-brown, 2-7 cm. long, of 5 to 40 approximate spikelets that are 5- to 20-flowered, 5-20 mm. long and 4-7 mm. broad, the mature florets often strongly reflexed, usually not closely imbricate; first glume 2-3 mm. long; second glume 3-4 mm. long; lemma 2.5-6 mm. long, firm, with a broad hyaline margin; palea 3-5 mm. long, the keels conspicuously serrate to the base, often dentate, narrowed or winged at base, occasionally with a few long hairs on back; grain 2-5 mm. long, sometimes slenderly tapered to a single beak, sometimes truncate with a double beak; *staminate spike* green or rarely purplish, drying stramineous-brown, 2-5 cm. long, of 5 to 25 approximate spikelets that are 5- to 20-flowered, 5-20 mm. long and 4-7 mm. broad, closely imbricate; first glume 2-3 mm. long; second glume 3-4 mm. long; lemmas 5-6 mm. long, firm, equalled by the palea; palea 5-6 mm. long, the keels conspicuously serrate to the base, infrequently dentate, rarely broadly winged, usually with at least one prominent marginal vein. *D. stricta* (Torr.) Rydb. Locally abundant in alkaline or alkaline-saline areas of w. half of Tex., summer-fall; w. U.S. e. to the Dakotas, Neb., Kan., Okla., Tex., Coah. and Chih.

113. *MONANTHOCHLOË* ENGELM.

A monotypic North American genus.

1. *Monanthochloë littoralis* Engelm. Perennial forming extensive mats by rhizomes and/or stolons; flowering culms ascending, 5-25 cm. long; branches of 2 size-classes; few-noded elongate culms with leaves 10-15 cm. long, bearing in the axils many-noded short shoots with crowded leaves 5-10 mm. long; sheaths and blades extremely short,

¹⁶ In part adapted from Alan A. Beetle in Bull. Torrey Club 70: 638-650. 1943.

very firm, indurate-wiry, folded-falcate, grayish-green; male and female flowers on separate plants; panicles reduced to solitary 3- to 5-flowered spikelets, appearing terminal and embedded in the masses of leaves of the short shoots, difficult to find; glumes apparently absent; lemmas coriaceous or in the pistillate spikelet like the leaves; upper florets rudimentary; rachilla of pistillate floret tardily abscising at the lower part of the nodes. Locally abundant in poorly drained brackish or saline flats or cayos near the coast, s.e. Tex. and Rio Grande Plains, also in Gonzales Co., spring; Fla. to Cuba; Tex. to Tam. and Coah.; Calif. to Baja Calif., Son. and Sin.

114. VASEYOCHLOA HITCHC. TEXAS GRASS

A monotypic genus.

1. *Vaseyochloa multinervosa* (Vasey) Hitchc. Perennial with slender fragile short rhizomes and occasionally short fragile stolons (these often with cleistogenes in the lower sheaths); culms 4-11 dm. long, erect; lower sheaths obscurely keeled; blades 2-6 mm. broad, flat or mostly involute on drying; panicle 8-35 cm. long, with few long remote few-flowered branches (these at first ascending, later widely spreading); spikelets remote, on very short pedicels, appressed to the branches to slightly drooping, scarcely at all compressed, 8- to 12-flowered, all the florets perfect but in the uppermost the pistil often abortive; rachilla abscising at the nodes; glumes shorter than first lemma, several-nerved; lemmas 7- to 9-nerved, about 6 mm. long, the 6 to 8 lateral nerves ending well within the distal margin, the midnerve attaining it but not excurrent; palea splitting at maturity by the widening of the large dark grain. Frequent in shady woods on loose sandy soil, Rio Grande Plains, rare in s. part of s.e. Tex., spring-fall; endemic.

115. ARISTIDA L. THREE-AWN GRASS

Spikelets 1-flowered and relatively large; glumes membranous, linear-lanceolate, often acute or acuminate; zone of abscission between the glumes and lemma; lemma indurate, linear, the back rounded and completely enclosing the palea and sex organs, basally with a sharp callus and apically narrowed and bearing 3 awns (the two lateral ones reduced to minute points in some species); the lemma and its appendages and enclosures constitute the "fruit."

The genus comprises about 330 species in the warmer usually arid parts of the world. In our flora it has the reputation of great taxonomic difficulty. The 26 "species" here included could easily be condensed to 20 or fewer if the segregate forms were reduced to synonymy. For the most part only mature material with fully expanded panicles and dry fruits can be determined with confidence.

Three-awn grasses are considered comparatively poor as forage, but they are of importance, especially in the spring and where the more desirable grasses have been removed by the usually abusive practices of overgrazing. The basal, sharp calluses of the fruits are troublesome to stock in summer and fall.

1. Apical portion of lemma with 3 awns attached to it separating from the rest of the lemma at maturity 1. *A. desmantha*.
1. Awn(s) persisting at the top of the lemma (2)
 - 2(1). Panicle much-branched, the ascending or spreading several-flowered branches 3-15 cm. long, straight and basally naked; blades membranous, straight for nearly the entire length, the lower parts usually flat, the upper involute; plants perennials (3)
 2. Panicle narrow, if branched then the branches short, densely-flowered, curved or appressed, or if the branches somewhat spreading then the leaves closely involute, short and curved (7)
 - 3(2). Panicle branches mostly 2-4 cm. long, spreading at right angles; culms erect, mostly less than 3 dm. tall, slender, at maturity usually breaking beneath the panicle; basal flat part of the blades less than 2 mm. broad 22. *A. barbata*.

3. Panicle branches usually ascending or drooping, 3-15 cm. long; culms usually decumbent, stouter; basal flat part of blades several mm, broad (4)
- 4(3). All 3 awns about equal in length (5)
4. Lateral awns minute (6)
- 5(4). Narrow part of lemma just below awns twisted 1 to 3 turns 23. *A. divaricata*.
5. Lemma just below awns not or only slightly twisted .. 24. *A. hamulosa*.
- 6(4). Narrow part of lemma just below awns twisted 1 to 3 turns 26. *A. Orcuttiana*.
6. Lemma just below awns not or only slightly twisted .. 25. *A. ternipes*.
- 7(2). First glume usually less than two thirds as long as the second (almost as long in some plants of *A. glauca*); blades usually closely involute even to the base (except some specimens of *A. purpurea* and *A. Roemeriana*), falcately curved outward and mostly less than 15 cm. long; strong perennials (8)
7. First glume about three fourths or four fifths as long as second (except about two thirds in *A. adscensionis* and *A. longespica*); lower parts of blades flat, the upper parts usually somewhat involute and either straight or becoming irregularly curly when dry; perennials or annuals (15)
- 8(7). Panicles with few straightish ascending branches 2-5 cm. long, diverging at angles of 15°-55°; blades closely involute the entire length (9)
8. Panicle branches closely appressed or else slender and distinctly curved and flexed (10)
- 9(8). Spikelets spreading from the branches of the panicle 21. *A. dissita*.
9. Spikelets appressed to the branches of the panicle 20. *A. pansa*.
- 10(8). Branches of the panicle short, slender, weak, at least some of them *at maturity* reflexed or arched (11)
10. Branches of the panicle (if any) straight and appressed, the panicle thus nearly spikelike (12)
- 11(10). Lemma about 10-13 mm. long; awns 2-5 cm. long; plants mostly 30-100 cm. tall 18. *A. purpurea*.
11. Lemma usually less than 10 mm. long; awns usually 1-2 cm. long; plants mostly 12-50 cm. tall 19. *A. Roemeriana*.
- 12(10). Awns longer than 4 cm.; plants 15-35 cm. tall; culms leafiest at the base but some leaves attached at the middle of the plant or higher 17. *A. longiseta*.
12. Awns shorter, usually less than 4 cm. long (13)
- 13(12). Plants only 10-35 cm. tall; leaves short and very curly, forming a compact tuft at the very base, scarcely attaining a third the height of the plant 16. *A. Fendleriana*.
13. Plant mostly 20-100 cm. tall; lower halves of the culms leafy; awns only 15-30 mm. long (14)
- 14(13). Plants mostly 30-100 cm. tall; lemma just below the awns slightly or not at all twisted 14. *A. Wrightii*.
14. Plants mostly 12-50 cm. tall; lemma just below the awns twisted 1 to 3 turns 15. *A. glauca*.
- 15(7). Strong perennials; culms basally at least 1 mm. thick and mostly 6-12 dm. long, erect, usually simple above the base; usually some of the lowest flat blades of the spring more than 2 dm. long, drying and persisting in the fall as irregular brown curls like wood shavings (16)
15. Annuals; culms basally about 0.4-0.5 mm. thick and mostly less than 6 dm. tall (to 1.1 mm. thick and 10 dm. tall in *A. intermedia*), often weak and sprawling basally and in the lower half repeatedly branched; usually the flat blades shorter than 2 dm. and not curly (20)

- 16(15). Lemma more or less narrowed and twisted just below the awns; plants of mountains of Trans-Pecos Texas13. *A. arizonica*.
16. Lemma not remarkably twisted; plants of sandy soils of eastern Texas (17)
- 17(16). Lemma 7-10 mm. long to the base of the awns (18)
17. Lemma 4-7 mm. long to the base of the awns (19)
- 18(17). Sheaths woolly12. *A. lanosa*.
18. Sheaths essentially glabrous11. *A. affinis*.
- 19(17). Awns all about equally divergent 9. *A. purpurascens*.
19. Central awn more deflexed than the lateral ones10. *A. virgata*.
- 20(15). Lemma below the awns 16-28 mm. long (21)
20. Lemma shorter than 15 mm. (22)
- 21(20). Awns 3-7 cm. long, about equal, the central one with a simple flex basally, otherwise straight 3. *A. oligantha*.
21. Central awn about 2 cm. long, with a semicircular bend or part of a coil basally; lateral awns only 1-5 mm. long 4. *A. ramosissima*.
- 22(20). Lateral awns 10-30 mm. long, nearly or quite as long as central one, none of the awns remarkably reflexed (23)
22. Lateral awns 0.5-9 mm. long, distinctly shorter than the central one which is remarkably bent basally (24)
- 23(22). Panicles mostly less than 15 cm. long, densely flowered owing to the presence of 4 to 20 spikelets on each branch; plants of western and southern Texas
..... 2. *A. adscensionis*.
23. Panicles mostly more than 15 cm. long, narrow and spikelike, each branch with only 1 to 5 spikelets; plants of sandy soils of the Coastal Plains
..... 8. *A. intermedia*.
- 24(22). Central awn not basally coiled 7. *A. longespica*.
24. Central awn basally coiled (25)
- 25(24). Lateral awns half to two thirds as long as the central one
..... 6. *A. basiramea*.
25. Lateral awns 0.5-3 mm. long, less than half as long as the central one
..... 5. *A. dichotoma*.

1. *Aristida desmantha* Trin. & Rupr. Erect annual; culms sparingly branched, 5-10 dm. long, 2-3 mm. thick, often purplish basally; lower sheaths thinly woolly; blades mostly 2-3 dm. long, flattish basally, involute above; panicles 1-2 dm. long, with ascending somewhat flexuous few-flowered flabellate branches; glumes about equal, 12-20 mm. long, apically filiform; lemma 9-10 mm. long to base of awns; awns about equal, slightly contorted basally, divergent, about 25 mm. long. Sandy soils, openings in oak woods, e. Tex. and n. Rio Grande Plains, June-Oct.; reported to occur also in Neb. and Ill.; otherwise restricted to Tex.

2. *Aristida adscensionis* L. SIX-WEEKS THREE-AWN. Annual, much-branched at base and less profusely above; culms 1-8 dm. long, 0.5-1 mm. thick, erect or usually sprawling, often purplish basally; blades 4-15 cm. long, flat in basal half, involute above; panicles narrow and rather dense, 6-15 cm. long; first glume 4-7 mm. long; second glume 7-10 mm. long; lemma 6-9 mm. long to base of awns; awns 10-15 mm. long, flattened basally, about equal (one rare form has the lateral awns much-reduced). Dry soil, especially as weed along roads and other disturbed areas, common in the Trans-Pecos, scarce on Edwards Plateau, Rio Grande Plains and Plains Country, summer-fall (occasionally spring along the Rio Grande); widespread weed in the warmer drier parts of the world.

3. *Aristida oligantha* Michx. PRAIRIE THREE-AWN. Annual, much-branched throughout; culms mostly 3-6 dm. tall, 1-1.5 mm. thick, often purplish basally, erect or ascending; leaves at base of plants with blades 15-30 cm. long and 1-2 mm. broad at the flat basal part; cauline blades 3-15 cm. long, only about 1 mm. broad basally; panicle very open and amorphous; spikelets solitary on the branchlets; glumes apically filiform, 2-5 cm. long; lemmas 18-28 mm. long to base of awns; awns 3-7 cm. long, about equal, simply

bent at the base. Mostly sandy and calcareous sandy soil, open ground, throughout the e. half of Tex., less common w. to e. Edwards Plateau and e. Plains Country, June-Oct.; throughout e. U.S. w. to Tex. and S.D.; also Ariz., Calif. and Ore.

4. *Aristida ramosissima* Gray. Annual, much-branched; culms 3-5 dm. tall; flat part of cauline blades about 1 mm. broad; panicle narrow and short; first glume about 15 mm. long; second glume about 2 cm. long; lemma about 25 mm. long; central awn 15-20 mm. long, spreading, with a semicircular bend or part of a coil basally; lateral awns only 1-5 mm. long. Reported to occur in Tex.; otherwise occurring from Ia. s. to Okla., Ark. and La., e. to Ky. and Tenn.

5. *Aristida dichotoma* Michx. Annual, branched at base and above; culms mostly 2-4 dm. long, 0.5 mm. thick, ascending or erect; blades of basal leaves 8-10 cm. long, those of cauline leaves 2-5 cm. long, the basal flat portion of both kinds 0.5-1 mm. broad; panicle spikelike, 5-10 cm. long, few-flowered; glumes 6-9 mm. long, nearly equal; lemma 5-6 mm. long to base of awn; central awn 5-8 mm. long, basally coiled 2 or 3 turns and deflexed; lateral awns 0.5-3 mm. long. Sandy soils, e. Tex., apparently rare, Sept.-Oct.; throughout e. U.S. (See remark under the next species.)

6. *Aristida basiramea* Vasey. Annual, similar to *A. dichotoma* but the second glume 9-11 mm. long, a little longer than the first, central awn 9-15 mm. long and lateral awns 2-7 mm. long. Incl. var. *Curtissii* (Gray) Shinnery, *A. Curtissii* (Gray) Nash. Sandy open ground, n.-cen. Tex. (Dallas and Red River cos.), apparently rare, Aug.-Oct.; Va. and Me., w. to Wyo. and Colo., s. to Okla. and Tex. Probably just a form of *A. dichotoma*.

7. *Aristida longespica* Poir. Annual, branched at base and less profusely so above; culms 3-6 dm. long, 0.3-0.8 mm. thick, erect or decumbent at base and geniculate at lower nodes; basal blades 5-12 cm. long, the cauline ones 2-5 cm. long, the basal flat portion of both kinds 0.5-1 mm. broad; panicle spikelike, 5-18 cm. long, few-flowered; glumes 3-6 mm. long, nearly equal or occasionally the first only two thirds as long as the second; lemma 4-6 mm. long to base of awns; central awn basally markedly deflexed but not twisted nor coiled, 5-13 mm. long; lateral awns 0.5-9 mm. long, up to five eighths as long as the central one and not or only slightly deflexed. Incl. var. *geniculata* (Raf.) Fern. Sandy open ground, e. and s.e. Tex., frequent, Aug.-Oct.; nearly throughout e. U.S., w. to Kan., Okla. and Tex.

Toward the coast and the Rio Grande Plains passing into *A. intermedia*, the intermediate plants more robust, with longer panicles, with central awns longer and not deflexed and the laterals proportionately longer.

8. *Aristida intermedia* Scribn. & Ball. Annual but becoming hard and knotty basally late in the fall and resembling a perennial, much-branched at the base and in the lower half; culms 3-10 dm. long, 0.9-1.2 mm. thick, erect, often decumbent basally and geniculate at the lower nodes; blades (even cauline ones) 5-20 cm. long, the basal flat part 1.5-2 mm. broad; panicle spikelike, 10-21 cm. long; first glume 5-7 mm. long; second glume 6-9 mm. long, very narrow; lemma 7-9 mm. long to base of awns; central awn 20-37 mm. long, the laterals 15-30 mm. Loose sandy ground, Rio Grande Plains and s.c. Tex., Aug.-Nov.; from the Gulf Coastal States; also Ga., Ark., Okla. and Kan.

This describes the common robust plant of the Rio Grande Plains and may not apply to the true *A. intermedia*, which is one of the numerous forms intermediate between the plant described here and *A. longespica*.

9. *Aristida purpurascens* Poir. ARROWFEATHER THREE-AWN. Perennial, tufted, very sparingly branched near the base, the herbage green or often purplish-glaucous; culms strictly erect, mostly 5-10 dm. tall, 1-2 mm. thick; basal blades 2-3 dm. long, the basal flat part 2-3 mm. broad, the cauline leaves shorter and somewhat narrower; blades often remaining flat in the lower part and persisting after drying in the form of brown ribbons curling at the lower half of the tuft; panicles 16-30 cm. long, spikelike; glumes 5-10 mm. long, nearly equal; lemma 4-7 mm. long to base of awns; awns nearly equal, not markedly deflexed basally, 15-30 mm. long. Sandy woods and openings, n.-cen., e. and s.e. Tex., Aug.-Oct.; e. U.S. w. to Kan., Okla. and Tex. (See remarks under *A. virgata*.)

10. *Aristida virgata* Trin. Similar to *A. purpurascens* but the central awn markedly more deflexed than the laterals. Sandy prairies and openings in sandy woods, e. and s.e. Tex., Aug.-Oct.; Coastal States, N.J. to Tex.

The measurements of the spikelets are those of *A. purpurascens*, of which this is

probably only a form. The characters of the awn are those of the next 2 species. *A. affinis* and *A. lanosa*.

11. *Aristida affinis* (Schult.) Kunth. Perennial, tufted from hard bases; culms 7-15 dm. tall, 1.1-2.3 mm. thick, strictly erect; basal blades 2-4 dm. long, the cauline ones a little shorter, the flat basal portion 2-4 mm. broad; leaves often remaining partly flat and persisting after drying in the fall in the form of brown ribbons; panicles 16-30 (-50) cm. long, narrow, somewhat branched, the branches mostly appressed; glumes 9-14 mm. long; lemma 7-10 mm. long to base of awn; central awn 15-30 mm. long and deflexed, the laterals less deflexed and shorter. Loose sandy soil, openings in forests, e. and s.e. Tex., uncommon, Sept.-Oct.; Coastal States, N.C. to Tex.

Probably only a glabrous form of *A. lanosa*.

12. *Aristida lanosa* Ell. Perennial, like *A. affinis* but the sheaths woolly. Same habitats, dates and range in Tex.; Coastal States, N.J. to Tex.; also Mo., Ark., Okla. and W.Va.

13. *Aristida arizonica* Vasey. Perennial, tufted at the base; culms erect, 3-12 dm. tall, 1-2 mm. thick, not or rarely branched; basal blades 15-30 cm. long, the cauline ones shorter, the flat basal portions 1.2-3 mm. broad, persisting after drying as irregular brown curls; panicles 10-25 cm. long, rather spikelike; glumes nearly equal, 10-15 mm. long; lemma 13-16 mm. long to base of awns, the upper narrow portion twisted 1 to 3 turns; awns about equal, not markedly deflexed, 10-25 mm. long. Rocky slopes at alt. of 4,500 ft. or more in the Trans-Pecos, apparently rare (known from Culberson, Jeff Davis and Brewster cos.), Aug.-Sept.; Colo. and Ariz. s. to Son., Chih. and Tex.

14. *Aristida Wrightii* Nash. Tufted perennial; culms erect, rarely branched, 3-8 dm. tall; blades 3-15 cm. long, involute, curved; panicles 12-25 cm. long, narrow, generally spikelike or with the short branches divergent from the axis at angles of 5°-20°; first glume about half to two thirds as long as the second; second glume 11-14 mm. long; lemma about as long as second glume or 1-1.5 mm. longer, stout just below the awns, 0.2-0.5 mm. thick, straight or twisted up to 200°; awns 11-28 mm. long, about equal and equally divergent. Rocky usually limestone slopes, Trans-Pecos (abundant locally) and Plains Country, e. to n.-cen. Tex. and n. part of Rio Grande Plains, May-Dec.; Okla. to Ut. and s. to cen. Mex. Passing into *A. purpurea* and probably not distinct from *A. glauca*.

15. *Aristida glauca* (Nees) Walp. Tufted perennial; culms erect, sparingly branched, 2-6 dm. long; blades 3-15 cm. long, involute, arched, mostly crowded at the base of the plant; panicles 10-25 mm. long, very narrow, spikelike; first glume half to three fourths as long as the second; second glume 8-12 mm. long; lemma about 1-3 mm. longer than the second glume, just below the awns 0.1-0.2 mm. thick and twisted 1 to 3 turns; central awn 8-25 mm. long, the laterals usually equally long but in one rare form reduced to 1-2 mm. in length. Rocky usually limey slopes, Trans-Pecos (abundant locally) and Plains Country, c. to n.-cen. Tex. and n. Rio Grande Plains, May-Dec.; Okla. to s. Calif. and s. to Pue. Passing freely into several other species.

16. *Aristida Fendleriana* Steud. Tufted perennial; culms erect, essentially unbranched, 1-3 dm. long; blades 4-10 cm. long, essentially confined to the very base of the plant, those of the culms very few and reduced, involute, strongly curly; panicle 5-10 cm. long, few-flowered, lax, loosely spikelike or with short flexuous branches; first glume half to two thirds as long as second; second glume about 1 cm. long; lemma 1-2 mm. longer than the second glume, just below the awns narrowed and straight or twisted as much as one turn (360°); awns 2-3 cm. long, equal and equally divergent. Rocky limey slopes, Plains Country and n.-cen. Tex., rare, spring-summer; N.D., Mont. and Nev. s. to Mex. Passing into the next and other species.

17. *Aristida longiseta* Steud. Tufted perennial; culms erect, essentially unbranched, 15-35 cm. long; blades 4-10 cm. long, mostly aggregated toward the base of the plant, involute, arcuate; panicle 5-11 cm. long, lax and few-flowered, loosely spikelike or usually with short flexuous branchlets; first glume about half as long as the second; second glume 15-22 mm. long; lemma a little shorter than the second glume; awns 4-9 cm. long, equal and equally divergent. Rocky or sandy slopes, Trans-Pecos and Plains Country e. to n.-cen. Tex. and Rio Grande Plains, abundant locally, spring-fall; Ia. and N.D., w. to Wash. and s. to Mex.

18. *Aristida purpurea* Nutt. PURPLE THREE-AWN. Tufted perennial; culms erect, usually branched and leafy, 3-8 dm. tall; blades 3-17 cm. long, involute and arched or less com-

monly flat and 1-2.5 mm. broad; panicles 10-25 cm. long, lax, the axis straight or commonly weak and nodding, the lower parts of some of the branchlets naked, capillary, reflexed and curved; first glume about half as long as second glume; second glume 10-15 mm. long; lemma about as long as second glume; awns 24-56 mm. long, about equal and equally divergent. Loamy or rock soils, open ground, throughout w. Tex. e. to w. parts of e. Tex., locally abundant, spring-fall; Ut., Colo. and Kan. s. to n. Mex.

19. *Aristida Roemeriana* Scheele. Tufted perennial; culms erect, usually much-branched and leafy, 15-60 cm. long; blades 3-10 cm. long, usually involute and curved but occasionally flat, nearly straight, about 1 mm. broad; panicle 5-20 cm. long, fairly narrow but not spikelike, lax, the axis weak and often nodding, the lower parts of some of the branchlets naked, capillary, reflexed and curved; first glume about half as long as the second; second glume 8-10 mm. long; lemma about as long as second glume; awns 19-31 mm. long, about equal and equally divergent. Loamy soils, prairies and brushlands, abundant in Rio Grande Plains and infrequent n. to n.-cen. Tex. and the Plains Country, and w. to the Trans-Pecos, spring-fall; also N.M. and n.e. Mex.

20. *Aristida pansa* Woot. & Standl. Tufted perennial; culms erect, sparingly branched, leafy, 25-55 cm. long; blades 4-13 cm. long, involute, arched; panicle 12-20 cm. long, open, few-flowered, much-branched, the branches 3-6 cm. long, diverging at angles of 10°-40°, stiffly ascending, naked in the lower part, the few spikelets appressed to the branchlets or diverging from them at angles of 10°-20°; first glume about two thirds as long as the second; second glume 8-12 mm. long; lemma about as long as the second glume, just below the awns straight or twisted as much as one full turn (360°); awns 10-26 mm. long, about equal and equally divergent. Rocky usually limestone dry slopes and flats in the Trans-Pecos and w. Edwards Plateau, infrequent, spring-fall; Tex., N.M. and Ariz. s. to n. Mex.

21. *Aristida dissita* I. M. Johnst. Tufted perennial; culms erect, essentially unbranched, leafy, 20-45 cm. long; blades 4-15 cm. long, involute, arched; panicle 1-2 dm. long, open, few-flowered, much-branched, the main axis straight, the branches 1-5 cm. long, diverging at angles of 20°-90°, naked in the lower part, the few spikelets diverging at angles of 20°-100°; first glume usually at least three fourths as long as second; second glume 7-10 mm. long, usually dark purple; lemma 1-2 mm. longer than the second glume, usually twisted 1 or 2 turns just below the awns; awns 5-15 mm. long, about equal and equally divergent. Rocky usually limestone dry slopes and flats in the Trans-Pecos, infrequent, summer-fall; also N.M. to n. Mex.

Perhaps not distinct from *A. pansa*; passing into *A. barbata*.

22. *Aristida barbata* Fourn. Densely tufted perennial; culms numerous, erect, sparingly or not branched, 14-32 cm. long; lower blades very numerous, slender, involute, nearly straight, densely clustered at base of plant, 5-12 cm. long; blades of midculm few, 2-10 cm. long, straight, usually at least some of them basally flat, 0.7-1.5 mm. broad; panicles 6-15 cm. long, very diffuse, the main axis curved or sinuous and very slender, the branches 2-7 cm. long, at least some of them diverging at right angles, often curved in some segments, the spikelets attached at remote points along the branches and diverging from them at angles of 20°-45°; first glume nearly as long as second; second glume 9-12 mm. long; lemma 0-2 mm. longer than second glume, just below the awns very slender and twisted 1 to 3 turns; awns 12-22 mm. long, about equal and equally divergent. Loamy desert flats or less commonly dry rocky slopes, abundant in the Trans-Pecos, rare in w. Plains Country, summer-fall; Tex., Ariz. and N.M. s. to cen. Mex.

23. *Aristida divaricata* Willd. Perennial; culms few, often decumbent, sparingly branched, 3-7 dm. long; blades 3-12 cm. long, straight, the cauline blades usually basally flat and about 2 mm. broad, the rest involute; panicles 2-3 dm. long, very diffuse, the main axis essentially straight, the principal branches remote, 5-11 cm. long, spreading mostly at right angles, straight except sometimes arched upward near the base, naked basally more than half the length, bearing short appressed secondary branches distally; spikelets mostly appressed, congested at the ends of the branches; glumes 10-12 mm. long; lemma 10-13 mm. long to base of awns, just below the awns about 0.2 mm. thick and twisted 1 to 4 turns; awns 7-17 mm. long. Grasslands and scrub on slopes at elev. greater than 4,000 ft., Trans-Pecos mts., infrequent, also recently reported to occur in the Plains Country (Castro and Parmer cos.), summer-fall; Kan. to Calif. and s.e. to Guat.

24. *Aristida hamulosa* Henr. Perennial; culms few, often decumbent, sparingly branched, 5-7 dm. long or more; blades 5-30 cm. long, straight, the cauline blades usually basally flat and about 3 mm. broad, the rest involute; panicles 25-40 cm. long, very diffuse, the main axis essentially straight, the principal branches remote, 6-18 cm. long, spreading mostly at right angles, straight except sometimes arched upward near the base, naked basally half the length, branched distally, the branches appressed or diverging at angles of 10°-30°; glumes 11-15 mm. long; lemma 11-15 mm. long to base of awns, just below the awns about 0.3 mm. thick and not or only very slightly twisted; awns 10-23 mm. long. Grasslands and scrub on slopes at elev. greater than 4,000 ft., Trans-Pecos mts., infrequent, summer-fall; Tex. and N.M. to Calif. and s. to Guat.

Perhaps only a form of *A. divaricata*, but averaging larger in all measurements, and the lemma not twisted.

25. *Aristida ternipes* Cav. SPIDER GRASS. Perennial; culms few, erect or often weak and sprawling, sparingly branched, 25-100 cm. long; blades 8-40 cm. long, straight, the cauline blades usually basally flat and 2-4 mm. broad, the rest involute; panicle 15-40 cm. long, very diffuse, the main axis essentially straight, the principal branches remote, 5-15 cm. long, spreading mostly at right angles, straight except arched upward near the base, naked basally, branched distally, the branches appressed or diverging; glumes 10-14 mm. long; lemma to base of awns about as long as glumes, just below the awns about 0.3 mm. thick, not or only very slightly twisted; central awn 8-15 mm. long; lateral awns only 1 mm. long or shorter. Incl. var. *minor* (Vasey) Hitchc. Grasslands and scrub on slopes at elev. usually greater than 4,000 ft., Trans-Pecos mts., frequent, summer-fall; Tex. and N.M. to Ariz. and s. to Nic.; S.A.; W.I.

26. *Aristida Orcuttiana* Vasey. BEGGARTICK THREE-AWN. Perennial; culms erect or sprawling, sparingly branched, 25-70 cm. long; blades 6-25 cm. long, straight when fresh, basally usually flat and about 2 mm. broad, with a finely involute distal portion but often some of the lowest blades drying flat and remaining in the fall as brown curls around the base of the plant; panicle 1-3 dm. long, rarely narrow, usually very diffuse, the main axis essentially straight, the principal branches very few and remote, 2-15 cm. long, mostly spreading at right angles basally then curved upward, naked basally; spikelets appressed to the branches and branchlets; glumes 8-11 mm. long; lemma to base of awns 11-15 mm. long, just below the awns 0.1-0.2 mm. thick and twisted 2 to 5 turns; central awn 5-10 mm. long or rarely longer, set at a marked angle of 20°-80° from apex of lemma; lateral awns about 0.5 mm. long. Grasslands and scrub, rocky slopes at elev. of 4,500-6,000 ft., Trans-Pecos mts., rare, summer-fall; Tex. to s. Calif. and s. to n. Mex.

FAM. 27. CYPERACEAE JUSS.

SEDGE FAMILY

Herbs with tristichous leaves and often triangular stems; blades often long and linear or gradually tapered; inflorescences diverse; florets often borne grouped into spikelets, each floret subtended by a single abaxial scale (apparently 2 scales in *Hemicarpha*; pistillate flower surrounded by a sac in *Carex*); perianth either of bristles or plumes or more elaborate structures or absent; fruit an achene.

About 4000 species in 90 genera of world-wide distribution.

1. The unit of the infructescence (i.e., the object bearing one seed and which falls from the plant at maturity) comprising not only an achene and usually a portion of the style but also a thin bag surrounding those structures; monoecious or dioecious 15. *Carex*, p. 316.
1. The unit of the infructescence merely an achene with or without attached stylar or other floral tissue, but never surrounded by a sac (2)
- 2(1). Perianth of 3 stalked scalelike or paddlelike structures, often thickened at maturity, with or without 3 bristles in addition 3. *Fuirena*, p. 267.
2. Perianth of bristles or plumose structures or absent (3)
- 3(2). All or virtually all florets of each spikelet perfect (4)
3. In each spikelet either the florets all pistillate or all staminate or merely some of them strictly staminate (11)

- 4(3). Each achene subtended by 2 scales, the lower scale easily visible, the adaxial one hyaline, very inconspicuous and often split or torn by the growing achene or adhering to it 7. *Hemicarpha*, p. 284.
4. Each achene subtended only by one abaxial scale (5)
- 5(4). Culms naked, the sheath solitary on the extreme base of the culms and entirely bladeless 4. *Eleocharis*, p. 268.
5. Culms not so naked, if some of the sheaths bladeless then each culm with several of them (6)
- 6(5). Scales of spikelets distichous and perianth bristles present; base of style not much swollen but almost the entire style below the fork persistent on the achene 1. *Dulichium*, p. 262.
6. Scales of spikelet distichous or spirally imbricate and perianth bristles present or absent, but if scales distichous then bristles absent; base of style swollen or not, persistent or deciduous (7)
- 7(6). Swollen style base persistent on the achene as a tubercle of a color and texture distinct from those of the achenial body (8)
7. Style swollen or not but not persistent on the achene (9)
- 8(7). Style 3-branched; achene trigonous 5. *Bulbostylis*, p. 278.
8. Style 2-branched; achene biconvex 13. *Psilocarya*, p. 313.
- 9(7). Scales of spikelets distichous on the spikelet axis (this obscure in *C. sesquiflorus*, *C. tenuifolius* and *C. brevifolius*) 8. *Cyperus*, p. 284.
9. Scales of spikelets spirally arranged (10)
- 10(9). Style base swollen 6. *Fimbristylis*, p. 279.
10. Style slender, nearly uniform in diameter from the apiculus of the achene to the base of the branches 2. *Scirpus*, p. 263.
- 11(3). Inflorescence bracts basally white, distally green .. 11. *Dichromena*, p. 305.
11. Inflorescence bracts essentially unicolored, green (12)
- 12(11). Scales of spikelets visibly distichous; spikelets agglomerated into a tight head 10. *Schoenus*, p. 305.
12. Scales of spikelets spirally disposed (this obscure in *Scleria*) or at least not definitely distichous (13)
- 13(12). Style base enlarged and persistent as a tubercle of a color and texture distinct from those of the achenial body; perianth bristles or plumes usually present 12. *Rhynchospora*, p. 306.
13. Style base not persistent; perianth absent (14)
- 14(13). Achene often bony, pearly or crustaceous, supported on a disk or appearing sculptured basally; pistillate flowers solitary and borne in separate spikelets ... 14. *Scleria*, p. 313.
14. Achene otherwise; spikelets all alike and borne in very large inflorescences 9. *Cladium*, p. 304.

I. DULICHIMUM PERS.

The genus comprises only one species; confined to North America.

1. *Dulichium arundinaceum* (L.) Britt. THREE-WAY SEDGE. Perennial with creeping rhizomes 2-3 mm. thick and with internodes 2-5 cm. long; culms simple, solitary from the nodes of the rhizomes, 2-10 dm. long, 2-5 mm. thick, erect, with short internodes; lowest leaves with nearly bladeless sheaths, the upper with short stiff pointed ascending blades 2-10 cm. long, the upper 5 to 20 leaves functioning as bracts, each subtending a peduncled spike; peduncle of spike only slightly longer than the bract sheath; spike 2-6 cm. long, 15-50 mm. thick, of 6 to 15 ascending to eventually spreading spikelets; spikelets of 5 to 10 distichous scales, the axis with each internode thickened and concave (nched) on the fertile side and with 2 narrow vertical wings at the edges of the niche; perianth bristles 6 to 9, coarse, longer than the achene, retrorsely serrate; style branches 2; achene flattened, beaked with the long persistent style. Infrequent or rare in boggy

places, e. Tex. (Leon, Robertson and Wood cos.), fall; wet places and in shallow water over much of the lowlands of U.S., n. to Nfld., Que., Ont. and B.C., s. to the Gulf States and Calif.

2. SCIRPUS L. BULRUSH

Annual or perennial herbs, usually aquatic; leaves either well-developed or the blades much-reduced in some species; inflorescences very variable; scales of spikelets spirally imbricate; each flower with only a single subtending scale; bristles present or rarely absent; styles 2- or 3-branched; achenes plano-convex, biconvex or trigonous, usually apiculate but the apex of the same texture and color as the rest of the achene (not differentiated as a "tubercle"); style completely deciduous.

About 300 species, cosmopolitan.

- 1. Bracts leaflike, none appearing as a continuation of the culm (2)
- 1. The primary bract appearing as a continuation of the culm and similar to it in texture, color and usually in transectional outline (6)
- 2(1). Spikelets in dense spherical or prolate heads 1-2 cm. thick 13. *S. cubensis*.
- 2. Spikelets either solitary on their peduncles or in small fascicles or glomerules, never in dense heads (3)
- 3(2). Achene 3-4 mm. long 1. *S. maritimus*.
- 3. Achene about 1 mm. long (4)
- 4(3). Bristles very long and far-surpassing the scales ... 4. *S. cyperinus*.
- 4. Bristles mostly shorter than scales or if longer then never exerted from the spikelet (5)
- 5(4). Rhizomatous; bracts as long as or exceeding the inflorescence; each spikelet with 20 to 40 florets 2. *S. atrovirens*.
- 5. Not distinctly rhizomatous; bracts shorter than inflorescence; each spikelet with 70 to 200 florets 3. *S. georgianus*.
- 6(1). Achene 0.8-0.9 mm. long 6. *S. molestus*.
- 6. Achene 1.3-3 mm. long (7)
- 7(6). Achene 1.3-1.5 mm. long; culms 0.3-1.8 mm. thick; tufted annuals (8)
- 7. Achene 1.5-3 mm. long; culms usually thicker; rhizomatous perennials (9)
- 8(7). Achene with vertical rows of minute pits 5. *S. koilolepis*.
- 8. Achene with horizontal ridges 7. *S. supinus*.
- 9(7). Culms 3-20 dm. long, often sharply triquetrous, 2-8 mm. thick, often arcuate (10)
- 9. Culms 10-30 dm. long, either terete or only obscurely trigonous, 8-23 mm. thick near base, 2-4 mm. thick just beneath the inflorescence, usually rigidly erect (11)
- 10(9). Achene 2.5-3 mm. long; lower scales of the spikelets often much longer than the rest and with strong venation, bracteolelike; inflorescence a solitary spikelet or glomerule of 2 to 4 spikelets 8. *S. americanus*.
- 10. Achene 1.8-2.6 mm. long; lower scales of the spikelets not differentiated; inflorescence a dense glomerule of 5 to 15 spikelets 9. *S. Olneyi*.
- 11(9). Sheaths (near base of culm) at margins rather regularly retrorsely fimbriate-filiferous; achene bristles 2 to 4, each bristle on each side with 15 to 20 reddish-brown closely spaced spreading or somewhat retrorse projections (not barbellate) 12. *S. californicus*.
- 11. Sheaths smooth or merely lacerate; achene bristles usually 4 to 6, retrorsely barbed (each bristle on each side with 10 to 16 well-spaced barbs) (12)
- 12(11). Scales about 5 mm. long, thin-membranous, pale-brown and with conspicuous elongate reddish glutinous spots (seen under a lens), the distal margin lacerate; achene 1.8-2.9 mm. long 10. *S. acutus*.
- 12. Scales 3-4 mm. long, firm-membranous, dark-brown, nearly smooth (occasionally with a few reddish gummy spots near the midveins), the distal margin nearly smooth to slightly lacerate 11. *S. validus*.

1. *Scirpus maritimus* L. SALT-MARSH BULRUSH. Rhizomatous perennial; rhizome several mm. thick, extensive; culms tufted along the rhizome, often with tuberlike enlargements basally, 5-20 mm. thick above the tuber, 35-100 cm. long, erect, triquetrous; leaves several, well-developed; bracts several, flat, leaflike, ascending or usually spreading; inflorescence of 3 to 15 ovoid to ovoid-cylindric erect or ascending spikelets either all sessile or some variously sessile and others peduncled, quite variable; scales 6-10 mm. long, almost as broad, apically mostly retuse and the midnerve prolonged into a point 1-3 mm. long; achenes obovate-apiculate, 3-4 mm. long, about 2 mm. broad, in transection biconvex or one of the sides more convex or bifaceted than the other, ripening to a dark-brown. The species is nearly world-wide.

We have 2 varieties:

Var. *macrostachyus* Michx. Scales firm, maturing to a dark-brown; styles usually 3-branched. S. *robustus* Pursh. Coastal marshes, s.e. Tex. and Rio Grande Plains, spring-summer-fall.

Var. *paludosus* (A. Nels.) Koyama. Scales thin, translucent, whitish to pallid-buff; styles uniformly 2-branched. S. *paludosus* A. Nels. Marshes, n.-cen. and Trans-Pecos Tex., the Plains Country, Edwards Plateau and Rio Grande Plains.

2. *Scirpus atrovirens* Willd. Rhizomatous perennial; rhizome 2-6 mm. thick; culms 5-8 mm. thick basally, 8-15 dm. long, erect, somewhat trigonous in the upper portion, leafy; bracts several, well-developed, leaflike, ascending or spreading, as long as or exceeding the inflorescence; inflorescence complicatedly decompound, of 100 to 250 (to 500) spikelets in glomerules which in turn are disposed in dense compound panicles, some of the primary branches that bear the panicles 5-14 cm. long; spikelets ovoid to narrowly ovoid, dark-brown to fuscous, of 20 to 40 flowers; bristles almost as long as the achene; scales 1.5-3 mm. long, ovate, acute, with a strong midrib; achene oblong, about 1 mm. long, in transection flattened-trigonous (the abaxial angle blunt, the others sharp). Most of U.S. (except Pac. States).

We have 2 varieties:

Var. *atrovirens*. Scales with a minute mucro only. Rare in moist loam, e. Tex. (Angelina Co.), summer; otherwise in e. U.S. and e. Can., one station in Ariz.

Var. *pallidus* Britt. Scales with a strong mucro or very short awn. S. *pallidus* (Britt.) Fern. Rare in Plains Country (Panhandle), summer; otherwise in cen. and w. U.S.

3. *Scirpus georgianus* Harper. Tufted perennial from thick ascending ligneous caudexes but not distinctly rhizomatous; culms 5-15 dm. long, erect (some very shortly decumbent basally), 3-6 mm. thick just above the caudex, obscurely trigonous above, leafy; bracts several, leaflike but reduced in size, ascending, shorter than the inflorescence; inflorescence a decompound often droopy panicle, some of the longer branches 3-7 cm. long, the 50 to 120 spikelets not in glomerules but most of them on pedicels 2-8 mm. long; spikelets ovoid to usually cylindric, of 70 to 150 (to 200) flowers at maturity; scales ovate, about 2 mm. long, acute, brown with very strongly pronounced green or buffy midnerve; bristles several, about twice as long as the achenes or as long as the scales but mostly crumpled and entangled and never exerted from the spikelet; achene oblong, about 1 mm. long, in transection flattened-trigonous (the abaxial angle blunt, the others sharp). S. *atrovirens* var. *georgianus* (Harper) Fern. Infrequent in n.-cen. Tex., rare in e. Tex., spring; P.E.I. s. to Ga. and w. to Neb. and Tex.

4. *Scirpus cyperinus* (L.) Kunth var. *rubricosus* (Fern.) Cilly. Perennial probably from short thick rhizomes; culms 8-20 dm. long, 6-13 mm. thick basally, 3-4 mm. thick apically where obscurely trigonous; leaves numerous; bracts several, leaflike, basally brownish or reddish-brown, ascending, the lowest one about as long as or slightly surpassing the inflorescence, the rest much shorter; inflorescence a dense decompound panicle (some of the longer primary branches 5-11 cm. long), somewhat droopy, of 200 to 500 spikelets, most of them on slender peduncles 4-10 mm. long, not in glomerules; spikelets ovoid to ellipsoid, brown, 3-5 mm. long, of 40 to 100 flowers; scales elliptic, 1.5-2 mm. long, brown, acute; bristles several, very long, brown, far-surpassing the scales; achenes about 1 mm. long, oblong-apiculate, whitish, flattened-triangular (the abaxial angle blunt, the inner 2 sharp). S. *rubricosus* Fern. Wet or boggy places, e. Tex., summer; the var. *cyperinus* is widespread in e. U.S. and Can.; the var. *rubricosus* is found mostly in s.e. U.S. but occurs n. to Mich. and N.E.

5. *Scirpus koilolepis* (Stued.) Cl. Tufted annual; culms 4-22 cm. long, dark-grayish-green, compressed, 0.3-0.35 mm. thick, minutely striate, ascending, often somewhat flexuous or arcuate; blades 2-5 cm. long, arcuate-setaceous; bract solitary, appearing as a continuation of (and as thick as) the culm, (13-) 17-33 mm. long; inflorescence of 1 or less commonly 2 spikelets; spikelets 3-7 mm. long, narrowly ovoid, acute, of (7 to) 10 to 14 flowers; scales never purplish or reddish, tardily serially deciduous; lowest scale larger than the rest; second or third scale from the bottom 2-2.5 mm. long, ovate, acuminate, strongly gibbous, arcuate-convex, the midnerve forming a broad grayish-green keel and mucro or apiculus, the sides translucent, membranous, cellular, with 1 to 3 acrodrome veins near the keel on each side; perianth bristles absent; style 3-branched; achene globose to globose-oblong, trigonous, basally rounded or shortly stipitate, apically rounded or usually minutely apiculate, 1.3-1.5 mm. long, the 3 angles about equally prominent, the sides flat or slightly convex, superficially brownish, with numerous vertical rows of very minute pits and a thin whitish-waxy bloom. Frequent in moist sandy loam, e., s.e., and n.-cen. Tex., rare in Edwards Plateau (Burnet Co.), spring; Ga., Tenn. and Ala. to Okla. and Tex.; Calif.

6. *Scirpus molestus* M. C. Johnst. Tufted annual; culms 5-16 cm. long, grayish-green, compressed, 0.2-0.25 mm. thick, minutely striate, ascending, often somewhat flexuous or arcuate; sheaths short, slightly loose, quite smooth at the hyaline apical-ventral orifice, grayish-green, eventually turning brownish-stramineous, never red or purple; blades 2-3 cm. long, tightly involute, arcuate-setaceous, about as thick as the culms; bract solitary, appearing as a continuation of (and as thick as) the culm, 5-10 (-23) mm. long; inflorescence a glomerule of 2 or 3 spikelets, less commonly a solitary spikelet; spikelet 2-7 mm. long, ovoid to lance-ovoid, of (10 to) 20 to 30 flowers; scales never purplish or reddish, promptly and serially deciduous after anthesis, beginning at the bottom of the spikelet, the lowest scale larger than the rest; the second or third scale from the bottom 1-1.3 mm. long, gibbous, strongly arcuate-convex, broadly ovate, acute, the midnerve forming a broad grayish-green keel and mucro, the sides translucent, thin-membranous, unpigmented, cellular, with 1 or 2 acrodrome veins near the keel on each side; perianth bristles absent; stamens 2; filaments about as long as the achenes; anthers minute; style 3-branched; achene globose-trigonous, basally rounded or minutely stipitate, apically rounded or extremely minutely apiculate, 0.8-0.9 mm. long, the 3 angles about equally prominent, the sides flat or slightly concave, superficially pinkish-brownish with numerous vertical rows of very minute pits, this pattern and color obscured by a more or less thick whitish-waxy coat. Frequent in moist sand, often associated with *S. koilolepis*, e. and s.e. Tex., spring; Ark., La. and Tex.

7. *Scirpus supinus* L. Tufted annual; culms 3-35 cm. long, 0.6-1.8 mm. thick, essentially terete (ridged on drying), not or only obscurely and bluntly trigonous; sheaths somewhat loose, apically oblique and acute, essentially bladeless; lower bract appearing as a continuation of the culm, (1-) 3-10 (-15) cm. long; other bracts much-reduced, very inconspicuous; inflorescence a glomerule of 2 to 8 spikelets or occasionally some of these extended on peduncles 1-3 cm. long; spikelets lance-ovate, 4-11 mm. long, of 15 to 36 flowers; scales somewhat convex basally, ovate, acuminate, acute, with a very strong keel (green turning stramineous) and sides which are green-membranous turning firm and buffy to purple; style 2-branched [var. *Hallii* (Gray) Gray] or 3-branched [var. *saximontanus* (Fern.) Koyama]; bristles variable; achenes 1.3-1.5 mm. long, glabrous, to broadly elliptic, in transection either plano-convex (var. *Hallii*) or strongly trigonous (var. *saximontanus*) and superficially with horizontal ridges or wrinkles. Frequent in moist areas near the coast, s.e. Tex. and Rio Grande Plains (both varieties), rare in n.-cen. Tex. and Plains Country (var. *saximontanus*), spring-summer; var. *supinus* is widespread in temp. parts of the world; var. *Hallii* in e. U.S. mainly on Coastal Plain; var. *saximontanus* in Great Plains, N.D. to Tex.

Scirpus "supinus," in the present broad sense, has only recently been treated as several narrowly defined species, of which three are attributed to our area and are characterized as follows:

S. Wilkensis Schuyler. Styles mostly 2-parted and achenes 2-angled; scales mostly 1.9-2.3 mm. wide, the cells at the upper margin of the ventral surface 2 to 5 times as long as wide; spikelet achenes mostly 1-1.2 mm. wide, with narrow acute transverse ridges.

Ditches, swales and pond margins, s. Tex. (Aransas, Atascosa, Kleberg, Nueces and Wil-lacy cos.), spr.-fall; also Tam.

S. saximontanus Fern. Styles mostly 3-parted and achenes 3-angled; scales usually longer than wide; spikelet achenes with more than 15 narrow transverse ridges. Local in ditches, sink-lakes, ponds and wet prairies, e. (Austin Co.) and s. (Aransas, Bexar, Cameron, Hidalgo, Nueces and San Patricio cos.) Tex., Plains Country (Tom Green Co.) and Pan-handle (Hale and Lynn cos.), spr.-fall; Kan., Mo., Neb., O., Okla., S.D., Tex., Wyo., S.L.P. and Tam.

S. Bergsonii Schuyler. Styles mostly 3-parted and achenes 3-angled; scales broadly ovate, mostly 2.1-2.9 mm. long and 2.2-3 mm. wide; spikelet achenes with fewer than 15 firm undulating transverse ridges. Local in ditches and on pond margins in s. Tex. (Kenedy, Kleberg and Nueces cos.), summer-fall; endemic. Said to hybridize with *S. Wilkensis* in Kenedy and Nueces counties.

8. *Scirpus americanus* Pers. var. *longispicatus* Britt. SWORD-GRASS, THREE-SQUARE BULRUSH. Rhizomatous perennial; rhizomes extensively creeping, reddish-brown, 2-3 mm. thick; culms rising at short intervals, (1-) 3-15 dm. long, 2-6 mm. thick, ascending, in the distal half sharply triquetrous and often somewhat nodding; leaves 2 to 4, usually 2, with involute blades several cm. long; principal bract solitary, appearing as a continuation of the stem, (15-) 30-50 (-155) mm. long; (lower scales of the spikelets often much longer than the rest and with strong venation, bractlike); inflorescence a solitary spikelet or a glomerule of 2 to 4 spikelets; spikelets sessile, 7-17 mm. long, 4-5 mm. thick, narrowly ovoid or lance-ovoid, of 28 to 50 flowers; scales (except lowest) obovoid, brown, 4-5 mm. long, lower ones emarginate, with a well-marked buffy midnerve (prolonged into a short awn) and firm to membranous deep-brown sides; bristles about 4, about equaling the achene, retrorsely barbellate; style 3-branched, less commonly 2-branched; achene 2.5-3 mm. long, 1.8-2.5 mm. broad, broadly obovate, apiculate, plano-convex, smooth, dark-brown when mature. Some of our plants have been known incorrectly as var. *polyphyllus* (Boeck.) Beetle. Essentially throughout the state in low often moist ground, spring-summer; nearly throughout temp. parts of the world.

9. *Scirpus Olneyi* E. & G. Rhizomatous perennial; rhizomes extensive, 2-4 mm., thick; culms rising at intervals, 6-20 dm. long, 4-8 mm. thick, sharply triquetrous most of the length (the sides often concave); leaves crowded at the base, usually 2 or 3, the lowest ones with loose membranous sheaths and reduced or obsolete, the upper one (which still appears basal) with a slightly longer blade; principal bract solitary, appearing as a continuation of the stem, 1-4 (-15) cm. long; (lower scales of the spikelets not differentiated from the rest); inflorescence a dense glomerule of 5 to 15 spikelets; spikelets sessile, 5-8 (-12) mm. long, 3-5 mm. thick, mostly ovoid, of 24 to 30 (to 40) flowers; scales 3-4 mm. long, the lower ones emarginate, brown, the midrib paler, prolonged as a mucro; bristles about 4, about equaling the achene, retrorsely barbellate; style usually 2-branched, less commonly 3-branched; achene 1.8-2.6 mm. long, 1.5-1.8 mm. broad, obovate, apiculate, plano-convex or unequally biconvex. Our plants have been known incorrectly as *S. chilensis* Nees. Rare and scattered, marshy soil, s.e. and e. Tex., Trans-Pecos, Plains Country and probably elsewhere, spring-summer; temp. N.A.; also Br. Hond., Venez. and Chile.

10. *Scirpus acutus* Muhl. HARD-STEM BULRUSH. Rhizomatous perennial forming extensive colonies; culms 1-3 m. long, rising at close intervals from the rhizomes, 8-23 mm. thick near the base, long-tapered, 2-4 mm. thick just under the inflorescence, essentially terete to very obscurely trigonous; leaves 1 or 2 per culm, confined to the very base, consisting of short mostly open sheaths with nearly smooth to lacerate margins; blades obsolescent; bract appearing as a continuation of the culm, (5-) 10-30 (-55) mm. long, shorter than the inflorescence; inflorescence 3-10 cm. long, decom-pound, with several drooping primary branches and 10 to 35 spikelets; spikelets lance-ovoid, at maturity 8-15 mm. long, of 20 to 50 flowers; scales about 5 mm. long (the lower ones emarginate), thin-membranous, pale-brown and with conspicuous elongate reddish glutinous spots (seen under a lens), the distal margin lacerate, the midnerve scabrous and projected as a mucro or short awn; bristles 4 to 6, about equaling the achene, retrorsely barbed, on each side of the bristle 10 to 16 well-spaced barbs; styles mostly 2-branched; achene obovate, apiculate, plano-convex or very unequally biconvex, (1.8-) 2.1-2.4 (-2.9) mm. long. *S. lacustris* L. subsp. *glaucus* (Sm.) Hartm., *S. Tabernaemontani* Gmel., *S. lacustris*

var. *occidentalis* Wats. Alkaline or calcareous mud, usually in water, Plains Country and Trans-Pecos, rare e. to n.-cen. Tex., spring-fall; Eur.; much of temp. N. A. s. to Gulf States, Chih., Coah. and Calif.

This is perhaps only a variety of *S. lacustris*. Some specimens from the lower Rio Grande Plains seem to be intermediate between *S. acutus* and *S. validus*.

11. *Scirpus validus* Vahl. GREAT or SOFT-STEM BULRUSH. Rhizomatous perennial forming extensive colonies; culms 1-3 m. long, rising at close intervals from the rhizomes, 8-23 mm. thick near the base, long-tapered, 2-4 mm. thick just under the inflorescence, essentially terete or very obscurely trigonous; leaves 1 or 2 per culm, confined to the very base, consisting of short mostly open sheaths with nearly smooth to lacerate margins; blades obsolescent; bract appearing as a continuation of the culm, (5-) 10-30 (-55) mm. long, shorter than the inflorescence; inflorescence 3-10 cm. long, decompound, with several drooping primary branches and 20 to 120 spikelets; spikelets ovoid, 5-10 mm. long, of 20 to 50 flowers; scales obovate, 3-4 mm. long, firm-membranous, dark-brown, nearly smooth (occasionally with a few reddish gummy spots near the midnerve), the distal margin nearly smooth to slightly lacerate, the midnerve projected as a mucro or short awn; bristles 4 to 6, mostly slightly surpassing the achene, retrorsely barbed (on each side of each bristle 10 to 16 well-spaced barbs); styles mostly 2-branched; achenes obovate, apiculate, plano-convex or very unequally biconvex, (1.5-) 1.9-2.1 (-2.2) mm. long. *S. lacustris* var. *condensatus* Peck. In mud and usually in shallow water, infrequent in scattered parts of e., s.e. and n.-cen. Tex. and Rio Grande Plains, spring-fall; temp. N.A. s. to S.A. Perhaps only a variety of *S. lacustris*.

12. *Scirpus californicus* (C. A. Mey.) Steud. GIANT BULRUSH, TULE. Perennial from tight subrhizomatous knots; culms closely tufted, 1-2 m. long, 8-22 mm. thick near the base, 2-4 mm. thick near the inflorescence, bluntly trigonous; leaves few, basal, consisting only of mostly open brownish sheaths whose margins are rather regularly retrorsely fimbriate-filiferous; primary bract appearing as a continuation of the culm, 18-70 mm. long (other bracts reduced, scalelike), shorter than the inflorescence; inflorescence 4-12 cm. long, decompound with a number of usually drooping branches, altogether with 50 to 150 spikelets; spikelets lance-ovoid, 6-11 mm. long, of 30 to 50 flowers; scales about 3 mm. long, ovate to obovate, dark-brown, some of them emarginate, mucronate, the distal margins essentially entire; bristles 2 to 4, subligulate, reddish-brown, each one on each side with 15 to 20 reddish-brown closely spaced spreading or often somewhat retrorse projections (not barbellate); styles mostly bifid; achene obovate, apiculate, about 2 mm. long, brown, plano-convex or biconvex. Scattered in mud and shallow water throughout Tex. except the Plains Country, spring-summer; warmer parts of Am., n. to Gulf States, s. Ariz. and s. Calif.

13. *Scirpus cubensis* Poepp. & Kunth. Rhizomatous perennial; rhizome 1-5 mm. thick; aerial culms solitary at the nodes of the rhizome, to 1 m. tall, sharply trigonous, smooth; leaves all basal with blades to 15 mm. broad; inflorescence involucrate, umbel-like; bracts 2 to 5, leaflike, spreading, unequal, often much-elongate, far-surpassing the umbel; branches of umbel very unequal (1 head usually quite sessile), usually 1-3 cm. long; each branch terminated by a dense spherical or somewhat prolate head 1-2 cm. thick; each head of many spikelets; scales about 3 mm. long, reddish, spreading, tapered to the acute reflexed tip; bristles absent; style bifid; achene about 3 mm. long, lenticular, apiculate. Very rare, known only from Eagle Nest Lake, Brazoria Co. where collected once in 1958, summer-fall; warmer parts of Am., n. to Gulf States; also Afr.

3. FUIRENA ROTTB. — UMBRELLA-GRASS

Perennials, usually rhizomatous, the lowest leaves often with reduced blades, the upper 1, 2 or 3 leaves functioning as bracts with each subtending a very much condensed often glomerulelike inflorescence of 1 to 10 spikelets; spikelets globose to oblong-cylindric; scales numerous, spirally imbricate, usually pubescent, all fertile, usually obovate and awn-tipped (awn short in one species); perianth of 3 stalked scalelike or paddlelike structures often thickened at maturity, often additionally three perianth bristles alternating with these stalked structures; style branches 3; achene plumply trigonous, shiny, apically tapering into a more or less persistent indurate linear style base often nearly as long as the achenial body itself.

The genus is related to, and should be included within, *Scirpus*, according to some authors. A small genus of 40 species in warmer regions of the world.

1. All or nearly all blades reduced; awns of spikelet scales only about 1 mm. long, ascending1. *F. scirpoidea*.
1. Nearly all blades well-developed, only the lowest reduced; awns of spikelet scales usually 2-4 mm. long, often spreading apically (2)
- 2(1). Each of the 3 prominent perianth parts with an acuminate apex which often arches toward the style2. *F. squarrosa*.
2. Each of the 3 prominent perianth parts with an acute, blunt or even emarginate apex and often subapically on the dorsal side with a mucro or a minute awn3. *F. simplex*.

1. *Fuirena scirpoidea* Michx. Strongly rhizomatous; only the middle sheaths with small blades; inflorescences often only at the uppermost node and reduced to 1 to 3 spikelets; scales of spikelets with very short straight awns; the 3 expanded perianth parts tapering to their acumens. Rare in wet sand, s.e. Tex. (Aransas and San Patricio cos.), summer; coastwise, Ga. to Tex.; Cuba.

2. *Fuirena squarrosa* Michx. Scales of spikelet with long often decurved awns; expanded perianth parts tapering to the nonmucronate acumen which is often incurved to the style. *F. hispida* Ell., *F. breviseta* Cov. Frequent in moist usually acid soils of marshes and bogs, e. and s.e. Tex. s. to Aransas Co., summer; parts of e. U.S. w. to e. Okla. and Tex.; Cuba; P.R.

3. *Fuirena simplex* Vahl. Scales of spikelet with long awns; expanded perianth parts variable but usually apically blunt or retuse and dorsally just below the tip with a mucro or minute awn. Frequent in wet areas, usually in calcareous mud, w. part of Tex., e. to n.-cen. Tex. and Rio Grande Plains, late summer-fall; Guat. and Br. Hond. n.w. to Mo., Neb., N.M., Son. and Baja Calif.

4. ELEOCHARIS R. BR.* SPIKERUSH

Annual or perennial broomlike sedges usually in aquatic environments; leaves reduced to mere bladeless sheaths; inflorescence solitary, terminal, spiciform (the bract reduced to a mere basal scale or usually absent), bearing few to many perfect flowers crowded in 3 to many ranks; scales spirally imbricate or rarely distichous (as in *E. Baldwinii* and perhaps *E. minima*), usually closely crowded, remaining so even when the achenes mature in some species (in others serially deciduous starting at the base of the spike), of various textures but always glabrous; perianth bristles 6 to 9 (or in some species reduced or absent); stamens usually 3, in some species often reduced to 2 or 1; styles 2- or 3-branched, basally enlarged into a persistent base (called the "tubercle") capping the achene, with a postanthetic zone of abscission between this base and the more slender portion, variously shaped and textured, either well-demarcated from the body of the achene or appearing to merge with it (as in *E. parvula* and *E. Engelmannii*, etc.); achene body plano-convex or isolaterally or isosceleslike trigonous (the trigony often obscure) to nearly tercte, of various shapes, textures, colors and surficial sculpturing.

A cosmopolitan genus said to comprise about 200 species.

1. Tubercle 1.2-1.7 mm. long, about as broad as the achenial body30. *E. tuberculosa*.
1. Tubercle less than 1.1 mm. long (2)
- 2(1). Achenes with about 6 longitudinal panels or rows of numerous horizontally elongate cells (trabeculae) visible under a strong lens (3)
2. Achenes various but not trabeculate (6)
- 3(2). Tufted annual; horizontally elongate cells about 15 in each longitudinal series12. *E. brachycarpa*.
3. Perennials; trabeculae more numerous (4)
- 4(3). Culms strongly compressed, 2-edged, often C-shaped in transection, 0.6-1.3 mm. broad11. *E. Wolfii*.
4. Culms neither strongly compressed nor 2-edged (5)

* We wish to acknowledge the assistance of Henry K. Svenson, especially with field work.

- 5(4). Culms 0.2-0.4 mm. thick; anthers 0.5-1 mm. long . . . 9. *S. acicularis*.
 5. Culms 0.6-1 mm. thick; anthers 0.3-0.4 mm. long . . . 10. *E. radicans*.
- 6(2). Culms sharply triquetrous or quadrangular in transection, 2.5-4 mm. broad across each side, 5-8 dm. long (7)
 6. Culms not as above, if triquetrous or quadrangular then much less coarse (8)
- 7(6). Culms quadrangular; achenial body 1.7-2.3 mm. long; tubercle 1-1.5 mm. long . . .
 3. *E. quadrangulata*.
 7. Culms triquetrous; achenial body 1.4-1.7 mm. long; tubercle 0.7-1 mm. long
 4. *E. fistulosa*.
- 8(6). Tubercle coronalike, 0.3-0.5 mm. high, 0.8-1 mm. broad, capping and often broader than the trigonous-obpyramidal body 8. *E. melanocarpa*.
 8. Tubercle not as above, if coronalike then the body not trigonous (9)
- 9(8). Achene biconvex, lustrous, brown when mature; style branches 2; tubercle forming a narrow lamelliform cap on and in outline confluent with the body (10)
 9. Achene trigonous or biconvex, if biconvex then the style branches 3 and/or the tubercle not lamelliform (11)
- 10(9). Spikelets lanceolate, acuminate; scales acute 14. *E. lanceolata*.
 10. Spikelets broadly ovoid to ovoid-cylindric, obtuse; scales obtuse
 13. *E. obtusa*.
- 11(9). Culms 1.5-9 mm. thick; spikelets of 40 to 350 flowers; achenes biconvex (12)
 11. Culms 0.1-1.4 mm. thick; spikelets of 5 to 80 flowers; achenes either biconvex or trigonous (16)
- 12(11). Culms with complete septa (as revealed by dissection) (13)
 12. Culms not septate or irregularly and incompletely septate (15)
- 13(12). Culms 1.5-3.5 mm. thick; septa 2-5 mm. apart; tubercle depressed, 0.1-0.2 mm. high, in outline confluent with the body; body of achene 0.9-1.1 mm. long
 26. *E. montana*.
13. Culms 4-9 mm. thick; septa mostly farther apart; tubercle conic, 1-1.2 mm. long; body of achene 1.8-2.2 mm. long (14)
- 14(13). Septa very crowded just below the spikelet 1. *E. interstincta*.
 14. Septa not very crowded just below the spikelet 2. *E. equisetoides*.
- 15(12). Body of achene about 2 mm. long, the surface cellular, appearing as if embedded in plastic; scales obtuse; spikelet 19-36 mm. long, cylindric
 5. *E. cellulosa*.
15. Body of achene 1.2-1.8 mm. long, surface smooth or micropunctate; scales usually acute; spikelets 8-25 mm. long 18. *E. macrostachya*.
- 16(11). Achenes biconvex, lustrous, black when mature, the bodies 0.5-1 mm. long; tubercles 0.05-0.2 mm. long; style branches 2 (17)
 16. Achenes trigonous or if obscurely so then not black when mature (19)
- 17(16). Perennial usually with slender rhizomes; flowers 15 to 25 per spikelet; scales obviously keeled 15. *E. flavescens*.
 17. Annuals, densely tufted; flowers 28 to 80 per spikelet; scales not or inconspicuously keeled (18)
- 18(17). Achenial body 0.7-1 mm. long; tubercle (0.05-) 0.1-0.2 mm. long; culms 0.4-1 mm. thick 16. *E. caribaea*.
 18. Achenial body 0.5-0.6 (-0.7) mm. long; tubercle 0.05 mm. long; culms 0.2-0.3 mm. thick 17. *E. atropurpurea*.
- 19(16). Achenial body rather sharply trigonous, broadest near the middle, apically confluent in outline with the tubercle which is pyramidal and 0.1-0.2 mm. long; rhizomatous mat-formers; culms 2-12 cm. long, 0.1-0.4 mm. thick
 6. *E. parvula*.
19. Achenial body either not sharply trigonous or (if so) not confluent with the tubercle, or else plants otherwise habitally (20)

- 20(19). Tubercle columnar or slightly tapered, blunt, 0.7-1 mm. long, 0.3-0.4 mm. thick basally, not constricted basally but confluent with the body of the achene; culms wiry, compressed, 1-1.4 mm. thick in the larger dimension 7. *E. rostellata*.
20. Tubercle shorter or if as much as 0.7-1 mm. long then constricted basally, not confluent (21)
- 21(20). Tubercle 0.6-1 mm. long, high-pyramidal, basally truncate; body of achene 1.2-1.7 mm. long, surficially cellular (the cells with prominent margins) and olivaceous brown to olivaceous gray when mature ..31. *E. tortilis*.
21. Tubercle 0.05-0.7 mm. long, mostly pyramidal, low to depressed-pyramidal or globose; body of achene 0.5-1.8 mm. long, surficially smooth to warty or punctate but not cancellate, variously colored (22)
- 22(21). Spikelets 5- to 20-flowered; culms 0.1-0.3 mm. thick; achenes rather sharply trigonous, mostly whitish or maturing to shades of olive, surficially smooth; sheaths long-oblique apically (23)
22. Spikelets 20- to 110-flowered; culms 0.2-1.4 mm. thick; achenes mostly not so sharply trigonous (except in *E. tenuis*, *E. cylindrica* and *E. austrotexana*), maturing (except in *E. tenuis*) through shades of yellow to golden-brown or brown; sheaths truncate or only very slightly oblique apically (25)
- 23(22). Spikelets narrowly elliptic, 4-7 mm. long; scales appearing distichous, lance-elliptic, 3-4.5 mm. long, buffy to ferruginous-buff ..28. *E. Baldwinii*.
23. Spikelets ovoid, 2-5 mm. long; scales rarely appearing distichous (except in *E. minima*?), ovate, shorter, usually whitish to purplish (24)
- 24(23). Culms about 0.1 mm. thick, strongly recurved, 3-7 (-10) cm. long; spikelets 5- to 10-flowered; achenial body 0.7-0.8 mm. long, maturing through whitish or olive to olive-gray; tubercle pyramidal, 0.15-0.3 mm. long 27. *E. minima*.
24. Culms (0.1-) 0.15-0.3 mm. thick, mostly erect, 4-28 cm. long; spikelets 8- to 15-flowered; achenial body 0.5-0.6 mm. long, pearly-white; tubercle depressed-pyramidal, 0.05-0.1 (-0.15) mm. high 29. *E. microcarpa*.
- 25(22). Scales broadly ovate, subcartilaginous medially, firm-membranous marginally, stramineous in color; somewhat lustrous; achenial body ripening through shades of olive-whitish to brownish-olive and finally to a rich dark-chocolate-brown; bristles conspicuous, reddish-brown at maturity ...32. *E. albida*.
25. Scales mostly thinner, membranous and usually with some dark pigmentation; achenial body (except in *E. tenuis*) ripening through shades of yellow to golden-brown; bristles various (26)
- 26(25). Achenial body minutely but pronouncedly warty or pitted in vertical lines, 0.6-0.8 mm. long, ripening through shades of ivory to greenish-olive; tubercle pronouncedly depressed, 0.1-0.2 mm. high, not much-constricted basally; culms 0.2-0.3 mm. thick20. *E. tenuis*.
26. Achenial body minutely punctate-reticulate to smooth but not warty, 0.6-1.8 mm. long, ripening through shades of yellow to brown; tubercle usually conic-globular, usually constricted basally; culms 0.4-1.4 mm. thick (27)
- 27(26). Scales of spikelet apically rounded, hyaline only in a very narrow rounded border at the apex (28)
27. Scales of spikelet deltoid or ovate-acute to lance-acuminate, with a more or less acute more or less extensive hyaline apex (29)
- 28(27). Spikelets very variable, from globular to broadly cylindrical or ovoid to elliptic, apically usually blunt; achenial body obscurely trigonous, punctulate-reticulate surficially23. *E. montevidensis*.
28. Spikelet linear-cylindrical, acute; achenial body distinctly trigonous, smooth and satiny24. *E. cylindrica*.
- 29(27). Achenial body 1.2-1.8 mm. long; tubercle 0.2-0.7 mm. long; styles mostly 2-branched, rarely 3-branched (30)
29. Achenial body 0.7-1.2 mm. long; tubercle 0.1-0.2 mm. long; styles 3-branched (31)

- 30(29). Styles always 2-branched; achenial bodies very faintly reticulate-punctulate to essentially smooth; common18. *E. macrostachya*.
30. Styles 2- or 3-branched; achenial bodies distinctly reticulate-punctulate; exceedingly rare19. *E. fallax*.
- 31(29). Culms 30-45 cm. long, with complete septa at regular short intervals (as revealed by dissection); achenial bodies with at least 2 distinct angles, the third sometimes also fairly sharp, the surface essentially smooth; scales merely acute, about 2 mm. long25. *E. austrotexana*.
31. Culms 8-28 cm. long, not septate; achenial bodies obscurely trigonous, the surface somewhat punctulate-reticulate; scales with long-acuminate scarious or hyaline apexes which often become split (bifid) during elongation (32)
- 32(31). Culms strongly compressed, 0.6-1 mm. thick in the flat dimension; deep east Texas21. *E. compressa*.
32. Culms variable, somewhat to not at all compressed, 0.3-0.8 mm. thick; Edwards Plateau, Plains County, north-central and southeast Texas
.....22. *E. acutisquamata*.

1. *Eleocharis interstincta* (Vahl) R. & S. Tufted perennial; culms 5-10 dm. long, 4-9 mm. thick, erect, essentially terete, septate, the septa closer together as the spikelet is approached; sheaths often tinged dark-red, apically firm, oblique; spikelets cylindrical, 22-42 mm. long, 5-7 mm. thick, with 80 to 140 flowers; scales (sub)cartilaginous, 3.5-5 mm. long and broad, obtuse, rounded, stramineous to buffy-stramineous, marginally darker and thinner, medially flat with a faint narrow midvein which is more heavily pigmented distally; bristles 6, exceeding the achene, brownish, stout, subcartilaginous, flattened, with (usually retrorse) serrulations; styles 2- or 3-branched; achene body biconvex, 1.8-2.2 mm. long, brown (yellow when immature), shiny; tubercle high-conic, 1-1.2 mm. long, 0.8 mm. broad, dark, slightly constricted basally. Infrequent to rare in mud in e. Tex., Rio Grande Plains and Edwards Plateau, probably elsewhere, summer-fall; Fla.; Tex.; Berm.; W.I. s. to Bol. and Braz.

2. *Eleocharis equisetoides* (Ell.) Torr. Tufted perennial, exceedingly similar to *E. interstincta* but the septa not as crowded just below the spikelet and the bristles slightly shorter and thinner on the average. Rare in e. and s.e. Tex., summer-fall; Coastal States, Mass. to Tex.; also Ind., Mich., Wisc. and Mo.

3. *Eleocharis quadrangulata* (Michx.) R. & S. Tufted perennial; culms 5-8 dm. long, 2.5-4 mm. thick, erect, sharply 4-angled, not septate; sheaths membranous, brownish or less commonly reddish, apically oblique; spikelets cylindrical, 20-42 mm. long, 3.5-4.5 mm. thick, with 40 to 90 flowers; scales rotundly-obovate to ovate, 5.5-6 mm. long, 3-5 mm. broad, medially nearly flat, stramineous and subcartilaginous, laterally broadly chartaceous to hyaline, the distal margin with slightly darker coloration; bristles about 6, slender, unequal, some equaling the body, others surpassing the tubercle, with minute retrorse serrulations; style 2- or 3-branched; achene body biconvex to turgidly biconvex, 1.7-2.3 mm. long, brown (yellow when immature), shiny; tubercle high-conic to deltoid or oblong, 1-1.5 mm. long, 0.8-1 mm. broad, basally constricted, dark. Infrequent in mud in e. and s.e. Tex., rare in n. part of Rio Grande Plains, late spring-fall; most of e. U.S., w. to Wisc., Mo., Okla. and Tex.; also Jal.

4. *Eleocharis fistulosa* (Poir.) Schult. Tufted perennial, apparently rather similar to *E. quadrangulata* but the culms sharply triangular and the spikelets and scales averaging slightly smaller; achene body 1.4-1.7 mm. long; tubercle 0.7-1 mm. long. Rare in Rio Grande Plains, summer-fall (?); widely distributed in the warmer parts of the world, in Am. n. to Cuba and Tex.

5. *Eleocharis cellulosa* Torr. Tufted perennial; culms 5-8 dm. long, 2-5 mm. thick, erect, essentially terete or irregularly compressed and striate; sheaths usually reddish, apically oblique, membranous; spikelets cylindrical, 19-36 cm. long, 3.5-5 mm. thick, with 50 to 90 flowers; scales broadly ovate to obovate, 5-6 mm. long, 3-3.5 mm. broad, medially with a prominent midrib and subcartilaginous and stramineous, striate and brown-penicillate, in texture passing laterally to chartaceous and finally to hyaline, in color to pallid-buff, the distal margin finely white-hyaline, submarginally with a thin brown line; bristles about 6, slender, mostly exceeding the achene and not serrulate; style 3-branched; achene body biconvex, about 2 mm. long, brownish, surficially dis-

tinctly cellular (the cells quadrangular, appearing as if embedded in clear plastic), apically umbonate (forming a buttonlike base which is the podium for and merges into the tubercle); tubercle conic-deltoid, 0.6-1 mm. long, 0.4-0.6 mm. broad, dark, not at all constricted basally but appearing as a continuation of the umbo of the body although differing texturally (being noncellular). Infrequent in fresh-water mud in Edwards Plateau, rare in Rio Grande Plains, exceedingly rare in e. Tex., spring-fall; Coastal States, N.C. to Tex.; Mex.; W.I.; Berm.

6. *Eleocharis parvula* (R. & S.) Link. Tufted annual (?) spreading by short stolons or rhizomes 0.2-0.5 mm. thick, forming mats in mud; culms 2-7 (-12) cm. long, 0.1-0.4 mm. thick, usually sulcate or irregularly flattened; sheaths extremely short and inconspicuous, hyaline, often slightly reddish; spikelets ovoid to cylindrical, 2-9 mm. long, about 2 mm. thick, with (3 to) 5 to 8 (to 20) flowers; scales ovate, about 2 mm. long, stramineous, medially chartaceous, laterally membranous and marginally hyaline; bristles usually reduced and essentially obsolete [in our plants, most of which are of the var. *anachaeta* (Torr.) Svens.]; stamens 3; style 3-branched; achenial body ovoid to ob-ovoid, trigonous, 0.8-1 mm. long, passing through shades of gray to fuscous or black at maturity, smooth, usually somewhat shiny; tubercle conic-trigonous, much narrower than the body of the achene and confluent with it, scarcely differentiable except under high magnification, 0.1-0.2 mm. long. *Scirpus nanus* Spreng. (non Poir.), *E. membranacea* (Buckl.) Gilly. Infrequent to locally abundant, essentially throughout Tex., in mud, spring-fall; var. *parvula* is widespread in Eur., N. Afr., the Near East and N.A.; var. *anachaeta* is scattered in w. N.A.

7. *Eleocharis rostellata* (Torr.) Torr. Tufted perennial with short often erect rhizomes to 5 mm. thick; culms 25-80 (-150) cm. long, flattened (1-1.4 mm. thick in the broader dimension), on each side usually 3- or 4-costate, wiry, tough, erect or the more elongate ones arching and taking root as the spikelet touches the ground, thus stoloniform; sheaths firm, apically slightly oblique; spikelets lanceolate, acute, 8-17 mm. long, 2.5-4.5 mm. thick, with 12 to 30 flowers; scales ovate, 3-3.5 mm. long, the upper ones more acute than the lower, medially rigid and with a strong stramineous midrib, passing laterally through chartaceous to a membranous texture and in color through shades of brown to pale-brown or stramineous marginally; bristles firm, regularly serrulate, pale-brown, about equaling the tubercle; style 3-branched; achene body obscurely trigonous or turgidly plano-convex, obovoid, brownish, shiny, 1.5-1.7 mm. long, apically narrowed and merging with the tubercle; tubercle oblong or steeplike, 0.7-1 mm. long, 0.3-0.4 mm. thick basally (at attachment but narrower most of the length). Mud in upland areas, frequent in Plains Country, infrequent on Edwards Plateau, summer-fall; N. S. and Me. to Fla., inland in Ont. to N.J., Mich., Wisc., Ill., Kan., Okla., Tex., Coah., B.C. to Wyo., Ut., Calif., N.M.; Berm.; Cuba; Hisp.; n. Mex.; mts. of Ecu. and Arg.

8. *Eleocharis melanocarpa* Torr. Densely tufted perennial; culms 2-6 dm. long, flattened, about 1 mm. thick in the larger dimension, on each side paucicostate and paucisulcate; sheaths apically firm and thickened, mucronate; spikelets narrowly ovoid, obtuse, 6-12 mm. long, 4-5 mm. thick, with 20 to 40 flowers; scales ovate, 3-3.5 mm. long, with a pale buffy very firm midrib, passing laterally through firm-brown to membranous-stramineous marginally; bristles dark-brown, shorter than the achene tubercle, retrorsely toothed or much-reduced; style 3-branched; achenial body obpyramidal-trigonous, 0.8-1 mm. long, apically truncate, ripening through fuscous to black, glossy; tubercle paler, caplike, 0.3-0.5 mm. long, 0.8-1 mm. broad, often broader than the body and overhanging its truncate apex, depressed centrally with a slight pointed umbo. Rare in moist sandy often boggy loam, e. Tex. (Leon and Upshur cos.), summer-fall (?); Coastal States, Mass. to Tex.; also Ind. and Mich.

Plants of this species appear to combine some characters of *E. rostellata* and some of *E. obtusa*.

9. *Eleocharis acicularis* (L.) R. & S. Rhizomatous perennial forming mats; roots not fleshy; rhizomes 0.3-0.6 mm. thick, extensively creeping; aerial culms 2-23 cm. long, 0.2-0.4 mm. thick, about 8-costate and -sulcate, often somewhat flattened or angulate; sheaths thin, reddish below, pallid and membranous or hyaline terminally, oblique; spikelets narrowly ovoid to ovoid-elliptic, 2-5 mm. long, 5- to 15-flowered; scales membranous, whitish to usually dark-purplish-red (or marginally pallid), ovate, 1.5-2 mm. long, rather truncate to acute; bristles 3 or 4 or usually (in Texas material) reduced or

absent; styles 3-branched; achenial body obovoid, obscurely trigonous to usually nearly terete because of the turgid sides, 0.5-0.7 mm. long, pearly-white, with a number of longitudinal ribs and between each 2 ribs 25 to 40 close horizontally elongate facets or cells; tubercle conic, 0.075-0.15 mm. long, constricted basally, much narrower than the achenial body. *E. Reverchonii* Svens. Mud, nearly throughout the state except Trans-Pecos and e. Tex., infrequent or locally abundant, Feb.-summer; most n.-temp. areas of the world, in Am. s. to Calif., Chih., N.M. and the Gulf States.

10. *Eleocharis radicans* (A. Dietr.) Kunth. Densely matted perennial, the rhizomes very short; culms succulent (pressed flat in specimens), only 3-8 cm. long, 0.6-1 mm. thick, erect; sheaths membranous, tight; spikelets ovoid, 3-4 mm. long, 6- to 12-flowered; scales ovate-lanceolate, greenish-stramineous; bristles usually 4, slender, white, retrorsely toothed, variable in length, in some specimens reduced or absent; style 3-branched; achenial bodies narrowly obovoid, 0.7-0.9 mm. long, pearly, obscurely trigonous or usually essentially terete, with several longitudinal ridges and (between them) many (30 to 40) close horizontally elongate cells (trabeculae) in each longitudinal series; tubercle conic, 0.1-0.2 long, much narrower than the body. *Scirpus radicans* Poir. (an illegit. name), *Eleogiton radicans* A. Dietr., *Eleocharis Lindheimeri* (Clarke) Svens. Rare in marshy areas, e. and s.e. Tex., spring (-summer?); Va., Mich., Tex., Okla., Calif., Son., Gr. Ant., S.A.; H.I.

11. *Eleocharis Wolfii* (Gray) Patt. Perennial (?); rhizomes slender, creeping, fragile; culms tufted, 2-edged, somewhat concavo-convex or C-shaped in transection, 12-30 cm. long, 0.6-1.3 mm. broad, erect; sheaths apically scarious, oblique; spikelets ovoid-lanceolate, acute, 5-10 mm. long, 18- to 34-flowered; scales narrowly ovate, acute, usually with 2 purple longitudinal stripes and the rest stramineous, firm or marginally scarious; bristles absent; style 3-branched; achenial bodies narrowly obovoid, 0.8-0.9 mm. long, pearly, obscurely trigonous to terete, with about 9 longitudinal ridges and between each 2 ridges about 40 close horizontally elongate cells (trabeculae); tubercle depressed-conic, about 0.1 mm. long, much narrower than the body. Rare in wet sand, Plains Country and s.e. Tex., probably scattered elsewhere, spring-summer; Sask., Ind., Ill., Mo., Kan., Colo., Okla., Tenn., La. and Tex.

12. *Eleocharis brachycarpa* Svens. Slightly tufted annual; culms flexuous, "capillary," 1-7 cm. long; spikelets 2-4 mm. long, several-flowered; scales lanceolate, striate, apically scarious, green or streaked with brown; bristles absent; styles 3-branched; achenial body obovoid, nearly terete, with several longitudinal series, each of about 15 horizontally elongate cells (trabeculae); tubercle conic, much narrower than the body, basally constricted; body of achene plus tubercle totalling 0.4-0.5 mm. long. Rare in Rio Grande Plains (last collected in April, 1834), spring; also Tam.

13. *Eleocharis obtusa* (Willd.) Schult. Densely tufted annual (rarely persisting more than 1 season); culms 3-50 cm. long, 0.3-1.6 mm. thick (fleshy and sometimes seemingly broader when pressed flat), erect, striate; sheaths often slightly purplish basally, apically firm and oblique; spikelets broadly ovoid to nearly cylindrical, of 50 to 100 flowers (50 to 80 in var. *obtusa*, 60 to 100 in var. *detonsa*), obtuse; scales oblong to suborbicular, firm, drab-stramineous with a narrow scarious margin, obtuse, falling promptly in series from bottom to top of spikelet; bristles several, varying from surpassing the tubercle to essentially absent; style 2- or 3-branched; achenial body biconvex, pyriform, 0.8-1.2 mm. long, 0.7-1 mm. broad, smooth and shiny, ripening through shades of yellow-green to brown; tubercle forming a dark broad low-deltoid crown on the body and in outline merging with it, not constricted basally, 0.1-0.4 mm. long, 0.5-1 mm. broad (in var. *obtusa* the tubercle 1.7 to 3 times broader than long; in var. *detonsa* 2.8 to 4.5 times broader than long). *E. Engelmannii* Steud. Locally abundant in moist sandy soils; the var. *obtusa* in e. and s.e. Tex. passing into var. *detonsa* (Gray) Drapalik & Mohlenbrock in n.-cen. Tex. and Edwards Plateau (Enchanted Rock area only), spring-summer; over much of temp. N.A. [and perhaps including the Euras. *E. ovata* (Roth) R. & S. as var. *ovata* (Roth) Drapalik & Mohlenbrock].

14. *Eleocharis lanceolata* Fern. Densely tufted annual; culms 1-2 dm. long, 0.3-0.9 mm. thick, erect; sheaths apically firm and oblique; spikelets lanceolate to lance-ovoid, of 30 to 80 flowers, acute; scales ovate, firm, brownish-stramineous, with a narrow scarious margin, acute, falling promptly in series from bottom to top of spikelet; bristles 6 or 7, usually surpassing the tubercle; style 2- or 3-branched; achenial body 0.9-1.1 mm. long,

0.7-0.8 mm. broad, biconvex, pyriform in outline, smooth, shiny, ripening to a brownish color; tubercle forming a dark broad low-deltoid crown on the body and in outline merging with it, not constricted basally, about 0.4 mm. long, 0.5-0.6 mm. broad. *E. obtusa* var. *lanceolata* (Fern.) Gilly. Rare in n.-cen. and n.e. Tex. (Grayson and Bowie cos.), in moist loam, summer-fall(?); Mo., Kan., Ark., Okla. and Tex.

15. *Eleocharis flavescens* (Poir.) Urban. Perennial, often with elongate fleshy rhizomes 0.5-1 mm. thick; culms either densely tufted or rising singly from the nodes of the rhizome, 4-35 cm. long, 0.3-1 mm. thick, ascending, firm to flaccid, often sulcate when dried; sheaths apically oblique, hyaline, fragile, promptly becoming loose and withered on drying; spikelets 3-6 mm. long, ovoid, acute or blunt, with 15 to 25 flowers at maturity (the numerous more apically situated primordia never maturing); scales ovate to ovate-oblong, firm to membranous, somewhat striate, with a strong greenish keel-like midrib and brown-stramineous sides; bristles about 7, pallid to pure white, quite variable in length but usually about equaling the tubercle; style 2-branched; achenial body obovate to pyriform, 0.8-0.9 (-1) mm. long, biconvex, shining, microscopically pitted, ripening through shades of chartreuse and olive-brown to purplish-brown or even purplish-black; tubercle conic, yellow to greenish-white, acute, 0.1-0.2 mm. long, about 0.1 mm. broad, basally very slightly constricted. *E. olivacea* Torr., *E. ocreata* (Nees) Steud. Rare in moist soil, e. and s.e. Tex. and Edwards Plateau, probably elsewhere, spring-fall; e. N.A. w. to Minn. and Tex.; W.I., Mex., S.A. Easily confused with *E. caribaea*.

16. *Eleocharis caribaea* (Rottb.) Blake. Densely tufted annual (when plants are covered slowly with shifting sand the bases elongating upward somewhat like rhizomes) or perhaps rarely perennial; culms 4-30 cm. long, 0.4-1 mm. thick, terete (or striate and sulcate on drying); sheaths apically oblique, firm; spikelet 3-6 mm. long, ovoid to broadly ovoid, obtuse, of 28 to 50 flowers; scales broadly ovate, 1.5-2 mm. long, firm, when mature stramineous to pallid-buffy and with inconspicuous midrib, obtuse, eventually serially deciduous from lowest to highest; bristles about 7, dark-colored, usually about equaling the tubercle; style 2-branched; achenial body (0.7-) 0.8-1 mm. long, obovate to pyriform in outline, biconvex, ripening through shades of pale-green to purplish-black, shiny; tubercle conic (depressed or acute), (0.05-) 0.1-0.2 mm. long, pallid-greenish or whitish, slightly constricted basally. Locally abundant in moist calcareous soil in most parts of the state (absent from Plains Country and e. Tex.), summer-fall; widespread in warmer parts of the world; in Am. n. to Gulf States, casual elsewhere.

Has been known incorrectly as *E. geniculata* (L.) R. Br.; the latter is a species of coarse, tropical perennials not occurring in Texas.

17. *Eleocharis atropurpurea* (Retz.) J. & C. Presl. Densely tufted annual; culms 3-12 cm. long, 0.2-0.3 mm. thick, arcuate-erect, terete (sulcate or striate on drying); sheaths apically oblique, firm; spikelet narrowly ovoid, 2-4 mm. long, of 40 to 80 flowers; scales ovate to narrowly so, about 1 mm. long, obtuse to abruptly acute, firm-membranous, with a green midrib, brown to purplish laterally; bristles several, usually colorless, translucent, about equaling the achenial body or much-reduced; style 2-branched; achenial body 0.5-0.6 (-0.7) mm. long, obovate to pyriform in outline, biconvex, when mature quite jet black, shiny; tubercle conic, about 0.05 mm. long, whitish, constricted basally. Rare and local in moist sandy soil, e. Tex. (Bastrop Co.), Edwards Plateau (Burnet Co.), Plains Country (Hale Co.) and Rio Grande Plains (Hidalgo Co.), scattered, summer; scattered in warmer parts of both hemispheres, in Am. n. to Ia., Neb., Colo. and Wash.

18. *Eleocharis macrostachya* Britt. Rhizomatous perennial; rhizomes 1-2.5 mm. thick, often reddish; culms in tufts along the rhizome, 18-50 cm. long, 0.9-3 mm. thick, erect, often appearing slightly spongy and irregularly sulcate on drying, occasionally compressed; sheaths tight, apically truncate or very slightly oblique, very firm, in many specimens mucronate, basally dark-reddish-brown; spikelets 8-25 mm. long, about 3 mm. thick, lanceolate or linear-lanceolate, acute, of 40 to 100 flowers; lowest 1 to 3 scales sterile, firm, obtuse, the lowest one sometimes completely encircling the base of the spikelet; fertile scales lanceolate to broadly lanceolate, more or less acute, about 3 mm. long, with a green or stramineous midrib (which does not reach the apex), a firm buffy to castaneous lateral and subapical zone and a hyaline margin and apex; bristles 7 or 8, brownish, unequal, the longest usually as long as the tubercle; style 2-branched, the upper part promptly deciduous from the base; achenial body obovate to pyriform, 1.2-1.8 mm. long, usually more turgidly convex on one (abaxial) side than on the other,

surficially nearly smooth or very faintly reticulate-punctate in an open pattern, lustrous, ripening through shades of yellow to golden-brown; tubercle 0.3-0.7 mm. long, conic to depressed or even subglobular, grayish, texturally like pumice or rotted bone, usually about half as broad as the body, basally constricted. Some workers refer these plants to the Old World complex known by the name *E. palustris* (L.) R. & S. *E. xyridiformis* Fern. & Brack. Most of Tex. (except extreme e. and s.e.), usually in slightly alkaline mud, spring-summer; Minn. to Ill., Mo., Kan., Okla. and Tex., w. to s. Alas., Calif. and s. to cen. Mex.; Col.

19. *Eleocharis fallax* Weath. Perennial much like *E. macrostachya* but styles 2- or 3-branched, the achenes averaging smaller (body 1.2-1.7 mm. long and tubercle 0.2-0.5 mm. long) and the body more distinctly and regularly punctate (much as in *E. montevidensis*). Rare in (brackish?) mud, s.e. Tex. (collected once in Matagorda Co.), summer (?); coastwise, Mass. to Tex.; Cuba.

20. *Eleocharis tenuis* (Willd.) Schult. var. *verrucosa* (Svens.) Svens. Rhizomatous perennial; rhizomes 1-2 mm. thick, scaly-fibrous, castaneous-fuscous; culms tufted at intervals along the rhizomes, 15-50 cm. long, 0.2-0.3 mm. thick, weakly ascending, 4- or 5-sulcate or simply angled; sheaths basally purplish-red, apically firm, truncate to very slightly oblique, usually with a minute mucro; spikelets oblong or narrowly ovoid to lance-ovoid, 3-9 mm. long, of 20 to 40 flowers; scales ovate to obovate, obtuse, about 2 mm. long, with a greenish or stramineous midrib and firm castaneous to purplish-black sides, marginally very narrowly scarious; bristles 2 or 3, promptly deciduous, very short; styles 3-branched; achenial body broadly obovoid to suborbicular, distinctly trigonous, 0.6-0.8 mm. long, ripening through shades of ivory to greenish-olive, surficially minutely but pronouncedly warty or pitted in vertical lines; tubercle strongly depressed-pyramidal, 0.1-0.2 mm. long, slightly constricted basally. Infrequent in moist sand, forested areas, e. Tex., rare in s.e. Tex., spring; temp. e. N.A., w. to Ill., Mo., Okla. and Tex. (the var. *verrucosa* in the w. part of that distributional area).

21. *Eleocharis compressa* Sulliv. Rhizomatous perennial; rhizomes 2-4 (-6) mm. thick, usually short and forking, forming dense thick mats; culms tufted along the rhizome, 9-20 cm. long, erect, strongly compressed, 0.6-1 mm. broad in the flat dimension, several-striate on each side; sheaths usually reddish basally, apically firm and truncate or only very slightly oblique, with a mucro; spikelets ovoid to narrowly ovoid, 5-12 mm. long, with 20 to 40 flowers; scales broadly lanceolate, the lower medial portion chestnut-brown or chestnut-fuscous (the mid-nerve somewhat paler), the margins and the long-attenuate sometimes bifid (split) apex translucent-scarious; bristles 1 to 5, promptly deciduous, very short; style 3-branched; achenial body broadly obovoid, turgid, obscurely trigonous, about 1 mm. long, ripening through yellow to a golden-brown, surficially granular-roughened or reticulate (rougher than in the following species but not as rough as in *E. tenuis*); tubercle 0.1-0.2 mm. long, depressed- to globose-conic, usually slightly constricted basally. *E. elliptica* Kunth var. *compressa* (Sulliv.) Drapalik & Mohlenbrock. Rare in loamy usually moist soil in e. Tex. (San Augustine Co.), spring; most of n.e. U.S.; also Ont., Sask., Ga., Okla. and Tex.

22. *Eleocharis acutisquamata* Buckl. Rhizomatous perennial; rhizomes 2-4 (-6) mm. thick, usually short and forking, forming dense thick mats; culms tufted along the rhizome, 8-20 (-28) cm. long, 0.3-0.8 mm. thick, slightly compressed or usually merely irregularly several-angled; sheaths usually slightly pinkish basally, apically firm and truncate or only very slightly oblique, not mucronate; spikelets narrowly oblong or cylindrical to narrowly elliptic, usually with a blunt point, 3-11 mm. long, of 24 to 44 flowers; scales broadly lanceolate, the lower medial portion brown (the midnerve slightly paler), the margin and the long-attenuate sometimes bifid (split) apex translucent-scarious; bristles several, extremely short and promptly deciduous; style 3-branched; achenial body broadly obovoid to obovoid-pyriform, turgid, obscurely trigonous, 0.9-1.2 mm. long, ripening through yellow to a golden-brown, surficially very minutely granular-roughened and obscurely reticulate; tubercle conic to essentially globular, 0.1 mm. long (rarely to 0.2 mm.), basally constricted. Probably conspecific with *E. compressa*. Abundant in calcareous loamy (usually slightly moist) soil, Edwards Plateau and n.-cen. Tex., infrequent s. to s.e. Tex. (Refugio Co.) and in e. Plains Country, spring; also Okla.

23. *Eleocharis montevidensis* Kunth. Rhizomatous perennial; rhizomes extensive, 1-2 (-2.5) mm. thick, usually dark-reddish; culms 1-5 dm. long, 0.4-1 mm. thick, erect,

rather soft, sometimes slightly compressed, in pressed specimens often irregularly sulcate and showing incomplete and weak septa; sheaths basally dark-reddish, apically quite firm, truncate or only very slightly oblique and weakly mucronate; spikelets very variable in shape, from globular to cylindrical or ovoid to elliptic, apically blunt, 3-14 mm. long, with 24 to 70 (to 110) flowers; scales mostly oblong to oblong-ovate, 2-3 mm. long, obtuse to slightly emarginate, the median portion membranous and brownish to atrocastaneous (with or without a paler midnerve), marginally scarious, often somewhat convex abaxially, concave adaxially (this true even before the achenes mature, so the spikelets appear filled out soon after anthesis); bristles 4 to 6, some of them usually equaling the tubercle; style 3-branched; achenial body obovoid to pyriform-obovoid, (0.8-) 0.9-1.1(-1.2) mm. long, turgid, obscurely trigonous, ripening through shades of yellow to golden-brown or even dark-brown, punctuate-reticulate surficially (varying from as rough as in *E. compressa* to nearly smooth as in the plant called *E. Palmeri*), lustrous; tubercle precisely to irregularly conic, (0.1-) 0.2-0.3 (-0.4) mm. long. *E. arenicola* Torr., *E. Palmeri* Svens. Perhaps our commonest species, occurring in moist soil essentially throughout Tex. (rare in extreme e. and extreme w.), spring (-summer); cen. Mex. n. to Ore., Ida., N.M., Okla., the Gulf States and S.C.; also s. Braz., Urug. and Arg.

24. *Eleocharis cylindrica* Buckl. Rhizomatous perennial; rhizomes slender (1-2 mm. thick); culms 15-30 cm. long, 0.4-0.5 mm. thick, about 4-sulcate and -angled, erect; sheaths faintly reddish-brown basally, apically firm, truncate or very slightly oblique, mucronate; spikelets linear-cylindric, 8-17 mm. long, 2-2.5 mm. thick, acute, of 50 to 60 flowers; scales about 2 mm. long, ovate, acute, medially thin-membranous, brown (the midnerve pale), marginally white-hyaline, slightly convex abaxially; bristles pale-brown, 0.05-0.1 mm. long, extremely inconspicuous; style 3-branched; achenial body 0.6-0.8 (-1) mm. long, obovoid, strongly and obviously trigonous (the sides slightly concave, the angles prominent but not sharp), ripening through canary-yellow to golden-brown or dark-brown, essentially smooth and satiny, apically conspicuously and abruptly narrowed to a short cylindrical pedestal; tubercle depressed-pyramidal, about 0.1 mm. long and about as wide or pyramidal and about 0.3 mm. long. Rare, probably in shallow water or calcareous mud, Plains Country (Lubbock Co.) and Trans-Pecos (Presidio Co.), June-July; endemic, to be sought in N.M. and Chih.

25. *Eleocharis austrotexana* M. C. Johnst. Densely tufted perennial (probably with short slender matted reddish rhizomes); culms 30-45 cm. long, erect, 0.8-1.1 mm. thick, essentially terete, with 12 to 15 minute striae in dried specimens and very weak but complete transverse septa 2-3 mm. apart (otherwise hollow); sheaths 2-5 cm. long, tight, mostly reddish, apically quite firm, truncate or only very slightly oblique and with a seta or mucro to 1 mm. long; spikelets lanceolate, acuminate, acute, 8-13 mm. long, of about 50 to 70 flowers; scales ovate and acute to broadly lanceolate, about 2 mm. long, medially buffy-brown (midnerve paler) and membranous, marginally hyaline, whitish; bristles about 6 to 8, pale-brown, translucent, inconspicuous, persistent, unequal, the longer ones about equaling the achenial body; style 3-branched; achenial body obovoid-pyriform, 0.7-0.9 mm. long, obscurely trigonous (the 2 inner angles definite, though not sharp, the abaxial one obscure), ripening through shades of yellow to golden-brown, surficially nearly smooth, slightly lustrous (under very high magnification punctulate-reticulate); tubercle depressed-pyramidal, about 0.2 mm. long and broad, slightly constricted basally. Rare in Rio Grande Plains and s.e. Tex., Apr.; endemic.

26. *Eleocharis montana* (H.B.K.) R. & S. Perennial, basally subrhizomatous but not extensive; culms densely tufted, 3-8 dm. long, 1.5-3.5 mm. thick, erect, terete, with complete septa 2-3 mm. apart; sheaths basally reddish, apically lineolate, very firm, only very slightly oblique, mucronate; spikelets lanceolate, 8-24 mm. long, acute, with 110 to 240 (to 350) flowers; scales ovate and acute to broadly lanceolate, about 2 mm. long, medially buffy-brown and membranous, marginally hyaline and paler; bristles 6 to 8, brownish, unequal, the longer ones about equaling the achenial body; style 2-branched (in Texas material); achenial body 0.9-1.1 mm. long, obovate, biconvex (not turgidly so), with 2 definite angles (in Texas material), ripening through shades of pallid chartreuse and yellow to olive-brown, surficially punctulate-reticulate; tubercle 0.1-0.2 mm. long, depressed-deltoid, about half as broad as the body and scarcely restricted basally, almost merging with the body. Scarce in wet places, s.e. Tex. and s. as far as Nueces Co., summer; widespread in S.A. and C.A., W.I., n. to Ariz., Tex., La. and Fla.

27. *Eleocharis minima* Kunth. Tufted annual; culms 3-7 (-10) cm. long, about 0.1 mm. thick, extremely weak, often flexuous and recurved, quadrangulate-sulcate; sheaths dark-reddish, apically long-oblique, blunt, hyaline; reduced (cleistogamous?) spikelets often present at the base of the plant among the culms; ordinary spikelets 2-4 mm. long, ovoid, 5- to 10-flowered, usually blunt; scales ovate to narrowly ovate, blunt or shortly acute, 1.5-2 mm. long, brown and membranous (midrib paler), marginally hyaline; bristles about 5 to 7, whitish, about as long as the body of the achene; style 3-branched; achenial body obovoid, 0.7-0.8 mm. long, sharply trigonous (the 3 sides slightly convex), ripening through olive-whitish to pale-olive or even dark-olive-gray, often somewhat mottled, darker near the angles and the ends, essentially smooth; tubercle sharply pyramidal-trigonous, 0.15-0.3 mm. long and broad, slightly constricted basally. Rare in mud in s.e. Tex. (Aransas and Jackson cos.), spring and fall; trop. Am. s. to s. Braz. and n. to Ga., Tex. and Calif.

28. *Eleocharis Baldwinii* (Torr.) Chapm. Tufted annual; culms 6-20 cm. long, 0.1-0.25 mm. thick, ascending or often strongly recurved and stoloniform; sheaths mostly reddish, long-oblique, blunt, hyaline; cleistogamous few-flowered spikelets usually abundant at base of plant among the sheaths; ordinary spikelets mostly narrowly elliptic, 4-7 mm. long, of 5 to 10 flowers, frequently proliferating when the recurved culm (stolon) touches the ground; scales pseudodistichous, the lowest linear and with a strong green midnerve, the others progressively broader toward the top of the spikelet, lance-elliptic, 3-4.5 mm. long, buffy to ferruginous-buff, membranous, strictly appressed, acute; bristles several, pallid, about equaling the achenial body or reduced; style 3-branched; achenial body obovate, 0.7-0.8 mm. long, whitish-buffy to olive or brownish-olive, trigonous (angles distinct and sides nearly flat), smooth; tubercle pyramidal-trigonous, 0.2-0.3 mm. long, acute, constricted basally. Near Caddo Lake, La. (part of this lake extends into e. Tex.), summer-fall; N.C., Ga., Fla., La., (Tex.?).

29. *Eleocharis microcarpa* Torr. Tufted annual; culms 4-28 cm. long, (0.1-) 0.15-0.3 mm. thick, mostly erect or ascending (less commonly weak and somewhat flexuous), often quadrangulate-sulcate (at least when dry); sheaths short, stramineous or slightly tinged with pink basally, apically long-oblique, blunt and hyaline; spikelets never at the base of the plant, always terminal on elongate culms, ovoid, 2-5 mm. long, 8- to 15-flowered, often proliferous (sending out culms instead of flowers, usually from the axil of the lowest scale), the spikelet then slightly inclined; lowest scale differentiated, bract-like, sterile, lanceolate to linear, often a third to three fourths the entire length of the spikelet, consisting mostly of a prominent green midnerve with reduced membranous sides; other scales ovate, about 1.5 mm. long, blunt, the median distal portion purplish (midrib paler) and membranous, the median proximal portion whitish, the margins white-hyaline; bristles somewhat variable, in our specimens much reduced or usually absent; styles 3-branched; achenial body 0.5-0.6 mm. long, obovoid, trigonous (angles not very prominent, sides convex), pearly-white, lustrous, smooth; tubercle 0.05-0.1 (-0.15) mm. long, depressed-pyramidal, buffy-white, slightly constricted basally. *E. Brittonii* Small, *E. Lundellii* Svens. Frequent in sandy loams, s.e. Tex., infrequent in e. Tex., spring-fall; coastal areas, Conn. and N.J. to Tex.; also Tenn. and Ind.

30. *Eleocharis tuberculosa* (Michx.) R. & S. Tufted perennial, often with ascending rhizomes 3-6 mm. thick; culms 15-80 cm. long, compressed, 0.5-1 mm. thick in the longer dimension, erect, wiry, sulcate, grayish-yellow; sheaths grayish-yellow, shortly oblique and acute; spikelets ovoid to lance-ovoid, 5-15 mm. long, blunt to acute, with 25 to 40 flowers; scales ovate to nearly orbicular, about 3 mm. long, blunt, grayish-yellow to stramineous, firm (chartaceous to subcartilaginous), not keeled, marginally slightly thinner than medially; bristles several, brownish, usually surpassing the achenial body; style 3-branched; achenial body broadly obovoid, 1.2-1.7 mm. long, obscurely trigonous, stramineous to olivaceous, surficially with pronounced large cells (the cell-walls prominent), lustrous; tubercle 1.2-1.7 mm. long, irregularly stele-shaped-conic, apically rounded, toward the base flared out mushroomlike and as broad as the body, very strongly truncate, the connection to the body very thin. Frequent in moist sand, s.e. and e. Tex., May-Nov.; coastal provinces and states, N.S. and N.H. to Tex.; also Tenn. and Ark.

31. *Eleocharis tortilis* (Link) Schult. Tufted perennial; rhizomes ascending, 2-3 mm. thick; culms 15-50 cm. long, 0.5-1 mm. thick, usually flattened or irregularly 3-costate

and -sided, often twisted, wiry, grayish to yellowish; sheaths grayish or yellowish, shortly oblique and acute or blunt, firm; spikelets ovoid to lance-ovoid or cylindrical-ovoid, 6-14 mm. long, of 13 to 38 flowers; scales ovate to suborbicular, about 3 mm. long, blunt, firm (subcartilaginous medially to chartaceous marginally), yellowish or grayish-stramineous, sometimes with a subterminal purplish splotch especially when immature; bristles several, brownish, often surpassing the achenial body; style 3-branched; achenial body broadly obovoid, 1.2-1.7 mm. long, obscurely trigonous, the sides convex, superficially pronouncedly large-cellular (the cell walls prominent), lustrous, olivaceous-brown or gray; tubercle pyramidal, 0.6-1 mm. long, usually acute, basally narrower than the body, truncately constricted to the very narrow attachment. Infrequent in moist sandy soil, e. Tex., May-Nov.; coastal areas, N.Y. to Tex.

32. *Eleocharis albida* Torr. Rhizomatous perennial; rhizomes extensive, 1-2 mm. thick, orangish-brown; culms tufted at intervals along the rhizome, 5-30 cm. long, about 1 mm. thick, erect, essentially terete, stramineous or basally slightly pinkish; sheaths apically truncate or shortly oblique and firm but membranous, basally often pinkish to red; spikelets ovoid to ovoid-cylindric, 5-16 mm. long, of 30 to 90 flowers, rarely proliferating; scales broadly ovate, subcartilaginous medially, firm-membranous marginally, stramineous, shiny; bristles 5 to 8, when mature reddish-brown, some often surpassing the achenial body, others half as long; style 3-branched; achenial body broadly obovoid, 0.8-1 mm. long, trigonous (the 2 inner angles sharper and more definite than the abaxial one, the faces only slightly convex), maturing through shades of olive-whitish to brownish-olive and finally to a rich dark-chocolate-brown, lustrous; tubercle varying from conic to globular, 0.15-0.3 mm. long, paler than the body at maturity, constricted basally. Frequent in moist perhaps brackish sand in coastal parts of Rio Grande Plains and s.e. Tex., spring-summer; coastal areas, Md. to Mex.; Berm.

5. BULBOSTYLIS KUNTH

Essentially glabrous perennial forming tight swards of limited extent or less commonly annual herbs; culms closely tufted, 4-30 cm. long, 0.2-0.6 mm. thick, wiry, erect; leaves setaceous, about half as high as and even thinner than the culm; primary bract setaceous, often appearing as a continuation of the culm or spreading, 3-22 mm. long; other bracts setaceous, much-reduced; inflorescence umbelliform or cymose, simple or compound, 5-40 mm. long or occasionally reduced to a glomerule or even rarely a single spikelet; spikelets lance-cylindric, dark-brown, of 7 to 25 perfect flowers; scales spirally imbricate, ovate, obtuse to acute or rarely retuse, dark-brown, 1-2 mm. long, strongly keeled (the keel paler), occasionally slightly gibbous, glabrous to strigose or puberulent, marginally smooth to slightly fimbriate; perianth bristles absent; style 3-branched, the base enlarged and persistent as a tubercle 0.5-1 mm. long, differentiated in texture and color from the achenial body; achenial body obovoid or usually obpyramidal, strongly triquetrous, 0.7-0.9 mm. long, maturing through shades of white to pale-buffy-white or grayish, with papillae or transverse ridges. *Stenophyllus* Raf. (a rejected name). Many authors, with much justification, include *Bulbostylis* in *Fimbristylis*.

About 100 species in warm regions.

1. Achenes papillose, maturing yellowish or grayish; cyme typically compound 1. *B. ciliatifolia*.
1. Achenes transversely ridged or rugose; cyme simple (2)
- 2(1). Annual or perennial; achenes with about 10 indistinct transverse ridges on each face, maturing to a buffy-white 2. *B. capillaris*.
2. Strong perennial; achene with about 20 minute but (under a lens!) conspicuous and pronounced transverse rugae on each face, maturing to a grayish color 3. *B. juncooides*.

1. *Bulbostylis ciliatifolia* (Ell.) Fern. Characters given in the generic description and the key. Uncommon in periodically wet sandy soil of open woods and hillsides in e. and s.e. Tex., summer-fall; from Va. s. to Fla., w. to Tex.

2. *Bulbostylis capillaris* (L.) Clarke. Characters given in the generic description and the key. *Fimbristylis capillaris* (L.) Gray. Infrequent in sandy soil and in crevices of

granitelike rocks which decompose to sandy soil, e., s.e. and n.-cen. Tex. and Edwards Plateau (Central Mineral Region), rare in Trans-Pecos, spring-summer; widespread in warm-temp. N.A., s. to Calif., Ariz., N.M. and the Gulf States; Tam.; Cuba; reported in Chih.

3. *Bulbostylis juncoides* (Vahl) Kükenth. Characters given in the generic description and the key. Locally frequent in rock crevices in Chisos and Davis Mts. in the Trans-Pecos, rare in granite area of Edwards Plateau, summer; Tex. and Ariz. s.e. to Guat.; Hisp.; Bol. to Urug. and Arg.

Our plants are referable to the var. *ampliceps* Kükenth. (which name is probably not the earliest applicable one in the varietal rank).

6. FIMBRISTYLIS VAHL¹⁷

Perennial or annual, the culms solitary or in tufts, or variously rhizomatous, rigid or lax, leafy toward the base; leaves filiform to narrowly or broadly linear, glabrous to pubescent, flat or involute, ligulate or eligulate, the sheaths closed or partly open at maturity of the leaf; spikelets lanceolate or oblong to ovoid or round in outline, terete or somewhat flattened or angled, either solitary and terminal on the scapes or in simple or compound umbelliform systems involving pedunculate and sessile spikelets of cymules, the whole inflorescence as well as the cymules composing it often subtended by a leafy involucre; fertile scales glabrous or variously pubescent, subdistichous to more often spirally arranged, deciduous, all but the lowermost fertile; florets perfect; perianth absent (the flower produced on a short pedicel joint which usually disarticulates with the achene); stamens one to three; anthers oblong, basifixed, sometimes apiculate, the two thecae at maturity longitudinally and laterally dehiscent; style 2- or 3-branched, the unbranched portion flattened and fimbriate for at least a portion of its length or (more rarely) subterete or angled, the style base either flattened or swollen but in any event not persistent at the summit of the achene; achene lenticular or trigonous; surface of achene smoothish, cancellate or warty, usually made up of isodiametric or horizontally arranged rectangular cells, these either concave or protuberant.

Over 200 described species, in a variety of habitats in warm temperate to tropical regions of the world.

1. Style 3-branched (2)

1. Style 2-branched (3)

2(1). Achene trigonous, the surfaces smooth or warty; ligule of short hairs present 1. *F. autumnalis*.

2. Achene not trigonous or only obscurely so, obovoid, the surfaces usually warty; ligule absent 2. *F. miliacea*.

3(1). Ligule of short hairs present (this characteristic is most noticeable in those entities that have broadly linear flattened leaf blades but is difficult to detect in those extremes that have very involute narrow leaf blades (4)

3. Ligule absent (8)

4(3). A system of slender pale or reddish rhizomes present; robust perennials with tall wandlike culms (5)

4. Rhizomes absent or (if present) thickened and composed of stout contiguous culm-bases; perennial or annual species (6)

5(4). Fertile scales puberulent toward the tip; scapes usually flattened, often scabrous-edged distally; edges of leaves (especially toward the tip) scabrid; achene finely but definitely reticulate; in upper edges of salt marshes, dune swales or fresh marshes on the Coastal Plain 3. *F. caroliniana*.

5. Fertile scales usually smooth; scapes more slender, terete or broadly oval in cross section and smooth distally; edges of leaves usually not scabrid; achene smoothish or with longitudinal rows of shallow isodiametric pits; moist or wet prairies, river sloughs, marshes and springy places in west Texas 10. *F. puberula* var. *interior*.

¹⁷ Adapted from Robert Kral in *Sida* 4, No. 2, 1970,

- 6(4). Face (one side) of achene smoothish or with many (15 or more) longitudinal rows of shallow pits or cells (thus finely striate) . . . 4. *F. tomentosa*.
6. Face (one side) of achene more closely reticulate, usually with 12 or less longitudinal rows of horizontally oriented rectangular cells (7)
- 7(6). Sheaths densely spreading-hairy; margins of leaf blades spreading-hairy (at least toward the base); leaves broadly linear, spreading, subdistichous; primary rays of umbel stiffly spreading, the inflorescence often as wide as long or wider; edges of achene with at least low warts; weed of Gulf Coastal Plain 5. *F. decipiens*.
7. Sheaths and leaves variable in pubescence; leaves narrowly linear, usually ascending; primary rays of umbel spreading or ascending but inflorescence usually longer than broad; achene lacking warts or copiously warty; widespread 6. *F. annua*.
- 8(3). Low often densely tufted weedy annual; leaf blades linear-filiform 7. *F. Vahl.*
8. Taller more robust wider-leaved perennials (9)
- 9(8). Plants densely caespitose; bases of leaves hard, leathery, usually very dark-brown or castaneous, often quite lustrous, deeply set in substrate; common to brackish coastal habitats 8. *F. castanea*.
9. Plants in small tufts or culms solitary; bases of leaves thickened and hard or culm bases bulbous but in any case more shallow-set in substrate; either with stout contracted rhizomes or with fasciculate clusters of narrow orange-brown rhizomes; from sandy acid pineland savannahs or oak barrens to heavy prairie soils but not in brackish coastal habitats (10)
- 10(9). Base of culms bulbous, often joined together into a stout knotty rhizome; old leaf bases often persisting as shreddy remnants; outer surface of fertile scales usually with some puberulence 9. *F. puberula*.
10. Base of culms rarely bulbous, usually producing fascicles of slender orangish rhizomes; old leaf bases not persisting as shreddy remnants; outer surface of fertile scales seldom with any puberulence 10. *F. puberula* var. *interior*.

1. *Fimbristylis autumnalis* (L.) R. & S. Caespitose annual, usually 5-20 cm. tall; leaves glabrous, spreading, subdistichous, from half as long as the culms to equaling the culms; blades linear (to 4 mm. broad), flat, the backs with numerous raised veins, the margin a pale cartilaginous ciliate-scabrid border; sheaths broader, keeled, with a broad scarious tan entire margin, joining the blade at an acute angle or truncate; ligule present as a line of short pale hairs; scapes flat, similar to the leaf blades, the edges often harsh; longest involucre bract with blade similar to that of the leaves, seemingly a continuation of the scape, shorter to longer than the inflorescence; spikelets linear-oblong to lanceolate, usually 3-7 mm. long, pale- to dark-brown, in an open to densely closed paniculate system of cymes, the primary rays usually ascending; fertile scales ovate-lanceolate, usually keeled, entire, the midrib excurrent as a mucro; stamens usually 2, rarely 1, 0.2-0.3 mm. long; style 3-branched, much longer than the achene, trigonous at the base, subterete above toward the branches, entirely smooth; achene trigonous-obovoid, apiculate, about 1 mm. long, pale-brown, the surface smooth to quite verrucose. Moist to wet sands, peats, silts or clays, primarily of disturbed sunny ground, various provinces of e. N.A.; Carib. I., Mex. and C.A.; also Old and New World trop.

2. *Fimbristylis miliacea* (L.) Vahl. Caespitose annual to 5 dm. tall (rarely to 1 m.); leaves equitant, distichous, from one half the length of the plant to nearly as long, rigid, smooth, flabellately spreading, tapering evenly from broad clasping sheaths into the blade, thence continuing to taper into a slender tip, the numerous veins raised and evenly spaced; margin of the blade narrow, pale, cartilaginous, antorsely ciliate-scabrid, the margin of the sheath somewhat broader, scarious and entire; sheaths keeled, often bladeless; ligule not evident; scapes slender but rigid, flattened or somewhat angled in cross section toward the base, more flattened distally but often with a double margin along each edge; spikelets subglobose to ovoid or short-cylindrical, 2-4 mm. long, on flattened scabrous pedicels in a compound loose to congested system of cymes; longest involucre bract usually shorter than the inflorescence; fertile scales ovate, pale-

(usually) dark-brown, smooth, the apex obtuse to rounded or emarginate, the margin entire, the midrib paler by contrast or greenish and rarely excurrent; stamens 1 or 2, the anthers less than 1 mm. long; style 3-branched, the unbranched portion not much longer than the achene, subterete below, more flattened and fimbriate above toward the branches; achene obovoid (usually narrowly so), apiculate, about 1 mm. long, pale-brown, reticulate, the cells narrowly rectangular and horizontally oriented in 4 to 6 rows on a face, the longitudinal ribs usually more prominent and usually verrucose. Sandy peat, peat-muck and silt of open areas such as savannahs, pond, lake or river shores, cult. areas (particularly rice fields), in the U.S. from N.C. s. in the Coastal Plain into peninsular Fla., w. along the Gulf Coast into Tex.; throughout the Carib. I., Mex. and C.A.

3. *Fimbristylis caroliniana* (Lam.) Fern. Rhizomatous perennial, to 1.5 (-2) m. tall; culms solitary or in small tufts, the bases rather shallowly set in the substrate; leaves subdistichous, usually spreading, about half as long as the scapes; blades firm, linear, 2.5 (-7) mm. wide, the surfaces smooth or in some cases pubescent near the ligule or the upper face, the backs with several raised nerves, the pale margin hyaline and scabrid; leaf-sheath broader, clasping, firm, pale- to dark-brown, glabrous to sparsely pubescent, with a wide stramineous to tan or reddish-brown scarious margin (this gradually or abruptly passing into the blade and often ciliate at this point); ligule of appressed hairs, usually complete; scapes about the width of the leaf blade, glabrous, many-ribbed, subterete toward the base, usually flattened toward the apex (in which case the edges scabrid); longest bract of the involucre much shorter than the inflorescence to but slightly exceeding it, the back glabrous to puberulent, the margin harsh; spikelets ellipsoidal to lance-ovoid or oblong, 5-15 mm. long, blunt to acute, pale-dull-brown to reddish-brown, few to many in a compound umbellate system of cymes, the edges of the peduncles scabrid; fertile bracts ovate, glabrous or puberulent on the backs toward the apex, the margin entire, the surface marked by a thick usually paler area of midrib (this sometimes excurrent as a short mucro); stamens 3, the apex of the flattened filaments narrowed, the anthers about 3 mm. long; style 2-branched, flat, fimbriate from near the base to slightly beyond the point of branching; achene lenticular-obovoid, about 1 mm. long, pale- to deep-brown, often lustrous, finely reticulate with the reticule composed of several fine rows of foveae or horizontally oriented rectangular cells; pedicel joint very short, usually persistent. Brackish, alkaline or mildly acid sands or sandy peats of beaches, dune swales, lake shores, roadside ditches, more rarely savannahs or flatwoods, Coastal Plain from N.J. s. into the Fla. Keys and w. along the Gulf Coast to Tab.; Cuba.

4. *Fimbristylis tomentosa* Vahl. Cespitose annual to 7.5 dm. tall; leaves from half as long to nearly the length of the mature culms; blades linear, 2-4 (-5) mm. broad, usually flat but sometimes slightly involute, spreading to ascending, the surfaces pubescent, the backs with several prominent raised nerves, the margin evident as a pale cartilaginous narrow border which is ciliate-scabrid; leaf sheath broad, usually tomentose, with a wide brownish subscarious margin (this long-ciliate and truncate above at juncture with blade); ligule present as horizontal line of short pale hairs; scapes rather rigid, subterete basally, usually flattened or oval in cross section just below inflorescence, smooth or variously pubescent; spikelets at maturity a rich-reddish-brown, lance-ovoid, 4-6 mm. long, acute, usually many in a rather dense paniculate system of cymes the primary branches of which are usually ascending, pubescent (spikelets solitary in depauperate specimens); longest involucral bract exceeding inflorescence, leaflike in its vestiture, always with a prominently hairy sheath; fertile bracts ovate, at maturity glabrous, reddish-brown except for a paler often greenish area of midrib (this usually exerted as a short cusp (backs of the midrib of lowermost scales often with some hairs)); anthers 2, 0.7-1 mm. long; style 2-branched, flattened, the edges fimbriate from near the base to the base of the branches; achene obovoid, slightly apiculate, including the pedicel 1.7-2 mm. long, lenticular, finely foveate (pitted) with the pits arranged in many vertical rows, sometimes slightly umbonate, at maturity a dark- to pale-brown except for the pale margin; pedicel joint persistent, to 0.5 mm. long. Moist to wet sands, silts or clays of disturbed habitats such as pond or river banks, roadside ditches, canals or agricultural grounds, Coastal Plain from N.C. s. to n. Fla. and w. into Tex.

5. *Fimbristylis decipiens* Kral. Cespitose decumbent annual to about 3 dm. tall, the scapes spreading or ascending; leaves about one half as long as the mature culms; blades linear, pale-green, averaging about 2 mm. wide, the upper and lower surfaces smoothish

or with erect long trichomes along the veins beneath, the backs with several prominent raised nerves; leaf margins thickened, pale-cartilaginous, with approximate to scattered long horizontal trichomes toward the blade base (these grading into a scabrid margin distally); sheaths closed, with a broad scarious tan margin that is spreading-pilose and also ciliate apically; ligule present as a line of short pale appressed hairs; scapes fairly rigid, multicostate, terete below, sometimes slightly flattened distally, the ridges sometimes with scattered horizontally spreading hairs; longest involucrel bract longer than the inflorescence, similar to leaves in width and indument of blade, the expanded sheath spreading-pilose; spikelets ellipsoidal to lance-ovoid, 5-6 mm. long, acute, stramineous to brownish, few to several in an open system of spreading usually 1- to 3-spikeletted cymules, the inflorescence usually about as broad as or broader than long; fertile bracts broadly oblong to ovate, the apex acute to acuminate or obtuse, the margin entire and scarious, paler, the surface smooth, tan or tinted with brown, the midveins inconspicuous and pale or the midnerve itself green; midvein usually excurrent as a short mucro; anthers 1 or 2, about 0.8 mm. long; style 2-branched, flattened, the edges usually fimbriate only from about the midpoint to the base of the style branches; achene broadly lenticular-obovoid, about 1 mm. long, pale-brown or greenish-brown, the 2 edges somewhat thickened and paler, the surface ridged-reticulate, the cells rectangular and horizontally oriented in 8 to 11 vertical lines to a side, with the longitudinal edges more prominent than the transverse; edges of the achene usually with a few isolated papillae toward the distal end. A weed of moist sandy roadbanks, fields and disturbed open usually piney woods, in the Coastal Plain from e. N.C. s. to n. Fla. and w. to e. Tex.

6. *Fimbristylis annua* (All.) R. & S. Cespitose, decumbent to ascending or erect annual, to 5 dm. tall (usually much lower); leaves from half as long to nearly the length of the mature culms; blades usually narrowly linear, glabrous to tomentose, 1-2 (-4) mm. wide, the backs with several prominent raised nerves, the often pale margin cartilaginous and usually ciliate-scabrid; sheaths broad, smooth or pubescent, with a wide subscarious margin that is smooth or pubescent, pale brown, toward its apex ciliate and truncate or acute; ligule present as a horizontal line of short hairs; scapes lax to rigid, ascending or erect, subterete basally, flattened or subterete above at juncture with inflorescence; longest involucrel bract similar to leaves in its width and indument, shorter or longer than the inflorescence, the sheathing base smooth or hirsute; spikelets lance-ovoid or oblong, 3-8 mm. long, acute, greenish to tan or brown to a dark-reddish-brown, in a few- to many-spikeletted simple or compound umbellate system of cymes (spikelets solitary in depauperate specimens); fertile bracts broadly oblong to ovate, the apex acute to obtuse, the margin entire, the surface smooth, the paler midrib seldom excurrent; anthers 1 or rarely 2, about 1 mm. long; style 2-branched, flattened, the edges fimbriate from the base to the branches or entire basally; achene lenticular, ovoid or obovoid and quite tumid, about 1 mm. long, apiculate, white to brownish, often iridescent, striate-reticulate, the rectangular cells shallowly concave and horizontally arranged in from 5 to 12 longitudinal rows per side, the longitudinal ribs more conspicuous than the horizontal; surface of achene often verrucose, the warts forming either along the longitudinal ribs or over entire cells. On a variety of moist sunny substrates such as savannahs, roadsides, grasslands and disturbed or cultivated areas, in temp. to trop. climates of both hemispheres.

7. *Fimbristylis VahlII* (Lam.) Link. Cespitose low annual, the culms to 1.5 dm. tall (usually much lower); leaves one third as long as the scape to equaling or exceeding it; blades linear-filiform, spreading-recurved, less than 1 mm. broad, somewhat involute, the backs with several prominent raised veins, often with small stiff ascending hairs, the margin somewhat thickened and similarly hairy; leaf sheath broad, stramineous or pale-brown, usually smooth or with a scattering of small hairs, the margin scarious, entire, passing gradually into the blade; ligule absent; scapes stiffly ascending, wiry, slightly broader than the leaves, glabrous, many-ribbed, subterete; spikelets lance-ovoid to linear-ellipsoidal or oblong, 5-10 mm. long, usually acute, pale-greenish-brown, 3 to 8 in a dense terminal cluster that are subtended by several leaflike involucrel bracts (these always exceeding the inflorescence and usually at least the length of the basal leaves); fertile bracts ovate-lanceolate or oblong-lanceolate, glabrous, stramineous or pale-green, the midrib conspicuous, dark-green and pointed beyond the scale as a short erect or slightly recurved mucro; stamen 1, the anther less than 0.5 mm. long; style 2-branched, much longer than the achene, subterete, the base swollen, the surface smooth or papillate

from about the midpoint to the point of branching; achene obovoid, tumid, 0.5-0.7 mm. long, pale, sometimes slightly iridescent, reticulate, the individual rectangular cells arranged horizontally in 5 to 7 vertical rows on a side. Fine sands, silts or clays, usually alluvial or shoreline situations, often on areas of disturbed bottomland, S.C. s. to n. Fla., w. to Tex.; scattered localities in inland states; in w. U.S., Calif. and Ariz.; Mex. and C.A.

8. *Fimbristylis castanea* (Michx.) Vahl. Densely caespitose perennial to 1.5 (-2) m. tall, the bases of the plants castaneous, deep-set in substratum, the outer leaves of a tuft and the older leaves persistent as imbricated scales; leaves from one third the length of the culms to nearly as long; blades usually very narrowly linear (rarely to 2 or 3 mm. broad), ascending, thick (often semicircular in cross section), most frequently involute, smooth (particularly toward the base), the nerves on the back numerous and indistinct but the marginal nerve or nerves ciliate-scabrid with ascending stout-based hairs; sheathing portion of the leaf broad (broadening gradually toward the base), pale-brown to dark-brown or very deep-lustrous-reddish-brown, thick and rigid, the broad margin thin or even scarious, entire except for the truncate or rounded ciliate apex; ligule of hairs either absent or incomplete but a color change evident on the upper surface of the leaf at the collar; scapes slender, wandlike, as wide as the blades or somewhat wider, many-ribbed, terete toward the base of the plant, subterete to oval or elliptical in cross section upwardly; longest bract of the involucre usually shorter than the inflorescence or about the length of the inflorescence (rarely longer), the blade somewhat flattened, ciliate-scabrid; spikelets usually ovoid or lance-ovoid, very rarely cylindrical, 5-10 mm. long, rarely longer, the mature ones usually pale- to dark-brown, dull, in a dense to open ascending or spreading umbellate compound system of cymes; fertile bracts broadly ovate, smooth, brown, usually dull, the margin entire or becoming erose with age, the apex rounded; veins of the mid-portion of the scale obscure or visible as faint pale lines that converge apically to form a short mucro; stamens 2 or 3, the anthers about 2 mm. long; style 2-branched, flattened, fimbriate from the base to the point of branching; achene lenticular-obovoid or obpyriform, 1.5-2 mm. long, reddish-brown or dark-brown, often lustrous, scalariform-foveate or reticulate, the individual cells almost isodiametric or horizontally rectangular and usually arranged in numerous fine vertical rows. Moist sands or muck of coastal marshes, dune swales or estuary banks (rarely alkaline situations inland), L.I. s. along the Atl. Coast into the Fla. Keys, along the Gulf Coast s. and w. into Tam. and the Yuc. Peninsula; Bah. I., Cuba.

9. *Fimbristylis puberula* (Michx.) Vahl. Perennial to 1 m. tall; culms solitary or in small tufts, the bases often hard, knotty and jointed together into short thick rhizomes on which the old leaf bases often persist as shreddy remnants; leaves from one third as long to nearly equaling the culms; blades narrowly linear, usually involute at least toward the base, about 1 mm. wide, the backs with several raised nerves, smooth to variously pubescent, the upper surface smooth or variously pubescent, the pale margin cartilaginous and ciliate-scabrid (this most noticeable toward the blade-base and -apex); sheaths hard, thick, fibrous, pale- to dark-brown, the broad margin scarious and entire except for long cilia at apex; ligule inconspicuous, incomplete or absent; longest bract of inflorescence erect, the blade flattened, usually much-surpassed by the inflorescence; spikelets lance-ovoid to ovoid or ellipsoidal, 5-10 mm. long, reddish-brown, in a usually few-flowered compact to open system of pedunculate cymules or a simple umbel-like cyme; fertile scales ovate to obovate or even reniform, reddish-brown to dull-brown or flavescent, the backs rounded, the scarious rounded margin entire and ciliate or somewhat lacerate, the inconspicuous nerves flavescent to pale-brown or sometimes the central ones slightly raised, greenish and slightly excurrent as a short mucro; outer surface of at least the lower scales puberulent at least toward the apex; stamens 3, the anthers 2-2.5 mm. long; style 2-branched, flattened, the edges usually fimbriate from about the mid-point to the base of the style branches; achene lenticular-obovoid, about 1 mm. long, rather flat to somewhat tumid, sometimes umbonate, flavescent to dark-brown, the surface distinctly to faintly reticulate, the rectangular cells usually arranged in several longitudinal lines (11 to 20 on a face) in a few cases with very many longitudinal lines with the cells isodiametric, the longitudinal lines prominently to slightly raised. Sands, sandy peats or clays of savannahs, open pinelands, upper edges of grass-sedge bogs, meadows and prairies, throughout the Atl. and Gulf Coastal Plain from L.I. s. into peninsular Fla. and w. to Tex. nearly to the Mex. border; scattered from the cen. Piedmont to its southwest.

edge; scattered in the interior highlands and of frequent occurrence in the moist meadows and prairies of the cen. lowlands, particularly along the Great Lakes on the Pleistocene shores and w. into the tall and mid-grass prairies of Tex., Okla., Kan. and Neb.; Can.

10. *Fimbristylis puberula* var. *interior* (Britt.) Kral. As the species but plant base less bulbous and producing dense clusters of short slender twisted pale-reddish-brown rhizomes; foliage pale-green, sometimes appearing glaucous; blade margins distantly to approximately ciliate-scabrid; ligule inconspicuous or present as a narrow line of short ascending hairs; longest involucral bract usually longer than the inflorescence; spikelets ovoid to cylindrical or ellipsoidal, 5-10 mm. long, stramineous to reddish-brown, the backs of the scales usually smooth, the central nerve of at least the lower scales excurrent as a definite terete mucro; achene with several prominent to rather obscure longitudinal ridges that are interconnected with finer horizontal lines, hence the surface composed of longitudinal rows of roughly isodiametric shallowly concave cells. Sandy sloughs in prairie provinces, particularly in w. Kan. and Neb. but extending s. into w. Tex. and southw. Ariz.

7. HEMICARPHA NEES & ARN.

A genus of a few species (perhaps as many as 6) of warm regions. *Hemicarpha* is closely related to *Cyperus* subgenus *Kyllinga* but the inflorescence and flowers are much-reduced. Some authors include *Hemicarpha* in *Scirpus* but this has very little merit.

1. *Hemicarpha micrantha* (Vahl) Britt. Essentially glabrous densely tufted annuals; culms 1-22 cm. long, 0.2-0.6 mm. thick, essentially leafless; leaves usually 2 per culm at its base; upper sheath purplish or brownish, its blade linear to setaceous; lower sheath much-reduced, its blade absent; lower bract often appearing as a continuation of the culm, 7-37 mm. long; 1 or 2 other much-reduced bracts present; inflorescence a glomerule of 2 (rarely 3) sessile heads or head solitary; heads broadly ovoid, 2-8 mm. long, of 60 to 140 uniflorous spikelets arranged in tight spirals; scale solitary per spikelet, abaxial, ovate to lanceolate, 0.8-2.3 mm. long, the midrib conspicuous often as a keel in the lower part and a mucro or awn apically, the sides membranous, convex; "perianth" (actually the wings of the reduced spikelet axis) of a single hyaline adaxial scale, often split and torn by or adhering to the achene, very inconspicuous; stamens 1 or 2; styles 2-branched; achene oblong, nearly terete or elliptic in transection, 0.5-0.8 mm. long, very minutely apiculate, superficially microscopically papillate. *Scirpus micranthus* Vahl. The species is widespread in warm temp. and trop. areas of Am. We have 3 varieties as follows.

Var. *micrantha*. "Perianth" scale much shorter than the achene, often bifid or reduced or absent. Infrequent or rare in moist soil, s. part of e. Tex., Rio Grande Plains and Trans-Pecos; widespread in trop. Am., Calif., Wash., Gulf States and n.e. U.S.

Var. *aristulata* Cov. "Perianth" scale equaling or surpassing the achene and often cupped around it distally and adaxially, with no definite vascular tissue (use magnification of 40 diameters); awn of floral scale two thirds as long as to a little longer than the body of the scale. Infrequent in moist soil, e., s.e., n.-cen. and Trans-Pecos Tex., Edwards Plateau and Rio Grande Plains; Neb. and Wyo. s. to Tex., N.M. and Ariz.

Var. *Drummondii* (Nees) Friedl. "Perianth" scale equaling or surpassing the achene and often cupped around it distally and adaxially, with 3 to 5 vascular strands; mucro of floral scale less than two thirds as long as the body of the scale. Frequent in e. and n.-cen. Tex.; from Mo. and Neb. s. and s.w. to Tex., N.M. and Ariz.; intergrading with the last variety.

8. CYPERUS L. FLATSEDGE

Herbs, usually with culms leafy near the base, often subscapose; inflorescence terminal, an umbel-like aggregation of primary peduncles (each subtended by a bract, usually) bearing spikes or heads of spikelets or the longer of the peduncles each bearing smaller umbel-like aggregations of secondary peduncles (with or without bractlets) each bearing spikes or head of spikelets or the whole inflorescence contracted into a dense flowering mass with the true form obliterated; spikelets usually borne in several rows on the spike or head axis, with a minute bract basally and either with several to many fertile scales

distichously arranged or else reduced to a single fertile scale plus one or more sterile scales above, when several scales present the spikelet usually discernibly laterally compressed (i.e., as if the 2 margins of the folded scale were pushed toward each other and the scale creased at the usually keel-like median portion, the breadth of the spikelet then measured from keel to keel of alternating scales and the thickness from side to side of the same folded scale), the spikelet axis either disarticulating at the top of each internode or only at its base or often completely persistent, each internode of the spikelet axis often with 2 thin "wings" on each side of the flower (the decurrent lower margins of the next superjacent scale); scales usually folded, either persistent or deciduous; perianth absent; stamens 1 to 3; styles 2- or 3-branched; achenes lenticular or trigonous, often stipitate and/or apiculate, jointed with the style usually at the very top of the achene, the achenial body there with or without a minute apiculus but the latter (if present) of the same color and texture as the main part of the achene.

With upwards of 900 species in warm regions, *Cyperus*, a vast, difficult genus, is often made more confusing by a very unsatisfactory and arbitrary segregation of smaller "genera," such as *Mariscus* Vahl, *Pycreus* Beauv., *Kyllinga* Rottb.

1. Achene lenticular, biconvex or concavo-convex (2)
1. Achene trigonous or vaguely so, occasionally appearing nearly terete but definitely not biconvex or concavo-convex (10)
- 2(1). Achene dorsiventrally compressed, i.e., with one of the sides appressed to the spikelet axis, the other appressed to the inner surface of the scale (the latter not keeled)38. *C. laevigatus*.
2. Achene laterally compressed, i.e., with one angle next to the spikelet axis and the 2 slightly convex sides parallel with the 2 sides of the scale, the scale being folded and creased at the keel-like median (3)
- 3(2). Each spikelet with only 2 scales and only one achene (4)
3. Each spikelet with 6 to 60 scales, usually several of them fertile (6)
- 4(3). Stamen solitary; plants rhizomatous, the culms rising at intervals of 3-10 mm. ...
.....46. *C. brevifolius*.
4. Stamens paired; culms densely tufted or plants mat-forming (5)
- 5(4). Densely tufted with a culm density of 4 to 20 per square cm. in the tufts; culms about 0.7 mm. thick basally; inflorescence 3-8 mm. long; bracts with translucent corners at the very base; spikelets 2-2.5 mm. long, 0.7-0.8 mm. broad, sordid-whitish or very pale-brownish; lower (fertile) scale 1.7-2.4 mm. long; achene elliptic, 0.9-1.1 mm. long (not including the apiculus), 0.5-0.6 mm. broad, ripening to a very dark-brown45. *C. tenuifolius*.
5. Culm density in the mat 1 to 4 per square cm.; culms 0.8-1.8 mm. thick basally; inflorescence 7-14 mm. long; bracts without translucent corners; spikelets 2.3-3 mm. long, 1.2-1.3 mm. broad, buffy-white to white; lower (fertile) scale 2.2-2.9 mm. long; achene obovate, 1-1.4 mm. long (not including the apiculus), 0.75-0.9 mm. broad, ripening black44. *C. sesquiflorus*.
- 6(3). Spikelets borne in lax spikes 12-40 mm. long, 12-23 mm. thick; scales with broad white-hyaline margins markedly contrasting with the brownish sides; achenes 1.2-1.5 mm. long39. *C. albomarginatus*.
6. Spikelets borne in heads or glomerules; scales with thin but not hyaline nor white margins; achenes mostly less than 1.2 mm. long (7)
- 7(6). The lower part of the edges of the internodal niches of the spikelet axis with minute persistent wings which become narrowed and join abaxially forming a minute cup at the base of the achene40. *C. polystachyos*.
7. The edges of the internodal niches essentially wingless (8)
- 8(7). Achenial surface with rectangular-linear cells oriented vertically in horizontal rows, these rows marked off by horizontal wavy usually discolored sutures
.....43. *C. flavescens*.
8. Achenial surface with vertical rows of minute essentially isodiametric usually somewhat hexagonal cells (9)

- 9(8). Spikelets 7-12 mm. long; each scale in the center of each side having a splotch of a brownish or fuscous color darker than the marginal zone; scales about 2 mm. long41. *C. niger*.
9. Spikelets 3-7 mm. long; each scale nearly uniformly stramineous or olive-stramineous, 1.5-1.8 mm. long42. *C. lanceolatus*.
- 10(1). The spikelet axis at maturity disarticulating at the base of each internode (just above each node), thus breaking into units consisting of a scale, the next lowest internode and the attached wings and clasped achene; internodes postantheically on the sterile side becoming thickened and assuming a white cartilaginous texture (11)
10. The spikelet axis either persistent as a unit or else deciduous as a unit, not disarticulating spontaneously at maturity (12)
- 11(10). Inflorescence ample, relatively lax, to 45 cm. long35. *C. odoratus*.
11. Inflorescence congested into a single large headlike mass36. *C. macrocephalus*.
- 12(10). Culms stiffly erect with complete septa at intervals of 5-50 mm. 4. *C. articulatus*.
12. Culms nonseptate (13)
- 13(12). Each of the 5 to 8 extremely unequal primary peduncles with an irregular panicle of several spikes each with a number of ascending spikelets; the total inflorescence with 100 to 600 spikelets; scales when spread out nearly orbicular, about 1.5 mm. long; spikelet axes wingless 8. *C. Iria*.
13. Each primary peduncle either reduced or bearing a head or spike or a glomerule or bearing several short secondary peduncles but never an irregular panicle; scales usually considerably longer than broad or if nearly as long as broad then longer than 1.5 mm. (14)
- 14(13). Stamen 1; spikelet axis wingless or essentially so (15)
14. Stamens 3; spikelet axis winged or wingless (22)
- 15(14). Achenes nearly as thick as long, with concave sides; matted perennials of Chisos Mountains22. *C. seslerioides*.
15. Achenes (1.5 to) 2 to 3 times as long as broad; sides of achenes not concave (16)
- 16(15). Tufted annual with culms 1-20 cm. long and a peculiar persistent odor; scales with 7 or 9 strong evenly distributed nerves and a wholly keel-like median portion, the tip usually strongly acuminate and excurved37. *C. aristatus*.
16. Tufted or rhizomatous perennials (some flowering the first year) with culms 10-110 cm. long, odorless (except in some specimens of *C. acuminatus*); scales with 3 or 5 nerves and these usually obscure and concentrated in the median portion which has a flat portion or groove at the base dorsally, the tip either incurved or straight (slightly excurved in *C. acuminatus*) (17)
- 17(16). Achenes only 0.7-0.8 mm. long; culms with scattered microscopic retrorse projections like shark's teeth17. *C. surinamensis*.
17. Achenes 0.9-1.5 mm. long; culms either smooth or with antrorse or horizontal projections (18)
- 18(17). Culms 5-12 mm. thick basally, apically 3-8 mm. thick and with microscopic antrorse projections like shark's teeth; scales 2-2.4 mm. long, when spread out 1.2-1.5 mm. broad at the broadest point (just below the middle)13. *C. virens*.
18. Culms 0.7-5 mm. thick basally, apically 0.4-2.7 mm. thick, either smooth or with microscopic knobs (very rarely with antrorse projections in *C. pseudovegetus*); scales 1.3-1.9 mm. long (19)

- 19(18). Scales with the dorsal basal flat portion or groove continuing a third to half the total length of the scale and 0.3-0.5 mm. broad; scales when spread out 1.5-1.9 mm. broad near the base and tapering all the way to the apex; achene 1.3-1.5 mm. long, 0.5-0.6 mm. thick, maturing to a nearly black color 12. *C. ochraceus*.
19. Scales with the dorsal basal flat portion or groove continuing only a fifth to a third the total length and only 0.1-0.2 (-0.3) mm. broad; scales when spread out 0.6-1.2 mm. broad at the broadest (near the middle or shortly below); achene 0.9-1.3 mm. long, 0.2-0.45 mm. thick, maturing to a brownish color (20)
- 20(19). Scales essentially linear for most of the length, only 0.6-0.7 mm. broad and (as folded in place) the whole scale incurved-falcate; achene linear, 0.2-0.3 mm. thick 14. *C. pseudovegetus*.
20. Scales ovate, 0.8-1.1 mm. broad at the broadest point, as folded in place the lower part of the keel, incurved but the upper part either straight or slightly excurved; achene elliptic to oblong, 0.3-0.45 mm. thick (21)
- 21(20). Spikelets with 8 to 12 scales, these in 3- to 30-lobed compound glomerules each with 25 to 100 spikelets; scales reddish with greenish keels; plants basally often with short scaly creeping rhizomes 1-1.5 mm. thick, the culms basally 1-2.5 mm. thick 15. *C. reflexus*.
21. Spikelets with 12 to 44 scales, these in nearly hemispherical to spherical heads each with 13 to 44 spikelets; scales brownish-stramineous to rarely tawny stramineous; plants tufted, the culms basally 0.7-1.2 mm. thick .. 16. *C. acuminatus*.
- 22(14). Most leaves reduced to mere bladeless sheaths or occasionally the uppermost sheaths with short blades very rarely to 10 cm. long (23)
22. Even the lower leaves with well-developed blades (26)
- 23(22). Inflorescence (not including bracts) 1-2 cm. long .20. *C. phaeolepis*.
23. Inflorescence (not including bracts) 3-35 cm. long (24)
- 24(23). Bracts usually 2, 1 of them 0.3 to 1 (to 2) times as long as the inflorescence 21. *C. Haspan*.
24. Bracts 10 to 25, often much-surpassing the inflorescence (25)
- 25(24). Internodes of spikelet axes with deciduous wings about 1 mm. long and 0.2-0.3 mm. broad 1. *C. giganteus*.
25. Spikelet axes wingless 19. *C. alternifolius*.
- 26(22). Achene 0.4-0.7 mm. long, 0.4-0.5 mm. thick, subglobose, white; bracts usually only 2 in number 21. *C. Haspan*.
26. Achene 0.7-3 mm. long, usually considerably longer than thick; bracts 3 to 13 (27)
- 27(26). Scales 1.3-2 mm. long; achenes 0.8-1 mm. long, 0.3-0.6 mm. thick, unequally trigonous; spikelet axis with readily deciduous wings 0.2-0.3 mm. broad; spikelets only 1 mm. broad, much-compressed, borne 15 to 70 together in spikes (28)
27. Scales (at least the fertile ones) 2.3-5.5 mm. long; spikelet axis either wingless or with more or less persistent wings; spikelets variously borne but if only 1 mm. broad then not much-compressed (29)
- 28(27). Internodes of spikes 0.0-0.5 mm. long; scales 1.3-1.5 mm. long 2. *C. erythrorhizos*.
28. Internodes of spikes 0.6-2 mm. long; scales 1.5-2 mm. long 3. *C. digitatus*.
- 29(27). Achene 0.25-0.3 mm. thick 18. *C. onerosus*.
29. Achene 0.4-1.2 mm. thick (30)
- 30(29). Achene 1-1.3 mm. long, nearly as thick (0.9-1 mm.) as long; spikelets much-compressed, 2-3 mm. broad, grayish-white with a pale whitish broad stripe running down each side (this formed from the pale margins of the scales) 9. *C. compressus*.
30. Achene 1.3-3 mm. long, much longer than thick (31)
- 31(30). Spikelet axis internodes essentially wingless, occasionally with wings up to 0.2 mm. broad (32)
31. Spikelet axis internodes with wings 0.3-1.2 mm. broad (37)

- 32(31). Viscid tufted perennials with culms 3-7 mm. thick, the longer peduncles in most inflorescences with secondary peduncles each bearing a head similar to those of the shorter primary peduncles; leaves spongy at base, when dried their incomplete septa visible, the leaf apexes involute (33)
32. Nonviscid perennials, tufted and usually with extensive knotty subrhizomatous bases; secondary peduncles absent; leaves neither spongy nor septate basally (34)
- 33(32). Spikelets grayish-ochraceous turning grayish-brown; achene thickest (0.7-0.8 mm.) near the apex, long-tapered to the base, 1.4-1.8 mm. long, only slightly apiculate 10. *C. elegans*.
33. Spikelets grayish-yellow becoming rich-golden-brown; achene nearly cylindrical or very slightly thickened in the upper part, long-tapered below, the main part 1.5 mm. long and 0.5 mm. thick but also with the persistent style base (or very large apiculus) adding almost 1 mm. to the length 11. *C. oxylepis*.
- 34(32). Inflorescence a single dense sessile head 1-3 cm. thick with 15 to 55 spikelets ..
..... 31. *C. filiculmis*.
34. Inflorescence a short or long relatively lax spike with 3 to 30 spikelets (35)
- 35(34). Spikes 20-50 mm. long, 20-30 mm. thick, with 9 to 30 divaricately spreading spikelets; scales 1.5-2 mm. broad when unfolded, deciduous from the spikelet axis, usually chestnut-brown or less commonly a tawny grayish-brown
..... 34. *C. spectabilis*.
35. Spikes 10-25 (-30) mm. long, 6-14 mm. thick, with 3 to 18 spikelets; scales 2-3 mm. broad when unfolded, usually relatively persistent, brown to brownish-gray to dark-olive-brown (36)
- 36(35). Inflorescence with 4 to 8 erect or ascending unequal primary peduncles 2-80 mm. long, each bearing a spike 9-14 mm. thick of erect or ascending spikelets 3-4 mm. broad; scales 3-3.8 mm. long; achenes 2-2.8 mm. long
..... 32. *C. Schweinitzii*.
36. Inflorescence with (1 to) 3 to 5 (or 6) spikes, either all of them sessile or a very few of them elevated on peduncles; spikes 6-11 mm. thick, of spreading spikelets 2-3 mm. broad; scales 2.3-3.3 mm. long; achenes 1.6-2.1 mm. long
..... 33. *C. Fendlerianus*.
- 37(31). Rhizomatous perennials; spikelets with 6 to 40 eventually deciduous scales; spikelet axes persistent on the axis of the cluster or spike (38)
37. Tufted perennials (occasionally with knotty subrhizomatous bases in *C. huarmensis*); spikelets with 2 to 8 scales (up to 20 in *C. strigosus*) and these persistent (deciduous in some specimens of *C. strigosus*); spikelet axis deciduous (more or less so in *C. strigosus*) (40)
- 38(37). Bracts 3 or 4, about equaling the inflorescence; inflorescence with 20 to 65 spikelets altogether, usually even the longer primary peduncles bearing a simple cluster or spike of spikelets just as do the shorter peduncles; each cluster or spike with 3 to 9 spikelets; wings of spikelet axis 2-3 mm. long; achenes 0.9-1 mm. thick 5. *C. rotundus*.
38. Bracts 5 to 13, usually much-surpassing the inflorescence; inflorescence with 70 to 350 spikelets altogether; the longer primary peduncles usually with several nearly sessile clusters or spikes of spikelets; each cluster or spike with 10 to 50 spikelets; wings of spikelet axis 1-1.5 mm. long; achenes 0.4-0.8 mm. thick (39)
- 39(38). Culms (60-) 75-110 cm. tall; bracts 9 to 13; primary peduncles 9 to 13; spikelets reddish-brown; achenes 0.4-0.5 mm. thick . 6. *C. setigerus*.
39. Culms 15-50 (-65) cm. tall; bracts 5 to 10; primary peduncles 5 to 10; spikelets brown, buffy-brown or golden-brown; achenes 0.6-0.8 mm. thick
..... 7. *C. esculentus*.
- 40(37). Achenes mostly 0.3 to 0.5 times as long as the scales; spikelets 10-29 mm. long, 1-2 mm. broad, usually less than half as thick as broad (41)
40. Achenes mostly 0.6 to 0.8 times as long as the scales; spikelets 3.5-11 mm. long, 0.5-1 (-1.3) mm. broad, usually more than half as thick as broad (42)

- 41(40). Blades 2-8 mm. broad; most inflorescences with the longer peduncles bearing a few short secondary ones; spikes 13-35 mm. long, 20-45 mm. thick, thus usually thicker than long, with 20 to 70 spikelets 1-2 mm. broad, golden- or tawny-brown, with 5 to 20 scales23. *C. strigosus*.
41. Blades 1.5-5 mm. broad; secondary peduncle formation rare; spikes 20-40 mm. long, 15-27 mm. thick, thus usually longer than thick, with 14 to 45 spikelets 0.7-1.3 mm. broad, grayish-brown, with 3 to 6 scales24. *C. tenuis*.
- 42(40). Head obovoid, 8-15 mm. long, 9-17 mm. thick, with 60 to 80 spikelets in each head, the higher spikelets very short, the middle ones spreading and very crowded, the lower ones less closely crowded on the axis but retrorsely appressed to the stiff peduncle; scales of middle spikelets 5-5.5 mm. long; wings about 3 mm. long, clasping the linear achene which is about 3 mm. long28. *C. retrofractus*.
42. Heads or spikes various but not as described above; scales 2.5-4.5 mm. long; wings 0.8-2.2 mm. long; achenes 1.3-2.5 mm. long (43)
- 43(42). Each wing of the spikelet axis thickened in a narrow longitudinal stripe near where it clasps one of the adaxial angles of the achene, the thickened part chartaceous and usually slightly discolored brownish in contrast to the white-hyaline remainder27. *C. uniflorus*.
43. Wings not thickened and often not noticeably clasped around the achene (44)
- 44(43). Perennial from black knotty subrhizomatous bases; inflorescence only 2-3 (-4) cm. long, of 3 to 6 essentially sessile spikes 10-25 mm. long and 7-10 mm. thick, with 40 to 80 three-scaled spikelets; only the lowest scale of each spikelet fertile and it enclosing the achene (1.5-2.1 mm. long, 0.8-1 mm. thick)26. *C. huarmensis*.
44. Tufted perennials; inflorescence (1-) 2-15 cm. long, of 1 to 14 usually peduncled heads or spikes 7-30 mm. long and 7-20 mm. thick, with 8 to 240 2- to 8-scaled spikelets in which only the terminal scale is sterile, the rest all fertile; achenes 0.5-0.8 mm. thick (45)
- 45(44). Spikes lax, 10-30 mm. long, with 8 to 30 spikelets25. *C. hermaphroditus*.
45. Heads or spikes dense (the spikelets touching), 7-15 mm. long, with 25 to 240 spikelets (46)
- 46(45). Achenes 1.8-2.2 mm. long; wings 1-2 mm. long; scales 1.2-2 mm. broad; spikelets 50 to 240 per head or spike, 0.5-1 mm. broad, with 2 to 4 scales, straw-brown to dark-brown (to tawny ochraceous)29. *C. ovularis*.
46. Achenes 1.3-1.7 mm. long; wings 0.8-1.4 mm. long; scales 1-1.3 mm. broad; spikelets 25 to 70 per head, with 3 to 8 scales, greenish-brown to ochraceous-brown or olive30. *C. globulosus*.

1. *Cyperus giganteus* Vahl. Perennial, densely tufted; culms 4-15 dm. long; leaves reduced to mere long brown sheaths at the base of the culm; inflorescence an umbel-like aggregation of 10 to 25 primary peduncles (the longest only about twice as long as the shortest), each bearing an umbellule of 4 to 8 peduncled lax spikes with elongate axes and 10 to 20 (reportedly up to 50) spreading spikelets; spikelets about 1 mm. broad or narrower, laterally much-compressed, 4-10 mm. long, with 8 to 18 flowers; bracts of umbel about as many as the primary peduncles and surpassing the umbel; bracts of umbellules as many as the spikes and mostly exceeding them; spikelet axis persistent as a unit after the achenes and scales fall; lower margins of scales decurrent on the spikelet axis as hyaline readily deciduous wings 0.2-0.3 mm. broad and more than 1 mm. long; stamens 3; anthers with 2 cells, the connective between the cells prolonged 0.2-0.5 mm. beyond the end of the anthers; achene unequally trigonous, the 2 adaxial angles much smaller (sharper) than the abaxial one. Rare in extreme s.e. Tex. (Orange Co.) in marshes, probably not a persistent member of our flora; Parag., Urug. and Col. n. to Hond. and Gr. Ant.

2. *Cyperus erythrorhizos* Muhl. Tufted annual or becoming a definite perennial in s. Tex.; culms 5-14 dm. long; inflorescence an umbel-like aggregation of 4 to 10 long

markedly unequal peduncles each bearing an irregular cluster of several nearly sessile spikes with elongate axes (with internodes 0-0.5 mm. long) and 15 to 70 spreading spikelets; spikelets about 1 mm. broad or narrower, laterally much-compressed, very thin, 3-10 (-15) mm. long with 6 to 34 or more flowers; bracts of umbel about as many as primary peduncles and some about as long as the inflorescence; bracts of the spike clusters considerably reduced, inconspicuous; spikelet axes persistent as a unit after the achenes and scales have fallen; scales keeled, the lower margins decurrent on the spikelet axis as readily deciduous hyaline wings about 0.8 mm. long and 0.2-0.3 mm. broad; stamens 3; connective of anthers not surpassing the anther cells themselves or else projected as a red point only 0.05-0.1 mm. long; achene unequally trigonous. Abundant in marshy places, s.e. Tex., infrequent in Rio Grande Plains, n.-cen. and e. Tex., probably elsewhere, July-Dec.; Ont. and e. U.S. w. to N.D., S.D., Neb., Kan., Okla. and N.M.; also Wash., Ore., Calif., Ariz. and Ut.; presumably also Tam.

Probably not sufficiently distinct from *C. digitatus*.

3. *Cyperus digitatus* Roxb. Tufted perennial; culms 5-15 dm. long; inflorescence an umbel-like aggregation of 5 to 13 long markedly unequal peduncles each bearing an irregular cluster of several nearly sessile spikes with elongate axes (internodes of spike axis 0.6-2 mm. long) and 15 to 35 spreading spikelets; spikelets about 1 mm. broad, laterally compressed, 7-15 mm. long, with 8 to 35 flowers; bracts of umbel about as many as peduncles and some as long as or longer than the inflorescence; bracts of spike clusters considerably reduced, inconspicuous; spikelet axes persistent as units after the achenes and scales have fallen; scales keeled, the lower sides decurrent down the spikelet axis as readily deciduous hyaline wings 0.2-0.3 mm. broad and about 0.8 mm. long; stamens 3; connective of anther not surpassing the anther cells themselves or else merely a red point 0.05-0.1 mm. long; achene unequally trigonous. Local in marshy places near Brownsville, Laredo and Corpus Christi in Rio Grande Plains, July-Dec.; Braz., Col., Mex., W.I. and Tex.

4. *Cyperus articulatus* L. CHINTUL. Perennial forming colonies with creeping scaly rhizomes 1.5-6 mm. thick; culms rising at intervals 7-50 mm. apart on the rhizomes, erect, 5-14 dm. long, 2-8 mm. thick, nearly terete or only vaguely triangular, septate at intervals of 5-50 mm.; leaves only few, toward the base, reduced to small essentially bladeless sheaths; bracts few, 3-11 mm. long; inflorescence comprising 4 to 12 glomerules of spikelets, some glomerules nearly sessile and some on slender nodding peduncles to 12 cm. long; glomerules with up to 20 spikelets, essentially bractless; spikelets 6-25 mm. long, about 2 mm. broad, laterally compressed, the axis remaining intact after the scales and achenes fall; scales keeled, the lower sides decurrent on the spikelet axis as readily deciduous wings 0.2-0.4 mm. wide and about 1 mm. long; stamens 3; connective very minutely prolonged beyond the end of the anther; achene unequally trigonous. Abundant in moist clay meadows, s.e. Tex. and Rio Grande Plains, rare n. to s. part of n.-cen. Tex. (Comal, Travis and McLennan cos.), May-Oct.; Braz. and Col. n. to Gulf States.

5. *Cyperus rotundus* L. NUT-CRASS, TULLILLO. Perennial forming colonies with creeping rhizomes about 1 mm. thick, at intervals with tuberlike thickenings to 1 cm. thick; culms 8-30 (-75) cm. long, just beneath the inflorescence 0.8-1.8 mm. thick; leaves crowded in the basal few cm., much shorter than the culm and usually spreading; inflorescence 3-11 cm. long, of 3 to 8 extremely unequal peduncles each bearing a (rarely compound) cluster or short spike of divaricate spikelets, each cluster or spike with 3 to 9 spikelets, the total inflorescence with 20 to 65 spikelets; bracts usually about 3 or 4 and about as long as the inflorescence; spikelets 4-30 mm. long, 1-2 mm. broad, laterally much-compressed, with 12 to 36 flowers; scales keeled, straight, dark-reddish, dark-purplish or dark-purplish-brown, 3-3.5 mm. long, with about 7 paler nerves crowded near the median so that each of the halves is nerveless in the marginal half to five eighths the width, the sides decurrent basally as hyaline persistent wings on the spikelet axis which remains intact even after the scales and achenes have fallen; stamens 3; the prominent long-exserted anthers with the connective slightly prolonged into a minute reddish knob; achenes trigonous. Abundant in loamy soils, s.e., n.-cen. Tex. and Rio Grande Plains, rare in Plains Country and Trans-Pecos, a pernicious lawn-weed, adv. with us, July-Dec., less commonly Jan.-Apr.; widespread in the warmer parts of the world, nat. to Euras.

6. *Cyperus setigerus* T. & H. Perennial forming small colonies with creeping rhizomes (1-) 1.5-5 mm. thick or slightly thicker at the culm bases; culms (60-) 75-110 cm. long, just beneath the inflorescence (1.5-) 2.3-3.3 mm. thick; leaves few, attached in

the basal third of the culm, shorter than the culm, ascending; inflorescence (not including bracts) (7-) 10-16 (-20) cm. long, of 9 to 13 extremely unequal peduncles each bearing a compound cluster or short spike of divaricate spikelets, each cluster or spike with 10 to 30 spikelets, the total inflorescence with 120 to 350 spikelets; bracts about as many as the primary peduncles, the longer ones far-surpassing the inflorescence; spikelets 6-40 mm. long, 1.5-2 mm. broad, laterally much-compressed, with 6 to 40 flowers; scales keeled, reddish-brown, straight, 3-4 mm. long, with 5 to 7 nerves either crowded medially or somewhat spread out so that each of the halves is nerveless in the marginal fifth to three eighths the width, the sides decurrent basally as hyaline persistent wings on the spikelet axis which remains intact even after the scales and achenes have fallen; stamens 3; anther connective sometimes minutely prolonged; achenes trigonous. Scattered and local in moist clay meadows and ditches, n.-cen. Tex., Rio Grande Plains, Edwards Plateau (Mason Co.) and Plains Country, summer; Kan., Mo., Okla. and Tex.

7. *Cyperus esculentus* L. **YELLOW NUT-GRASS**. Perennial forming colonies with creeping rhizomes 1-1.5 (-2) mm. thick (some forms have tuberlike thickenings on the rhizomes; these forms rarely flower); culms 15-50 (-65) cm. long, just below the inflorescence 1.5-3 (-3.8) mm. thick; leaves several, attached in the basal half of the culm, the upper ones ascending, almost equaling or surpassing the inflorescence; inflorescence (not including bracts) 4-14 (-24) cm. long, of 5 to 10 extremely unequal peduncles each bearing a short spike (or the longer peduncles a cluster of short spikes) of divaricate spikelets, each spike or cluster with 12 to 50 spikelets, the total inflorescence with 70 to 350 spikelets; bracts about as many as the primary peduncles, the longer ones far-surpassing the inflorescence; spikelets 6-30 mm. long, 1-2 mm. broad, somewhat laterally compressed, with 8 to 40 flowers; scales keeled, straight, brown, buffy-brown or golden-brown, 2.6-4 mm. long, hyaline, with 7 to 9 nerves which are about equidistant and so spaced out that only about the marginal third of each side of the scale is nerveless, the sides decurrent basally as hyaline persistent wings on the spikelet axis which remains intact even after the scales and achenes have fallen; stamens 3; anther connective prolonged into a red dot 0.05-0.1 mm. long; achenes trigonous. Locally abundant and weedy in occasionally moistened sandy usually disturbed or unstable or loamy soil, scattered all over Tex. but rare in Edwards Plateau and higher parts of the Plains Country, summer-fall (through Dec. in extreme s.); scattered in the warmer parts of the world, in Am. n. to Que., Ont., Minn., Ore. and Alas.; probably adv. in Tex.

8. *Cyperus Iria* L. Tufted annual; culms 8-60 cm. long, erect; leaves crowded near the base, shorter than the culm; inflorescence 4-12 cm. long (not including the bracts), an umbel-like aggregation of 5 to 8 extremely unequal peduncles each bearing an irregular panicle of several spikes each with a number of ascending spikelets, the total inflorescence with 100 to 600 spikelets; bracts about 4, much longer than the inflorescence; spikelets 3-10 mm. long, 1.3-1.8 mm. broad, with 2 to 22 flowers, the axis persisting and remaining intact even after the achenes and scales fall; scales nearly orbicular or as seen laterally and folded appearing obovate, about 1.5 mm. long, rounded to emarginate, mucronulate, with about 4 nerves in the incurved weakly keel-like median, brownish or golden-brown, the hyaline margins tending to fold in and meet on the adaxial side of the achene, decurrent below as thin striations but not as wings; stamens 2 or 3; achene trigonous, 1.2-1.3 mm. long. Wet clay in coastal rice-growing areas, s.e. Tex. (Colorado, Harris, Jackson and Matagorda cos.), locally common, July-Sept.; s.e. Asia (n. to Korea and Mongolia), N. Austral., Malaysia, India, Afr., Madag., Iran, Afghan., adv. in scattered parts of Am., especially in the Gulf and s. Atl. States; W.I.

9. *Cyperus compressus* L. Tufted annual (or occasionally appearing as a short-lived perennial); leaves few, clustered near the base, little shorter than the culms; inflorescence (not including bracts) 1-7 cm. long, either of a single nearly sessile head or an umbel-like aggregation of 2 to 6 very unequal peduncles each bearing a head of more or less spreading spikelets, the total inflorescence with 5 to 38 spikelets; bracts 3 to 5, the longer ones far-surpassing the inflorescence; spikelets 10-24 mm. long, 2-3 mm. broad, laterally compressed, with 12 to 24 flowers, the axis persistent and remaining intact even after the achenes and scales have fallen; scales 3-3.5 mm. long, acuminate, the keel-like median somewhat excurved in the distal half and with 9 to 13 nerves, grayish-white with very pale broad hyaline margins (so the entire spikelet appears to have a white mid-stripe), decurrent below as definite wings but these persistent until the scale

next below falls; stamens 3; achene trigonous, 1-1.3 mm. long, almost as thick as long. In moist sand, infrequent in s.e. Tex., rare in e. Tex., July-Sept.; Afr., Madag., s.e. Asia, Malaysia, N. Austral., Micronesia; in Am. from Ecu., Bol. and Braz. n. to N.Y., Pa., O., Ark. and Tex.

10. *Cyperus elegans* L. Tufted perennial; culms 3-7 dm. long, erect; leaves viscid, crowded near the base, basally stramineous and somewhat spongy when fresh and upon drying the incomplete septa becoming conspicuous, the upper part involute; inflorescence (excluding bracts) 5-15 (-22) cm. long, of 3 to 10 extremely unequal primary peduncles, the shorter ones each bearing a head of spikelets, the longer ones often with several short secondary peduncles each bearing a head; each head with 5 to 13 spikelets; bracts 3 to 5, the longer ones much-exceeding the inflorescence; spikelets 3-15 mm. long, 2.5-4 mm. broad, with 6 to 20 flowers, viscid, grayish-ochraceous turning grayish-brown at maturity, the axis persistent and remaining intact even after the scales and achenes have fallen, wingless; scales firm, 3-4.2 mm. long, with 3 strong nerves close together on the weakly keel-like median and farther apart on each side 2 or 3 less conspicuous ones (7 to 9 altogether), the very sharp tip slightly excurved, the lower sides not decurrent (the scale measured as folded in the spikelet is 1-1.2 mm. broad); stamens 3; achene 1.4-1.8 mm. long, black at maturity, trigonous, widest near the apex and long-tapered to the base. In moist calcareous soil, frequent in s.e. Tex. and Rio Grande Plains, infrequent to rare in Edwards Plateau and Trans-Pecos, Aug.-Nov., rarely in spring or early summer; W.I., Trin., C.A., Mex., Fla., La. and Tex.; a var. *major* Kükenth. in Peru.

11. *Cyperus oxylepis* Steud. Tufted perennial; culms 3-7 dm. long, erect; leaves viscid, crowded near the base, basally stramineous spotted with red, somewhat spongy when fresh and upon drying the incomplete septa becoming conspicuous, the upper part involute; inflorescence (excluding bracts) 5-15 cm. long, of 3 to 10 extremely unequal primary peduncles, the shorter ones each bearing a head of spikelets, the longer ones often with several short secondary peduncles each bearing a head, each head with 6 to 18 spikelets; bracts 3 to 5, the longer ones much-exceeding the inflorescence; spikelets 8-22 mm. long, 2.5-3.5 mm. broad, with 10 to 24 flowers, viscid, grayish-yellow becoming at maturity a rich golden-brown, the axis persistent and remaining intact even after the scales and achenes fall, wingless; scales firm-membranous, 3.3-3.7 mm. long, with 3 strong nerves together on the weakly keel-like median and farther apart on each side 2 less conspicuous ones (7 altogether), the sharp point very slightly excurved, the lower sides not decurrent on the axis (the half-scale measured as it is folded in the spikelet is 0.8 mm. broad); stamens 3; achene 1.4-2 mm. long, dark-brown at maturity, trigonous, nearly cylindrical or very slightly thickened in the upper part and long-tapered below, capped by the beaklike persistent style base about 1 mm. long. Infrequent in coastal s.e. Tex. (Harris, Nueces, Refugio and San Patricio cos.), in clay ditches and ponds, May-Aug.; Arg., Parag., Ecu., Col., Br. Gui., Jam., Virg. I., Oax., Sin., Son., Tex. and La.

12. *Cyperus ochraceus* Vahl. Perennial, tufted; culms 11-80 cm. long, basally 2-5 mm. thick, apically bluntly trigonous, 1-2.7 mm. thick, erect, smooth; leaves several, basally aggregated, the longer ones about as long as the culm, not septate-nodulose; inflorescence (excluding bracts) 25-185 mm. long, of 6 to 12 very unequal primary peduncles, the shorter of which bear nearly spherical lax heads of 4 to 15 spikelets, the longer ones bearing some short unequal secondary peduncles each with a head of 4 to 24 spikelets; bracts 5 to 8, the longer ones far-surpassing the inflorescence; spikelets 5-20 mm. long, 2-2.5 (-3) mm. broad, linear, acute, with 10 to 30 (to 40) flowers, olive-stramineous (young) to olive-yellow or yellowish-brown (mature), laterally compressed, the axis flat, wingless and persistent as a unit after the scales and achenes have fallen; scales laterally membranous and with visible cells, medially chartaceous (eventually subcartilaginous), 1.5-2 mm. long, in the proximal half to two thirds definitely bicarinate with a flat area or shallow groove (0.3-0.5 mm. broad) dorsally (abaxially), the 2 lateral parts 0.6-0.7 mm. broad (therefore the scale when spread out 1.5-1.9 mm. broad at the very base, tapering all the way to the blunt apex), with 5 nerves (the midvein in the channel between the keels inconspicuous) including a nerve at each keel and one on each lateral face about a third the distance from the keel to the margin, the whole scale as folded in position in the spikelet incurved slightly in the distal half; stamen solitary; achene ovoid, 1.3-1.5 mm. long, 0.5-0.6 mm. thick, nearly terete or obscurely triangular, slightly stipitate, apically acuminate and passing imperceptibly into the

style, black when mature but appearing dark-iridescent-gray because of outer 1-cell-thick covering of translucent cells; stigmas 3. Abundant in shallow water and mud, Rio Grande Plains (n. to Bexar Co.) and s.e. Tex., throughout year, most profuse Sept.-Nov.; C.A., W.I., Mex., n. to Cuba and La.

A robust flatsedge related to *C. ochraceus* was collected near Blewett, Uvalde Co., among boulders at edge of water along stream below dam in Oct.; its very ample inflorescence has numerous drooping spikelets up to 38 mm. long, each with 60 to 88 flowers. It probably represents an undescribed variety.

13. *Cyperus virens* Michx. Tufted perennial; culms 5-11 dm. long, erect, basally leafy and 5-12 mm. thick, just beneath the inflorescence 3-8 mm. thick, sharply triquetrous and often with microscopic rigid antrorse projections like shark's teeth especially on the angles; leaves several, the longer ones almost as long as the culm, basally usually with numerous short incomplete transverse septa visible after pressing and drying; inflorescence (excluding bracts) 3-13 cm. long, of 6 to 14 very unequal primary peduncles, the shorter of which bear nearly spherical heads of 12 to 30 spikelets, the longer ones bearing some shorter unequal secondary peduncles each with a head of 16 to 40 spikelets; bracts 5 to 9, the longer ones far-surpassing the inflorescence; spikelets 6-13 mm. long, 2.5-3.3 mm. broad, linear, acute, with 10 to 36 flowers, stramineous (young) to olive-brown or grayish-brown (mature), laterally compressed, the axis flat, wingless and persistent as a unit after the scales and achenes have fallen; scales laterally firm-membranous and with visible cells, medially chartaceous (to eventually subcartilaginous), 2-2.4 mm. long, in the proximal third to five eighths the length definitely bicarinate with a flat area or shallow groove 0.25-0.4 mm. broad dorsally (abaxially), the 2 lateral parts 0.5-0.6 mm. broad (therefore the scale spread out 1.2-1.5 mm. broad just below the middle), in the lower half linear, gently tapering distally, with 5 nerves (1 of these being the inconspicuous midvein between the keels), including 1 nerve at each keel and 1 on each lateral face about a fourth to a third the distance from the keel to the margin, the whole scale (as folded in the spikelet) incurved slightly in the distal half; stamen 1; achene linear, triquetrous, basally stipitate, apically acuminate, 1-1.5 mm. long, 0.3-0.5 mm. thick, brownish with a very thin translucent surficial layer of cells. Abundant in moist places, s.e. Tex., frequent in e. Tex. and coastal parts of Rio Grande Plains, May-Oct.; Urug. and Ecu. n. to N.C. and the Gulf States, adv. in Calif.

Through error, the name *C. virens* has been widely misapplied to *C. pseudovegetus* (next below). The 2 taxa are extremely closely related and occasionally hybridize. Young specimens of *C. virens* greatly resemble *C. pseudovegetus*.

14. *Cyperus pseudovegetus* Steud. Tufted perennial, often slightly more loosely tufted than in *C. virens* by elongation of rhizomes 2-5 mm. between culms; culms 3-8 dm. long, erect basally with a few leaves and 2-5 mm. thick, just beneath the inflorescence 1-2.2 mm. thick, roundly triquetrous, smooth or rarely with microscopic antrorse scabrousness; leaves few to several, the larger ones almost as long as the culms, basally often with minute transverse septa between the close veins; inflorescence (excluding bracts) 2-9 cm. long, of 3 to 10 very unequal primary peduncles, the shorter of which bear dense strongly 3- to 8-lobed glomerules or heads of 15 to 50 spikelets, the longer ones bearing some shorter unequal secondary peduncles each with such a head; bracts 3 to 6, the longer ones far-surpassing the inflorescence; spikelets 2.5-4 mm. long, 2.2-3 mm. broad, narrowly ovate, blunt or slightly acute, with 6 to 14 flowers, tawny stramineous to (very slightly reddish-) brown, laterally compressed, the axis flat, wingless and persistent as a unit after the scales and achenes have fallen; scales laterally membranous with visible cells, medially firm to chartaceous, 1.8-2.5 mm. long, in the proximal fourth to third the length bicarinate with a flat or shallowly grovelike area 0.1-0.2 (-0.3) mm. broad dorsally (abaxially), the 2 lateral parts 0.2-0.4 mm. broad (therefore the scale spread out is 0.6-0.7 mm. broad near the middle, almost linear), tapering only at the very tip, with 5 inconspicuous nerves in the median portion, the whole scale (as folded in the spikelet) incurved-falcate; stamen 1; achene linear, 1-1.3 mm. long, 0.2-0.3 mm. thick, bluntly trigonous, basally short-stipitate, apically acuminate, often slightly falcate, brown with a very thin translucent-iridescent surficial layer of cells. *C. arenicola* Steud. Locally frequent in moist places, e. and s.e. Tex., infrequent in n.-cen. Tex., May-Sept.; Gulf States and n. to N.J., Ind., Ill., Mo. and Kan.

Through error this species, in some works, has been called *C. virens*.

15. *Cyperus reflexus* Vahl. Perennial with scaly creeping rhizomes 1-1.5 mm. thick; culms contiguous or several mm. apart along the rhizome, 3-7 dm. long, erect, basally with a slightly bulblike enlargement, with a few leaves and 1-2.5 mm. thick (just above the "bulb"), just beneath the inflorescence 0.5-1.3 mm. thick, roundly triquetrous, smooth; leaves few, the longer ones about as long as the culms or shorter, basally not septate; inflorescence (excluding bracts) 15-50 mm. long, of 3 to 8 very unequal primary peduncles the shorter of which bear very dense strongly 3- to 8-lobed glomerules of 25 to 50 spikelets, the longer ones (more than 15 mm. long) with dense strongly 15- to 30-lobed compound glomerules of up to 100 spikelets; bracts 3 to 5, the longer ones far-surpassing the inflorescence; spikelets 3-5 mm. long, 1.5-2.2 mm. broad, nearly linear in the lower part, distally tapered and apically crowded, with 8 to 12 flowers, red and green, laterally compressed, the axis flat, wingless and persistent as a unit after the scales and achenes have fallen; scales laterally red, membranous, inconspicuously cellular, medially firm-membranous, 1.5-2 mm. long, in the proximal fourth the length with a narrow flat area about 0.2 mm. broad dorsally (abaxially), the 2 lateral parts red, 0.5-0.6 mm. broad (therefore the scale spread out is about 1.1 mm. broad, narrowly ovate), tapering distally to the slightly acute tip, with 5 inconspicuous nerves in the median portion, the median portion of the scale (as folded in position in the spikelet) with a distinct curve in the proximal part but distally nearly straight; stamen 1; achene oblong or elliptic-oblong, 0.9-1 (-1.2) mm. long, 0.3-0.4 mm. thick, sharply trigonous, basally short-stipitate, apically shortly acuminate or pyramidal, pale-brown (finally dark-fuscous beneath the outer cellular layer). *C. rufescens* Torr. Rare in e. and s.e. Tex. inland to Houston, Bastrop and DeWitt cos., in moist sand, spring-summer; otherwise scattered in S.A., Mex., La. and Okla.

The plants here called *C. reflexus* may actually be only a form of *C. pseudovegetus* and *C. acuminatus*; in several characters they appear intermediate between *C. pseudovegetus* and *C. acuminatus*; the young *C. acuminatus* inflorescence is extraordinarily similar to the mature *C. reflexus* inflorescence. Only mature material can be determined with confidence.

16. *Cyperus acuminatus* T. & H. Short-lived perennial, flowering the first year, tufted; culms 1-4 dm. long, erect, basally with a few leaves and 0.7-1.2 mm. thick, just beneath the inflorescence 0.4-0.8 mm. thick, roundly triquetrous, smooth or with more or less abundant microscopic knobs more or less at right angles to the culm; leaves few, 0.5-2 mm. broad, the longer ones sometimes equaling the culms, basally not septate; inflorescence (excluding bracts) 2-8 cm. long, of 2 to 5 very unequal primary peduncles, the shorter of which bear nearly hemispherical to spherical glomerules of 13 to 25 spikelets, the longer ones with such glomerules (rarely compound or with secondary peduncles) of up to 55 spikelets; bracts 3 or 4, the longer ones nearly erect and far-surpassing the inflorescence; spikelets 4-10 mm. long, 1.5-2.5 mm. broad, nearly linear, with 12 to 44 flowers, stramineous to brownish-stramineous or rarely tawny-stramineous, laterally compressed, the axis slightly flattened, wingless and persistent as a unit after the scales and achenes have fallen; scales laterally membranous, inconspicuously cellular, medially firm-membranous, 1.3-1.9 mm. long, in the proximal fifth to fourth the length with a flattish area about 0.2 mm. broad dorsally (abaxially), the 2 lateral parts 0.4-0.6 mm. broad (the scale spread out 0.8-1.2 mm. broad, ovate or narrowly so), tapering distally to the acute apex, with 3 nerves (the inconspicuous midnerve plus on each side a conspicuous nerve about three eighths to two fifths the distance from the midnerve to the margin), the dorsal (median) portion of the scale (as the scale is folded in position in the spikelet) incurved in the lower part, in the distal part either straight or usually with a slight to marked excurvature so that the whole is weakly S-shaped; stamen 1; achene elliptic, 0.9-1.1 mm. long, 0.35-0.45 mm. thick, sharply trigonous, basally short-stipitate, apically prolonged-acuminate, pale-brown, occasionally maturing to brown. *C. cyrtolepis* T. & H. Abundant in moist places, e., s.e., n.-cen. Tex. and Rio Grande Plains, rare in Edwards Plateau (Central Mineral Region only) and the Trans-Pecos (Jeff Davis and Presidio cos.), almost all year; Mo. and N.C., s. to La., Tex. and Coah.; also Ga., Ariz., Nev., Calif. and Ore.

Young specimens strongly simulate dwarf specimens of *C. reflexus*.

17. *Cyperus surinamensis* Rottb. Short-lived tufted perennial, flowering the first year; culms 1-4 (-8) dm. long, with scattered microscopic retrorse projections like shark's

teeth, erect, basally with a few leaves and 0.8-3.5 (-4.5) mm. thick, just beneath the inflorescence 0.4-1.5 mm. thick and bluntly triquetrous; leaves few, the longer ones nearly as long as the culm, basally usually with scattered microscopic transverse septa between the nerves; inflorescence (excluding bracts) 1-8 cm. long, of (4 to) 7 to 12 very unequal primary peduncles the shorter of which bear nearly spherical glomerules of 8 to 25 spikelets, the longer usually with several very unequal secondary peduncles each with a nearly spherical head of 11 to 35 spikelets; bracts 5 to 7, the longer ones far-surpassing the inflorescence; spikelets 3-6 (-14) mm. long, 1.8-2.5 mm. broad, nearly linear, with 10 to 20 (to 30) flowers, stramineous to chartreuse or ochraceous, laterally compressed, the axis slightly flattened, wingless and persistent as a unit after the scales and achenes have fallen; scales laterally membranous, inconspicuously cellular, medially slightly firmer, 1-1.5 mm. long, in the proximal third to three fifths the length with a flat abaxial (dorsal) area 0.15-0.2 mm. broad, the 2 lateral parts 0.4-0.6 mm. broad (the scale when spread out 0.9-1.2 mm. broad, ovate), rounded or slightly acute, with 3 nerves (the inconspicuous midnerve plus the 2 prominent laterals which form the proximal keels); dorsum of the scale as it is folded in position in the spikelet gently incurved in the proximal part, nearly straight distally; stamen 1; achene elliptic-oblong or oblong, 0.7-0.8 mm. long, 0.25-0.3 mm. thick, bluntly trigonous, dark-rosy-brown, basally minutely stipitate, apiculate or shortly acuminate. Infrequent in moist places, s.e. Tex. and coastal parts of Rio Grande Plains, rare in n.-cen. and e. Tex., July-Nov., rarely spring; Arg. and Bol. n. to Fla., La. and Tex.

18. *Cyperus onerosus* M. C. Johnst. Perennial with scaly rhizomes 5-80 mm. long and 1-2 mm. thick; culms 20-49 cm. long, erect, basally leafy and 2-4 mm. thick, just beneath the inflorescence smooth, sharply triquetrous and 1.5-2 mm. thick; leaves few, basally with no transverse septation, some of the longer ones usually surpassing the inflorescence; inflorescence (excluding bracts) 2-12 cm. long, with 7 to 15 very unequal primary peduncles, the shorter of these bearing nearly spherical heads of 8 to 25 spikelets, the longer ones bearing 3 to 12 unequal secondary peduncles each bearing a head of 20 to 35 spikelets; bracts about 4, the longer one nearly erect, exceeding the inflorescence; spikelets 7-13 mm. long, 2.5-3.5 mm. broad, linear, with (10 to) 16 to 26 (to 42) flowers, brownish to tawny-brown, laterally compressed; the axis wingless, thick, dorsiventrally slightly flattened, persistent as a unit after the scales and achenes have fallen, the internodes sculptured (with a niche for each achene); scales 2.3-2.9 mm. long, 1.2-1.4 mm. broad, ovate-elliptic when unfolded, basally slightly gibbous, laterally firm-membranous, medially chartaceous and with a midnerve and on each side 2 (rarely 3) nerves (the total number obscure except when the scale is young and translucent), the medial nerved keel-like zone (as seen in place in the spikelet) except for the curve at the gibbous base mostly straight or very slightly excurved to the very acute apex; stamens 3; achene elliptic to narrowly so, trigonous, acuminate at both ends, 0.7-0.8 mm. long, 0.25-0.3 mm. thick, whitish or eventually turning brownish. Locally frequent in moist loose sand and pools between sand dunes, s.w. part of Plains Country (Ward and Winkler cos.), June-Nov.; endemic.

19. *Cyperus alternifolius* L. UMBRELLA FLATSEDEGE, UMBRELLA PLANT. Tufted perennial; culm 3-15 dm. long, erect, basally 5-20 mm. thick, just below the apex 1-5 mm. thick, triangular; leaves few, basal, reduced to sheaths, apically with a diagonal orifice and a short flat triangular blade 5-50 (-100) mm. long; inflorescence (excluding bracts) 3-10 cm. long, of 15 to 25 slightly unequal primary peduncles each bearing a short headlike raceme of 8 to 15 short-peduncled spikelets; bracts 15 to 25, 15-40 cm. long, 1-15 mm. broad, spreading (forming an umbrella); spikelets 5-10 mm. long, 1.5-2 mm. broad, with 12 to 30 flowers, compressed, the axis wingless and remaining intact as a unit after the scales have fallen (achenes often more persistent); scales 1.6-2 mm. long, 1.4-1.6 mm. broad when unfolded, several-nerved; stamens 3; achene trigonous, 0.6-0.9 mm. long, 0.5-0.6 mm. thick, brown, elliptic-oblong. S.e. Tex., cult. in moist ground and rarely escaping, summer-fall; nat. of the Old World, probably Afr. or Madag., widely cult. and escaping in warm regions.

20. *Cyperus phaeolepis* Cherm. Densely tufted perennial; culm 3-5 (-9) dm. long, erect, basally 2-3 mm. thick, just beneath the inflorescence 1.7-2 mm. thick, irregularly striate; leaves few, basal, reduced to usually reddish-brown sheaths with diagonal orifices, the "blades" only a few mm. long; inflorescences (excluding bracts) 1-2 cm. long, of

8 to 12 unequal peduncles each bearing a headlike (occasionally compound) glomerule of 8 to 15 spikelets; bracts 9 to 13, spreading, 3-10 cm. long, (1-) 3-5 mm. broad, abruptly acute; spikelets 3-6 mm. long, 1.5-2 mm. broad, with 12 to 18 flowers, compressed slightly, the axis flat, wingless and remaining intact as a unit after the scales have fallen (achenes sometimes more persistent); scales 1.3-1.5 mm. long, about as broad, broadly ovate when unfolded, obtuse, laterally membranous, whitish or with a chestnut-tawny splotch, dorsally-proximally flat, the midnerve obscure and the 2 other nerves forming keels on each side of the flat area for about three eighths the total length; stamens 3; achenes 0.7-0.8 mm. long, ellipsoid, obscurely trigonous, pallid-brown turning brown. *C. albiflorus* Cherm. Rare in moist places, s.e. (Galveston) and Trans-Pecos (4 miles n. of Ft. Stockton) Tex., escaped, Apr.-June; Madag.; Tex.

21. *Cyperus Haspan* L. Short-lived tufted perennial, flowering the first year; culms 1-7 dm. long, erect, basally 2-5 mm. thick, just beneath the inflorescence 1.5-3 mm. thick, sharply trigonous but soft and easily pressed flat; leaves basal, the lowest ones bladeless, some of the upper ones consisting of sheaths with oblique orifices or even with soft blades 1-10 cm. long; inflorescence (excluding bracts) 4-12 cm. long, of 10 to 15 extremely unequal primary peduncles the shorter of which each bears a lax glomerule of 3 to 12 spikelets and the longer with several secondary peduncles each with a lax glomerule (or occasionally bearing unequal tertiary peduncles with glomerules); bracts usually 2, one of them 0.3 to 1 (to 2) times as long as the inflorescence, the other much shorter and inconspicuous; spikelets 4-10 mm. long, about 1 mm. broad, linear, compressed, brown, with 8 to 30 flowers, the axis persistent as a unit after the scales have fallen (the achenes and filaments often less readily caducous than the scales); scales 1.2-1.6 mm. long, 0.8-1 mm. broad, obtuse, fragile-membranous, 3-nerved (actually with 5 nerves but the ones nearest the margin extremely inconspicuous and in some specimens weakly developed); stamens 3; achene globose-obovate to subglobose, obscurely trigonous, 0.4-0.7 mm. long, 0.4-0.5 mm. thick, whitish, roughened. Incl. var. *americanus* Boeck., *C. juncooides* Lam. Infrequent in moist places, e. and s.e. Tex. and coastal parts of Rio Grande Plains, inland to Guadalupe Co., June-Oct.; widely distributed in warm regions.

22. *Cyperus seslerioides* H.B.K. Tufted perennial forming tough fibrous black mats (bulblike bases connected by extremely short branching rhizomes); culms 10-25 cm. long, erect, basally about 1 mm. thick, apically about 0.5 mm. thick; leaves 2 or 3 per culm, basal, 1-2 mm. broad; inflorescence (excluding bracts) 6-12 mm. long, contracted into a single densely flowered several-lobed subhemispheric whitish or pallid-brownish (*Dichromena*-like) head; bracts 3 or 4, linear, 2 to 10 times as long as the head, spreading or reflexed; spikelets 3-7 mm. long, 2-2.5 mm. broad, compressed, with 10 to 20 flowers, the axis wingless and persistent as a unit after the scales have fallen; scales 1.5-2.7 mm. long, 1.1-1.6 mm. broad, membranous, 3-nerved, acuminate, sharp; stamen 1; achene 0.7-1 mm. long and nearly as thick, suborbicular, strongly 3-angled with concave sides, maturing to a very dark-brown. Scarce in shaded ravines high in the Chisos Mts. in the Trans-Pecos, summer; Venez., Guat., Mex., Ariz. and Tex.

23. *Cyperus strigosus* L. Tufted perennial (occasionally flowering the first year); culms 4-10 dm. long, subbasally 3-9 mm. thick (at the extreme base swollen tuberlike), just below the inflorescence trigonous and 1.7-3 mm. thick; leaves 2-8 mm. broad, firm, the longer ones about equaling the culm; inflorescence 7-30 (-40) cm. long, of 4 to 11 very unequal primary peduncles the shorter of which bear spikes 13-25 mm. long and 2-4 cm. thick, each spike with 20 to 40 divaricately spreading spikelets in several ranks, the longer peduncles in turn bearing a few secondary peduncles (often very short) each with a spike 15-35 mm. long and 20-45 mm. thick, each spike with 25 to 70 spreading spikelets; bracts 3 to 10, the longer ones far-surpassing the inflorescence; spikelets linear, straight, (10-) 12-25 (-29) mm. long, 1-2 mm. broad, less than half as thick as broad, golden-brown or tawny-brown, with 5 to 20 scales (the terminal one sterile, tending to become involuted and forming a short point), the axis at maturity detaching as a unit from the spike axis, the internodes on the fertile side with 2 narrow hyaline wings 1.5-2 mm. long, about 0.4 mm. broad; scales 3.7-4.5 mm. long, 1.2-1.8 mm. broad, with 7 or 9 nerves, overlapping, usually persistent or less commonly belatedly deciduous either before or after the axis falls from the plant; stamens 3; achene 1.5-2 mm. long (usually about half as long as the scale), 0.5-0.6 mm. thick, trigonous, linear-oblong, brown,

basally substipitate, short-apiculate. Frequent in bogs and marshy areas, e. and s.e. Tex., less frequent in n.-cen. Tex. and rare in the Panhandle (genetically dilute plants rare elsewhere), summer-fall; e. U.S. n. to Que., Ont., Minn., w. to Neb., Kan., Okla. and Tex.; also Pac. States.

The description applies to the more or less typical plants; through various intermediate forms the species is linked to *C. tenuis* and *C. hermaphroditus* and through forms known as *C. "refractus"* and *C. dipsaciformis* to *C. retrofractus*. The forms in which the scales fall before the spikelet axis falls usually show evidence of contamination from one of the group of related species which includes *C. esculentus* and *C. setigerus*. The southern Louisiana plants called *C. cephalanthus* T. & H. (based on a supposedly Texan specimen but not found in Texas at least since 1835) probably are basically *C. strigosus* but contaminated by something like *C. virens*; they probably do not deserve specific rank.

24. *Cyperus tenuis* Sw. Tufted perennial; culms 3-8 dm. long, basally 2-7 mm. thick, just below the inflorescence 1.1-2.8 mm. thick; leaves 1.5-5 mm. broad, the longer ones about equaling the culms; inflorescence 6-20 cm. long, of 4 to 11 extremely unequal primary peduncles the shorter of which bear spikes 2-3 cm. long and 15-24 mm. thick, each spike with 14 to 30 divaricately spreading spikelets in 3 or 4 ranks, the longer peduncles each with a spike 25-40 mm. long and 18-27 mm. thick, each spike with 19 to 45 spikelets, the spikes occasionally compound with 1 or 2 smaller nearly sessile spikes basally; bracts 3 to 11, the longer ones far-surpassing the inflorescence; spikelets linear, straight, 10-15 mm. long, 0.7-1.3 mm. broad, about half as thick as broad, grayish-brown, with 3 to 6 scales (the terminal 1 sterile, tending to become involute and forming a short point), the axis at maturity detaching as a unit from the spike axis, the internodes on the fertile side with 2 narrow hyaline wings 1.5-2 mm. long and 0.3-0.5 mm. broad; scales 3.5-5 mm. long, 1-1.6 mm. broad, with 7 or 9 nerves, overlapping, persistent; stamens 3; achene 1.3-1.6 mm. long, less than half as long as the scale, 0.5-0.6 mm. thick, trigonous, ellipsoid to obovoid-ellipsoid, brown, very minutely stipitate, apiculate. Incl. var. *lentiginosus* (Millsp. & Chase) Kükenth., *C. strigosus* var. *gracilis* Britt., *C. lentiginosus* Millsp. & Chase. Infrequent in s. part of s.e. Tex. (San Patricio and Nueces cos.) and coastal parts of Rio Grande Plains (Duval, Karnes and Cameron cos.), in moist clayey loam, summer-fall; n. S.A. w. to C.A. and Mex., n. to Sin. and Tex.; also (?) Afr.

Plants intermediate to *C. strigosus* occur, as do also forms leading from *C. tenuis* through *C. hermaphroditus* (shorter redder scales, greater tendency for the terminal scale to become awnlike, broader wings, etc.) toward the *C. uniflorus* plexus.

25. *Cyperus hermaphroditus* (Jacq.) Standl. Tufted perennial; culms very slightly thickened, 15-80 cm. long, subbasally 1-3 mm. thick, just below the inflorescence 0.7-2 mm. thick; leaves 1-3 mm. broad, the longer ones about as long as the culm; inflorescences 3-15 cm. long, of 4 to 8 or more slender very unequal peduncles each with a lax spike 1-3 cm. long and 1-2 cm. thick, of 8 to 30 or more divaricately spreading spikelets in 3 or 4 ranks, secondary peduncles absent; bracts 3 to 8, the longer ones far-surpassing the inflorescence; spikelets linear, 5-11 mm. long, 0.5-1 mm. broad, more than half as thick as broad, dull-brown, with 3 to 7 scales (the terminal one sterile, tending to become involute and forming a short point), the axis at maturity detaching as a unit from the spike axis, the internodes on their fertile side with 2 narrow hyaline wings 1.3-2 mm. long and 0.3-0.5 mm. broad; scales 2.5-3.5 mm. long, 0.8-1.3 mm. broad, with about 9 nerves, overlapping, persistent; stamens 3; achene 1.6-1.8 (-2) mm. long, 0.6-0.8 mm. thick, trigonous, oblong to ellipsoid, yellowish brown to brown, substipitate, apiculate. Incl. var. *angustior* (Clarke) Kükenth., *C. thyrsiflorus* Schlecht. & Cham., *C. dissitiflorus* Torr. Rare in rich loam, shaded river woods, s.e. Tex. (Brazoria, Colorado, Harris and Jackson cos.), summer; widespread in warmer parts of Am., n. to Ala., La., Tex., Coah. and Ariz.

This "species," one of a group of exceedingly poorly marked ones, verges both toward the *C. "tenuis"* complex and toward the *C. uniflorus* complex. Those plants with somewhat larger achenes and broad clasping wings thickened near the adaxial angles of the achene are here arbitrarily referred to *C. uniflorus*. The plants from Louisiana and southeast Texas referred here differ from the more or less typical populations of tropical America in the narrow leaves; most populations elsewhere have blades 2-7 mm. broad. Some collections from the Chisos Mountains in Trans-Pecos Texas represent the "true"

broadleaved *C. hermaphroditus*, which comes northward from the mountains of Coahuila and Nuevo Leon.

26. *Cyperus huarmensis* (H.B.K.) M. C. Johnst. (Often loosely) tufted perennial from black knotty subrhizomatous bases; culms 1-4 dm. long, subbasally 1.5-3 mm. thick, just beneath the inflorescence 0.7-1.3 mm. thick; leaves 2-4 mm. broad, firm, shorter than the culms; inflorescence 2-3 (-4) cm. long, of 3 to 6 essentially sessile (or occasionally 1 or 2 of them on peduncles 1-2 cm. long) dense spikes 10-25 mm. long and 7-10 mm. thick, with 40 to 80 ascending spikelets; bracts 3 to 6, spreading, the longer ones 3 to 10 times as long as the inflorescence; spikelets 4-7 mm. long, about 1 mm. broad and almost as thick, ochraceous gray-brown to tawny-gray, with 3 scales (usually only the lowest one fertile and it slightly longer than the others), straight, the axis at maturity detaching as a unit from the spike axis, the internodes of the fertile side with 2 hyaline wings 1.5-2.2 mm. long and 0.6-0.8 mm. broad, clasping the achene; fertile scale 3-4 mm. long, about 2 mm. broad, with about 9 nerves, almost completely overlapping the higher scales; stamens 3; achene 1.5-2.1 mm. long, 0.8-1 mm. thick, oblong-obovoid, trigonous, very dark-brown, substipitate, apiculate. *C. cayennensis* (Lam.) Britt., non Link, *C. flavus* (Vahl) Nees, non J. & C. Presl, *Mariscus huarmensis* H.B.K., *C. obesus* Liebm. Rare in s.e. Tex. (Aransas and San Patricio cos.), spring-fall; widespread in the warmer parts of Am. s. to Arg. and n. to Ariz., N.M., Tex. and La.

27. *Cyperus uniflorus* T. & H. Tufted perennial; culms usually very slightly tuberous-thickened basally, 8-30 (-40) cm. long, subbasally 0.7-1.5 (-1.8) mm. thick, just beneath the inflorescence 0.5-1 (-1.3) mm. thick; leaves 1-3 mm. broad, the longer ones shorter than the culm; inflorescence 8-60 mm. long, of (1 to) 3 to 6 slender very unequal peduncles each bearing a lax or dense head or spike of 10 to 38 spreading spikelets in at least 4 ranks; secondary peduncles absent; bracts 3 to 6, the longer ones far-surpassing the inflorescence; spikelets linear, 4-8 (-11) mm. long, 0.5-1 mm. broad, more than half as thick as broad, stramineous to grayish-brown to brownish-red, with 2 to 5 scales (the terminal one sterile, becoming involute and forming an awnlike straight or curved point), mostly straight (or, when abortive and drying before maturing fruit, then often falcate, especially at the tip), the axis at maturity detaching as a unit from the spike axis, the internodes on the fertile side with 2 wings 1.7-2.7 mm. long and 0.5-0.8 mm. broad, conspicuously clasping the 2 adaxial angles of the achene and subchartaceous and discolored over these angles (wings otherwise membranous and translucent); fertile scales 3-4.5 mm. long, 1.3-2 mm. broad, with 9 or 11 nerves aggregated in a median strip about half as wide as the whole scale, overlapping, persistent; stamens 3; achene oblong, 1.7-2.5 mm. long (more than half as long as the scale), 0.6-0.9 mm. thick, trigonous, dark-brown to dark-chestnut, substipitate, subapiculate. Abundant or scattered in dry to somewhat moist sandy or loamy prairies, brush and open woodland, nearly throughout except rare in Trans-Pecos and extreme e. Tex., infrequent in the Panhandle, spring-fall, occasionally winter; Ark., Okla., N.M. and Ariz., s. to n. Mex.

On soil derived from limestone and granite in the Edwards Plateau and elsewhere, especially in shaded ravines, occur plants (*C. uniflorus* var. *pseudothyrsiflorus* Kükenth.) technically referred here because of the broad, achene-clasping, thickened wings of the spikelet-axis, but otherwise with the characters of *C. hermaphroditus*, s. *amplo*. They probably would be better referred to *C. hermaphroditus*, but the specific lines become blurred, probably through introgression, and the characters thoroughly scrambled. Likewise, *C. uniflorus* grades through a perplexing series to *C. globulosus* (through *C. "subuniflorus"* Britt.) to the *C. "retrorsus"* form of *C. ovularis* (through *C. uniflorus* var. *floribundus* Kükenth.) to *C. ovularis*; and to *C. retrofractus*.

28. *Cyperus retrofractus* (L.) T. & G. Loosely tufted perennial with conspicuous tuberous enlargements; culms 3-9 dm. long, subbasally 2-3 mm. thick, just beneath the inflorescence 1-2 mm. thick; leaves 2-6 mm. broad, even the longer ones much shorter than the culms; inflorescence 6-20 cm. long, of 6 to 10 rather unequal stiffly ascending peduncles each bearing a dense obovoid head 9-17 mm. long and 8-15 mm. thick, with 60 to 180 spikelets borne in a spiral arrangement, densest apically and with a progressively laxer pattern downward; secondary peduncles absent; bracts 4 to 7, only the very longest ones equaling or slightly exceeding the inflorescence; apical spikelets very short and spreading, the middle ones longer and markedly reflexed or the lowest retrorsely appressed to the head axis; middle spikelets of head linear, 6-10 mm. long, 0.5-0.7 mm.

broad, almost as thick, straw-brown to brown, with 2 or 3 scales (the terminal one sterile, becoming involute and forming a point), straight, the axis at maturity detaching as a unit from the head-axis, the internodes on the fertile side with 2 wings about 3 mm. long and 0.5 mm. broad, usually clasping the 2 adaxial angles of the achene, thin and translucent; fertile scales 5-5.5 mm. long, 1.2-1.5 mm. broad, with 11 or 13 nerves, overlapping, persistent; stamens 3; achene linear, about 3 mm. long, 0.5-0.8 mm. thick, trigonous, dark-brown, substipitate, subapiculate. *C. Plukenetii* Fern. Infrequent in woods on moist or dry sandy soil, e. and s.e. Tex., July-Oct.; s.e. U.S. n. to N.J., O., Mo. and Okla.

The typical form is described above. It passes through intermediate forms (some incorrectly called *C. hystricinus*) to *C. uniflorus*; through forms known as *C. dipsaciformis* Fern. and *C. "refractus"* Steud. emend. Boeck. to *C. strigosus*; through *C. hystricinus* Fern. (sometimes incorrectly called *C. retrofractus*) to the *C. retrorsus* form of *C. ovularis*; and through forms known as *C. lancastriensis* Porter to true *C. ovularis*.

29. *Cyperus ovularis* (Michx.) Torr. Tufted perennial; culms, basally with tuberos enlargements, 25-80 cm. long, subbasally 1-3 mm. thick, just beneath the inflorescence 0.6-2 mm. thick; leaves 1.5-5 mm. broad, the longer ones about equaling the culms; inflorescence (1-) 3-12 cm. long, of (1 to) 3 to 8 very unequal peduncles each with a dense spherical or prolate-spherical head 7-19 mm. long and 7-18 mm. thick, with (70 to) 100 to 240 spikelets borne spirally or in many ranks, about equally dense at top and bottom, the upper spikelets ascending, middle ones spreading and lower ones retrorsely appressed; secondary peduncles absent; bracts (2 or) 3 to 7, the longer ones far-exceeding the inflorescence; spikelets 3.5-9 mm. long, 0.5-1 mm. broad, about half to three fourths as thick as broad, straw-brown to dark-brown, with 2 to 4 scales (the terminal one or two sterile and forming a blunt point, not an awn), straight, the axis at maturity detaching as a unit from the head axis, the internodes on the fertile side with 2 hyaline wings 1-2 mm. long and 0.3-0.7 mm. broad, usually not clasping the achene; fertile scales 2.5-4 mm. long, 1.2-2 mm. broad, obtuse, with about 9 nerves well-distributed over the width, overlapping, persistent; stamens 3; achene narrowly oblong, 1.8-2.2 mm. long, 0.5-0.7 mm. thick, trigonous, brown, substipitate, apiculate. Incl. var. *sphaericus* Boeck. and var. *robustus* Britt., *C. Wolfi* Wood. Infrequent in moist sand, e., s.e. and n.-cen. Tex., spring-fall; e. U.S. n. to N.Y., Pa., O., Ind., Ill. and Mo., w. to Kan., Okla. and Tex.

The description above applies to the typical form. A more common form is the var. *cylindricus* (Ell.) Torr. (*C. retrorsus* Chapm.) with narrower and proportionally more elongate heads (actually short spikes), paler and with a slightly more tawny-ochraceous tinge, with fewer spikelets on the average (50 to 100), only 2 or 3 scales per spikelet, the wings averaging slightly narrower, the wings, scales and achene averaging shorter. These characters, except for the spikelike heads, are mostly intermediate between the true *C. ovularis* and *C. globulosus*, into which the former freely grades (the var. *cylindricus* could equally well be treated as a variety of *C. globulosus*). Both the var. *ovularis* and the var. *cylindricus* grade freely into *C. uniflorus* as well as into *C. retrofractus*.

30. *Cyperus globulosus* Aubl. Tufted perennial; culms slightly tuberos-enlarged basally, 1-8 dm. long, subbasally 1.5-2.5 mm. thick, just beneath the inflorescence 1-1.7 mm. thick; leaves 1.5-3 mm. broad, the longer ones about equaling the culms; inflorescences 2-8 cm. long, of 3 to 14 very unequal peduncles each with a dense head 7-15 mm. long and 8-17 mm. thick, with 25 to 70 spikelets borne spirally or in a number of ranks, about equally dense throughout, the upper spikelets ascending, the middle ones spreading, the lower spreading or slightly descending but never retrorsely appressed; secondary peduncles absent; bracts 4 to 11, the longer ones far-exceeding the inflorescences; spikelets 5-10 mm. long, 0.7-1.3 mm. broad, almost as thick as broad, greenish-brown to ochraceous-brown or olive, with 3 to 8 scales (the terminal one sterile or staminate and forming a short point, or blunt), straight, the axis at maturity detaching as a unit from the head axis, the internodes with hyaline wings 0.8-1.4 mm. long and 0.25-0.6 mm. broad and not clasping the achene; scales 2.5-3 mm. long, 1-1.3 mm. broad, obtuse, with usually 9 well-distributed nerves, overlapping, persistent; stamens 3; achene narrowly oblong, 1.3-1.6 mm. long, about 0.6 mm. thick, trigonous, brown, substipitate, subapiculate. Frequent in moist or dry sandy soil, e. and s.e. Tex., rare and in genetically dilute form inland to n.-cen. Tex., summer-fall; n. S.A., n. reputedly to Va., Mo. and Okla.

This "species" grades freely into the various forms of *C. ovularis* (especially the

C. "retrorsus"); into some forms of *C. uniflorus* (especially the *C. "subuniflorus"*); and less commonly through *C. "Martindalei"* into *C. filiculmis* next below.

31. *Cyperus filiculmis* Vahl. Tufted or very loosely tufted perennial; culms basally tuberous-thickened or with short thick rhizomes, 10-35 (-50) cm. long, subbasally 1-2 (-2.3) mm. thick, just beneath the inflorescence 0.5-1 mm. thick; leaves 1-2 mm. broad, even the longer ones mostly shorter than the culms; inflorescence 1-3 cm. long, of a single nearly spherical head of 15 to 55 spikelets or (usually in contaminated plants) the inflorescences with such a head plus a few peduncles 1-5 cm. long each with a head or glomerule of 8 to 20 spikelets; bracts 3 or 4, 0.5-1 mm. broad, much-exceeding the inflorescence, usually spreading or reflexed; spikelets 6-16 mm. long, 2.5-4 mm. broad, about 1 mm. thick, grayish-brown to dark-tawny-grayish-brown, with 7 to 20 scales (the terminal one sterile or staminate and slightly reduced), straight, the axis noticeably dorsiventrally flattened, at maturity either persistent or commonly tardily deciduous as a unit from the head axis, the flat sculptured internodes commonly wingless or with wings only to 0.2 mm. broad; scales spreading at a 45° angle (the spikelet axis thus exposed), most much-overlapping, 2.5-3.5 mm. long, 2-2.5 mm. broad, broadly ovate, with 9 to 11 nerves; stamens 3; achene 1.5-2.2 mm. long, 0.8-1.1 mm. thick, broadly oblong, trigonous, dark-brown. *C. Houghtonii* Torr. var. *Bushii* (Britt.) Kükenth. Infrequent, scattered in seasonally moist sandy loam in open-wooded areas, n.-cen. Tex., Plains Country and Edwards Plateau, rare in the Trans-Pecos (i.e., genetically dilute plants in Glass Mts.), spring-fall; e. U.S. and s.e. Can. w. to the Rocky Mts.

On a broad scale this species has hybridized with *C. Schweinitzii* in the Great Plains and locally (in Glass Mts.) perhaps with *C. spectabilis*. In southeastern United States occurs *C. "Martindalei"* Britt. which is basically *C. filiculmis* contaminated by *C. globulosus*.

32. *Cyperus Schweinitzii* Torr. Fairly densely tufted perennial from hard knotty subrhizomatous bases; culms 15-45 cm. long, subbasally (1-) 2-3 mm. thick, just beneath the inflorescence 0.8-1.4 mm. thick; leaves 1-3 mm. broad, even the longer ones mostly shorter than the culm; inflorescence 3-10 cm. long, of 4 to 8 erect to ascending primary peduncles 2-80 mm. long each bearing a short lax spike 1-2 cm. long and 9-14 mm. thick, with 5 to 18 erect or ascending spikelets that are set 1-2 mm. apart on the axis; bracts 4 to 8, the longer ones far-exceeding the inflorescence; spikelets 4-10 mm. long, 3-4 mm. broad, 1-1.5 mm. thick, brown to dark-olive-brown, with 5 to 11 scales, straight, the axis noticeably dorsiventrally flattened, at maturity usually persistent, essentially wingless; scales spreading at 45° angle (the axis thus exposed), not much-overlapping, 3-3.8 mm. long, 2-3 mm. broad, broadly ovate, with 11 to 15 nerves, apically acute and usually acuminate with a fine sharp point, eventually deciduous from the axis; stamens 3; achene 2-2.8 mm. long, 1-1.2 mm. thick, broadly ellipsoid, trigonous, dark-brown. *C. Houghtonii* Torr. var. *uberius* Kükenth. Frequent in deep sands in higher (western) parts of the Plains Country and infrequent to the lower Plains Country, rare in n.-cen. Tex., probably also scattered in the Trans-Pecos, spring-summer; s.w. Que. to Sask. s. to N.Y., Pa., O., Ind., Ill., Mo., Okla. and Tex.; also extreme n. Chih. (Samalayuca dunes area).

This species passes into *C. Fendlerianus* of the Trans-Pecos mountains and toward the north has hybridized with *C. filiculmis*.

33. *Cyperus Fendlerianus* Boeck. Loosely tufted or forming stools from knotty or tuberlike bases; culms 1-4 (-5) dm. long, subbasally 0.7-2.2 mm. thick, just beneath the inflorescence 0.5-1.2 mm. thick; leaves 1-3 (-5) mm. broad, the longer ones shorter than or equaling the culms; inflorescence (15-) 30-80 (-150) mm. long, of (1 to) 3 to 5 (or 6) spikes, several or all of them nearly sessile and crowded into a dense mass at the culm summit and the rest elevated on erect peduncles; spikes lax, 12-25 (-30) mm. long, 6-11 mm. thick, of 3 to 13 erect or ascending spikelets; bracts 3 to 5, the longest usually erect and far-exceeding the inflorescence; spikelets 7-12 mm. long, 2-3 mm. broad, about 1 mm. thick, brownish-gray to pale-brown, with 3 to 16 scales, straight, the noticeably dorsiventrally flattened axis at maturity usually persistent, essentially wingless; scales (including mucro) 2.3-3.3 mm. long, 2-2.6 mm. broad, broadly ovate, with 9 or 11 nerves, acute, usually mucronate, slightly overlapping, spreading at almost a 40° angle, at least the lower ones eventually deciduous from the axis; stamens 3; achene 1.6-2.1 mm. long, 0.9-1.2 mm. thick, broadly ellipsoid, trigonous, dark-brown. *C. Schweinitzii*

var. *debilis* Britt. Frequent locally in Trans-Pecos mts. (Chisos and Davis) mostly above 5,000 ft. alt., summer; highlands of Mex. and s.w. U.S.

We have mostly the var. *debilis* (Britt.) Kükenth.; the var. *Fendlerianus* in which none of the peduncles is elongated and the bracts are usually reflexed is rare in the Davis Mts. The species is extremely closely related to, and often confused with, *C. Schweinitzii* and *C. manimae* H.B.K. These "species" need re-evaluation.

34. *Cyperus spectabilis* Link. Loosely tufted or matted perennial from short knotty branched fibrous blackish rhizomes; culms 3-8 dm. long, subbasally 2-3.5 mm. thick, just beneath the inflorescence 0.7-1.2 mm. thick; leaves 2-4 mm. broad, even the longer ones shorter than the culm; inflorescence 5-13 cm. long, of 4 to 9 very unequal peduncles each bearing a lax spike 2-5 cm. long and 2-3 cm. thick, of 9 to 30 well-spaced spikelets (mostly divaricately spreading or the lower ones slightly reflexed); bracts 3 to 5, ascending or spreading, the longer ones about twice as long as the inflorescence; spikelets 8-15 mm. long, 2-3 mm. broad, about 0.7 mm. thick, chestnut-brown or less commonly a tawny grayish-brown, with 9 to 15 scales, straight, the axis dorsiventrally flattened, at maturity usually persistent, essentially wingless; scales 2.5-3 mm. long, 1.5-2 mm. broad, ovate, obtuse, with 7 to 11 nerves, slightly overlapping, spreading at about a 40° angle, at maturity deciduous; stamens 3; achene 1.7-2 mm. long, 0.6-1 mm. thick, trigonous, oblong or ellipsoid, dark-brown, substipitate, subapiculate. *C. Buckleyi* Britt. Rare in the Trans-Pecos (Davis and Glass mts.), summer; highlands of Mex. n. to Ariz. and Tex.; Arg.; Peru.

In the Glass Mts. (Green Valley, Split Tank) occur plants with characteristics somewhat intermediate between this species and *C. filiculmis*.

35. *Cyperus odoratus* L. Tufted perennial, rarely rhizomatous or often flowering the first year and behaving annual; culms often slightly tuberous-thickened basally, 1-90 cm. long, subbasally 1-6 mm. thick, just beneath the inflorescence 0.3-3 mm. thick; inflorescence 1-45 cm. long, of numerous very unequal spreading or ascending primary peduncles the longer of which usually bear several unequal secondary peduncles, all eventually bearing lax to subdense spikes of rather numerous spreading spikelets; bracts 3 to 10, the longer far-surpassing the inflorescence; spikelets quite variable in size (about 1 mm. broad and thick) and number of scales (4 to 30), each internode of the axis unilaterally (on the sterile side) postantheically bulbous with white cartilaginous thickening and on the fertile side with 2 hyaline wings (eventually becoming papery) clasping the achene and at the base of each internode (above each node) abscising so that the whole spikelet breaks up into joints each comprising a scale, the next lower internode and the attached wings and achene; scales small, brownish, with a number of nerves, each persistent on its joint; stamens 3; achenes brownish, unequally trigonous, the 2 smaller (sharper) angles adaxial, clasped by the wings. *C. ferax* Rich., *C. speciosus* Vahl, *C. ferruginescens* Buckl. Abundant in all parts of Tex., perhaps our most abundant flatsedge and one of the most variable, but it is impossible to distinguish segregate taxa, spring-fall, occasionally winter; semicosmopolitan in temp. and trop. regions. Passing through the form called *C. Eggersii* Boeck. to *C. macrocephalus*.

36. *Cyperus macrocephalus* Liebm. Like *C. odoratus* but the peduncles absent so the extremely dense spikes are confined to a single large headlike mass. *C. oxycarioides* Britt. Common in resacas and ditches, Brownsville region of extreme s. Tex., nearly all year; otherwise Yuc., Ver. and Tam. Probably a mere form of *C. odoratus* (many species of flatsedges have parallel forms), but geographically rather well-localized.

37. *Cyperus aristatus* Rottb. Tufted annual with persistent coffee-and-chicory or curry powder odor (like *Ulmus rubra*, *Phyllanthus ericoides*, *Gnaphalium obtusifolium*, flowers of Bombacaceae, etc.); culms 1-20 cm. long, the longer leaves often equaling or surpassing them; inflorescence of 1 to 3 heads, essentially sessile at the summit, often with 1 to 6 additional shortly peduncled ones; bracts 2 to 4, the longer ones far-surpassing the inflorescence, often ascending; heads 5-20 mm. thick, often slightly prolate, with 2 to 50 spikelets; spikelets 4-14 mm. long, 2-3 mm. broad, about 0.5 mm. thick, laterally compressed, straight, with 5 to 30 scales, brown to yellow-brown to tawny-brown, the axis essentially wingless, at maturity eventually deciduous as a unit from the head axis; scales deciduous either before or after fall of the spikelet axis, 2-2.5 mm. long, about in the distal third the length being a very slender sharp acuminate-subulate prominently

recurved tip, with 7 or 9 evenly distributed nerves; stamen 1; achene 0.7-1 mm. long, 0.2-0.5 mm. broad, from nearly linear-oblong to obovoid, dark-brown. *C. inflexus* Muhl. Throughout Tex. (except Plains Country), scattered, spring-early winter; nearly cosmopolitan in temp. and trop. areas.

In extreme south coastal Texas occurs the var. *Runyonii* O'Neill with the achenes at the extremes of greatest length and narrowness allowed here.

38. *Cyperus laevigatus* L. Densely tufted or mat-forming perennial; culms soft, 5-25 cm. long, 1-1.5 mm. thick; leaves reduced to basal sheaths with subulate or setaceous blades 3-30 mm. long; inflorescence 5-10 mm. long, of a single head of 4 to 8 spikelets; bracts 2, the longer one 2-8 cm. long, appearing as a continuation of the culm; spikelet straw-white or often white with atropurpureous blotches medially, 4-7 mm. long, 2-3 mm. broad, 0.7-1 mm. thick, with 8 to 30 scales, the axis persistent, essentially wingless, somewhat flattened; achene lenticular (often concavo-convex) with one of the flat sides against the flattened spikelet axis. Infrequent in fresh or subsaline or gypseous mud in the Trans-Pecos, Feb.-Oct.; widely distributed in warm-temp. and trop. regions.

39. *Cyperus albomarginatus* Mart. & Schrad. Tufted annual; culms 2-9 dm. long, basally leafy and 2-8 mm. thick, apically 0.7-4 mm. thick; inflorescences 2-13 cm. long, of 3 to 12 very unequal peduncles each bearing a lax spike 12-40 mm. long and 12-23 mm. thick, of 10 to 60 spreading spikelets or the longer peduncles bearing secondary peduncles with such spikes; bracts 3 to 7, far-surpassing the inflorescence; spikelets 5-12 mm. long, 1.7-3 mm. broad, about 0.7 mm. thick, with 6 to 18 scales, straw-brown to dark-chocolate-brown, straight, the axis somewhat 4-angled, at maturity persistent, each internode on the fertile side with a niche for an edge of the achene and on the edges (at the sides of the achene) with minute winglike margins; scales 1.4-1.7 mm. long, 1.4-2 mm. broad, obovate, membranous, with 5 nerves at the keel-like median and marginally with a broad hyaline zone (albomargin) markedly contrasting with the brownish sides, deciduous, not much overlapping, clasping the achene; stamens 2 or 3; achenes lenticular, with an angle fitting into the niche of the internode, nearly as long as the scale, broadly obovate, apiculate, 1.2-1.5 mm. long, 0.6-1 mm. broad, maturing to black. Infrequent or rare, scattered in s.e. and Trans-Pecos Tex., summer; Afr., Madag., India, Burma, Austral.; in Am. from Arg. and Bol. n. to Va., N.C., S.C., Ala., La., Tex. and Ariz.

40. *Cyperus polystachyos* Rottb. var. *texensis* (Torr.) Fern. Tufted perennial (flowering the first year); culms 3-35 cm. long, basally 0.8-3 mm. thick, apically 0.5-1.5 mm. thick, wiry; leaves basal, mostly shorter than the culms; inflorescence 12-60 mm. long, of several unequal peduncles (these, especially in coastal populations, suppressed so the inflorescence is congested) with glomerules or short lax spikes, or rarely the longer ones with secondary peduncles 1-3 mm. long each with a glomerule or lax spike; glomerules or lax spikes with 5 to 10 mostly spreading spikelets; bracts 1 to 6, the longer ones usually about twice as long as the inflorescence; spikelets 4-25 (-43) mm. long, 0.7-2 mm. broad, about 0.5 mm. thick, with 10 to 40 (to 60) scales, brownish-buff to tawny-stramineous, straight, the axis slightly 4-angled, at maturity persistent, each internode on its fertile side with a niche for one edge of the achene, near the base of the niche with minute hyaline wings that narrow and join abaxially forming a minute cup at the base of the achene (use a strong lens!); scales 1.4-2 mm. long, about 1 mm. broad, ovate, appressed, much-overlapping, with 3 obscure nerves at the keel-like median, deciduous; stamens 2; achene lenticular, with an angle fitting the niche of the internode, about 1 mm. long, oblong to narrowly oblong, ripening through brown to black. Incl. var. *leptostachyus* Boeck. Locally abundant in seasonally moist sand, e. and s.e. Tex. and coastal part of Rio Grande Plains, spring-fall; widespread in Am. n. to Mass., Pa., Mo., Ark. and Okla.; the var. *polystachyos* (*C. filicinus* Vahl) occurs in coastal areas, Mass. to Va.; the var. *paniculatus* (*C. vulgaris* var. *teretifructus* (Steud.) Miq.) occurs widely in trop. of both hemispheres.

41. *Cyperus niger* R. & P. Annual or usually weak perennial occasionally forming mats by rooting of very shortly decumbent culms; aerial parts 1-4 (-6) dm. long, mostly erect, subbasally 1-2 mm. thick, apically 0.4-1.4 mm. thick; leaves few, mostly much shorter than the culms; inflorescence commonly of a single sessile irregular head 1-2 cm. thick of 3 to 30 spikelets, rarely more elaborate with a sessile head plus 2 or 3 peduncles to 4 cm. long each with a lax irregular head or glomerule of up to 20 spikelets; bracts 1 to 3, the longest far-surpassing the inflorescence and (when young) commonly erect

(like a continuation of the culm), later spreading; spikelets 7-12 mm. long, 1.7-2.2 mm. broad, about 0.7 mm. thick, with 10 to 22 scales, straight, pale-chestnut-brown or often with darker blotches of chestnut on each scale, rarely almost totally dark-brown, the axis persistent, somewhat 4-angled but essentially wingless, each internode on the fertile side with a niche into which fits an angle of the achene; scales about 2 mm. long, much-overlapping, with about 3 nerves crowded in the arcuate keel-like median, otherwise smooth and shiny, deciduous; stamens 2; achene lenticular (biconvex) about 1 mm. long, elliptic, apiculate, surficially nearly featureless, ripening through shades of brown to nearly black, oriented so an angle fits into the internodal niche. *C. melanostachys* H.B.K. We have two varieties.

Var. *castaneus* (Pursh) Kükenth. With usually lax elaborate inflorescences. *C. bipartitus* Torr., *C. rivularis* Kunth. Rare in moist sandy loam in e. Tex. (Austin and Washington cos.); from Que. w. to Minn. and Neb., s. to Ga., Ala., Miss. and Tex.; also Calif. and Ore.

Var. *capitatus* (Britt.) O'Neill. With relatively light-colored (chestnut-brown) glumes and strongly apiculate achenes. Local in creeks in igneous Trans-Pecos mts. at elev. of more than 4,000 ft., summer-fall; from Cuba and C.A. n.w. to Calif., Ariz. and Colo.

Reports of *C. diandrus* Torr. from Texas are erroneous and based largely on specimens of *C. niger*. The var. *niger* occurs from Arg. and Bol. n. to Coah.

42. *Cyperus lanceolatus* Poir. var. *compositus* C. & J. Presl. Loosely tufted perennial or mat-forming by decumbence and rooting of bases of culms; aerial parts of culms 5-50 cm. long, 2-3 mm. thick basally, 1-1.5 mm. thick apically; inflorescence congested into a sessile head plus 1 to 5 very short peduncles each with a head of 6 to 30 spikelets; bracts 2 or 3, the longer ones far-surpassing the inflorescence; spikelets 3-7 mm. long, 1.5-2 mm. broad, stramineous, sometimes with an olivaceous tinge (but not having a darker splotch on each scale), the axis straight, persistent, somewhat flattened but essentially wingless, each internode with a niche into which fits an angle of the achene; scales 1.5-1.8 mm. long, blunt, much-overlapping, with 3 or 5 nerves crowded into the keel-like median, otherwise smooth and shiny, deciduous; stamens 2; achene lenticular (biconvex), about 1 mm. long, obovate, short-apiculate, short-stipitate, surficially featureless or with regular hexagonal cells arranged in vertical rows, ripening to purplish-brown. Exceedingly rare in Llanó Co. in the Central Mineral Region on the Edwards Plateau, Sept. The nominate variety occurs in Arg., Bol., Urug., Parag., Braz., Col., Pan., Nic., Guat., s. Mex. and has been reported casual in La. and Fla. The var. *compositus* occurs in Braz., Col., Gr. Ant., C.A., Mex. (n.w. to Son. and Chih.) and (?) Tex. The species is closely related to *C. niger*.

43. *Cyperus flavescens* L. Tufted annual; culms 10-25 cm. long, basally 0.8-1.9 mm. thick, apically 0.7-1.1 mm. thick; inflorescence a congested (compound) sessile head of 10 to 35 spikelets plus occasionally 1 to 3 peduncles 1-3 cm. long each with a head of 4 to 10 spikelets; bracts 1 to 4, the longer ones usually surpassing the inflorescence; spikelets 6-20 mm. long, 1.8-3 mm. broad, about 0.8 mm. thick, with 22 to 40 scales, mostly straight, uniformly stramineous to ochre-stramineous, the axis persistent, straightish, flattened, essentially wingless, each internode with a niche into which fits an angle of the achene; scales deciduous, 1.5-2 mm. long, 1.2-1.6 mm. broad, ovate, with 3 nerves in the keel-like median; stamens normally 3; achene lenticular (biconvex), about 0.9 mm. long and 0.6 mm. broad, obovate, substipitate, short-apiculate, ripening to black, surficially shiny and with rectangular linear (vertical) cells (the rows of these cells marked off by horizontal wavy usually discolored sutures). Infrequent or rare in moist sand, e., s.e. and n.-cen. Tex., July-Nov.; widespread (in several varieties) in warm regions; in Am. n. to N.Y., Pa., Mich., Mo. and Kan.

44. *Cyperus sesquiflorus* (Torr.) Mattf. & Kükenth. Annual (?) or usually perennial mat-formers, emitting a strong citronellalike odor when bruised, with a culm density of 1 to 4 flowering culms per square cm. in the mat; culms 5-30 cm. long, basally 0.8-1.8 mm. thick, apically 0.5-1 mm. thick; leaves essentially basal, with sheaths 1-2 (-3) cm. long and firm-membranous, ascending blades 3-12 cm. long and 2-3.5 (-5) mm. broad, mostly much shorter than the scapelike culms; inflorescence a single prolate few-lobed compound congested headlike mass 7-14 mm. long and 6-8 mm. broad in the upper cylindrical lobe, with 50 to 200 spikelets altogether; bracts 3 (or 4), ultimately slightly to strongly reflexed, firm-membranous, 2-8 cm. long, 1-3 mm. broad, at the very base

discolored whitish-green but not hyaline at corners; spikelets each deciduous as a unit, 2.3-3 mm. long, 1.2-1.3 mm. broad, about 0.4 mm. thick, with 2 scales, buffy-white to white laterally, the lower scale enclosing a fertile floret, the upper one empty, the single short internode with very broad hyaline wings clasping the achene and continuous with the lower part of the higher scale; scales persistent (the lower one 2.2-2.9 mm. long) with green keels and buffy-white to white sides, each side with a couple of inconspicuous well-distributed longitudinal nerves; stamens uniformly 2 at the abaxial angle of the achene; stigmas 2; achene lenticular with the adaxial angle against the internode, the abaxial one at the keel of the lower scale, obovate, 1-1.4 mm. long, plus an apicule 0.05-0.15 mm. long, 0.75-0.9 mm. broad, ripening to jet-black. *Kyllinga odorata* Vahl. Frequent in moist sandy loam, e. Tex. (Angelina, Austin, Gonzales, Hardin, Lavaca and Newton cos.), June-Oct.; widespread in warm regions.

45. *Cyperus tenuifolius* (Steud.) Dandy. Densely tufted fragrant annual (or short-lived perennial?) with density of about 4 to 20 culms per square cm.; culms 1-21 cm. long, 0.5-0.7 mm. thick throughout; leaves with sheaths 8-45 mm. long and membranous; flaccid blades 2-11 cm. long, 1-1.8 mm. broad, often more than two thirds as long as the culms; inflorescence a single roundish 3-lobed compound headlike mass 3-8 mm. long and 5-6 mm. broad in the upper obtuse lobe, with 40 to 170 spikelets altogether; bracts 3 (or 4), ultimately spreading or slightly reflexed, flaccid, 2-10 cm. long, 1-2 mm. broad, at the very base with broad translucent membranous corners; spikelets each deciduous as a unit, 2-2.5 mm. long, 0.7-0.8 mm. broad, about 0.3 mm. thick, sordid-whitish or very pale-brownish, with 2 scales, the lower one enclosing a fertile floret, the upper empty, the single short internode with very broad hyaline wings clasping the achene and continuous with the lower part of the higher scale; scales persistent (the lower one 1.7-2.4 mm. long) with green keels and translucent sides, each side with a couple of inconspicuous well-distributed longitudinal nerves; stamens uniformly 2 at the abaxial angle of the achene; stigmas 2; achene lenticular, with the adaxial angle against the internode, the abaxial one at the keel of the lower scale, elliptic, 0.9-1.1 mm. long (plus an apicule 0.1 mm. long), 0.5-0.6 mm. broad, ripening to a very dark-brown. *Kyllinga pumila* Michx., *Cyperus densicaespitosus* Mattf. & Kükenth. Infrequent in moist loam, e. Tex. (Bowie, Cass, Hardin and Polk cos.), rare in n.-cen. Tex. (Grayson Co.), Sept.-Nov.; widespread in warmer moister parts of Am.; also Afr. and Madag.

The name is incorrectly said by some writers to be illegitimate.

46. *Cyperus brevifolius* (Rottb.) Hassk. Perennial with creeping branching reddish-brown rhizomes to 20 cm. long and 1-2 mm. thick; flowering culms rising from the rhizomes 3-10 mm. apart, 4-20 (-38) cm. long, 0.4-1 mm. thick; leaves with sheaths 5-30 mm. long and membranous; flaccid blades 1-3 (-10) cm. long, 1-3 mm. broad, mostly much shorter than the culms except when the latter are dwarfed; inflorescence a single roundish seemingly simple congested head 4-6 mm. long and broad, with 38 to 100 spikelets; bracts 3 (or 4), the longest one usually nearly vertical or ultimately reflexed, membranous, 15-120 mm. long, 1-2 mm. broad; spikelets each deciduous as a unit, 2-2.9 mm. long, 0.8-1.1 mm. broad, about 0.3 mm. thick, sordid- or buffy-whitish or very pale-brownish, with 2 scales, the lower one enclosing a fertile floret, the upper empty, the single short internode with very broad hyaline wings clasping the achene and continuous with the lower part of the higher scales; scales persistent (the lower one 1.9-2.4 mm. long), with green keels and translucent sides, each side with a couple of inconspicuous well-distributed nerves; stamens 1 (very rarely 2 in isolated spikelets, never many on the same head), at the abaxial angle of the achene; stigmas 2; achene lenticular with an adaxial angle against the internode and abaxial one at the keel of the lower scale, obovate or oblong-obovate, 1-1.2 mm. long (plus an apicule 0.05-0.1 mm. long), (0.6-) 0.7-0.8 mm. broad, ripening to a rich-brown. *Kyllinga brevifolia* Rottb. Common weeds in moist loam, s.e. Tex., less common in e. Tex., rare in Edwards Plateau and Brownsville region, Apr.-Nov.; widespread in warm regions.

9. CLADIUM P. BR.

About 55 species of tropical and temperate regions, especially Australia; our species almost cosmopolitan.

1. *Cladium jamaicense* Crantz. SAW-GRASS. Coarse erect reed 1-2.5 m. tall, with short rhizomes; leaves long, very tough, channeled ventrally, with dangerous saw-toothed cutting margins; inflorescences ample, 2-5 dm. long, much-branched, often droopy; spikelets ovoid, chestnut-brown, 3-5 mm. long, in fascicles of 2 to 6 at ends of the branchlets, each with a single fertile floret and below it 2 or 3 other spirally imbricate scales, all but the lowest enclosing stamens; perianth absent; achene obovoid, apiculate, somewhat lustrous, brownish, the obovoid body 2-2.5 mm. long, the apicule 0.6-1 mm. long. Locally abundant in fresh water on margins of streams, ponds and lakes, mostly in areas of calcareous soil, Rio Grande Plains, s.e. Tex., Edwards Plateau and Trans-Pecos, summer; widespread in Carib. region, n. to Gulf States and Va. The var. *chinense* (Nees) Koyama occurs in China and Japan.

Some of the plants of the Edwards Plateau and the Trans-Pecos have, on the average, slightly smaller, proportionately shorter and more numerous spikelets and denser inflorescences; these have been segregated as a separate species, *C. californicum* (Wats.) O'Neill, but this is at best weakly marked. Similar plants occur in Coahuila, New Mexico, Arizona, Nevada and California.

10. SCHOENUS L.

About 100 species, world-wide in distribution.

1. *Schoenus nigricans* L. Coarsely tufted perennial; culms slender, wiry, erect, simple, 2-6 dm. long, about 1 mm. thick; leaves basally crowded, the lower sheaths chestnut-black and shiny, the upper blades tough, thin, wiry, involute, shorter than the culms, apically spinose; bracts 1 or 2, the lower one far-surpassing the inflorescence, involute and wiry like the leaves; inflorescence a single sessile glomerule of about 10 sessile spikelets; spikelets laterally compressed, of about 5 to 10 distichous much-overlapping dark-chestnut to blackish scales of which only the upper few produce mature fruit; perianth bristles few, much shorter than the achene, minutely plumose at the very base; style 3-branched; achene shortly obovoid-trigonous with convex sides, pearly- or bony-white, shiny, jointed abruptly with the differently-textured style which thus does not leave a tubercle. Infrequent or rare in creek canyons, s. part of Edwards Plateau, spring; widespread in warm-temp. usually semiarid parts of the world.

11. DICHROMENA MICHX.

WHITE-TOP SEDGE

Tufted or rhizomatous perennials with stems leafy basally, the blades ascending; flowering culms terminating in an involucrate headlike agglomeration of spikelets, the bracts white basally but green distally; spikelets usually whitish; scales several, spirally imbricated or irregularly distichous, the terminal ones enclosing a fertile floret, the lower ones staminate or empty; perianth absent; achenes lenticular, transversely rugose, crowned with the broad persistent base of the style (tubercle) as in *Rhynchospora*. Some authors would include *Dichromena* within *Rhynchospora*.

One of the more easily recognizable of the sedges because of the white bases of the bracts; these apparently function to attract insects. Most sedges, on the contrary, are thought to be wind-pollinated. About 60 species in the Western Hemisphere.

1. Plants densely tufted; rhizomes absent; culms 1 mm. or less thick; blades 3-7 cm. long, 1 mm. broad basally, arcuate-filiform in the distal part; bracts 2 (rarely 3), the longer ones 17-37 mm. long, filiform most of the length 3. *D. nivea*.
1. Plants with extensively creeping orangish or whitish rhizomes; culms 1.5-3 mm. thick basally; blades 6-25 cm. long, 1.2-4 mm. broad basally and at least 1 mm. broad even in the distal part; bracts several, the longer ones (20-) 40-130 mm. long, not filiform except perhaps at the extreme apex (2)
 - 2(1). The white spot at the base of the longer bracts 5-20 (-25) mm. long, a (third to a) fifth to a tenth as long as the bract; bracts 3 to 6 (or 7) 1. *D. colorata*.
 2. The white spot at the base of the longer bracts 25-50 mm. long, about half as long as the bract; bracts 6 to 10 2. *D. latifolia*.

1. *Dichromena colorata* (L.) Hitchc. WHITE-TOPPED UMBRELLA GRASS. Rhizomes usually orangish, 2-3 mm. thick, extensively creeping, scaly; culms, 12-56 cm. long, erect or often decumbent at the very base; leaves crowded basally, mostly rather stiffly ascending, 2-6 mm. broad, linear-involute at the tip; bracts 3 to 6 (or 7), mostly basally ascending but for most of the length spreading or slightly reflexed, lanceolate, very unequal, the longer ones (3-) 5-15 cm. long, (1.5-) 2.5-5 mm. broad basally, with a white spot 5-20 (-25) mm. long. Locally frequent in swales, ditches and wet places generally, s.e. Tex., Rio Grande Plains and Edwards Plateau, rare in s. part of e. Tex., w. to Terrell Co. in the Trans-Pecos, (spring-) summer; widespread in Carib. region, n. to Va. and the Gulf States; e. Mex.

2. *Dichromena latifolia* Ell. Perennial with rhizomes 2-3 mm. thick; culms rather stiffly erect the full length, 4-8 (-10) dm. long, 2-4 mm. thick basally; leaves crowded basally, ascending, 4-6 mm. broad basally, tapered upward and involute in the distal third, apically pointed; bracts 6 to 10, mostly basally ascending but for most of the length spreading or slightly reflexed, lanceolate, very unequal, the longer ones 5-10 cm. long, 4-10 mm. broad in the lower half, with a white spot 25-50 mm. long (about half as long as the bract). Locally frequent in poorly drained pine savannahs, s.e. Tex. (Hardin and Jefferson cos. only), summer; Gulf States and n. to N.C.

3. *Dichromena nivea* (Boeck.) Britt. Densely tufted; rhizomes absent; culms weak, ascending, 1-3 (-4) dm. long, about 1 mm. thick or less; leaves in the lower part, flaccid, 3-7 cm. long, about 1 mm. broad basally, arcuate-filiform; bracts 2 (rarely 3), weak, the longer ones 17-37 mm. long, filiform most of the length, with a white spot only at the very base. *D. Reverchonii* S. H. Wright, *Rhynchospora nivea* Boeck. Locally frequent in creek beds through limestone on Edwards Plateau, rare in n.-cen. Tex., summer; also Ark. and Okla.

12. RHYNCHOSPORA VAHL (CORT. WILLD.)

BEAK-RUSHES

Perennials (rarely annuals); culms leafy; inflorescence of each culm usually divided into several discontinuous parts (branches of the culm), the largest part (appearing terminal) usually subumbelliform (occasionally much-reduced) with several unequal primary branches (each subtended by a bracteal leaf) and these in turn bearing spikelets or glomerules or corymbs of spikelets; the several axillary parts of the inflorescence below usually reduced as compared to the terminal part, occasionally reduced to virtual absence; spikelets with several spirally-disposed scales, the axils of the lowest 1 (or 2) scales empty, the 1 to 10 axils above with perfect flowers, and usually above that 1 or 2 scales enclosing staminate or rudimentary flowers; scales usually broad, membranous, usually brownish with very indistinct midnerves and no other nervation; bristles usually about 6 or 8 (or up to 20) or reduced to virtual absence; stamens usually 1 or 2 or 3; style bifurcate either at the very tip or usually much farther down, its base becoming indurate and persisting on the achenial body as a tubercle of distinctly different texture; achenial body usually distinctly biconvex, varying to nearly flat or nearly turgid, the cells of the face usually variously sculptured and elongated, the walls often prominent.

About 200 species, cosmopolitan in distribution, especially tropical. The name has been misspelled as *Rynchospora* and *Rhynchospora* in various works.

- 1. Style nearly simple or very shortly 2-branched at the summit; achenial bodies 3.5-6 mm. long; tubercle 3.5-18 mm. long (2)
- 1. Style with 2 long branches; achenial bodies and tubercles mostly shorter (4)
- 2(1). Mature spikelet 7-10 mm. long; achenial body 3.5-4 mm. long; tubercle 3.5-4 mm. long 3. *R. indianolensis*.
- 2. Mature spikelet 15-23 mm. long; achenial body 4-5 mm. long; tubercle 13-18 mm. long (3)
- 3(2). Bristles (at least most of them) much-exceeding the achenial body 1. *R. macrostachya*.
- 3. Bristles shorter than the achenial body, stout and closely appressed 2. *R. corniculata*.

- 4(1). Achenial bodies pearly-white, 0.7-0.8 mm. long; tubercles 0.1-0.2 mm. long, 0.15-0.2 mm. broad; spikelets with 5 to 8 fertile flowers; perianth bristles absent (5)
4. Achenial bodies and/or tubercles considerably larger and often brownish in color; spikelets with fewer fertile flowers; perianth bristles usually present (6)
- 5(4). Achenial body smooth under low magnification or faintly cellular-reticulate under high magnification, the 2 faces strongly convex 4. *R. divergens*.
5. Achenial body with transverse ridges, the 2 faces only slightly convex 5. *R. pusilla*.
- 6(4). Bristles conspicuously retrorsely barbed (7)
6. Bristles antrorsely barbed or plumose or absent or smooth (9)
- 7(6). Bristles 10 to 20 per achene; spikelets with only 1 fertile flower and this appearing terminal (no rudimentary flower above it); inflorescence usually merely a dense terminal fascicle 8. *R. macra*.
7. Bristles fewer; spikelets usually with 2 fertile flowers or one fertile flower and a reduced one above it; each culm with several fascicles, one terminal and several axillary (8)
- 8(7). Central portions of the 2 sides of the achenial body abruptly raised in a hump and polished-buffy, contrasting with the dark chestnut-brown submarginal flat portions, the margins themselves pale and wirelike; leaves basally 5-6 mm. broad; culms basally 2-3.5 mm. thick 6. *R. glomerata*.
8. The 2 sides of the achenial body rather evenly convex all over, grading from buffy centrally to darker brownish marginally, the margins themselves slightly paler and wirelike; leaves basally 2-3 mm. broad; culms basally 1-2 mm. thick 7. *R. capitellata*.
- 9(6). Bristles heavily plumose basally (10)
9. Bristles antrorsely serrulate or barbed, smooth or these absent (11)
- 10(9). Spikelets 4-7 mm. long, 1 to 5 present per culm, remote on slender pedicels; achene 2.3-2.6 mm. long (excluding tubercle) 9. *R. oligantha*.
10. Spikelets 3-4 mm. long, more numerous, congested in spike-like fascicles; achene 1.4-1.8 mm. long (excluding tubercle) 10. *R. plumosa*.
- 11(9). Achenial body smooth (12)
11. Achenial body with transverse wrinkles or transverse rows of cells with sculptured walls (14)
- 12(11). Achenial body 0.9-1 mm. long; tubercle 0.4-0.6 mm. long 11. *R. filifolia*.
12. Achenial body 1.3-1.8 mm. long; tubercle 0.4-2 mm. long (13)
- 13(12). Tubercle 0.4-0.7 mm. long 12. *R. fascicularis*.
13. Tubercle 1-2 mm. long 13. *R. gracilentia*.
- 14(11). Terminal part of inflorescence of each culm very lax, with only 6 to 12 (to 20) spikelets each on a capillary pedicel 3-12 mm. long; culms only 0.6-1 mm. thick 16. *R. rariflora*.
14. Terminal fascicle denser with more spikelets or if as few as 12 then either denser or else the culm thicker than 1 mm. basally (15)
- 15(14). Horizontal rows of cell counted in vertical series near the middle of one face of the achenial body numbering (14 to) 16 to 30 and all the cells nearly isodiametric, the horizontal cell walls only slightly if at all raised more than the vertical walls; achenes turgid, 1 mm. or more thick from the middle of one face to the middle of the other (16)
15. Horizontal rows of cells usually 11 to 15; (except in *R. mixta*) those cells near the middle of the face greatly vertically elongated and their horizontal walls very prominent and forming horizontal wrinkles on the achene, but those cells near the base and top of the body nearly isodiametric; achenes less turgid, less than 1 mm. thick from face to face (17)

- 16(15). Achenial body 2-2.4 mm. long, 1.5-1.8 mm. thick from face to face; horizontal rows of cells 25 to 30 or more; spikelets 4-5.5 mm. long 14. *R. Grayi*.
16. Achenial body 1.5-1.8 mm. long, 1-1.5 mm. thick from face to face; horizontal rows of cells (14 to) 16 to 20; spikelets 2.5-3 mm. long .. 15. *R. Harveyi*.
- 17(15). Achenial body twice as long as broad 17. *R. inexpansa*.
17. Achenial body less than twice as long as broad (18)
- 18(17). Bristles (most of them) surpassing the tubercle (19)
18. Bristles not surpassing the tubercle (21)
- 19(18). Achenial body 1.2-1.3 mm. long, the 2 faces nearly flat; plants never rhizomatous; tubercle 0.3-0.4 mm. long 19. *R. Elliottii*.
19. Achenial body 1.3-1.7 mm. long, the 2 faces distinctly convex at least in the upper part; plants rhizomatous (this often obscure in exsiccatae); tubercle 0.4-0.9 mm. long (20)
- 20(19). Achenial body only 0.8-0.9 mm. broad, with numerous indistinct transverse lines 18. *R. mixta*.
20. Achenial body 1.2-1.6 mm. broad, with strong transverse wrinkles 22. *R. caduca*.
- 21(18). Primary branches of the terminal part of the inflorescence straight, stiffly ascending; faces of the achenial body definitely convex at least in the upper half 23. *R. globularis*.
21. Primary branches of the terminal part of the inflorescence arcuate, often slightly droopy; faces of the achenial body nearly flat or only very slightly convex (22)
- 22(21). Bristles half as long as to nearly as long as the achenial body; blades usually flat basally 20. *R. microcarpa*.
22. Bristles less than half as long as the achenial body; blades usually nearly all strongly involute 21. *R. perplexa*.

1. *Rhynchospora macrostachya* Torr. HORNED-RUSH. Tufted perennial; culms 5-10 dm. long, erect, 3-7 mm. thick basally, triquetrous, leafy; basal sheaths becoming markedly fibrous; inflorescence (at maturity) clavate, 3-6 cm. thick, the branches numerous but rather short, erect; spikelets subulate, rich-brown, 15-23 mm. long, the distal third consisting merely of the protruding distal part of the tubercle; bristles several (4 to 7), about 1.5 to 2.5 times as long as the achenial body, stiff, brownish, antrorsely barbed; achenial body 4-5 mm. long, obovate, nearly flat on the 2 faces, dark-brown; tubercle subulate, consisting of the indurated entire portion of the style, 13-18 mm. long, pale-brownish to buffy. *R. corniculata* var. *macrostachya* (Torr.) Britt. Infrequent in s.e. Tex., rare in e. Tex., in mud, summer; s.e. U.S. n. to N.E., N.Y. and Mo., w. to Kan., Okla. and Tex.

2. *Rhynchospora corniculata* (Lam.) Gray. HORNED-RUSH. Perennial, either tufted or usually with thick scaly rhizomes (these often broken off in specimens); culms 6-11 dm. long, erect, 3-9 mm. thick basally, triquetrous, very leafy; basal sheaths becoming only slightly fibrous; inflorescence at maturity loose-obovoid, ample, 7-15 cm. thick, the numerous branches ascending to spreading; spikelets subulate, rich-brown, 15-23 mm. long, the distal third to half consisting merely of the protruding distal part of the tubercle; bristles 2 to 4 (or 5), about a third to two thirds as long as the achenial body, stiff, brownish, closely appressed; achenial body 4-5 mm. long, obovate, nearly flat on the 2 faces, dark-brown; tubercle subulate, consisting of the indurated entire portion of the style, 13-18 mm. long, pale buffy. Frequent in mud., e. and s.e. Tex., spring-summer (fruiting into fall); s.e. U.S., n. to Del., Ky., Ind. and Mo., w. to Okla. and Tex.; W.I.

Ours are nearly all of the var. *interior* Fern. in which the achenial body is only about 1.5 times as broad as the base of the tubercle; a few are of the var. *corniculata* in which the body is about twice as broad as the tubercle.

3. *Rhynchospora indianolensis* Small. Tufted perennial; culms 5-9 dm. long, erect, 3-6 mm. thick basally, triquetrous, leafy (especially in the basal part); terminal part of the inflorescence somewhat umbelliform, *Cyperus*-like, 4-9 cm. long, with several ascending rays each bearing a dense roundish glomerule or capitulum of nearly sessile spikelets,

usually a reduced axillary part of the inflorescence present; spikelets 7-10 mm. long, lanceolate, brown, acute, the tubercle only slightly if at all exerted; bristles 3 to 5, about equaling the achenial body, stiff, appressed; achenial body 3.5-4 mm. long, obovate, nearly flat on the 2 faces, dark brown; tubercle 3.5-4 mm. long, brown, elongate-deltoid, acute or slightly acuminate. Locally frequent in mud, s.e. Tex., summer; endemic.

4. *Rhynchospora divergens* M. A. Curtis. Tufted short-lived perennial (or annual?); culms 18-42 cm. long, 0.3-0.9 mm. thick, erect; leaves numerous, 5-10 cm. long, setaceous-involute; terminal part of the inflorescence umbel-like, 1-2 cm. long, about 1 cm. broad, occasionally 1 or 2 reduced axillary parts of the inflorescence present below; spikelets linear, 3- to 10-flowered, about 1 mm. thick, the fruits very quickly maturing in succession acropetally as the spikelet elongates, the scales and achenes falling as the achenes mature, eventually as many as 5 to 8 fruits maturing from a single spikelet but only 1 or 2 visible at any one time; scales brownish, about 1.5 mm. long; bristles absent; achenial body 0.7 mm. long, obovate, white, the 2 faces convex and under low magnification appearing smooth, under higher magnification faintly cellular-reticulate; tubercle about 0.15 mm. long and 2 mm. broad, whitish, blunt. Rare in moist sand, s.e. Tex. (Aransas and Montgomery cos.), summer; S.C., Ga., Fla., Bah. I. and Tex.

5. *Rhynchospora pusilla* M. A. Curtis. Tufted short-lived *Bulbostylis*-like perennial; culms 15-30 cm. long, 0.2-0.7 mm. thick, erect; leaves numerous, 5-10 cm. long, setaceous-involute; terminal part of the inflorescence reduced, somewhat umbel-like or corymbose, 6-20 mm. long, 5-10 mm. broad, often reduced parts of the inflorescence also present from the penultimate axils; spikelets linear, 3- to 10-flowered, about 1 mm. thick, the fruits very quickly maturing in acropetal succession and falling with the scales, as many as 5 to 8 fruits maturing from a single spikelet but only 1 or 2 visible at any one time; scales brownish, about 1.5 mm. long; bristles absent; achenial body 0.7-0.8 mm. long, obovate, whitish, the 2 faces nearly flat, with transverse rugae; tubercle 0.1-0.15 mm. long, 0.15-0.2 mm. broad, whitish, blunt. Rare in moist sand, s. part of e. Tex. (Hardin Co.), summer; Fla. to Tex.; W.I. Some authors have referred these plants to *R. intermixta* Wright.

6. *Rhynchospora glomerata* (L.) Vahl. Tufted perennial; culms 6-11 dm. long, erect, 2-3.5 mm. thick basally, triquetrous, leafy; larger leaves 5-6 mm. broad near the base of the plant; inflorescence variable, either of a number of subcapitate glomerules scattered along the upper half of the culm ("var. *glomerata*") or of a few more discretely grouped glomerules ("var. *angusta* Gale"); spikelets lanceolate, 4.5-6 mm. long, rich-dark-brown, with usually 2 fruits (less commonly 3 or 1, if with 1 then with a terminal rudimentary flower); bristles about 6, exceeding the achene and often about equaling the tubercle, somewhat dorsiventrally compressed, conspicuously retrorsely barbed; achenial body pyriform, 1.5-1.7 mm. long, the 2 sides with an abruptly raised central hump which is polished and buffy, contrasting with the dark-chestnut-brown submarginal flat portion, the margins themselves pale like the umbo; tubercle 1.3-1.8 mm. long, elongate-deltoid, much-compressed, grayish. In moist sand, frequent in e. Tex., infrequent in s.e. Tex., summer; Gulf States, n. to Del., Va., Tenn. and Ark., w. to Okla. and Tex.

7. *Rhynchospora capitellata* (Michx.) Vahl. Tufted perennial; culms 2-9 dm. long, erect, 1-2 mm. thick basally, bluntly 3-angled, leafy; larger leaves 2-3 mm. broad near the base of the plant; inflorescence of a few turbinate fascicles scattered along the upper half of the culm; spikelets lanceolate, 3.5-5 mm. long, usually with 2 fruits (less commonly 3 or 1, if with 1 then also with a terminal rudimentary flower); bristles about 6, exceeding the achene, usually about equaling the tubercle, somewhat dorsiventrally compressed, conspicuously retrorsely barbed; achenial body pyriform or obovate, basally cuneate, 1.3-1.6 mm. long, the 2 sides merely convex (the central portions paler, grading off into the darker brown submarginal zones, the margins themselves pale like the center); tubercle elongate-deltoid, 0.9-1.6 mm. long, grayish, much-compressed. Infrequent or rare in e. Tex. (Austin, Guadalupe, Henderson and Leon cos.), apparently always in acid boggy ground, summer; e. U.S. n.e. to N.S., w. to Wisc., Mo., Okla. and Tex.

8. *Rhynchospora macra* (Clarke) Small. Tufted (?) or with rhizomes about 1 mm. thick; culms 3-7 dm. long, erect, triquetrous, 1.5-2 mm. thick near the base; leaves several, the blades 2-3.5 mm. broad near the base of the plant; inflorescence primarily a large terminal turbinate-corymbose fascicle 1-3 cm. broad, 1 or 2 extremely reduced axillary fascicles also present; spikelets linear-lanceolate, 4-5 mm. long, pale brown, each with a

single fertile flower and never a higher rudimentary one; bristles 10 to 20 per achene, much-surpassing the body, conspicuously retrorsely barbed; achenial body pyriform, 1.8-2 mm. long, brown (the raised central portions of the 2 sides paler, buffy), the submarginal surfaces with very faint transverse wrinkles; tubercle elongate-deltoid, much-compressed, about 1 mm. long. Very rare in bogs in e. Tex. (Houston and Robertson cos.), summer; Ga., Fla., Miss. and Tex.

9. *Rhynchospora oligantha* Gray. Tufted perennial; culms 15-45 cm. long, erect or ascending, 0.3-0.6 mm. thick; leaves filiform-setaceous, resembling the stems; inflorescence of a lax terminal fascicle and usually a remote reduced axillary one, each fascicle with only 1 to 3 spikelets; spikelets on slender individual pedicels 3-10 mm. long, narrowly ovoid, pale-brown, 4-7 mm. long, usually with 2 fruits (1 to 3); bristles 6, in the lower half densely plumose, slightly shorter than the body; achenial body 2.3-2.6 mm. long, broadly ovate, dark-brown when mature, very turgidly biconvex, transversely wrinkled, apically pronouncedly narrowed into a definite hour-glass-shaped tubercle base; tubercle very short-conic, 0.3-0.6 mm. long. Rare in bogs in e. Tex. (Austin, Henderson, Smith and Waller cos.), spring (May-early June); N.J., Del., N.C., Ga. and Gulf States; Gr. Ant.; C.A.

10. *Rhynchospora plumosa* Ell. Tufted perennial; culms wiry, 2-4 dm. long, erect, 0.6-1.1 mm. thick basally, stramineous; leaves setaceous-filiform, wiry, numerous, often curling toward the ends; lower bracts of the fascicles elongate, wiry, like the leaves, far-surpassing the inflorescence; inflorescence compact, congested, terminal, 1-3 cm. long, about 1 cm. thick, often spikelike; spikelets pale- to dark-brown, lance-elliptic, 3-4 mm. long, usually with 1 or 2 fruits; bristles 6, densely plumose in the lower part; achenial body broadly obovate, 1.4-1.8 mm. long, brown, turgid, transversely wrinkled, not narrowed apically; tubercle short-conic, about 0.5 mm. long, brown. *R. semiplumosa* Gray. Infrequent in s.e. Tex. (Hardin, Tyler and Newton cos.), Apr.-May; coastal flats, N.C. to Tex.; Cuba.

11. *Rhynchospora filifolia* Gray. Tufted perennial; culms 3-6 dm. long, about 1 mm. thick near the base, erect, wiry; leaves mostly involute, resembling the culms; inflorescence a terminal very dense round-topped fascicle 10-15 mm. broad, plus usually one reduced fascicle in the next lowest axil; spikelets cinnamon-brown, lanceolate, 3-5 mm. long, with 3 to 10 flowers, the 2 to 6 achenes and their scales quickly falling in acropetal succession, upon maturation only 1 or 2 mature achenes present at any one time and these usually exposed by the rapid shedding of the scales; bristles 6, usually surpassing the tubercle, minutely antrorsely barbed; achenial bodies obovate, 0.9-1 mm. long, biconvex, the 2 polished smooth faces brown or the central portions paler, buffy; tubercle deltoid, grayish, compressed, acute, 0.4-0.6 mm. long. Rare in moist loam, e. Tex. (Hardin and Waller cos.), summer; coastal areas, N.J. to Tex.; Cuba.

12. *Rhynchospora fascicularis* (Michx.) Vahl. Tufted perennial; culms 5-13 dm. long, 1.5-2.5 mm. thick basally, subterete or obtusely 3-angled, leafy; leaves 1-4 mm. broad; inflorescence a crowded terminal group of 1 to 3 fascicles (about 1 cm. broad and over-topped by the setaceous bracts) plus usually 1 (rarely 2) remote similar axillary fascicles below; spikelets 3.5-5 mm. long, lanceolate, cinnamon-brown, several-flowered and -fruited, the scales caducous in acropetal succession, each falling just before maturation of its achene; bristles about 6, minutely antrorsely serrulate or barbed; achenial body nearly orbicular, biconvex, very dark-brown or fuscous except for a buffy spot in the center of each of the 2 smooth faces, 1.4-1.5 mm. long; tubercle deltoid, 0.4-0.7 mm. long, much-compressed, grayish. Infrequent in moist sand, s.e. Tex. (Aransas, Chambers and Jefferson cos.), summer; low coastal areas, Va. to Tex.; Berm.; Gr. Ant.

13. *Rhynchospora gracilentia* Gray. Tufted perennial; culms 5-9 dm. long, erect, 1-1.5 mm. thick basally, essentially terete; leaves mostly confined to the base of the plant, the blades proximally only 1-2.5 mm. broad, distally involute; inflorescence a terminal fascicle about 1 cm. broad and usually a remote slightly smaller axillary one a few cm. below; spikelets broadly lanceolate, 3-4 mm. long, cinnamon-brown, with 2 or 3 flowers, when 3 flowers present usually only the middle one or the upper 2 bearing fruit; bristles about 6, about equaling the body or tubercle, minutely antrorsely serrulate or barbed; achenial body broadly obovate or nearly orbicular, turgidly biconvex, 1.3-1.8 mm. long, smooth, dark-brown (or a central spot on each of the 2 faces slightly paler); tubercle much-compressed, whitish, 1-2 mm. long including the straplike prolongation. Infrequent in

boggy ground, e. and s.e. Tex., summer (-fall?); s.e. U.S. mainly near the coast, N.J. to Tex., less frequent inland to Tenn. and Ark.

14. *Rhynchospora Grayi* Kunth. Tufted perennial; culms 4-7 dm. long, 1.5-2 mm. thick basally, erect; leaves mostly crowded toward the base, curly, 2-4 mm. broad; inflorescence a dense terminal fascicle about 1 cm. broad and long, of essentially sessile spikelets, plus sometimes a reduced fascicle lower down; spikelets cinnamon-brown, 4-5.5 mm. long, narrowly ovoid to broadly lanceolate, of 2 to 3 flowers, but usually maturing only 1 fruit; bristles 6, minutely antrorsely serrulate; achenial body broadly obovate, 2-2.4 mm. long, 1.8-2.2 mm. broad, 1.5-1.8 mm. thick from face to face, turgid, at maturity dark-brown, each face with 25 to 30 or more horizontal rows of minute nearly isodiametric cells whose horizontal walls are only slightly more prominent than the vertical walls; tubercle conic, 0.4-0.6 mm. high, basally not wider than (but often appearing embedded in) the top of the body. Rare in moist sand, e. Tex. (Jasper and Liberty cos.), Mar.-May (earlier-flowering than most beak-rushes); lowlands near the coast, Va. to Tex.; Cuba.

15. *Rhynchospora Harveyi* W. Boott. Tufted perennial; culms 15-60 cm. long, 1-2 mm. thick near the base, erect, obtusely triquetrous, leafy; leaves 1.5-3 mm. broad; inflorescence a dense terminal fascicle about 5 mm. high and 5-10 mm. broad, of essentially sessile spikelets plus usually 1 or 2 reduced similarly dense glomerules lower down; spikelets cinnamon-brown, ovoid, 2.5-3 mm. long, usually with 2 flowers and setting 1 fruit; bristles 6, minutely antrorsely serrulate; achenial body broadly obovate, 1.5-1.8 mm. long, 1.3-1.6 mm. broad, 1-1.5 mm. thick from face to face, turgid, at maturity rich-dark-brown, each face with (14 to) 16 to 20 horizontal rows of minute nearly isodiametric cells with prominent walls; tubercle conic, 0.4-0.5 mm. long, basally no wider than (but often appearing embedded in) the top of the body. *R. Plankii* Small. Frequent to abundant in low places in open woods and prairies, e., s.e. and n.-cen. Tex., Apr.-Sept.; s.e. U.S. n. to Va., Tenn. and Mo., w. to Okla. and Tex.

16. *Rhynchospora rariflora* (Michx.) Ell. Tufted perennial; culms 3-6 dm. long, 0.6-0.9 mm. thick near the base, ascending but often flexuous, essentially terete; leaves in lower half of plant, capillary-setaceous; inflorescence of a terminal 6- to 12- (to 20-) spikeletted lax subumbelliform unit 1-3 cm. broad, the individual capillary pedicels 3-12 mm. long; spikelets narrowly ovoid, subacute, pale-cinnamon-brown, 3-4 mm. long, with 2 to 4 flowers and maturing 1 to 3 fruits; bristles 6, shorter than the achenial body, minutely antrorsely serrulate; achenial body broadly obovate, 1.1-1.4 mm. long, biconvex, pale-brown, the 2 faces with strong transverse ridges; tubercle deltoid, compressed, 0.3-0.6 mm. long. Rare in bogs or piny crayfish-land, e. and s.e. Tex. (Austin, Harris, Henderson, Orange and Waller cos.), May-June; coastal areas, N.J. to Tex.; also Tenn., Gr. Ant. and C.A.

17. *Rhynchospora inexpansa* (Michx.) Vahl. Tufted perennial; culms 5-8 dm. long, erect (or terminally drooping), wiry, 1.5-2 mm. thick near the base; leaves mostly basal, with long tough somewhat curly blades; inflorescence fairly narrow, elongate and drooping; spikelets lanceolate, brown, 4.5-6 mm. long, with 2 to 5 flowers, setting 1 to 4 fruits; bristles about 6, surpassing the tubercle, minutely antrorsely serrulate; achenial body elliptic-obovate, 2-2.2 mm. long, 0.8-1 mm. broad, much-compressed, the 2 flat faces transversely ridged; tubercle deltoid, 0.9-1.2 mm. long. Locally frequent in open pine-lands, e. and s.e. Tex. (Angelina, Hardin, Jasper, Jefferson and Liberty cos.), summer; Coastal States, Va. to Tex.; also Ark. and Okla.

18. *Rhynchospora mixta* Small. Rhizomatous perennial; culms about 1 m. long, about 2 mm. or more thick basally, leafy, erect or ascending (flexuous in the distal floriferous portion); blades 3-4 mm. broad; inflorescence decomposed, open, the terminal portion 3-4 cm. broad, very lax, of about 25 spikelets, some of the ultimate glomerules on long spreading arcuate-erect peduncles 10-15 mm. long; spikelets narrowly ovoid, 4-6 mm. long, brown, with 2 or more (rarely as many as 10) flowers, 1 (rarely as many as 10) fruit produced; bristles about 6, surpassing the tubercle, upwardly minutely barbed; achenial body narrowly obovate, 1.3-1.4 mm. long, 0.8-0.9 mm. broad, turgidly biconvex, with very numerous faint transverse lines; tubercle deltoid-attenuate, 0.4-0.9 mm. long, compressed. Rare in sandy forested areas near streams, e. Tex. (Nacogdoches Co.), summer; near the coast, N.C. to s.e. La.; Tex.

19. *Rhynchospora Elliottii* A. Dietr. Tufted perennial; culms 8-15 dm. long, 2.5-5 mm. thick basally, erect except slightly nodding distally; leaf blades 4-5 mm. wide basally,

mostly long-tapered, strictly erect and appressed; inflorescence of 2 to 5 dense compound separate portions, the terminal portion irregularly corymbiform, 2-6 cm. broad, of 150 to 300 spikelets; spikelets ovoid, rich-dark-brown, 2.5-3.2 mm. long, with 3 to 6 flowers and setting 2 to 4 fruits; bristles 6, surpassing the tubercle, minutely antrorsely serrulate, not closely appressed to the achene but slightly spreading basally and arcuate-erect; achenial body obovate, tawny-brown, 1.2-1.3 mm. long, 0.9-1.1 mm. broad, with very pronounced transverse ridges on the 2 nearly flat faces; tubercle deltoid, 0.3-0.4 mm. long. *R. schoenoides* (Ell.) Wood, an illegit. name. Frequent in moist sand in e. and s.e. Tex., summer; near the coast, N.C. to Tex. (except Fla.).

20. *Rhynchospora microcarpa* Gray. Tufted perennial; culms 5-8 dm. long, 2-3 mm. thick basally, erect; leaves mostly appressed or curly, 2-3 mm. broad basally; inflorescence in (1 or) 2 to 4 parts per culm, the terminal part irregularly corymbiform, dense, nearly erect, 2-6 cm. broad, of 100 to 200 spikelets or less commonly fewer; spikelets ovoid to narrowly ovoid, 2.5-3 mm. long, dark-rich-brown, with 3 or 4 flowers and setting 2 or 3 fruits; bristles about 6, from half as long as to as long as the body or rarely nearly equaling the tubercle, stiffly erect and mostly appressed to the body, minutely antrorsely serrulate; achenial body obovate, 1-1.2 mm. long, 0.8-1.2 mm. broad, the 2 nearly flat or very slightly convex faces with strong transverse wrinkles; tubercle deltoid, 0.2-0.5 mm. long. Rare in moist sand, s.e. Tex. (Aransas Co.), summer; near the coast, Fla. and Ga. to Tex.; Bah. I., Hisp. and Cuba.

21. *Rhynchospora perplexa* Small. Tufted perennial; culms 5-11 dm. long, 1.5-2 mm. thick basally, wiry, erect or very slightly flexuous in the floriferous region; leaf blades 1-2 mm. broad basally, mostly strongly involute; inflorescence in 1 to 3 parts per culm, the terminal part very irregularly corymbiform, 1-4 mm. broad, usually dense and with upwards of 100 to 200 spikelets; spikelets ovoid, rich-dark-brown, 2.5-3 mm. long; bristles about 6 or fewer, less than half as long as the body to which they are appressed or reduced to virtual absence; achenial body obovate, 1-1.3 mm. long, 0.9-1.2 mm. broad, tawny, the 2 nearly flat or very slightly convex faces with strong transverse wrinkles; tubercle deltoid, 0.2-0.3 mm. long. Rare in moist sand in e. and s.e. Tex. (Aransas, Hardin, Tyler and Waller cos.), late spring-summer; Coastal States, s.e. Va. to Tex.; Tenn.; Gr. Ant. Probably not specifically distinct from *R. microcarpa*.

22. *Rhynchospora caduca* Ell. Rhizomatous perennial; culms 7-13 dm. long, 2-4 mm. thick near the base, ascending but quite flexuous in the upper part; leaves 4-7 mm. broad below the middle, tapering in both directions; inflorescence of 3 to 5 parts per culm, the terminal part obovoid, irregularly corymbiform, 2-4 cm. broad, with 60 to 125 spikelets, some of the primary branches commonly elongate, erect and 1-2 cm. long; spikelets rich-dark-brown, ovoid, 4-4.5 mm. long, with 3 to 6 flowers and setting 2 to 5 fruits; bristles about 6, surpassing the tubercle and somewhat stiffly spreading away from the body basally, minutely antrorsely serrulate; achenial body obovate, 1.4-1.7 mm. long, 1.2-1.6 mm. broad, the 2 faces with strong transverse wrinkles and at least in the upper part pronouncedly convex; tubercle deltoid, 0.6-0.8 mm. long. Frequent in moist sand, s.e. Tex., less frequent in e. Tex. and very local in Burnet and Llano cos. on the Edwards Plateau, summer; Coastal States, Va. to Tex.; also Ark. and Okla.

23. *Rhynchospora globularis* (Chapm.) Small. Tufted perennial; culms (15-) 30-75 (-90) cm. long, 1-1.8 (-2.5) mm. thick near the base, basally often shortly reclining, mostly erect, leafy with the old sheaths basally becoming somewhat fibrous; blades 1.5-4 mm. broad; inflorescence in 1 to 4 parts per culm, the terminal part usually strictly erect, of several straight stiffly ascending unequal branches each topped by a corymbiform glomerule 8-15 mm. broad (broader than high) and often with stiffly erect setaceous protruding bracts; spikelets ovoid, 2.5-4 mm. long, cinnamon-brown, with 1 to 4 flowers and setting 1 to 3 fruits; bristles about 6, shorter than the body of the achene, minutely antrorsely serrulate; achenial body obovate, 1.2-1.6 mm. long, 1-1.5 mm. broad, castaneous, with 2 faces which are convex at least in the upper part and have strong transverse wrinkles; tubercle deltoid, 0.3-0.6 mm. long. *R. cymosa* of many auth., not (Willd.) Ell., *R. globularis* var. *recognita* Gale, *R. obliterated* Gale. Moist sandy soil, frequent in e. Tex., infrequent in s.e. Tex. and rare inland to n.-cen. Tex., late spring-summer; widespread in s.e. U.S., n. to N.J., Tenn. and Mo., w. to Okla. and Tex.; also Calif., W.I. and C.A.

13. PSILOCARYA TORR. BALD RUSH

An American and Australian genus of about 6 species, included by several workers in *Rhynchospora*.

1. *Psilocarya nitens* (Vahl) Wood. Said to be annual but occasionally with weak short rhizomes and often rooting from the lower nodes; culms few, erect, soft, 3-8 dm. long, 1-4 mm. thick, usually with 1 to 3 weakly exerted ascending branches in the middle part; leaves crowded in lower half of culm, with long acute ascending blades; main panicle lax, terminal on main stem, smaller panicles terminating the branches; bracts several, attached at close intervals along the panicle axis, shorter than the inflorescence; inflorescence axis about 1 cm. long, with several unequal divergent mostly naked branches bearing racemes of spikelets; spikelets 5-9 mm. long, narrowly ovoid, acute; scales numerous, spirally attached, strongly imbricate, brown, ovate, acute, all fertile; perianth absent; style branches 2; base of style becoming indurated and persistent on the achene as a low grayish tubercle almost as broad as the achene itself (but not as thick) achene plumply biconvex, *Rhynchospora*-like, strongly transversely wrinkled. Infrequent or rare in s.e. Tex. (Hardin to Aransas cos.), usually in marshy places; coastwise, Mass. to Tex.; local in n.w. Ind.

14. SCLERIA BERG.¹⁸ STONE-RUSH. NUT-RUSH

Rhizomatous perennial or rarely tufted annual monoecious herbs; upper portion of sheaths often broadly 3-winged; leaf blades well-developed; ligule usually triangular or reduced to absent; flowers unisexual, the 2 kinds usually in separate spikelets; inflorescence congested but much-reduced, of a few spikelets in a fascicle or several or a number of these borne at intervals along the upper half of the culm; 1-flowered pistillate spikelet occasionally borne apparently from the lowest (sterile) scale of the staminate spikelet; perianth absent (perhaps partially represented by the "hypogynium," see below); stamens 1 to 3; style 2- or 3-branched, basally slender to thickened, totally deciduous; achene usually borne on an indurated base (hypogynium) which usually adheres to the base of the mature achene and bears 3 to 9 tubercles or a rough crust or is extended into 3 prominent lobes; achenial body (minus hypogynium) globose or ovoid to obovoid, in texture crustaceous or bony, smooth or rough, usually whitish.

About 200 species, mostly tropical and subtropical.

1. Hypogynium obscure or absent (2)
1. Hypogynium present, well-developed (5)
 - 2(1). Achene reticulate or verrucose 4. *S. verticillata*.
 2. Achene essentially smooth (3)
 - 3(2). Inflorescence an interrupted spiciform arrangement of glomerules 1. *S. nutans*.
3. Inflorescence a single cluster at the summit of the culm (4)
 - 4(3). Achene 2 mm. long, its base 6-pored 2. *S. georgiana*.
 4. Achene 3-4 mm. long, pores absent 3. *S. Baldwinii*.
- 5(1). Hypogynium covered with a rough white crust (6)
 5. Hypogynium not so covered (7)
 - 6(5). Leaves 5-8 mm. broad; achenes 2-2.5 mm. long ... 5. *S. triglomerata*.
 6. Leaves 1-2.5 mm. broad; achenes 1-1.8 mm. long 6. *S. minor*.
 - 7(5). Achene smooth 10. *S. oligantha*.
 7. Achene rugose or reticulate (8)
 - 8(7). Hypogynium not bearing tubercles but deeply 3-lobed 11. *S. Muhlenbergii*.
8. Hypogynium bearing 3 or 6 tubercles (9)

¹⁸ Largely adapted from Earl L. Core in C. L. Lundell, Flora of Texas I: 383-392. 1967.

- 9(8). Hypogynium bearing 6 tubercles9. *S. pauciflora*.
 9. Hypogynium bearing 3 tubercles (10)
 10(9). Plants pubescent7. *S. ciliata*.
 10. Plants glabrous8. *S. Brittonii*.

1. *Scleria nutans* Kunth. Perennial; rhizome elongate, odorous; culms 15-65 cm. long, erect, 1-2 mm. thick, acutely trigonous; sheaths hirsute; blades 4-20 cm. long, 2-5 mm. broad; inflorescence interrupted, glomerate-spicate, simple, terminal, 4-12 cm. long, of 3 to 9 sessile often nutant more or less remote glomerules; spikelets 4-5 mm. long; hypogynium absent; achene 1-2 mm. long, obovoid to subglobose, obscurely trigonous, whitish, smooth, shining, basally tapered, the basal pores 9 to 12, shallow or virtually absent. *S. hirtella* of most auth., not Sw. Moist soil, e. Tex., rare (collected once in Waller Co.), spring-early summer(?); Coastal States, Ga. to Tex.; W.I., Mex. and s. to Urug. and Parag.; also trop. Afr.

2. *Scleria georgiana* Core. SLENDER NUT-RUSH. Perennial; rhizomes 2.5-5 mm. thick; culms 3-5 dm. tall, about 1 mm. thick, wiry, trigonous, glabrous; sheaths glabrous, the lower ones bladeless; blades 12-16 cm. long or more, 1-2 mm. broad, few, glabrous, linear or filiform, simulating but shorter than the stem, involute; inflorescence a single terminal fascicle of 2 to 5 spikelets; lower bract 1-8 cm. long, 1-2 mm. broad, appearing as a continuation of the culm; spikelet about 5 mm. long; bractlets glabrous, lanceolate; hypogynium absent; achene about 2 mm. long, white, smooth, usually longitudinally ridged, dull, basally triangular and 6-pored, ovoid, shorter than the scales. Moist loam, e. and s.e. Tex., spring-early summer; Coastal States, N.C. to Tex.; Cuba; Jam.; Br. Hond.; s.e. Braz.

3. *Scleria Baldwinii* (Torr.) Steud. Perennial; rhizomes horizontal, nodose, thick; culms 3-9 dm. long, about 1 mm. thick, erect, sharply trigonous, lightly channelled, smooth or slightly scabrous distally on the angles; sheaths tight, glabrous; blades 10-45 cm. long, 1-5 mm. broad, glabrous or slightly scabrous at the margins, linear, rigid, keeled (i.e., midnerve prominent), few, the lower ones reduced or absent; lower bract of the inflorescence 4-15 cm. long, 1-4 mm. broad; inflorescence a single capitate cluster 1.5-2 cm. high; bractlets ovate; spikelets 8-10 mm. long, oblong, obtuse, of many flowers; hypogynium absent; achene ovoid, dull, whitish, smooth or often longitudinally ribbed, conspicuously apiculate, 3-4 mm. long, obscurely trigonous, basally triangular and pointed, pitless, concave laterally. Incl. var. *costata* Britt. Moist soil, s.e. Tex. (Harris Co.); Coastal States, Ga. to Tex.; Cuba.

4. *Scleria verticillata* Muhl. LOW NUT-RUSH. Annual; roots capillary, fibrous, odorous; culms 1-6 dm. long, about 1 mm. thick, simple, erect, trigonous; sheaths usually pilose; blades 5-30 cm. long, 0.5-2 mm. broad, flat; inflorescence interrupted-spiciform, simple, of 2 to 8 erect glomerules, 4-15 cm. long; spikelets 2-3 mm. long, of 2 or 3 flowers, sessile; bracts 6-7 mm. long, often caudate; hypogynium absent; achenes about 1 mm. long, reticulate or verrucose, globose, obscurely trigonous, whitish, fragile, mucronate, with about 5 pores just above the attenuate trigonous base. Moist sandy soil, often along river bars, extreme n. Rio Grande Plains (Guadalupe Co.) and n.-cen. Tex., probably elsewhere, rare, July-Sept.; Ont.; much of e. U.S.; Mex.; Cuba; Venez.; Surinam; Braz.

5. *Scleria triglomerata* Michx. WHIP-GRASS. Perennial; rhizomes clustered, hard, 3-5 mm. thick; culms 4-10 dm. long, 2-4 mm. thick basally, sharply trigonous, glabrous or nearly so, somewhat roughened distally; sheaths scarcely winged, scabrous on the angles; blades 15-30 cm. long, 5-9 mm. broad, rigid, scabrous marginally, scarcely narrowed up to the abrupt apex; inflorescence of 3 to 12 spikelets, terminal or axillary, in about 3 fascicles, the lateral ones often on erect peduncles; bracts foliaceous; staminate spikelets 5-6 mm. long, of 2 to 3 flowers; hypogynium low, obscurely trigonous, covered with a white papillose crust; achene 2-3 mm. long, ovoid-subglobose, smooth, shiny, bright white, obtuse. Moist soil, e., s.e. and n.-cen. Tex., locally abundant, June-Sept.; Ont. to Mass., s. to Ia. and the Gulf States.

6. *Scleria minor* (Britt.) Stone. Perennial; rhizomes 7 mm. thick, hard, clustered; culms 3.5-6 dm. long, 1-3 mm. thick basally, erect, sharply trigonous, glabrous or nearly so, somewhat roughened toward the apex; sheaths scarcely winged, slightly scabrous

on the angles; blades 1-2.5 mm. broad, long-tapered; inflorescence few-spikeletted, terminal or axillary in about 3 fascicles, the lateral ones on long filiform peduncles; male spikelets 5-6 mm. long; hypogynium low, obscurely trigonous, covered by a white papillose crust; achenes 1-1.8 mm. long, subglobose to ovoid, smooth, shiny, whitish, obtuse. *S. triglomerata* var. *gracilis* Britt. Moist soil, e. and s.e. Tex., rare (Matagorda and Newton cos.); Coastal States, N.J. to S.C.; Tex.

7. *Scleria ciliata* Michx. Perennial; rhizomes clustered, 2-3 (-5) mm. thick; culms 2-6 dm. long, 1.2-2.5 (-4) mm. thick, sharply triangular; sheaths pubescent, especially on the angles; blades 20-45 cm. long, 2-6 mm. broad, keeled, linear, obtuse, ciliate on the margins and midrib beneath, often much-surpassing the culm; inflorescence terminal and axillary, few-spikeletted, the cluster sometimes arising on short peduncles from the lower axils; male spikelets with 3 or 4 flowers; hypogynium a narrow obtusely trigonous flange supporting 3 globose brownish entire or 2-lobed tubercles; achene 2-3 mm. long, tuberculate or verrucose-scabrous, whitish, globose, fragile, usually mucronate-apiculate. *S. Elliottii* Chapm. E., s.e. and n.-cen. Tex., frequent, Apr.-Oct.; Va. to Mo. and s. to Gulf States; W.I., Br. Hond.

8. *Scleria Brittonii* Core. Perennial; rhizomes elongate, 4-6 mm. thick; culms 2-6 dm. or more long, 1-1.5 mm. thick, rigidly erect, trigonous, glabrous or sometimes scabrous distally; sheaths glabrous; blades to 2 dm. long and 2 mm. broad, few, glabrous; lower bract foliaceous, erect, often appearing as a continuation of the culm; inflorescence terminal or often with a remote axillary cluster on a long slender ancipital peduncle, the clusters small; spikelets of 2 or 3 flowers, 5 mm. long; hypogynium with 3 entire or 2-lobed tubercles; achene 2-3 mm. long, papillose-verrucose, globose or globose-ovoid, apiculate, whitish. Moist soil in s.e. Tex., rare (collected once in Jefferson Co.), summer; Coastal States, N.C. to Tex.

9. *Scleria pauciflora* Muhl. CAROLINA WHEAT-GRASS. Rhizomatous perennial; rhizomes 3-5 mm. thick, hard, clustered; culms mostly rising singly at short intervals from the rhizome, 2-5 dm. long, 2-3 mm. thick, basally stiffly erect; blades 15-20 cm. long, 3-4 mm. broad basally, few, rigid, scabrous marginally, often folded and/or pleated; inflorescence of a few spikelets in a terminal cluster or sometimes 1 or 2 in axillary clusters, the lateral ones remote on long filiform peduncles; bracts surpassing the culm; spikelets few-flowered; hypogynium a narrow trigonous border bearing 6 globose tubercles (disposed in pairs in the var. *kansana* Fern.); achene globose, 1-2 mm. long, whitish, apiculate, transversely verrucose-papillate, the lower papillae pointed down and elongate. *S. ciliata* var. *pauciflora* (Muhl.) Kükenth. Moist sandy soil, infrequent in e. and s.e. Tex., rare in n. part of Rio Grande Plains (Wilson Co.), summer; much of e. U.S., w. to Kan., Okla. and Tex.; Cuba; Br. Hond.

10. *Scleria oligantha* Michx. Perennial; rhizome 2-5 mm. thick; culms 3-6 dm. long, 2-3 mm. thick, erect, sharply trigonous, rising adjacently along the rhizome; sheaths narrowly winged; blades 12-25 cm. long, 2-6 mm. broad, scabrous on the nerves and margins, linear, somewhat revolute on drying; inflorescence of 2 to 5 dense clusters, terminal and axillary, the lateral on long filiform peduncles, few-spikeletted, the peduncles scabrous on the angles, dilated toward the apex; hypogynium borderlike, narrow, obtusely trigonous, with 8 or 9 small hemispheric white-pulverulent tubercles; achene ovoid, 3-4 mm. long, whitish, shiny, shorter than the scales, obtusely pointed. Moist sand, e., s.e. and n.-cen. Tex., frequent, Apr.-July; D.C. to Ind. and Mo., s. to the Gulf States.

11. *Scleria Muhlenbergii* Steud. Annual with fibrous roots or perennial with very short rhizomes; culms 15-80 cm. long, 1-1.6 mm. thick, trigonous or somewhat compressed, tufted, weak and diffuse; sheaths sometimes somewhat winged; blades 15-25 cm. long, 1-4 (-8) mm. broad, flat, often with cartilaginous margins, sometimes scabrous marginally and on the nerves beneath; inflorescence terminal and axillary (the lateral ones very remote, on long setaceous-filiform compressed often recurved or drooping peduncles), loosely flowered, the clusters 1-3 cm. long; spikelets 2-4 mm. long; hypogynium deeply 3-lobed, the lobes ovate-lanceolate, subacute, appressed; achene 2 mm. long, more or less reticulate, the transverse ridges pilose, sordid-white, globose-elliptic, umbonate, the ridges somewhat spirally disposed. *S. setacea* of many auth., non Poir. Moist sand, e. Tex., infrequent, rare in n. part of Rio Grande Plains (Guadalupe Co.); N.Y. to Ind. and s. to Gulf States; W.I.; Mex.; C.A., s. to Braz. and Bol.

15. CAREX L.

SEDGE. CARIC-SEDGE

Perennials with well-developed leaves, monoecious; inflorescence of several to many more or less spikelike spikelets emerging singly from the axils of the upper leaves (herein called bracts) (in *C. leptalea* the spikelet solitary), in some species the spikelets so numerous and crowded and the bracts so reduced that the inflorescence appears headlike or spikelike; spikelets of few to many unisexual flowers arranged spirally around the axis (rarely in definite rows) either wholly staminate or pistillate or androgynous (with staminate flowers at top, pistillate below) or gynecandrous (reverse order); *staminate flowers* comprising merely 3 stamens (rarely 2) subtended by a scale; *pistillate flowers* merely a scale subtending a "perigynium" that encloses an achene; perigynium an indehiscent bag or envelope completely enclosing the achene (but not adherent to it) except at the minute apical orifice through which the stigmas protrude at anthesis, falling with the mature achene and thus a spurious outer portion of the fruit which is unique to this genus.

An enormous, technical genus occurring in moist temperate and moist cool tropical regions. *Carex* is in dire need of critical taxonomic study bolstered by cytology and by field and garden studies which might elucidate many of the problems arising from hybridization or introgression. The keys and descriptions can be used only when the material to be determined is complete with underground parts and has fully mature achenes, the latter to be examined carefully at a magnification of at least 15 diameters.

Presumably caric-sedges provide some forage for stock.

1. Lower part of style (at least a segment half as long as the achene itself) hard, texturally similar to the achene, persistent (2)
1. Lower part of style (except in most species a minute apiculus of the achene) of a different texture from the achene, soft and soon after anthesis withering and usually becoming detached (11)
- 2(1). Spikelets solitary (rarely paired), gynecandrous .. 9. *C. typhina*.
2. Spikelets 2 to 8 per culm, never gynecandrous (3)
- 3(2). Lowest spikelet with 8 to 20 perigynia (4)
3. Lowest spikelet with 25 to 130 perigynia (5)
- 4(3). Perigynia lance-subulate; leaf blades 5-10 mm. broad 1. *C. folliculata*.
4. Perigynia ovoid or narrowly ovoid; leaf blades 2-5 mm. broad 2. *C. intumescens*.
- 5(3). Perigynia with obovoid bodies 2-4 mm. long which are apically truncate or very abruptly short-conic and with sharply defined subulate beaks about 1.5 mm. long 8. *C. Frankii*.
5. Perigynia with ovoid to obovoid or lance-acuminate usually longer bodies either long-tapered or long-conic apically and not sharply differentiated from the beak (6)
- 6(5). Perigynia with 8 to 11 slender longitudinal nerves clearly visible under a lens .. 5. *C. lurida*.
6. Perigynia with 13 to 21 slender longitudinal nerves or 20 to 25 vanishingly faint ones (7)
- 7(6). Perigynia only slightly if at all acuminate, tough-membranous to tough-chartaceous, with 20 to 25 vanishingly faint nerves, ascending, the lowest spikelet with 70 to 100 of these perigynia 10. *C. hyalinolepis*.
7. Perigynia acuminate, membranous, thin but often brittle, spreading at least at maturity, with 13 to 21 slender longitudinal nerves clearly visible under a lens (8)
- 8(7). Perigynia 11-20 mm. long (9)
8. Perigynia 4-7 mm. long (10)
- 9(8). Achene about as broad as (or usually broader than) long, with very knobby angles 3. *C. gigantea*.
9. Achene longer than broad, the angles from slightly prominent to moderately knobbed 4. *C. lupulina*.

- 10(8). Lowest spikelet 15-35 mm. long, 8-12 mm. thick, with 35 to 70 perigynia; beak of perigynium about half as long as the inflated body 6. *C. hystericina*.
10. Lowest spikelet 35-50 mm. long, 12-15 mm. thick, with 65 to 130 perigynia; beak of perigynium almost as long as the very slightly inflated body 7. *C. comosa*.
- 11(1). Spikelets solitary per culm 45. *C. leptalea*.
11. Spikelets 2 to numerous per culm (12)
- 12(11). Spikelets numerous (more than 15) per culm (13)
12. Spikelets 2 to 15 per culm (15)
- 13(12). Perigynial body 1-1.5 mm. long, the beak 0.3-0.5 mm. long 48. *C. decomposita*.
13. Perigynial body 2-3 mm. long, the beak 2-4 mm. long (14)
- 14(13). Perigynial body triangular in transection, inflated in the lower part, the beak 3-4 mm. long; each of the numerous spikelets with fewer than 8 perigynia 46. *C. crus-corvi*.
14. Perigynial body plano-convex, scarcely inflated, the beak 2-3 mm. long; each spikelet with 8 to 15 perigynia 47. *C. stipata*.
- 15(12). Terminal spikelet gynecandrous (i.e., the upper part bearing pistillate flowers, the lower part staminate ones) (see also *C. debilis*) (16)
15. Terminal spikelet staminate or less commonly androgynous (28)
- 16(15). Stigmas 3 and achenes triangular; perigynia only slightly if at all flattened and lacking winglike margins (17)
16. Stigmas 2 and achenes lenticular; perigynia flattened and often with winglike margins (21)
- 17(16). Terminal spikelet 20-50 mm. long; apiculus of the achene straight (18)
17. Terminal spikelet only 7-13 mm. long; apiculus of the achene bent (19)
- 18(17). Lowest spikelet with 12 to 20 ovoid perigynia each 4-6 mm. long and with 9 to 12 slender longitudinal nerves 26. *C. Davisii*.
18. Lowest spikelet with 20 to 44 fusiform-ellipsoid perigynia each 3.5-4 mm. long and with 6 to 8 slender longitudinal nerves 27. *C. oxylepis*.
- 19(17). Spikelet usually 2 per culm, the lower ones 7-10 mm. thick; scales of the lower part of the ovoid pistillate portion of the terminal spikelet strongly cuspidate, 4-5 mm. long, longer than the perigynia even at their maturity; perigynia 3-5 mm. long 28. *C. Bushii*.
19. Spikelets usually 3, less commonly 4 per culm, the lower ones 4-6 mm. thick; scales of lower part of the ovoid-cylindric to cylindric pistillate portion of the terminal spikelet 1.5-3 mm. long, shorter than to about as long as the mature perigynia; perigynia 1.8-2.8 mm. long (20)
- 20(19). Perigynia in transection flattened-triangular to unequally biconvex, 2.3-2.8 mm. long, ascending 29. *C. complanata*.
20. Perigynia in transection nearly round, 1.8-2.3 mm. long, spreading 30. *C. caroliniana*.
- 21(16). Perigynia sharp-edged but not wing-margined (almost as broad as long); usually only the terminal spikelet gynecandrous, the rest wholly pistillate 53. *C. atlantica*.
21. Perigynia wing-margined (variously shaped but if the wings narrow then the perigynia much narrower than long); usually the subterminal as well as the terminal spikelets gynecandrous (22)
- 22(21). Perigynia including wings 1-1.5 mm. broad 60. *C. tribuloides*.
22. Perigynia including wings 1.6-4.5 mm. broad (23)
- 23(22). Larger perigynia including beaks 5.5-8.5 mm. long (24)
23. Larger perigynia including beaks 2.8-5.5 mm. long (25)

- 24(23). Larger perigynia including wings 2.5-3.2 mm. broad 54. *C. hyalina*.
24. Larger perigynia including wings 3.7-6 mm. broad ... 55. *C. Brittoniana*.
- 25(23). Perigynial beak 1-1.7 mm. long, the venter (adaxial surface) of the perigynium (at maturity!) subcoriaceous, shiny and nearly veinless; spikelets nearly globose 56. *C. reniformis*.
25. Perigynial beak usually about 1 mm. long or shorter, if longer then the perigynium venter (at maturity) membranous and/or more or less veiny; spikelets ovoid to narrowly ovoid (26)
- 26(25). Perigynial body including wings 3.1-3.5 mm. broad 57. *C. alata*.
26. Perigynial body including wings 1.6-2.5 mm. broad (27)
- 27(26). Inflorescence 6-10 mm. thick; spikelets ovoid, each with 30 to 50 perigynia which are 2.8-3.2 (-3.5) mm. long and 1.6-2.2 mm. broad 58. *C. albolutescens*.
27. Inflorescence 12-15 mm. thick; spikelets narrowly ovoid, each with 55 to 80 perigynia which are (3-) 3.5-4.2 (-4.5) mm. long and 1.7-2.5 mm. broad 59. *C. Longii*.
- 28(15). Stigmas 2; achenes lenticular (29)
28. Stigmas 3; achenes triangular or vaguely so (37)
- 29(28). Terminal spikelet strictly staminate and lowest spikelet strictly pistillate, often with androgynous spikelets at intermediate levels (30)
29. Spikelets all about equally androgynous (33)
- 30(29). Lower pistillate spikelets about 1 cm. long 36. *C. aurea*.
30. Lower pistillate spikelets 2-10 cm. long (31)
- 31(30). Pistillate scales with oblong bodies and long spreading cusps surpassing the perigynia; most of the spikelets nodding 35. *C. crinita*.
31. Pistillate scales oblong, shorter than the perigynia; most of the spikelets ascending or erect (32)
- 32(31). Juncture of sheath and blade flat or slightly arcuate 33. *C. Emoryi*.
32. Juncture of sheath and blade inverted V-shaped 34. *C. stricta*.
- 33(29). Bodies of mature perigynia (not including beaks) 3-4 mm. long, thin-coriaceous; mountains of Trans-Pecos Texas 61. *C. praegracilis*.
33. Bodies of mature perigynia 1.5-3 mm. long, firm-membranous (sometimes spongy-coriaceous and discolored in the proximal part); not in Trans-Pecos Texas (34)
- 34(33). Inflorescence interrupted-spiciform, 35-80 mm. long, with 10 to 15 spikelets; sheath venters transversely wrinkled 49. *C. vulpinoidea*.
34. Inflorescence headlike to interrupted-spiciform, 10-40 mm. long, with 3 to 10 spikelets; sheath venters not transversely wrinkled except in genetically contaminated plants (35)
- 35(34). Perigynia spreading or at full maturity even slightly reflexed, brown and taking on a spongy-coriaceous texture in the proximal half .52. *C. retroflexa*.
35. Perigynia mostly ascending even at maturity and either not discolored and spongy or else becoming so only in the basal fifth to third the length (36)
- 36(35). Inflorescence an ovoid essentially bractless head 10-15 (-17) mm. long and 4-9 mm. thick 51. *C. cephalophora*.
36. Inflorescence elongate-ovoid to ovoid-oblong or linear-oblong, 20-40 mm. long, 10-15 mm. thick, with bracts 1-3 (-20) cm. long 50. *C. Muhlenbergii*.
- 37(28). Culms only 0.2-0.3 mm. thick even toward the base, wiry; Guadalupe Mountains in Trans-Pecos Texas 40. *C. eburnea*.
37. Culms 0.5-4 mm. thick OR if as thin as 0.3 mm. then not occurring in Trans-Pecos Texas (38)

- 38(37). Nerves of perigynia bearing a series of fuzzy warts (Trans-Pecos Texas)
 37. *C. muriculata*.
38. Perigynia not warty (39)
- 39(38). Achenes apically blunt, not apiculate but jointed with the style which is slightly enlarged at the base 44. *C. Willdenovii*.
39. Achenes either apiculate or if the apiculus is extremely small then the sides of the achene convex (40)
- 40(39). The 3 sides of the achene strongly convex; culms 1-30 cm. long, 0.3-0.6 mm. thick (41)
40. The sides of the achene nearly flat or concave; culms 4-120 cm. long, 0.5-4 mm. thick (43)
- 41(40). Perigynia about 3.3 mm. long 42. *C. nigromarginata*.
41. Perigynia 2.5-3 mm. long (42)
- 42(41). Culms 1-17 cm. long, usually much-surpassed by basally clustered bracts from which the lower pistillate spikelets emerge on capillary-flexuous peduncles 6-32 mm. long 41. *C. microrhyncha*.
42. Culms 15-30 cm. long, usually surpassing the leaves and bracts; lower pistillate spikes nearly sessile and borne high, only 3-10 mm. apart on the culm
 43. *C. physorhyncha*.
- 43(40). Bracts of lowest spikelet sheathless or with sheath only 1 mm. long or less (44)
43. Bracts of lowest spikelets with definite sheaths (48)
- 44(43). Lowest spikelet only 4-18 mm. long (45)
44. Lowest spikelet 20-50 mm. long (46)
- 45(44). Perigynia 3-4 mm. long, 3 to 14 per spikelet; flowering culms almost all with the lower pistillate spikelet(s) widely separated from the staminate spikelet, appearing to emerge severally on long peduncles from the basal clusters of leaves and bracts 38. *C. planostachys*.
45. Perigynia about 4.5 mm. long, 15 to 20 per spikelet; pistillate spikelets all sessile and subterminal 39. *C. tenax*.
- 46(44). Perigynia densely hirsutulous 12. *C. lanuginosa*.
46. Perigynia glabrous (47)
- 47(46). Perigynia 4-5 mm. long, with 11 to 14 nerves (2 stronger than the rest), spreading 31. *C. Joorii*.
47. Perigynia 3-4 mm. long, with 4 or 5 weak nerves, ascending
 32. *C. glaucescens*.
- 48(43). Perigynia with 6 to 10 nerves, 5-7 mm. long 11. *C. cherokeensis*.
48. Perigynia with 12 to 67 nerves, 2-9 mm. long (49)
- 49(48). Perigynia 6-9 mm. long 25. *C. debilis*.
49. Perigynia 2-5.5 mm. long (50)
- 50(49). Perigynia with 42 to 67 nerves (51)
50. Perigynia with 12 to 40 nerves (53)
- 51(50). Cauline blades 4-10 mm. broad; lower spikelet 12-50 mm. long, with 8 to 32 perigynia 18. *C. flaccosperma*.
51. Cauline blades 1.5-3.5 (-4.5) mm. broad; lower spikelet 5-13 (-20) mm. long, with 3 to 8 (to 10) perigynia (52)
- 52(51). Lower spikelet 5-10 mm. long; perigynia obovoid-ellipsoid, obtusely triangular, slightly inflated basally, apically pyramidal with an apical angle of 65°-85°
 16. *C. oligocarpa*.
52. Lower spikelet 8-13 (-20) mm. long; perigynia turgidly to slenderly obovoid, in transection nearly round (when fresh!), inflated (when fresh!), apically broadly rounded, very obtuse 17. *C. amphibola*.

- 53(50). Lowest pistillate spikelet(s) widely separated from the staminate ones, peduncled and appearing to emerge severally from the basal clusters of leaves (and bracts)38. *C. planostachys*.
53. Lower pistillate spikelet emerging from sheaths of cauline bracts (54)
- 54(53). Perigynia 2-2.5 mm. long, with about 12 nerves ..14. *C. granularis*.
54. Perigynia 2.5-5.5 mm. long, with 14 to 40 nerves (55)
- 55(54). Perigynia 2 to 3 times as long as broad, 3.5-5 mm. long (56)
55. Perigynia 1 to 1.7 times as long as broad, 2.5-4 mm. long (58)
- 56(55). Upper 2 or 3 spikelets including the very inconspicuous staminate one sessile and closely set, mostly overlapping, usually exceeded by the bract at the base of the terminal inflorescence24. *C. crebriflora*.
56. The peduncled pistillate spikelets remote from the terminal staminate one (57)
- 57(56). Leaves firm, pale, those of the rosettelike sterile tufts 7-25 mm. broad, those of the fertile culms 2-7 mm. broad; basal leaves of fertile culms reduced
.....22. *C. striatula*.
57. Leaves flaccid, deep green, those of the elongate sterile shoots 2-15 mm. broad, those of the fertile culms 2.5-3.5 mm. broad; basal leaves of fertile culms well-developed, with blades 3-7 mm. broad23. *C. styloflexa*.
- 58(55). Plants with elongate creeping rhizomes; perigynia with 13 to 23 nerves (59)
58. Plants only tufted; perigynia with 22 to 37 nerves (60)
- 59(58). Perigynia basally rounded or short-tapered, reddish-brown (as are also the scales), apically with a short minutely bidentate beak
.....13. *C. microdonta*.
59. Perigynia basally tapering, stramineous to yellowish, apically with a minute more or less strongly bidentate beak with a nearly entire orifice; perigynial scales often with conspicuous dark-purple submedian stripes15. *C. Mearnsii*.
- 60(58). Perigynia rather sharply triangular, apically scarcely beaklike; orifice often excentric19. *C. digitalis*.
60. Perigynia obtusely triangular, apically with a minute but definite beak with a right-angle bend (61)
- 61(60). Culms 0.8-1.5 mm. thick; staminate spikelet 2-3 mm. thick; upper 1 or 2 pistillate spikelets usually close to each other and to the staminate spikelet, often overlapping and nearly sessile; lower pistillate spikelet 4-6 mm. thick
.....20. *C. blanda*.
61. Culms 0.7-1 mm. thick; staminate spikelet 1-1.5 mm. thick; upper 1 or 2 pistillate spikelets usually well-separated (rarely upper 1 overlapping the staminate spikelet); lower pistillate spikelet 2-3 mm. thick21. *C. gracilescens*.

1. *Carex folliculata* L. var. *australis* Bailey. Tufted perennial; culms 4-8 dm. long, 2-4 mm. thick basally, erect; basal sheaths whitish, nodulose; blades 5-10 mm. broad; spikelets 3 or 4 per culm, remote except for sometimes the 2 upper ones; the uppermost spikelet staminate, 2-4 cm. long, 2-3 mm. thick, stramineous; next lowest spikelet pistillate (or with a very short terminal staminate portion), nearly sessile; lower spikelets progressively longer-peduncled and all pistillate, erect; lowest spikelet 15-27 mm. long, 15-23 mm. broad, with 12 to 20 spreading perigynia (internodes of rachis about 1 mm. long), the lance-acuminate scales hyaline-stramineous and 5-7 mm. long; bracts leaflike, that of the lowest spikelet 15-25 cm. long including the sheath; higher bracts progressively reduced; perigynia lance-subulate, not at all acuminate, nearly round in transection, 11-14 mm. long, greenish (drying stramineous), membranous, with 15 to 25 strong nerves narrower than the internerve spaces, inflated; achene rounded-triangular with concave sides, continuous with the long persistent slender style which basally has much the same porcelaneous texture as the achene itself. *C. lonchocarpa* Willd. Infrequent or rare in e. Tex. (Hardin, Jasper, Newton and Tyler cos.), in moist sand or mud, Apr.-May, rarely as late as June, a few perigynia persistent into July; Coastal States, Va. to Tex.

2. *Carex intumescens* Rudge. Tufted perennial; culms 3-7 dm. long, basally 1.5-3 mm. thick, erect; basal sheaths reddish-brown; blades 2-5 mm. broad; spikelets 2 to 4 per culm, clustered or remote; terminal spikelet staminate, 2-5 cm. long, 2-3 mm. thick, brownish; the remaining spikelets pistillate, ascending, 13-22 mm. long, 14-25 mm. broad, with 8 to 15 close spreading perigynia, the narrowly ovate scales acute and only about half as long as their perigynia; bracts sheathing, foliaceous, surpassing the inflorescence; perigynia 11-16 mm. long, the body three-fourths to five-sixths the total length, ovoid to narrowly so, olivaceous, crusty-membranous, much-inflated, with 14 to 19 slender nerves, basally rounded, apically tapered and passing gradually into the proportionally short bidentate beak; achene longer than thick, triangular, the angles not prominent and totally knobless, passing into the slender often looped style (the lower persistent part of which texturally resembles the achene). Frequent in moist areas, e. and s.e. Tex., Apr.-June; s.e. Can. and e. U.S. w. to Minn., Ia., Mo., Ark. and Tex.

3. *Carex gigantea* Rudge. Loosely tufted perennial with creeping scaly rhizomes 1.5-3 mm. thick; culms 35-80 cm. long; basal sheaths brownish to stramineous; blades 4-12 mm. broad; spikelets 3 or 4 (rarely 5) per culm, usually all but the lowermost overlapping; terminal spikelet staminate, 3-6 cm. long, 2-4 mm. thick; the remaining spikelets pistillate, cylindrical, the lowest 3-5 cm. long, 14-22 mm. thick (including beaks), with 30 to 65 close spreading perigynia, the lanceolate scales acute or acuminate and about half to three fourths as long as the perigynia; bracts sheathing, foliaceous, that of the lowest spikelet far-exceeding the inflorescence; perigynia 12-15 mm. long, the body about three-eighths the total length, ovoid, crusty-membranous, inflated, olive-stramineous, with 14 to 17 slender nerves, basally rounded, apically acuminate and passing into the long subulate bidentate beak; achene about as broad as or usually broader than long, rhombic-triangular with very prominent angles each with a pronounced knob near the middle, apically continuous with the violently looped style whose persistent lower part texturally resembles the achene. Rare in moist places, e. and s.e. Tex. (Harris and Polk cos.), May-July; lowlands of s.e. U.S. n. to Del., Ky., Ind., Mo. and Okla.

4. *Carex lupulina* Muhl. Perennial, usually very loosely tufted and with creeping rhizomes 1-3 mm. thick; culms 3-10 dm. long, erect, basally 1.5-10 mm. thick, the lower sheaths brownish, occasionally with a slight rosy hue; blades 3-12 mm. broad; spikelets 3 to 6 per culm, either clustered and overlapping or the lower remote, occasionally all rather remote and the lower ones long-peduncled; upper spikelet (rarely upper 2) staminate, 3-8 cm. long, 2-4 mm. thick, brownish; lower spikelets pistillate, usually cylindrical, less commonly oblong or ellipsoid-oblong, often slightly nodding terminally, 2-5 cm. long, 15-24 mm. thick, the lowest with 25 to 80 close ascending or somewhat spreading perigynia; scales mostly hyaline-translucent, broadly lanceolate, acute, often mucronate, less commonly with an awn about 2 mm. long, the whole only about half to two thirds as long as the perigynia; bracts sheathing, foliaceous, that of the lowest spikelet commonly far-surpassing the inflorescence; perigynia 11-20 mm. long, the body about half to five-eighths the total length, broadly ovoid, stramineous to olivaceous, crusty-membranous, with 14 to 21 slender nerves, inflated, basally rounded, apically acuminate and passing gradually into the long slender bidentate beak; achene longer than broad, triangular with more or less pronounced angles (making the sides seem concave) and with more or less of a process or knob on each angle (very indistinct in some plants), apically continuous with the violently looped style whose lower persistent part texturally resembles the achene. *C. lupuliformis* Sartw., *C. louisianica* Bailey. Frequent in moist soil, e. and s.e. Tex., Apr.-May, occasionally into early summer; N.S., Que. and Ont., e. U.S. w. to Minn., Ia., Mo., Okla. and Tex.

The form called *C. louisianica* has few, spreading perigynia per spikelet and these are proportionately short-beaked (i.e., the inflated body is proportionally longer) and the achenes are scarcely knobby; these seem to show introgressive influence on *C. lupulina* by *C. intumescens*. The form called *C. lupuliformis* has proportionately longer-beaked, more spreading perigynia, with blunter scales and very knobby achenes; these plants seem to show the introgressive influence on *C. lupulina* by *C. gigantea*. Plants are also found which show relatively short, narrow perigynia, and long-aristate pistillate scales; these seem to be hybrids of *C. lupulina* and *C. lurida*.

5. *Carex lurida* Wahl. Tufted perennial with very short rhizomes; culms 3-10 dm. long, 1.5-6.5 mm. thick, erect, leafy; basal sheaths brown (occasionally faintly reddish); blades

4-10 mm. broad; spikelets 3 to 5, mostly overlapping or occasionally the lower 1 or 2 slightly removed; terminal spikelet staminate, erect, 3-6 cm. long, 1-2 mm. thick; rest of spikelets pistillate, nearly sessile (or the lower occasionally on flexuous peduncles to 19 cm. long), often arcuate-nodding, the lowest 25-40 (-60) mm. long, 14-18 (-20) mm. thick including beaks, with 50 to 80 (to 110) close somewhat ascending perigynia, the scales about as long as the bodies of the perigynia and subulate or awnlike in their distal part; bracts foliaceous, sheathing, the blade of the lowest one much-surpassing the entire inflorescence; perigynia ampule-shaped, 7-11 mm. long, the bodies ovoid or obovoid, 2.3 mm. thick, 4-6 mm. long, inflated, membranous, olive-green, drying to olive-brown or olive-stramineous, with 8 to 11 nerves (2 slightly stronger than the rest) much narrower than the internerve spaces, basally tapered and shortly rounded, apically tapered or long-conic and passing gradually into the linear-subulate bidentate beak; achene triangular, continuous with the sinuous-flexuous persistent style the lower half of which is texturally similar to the achene. Frequent in moist sand and mud, e. Tex., May-June; e. temp. N.A. w. to Minn., Mo., Okla. and Tex.; also Ver.

6. *Carex hystericina* Muhl. PORCUPINE CARIC-SEDGE, BOTTLE-BRUSH CARIC-SEDGE. Perennial with rhizomes 1.5-2.5 mm. thick and several cm. long; culms tufted at intervals along the rhizome, 2-8 dm. long, 1-3.5 mm. thick, erect; lower sheaths stramineous, rarely with a reddish-tinge; blades 2.5-9 mm. broad; spikelets 3 to 4 (to 6) per culm, mostly overlapping or the lower one or 2 somewhat remote; uppermost spikelet staminate (rarely androgynous), 15-35 mm. long, 3-4 mm. thick, stramineous; lower spikelets pistillate (some upper ones infrequently androgynous), bristly, the lowest one erect or nodding slightly, 15-35 mm. long, 8-12 mm. thick, with 35 to 70 close spreading (at maturity) perigynia, the stramineous scales almost as long as the perigynia and with ovate hyaline bodies and long subulate cusps or awns; bracts sheathless, the blades of the lowest one often surpassing the terminal spikelets, the higher ones progressively much-reduced; perigynia lance-acuminate, in transection nearly round or (when immature or pressed) dorsiventrally flattened, 4-7 mm. long, stramineous-membranous, with 2 nerves or weak ribs and 11 to 14 fine nerves much narrower than the spaces between them, basally narrowly rounded, acuminate into a slender strongly bidentate beak about half as long as the inflated body; achene triangular, the sides concave in lower part, continuous with the long persistent slender style which basally has much the same porcelaneous texture as the achene itself. Locally abundant in calcareous mud of stream-beds in the mts. of the Trans-Pecos, rare e. to the Plains Country and Edwards Plateau, summer; s. Can. and n. U.S. s. to Va., Ky., Okla., Coah., Ariz. and Calif.

Sometimes incorrectly spelled "hystericina."

7. *Carex comosa* Boott. Mat-forming perennial with short branching rhizomes; culms 5-13 dm. long, erect, 3-10 mm. thick basally; lower sheaths brownish-stramineous; blades 6-12 mm. broad; spikelets 4 or 5 per culm, overlapping for most of their lengths; uppermost spikelet staminate, 25-50 mm. long, 3-5 mm. thick, brownish-stramineous; lower spikelets pistillate, nearly horizontal by virtue of a sharp bend at the top of each peduncle, bristly, the lowest one 35-50 mm. long, 12-15 mm. thick, with 65 to 130 spreading or even slightly deflexed close perigynia; bracts sheathless, the lowest one with a blade far-surpassing the inflorescence, the rest progressively reduced; perigynia lance-acuminate, in transection vaguely triangular or somewhat dorsiventrally flattened, 4-7 mm. long, stramineous, firm-membranous, with 2 ribs and 14 or 15 prominent nerves slightly narrower than the spaces between, basally narrowly rounded, acuminate into a slender beak almost as long as the very slightly inflated body and with 2 terminal arcuate-divaricate teeth; achene triangular, apically continuous with the long slender persistent style which proximally has much the same porcelaneous texture as the achene itself. Rare in lakes in e. Tex. (Wood Co.), Apr.-June; otherwise s.e. Can. and e. U.S. w. to Minn., Neb., Mo. and Tex.; also Ida., Wash., Ore. and Calif.

8. *Carex Frankii* Kunth. Perennial with extensively creeping rhizomes 1-2 mm. thick; culms 2-7 dm. long, 1.5-5 mm. thick basally; basal sheaths brownish, rarely rosy; blades 4-11 mm. broad; inflorescence of 4 to 6 ascending spikelets; terminal (often exceedingly inconspicuous) spikelet staminate, 3-50 mm. long, 1.5-5 mm. thick, stramineous or brown; the remaining spikelets pistillate, the upper ones overlapping and short-peduncled but the lowest commonly remote with a peduncle to 15 cm. long, 1-4 cm. long, 8-15 mm. thick, bristly, with 25 to 130 very close spreading perigynia and scales as long as or longer than

the perigynia with the distal part being a wiry awn or bristle; bracts sheathing, foliaceous, the blade of the lowest one commonly far-exceeding the inflorescence, the higher ones progressively reduced; perigynia 3.5-5.5 mm. long, with obovoid bodies 2-4 mm. long, olivaceous, inflated, membranous, with 10 to 15 nerves much more slender than the internerve spaces, basally tapered and narrowly rounded, apically abruptly short-conic and well-differentiated from the subulate beak (about 1.5 mm. long) and with a strongly bidentate orifice; achenes triangular, 1.5-2.2 mm. long, continuous with the persistent very slender usually straight style which in its lower half has much the same texture as the achene. Frequent in moist sand in e. and s.e. Tex., infrequent in n.-cen. Tex., rare in the Trans-Pecos (Franklin and Davis Mts.), in seeps and springs, Apr.-June (to July in Trans-Pecos); s.e. U.S. n. to N.Y., Ill. and Kan.; also Coah. and parts of s. S.A.

The Trans-Pecos and Coahuilan specimens differ from the others in being more robust, with very broad blades and very large spikelets with prominent staminate spikelets, in all measurement near the maxima given above.

9. *Carex typhina* Michx. Perennial; rhizomes black, scaly, 2-5 mm. thick, 1-4 cm. long between culm-tufts; culms 3-8 dm. long, 1.5-4 mm. thick basally; lower sheaths brown; blades 3-7 mm. broad; spikelets solitary (rarely geminate), terminal, gynecandrous, 3-4 cm. long, 12-15 mm. thick including the beaks, with a cylindric (slightly ovoid) terminal pistillate portion of 60 to 110 closely packed spreading perigynia, basally abruptly acuminate to the inconspicuous staminate portion; pistillate scales narrowly obovate to oblanceolate, apically acute but not mucronate, laterally hyaline; bract sheathless, the blade surpassing the spikelet; perigynia about 6 mm. long, the obovoid bodies 4-5 mm. long, inflated, brownish, brittle-membranous, shiny, with 2 faint nerves distally, basally narrowed and shortly rounded, apically abruptly short-conic to the subulate or linear bidentate spreading or usually very slightly ascending beak; achene triangular, occupying only a small portion of the perigynium, apically acute, continuous with the persistent slender abruptly sinuous style whose proximal part is texturally like the achene. *C. squarrosa* L. var. *typhina* (Michx.) Nutt. Rare in wet sandy loam, forests of e. Tex. (Harrison and Shelby cos.), July-Sept.; Que. and n.e. U.S. s. to S.C., Ky. and La., w. to Wisc., Ia., Mo. and Tex. May not be specifically distinct from *C. squarrosa*.

10. *Carex hyalinolepis* Steud. Perennial with extensively creeping rhizomes 2-5 mm. thick; culms single at the nodes of the rhizome, 4-8 dm. long, 5-8 mm. thick basally; leaves mostly crowded toward the base; basal sheaths yellowish-stramineous; blades 4-13 mm. broad, tough, with noxious serrulate edges; spikelets 4 to 6 (to 8) per culm, the upper 1 to 3 staminate and sessile, the lower 1 to 4 short-peduncled, erect and pistillate, often with an androgynous spikelet at an intermediate level; terminal spikelet 3-6 cm. long, 3-6 mm. thick; lowest pistillate spikelet 3-8 cm. long, 11-15 mm. thick, with 70 to 100 ascending perigynia (overlapping closely except occasionally the lowest 2 or 3), the scales much shorter than their perigynia; bracts foliaceous, short-sheathing, that of the lowest commonly surpassing the entire inflorescence, the higher ones progressively reduced; perigynia 6-9 mm. long, ampulelike or very narrowly ovate, in transection elliptic, stramineous-brown to olive-brown, tough-membranous, eventually becoming tough-chartaceous, with 20 to 25 very faint (vanishing in some specimens) nerves much narrower than the spaces between them, slightly inflated, basally rounded, in the upper half slightly acuminate to a scarcely beaklike firm bidentate apex; achene triangular, continuous with the basally curved style which basally has the same porcelaneous texture as the achene. Infrequent to rare in wet black clay in s.e. (Brazoria and Colorado cos.), e. (Bowie and Gonzales cos.) and n.-cen. (Dallas and Tarrant cos.) Tex., Apr.-May; Ont. and e. U.S. w. to Mich., Neb., Kan., Okla. and Tex.

11. *Carex cherokeensis* Schwein. Perennial forming dense auxoclones to 1 m. across, the short tough rooty black rhizomes 3-12 mm. thick (thickest of any of our caric-sedges); culms 30-75 cm. long, 1-2 mm. thick, ascending; leaves mostly crowded at the base, 2-6 mm. broad, chartaceous, pale-green, sometimes folded and often medially keeled abaxially, the sheaths dark castaneous-buffy; spikelets usually 4 to 7 per culm (but when subterminal ones are whorled, up to 12 spikelets per culm); terminal spikelet (less commonly two) staminate (occasionally compound basally), the subterminal ones either androgynous or pistillate and nearly sessile or on flexuous peduncles to 3 cm. long, the lowest ones usually all pistillate and nodding on flexuous peduncles to 1 dm. long; staminate portions 2-3 mm. thick, with stramineous-hyaline scales; lower pistillate spike-

lets 2-4 cm. long, 6-10 mm. thick, with 30 to 60 spreading-ascending crowded perigynia, the stramineous-hyaline scales lance-ovate and shorter than the perigynia; lower bract foliaceous, long-sheathing, the blade 1.5-5 mm. broad and 15-30 cm. long (but never attaining the pistillate spikelet), the higher ones progressively reduced; perigynia lance-ovoid, in transection from unequally biconvex to obscurely triangular, 5-7 mm. long, stramineous, membranous (eventually thin-chartaceous), inflated, with 2 strong nerves and 4 to 8 weaker ones, basally narrowly rounded, apically tapered and passing into the tubular beak (about 1 mm. long) and with a very strongly bidentate hyaline orifice; achene triangular with concave sides, apiculate, jointed with the style which entirely withers after anthesis. Abundant in sandy loam in woodlands, e., s.e. and n.-cen. Tex., spring; Gulf States plus Ga., Okla., Ark. and Mo.

12. *Carex lanuginosa* Michx. Perennial with branching rhizomes about 1.5 mm. thick and several cm. long (often broken off in prepared specimens); culms 3-6 dm. long, strictly erect, simple, in slender clumps, 2-4 mm. thick basally; blades 3-4 mm. broad, the sheath-orifices U-shaped, brownish-discolored and thickened; sheaths ventrally pale-brownish, basally with transverse septation between the nerves; spikelets about 3 or 4, sessile or on very short peduncles, the upper 2 usually overlapping slightly, the upper one or 2 completely or almost completely staminate or with a few female flowers at the very base; female spikelet 25-30 mm. long, 5-7 mm. thick, with 30 to 60 spreading-ascending spikelets; scales lanceolate, hyaline with green midrib, the body 1.5-2 mm. long and with a subulate mucro about 1 mm. long; bract of lowest spikelet not sheathing, its blade about 2 mm. broad and equaling or exceeding the staminate spikelet; perigynial body broadly ellipsoid, brown, firm-membranous, slightly inflated, about 2.5 mm. long, densely hirsutulous as seen under a lens (the nervature obscured), the beak about 1 mm. long and strongly bidentate apically; achene triangular with concave sides, 1.7-2 mm. long, sessile, short-apiculate, jointed with the very short straight style which entirely withers after anthesis. Sloughs of river bottoms, Panhandle of Plains Country (Hemphill Co.), rare, late spring-early summer; most of temp. N.A.

13. *Carex microdonta* T. & H. Perennial; rhizomes 2-15 cm. long, 1 mm. thick, brown; culms rising singly or in small tufts from the rhizomes, 9-50 cm. long, 0.7-1.1 mm. thick; leaves mostly crowded at the base, the basal sheaths brown; blades 2-7 mm. broad, shorter than the culm, shortly tapered apically; spikelets 3 to 5 per culm, the terminal one staminate (rarely androgynous), usually with the sessile staminate or androgynous second spikelet attached near its base and overlapping it; rest of spikelets usually more remote, erect, on pedicels 2-10 cm. long and nearly all pistillate (the upper one occasionally with a few terminal staminate flowers); staminate spikelets prominent, 2-5 cm. long, 4-8 mm. thick, often with prominent subsistent anthers, greenish or brownish, the narrowly obovate scales 3-8 mm. long and brownish to reddish-brown and hyaline with 3 prominent green midnerves; pistillate spikelets 1-5 cm. long, 5-6 mm. thick, with 20 to 40 close spreading perigynia, the ovate scales acuminate and half as long as the perigynia, reddish-brown with hyaline margins and prominent 3-nerved median; perigynia ovoid to narrowly ovoid, 2.6-3.6 mm. long (including beak), reddish-brown, firm-membranous, with 2 ribs and 12 to 15 less prominent nerves, rather closely investing the achene except at the rounded or very shortly tapered base and the conical apex which abruptly passes into the tubular beak (0.5-0.7 mm. long with a minutely 2-toothed apex); achene triangular with concave sides, bent-apiculate, jointed with the style which entirely withers after anthesis. Frequent in moist open places, usually calcareous areas, n.-cen. and s.e. Tex., Edwards Plateau, infrequent in e. Tex., rare in the Trans-Pecos, Mar.-May (June-Aug. in Trans-Pecos); Miss., La., Tex., Okla. and Mo.

14. *Carex granularis* Muhl. Tufted perennial; culms 18-55 cm. long, 0.5-1.1 mm. thick, erect, leafy; basal sheaths brown; cauline blades 2-4 mm. broad, olive-green, membranous, erect, long-tapered; spikelets 4 or 5 per culm, the upper 2 or 3 usually essentially sessile and approximate, the rest remote and on slender peduncles; terminal spikelet staminate, 15-25 (-35) mm. long, about 1 mm. thick, the ovate scales awned to cuspidate or acuminate, closely appressed and brownish; rest of spikelets pistillate, 5-20 mm. long, 3.5-5 mm. thick, with 10 to 40 close widely spreading perigynia, the ovate scales little over half as long as the perigynia; bracts foliaceous, with definite sheaths, the lower bracts (of fourth or fifth spikelet) often equaling or exceeding the staminate spikelet; perigynia broadly ovoid to broadly obovoid, round in transection, 2-2.5 mm. long, about

1.3 mm. thick, membranous, brownish, with 2 ribs and about 10 nerves (these much more slender than the internerve spaces), inflated, not closely investing the achene at any point, basally obtuse (either rounded or very shortly tapered), apically abruptly contracted into a minute entire straight (though often distorted in prepared specimens) tubular beak with a nearly entire orifice; achenes triangular with concave sides, bent-apiculate, jointed with the style which entirely withers after anthesis. Rare in extreme n.e. Tex. (Bowie Co.), in ditch, May; e. U.S. and Que. and Ont., w. to Minn., Kan., Okla. and Tex.

15. *Carex Meadii* Dew. Perennial; rhizomes 1.5-2 mm. thick, several cm. long; culms 3-5 dm. long, 1-2 mm. thick, triangular, erect, rising singly or few in bunches at intervals along the rhizomes; leaves few; blades firm-membranous, 3-5 mm. broad, not attaining the inflorescence; inflorescence 7-15 cm. long, 5-7 mm. broad, of usually 3 erect spikelets, the lowest on a peduncle 4-6 cm. long, the middle peduncle much shorter; terminal spikelet staminate, 2-3 cm. long, 3-4 mm. thick, the subtorninal one commonly androgynous or wholly pistillate, the lower one (often subcompound basally) pistillate and 1-2 cm. long and 5-6 mm. broad; lowest spikelet with a conspicuous leaflike bract about as long as the inflorescence, the higher bracts progressively smaller, all the bracts with noticeable sheaths; scales of pistillate spikelets very variable, half as long to as long as their perigynia, often with conspicuous dark-purple submedian stripes; perigynia 15 to 30 on the lowest spikelet, obovoid, fruitful distally, obtusely triangular in transection, only slightly inflated in distal part but not noticeably inflated basally, basally tapering, 3-4 mm. long, with 17 to 23 slender nerves (2 stronger than the rest), stramineous to yellowish, membranous, sessile, apically narrowed to a minute more or less strongly bent beak whose orifice is nearly entire; achenes triangular, the sides very slightly concave, shortly apiculate, jointed with the style which wholly withers after anthesis, only slightly shorter than the perigynia. *C. tetanica* var. *Meadii* (Dew.) Bailey. Infrequent in low clay prairies, s.e. and n.-cen. Tex., Apr.-May; Sask., N.D., S.D., Neb., Kan., Okla. and Tex., e. to Pa., N.J., N.C. and Tenn.

Reports of *C. tetanica* Schkuhr in Texas are based in part on specimens of *C. Meadii* and in part on specimens of *C. microdonta*.

16. *Carex oligocarpa* Schkuhr. Tufted perennial; culms 25-35 cm. long, about 1 mm. thick, erect, leafy (but not at the base); lower bracts purplish-tinged; blades 2-3 mm. broad, erect, long-tapered, green, membranous; spikelets usually 3 or 4 per culm, the terminal one staminate, the second one pistillate and either sessile and borne near the base of the staminate spikelet or short-peduncled and slightly remote, the lower ones pistillate and remote on peduncles; staminate spikelet 15-30 mm. long, about 2 mm. thick, brownish-stramineous; scales oblanceolate, acute, about 7 mm. long, with broad green midnerve and brownish-hyaline lateral portion; pistillate spikelet 5-10 mm. long, about 5 mm. thick, with 3 to 8 close ascending perigynia; scales ovate, acuminate (or the lower ones cuspidate), shorter than their perigynia, brownish-hyaline with green median; bracts foliaceous, definitely sheathed, the blades of the second one and sometimes the third one exceeding the staminate spikelet; perigynia obovoid-ellipsoid, obtusely triangular, often with concave sides, about 4 mm. long, firm-membranous, olive-brown, with 2 fairly prominent nerves and 42 to 65 less prominent ones (these minutely undulating and so closely set as to be about as broad as the internerve spaces), basally slightly inflated, shortly tapered and narrowly rounded, laterally closely investing the achene, apically pyramidal (apical angle about 65°-85°) and then capped by a very minute straight bidentate beak; achene triangular, apiculate, jointed with the straight thickish style which entirely withers after anthesis. Rare on wooded calcareous slopes, Edwards Plateau (Travis and Kendall cos.), Apr. 18-May 3; from Ont. and n.e. U.S. w. to Mich., Ia., Mo. and Okla., s. to Ala., Ky., Ark. and Tex.

Our specimens differ from those in the main part of the distributional area and perhaps should not be referred to this species, which ordinarily has staminate spikelets only 1-2 mm. thick with distinctly reddish scales only 5-6 mm. long, and perigynia with the apical conelike portion shorter, thus more abruptly leading to the longer, snoutlike beak that is about 0.5 mm. long.

17. *Carex amphibola* Steud. Tufted perennial; culms 15-30 (-40) cm. long, erect; basal sheaths purplish-brown with reduced blades; cauline leaves few, 1.5-3.5 (-4.5) mm. broad, membranous, green; spikelets usually 4, less commonly 3; terminal spikelets in-

conspicuous and staminate, nearly sessile, 6-20 mm. long, 1.5-2.5 mm. thick, stramineous, the scales broadly hyaline; rest of spikelets pistillate (the highest one subterminal and sessile at the base of the staminate spikelet, the others on slender short peduncles and more or less remote), 8-13 (-20) mm. long, about 5 mm. thick, with 3 to 6 (to 10) ascending perigynia which are close enough to overlap (except occasionally the lowermost), the scales with the hyaline broadly ovate main portion about a third to half as long as the perigynia but the abrupt subulate cusp almost equaling it; bracts narrowly foliaceous with definite sheaths, the blades greatly surpassing the spikelets; perigynia turgidly to slenderly obovoid, in transection nearly round when fresh but less so after drying, often obtusely triangular, 4-5 mm. long, inflated, brown-membranous, in the lower half with about 50 or 60 nerves which are so close they are only a little narrower than the internerve spaces (some of these ending so the upper part with fewer nerves than the lower), basally slightly tapered and narrowly rounded, apically broadly rounded or very obtuse, essentially beakless with a nearly entire orifice (after drying the apex often somewhat conical instead of rounded but still essentially beakless); achene triangular, apiculate, jointed with the style which entirely withers after anthesis. Incl. var. *globosa* (Bailey) Bailey, var. *rigida* Fern. and var. *turgida* Fern. "*C. grisea*" of many authors, not Wahl., *C. bulbostylis* Mack. Frequent in moist soil and woodlands, e., s.e. and n.-cen. Tex., infrequent to rare in moist areas of e. part of Edwards Plateau, spring; from Fla. to Tex., n. to Del., Pa., Tenn. and Ark. Seeming to grade somewhat into *C. flaccosperma* and our *C. "oligosperma"*.

18. *Carex flaccosperma* Dew. Tufted perennial; culms (14-) 25-40 (-60) cm. long, erect; basal sheaths usually glaucous to pale-brownish with reduced blades; cauline leaves few, 4-10 mm. broad, membranous, pale-green or glaucous-green; spikelets usually 5, less commonly 4; terminal spikelet very inconspicuous, staminate, nearly sessile or short-peduncled, 7-35 mm. long, 1-3 mm. thick, stramineous, the scales broadly hyaline; other spikelets pistillate (the highest one subterminal and nearly sessile or short-peduncled and attached near the base of the staminate spikelet, the others more or less remote on slender peduncles 1-15 cm. long), 12-50 mm. long, about 7 mm. thick, with 8 to 32 ascending perigynia which are close enough to overlap (except occasionally the lowermost); scales brownish-hyaline, ovate, less than half as long as the perigynia, acute to very short-cuspidate; bracts foliaceous, with definite sheaths, the blades greatly surpassing the spikelets; perigynia slenderly obovoid to ovoid-fusiform, in transection nearly round when fresh (but after drying often obtusely triangular), 4-5 mm. long, inflated, brown-membranous, in the lower half with 47 to 60 nerves which are so close they are only a little (if at all) narrower than the internerve spaces (some of them ending so the upper part has fewer than the lower), basally slightly tapered and narrowly rounded, apically tapered and narrowly rounded or acute, essentially beakless, with a nearly entire orifice; achene triangular, apiculate, jointed with the style which entirely withers after anthesis. Frequent in moist sandy soil in wooded areas, e. and s.e. Tex., infrequent in n.-cen. Tex., spring; s.e. U.S. n. to Va., Tenn. and Mo., w. to Okla. and Tex.

19. *Carex digitalis* Willd. Perennial in dense tufts (rhizomes very short); culms 1-5 dm. long, 0.5-1 mm. thick, weak but ascending, the basal sheaths brownish; leaves dark-green, membranous, the blades 2.5-5 mm. broad; spikelets usually not overlapping; terminal spikelet staminate, 1-1.5 mm. thick, on a filiform culm apex 1-5 cm. long, the scales white-hyaline and acute; lower (1 or) 2 spikelets pistillate (or often the very tip of the next-to-highest spikelet with some staminate flowers), 1-2 cm. long, about 3 mm. thick, with 8 to 20 overlapping perigynia, on filiform (often slightly arcuate) peduncles 3-10 cm. long; scales about 1 mm. long, ovate, acute to cuspidate, white-hyaline with green midnerve; bracts with definite sheaths, foliaceous, the upper one occasionally equaling or surpassing the staminate spikelet; perigynia obovoid, rather sharply triangular through most of the length, 2.5-3.5 mm. long, more than half as thick as long, 2-ribbed and with 25 to 35 slender nerves (much narrower than the internerve spaces), membranous, basally tapered to a short stipelike base, laterally closely enveloping the achene, abruptly tapered to the essentially straight pyramidal scarcely beaklike apex with an entire orifice; achene triangular, apiculate, jointed with the style which wholly withers after anthesis. Incl. the var. *asymmetrica* Fern. and var. *macropoda* Fern. Rare in forested areas, e. Tex. (Newton and Polk cos.), Apr.; Ont. and e. U.S. w. to Wis., Mo., Okla. and Tex.

20. *Carex blanda* Dew. Tufted perennial (rhizomes very short); culms 15-55 cm. long, ascending, 0.8-1.5 mm. thick; basal sheaths brownish at base and rather loose; basal blades 4-11 mm. broad, the cauline ones 3-5 mm. broad, thin-membranous; upper 2 or 3 spikelets usually close or even overlapping, nearly sessile, the lowest (usually fourth and/or fifth) spikelet usually widely separate and exerted on an erect filiform peduncle 2-8 cm. long; terminal spikelet staminate, 1-2 cm. long, 2-3 mm. thick, stramineous, the scales acute to acuminate or cuspidate; remainder of spikelets pistillate, 5-20 mm. long, 4-6 mm. thick, with 4 to 20 closely set overlapping perigynia, the ovate or obovate scales either mucronate (and shorter than their perigynia) or with a long subulate projection (this often equaling or exceeding the perigynium) and white-hyaline; bracts foliaceous, with definite sheaths (the edges of which are minutely fimbriate), the blades of the bract of the third or fourth spikelet from the apex often equaling or surpassing the staminate spikelet; perigynia turgidly obovoid, vaguely triangular, 3-4 mm. long, closely investing the achene not only laterally but in much of the apex as well, membranous, with 2 ribs and 23 to 30 nerves (much more slender than the internerve spaces), basally tapering and substipitate, apically rounded, abruptly very short-beaked, the beak about 0.5 mm. long and bent or recurved nearly at right angles to the axis of the perigynium, the orifice hyaline and entire; achenes triangular, bent-apiculate, jointed with the style which wholly withers after anthesis. Frequent in moist woods, e. and n.-cen. Tex., rare w. to Edwards Plateau (San Saba Co.), Apr.-May; e. temp. N.A. w. to the Dakotas, Neb., Kan., Okla. and Tex.

21. *Carex gracilescens* Steud. Tufted perennial (rhizomes very short); culms 15-60 cm. long, ascending, 0.7-1 mm. thick; basal sheaths brownish (said to be purplish-tinged), not loose; basal blades reduced, cauline blades 1-4 mm. broad, thin-membranous; spikelets 3 or 4 per culm, separated, rarely the 2 upper ones overlapping, the upper nearly sessile, the lower on erect peduncles 2-5 cm. long; terminal spikelets staminate, 8-19 mm. long, 1-1.5 mm. thick, stramineous, the obtuse scales hyaline; lower spikelets pistillate, 5-18 mm. long, 2-3 mm. thick, with 7 to 20 closely set mostly overlapping perigynia; scales ovate or obovate, cuspidate even with the subulate medial prolongation, not equaling the perigynium; bracts foliaceous, the edges of the definite sheaths minutely erose, the blade of the bract of the lowest spikelet 4-12 cm. long, occasionally surpassing the terminal spikelet; perigynia turgidly obovoid, vaguely triangular, 2.5-3.5 mm. long, closely investing the achene not only laterally but for a portion of the apex as well, membranous, with 2 ribs and 20 to 30 nerves (much more slender than the internerve spaces), basally tapering and substipitate, apically rounded, abruptly short-beaked, the beak about 0.7 mm. long, and recurved so the apex is at right angles to the perigynium, the orifice entire; achene triangular, bent-apiculate, jointed with the style which entirely withers after anthesis. Rare in s.e. Tex. (Jefferson Co.), Apr. (-May); e. temp. N.A. w. to Wisc., Mo., Ark. and Tex.

22. *Carex striatula* Michx. Loosely tufted perennial (rhizomes very short); fertile culms 2-6 dm. long, ascending, lateral, not leafy at the base, erose or obscurely erose-granulose on the sharp angles; sterile shoots at fruiting time not stemmy but mere rosetted tufts; leaves pale, scabrous, quite firm, with prominent ribs, those of the sterile tufts 7-25 mm. broad, those of the culms 2-7 mm. broad; basal sheaths brown, never with any purplish-tinge; terminal spikelet staminate, long- or short-peduncled, prominent, pale, stout (2-3.5 mm. thick), the broad scales white and with nonexcurrent midribs; the lower 2 or 3 spikelets pistillate, remote, scattered (the lowest on a peduncle a few times its own length, the higher peduncles shorter), interruptedly linear or oblong-cylindric, the longer one 15-35 mm. long and 4-8 mm. thick, with a smooth sharply angled rachis, often loose (but perigynia overlapping), 6- to 20-flowered, the cuspidate or acuminate scales white-hyaline and shorter than the perigynia; bracts foliaceous but shorter than or scarcely exceeding the staminate spike, their definite sheaths smooth on the edges; perigynia elliptic-obovoid to slenderly fusiform-obovoid, 4-5.5 mm. long, less than half as thick as long, outward-curving, 2-ribbed and 21- to 33-nerved (the nerves much narrower than the internerve spaces), very firm, basally obtusely triangular, stipelike, tapered (the stipelike portion 1.3-2 mm. long), laterally closely enveloping the achene (but not elsewhere), apically obtusely triangular, conical, gradually acute, long-tapered or somewhat abruptly narrowed into the straight or only slightly oblique (?) conspicuous beak with entire orifice; achene triangular, apiculate, jointed with the style which entirely

withers after anthesis. *C. ignota* Dew., *C. laxiflora* Lam. var. *Michauxii* Bailey. Forested areas, e. Tex., May; Gulf and Atl. states n. to N.Y. and Conn., inland to Ky. and Ind.

23. *Carex styloflexa* Buckl. Tufted perennial (rhizomes very short); fertile culms 2-8 dm. long, ascending, mostly lateral, few-leaved, more or less granulose-scabrous on the angles; sterile leafy basal shoots at fruiting time with culms elongating to 5-15 cm.; basal leaves of fertile shoots 3-7 mm. broad; upper blades of sterile shoots 2-15 mm. broad, the broadest ones with 13 to 35 nerves; culm blades of fertile shoots 2.5-3.5 mm. broad; all leaves membranous, deep-green, slightly roughened; basal sheaths brown, never with any purplish-tinge; terminal spikelet staminate, on a peduncle to 8 cm. long, conspicuous, prominent but slender, 2.5 mm. thick, the white-hyaline scale less firm than those of *C. striatula*; the lower 2 or 3 spikelets pistillate, scattered, remote, oblong-cylindrical to oblong or linear-oblong, 4- to 15-flowered, 5-30 mm. long, 4.5-10 mm. thick, closely flowered, all but the lowermost perigynia overlapping; scales acute to short-awned, not cuspidate, more or less strongly reddish-tinged, shorter than their perigynia, the rachis not sharply angled; bracts foliaceous but not surpassing the staminate spikelet, their definite sheaths minutely roughened on the edges; perigynia fusiform-obovoid, 3.5-5 mm. long, 2-3 mm. thick, 2 to 3 times as long as broad, nearly straight, barely curved or outwardly arching, 2-ribbed and with 18 to 33 slender nerves (much narrower than the internerve spaces), basally long-tapered, stipelike, obtusely triangular, laterally closely enveloping the achene (but not elsewhere), above tapered to a beak as long as the stipe, oblique but more or less straight, rather sharply triangular, with an entire orifice; achene triangular, apiculate, jointed with the style which entirely withers after anthesis. *C. laxiflora* Lam. var. *styloflexa* (Buckl.) Boott. Infrequent in moist rich hardwood forests, less common still in mixed pine-oak woods, e. Tex., Mar.-May; Gulf and Atl. states n. to N.Y. and Conn. Perhaps not sufficiently distinct from *C. striatula*.

24. *Carex crebriflora* Wieg. Perennial in large tufts (rhizomes very short); fertile culms 2-6 dm. long, ascending, usually retrorsely scabrous; broadest basal leaves 3-5 mm. broad; broadest cauline leaves 3-4 mm. broad; upper 2 to 3 spikelets nearly sessile, overlapping; terminal spikelet staminate, 1-3 cm. long, 1-2 mm. thick, inconspicuous, the white-hyaline scales usually acute but not cuspidate; lower spikelets pistillate, 5-20 mm. long, about 3 mm. thick, with 8 to 18 close overlapping perigynia, with smooth rachis; scales white-hyaline-membranous, acute but not cuspidate, with strong greenish midvein, more than half as long as their perigynia (often 1-2 dm. below the headlike aggregation of the upper spikelets occurs a third or fourth pistillate spikelet on a peduncle 15-40 mm. long and exceeded by its bract); bracts foliaceous with definite sheaths that are minutely rough on the edges, the bract of the lowest spikelet of the terminal aggregation usually exceeding the staminate spikelet; perigynia elliptic-obovoid to fusiform, 3.5-4.5 mm. long, about half as thick as long, essentially straight, with 2 ribs and 27 to 38 nerves (the nerves much narrower than the internerve spaces), firm-membranous, basally long-tapered and stipelike, laterally closely enveloping the achene and rather sharply triangular, above somewhat triangular and long-pyramidal, acute, tapered to an essentially straight beak as long as the stipe and with an entire orifice; achene triangular, apiculate, jointed with the style which entirely withers after anthesis. Infrequent to rare in e. and s.e. Tex. (Polk, Hardin and Harris cos.), Apr.; S.C., Ala., Fla., Miss., La. and Tex.

The characters of this plant suggest the products of hybridization of *C. blanda* and *C. styloflexa*.

25. *Carex debilis* Michx. Loosely tufted perennial; culms 15-60 cm. long, 0.6-1 mm. thick, basally with reduced blades and purplish red sheaths; cauline leaves 2-4 mm. broad, ascending, pale-green, membranous; spikelets 4 or 5 per culm, the terminal one (rarely the terminal 2) staminate in Texas material (some non-Texan specimens have gynecandrous terminal spikelets), 2-5 cm. long, about 1 mm. thick, erect or often nodding on a peduncle 2-5 cm. long, the scales stramineous-hyaline; the remaining spikelets pistillate, nodding on slender flexuous peduncles 2-5 cm. long, crowded or the lower ones usually remote, 3-6 cm. long, 4-6 mm. thick, with 12 to 25 ascending perigynia which are usually close enough to overlap a little (except the lowermost); scales subulate, hyaline, inconspicuous, about half as long as the perigynia and deciduous with them; lower bract long-sheathing, foliaceous, the blade 1-2 mm. broad and often equaling or surpassing the pistillate spikelet; perigynia narrowly fusiform, in transection nearly round when fresh, 6-9 mm. long, 1.2-1.7 mm. thick, stramineous-brown, membranous, inflated, with 2 strong

nerves and 10 to 18 weak slender ones, long-tapered basally and apically and passing into a beak about 1 mm. long and very deeply bidentate; achene triangular with concave sides and thickened angles, stipitate, apiculate, jointed with the style which entirely withers after anthesis. Infrequent near brooks and in low poorly drained pinewoods, e. and s.e. Tex. (Cass, Cherokee, Hardin, Nacogdoches, Panola and Polk cos.), Apr.-May; e. temp. N.A., w. to Wisc., Mo. and Tex.

26. *Carex Davisii* Schwein. & Torr. Loosely tufted perennial or with reddish-black scaly rhizomes 2.5-4 mm. thick; culms 2-6 dm. long, 1.5-3 mm. thick, erect, basally with reduced blades and reddish-black sheaths; cauline leaves 4-8 mm. broad, pale green, erect; spikelets 3 or 4 per culm; terminal spikelet gynecandrous, 2-3 cm. long, with a terminal pistillate section and a staminate portion about 2 mm. thick, on an ascending or only slightly nodding peduncle 1-3 cm. long, the stramineous-hyaline scales oblanceolate and long-cuspidate; the remaining spikelets pistillate, on ascending peduncles (that of the lowest spikelet 2-10 cm. long), either crowded terminally and overlapping or the lower ones remote, 2-5 cm. long, about 6 mm. thick, with 12 to 20 ascending perigynia which are close enough to overlap (except occasionally the lowermost); scales hyaline, elliptic, long-cuspidate, half to three fourths as long as the perigynia; lower bract very long-sheathing and foliaceous, the blade 2-6 mm. broad, usually equaling or surpassing the staminate spikelet; perigynia ovoid, in transection nearly round when fresh, 4-6 mm. long, brownish, membranous, strongly inflated, with 9 to 12 slender nerves (2 stronger than the others), basally rounded, apically obtuse and abruptly giving way to the beak (0.3-0.4 mm. long) with a strongly bidentate orifice; achene triangular with concave sides, apiculate, jointed with the style which entirely withers after anthesis. Infrequent in rich calcareous woods, n.-cen. Tex. (Dallas, Denton, Kaufman and Tarrant cos.), Apr.; Que. and n.e. U.S. w. to Minn. and Kan.; also Okla. and Tex.

27. *Carex oxylepis* T. & H. Loosely tufted perennial or with short purplish-black scaly rhizomes 2-3 mm. thick; culms 4-7 dm. long, 1-2 mm. thick, erect, basally with reduced blades and purplish-black sheaths; cauline leaves 2.5-6 mm. broad, pale-green, erect; spikelets usually 4 per culm; terminal spikelet gynecandrous, on a slender nodding peduncle 2-4 cm. long, 2-5 cm. long, with a short terminal pistillate portion and a long staminate portion about 2 mm. thick, with lanceolate hyaline stramineous scales; other spikelets pistillate, with slender nodding or flexuous peduncles usually only 2-4 cm. long, 18-35 mm. long, 4-5 mm. thick, with 20 to 44 ascending perigynia which are close enough to overlap (except occasionally the lowermost); scales hyaline, ovate, long-subulate-cuspidate, about three fourths as long as the perigynia; lower bract with definite sheath and a long blade 1-3 mm. broad, almost equaling the uppermost spikelet, the higher bracts progressively much-reduced; perigynia fusiform-ellipsoid, in transection nearly round when fresh or obtusely triangular after drying, 3.5-4 mm. long, green, membranous, inflated, with 6 to 8 slender nerves (2 stronger than the rest), basally and apically tapered, with a beak 0.2-0.3 mm. long and a nearly entire orifice; achene triangular with concave sides, apiculate, jointed with the style which entirely withers after anthesis. Infrequent in low moist rich woods near streams, e. and s.e. Tex., Mar.-Apr.; Fla., Ga., S.C., N.C., Ala., Tenn., Miss., La., Tex., Ark. and Mo.

28. *Carex Bushii* Mack. Tufted perennial; culms 3-9 dm. long, basally 1.5-2.5 mm. thick, erect, the basal sheaths rich-brown and quickly fading; foliage usually shortly pilose or hirsute at least on the sheaths; blades 2.5-5 mm. broad at the broadest point, the uppermost one usually surpassing the spikelets; spikelets usually 2, less commonly 3, overlapping; terminal spikelet gynecandrous, with an ovoid distal pistillate portion 7-10 mm. long and 7-9 mm. thick (including the scales), with ovate scales in the widest part pale-hyaline, strongly cuspidate and 4-5 mm. long (longer than the perigynia even at maturity), with an obconic basal staminate portion with elliptic acuminate whitish hyaline scales about 4 mm. long; the lower spikelet(s) all pistillate, ovoid, 9-14 mm. long, 7-10 mm. thick (including scales), with 12 to 25 ascending perigynia; lowest bract not sheathing, about 1 mm. broad, usually about equaling the terminal spikelet, the higher bracts greatly reduced; perigynia obovoid, in transection usually very slightly unequally triangular, 3-5 mm. long, brown, firm-membranous, with 2 strong nerves and 7 to 13 weaker slender ones (scarcely visible at maturity), basally obconical and shortly rounded, apically short-pyramidal and abruptly passing into the very short beak (some specimens essentially beakless) with essentially entire orifice; achenes triangular, bent-apiculate,

jointed with the style which entirely withers after anthesis. *C. caroliniana* var. *cuspidata* (Dew.) Shinners. Frequent in moist sandy soil in e. Tex., infrequent in n.-cen. Tex., spring; N.E. s. to D.C. and s.w. to Kan., Okla. and Tex.

Grades into or hybridizes with *C. caroliniana* and *C. complanata*.

29. *Carex complanata* T. & H. Tufted perennial; culms 3-8 dm. long, basally 1-2 mm. thick, erect, the basal sheaths dark-purplish; foliage often shortly pilose to hirsute on the sheaths and often also on the lower parts or all of the blade; blades 1.5-3 mm. broad at the broadest point, usually the uppermost one surpassing the spikelets; spikelets usually 3, less often 4, overlapping; terminal spikelet gynecandrous, with an ovoid-cylindrical distal pistillate portion 8-11 mm. long and 5-6 mm. broad (with brownish-white hyaline ovate scales, the lower ones more strongly acuminate than the upper, slightly longer than the immature perigynia but about equaling the mature ones), with a short obconic staminate portion with ovate acuminate brownish-white hyaline scales 3-4 mm. long; lower spikelets pistillate, ovoid to cylindrical, 5-12 mm. long, 5-6 mm. thick, with 11 to 25 close ascending perigynia; bracts not sheathing, that of the lowest spikelet 0.5-1.5 mm. broad and usually exceeding the terminal spikelets, that of the middle spikelet much-reduced, that of the terminal spikelet essentially absent; perigynia obovoid, in transection flattened-triangular to unequally biconvex, 2.3-2.8 mm. long, ascending, olive-brown, firm-membranous, with 2 strong and 7 to 14 weak (at full maturity scarcely visible) nerves, scarcely inflated, basally rounded, apically shortly acute to a nearly entire orifice; achene triangular, bent-apiculate, jointed with the style which entirely withers after anthesis. *C. hirsutella* Mack. Frequent in moist sandy woods, e. and s.e. Tex., spring; Ont. and e. U.S. w. to Mich., Mo., Okla. and Tex.

Apparently grading into *C. caroliniana* and *C. Bushii*. These three taxa probably should be treated as varieties of a single species (*C. caroliniana*).

30. *Carex caroliniana* Schwein. Tufted perennial; culms 3-6 dm. long, basally about 1 mm. thick, erect, the basal sheaths dark-purplish-black quickly fading to brown; foliage essentially glabrous; blades 1.5-3 mm. broad at the broadest point, usually the uppermost one surpassing the spikelets; spikelets usually 3, overlapping; terminal spikelet gynecandrous with a cylindrical distal pistillate portion 8-13 mm. long and 4-4.5 mm. thick (with scales ovate, brownish-white, hyaline, 1.5-2 mm. long, shorter than the perigynia) and a long-attenuate basal staminate portion 2-3 mm. thick with ellipsoid acute brownish-white-hyaline scales 2-2.5 mm. long; the lower spikelets all pistillate, cylindrical, 6-20 mm. long, 4-4.5 mm. thick, with 16 to 40 closely packed spreading perigynia; bracts not sheathing, that of the lowest spikelet 1-2 mm. broad, usually exceeding the terminal spikelet, that of the middle spikelet much-reduced, that of the terminal one essentially absent; perigynia obovoid, nearly round in transection, 1.8-2.3 mm. long, spreading, fuscous or reddish-brown, membranous, with 8 to 15 nerves (2 stronger than the rest), inflated, basally rounded, apically short-conic and passing abruptly to the short tubular bidentate beak or in some specimens essentially beakless; achene triangular, bent-apiculate, jointed with the style which entirely withers after anthesis. Infrequent in rich open woods near streams in sandy soil, e., s.e. and n.-cen. Tex. (Jasper, Jefferson, Kaufman and Walker cos.), spring; Pa. to Ind. and s. to N.C., Tenn., Ark., Okla. and Tex. (probably also La.). Grades into or hybridizes with *C. complanata* and *C. Bushii*.

31. *Carex Joorii* Bailey. Loosely tufted glabrous perennial with short blackish scaly rhizomes 3-8 mm. thick; culms 6-10 dm. long, erect; blades 4-8 mm. broad at the broadest point; spikelets (5 or) 6 (rarely up to 8); the upper 1 (or 2) spikelets staminate and erect, the lower ones pistillate (or the 2nd and 3rd from the top androgynous with a very short staminate portion) and downward progressively longer-peduncled and more nodding (at maturity!); terminal staminate spikelet 3-6 cm. long, 4-6 mm. thick, with mucronate scales 5-6 mm. long; lowest pistillate spikelet 25-40 mm. long, 6-9 mm. thick, with 25 to 60 close spreading perigynia and obovate or ovate strongly cuspidate hyaline scales about as long as the perigynia; lowest bract sheathless, the blade 2-4 mm. broad, often surpassing the staminate spikelet, the bracts of the higher spikelets progressively very strongly reduced; perigynia rhomboid-ovoid to -obovoid, in transection nearly round (fresh) to obscurely triangular (dried), 4-5 mm. long, inflated, firm-membranous, dark brown, with 2 strong pale nerves (or ribs) and 9 to 12 slightly less strong ones, basally rounded, apically pyramidal-acuminate, passing into the definite slender beak (about 0.5

mm. long) with an entire orifice; achene triangular with concave sides, apiculate, jointed with the style which entirely withers after anthesis. Frequent in e. and s.e. Tex., July-Oct.; Coastal States, Md. to Tex.; also Ark., Tenn. and Mo.

32. *Carex glaucescens* Ell. Tufted glabrous perennial with short blackish rhizomes 2-3 mm. thick; culms 5-12 dm. long, erect, leafy; blades 4-8 mm. broad at the broadest point; spikelets 4 to 7, the upper one staminate and erect, the lower ones pistillate (or some of them androgynous with very short staminate portions) and downward progressively longer peduncled and more nodding (at maturity); at anthesis many of them ascending); terminal staminate spikelet 25-40 mm. long, 5-7 mm. thick, with mucronate scales 5-7 mm. long; lowest pistillate spikelet 2-5 cm. long, 7-9 mm. thick, with 60 to 100 very close ascending perigynia and obovate reddish-brown hyaline scales (with greenish midnerves subulately exerted from an emarginate apex) about equaling the perigynia; lowest bract sheathless, the blade 1-4.5 mm. broad and from very short to surpassing the staminate spikelet, the bracts of the higher spikelet progressively strongly reduced; perigynia elliptic to obovate in the larger plane, in transection elliptic or obscurely very unequally triangular, 3-4 mm. long, somewhat inflated, membranous, purplish-brown with a very pronounced whitish bloom, with 2 strong nerves and 2 or 3 extremely weak scarcely visible ones, basally tapered and rounded, apically tapered to a very short beak (0.2-0.3 mm. long) and a nearly entire orifice; achene triangular with concave sides, apiculate, jointed with the style which entirely withers after anthesis. *C. verrucosa* var. *glaucescens* (Ell.) Wood. Frequent in e. Tex., rare in s.e. Tex., late spring-summer; Coastal States, Va. to Tex.

Perhaps not specifically distinct from *C. verrucosa* Muhl., the typical form of which has erroneously been reported to occur in Texas.

33. *Carex Emoryi* Dew. Perennial in large tufts and in tufts with extensively creeping scaly rhizomes 2-3 mm. thick; culms 4-10 dm. long, 2-3 mm. thick basally, remainder of leaves mostly clustered basally; basal sheaths light chestnut to purplish; juncture of sheath and blade flat or slightly arcuate; spikelets 4 to 7 per culm, overlapping or rarely slightly remote; uppermost spikelet nearly erect and usually entirely or nearly entirely staminate, 2.5-7 cm. long, 2.5-4 mm. thick, brownish-stramineous; lower spikelets usually sessile, androgynous, slightly nodding (at maturity); lowest spikelets usually almost entirely pistillate, 3-10 cm. long, 3.5-5 mm. thick, with 65 to 165 overlapping ascending perigynia (borne in rows); scales brownish-hyaline, oblong, blunt, with paler broad midnerves, shorter than the perigynia to which they are closely appressed; bract sheathless, that of the lowest spikelet 1.5-4 mm. broad and (in length) often attaining the uppermost spikelet, the higher bracts progressively drastically reduced; perigynia ovate to obovate, flattened (biconvex), 2.3-3.3 mm. long, stramineous, with 2 strong (marginal) nerves and a few vanishingly obscure ones, firm-membranous, basally rounded, shortly tapered to an essentially beakless or minutely beaked apex, the orifice essentially entire; stigmas 2; achene lenticular, only about half filling the perigynium, apiculate, jointed with the style which entirely withers after anthesis. Frequent in calcareous mud, n.-cen. and Trans-Pecos Tex. and Edwards Plateau, Apr.-May; Man. and N.D. s. to Coah. and Tex., e. to N.Y., N.J., D.C. and Va. Perhaps only a variety of *C. stricta*.

34. *Carex stricta* Lam. Perennial in large tufts, with slender easily detached rhizomes; culms 3-8 dm. long, 1-2 mm. thick basally, the basal sheaths chestnut-black; juncture of sheath and blade inverted V-shaped; spikelets usually 4 per culm, overlapping or occasionally the lowermost slightly remote; uppermost spikelet erect and usually entirely staminate, 2-4 cm. long, 2.5-4 mm. thick, buffy-brown; subterminal spikelets usually sessile, androgynous and slightly nodding (at maturity); lower spikelets usually almost entirely pistillate, 2-4 cm. long, 3-4 mm. thick, with 45 to 65 overlapping ascending perigynia (borne in elegant rows) and brownish oblong blunt scales with paler midnerve and slightly shorter than their perigynia to which they are closely appressed; bracts sheathless, that of the lowest spikelet often attaining the uppermost spikelet in length, those of higher spikelets progressively drastically reduced; perigynia ovate, flattened (biconvex), 2.5-3 mm. long, olivaceous, with 2 strong (marginal) nerves and a few vanishingly obscure ones, firm-membranous, basally rounded, shortly tapered to an essentially beakless or minutely beaked apex, the orifice essentially entire; stigmas 2; achene lenticular, only about half filling the perigynium, apiculate, jointed with the style which

entirely withers after anthesis. Rare in moist sandy forests and bogs, e. Tex. (Freestone and Walker cos.), Apr.-May; N.E., N.Y. and Pa. s. to N.C.; also Ind., Mich., Wisc., Ill., Minn. and Tex.

Our plants have longer, fewer perigynia than plants from most of the range in north-eastern United States and perhaps should be given a different name.

35. *Carex crinita* Lam. Tufted essentially glabrous perennial with branching scaly brownish rhizomes 2-4 mm. thick; culms 6-12 dm. long, 2.5-5 mm. thick basally; basal sheaths dark brown, bladeless; blades of cauline leaves 5-11 mm. broad; spikelets 4 or 5 per culm, overlapping, mostly nodding; terminal spikelet staminate, 3-5 cm. long, 2-3 mm. thick; subterminal spikelets androgynous and progressively longer-peduncled downward; lowest spikelet essentially all pistillate or with only a very small terminal staminate portion, 4-9 cm. long, 5-10 mm. thick (including the scale cusps), with 75 to 130 close ascending perigynia, the scales with hyaline oblong bodies shorter than the perigynia but with the midnerve elongated into a spreading cusp surpassing the perigynium; bract of lowest spikelet sheathless, erect and usually much-surpassing the terminal spikelet, the higher bracts progressively reduced; perigynia obovate, 3-3.5 mm. long, biconvex, membranous, somewhat inflated, with 2 strong marginal nerves and a few vanishingly faint ones, stramineous to brownish, basally tapered, apically rounded or tapered and giving way abruptly to the minute tubular beak with entire orifice; achene biconvex, only half filling the perigynium, apiculate, jointed with the 2-branched style which entirely withers after anthesis. Incl. var. *Mitchelliana* (M. A. Curtis) Gl. and var. *brevicrinis* Fern. Infrequent in wet places, usually in water, e. Tex. (Cass, Gregg and Morris cos.), May-June; e. N.A. w. to Man., Minn., Mo. and Tex.

36. *Carex aurea* Nutt. Perennial with extensive rhizomes several cm. long and 1 mm. thick; culms often weak and reclining basally, distally ascending, 7-20 cm. long, 0.5-0.8 mm. thick; leaves few, clustered basally; blades 15-25 cm. long and about 2 mm. broad, often surpassing the inflorescence; inflorescence of a terminal staminate spikelet and 2 or 3 subterminal weakly ascending peduncled (peduncle of lowest filiform one 1-2 cm. long, of upper ones shorter) lax pistillate spikelets about 1 cm. long; scales hyaline, minute, much smaller than their perigynia; bract of lowest spikelet leaflike, 3-10 cm. long, those of the higher spikelets smaller; perigynia 5 to 8 per spikelet, broadly ovate, plano-convex or lenticular, 2-2.5 mm. long, basally slightly narrowed, apically rounded, quite beakless, with a number of faint veins (2 of them less faint than the rest), membranous (when fresh somewhat succulent or baccate and translucent but drying firm, opaque in specimens), orange (in dried specimens rich-dark-brown); achene not quite filling the top of the perigynium (at least in dried specimens) but laterally filling it, lenticular, ovate, minutely apiculate, dark-brown, jointed with the style. Rare in seepy areas on shaded hillsides, Plains Country (Randall Co., Ceta Canyon), June; temp. N.A., s. to Conn., Mich. and Neb. and at moderate elev. to Tex., N.M., Ut., Nev. and Calif.

37. *Carex muriculata* Herm. Densely tufted perennial; culms 15-50 cm. long, 1-2 mm. thick, erect; leaves clustered basally; blades 10-23 cm. long, 2-3 mm. broad, long-tapered to a setaceous tip, some of the longer ones about equaling or surpassing the culms; inflorescence of 3 to 6 sessile ascending-appressed androgynous spikelets about 10-15 mm. long and 3-6 mm. thick, the lowest 2 of them separated by an internode 1-2 cm. long, the higher internodes shorter; scales mostly hyaline, about as long as their perigynia and partly concealing them; bract of the lowest spikelets foliaceous, 5-15 cm. long (some reportedly as long as "27 cm."), ascending, those of the upper spikelets smaller; perigynia 14 to 23 per spikelet, 4-4.2 mm. long, fusiform, stramineous-brown, firm, with 2 prominent nerves (one on each of the adaxial faces) and a number of other less prominent nerves each marking a row of minute fuzzy warts, the body obovoid, almost completely filled by the achene, rather sharply trigonous, 3-3.2 mm. long, apically narrowed, the beak rather poorly defined and about 1 mm. long, slightly flattened and bidentate; achenes brownish, rather sharply trigonous, 2.3-2.5 mm. long, apiculate, jointed with the rest of the style which however tends to persist. Locally abundant in mts. of the Trans-Pecos (Brewster, Culberson and Pecos cos.), flowers late spring-early summer, fruits in summer to Aug.; endemic but doubtless also to be found in Coah. and N.M.

Perhaps not specifically distinct from the Mexican *C. stellata* Mack., the typical form of which has erroneously been reported to occur in Texas.

38. *Carex planostachys* Kunze. Densely tufted perennial, basally brownish-black, hard and knotty; culms 4-30 cm. long, 0.5-1 mm. thick, wiry; blades of leaves and bracts commonly surpassing the culms; inflorescence variable, often of a headlike group of 1 terminal (staminate) and 1 to 3 pistillate subterminal nearly sessile spikelets (or else the staminate spikelet solitary) and with 1 to 3 pistillate spikelets (4-15 mm. long) on long capillary-flexuous peduncles widely isolated lower on the culm (appearing basal and emanating severally from the tight cluster of bracts); scales about as long as their perigynia, often slightly longer and concealing most of the dorsal part; bract of lowest subterminal pistillate spikelet foliaceous, (1-) 2-4 (-10) cm. long, 1-2 mm. broad, the bracts of upper spikelets reduced; perigynia 3 or 4 per spikelet, narrowly rhomboid-ellipsoid or obovoid-ellipsoid, 3-4 mm. long, rather sharply triangular, not at all inflated, membranous, minutely pubescent, narrowed basally and apically (beak not differentiable), with about 6 prominent close-set veins or ribs on each of the 3 sides (the 2 ribs on the adaxial corners more prominent than the rest); achenes almost completely filling the perigynium, triangular, the sides slightly concave, minutely apiculate, jointed with the style which completely withers after anthesis. Abundant in dry scrub on limestone, Edwards Plateau and n.-cen. Tex. (n. to Taylor, Parker, Tarrant and Dallas cos.), infrequent in mts. of the Trans-Pecos (Brewster, Hudspeth and Pecos cos.) and cuestas of Rio Grande Plains (Karnes, Live Oak and San Patricio cos.), Mar.-May; Tex., S.L.P., Pue.; Guat.

39. *Carex tenax* Chapm. Tufted perennial with tough knotty bases, forming stools 1-2 dm. across; culms 25-35 cm. long, about 1 mm. thick, tough, wiry, sharply triangular, erect; leaves mostly basal, grayish-green, the blades about 2 mm. broad, tough, stiffly ascending, the longer ones equaling or surpassing the culm; inflorescence a close group of usually 3 spikelets, a terminal staminate one and 2 subterminal sessile oblong pistillate spikelets (5-18 mm. long); bract of lowest spikelets foliaceous, 5-10 cm. long, 1-2 mm. broad, much-exceeding the inflorescence, the bracts of the higher spikelets smaller; perigynia 15 to 20 per spikelet, ellipsoid, about 4.5 mm. long, triangular, not inflated, firm-membranous, covered with a short white pubescence (especially dense in the distal half), with about 20 strong veins or ribs (about 6 or 7 per side), narrowed to a stipelike base, apically tapered to a scarcely beaklike apex, with an essentially entire orifice; achene almost completely filling the perigynium, triangular, with prominent angles and concave sides, minutely apiculate, jointed with the style which completely withers after anthesis. *C. dasycarpa* Muhl. var. *tenax* (Chapm.) Kükenth. Rare in pine-oaks, s.e. Tex. (known only in e. Hardin Co.), Apr.; S.C., Ga., Fla., Miss. and Tex. (presumably also La., Ala.).

40. *Carex eburnea* Boott. Perennial; rhizomes extensively creeping, scaly, about 1 mm. thick; culms in small tufts at intervals along the rhizome, 20-35 cm. long, 0.2-0.3 mm. thick, wiry, grayish-green; leaves involute-filiform, 15-20 cm. long, 0.2-0.3 mm. thick, mostly shorter than the culms, grayish-green, basally clustered; inflorescence essentially bractless except for a minute nearly bladeless hyaline sheath at the node of the subterminal spikelets, composed of a terminal erect staminate spikelet and usually 2 subterminal erect peduncled (peduncles filiform, erect, 1-2 cm. long) pistillate spikelets about 8 mm. long and 2 mm. thick, the nodes of attachment of spikelets being separated by internodes 8-12 (upper ones) or 13-27 (lower ones) mm. long; scales hyaline, very slightly shorter than their perigynia; perigynia 5 to 8 per spikelet, fusiform, 2.5-2.7 mm. long, the bodies narrowly obovoid-triangular (the angles blunt, the sides flat), 2-2.1 mm. long, membranous or subhyaline, glabrous, with 2 prominent veins and a number of faint ones, apically narrowed; beak 0.5-0.6 mm. long, not well-defined, thick basally, oblique and the orifice oblique; achenes 1.6-1.8 mm. long, dark-brown, obovoid, rather sharply trigonous, essentially filling the bodies of the perigynia, apiculate, jointed with the style which wholly withers after anthesis. Rare in seepage areas of limestone cliffs at alt. of 5,000-6,000 ft. in the Trans-Pecos (Guadalupe Mts.), July; temp. N.A. s. to Va., Tenn., Mo., Neb., and in mts. to Tex.

Our plants may be variably distinct in that the perigynia and achenes average slightly larger than in more northern plants.

41. *Carex microrhyncha* Mack. Perennial in dense tufts to 1 dm. across; culms 1-10 (-17) cm. long, 0.3-0.4 mm. thick; leaves (some of these bracteal) clustered at the base; lowest sheaths of new shoots with blades; blades 10-35 cm. long, 1-2 mm. broad, far-exceeding the culms; inflorescences diverse, some with a terminal staminate spikelet and

1 (rarely 2) subterminal nearly sessile ascending pistillate spikelet but usually with a terminal staminate spikelet and 2 or 3 pistillate spikelets widely separated from the staminate spikelet and each other and borne on capillary-flexuous peduncles 6-32 mm. long, thus appearing solitary on casual examination as they appear to be borne severally in the tight leaf- (actually bract-) clusters; scales about as long as the perigynia and largely covering them; bracts of upper spikelets negligible; perigynia 3 to 10 per spikelet, ascending, 2.5-3 mm. long, the bodies narrowly obovate and about 2 mm. long, vaguely triangular in transection, long-tapered basally (at the extreme base discolored), apically narrowed, minutely pubescent, with 2 prominent nerves and no others, membranous; beak about 0.5 mm. long (rarely to 1 mm.), shallowly bidentate; achene completely filling the upper part of the body, triangular, the angles blunt and sides convex, apically truncate, jointed with the style which completely withers after anthesis. Frequent but very inconspicuous in gravelly sandy soil, e. Tex. (Bastrop, Brazos, Colorado, Fayette, Lavaca, Lee and Shelby cos.), also reported in Dallas Co., Mar.-Apr.; Mo., Okla. and Tex.

By some authors this plant is merged with *C. abdita* Bickn. which ranges from Nfld. and Sask., s. to Va., Tenn., Ill. and Mo.

42. *Carex nigromarginata* Schwein. var. *floridana* (Schwein). Kükenth. Tufted perennial, often with scaly slender rhizomes; culms 4-20 cm. long, 0.3-0.5 mm. thick; leaves largely clustered near the base; lowest sheaths of the new shoots bladeless; blades 8-30 cm. long, far-exceeding the culms, 2-2.5 mm. broad; inflorescence subcapitate, 9-12 mm. long, 3-7 mm. thick, composed of one terminal staminate spikelet and a few subterminal sessile ascending-appressed pistillate ones so closely placed that they overlap for most of their lengths; scales about as long as the perigynia and mostly concealing them, often with a faint purplish marginal zone, otherwise thin-membranous; bract of lowest spikelet 6-9 mm. long, foliaceous, those of rest of spikelets smaller; perigynia 5 to 12 per spikelet, ascending-appressed, about 3.3 mm. long, the bodies narrowly obovate and about 2.8 mm. long, vaguely triangular in transection (the inner "angle" blunt), long-tapered basally (at the extreme base discolored), apically narrowed, minutely pubescent, with 2 prominent veins; membranous; beak about 0.5 mm. long, oblique or minutely bidentate; achene completely filling the upper part of the body of the perigynium, in transection with 2 definitely small angles and one ventral indefinite blunt one, with convex sides, apiculate, jointed with the style which completely withers after anthesis. Rare in moist sandy forests, e. Tex. (Nacogdoches and Newton cos.), Feb.-Mar.; Ga., Fla., Miss., La. and Tex. (the var. *nigromarginata* from Gulf States except Tex., n. to N.E.).

43. *Carex physorhyncha* Liebm. Tufted perennial, with scaly reddish brown rhizomes about 2 mm. thick; culms 15-30 cm. long, 0.3-0.6 mm. thick; lowest sheaths of flowering culms with blades, those of sterile shoots bladeless; blades 2-3 mm. broad, shorter than the culms; inflorescence interrupted-spiciform, 15-25 mm. long, 4-7 mm. thick, composed of one terminal staminate spikelet and 2 to 3 subterminal sessile ascending-appressed pistillate ones, the 2 lowest pistillate spikelets only 3-10 mm. apart on the axis; scales nearly as long as the perigynia, 3-veined medially, marginally hyaline; bracts of lowest spikelet setaceous to subfoliaceous, 5-44 mm. long, ascending, those of the rest of the spikelets smaller; perigynia 6 to 12 per spikelet, ascending-appressed, 2.5-3 mm. long (the bodies narrowly obovoid, bluntly triangular, 1.8-2.3 mm. long, about 1 mm. thick), basally strongly stipitate-narrowed and at the very base discolored, with 2 prominent veins, minutely pubescent, membranous; beak 0.5-0.7 mm. long, thin-membranous, shallowly bidentate; achene completely filling the upper part of the perigynium, triangular, apiculate with convex sides, jointed with the style which completely withers after anthesis. Rare in e. (Smith and Walker cos.), s.e. (Jefferson Co.) and n.-cen. (Dallas Co.) Tex. in moist sandy soil, Mar.-May; S.C., Ala., Miss., La., Ark., Okla., Tex. and Hgo.

44. *Carex Willdenovii* Schkuhr. Densely tufted perennial; culms 8-25 cm. long, leafy, the leaves far-surpassing the inflorescences; spikelets 1, 2 or 3, androgynous, 5-10 mm. long, 2-4 mm. thick, widely separated, the lower one essentially basal and on a peduncle 2-5 cm. long and 0.3-0.5 mm. thick, the upper one on a peduncle 8-15 cm. long and 0.4-0.5 mm. thick; pistillate scales minute; staminate scales very inconspicuous, the margins united basally; bract of terminal spikelet leaflike, 1-5 cm. long, far-surpassing the spikelet, bracts of lower spikelets somewhat smaller; perigynia 3 to 6 per spikelet, nearly round in transection or faintly triangular, with 2 prominent veins and none others,

glabrous, ascending, about 5 mm. long and 1.5 mm. broad, the body obovoid, apically rounded, basally tapered, closely enveloping the achene; beak about 2 mm. long, sharply distinguished from the body, subulate-triangular, at the orifice oblique and entire; achenes triangular, apically blunt, jointed with the style which is 3-branched and which withers in its entire length after anthesis. Rare (if present at all) in extreme e. Tex., late spring?; Vt. and Ont. s. to Ga., Miss. and La.; said to occur also in Texas, but no material has been seen from the state.

45. *Carex leptalea* Wahl. Perennial with creeping scaly rhizomes 0.5-1 mm. thick; culms in tight tufts along the rhizome, 1-4 dm. long, 0.5-1 mm. thick, erect; sheath venters broadly hyaline, splitting lengthwise; blades narrower than their sheaths, 0.5-1 mm. broad, shorter than to occasionally equaling the culms; inflorescence a solitary androgynous spikelet 5-18 mm. long and 2-3 mm. thick; scales red-dotted, those of the staminate flowers with edges connate on lower part; bract absent; perigynia compressed-triangular in transection, almost flat (flat in prepared specimens, appearing 2-edged), oblong-elliptic, 3.9-5 mm. long, 1 to 10 per spikelet, appearing to be tristichous, the lower ones maturing first and falling early in succession (with their scales!), appressed-erect, membranous, many-nerved, the upper part empty, basally spongy, substipitate, beakless, apically rounded; achenes triangular with concave sides, apically truncate, jointed with the flexuous style which all withers away after anthesis. Incl. var. *Harperi* (Fern.) Stone. Frequent in sphagnum areas, e. and s.e. Tex. (Anderson, Angelina, Hardin, Jasper, Nacogdoches, Newton, Shelby and Tyler cos.), Apr.-early June; e. temp. N.A. s. and w. to n. Calif., Colo. and Tex.

46. *Carex crus-corvi* Kunze. Densely tufted perennial (the internodes of the rhizomes very short); culms 4-9 dm. long, 4-12 mm. thick basally, soft; sheaths soft, ventrally thin-papery and easily splitting, the orifice horizontal or shallowly U-shaped, not thickened; blades long, often surpassing the inflorescence; inflorescence a decompound panicle 6-15 (-19) cm. long and 15-40 mm. thick, with 7 to 13 ascending or erect short branches (the lower-middle branches the longest), each branch with 3 to 10 burlike sessile androgynous bractless spikelets each with only a few perigynia; scales lanceolate, about as long as or slightly exceeding the body; perigynial body triangular, largely plano-convex, 2-3 mm. long, firm, brownish, basally inflated, discolored whitish, truncately narrowed to the minute stipelike base, apically passing into the linear strongly bidentate beak (3-4 mm. long); achene lenticular. In mud, frequent in e. Tex., infrequent in s.e. and n.-cen. Tex., rare in the Plains Country (Wichita Co.), spring; Gulf States and n. in cen. U.S. to O., Mich., Minn. and Wisc.

47. *Carex stipata* Muhl. Densely tufted perennial, the internodes of the rootstocks very short; culms 3-10 dm. long, 3-7 (-12) mm. thick basally, rather soft, triangular above with concave sides; sheaths soft, ventrally not transversely wrinkled, easily splitting, orifice horizontal or slightly prolonged and rounded, not thickened; upper blades usually about equaling the inflorescence; inflorescence a dense decompound panicle 3-10 cm. long and 10-25 mm. thick, with several ascending branches (the lower branches longer), each branch with 2 to 10 sessile subglobose essentially bractless androgynous spikelets each with 8 to 15 perigynia; scales ovate, acuminate, about equaling the perigynia; perigynial bodies plano-convex, ovate, firm, 2-3 mm. long, basally more or less discolored brownish-stramineous, firmer, abruptly narrowed to a minute stipe, apically passing into the linear beak which is strongly bidentate and 2-3 mm. long; achene lenticular. Incl. var. *maxima* Chapm., *C. uberior* (Mohr) Mack. Rare in mud, e. Tex. (Austin and Leon cos.), spring; most of temp. N.A. (except extreme s.w. U.S. and Mex.).

C. stipata and *C. Muhlenbergii* (especially the form "*C. Lunelliana*") have apparently hybridized in the past; some of the products have been called *C. oklahomensis* Mack. or *C. stipata* var. *oklahomensis* (Mack.) Gl. These plants show intermediate characters; plants of this kind have been found in Gray County (Panhandle, Plains Country). *C. stipata* itself is intermediate between *C. Muhlenbergii* and *C. crus-corvi* and may represent merely selected populations derived from ancient hybridization.

48. *Carex decomposita* Muhl. Perennial, the branching fibrous blackish rhizomes with internodes several mm. to several cm. long; culms weakly arcuately ascending, soft, 5-15 dm. long, 3-7 mm. thick, nearly terete; lower sheaths brownish or reddish-brown, 1-2 cm. long; sheath venters papery, tending to split at maturity, not at all wrinkled, orifice weakly rounded; upper leaves long, much-surpassing the inflorescences; inflorescence a

decompound panicle of 5 to 10 spiciform erect branches (the lower branches longer than the upper ones), each branch bearing 5 to 20 short ovoid sessile androgynous brownish essentially bractless spikelets each with 8 to 13 perigynia; scales narrower and shorter than the perigynia, perigynial bodies obovate, plano-convex, firm, 1-1.5 mm. long, 0.7-1 mm. broad, sharp-edged laterally; beak abrupt, 0.3-0.5 mm. long, bidentate; achene lenticular. Rare in wet areas, usually on rotten logs at lake-margins, n.e. Tex. (Marion and Wood cos.), spring; e. U.S. n. to N.Y. and Mich., w. to Mo. and Tex.

49. *Carex vulpinoidea* Michx. Densely matted rhizomatous perennial; rhizomes 2-4 mm. thick, dark-brown or black, fibrous, internodes only 1-2 mm. long; culms 35-70 (-90) cm. long, 1.5-3.5 mm. thick, erect; sheaths tight, ventrally papery, strongly and closely transversely wrinkled, at the orifice firm and rounded; leaf blades diverse, the lower ones only 5-10 cm. long, the upper very long and equaling or surpassing the heads, tapered to a setaceous tip; inflorescence interrupted-spiciform, 35-80 mm. long, 7-13 mm. thick, of 10 to 15 short sessile androgynous spikelets (each with 15 to 30 perigynia), all except the lowermost bractless (in var. *platycarpa* Hall) or with setaceous bracts 10-30 (-80) mm. long (in var. *vulpinoidea*); scales papery, lanceolate, acute, about equaling or usually a little shorter than their perigynia; perigynial bodies ovate to suborbicular, 2.5-3 mm. long, 2-3 mm. broad, strongly compressed, mostly flat ventrally, very slightly convex dorsally, smooth or usually serrulate marginally, ventrally usually with a few veins and often on both faces at maturity becoming brownish and firm-membranous; beak of perigynium either abruptly differentiated from and only about a third as long as the body (var. *platycarpa*) or less abrupt and about half as long to as long as the body (var. *vulpinoidea*), bidentate, serrulate or entire-margined; achene lenticular. *C. triangularis* Boeck., *C. annectans* Bickn. The var. *platycarpa* Hall is frequent in mud in e. and s.e. Tex., rare in n.-cen. Tex. (Denton Co.); var. *vulpinoidea* is rare in the Plains Country (Dallam and Hemphill cos.), spring (var. *platycarpa*) or summer (var. *vulpinoidea*); e. temp. N.A. w. to the Rocky Mts.; also B.C., Wash. and Ore.

50. *Carex Muhlenbergii* Schkuhr. Rhizomatous perennial, the rhizomes blackish and fibrous with extremely short internodes, the plants thus appearing tufted; culms 2-6 dm. long, mostly erect, 1.2-2.5 mm. thick basally; sheaths whitish or green-mottled, tight or loose, dorsally with or without transverse septate venation, ventrally smooth (wrinkled in genetically contaminated plants), the orifice shallowly U-shaped; blades 3-5 mm. broad, long-tapered to a setaceous tip, the upper ones about equaling the inflorescence; inflorescences elongate-ovoid to ovoid-oblong or linear-oblong, 2-4 cm. long, 10-15 mm. thick, of 5 to 10 sessile androgynous spikelets (each with 10 to 20 perigynia), the lower 1 to 8 spikes with ascending narrow bracts 1-3 cm. long (or in the form known as *C. arkansana* the bracts strongly elongated to 2 dm. long); scales acuminate, with strong green midribs, often nearly equaling (or the lower ones in each spike exceeding) the perigynia; perigynia ascending, plano-convex, with bodies 2.5-3 mm. long and broad, often slightly discolored brownish at the very base, marginally green (usually strongly contrasting with the membranous whitish or brown center), ventrally and dorsally smooth or somewhat veiny, narrowed to a bidentate serrulate beak a third to half as long as the body; achene lenticular. Incl. var. *enervis* Boott, var. *australis* Bailey and var. *austrina* Small (a superfluous and illegit. name), *C. arkansana* Bailey, *C. austrina* (Small) Mack., *C. onusta* Mack., *C. Lunelliana* Mack., *C. plana* Mack., *C. gravida* var. *Lunelliana* (Mack.) Herm. Frequent in e., s.e. and n.-cen. Tex., rare in Edwards Plateau and e. part of Plains Country, usually in sandy forested soil, spring; e. N.A., w. to Minn., Neb., Kan., Okla. and Tex.

C. Muhlenbergii grades freely into *C. cephalophora* and into the nexus of populations here called *C. vulpinoidea* and *C. stipata*.

51. *Carex cephalophora* Muhl. (Sub-) rhizomatous perennial; rhizomes 2-10 cm. long, much-branched, about 2 mm. thick, with very short internodes; culms 15-30 (-45) cm. long, 1-2 mm. thick, ascending; leaves 2 to 4 per culm, mostly basal; blades about 15 cm. long and 2 mm. broad, the sheaths ventrally smooth, rather tight-fitting, stramineous, the orifice broadly U-shaped; spikelets 5 to 10, each with about 10 perigynia, very short, sessile, androgynous, aggregated in a narrow more or less ovoid nearly or usually quite bractless head 10-15 (-17) mm. long and 4-9 mm. broad; scales inconspicuous, shorter than the perigynia; perigynia ascending, much-flattened, broadly ovate, the body 1.5-2.5

mm. long and 1-1.5 mm. broad, plano-convex, ventrally quite smooth and with raised margins, basally not differentiated or else discoloring brown in the basal third to fourth the length, firm-membranous, with inconspicuous only slightly tougher margins and with a very short triangular beak less than half as long as the body; achene lenticular. Incl. var. *angustifolia* Boott and some plants referred to *C. "mesochorea"* Mack., *C. Leavenworthii* Dew. Frequent in usually moist sandy soil in e., s.e. and n.-cen. Tex., rare in parts of "Edwards Plateau" (Enchanted Rock), spring; e. N.A., w. to Mich., Ia., Mo., Okla. and Tex.

Intergrades freely with *C. Muhlenbergii* and to some extent with *C. retroflexa*, and even rarely with the *C. vulpinoidea-C. triangularis* plexus; the description above applies to the essentially "pure" *C. cephalophora*.

52. *Carex retroflexa* Muhl. Rhizomatous perennial; rhizomes blackish, fibrous, 1-2 mm. thick, with extremely short internodes, the plants thus appearing tufted; culms erect, 12-45 cm. long, slender, about 1 mm. thick, surpassing the leaves; sheath venters flat, the orifices nearly straight; blades 3-15 cm. long, 1-2 mm. broad, ascending, long-tapered to a setaceous tip; inflorescences oblong to linear-oblong or interrupted-spiciform, 10-35 mm. long, about 5 mm. thick, of 3 to 6 very short sessile androgynous spikelets (each with 3 to 10 perigynia), the lower of these spikes sometimes separated from the rest; bractless or often the bract at the lowest node developed, setaceous and 10-25 mm. long; perigynia spreading or at length some of them even slightly reflexed, with ovate to obovate bodies 2-3 mm. long, plano-convex or very unequally biconvex, in the basal half strongly discolored white or brown and taking on a spongy-coriaceous texture, with several nerves visible under a lens, in the distal half firm-membranous, green, passing abruptly or often insensibly narrowed into a bidentate subulate beak a third as long as the body; achene lenticular. *C. texensis* (Torr.) Bailey. Infrequent in sandy woodland, e., s.e. and n.-cen. Tex., spring; e. U.S. w. to Ill., Mo., Okla. and Tex.

This species grades freely into *C. cephalophora* and *C. Muhlenbergii*.

53. *Carex atlantica* Bailey. Tufted perennial (internodes of the branching rhizomes less than 1 mm. long); culms 2-5 dm. long, about 1 (-2) mm. thick; sheaths stramineous, tight, ventrally papery, tending to split, the orifice horizontal or shallowly U-shaped; inflorescence interrupted-spiciform, 3-5 cm. long, 5-8 mm. thick, of 3 or 4 subglobose bractless spikelets each with 8 to 20 perigynia (rarely as many as 40) and separated by bare axis internodes 5-14 mm. long, the terminal spikelet attenuate basally (in the staminate portion), gynecandrous, the rest usually wholly pistillate; scales slightly shorter than the perigynia; perigynial bodies spreading at maturity, 1.5-1.8 mm. long, broadly ovate to nearly orbicular, plano-convex, firm, marginally sharp but not winged, shiny, stramineous, with several strong nerves ventrally (use lens), abruptly narrowed to the beak which is linear, 0.7-0.9 mm. long and bidentate; achene lenticular. *C. incomperta* Bickn., *C. Howei* Mack. Infrequent or rare at edges of clear acid streams in e. and s.e. Tex. (Hardin, Nacogdoches, Newton and Tyler cos.), spring; e. N.A., w. to Mich., Ind., Tenn. and Tex.

54. *Carex hyalina* Boott. Rhizomes 2-3.5 mm. thick, branching, black-fibrous, with internodes 0.5-1 mm. long; culms 25-60 cm. long, about 1 mm. thick, erect, sharply triangular; sheath venters pale-hyaline; blades 1-2 mm. broad, shorter than (or the uppermost equaling) the culms; inflorescence 15-35 mm. long, 8-11 mm. thick, of 2 to 4 noticeably separated sessile ascending gynecandrous subglobose (burlike) to prolate basally abruptly attenuate heads 8-12 mm. long and 8-11 mm. broad; scales much shorter than their perigynia; perigynia 15 to 30 per spikelet, divaricate, 5.5-6.5 mm. long (including the beak), 2.5-3.2 mm. broad, widest well below the middle, the body (poorly differentiated) broadly ovate, widest near the middle, at anthesis pale-greenish-stramineous, membranous and distended only over the achene, at maturity very firm, unequally biconvex centrally and with the margins and wings strongly curved toward the ventral surface, stramineous with a brownish submarginal zone, strongly veined ventrally, with transverse wrinkles between the veins and in the margins and wings; beak poorly differentiated, elongate-triangular, 1.5-2 mm. long, green turning brownish; achene lenticular. Infrequent to rare in mud in e. Tex. (Cass, Houston and Walker cos.), very rare in n.-cen. Tex. (Dallas Co.), Apr.-May; Ark., Okla. and Tex.

55. *Carex Brittoniana* Bailey. Tufted perennial; rhizomes 2-4 mm. thick, black-fibrous, with internodes about 1 mm. long, branching; culms 35-75 (-90) cm. long, 2-2.5 (-3) mm. thick, erect, sharply triangular; sheath venters stramineous-hyaline; blades 2.5-5 mm. broad, flat, shorter than the culms; inflorescence 25-50 mm. long, 10-25 mm. broad, of 2 to 5 clumped or slightly separated ascending nearly globose to ovoid burlike basally strongly attenuate gynecandrous sessile spikelets 11-16 mm. long; bracts essentially absent; perigynia (30 to) 40 to 50 (to 65) per bur, (5.5-) 6-8 (-8.5) mm. long (including the beak), (3.7-) 4-5.5 (-6) mm. broad (including the wings), at maturity divaricate, the body very broadly ovate to very broadly elliptic to nearly orbicular, occasionally broader than long, basally broadly rounded to slightly cordate, at anthesis thin-membranous, pale-greenish-stramineous, distended only over the achene, at maturity firm to subcoriaceous, plano-convex centrally, stramineous with a submarginal brown zone, ventrally nearly veinless; beak 2.5-3 (-3.5) mm. long, strongly differentiated, at anthesis green, at maturity brown, bidentate; achene lenticular. Frequent in moist areas in Rio Grande Plains, s.e. and n.-cen. Tex., infrequent in Edwards Plateau, Plains Country and e. Tex., Mar.-May; also Okla. Purported also to occur in Lee Co., Fla.

Poorly developed (especially drought-affected) specimens often resemble *C. hyalina* because of the few developed perigynia with long beaks.

56. *Carex reniformis* (Bailey) Small. Tufted perennial; culms 2-7 dm. long, 1-2 mm. thick, sharply triangular; sheath venters stramineous-hyaline; lower blades very short, upper ones 1.5-4 mm. broad, shorter than the culms; inflorescence (1.5-) 3-4.5 (-5) cm. long, 7-10 mm. thick, of 3 to 7 more or less strongly separate gynecandrous erect subglobose apically rounded basally abruptly attenuate spikelets 6-10 (-13) mm. long and 5-8 (-9) mm. broad; bracts essentially absent; scales half to two thirds as long as their perigynia; perigynia 25 to 40 per spikelet, erect, (3.3-) 3.8-5 (-5.5) mm. long (including the beak), (2.3-) 2.6-3.5 (-4.5) mm. broad, broadest near or below the middle, the bodies nearly orbicular to broadly oblong to obovate, winged, at anthesis extremely thin, distended only over the achene, membranous but at maturity firm to subcoriaceous, nearly plano-convex or concavo-convex, stramineous or with brownish submarginal staining, ventrally shiny and essentially veinless; beak well-differentiated from body, green turning pale-brownish, 1-1.7 mm. long, bidentate; achene lenticular. *C. brevior* (Dew.) Mack. Frequent in s.e., e., and n.-cen. Tex., in mud, occasionally in woodlands, usually in open places, Apr.-May; e. N.A. w. to B.C., Wash., Ore., Colo., N.M. and Tex.; typical form in s.e. U.S.; *C. brevior* form elsewhere.

The form known as *C. brevior* is the common one in Texas, having on the average (at maturity) subcoriaceous perigynia with bodies longer than broad; the typical form occurs in east and southeast Texas and has merely firm perigynia with bodies almost as broad as long, but there is no means of discerning two different species in this group of populations. A report of the occurrence in Texas of *C. Bicknellii* Britt. has been found to be based on a specimen of *C. reniformis*.

57. *Carex alata* Torr. Tufted perennial rather like *C. Longii* but the inflorescence perhaps on the average with the spikelets a little more separated from each other; perigynia (3.7-) 4-5 mm. long, 3.1-3.5 mm. broad, thus averaging longer and proportionately broader than in *C. Longii*, and with the ventral veins slightly less conspicuous. Rare in mud, e. Tex. (Anderson Co.), Apr.; otherwise attributed to Coastal States, Mass. to Fla. and Ind., Mich. and O.

The plant referred here probably represents an isolated product of ancient hybridization of the *C. tribuloides*-*C. Longii* plexus with plants here called *C. reniformis*; that it should be dignified with a botanical name is questionable and the application of the name *C. alata* is even more doubtful.

58. *Carex albolutescens* Schwein. Tufted perennial; culms 25-75 cm. long, 1-2 mm. thick, sharply triangular, erect; sheath venters broadly stramineous-hyaline; blades 1.5-3 mm. broad, shorter than the culms, in most specimens rather stiffly ascending, the lower ones extremely short; inflorescence interrupted-spiciform to moniliform-spiciform, 25-45 mm. long, 6-10 mm. thick, of 3 to 10 sessile basally attenuate ovoid apically rounded ascending gynecandrous spikelets 6-11 mm. long and 5-6 mm. thick; bracts absent; scales shorter than the perigynia; perigynia 30 to 50 per spikelet, 2.8-3.2 (-3.5) mm. long, 1.6-2.2 mm. broad, widest below the middle, the body broadly obovate, widest above the middle, at anthesis stramineous, very thin and distended only over the achene,

winged, at maturity stramineous and firmer, somewhat plano-convex, ventrally nearly veinless; beak 0.6-1 mm. long, flat, bidentate, serrulate, at anthesis green, at maturity brownish, contrasting with the body; achene lenticular. Infrequent or rare in moist sand in e. (Polk Co.) and s.e. (Jefferson Co.) Tex., Apr.; otherwise said to occur in Coastal States, N.S. to Fla.; also Mich., Ill., Ind., Mo., Tenn. and La.

The group of plants now passing under this name combines characters of the *C. brevior* form of *C. reniformis* and of *C. festucacea* Schkuhr (including *C. normalis* Mack.), which has been found in Okla. and La. and should eventually be found in Texas; *C. festucacea* is separated from *C. albolutescens* usually by the closer clustering of the spikelets, greener, veinier sheath venters (as in *C. tribuloides* and *C. Longii*), usually broadly ovate or broadly ellipsoid perigynial bodies (broadest below the middle), with somewhat veinier venters and weaker color-contrast of the body and beak.

59. *Carex Longii* Mack. Tufted perennial, the rootstocks with very short internodes; culms sharply triangular, 3-8 dm. long, erect, 1.5-2 mm. thick; sheaths short, the venters mostly green and veiny except for the immediate vicinity of the orifice; blades 1.5-4 mm. broad, shorter than the culms, at least the lower ones often relatively stiff and diverging slightly from the stem; inflorescence moniliform-spicate, 3-5 cm. long, 12-15 mm. thick, of 5 to 10 sessile basally abruptly attenuate narrowly ovoid ascending gynecandrous spikelets 7-11 mm. long and 5-8 mm. thick; bracts absent except occasionally a small setaceous one at the base of the lowest spikelet; scales shorter and narrower than their perigynia; perigynia 55 to 80 per spikelet, winged, when immature silvery-green, scalelike and subappressed, at maturity brownish and plano-convex, very firm, with tip erect, ventrally veiny, (3-) 3.5-4.2 (-4.5) mm. long, 1.7-2.5 mm. broad (including the wings), broadest near the middle (meaning in the upper half of the "body"), the broadly triangular "beak" about 1 mm. long and scarcely differentiable from the "body"; achene lenticular. Infrequent in mud and shallow water in e. and s.e. Tex., Apr.-early June; Coastal States, Mass. to Tex., Ind., Mich.; Mex.; Berm.; also reported in Venez.

Exceedingly like *C. tribuloides* except for perigynial shape. Plants intermediate between *C. Longii* and *C. reniformis* occur, probably indicating hybridization. Plants referred here to *C. alata* combine some of the characters of both species. The report of the occurrence in Texas of *C. molesta* Mack. is probably based on such a hybrid product.

60. *Carex tribuloides* Wahl. Tufted perennial; culms 3-8 dm. long, 1-2 mm. thick, basally slightly arcuate-ascending, mostly ascending, apically strongly angled; sheaths short, the venters mostly veiny except for the hyaline area near the orifice; blades (1-) 2.5-5 mm. broad, shorter than the culms and at least the lower ones often relatively stiff and diverging from the culm at an angle of 10-30° (-50°); inflorescence elongate, capitate or shortly subspicate, 25-50 mm. long, 9-15 mm. thick, of 5 to 15 closely set sessile burlike obovoid to oblong ascending gynecandrous spikelets 7-10 mm. long and 3-5 mm. thick; bracts absent except occasionally a small setaceous one at the base of the lowest spikelet; scales half to two thirds as long as their perigynia; perigynia 50 to 80 per spikelet, much-flattened and scalelike, distended only over the achene, winged, 3.5-5.2 mm. long (including the bidentate beak which is about 1 mm. long), 1-1.5 mm. broad including the wings (broadest near the middle, i.e., in the upper half of the "body"), stramineous-brown, ventrally veiny, stiffly ascending and apically not appressed nor incurved; achene lenticular. Rare in wet sand, s.e. Tex. (Jefferson and Montgomery cos.), May; e. temp. N.A. w. to Minn., Mo., Okla. and Tex.

61. *Carex praegracilis* W. Boott. Perennial; rhizomes 2-4 mm. thick, blackish, fibrous, creeping (but with internodes only 1 mm. long); culms rising at close intervals, 12-30 cm. long, 1-3 mm. thick, leafy; blades mostly folded, long-tapered to a fine point, the uppermost ones usually slightly exceeding the inflorescence; inflorescence 15-45 mm. long, 6-10 mm. thick, of about 6 to 15 short glomeriform androgynous spikelets, the lower 1 or 2 spikelets usually weakly separated from the rest; scales hyaline marginally, acuminate, longer than the perigynia; perigynia (about 10 per spikelet) plano-convex, ascending, thin-coriaceous when mature and with sharp coriaceous margins, the body obovate or ovate, 3-4 mm. long, 1.5-2 mm. broad, tapering into a serrulate beak half the length of the body or more; achene lenticular. Infrequent in moist canyons of basaltic mts. at elev. of 4,000-8,000 ft. in the Trans-Pecos (Chisos and Davis mts.), spring-early summer; temp. w. N.A., in mts. s. to Mexico City.

FAM. 28. PALMAE JUSS.¹⁹

PALM FAMILY

Trees, shrubs or perennial vines, endogenous in growth; leaves persistent and often shedding after withering and natural breaking of the petioles, in some detaching cleanly from sheathing base of the petiole and leaving rings on the trunk; leaf blades firm and durable, sometimes entire but mostly pinnate or palmate, the ultimate divisions with strong midrib and lesser parallel lateral veins; inflorescence or spadix various, ordinarily a long branching structure issuing from axils of present or of fallen leaves, each branch subtended by a bract or nodifrond or in some cases enclosed in a woody spathe-like structure or cymba; flowers paleaceous and very small in proportion to size of plant, perfect or unisexual, usually 3-merous or multiples thereof; calyx 3-parted or tridentate, sometimes subtended by involucre bracts; corolla polypetalous or gamopetalous: stamens 3, 6 or multiples thereof; pistils 1 to 3 in most species, ripening into a drupelike or fleshy fruit of many sizes and shapes, the exterior pulp sometimes edible, commonly with only 1 seed coming to maturity; seed a hard body often inseparably attached to carpellary parts; albumen sometimes partly liquid at maturity but commonly firm and hard and either continuous and plain in structure or ruminant by intrusion of lateral walls, placement of the embryo from basal to apical.

The genera and species are many, the latter in the thousands and often limited in distribution; mostly in tropical regions, with only one genus in Texas. Plants of most palms are highly ornamental, and several species are cultivated in the warmer areas of southern Texas, especially in the Rio Grande Valley. Among these are species of *Phoenix*, *Sabal* and *Washingtonia*.

1. SABAL ADANS.

Plant spineless, either acaulescent or caulescent, sometimes tall heavy trees; base of bole oblique, at first knoblike and rounded, sometimes not rising above the surface; petiole either ending at or near the base of the blade and the blade palmate or extending through the blade as a strong downwardly curved midrib and the blade costapalmate, segments in either case many, the hastula usually prominent; spadices or flower clusters intrafoliar, with many narrow acuminate nodifronds from which the separate flower clusters issue; flowers perfect, stamens 6; ovary solitary, superior; carpels 3, with the united styles forming a single central pistil, stigma usually not divided; fruit a berrylike or drupelike small body, exterior moderately fleshy, globular to oblate or pyriform; seed commonly flattened endwise, very hard, regular, the micropyle lateral, albumen plane or homogeneous.

A small genus of about 25 species confined to the Western Hemisphere.

1. Hastula short and obtuse, usually less than 5 cm. long; leaf blade palmate, split or divided nearly to middle; plant commonly acaulescent, only now and then with a short visible or an emerged trunk 1. *S. minor*.
1. Hastula elongated and acute, 10 cm. or more long; leaf blade costapalmate, downwardly curved; a tree 2. *S. texana*.

1. *Sabal minor* (Jacq.) Pers. BUSH PALMETTO, DWARF PALMETTO. Usually acaulescent, only occasionally developing an abbreviated stem that might become 6 m. tall; leaf blade bluish, not glaucous, stiff in appearance, to 15 dm. wide, divided to about two-thirds its length into numerous segments; petiole extending on lower side of blade as a midrib; fruits black, globular or oblate, dull or shining, 8-13 mm. in diameter. *Sabal louisiana* (Darby) Bomhard. In lowlands, swamps, river terraces and floodplains in e. Tex., w. to the Edwards Plateau and s. to Aransas Co.; from n.e. N.C., s. to s. Fla., w. to s.w. Ark. and Tex.

According to Bailey, the conspicuously caulescent plants, such as those found in Brazoria County, represent the optimum emergence of this species. Other than size, there seems to be no botanical difference between the dwarf acaulescent plants and those that

¹⁹ Adapted from L. H. Bailey in C. L. Lundell, *Flora of Texas* III:197-199. 1944.

develop a prominent trunk. The arborescent plants have been given the name *S. louisiana*.

2. *Sabal texana* (Cook) Becc. TEXAN PALMETTO, RIO GRANDE PALMETTO, PALMA DE MICHAROS. Usually tall stout trees to 16 m., with a trunk to 8 dm. in diameter; leaf blade green, to 1 m. wide or more, the segments many; petiole stout, equaling or exceeding the blade in length; fruits dull-black, 18-22 mm. in diameter. *S. mexicana sensu* Small, not Mart., *S. exul* (Cook) Bailey. On flatlands along the Rio Grande in Cameron Co. and across the river in adj. Tam.; introd. at Victoria, Tex., but apparently not yet spontaneous.

The "saw palmetto," *Serenoa repens* (Bartr.) Small [*S. serrulata* (Michx.) Hook.], has been reported from Texas, but it is not known to be native west of southeastern Louisiana. It has, however, been introduced as an ornamental at Brownsville. It may be superficially distinguished by its armed petioles with short, recurved spines along their edges and the palmately veined flabellate leaves without even the rudiment of a midrib.

A yet unidentified young plant of *Phoenix* (not *P. canariensis* Chab., *fide* H. E. Moore, Jr.) has been found growing naturally in a wooded-thickety ravine along Arroyo Colorado, 4 miles east of Harlingen. This plant could represent a naturalized species of palm in the Rio Grande Valley.

FAM. 29. ARACEAE JUSS. ARUM FAMILY

Perennial herbs from corms, rhizomes or thick roots, with soft succulent stems and leaves, usually with slender raphides and frequently with acrid or pungent juices; the veiny leaves simple or compound; flowers unisexual or perfect, crowded on a spadix which is usually subtended by a foliaceous or colored spathe; perianth none or composed of 4 to 6 similar hypogynous segments; stamens usually 4 to 6, hypogynous, opposite the perianth segments when these are present; ovary superior; fruit usually a berry, indehiscent or rupturing irregularly; seeds with fleshy albumen or none.

A large family, chiefly tropical, of about 115 genera and 2,000 species.

- 1. Plants floating on water; pistillate flowers solitary at base of inflorescence 5. *Pistia*, p. 343.
- 1. Plants rooted in soil; pistillate or perfect flowers several to many (2)
- 2(1). Spathe well-developed, fleshy or petaloid (3)
- 2. Spathe obscure or like the foliage leaves; flowers perfect, with perianths of 6 segments (4)
- 3(2). Flowers covering only the base of the spadix; leaves compound 1. *Arisaema*, p. 341.
- 3. Flowers almost completely covering the spadix; leaves simple 2. *Peltandra*, p. 342.
- 4(2). Spadix naked, terminating the terete scape; leaf blades oblong 3. *Orontium*, p. 343.
- 4. Spadix much-overtopped by the swordlike spathe that resembles the foliage leaves; leaf blades linear and more or less ensiform 4. *Acorus*, p. 343.

1. ARISAEMA MART. INDIAN-TURNIP

Low perennial monoecious herbs; the tuberous rhizome, tuber or corm sending up a simple scape sheathed with the petioles of the veiny leaves, with several sheaths surrounding base of plant; spathe convolute below and mostly expanded and arched over the spadix; flowers unisexual; perianth none; *staminate flowers* above the pistillate on the spadix, composed of a cluster of almost sessile 2- to 4-celled anthers that open by terminal slits or pores; *pistillate flowers* consisting of a 1-celled ovary that contains as many as 6 erect orthotropous ovules and a broad stigma; fruit a 1- to few-seeded globose scarlet berry.

About 150 species in America, Asia and Africa.

1. Primary leaf pedately divided into 5 to 15 very unequal leaflets; the oblong summit of the spathe with inrolled margins; spadix slender, tapering, long-exserted; fruiting head conical1. *A. Dracontium*.
1. Primary leaf palmately divided into 3 or 5 segments; the ovate to lanceolate arching hood or spathe flat; spadix cylindric-tapering to clavate, included; fruiting head ovoid or subglobose (2)
- 2(1). Primary leaf with 5 segments, the lateral segments sometimes partly united; spathes green or yellowish-green; hood broadly ovate, abruptly pointed, 3-5 cm. wide; spadix cylindric-tapering, curved3. *A. quinatum*.
2. Primary leaf with 3 segments, the lateral segments rarely bilobed; spathe typically suffused or striped with purple or red-brown; hood narrowly ovate to lanceolate, acute-acuminate, 2-3 cm. wide; spadix cylindric to somewhat clavate, straight ..
.....2. *A. triphyllum*.

1. *Arisaema Dracontium* (L.) Schott. GREEN DRAGON, DRAGON-ROOT. Leaf usually solitary, with a petiole to 5 dm. long at anthesis; leaflets sometimes confluent at base, elliptic to oblanceolate, acuminate, the central one to 2 dm. long, the outer ones successively smaller, with veins similar to those of *A. triphyllum*; peduncle to 25 cm. long; spathe thin, about 6 cm. long, light green; spadix with long tapering tip to 15 cm. long or more; berries about 1 cm. in diameter. *Muricauda Dracontium* (L.) Small. Rich woodlands and alluvial soils in woods and thickets in e. and s.e. Tex., w. onto the Edwards Plateau, May-June; Fla., w. to Tex., n. to N.H., Vt. and s.w. Que., s. Ont., Mich. and Wisc.

2. *Arisaema triphyllum* (L.) Schott. JACK-IN-THE-PULPIT, INDIAN-TURNIP. Leaves mostly 2, with petioles to 4 dm. long at anthesis; leaflets 3, elliptic to rhombic-ovate, acute to acuminate, the lateral ones asymmetrical, with veins parallel from midrib to margin; peduncle to 2 dm. long; spathe suffused or striped with purple or red-brown; hood 2-3 cm. wide; spadix straight; berries about 1 cm. in diameter. Wet woods, swamps and boggy areas in e. and s.e. Tex., May-June; from Ga., w. to Tex., n. to s.e. N.Y., Conn. and s.e. Mass.

Several segregates have been proposed in this species, which are probably found in our area. The most significant are var. *pusillum* Peck with lateral leaflets almost symmetrical and with the expanded limb of the spathe 1.5-3 cm. wide and usually all brown or red within; var. *Stewardsonii* (Britt.) Stevens with the inrolled tubular half of the spathe sharply and deeply corrugated.

3. *Arisaema quinatum* (Nutt.) Schott. Leaves mostly 1, with petioles to about 3 dm. long at anthesis; leaf segments 5, broadly ovate-elliptic to suborbicular-oval, tapering at the somewhat oblique base, abruptly acuminate at apex, glaucous beneath, to about 16 cm. long and 10 cm. wide, the lower 2 conspicuously the smallest; peduncle to 2 dm. long; spathe green or yellowish-green, the tube 5-6 cm. long; hood broadly ovate and abruptly acuminate, about as long as the tube and 3-6 cm. wide; spadix noticeably broadened near base, tapered to apex, curved; fruit 6-7 mm. thick. Moist wooded slopes in e. Tex., Apr.-May; from Tex. e. to Ga. and n. to Tenn. and N.C.

2. PELTANDRA RAF.

ARROW-ARUM

An American genus of several species.

1. *Peltandra virginica* (L.) Kunth. ТУСКАНОЕ. Plants monoecious, from thick fibrous or subtuberous roots, consisting of palmately 3-nerved and pinnately veined leaves produced at base along with one or more simple scapes; petiole to about 4 dm. long; leaf blade oblong to broadly triangular, with more or less divergent well-developed basal lobes narrowed to the tip, to 2 dm. long and 15 cm. wide, the basal lobes to 75 mm. wide, shorter than width of blade; scape to 35 cm. tall, in anthesis about equaling the leaves; spathe green with pale or whitish margins, somewhat leathery, to 1 dm. long; flowers unisexual, thickly covering the slender and tapering spadix throughout (or only its apex naked); perianth none; anther masses sessile, naked, covering the upper part of the spadix, each of 4 to 6 pairs of cells embedded in the margin of a thick and shield-shaped connective, opening by terminal pores; ovaries at the base of the spadix, each surrounded by several distinct scalelike staminodia, 1-celled; berry in an ovoid fleshy

head, green or light-brown, to about 1 cm. long when dried. *P. Tharpit* Barkl. Swamps, moist woodlands, bogs, along streams and about bodies of water in e. Tex., Apr.-May; from Fla., w. to Tex., n. to s. Me., N.H., Vt., s.w. Que., n. N.Y. and s. Ont.

A number of varietal segregates have been proposed based mainly on the shape and size of the leaf blades.

3. ORONTIUM L. GOLDEN CLUB

A monotypic genus of eastern North America.

1. *Orontium aquaticum* L. Plants aquatic, with a deep stout rhizome and basal long-petioled entire leaves; petioles to 2 dm. long; leaf blade with veins parallel from base to apex, to 2 dm. long, about a third as wide; scape to 4 dm. long; spathe incomplete and distant, merely a leaf sheath investing the lower part of the slender scape and bearing a small and imperfect bractlike blade; spadix 2-5 cm. long; flowers perfect, the lower ones with 6 concave sepals and 6 stamens, the uppermost flowers with 4; filaments wide and thin; anthers 2-celled, opening obliquely lengthwise; ovary 1-celled, with an anatropous ovule; fruit a blue-green or brownish utricle. Sandy, muddy and peaty shores and shallow water in e. (?) Tex., Apr.-June; from Fla. w. to La. (Cameron Parish) and probably Tex., n. to Mass., cen. N.Y., W.Va. and Ky.

This species has not yet been found in Texas, but since it occurs in Cameron Parish, La. adjacent to Jefferson and Orange counties, Texas, there is a good possibility that it occurs in marshes along the Sabine River in Texas. A specimen of *Lysichiton americanum* Hult. & St. John in the University of Texas herbarium bears the label "Gregg Co., March 20, 1943, Mrs. C. L. York." This typically far northern species, which was probably under cultivation at this Texas locality, resembles *O. aquaticum* but differs from it superficially by the more slender peduncle that is distinctly demarcated from the spadix.

4. ACORUS L. SWEETFLAG. CALAMUS

A genus of 2 species in the Northern Hemisphere.

1. *Acorus Calamus* L. Aromatic plants with thick creeping rhizome and ensiform leaves crowded at the base, erect, linear and more or less ensiform, to 2 mm. long and 25 mm. wide; scape resembling the leaves; spadix cylindrical, diverging laterally from a tall 3-angled scape, the upper and more foliaceous prolongation of the scape may be considered as a kind of open spathe, covered with yellowish-brown perfect flowers, to 1 dm. long and 1 cm. thick at anthesis, to as much as 2 cm. thick at maturity; perianth of 6 short concave segments; stamens 6, the linear filaments thin and flat, with 1-celled anthers reniform and opening transversely; ovary 2- or 3-celled; fruit obpyramidal about 4 mm. long. Wet places and borders of quiet water in n.-cen. and n.e. (Marion Co.) Tex., May-Aug.; from P.E.I., s. to Fla., w. to Mont., Ore. and Tex.; early introd. from Eur. and naturalized.

5. PISTIA L. WATER-LETTUCE. WATER-BONNET

A monotypic genus in southern United States and Latin America.

1. *Pistia Stratiotes* L. Plants monoecious, floating herbs; leaves clustered on very short branches at the nodes of the rootstock; leaf blades entire, cuneate to obovate-cuneate, to about 25 cm. long, strongly ribbed, dilated upward; spadix adnate to the axillary spathe; spathe about 15 mm. long, pubescent, the upper part ovate; flowers unisexual, the pistillate solitary and the staminate above the pistillate; perianth none. Streams, lakes and ponds in s. and s.w. Tex., spring; from Fla., w. along the coast to Tex., through Latin Am. to S.A.

FAM. 30. LEMNACEAE S. F. GRAY²⁰ DUCKWEED FAMILY

Minute green aquatic herbs floating on or below surface of water, often forming a solid cover over the surface, occasionally in wet seepage places, much-reduced and

²⁰ Ref.: E. H. Daubs, A Monograph of Lemnaceae. Urbana, 1965.

simplified in structure, stemless, rootless or with few nonfunctional roots, vascular tissue lacking in many of the species, reproducing chiefly by budding from a single basal pouch or 2 lateral pouches, many successive generations sometimes remaining attached by short stipes; flowers from a saclike spathe in a pouch at the basal margin of the frond or breaking through the surface to one side of the spathe, consisting either of a single stamen or a single pistil, often 2 staminate flowers and 1 pistillate flower to a spathe; fruit a 1- or 2-seeded utricle; seed large, smooth or ribbed.

A family consisting of 4 well-defined genera and including about 40 species.

1. Thallus with 1 or more roots and 2 lateral reproductive pouches; inflorescence of 2 staminate and 1 pistillate flowers surrounded by a membranaceous spathe (2)
1. Thallus rootless, each with a single basal reproductive pouch; inflorescence of 1 staminate and 1 pistillate flowers with a spathe (3)
- 2(1). Roots usually 2 or more on each thallus; mature thallus usually conspicuously 5- to 18-nerved, the ventral surface usually reddish-purple1. *Spirodela*, p. 344.
2. Roots solitary on each thallus; mature thallus 1- to 3-nerved, the ventral surface typically green or rarely streaked or tinged with brown2. *Lemna*, p. 345.
- 3(1). Thallus globose to ellipsoid, more or less obviously 3-dimensional, usually only mother- and daughter-thalluses connected; stipe attachment within the reproductive pouch3. *Wolffia*, p. 346.
3. Thallus flat, thin, lingulate, usually falcate, appearing 2-dimensional, solitary or united in stellate colonies; stipe attachment on one side of the reproductive pouch4. *Wolffiella*, p. 347.

1. SPIRODELA SCHLEID.

DUCK-MEAT

Thallus floating, solitary or usually in clusters of 2 to 5 or more, orbicular to obovate or elliptic-reniform, with 2 to numerous roots fascicled on ventral surface, palmately nerved; reproductive pouches 2, one on either side of the basal end; inflorescence arising from a pouch that consists of a saclike spathe enclosing 1 pistillate and 2 or 3 staminate flowers; ovary somewhat winged on the shoulders, 1- to 4-ovuled; fruit a utricle, slightly winged; seed longitudinally ribbed and transversely striate or smooth with a spongy outer layer.

About 6 species, cosmopolitan.

1. Roots 4 to several; thallus orbicular-obovate, 3-10 mm. long, almost as wide as long, conspicuously several-nerved with the nerves radiating from the stipe base1. *S. polyrhiza*.
1. Roots 2 to 5; thallus oblong-obovate to somewhat elliptic-reniform, 2.5-5 mm. long, not conspicuously nerved2. *S. oligorhiza*.

1. *Spirodela polyrhiza* (L.) Schleid. Thallus with 4 to 12 fascicled roots, conspicuously orbicular-obovate, 3-10 mm. long, almost as broad as long, dark-glossy-green above, usually reddish-purple beneath, with 5 to 11 conspicuous radiating nerves that create a peltate appearance, the stipe marginal or submarginal and the reproductive pouches on either side; roots provided with a single vascular strand and a long pointed rootcap; forming turions at all season but abundantly so in the fall. In ponds, lakes, bayous and sluggish streams throughout Tex.; cosmopolitan but apparently lacking in S.A.

This is the largest of the surface-floating duckweeds. It is often present as scattered, large thalluses in masses of *Lemna*, *Wolffiella* and *Azolla*, and occasionally in almost pure stands. The plants winter by producing buds that are dense and sink to the bottom of the pond.

2. *Spirodela oligorhiza* (Kurtz) Hegelm. Thallus with 2 to 5 roots, oblong-obovate to somewhat elliptic-reniform, 2.5-5 mm. long, 1.5-3 mm. broad, obscurely 3- to 5-nerved, closely resembling in size and shape some species of *Lemna*; dorsal surface yellow-green, flat to convex; ventral surface convex, frequently somewhat inflated, commonly red-purple-pigmented. On lakes and ponds, rare in e. Tex.; in the Far East, S. Pac. and U.S.

2. LEMNA L.

DUCKWEED. DUCK-MEAT

Diminutive free-floating aquatics or growing on wet surfaces; thallus solitary or in groups of 2 or more, with 1 to 3 nerves and a single root without vascular tissue, bearing on either side a meristematic pouch in which are vegetative and flower buds; vegetative buds usually disarticulate to form independent plants (in *L. trisulca* often remaining attached); flowers unisexual, produced in a membranous spathe; staminate flowers usually 2 to a spathe, each flower consisting of a single stamen; pistillate flowers usually 1 to a spathe and having a single pistil; ovary 1- to 3-ovuled; seeds usually early-ribbed and containing a distinct operculum.

About 15 species, mostly world-wide in distribution.

1. Thallus elliptic to lanceolate, commonly dilated below middle, usually submersed, long-stipitate, frequently with many remaining attached to form long chains, commonly denticulate near and at apex1. *L. trisulca*.
1. Thallus obovate to oblong, usually floating, short-stipitate or sessile, characteristically 2 to 5 attached, entire (2)
- 2(1). Dorsal surface flat, smooth, with no prominent protuberances, nerveless or very obscurely 1-nerved (3)
2. Dorsal surface with more or less prominent protuberances, indistinctly to prominently 3-nerved (4)
- 3(2). Thalluses often 8 to 10 attached, obliquely oblong, thin and flat, without papules, the surface texture uniform throughout2. *L. valdiviana*.
3. Thalluses seldom more than 2 remaining attached, oval, symmetrical, thick, with a low median ridge bearing 2 or more papules, usually with a thin margin
.....3. *L. minima*.
- 4(2). Root sheath with definite wings or appendages (5)
4. Root sheath without wings or appendages (6)
- 5(4). Thallus distinctly 3-nerved, flat, thin4. *L. trinervis*.
5. Thallus usually not prominently nerved, generally biconvex, the apical papilla prominent5. *L. perpusilla*.
- 6(4). Ventral surface of thallus flat or slightly convex but not inflated; dorsal surface of thallus dark-green, the air spaces not prominent; fruits broad but not winged at the shoulders; seed 16. *L. minor*.
6. Ventral surface of thallus noticeably convex, usually inflated; dorsal surface of thallus mottled yellow-green, the air spaces prominent; both surfaces of thallus showing red-purple coloring; fruits winged at the shoulders; seeds usually 2
.....7. *L. gibba*.

1. *Lemna trisulca* L. IVY DUCKWEED. Often forming dense masses, usually floating just beneath the surface except when flowering, mother- and daughter-thalluses often remaining attached for several generations by long, attenuate stipes; thallus 5-15 mm. long, 2.5-5 mm. wide, lanceolate-elliptic to oblanceolate, flat on both surfaces, translucent, attenuate below into a slender stipe, entire or mostly denticulate at the apex, each with a solitary root or in some thalluses the root lacking; rootcap acutely pointed. In ponds and slow-moving streams, reported from Tex.; in temp. zones of the N. Hemis.

2. *Lemna valdiviana* Phil. Thallus narrowly elliptic to oblong or oval, solitary or several together, 2-5 mm. long, 0.5-2 mm. wide, symmetrical to somewhat falcate, obscurely 1-nerved or nerveless, the dorsal surface of conspicuously uniform texture throughout, light-green and often translucent. In ponds, lakes, ditches and about springs throughout Tex.; widespread in the W. Hemis.

3. *Lemna minima* Phil. Thallus solitary or in small clusters, oblong to elliptic or somewhat ovoid, 1-2.5 mm. long, 0.7-1.5 mm. wide, sometimes with only occasional members larger, thick, the dorsal surface convex, commonly nerveless or with an obscure nerve and a row of papules along the middle, usually with a thin margin around the thallus that becomes hyaline near the base, the air chambers in 1 layer. In ponds, lakes, canals and lagoons, mostly in the w. half of Tex.; in w. U.S. and S.A.

4. *Lemna trinervis* (Aust.) Small. Thallus solitary or several attached, 2.5-5 mm. long, 1.5-3 mm. wide, obovate, with an obtuse apex and subacute base, very nearly symmetrical, thin and membranous, flat on both surfaces, light to medium green, not pigmented, papillae lacking or at least not prominent, with 3 distinct and prominent nerves; root sheath winged, the rootcap acute. *L. perpusilla* var. *trinervis* Aust. In lakes, streams, ditches and canals throughout Tex.; mostly in the W. Hemis.

5. *Lemna perpusilla* Torr. Thallus solitary or in small clusters, obovate to orbicular-obovate, oblique, 1-2.5 mm. long, 0.7-2 mm. wide, obscurely 1- to 3-nerved, rather thick, usually light-green, not pigmented, with large air spaces within that are in 1 layer, the apical papilla usually prominent, sometimes with a row of papules along the midnerve. In ponds and lakes in cen. and s. Tex.; distributed more or less throughout the world.

6. *Lemna minor* L. WATER LENTIL. Thallus solitary or clustered, suborbicular to elliptic-obovate, 2-4 mm. long, 1.5-3 mm. wide, opaque, with 2 layers of air spaces within that are not inflated, nearly flat on both sides, obscurely 1-nerved above, the dark-green surface often suffused with red or purple, a low median ridge often terminated by a conspicuous papilla or sometimes with a row of papules along the median ridge. In quiet waters of sloughs, lakes, canals and ponds, mostly in the w. half of Tex.; distributed throughout the world.

7. *Lemna gibba* L. INFLATED DUCKWEED, WIND-BAGS. Thallus solitary or few in a group, orbicular-obovate, 2-5 mm. long, 2-4 mm. wide, thick, with 2 layers of air spaces within, dark-green above and often suffused with red or purple, with a slight ridge and 1- to 3-nerved above and conspicuously round, usually inflated-gibbous on the ventral side because of the enlargement of the lower tier of air spaces or these not much enlarged and the thallus merely convex below. In ponds, marshes and slow streams in w. Tex.; widely distributed throughout most of the world.

3. WOLFFIA HORKEL

WATER-MEAL

Diminutive floating rootless herbs, scarcely visible to the naked eye as individuals and often forming uninterrupted green masses on the surface of the water as a thin green scum; thallus spheroid to ellipsoid, sometimes flattened above, with a single funnel-shaped reproductive pouch at one end that bears asexually successive daughter-fronds, sometimes bearing masses of red pigment bodies in each epidermal cell; inflorescence breaking through the upper surface of the frond, composed of 1 staminate flower consisting of a single stamen and 1 pistillate flower consisting of a single pistil; utricle spherical, smooth.

About 10 species, mainly in the tropics and subtropics. The thallus, about the size of a pinhead, is the smallest seed plant known.

- 1. Thallus mostly globular, the dorsal surface strongly convex and without a papilla, without pigmented cells in epidermis1. *W. columbiana*.
- 1. Thallus typically ellipsoidal or broadly ovoid, punctate on all surfaces, with brown pigment cells in epidermis (2)
- 2(1). Thallus with a prominent conical papilla in center of dorsal surface2. *W. papulifera*.
- 2. Thallus with dorsal surface flat or slightly rounded and without a papilla3. *W. punctata*.

1. *Wolffia columbiana* Karst. Thallus solitary or paired, globular or rarely ellipsoidal, 0.8-1.4 mm. long, 0.4-0.8 mm. wide, scarcely if at all flattened, green on all surfaces, not conspicuously punctate, the dorsal surface not flattened and without a papilla. On lakes and in sloughs of e. Tex.; from N.E. to Calif., s. to n. S.A.

2. *Wolffia papulifera* Thomps. Thallus solitary or paired, mostly broadly ovoid, 0.5-1.5 mm. long, 0.3-1 mm. wide, green, brown-punctate on all surfaces, the dorsal surface flattened and bearing a conspicuous papilla. On surface of lakes and ponds in e. Tex. and on the Edwards Plateau; from Va. s. to Fla., w. to Tex., Kan. and Ill.

3. *Wolffia punctata* Griseb. Thallus ellipsoid to ovoid-oblong, usually tapering to an acutish apex, 0.7-1.2 mm. long, 0.4-0.7 mm. wide, the dorsal surface flattened and without a papilla, punctate on all surfaces with brown pigment cells. Reported from Texas by Muenscher and others; from Conn. to Ont. and Minn., s. to Tex. (probably) and the W.I.

4. WOLFFIELLA HEGELM.

MUD-MIDGET. BOG-MAT

Thalluses flat, thin, membranous, elongate or straplike, frequently falcate, solitary or commonly 2 remaining attached, sometimes many remaining connected to form extensive colonies, rootless, usually floating submersed except for a small area at the base, more or less punctate with brown pigment cells in epidermis of all surfaces, commonly reproducing by budding from a single triangular (in outline) basal pouch, rarely flowering; flowering cavities on dorsal surface at one side of median line; flowers not enclosed in a spathe, unisexual, consisting of a single stamen or a single pistil, the pistillate flower with a single orthotropous ovule; fruit a slightly laterally compressed utricle with the style persistent; seed smooth, with spongy outer coat, the prominent operculum flattened.

About 8 species, primarily in the New World.

1. Thallus lingulate (strap-shaped), strongly curved, up to 4 times as long as wide, usually 2 attached to form a circle1. *W. lingulata*.
1. Thallus more or less sickle-shaped, mostly 5 times or more longer than wide, usually several to many cohering in colonies (2)
- 2(1). Thallus broad at base, abruptly tapered to the obtuse-rounded apex, slightly falcate2. *W. gladiata*.
2. Thallus narrow at base, gradually tapered to a slender sharp point, usually doubly falcate3. *W. floridana*.

1. *Wolffiella lingulata* (Hegelm.) Hegelm. Thalluses broadly oblong to linear, somewhat curved, 5-10 mm. long, 1-5 mm. wide, the surfaces concave or channelled, the parent- and daughter-thalluses often recurved and together appearing like a segment of a band. Reported from Tex.; in La. and Calif., probably Tex., s. through Latin Am. to Urug.

2. *Wolffiella gladiata* (Hegelm.) Hegelm. Thalluses 3.5-8 mm. long, 1-2 mm. wide at the broad base, tapered to an obtuse-rounded apex, usually several or many cohering to form submerged colonies, somewhat falcate. Growing in fresh nitrogenous water pond on Brazoria National Wildlife Refuge, s.e. of Angleton, associated with *Lemna*, *Riccia fluitans* and *Ricciacarpus natans* (fide R. J. Fleetwood), spring-summer; La., Tex. and Calif., s. through Latin Am. to Urug.

3. *Wolffiella floridana* (J. D. Sm.) Thomps. Thalluses fistulose, usually several in a group, sometimes paired or solitary, thin, sickle-shaped or conically elongated, attenuate to an acuminate apex, 5-10 mm. long, 0.4-0.7 mm. wide, green on all surfaces, often brown-punctate. On lakes and ponds in e. Tex.; in inland waters of the U.S. along the Atl. and Gulf coasts, and in the Miss. Valley n. to Mo.

FAM. 31. MAYACACEAE KUNTH

BOGMOSS FAMILY

Small mosslike plants of wet soils and shallow flowing water; leaves cauline, numerous, crowded on stem; peduncles axillary, 1-flowered, arising along stem; flowers perfect, regular, hypogynous, 3-merous; sepals and petals each 3, quite distinct from each other; stamens 3, opposite the sepals; filaments filiform; anthers oblong to ovoid, basifixed, opening by a terminal pore; ovary 1-celled, superior; ovules several; style filiform; fruit a 3-celled and 3-valved capsule, dehiscent between the placentae.

A monogeneric family.

1. MAYACA AUBL.

Characters of the family. About 10 species in tropical and warm-temperate America, one in tropical Africa.

1. *Mayaca Aubletii* Michx. Bogmoss. Stems tufted or matted, to 2 dm. long, usually much less; leaves linear-lanceolate, 3-5 mm. long, 1-nerved; pedicels much-exceeding the leaves in length; sepals lanceolate, about 4 mm. long; petals pink or whitish, obovate, about 4 mm. long, persistent with sepals; capsule subglobose, about 4 mm. in diameter.

M. Michauxii Schott & Endl. Springy and seepage areas, mainly along and in streams, and about ponds in s.e. Tex., May-July; on Coastal Plain from Va. (?) s. to Fla. and w. to Tex.

A second species, *M. fluviatilis* Aubl., with pedicels shorter than the leaves and its capsule more ellipsoid, occurs east of Texas. It may eventually be discovered in seepage areas in extreme southeast Texas.

FAM. 32. XYRIDACEAE AGARDH²¹

YELLOW-EYED GRASS FAMILY

Perennial or sometimes annual rushlike herbs with narrow mostly basal and tufted leaves that sheath the lower part of a naked scape which is terminated by a globose to cylindrical headlike spike of perfect trimerous flowers; floral bracts usually densely spirally imbricate, coriaceous or rigid, typically concave and dorsally marked with a blotch of different color or texture, the upper bracts subtending a solitary flower, the lower ones often sterile and forming an involucre; calyx irregular, glumaceous, the 2 persistent lateral sepals cymbiform and dorsally keeled or winged, the larger anterior sepal obovate and enfolding the corolla in bud and deciduous with it; petals yellow or rarely whitish, obovate, with claws that are more or less coherent, fugacious; stamens inserted on the petal claws, the basifixed anthers extrorse; staminodes (when present) alternate with the petals, bifid and bearded at apex; style 3-cleft; capsule ellipsoid, free, 1-celled, with 3 parietal somewhat projecting placentae, 3-valved, with numerous more or less ribbed ellipsoid to fusiform orthotropous seeds.

A family of two genera, mostly in tropical regions.

1. XYRIS L.

YELLOW-EYED GRASS

Characters of the family. A genus of about 250 species distributed mostly in tropical and subtropical regions in America, Africa and Australia.

1. Keel of lateral sepals ciliate or fimbriate (2)

1. Keel or lateral sepals lacerate, usually quite thin, rarely entire (4)

2(1). Tips of lateral sepals exerted beyond the subtending bract, fimbriate (usually crisped); spikes seldom shorter than 1 cm.; seeds seldom shorter than 0.8 mm., fusiform, with broad flat longitudinal ridges; sheaths of the scape exceeded by the leaves3. *X. caroliniana*.

2. Tips of lateral sepals not exerted beyond the subtending bract and not fimbriate (in old or dried spikes the lateral sepals may separate from the bracts and appear to be exerted but exertion is supposed to mean that bracts are shorter than sepals); seed lengths and shapes various but the seeds without broad flat longitudinal ridges; sheath lengths various (3)

3(2). Leaves ascending, twisted, strongly grooved; spikes ovoid, the bracts and lateral sepals with a small apical tuft of short reddish-brown hairs; bases of leaves abruptly expanded, pinkish or purplish, becoming dark-brown, the bases of the plants therefore bulbous and the outermost leaves often scalelike5. *X. torta*.

3. Leaves spreading, scarcely twisted; spikes lance-ovoid to ellipsoidal; bracts and sepals not as above; bases of leaves longitudinally striate (the innermost fresh leaf bases white, the striae in sharp dark contrast) and with the bases of the plants often invested by a stubble or ramentum of fibrous dead leaf bases2. *X. ambigua*.

4(1). Leaves filiform or rarely somewhat linear, the blades gradually expanding below into lustrous rich-brown or tan hard bases; plants densely cespitose; spikes ovoid and seldom longer than 1 cm.1. *X. Baldwiniana*.

4. Leaves broader or not as above, the bases softer or of a different color; plants or spikes not as above (5)

²¹ Adapted mainly from Robert Kral in Sida 2(3): 177-260. 1966.

- 5(4). Bases of the leaves rather abruptly expanded into thickened flaring equitant zones, thus the plant bulbous-based (the outer leaves are often shorter, darker and scapelike); scapes often flexuous, usually quite twisted, the green upper portion of leaf blades often conspicuously twisted; flowers opening in the afternoon 4. *X. platylepis*.
- 5. Bases of the leaves and the plant bases not as above; scapes usually not flexuous, the blades not conspicuously twisted; flowers opening in the early or late morning (6)
- 6(5). Plant bases greenish, pale to dark-brown or stramineous 7. *X. Jupicai*.
- 6. Plant bases pinkish or purplish (7)
- 7(6). Summit of scape not flattened and broad relative to the spike; scape ridges usually more than 3 and therefore the upper scape broadly oval or almost round in outline (except for projecting ridges); habitats various, usually not alluvial; foliage pinkish- or purplish-based but the surfaces (particularly of the outermost leaves) papillose or tuberculate-scabrid 8. *X. difformis* var. *Curtisii*.
- 7. Summit of scape quite evidently flattened and broad relative to the spike (at least on living specimens); scape ridges few, usually 2 or 3, the 2 most prominent ones along the scape edges and therefore the upper scape narrowly ellipsoidal or fusiform in cross section; plants commonly of wet situations in sun or shade; foliage smooth, a very deep-rich-green except for the reddish or purplish color of the leaf bases (8)
- 8(7). The two principal scape ridges noticeably and abruptly flattened and winglike below the spike and in the plane of the flattened scape, their combined width (on live specimens) broader than the scape, thus the outline of the cross section of the scape bicaudate; fruiting spikes seldom longer than 15 mm., ovoid, acute; seeds translucent, ovoid or ellipsoidal, seldom longer than 0.6 mm. 8. *X. difformis* var. *difformis*.
- 8. The two principal scape ridges not abruptly flattened, the scape itself flattened and 2-edged and (in cross section) narrowly elliptic; fruiting spikes seldom shorter than 15 mm., broadly ellipsoidal or oblong, blunt; seeds farinose, dark when ripe, fusiform or narrowly oblong and never as short as 0.6 mm. 6. *X. iridifolia*.

1. *Xyris Baldwiniana* Schult. In large tufts, the leaf bases usually brownish, lustrous; leaves filiform to linear-filiform, 1-3 dm. long, straight or slightly twisted, green, expanding more or less abruptly toward the lustrous base; sheath of the scape from one half as long to nearly as long as the principal leaves, tightly investing the scape except for the loose orifice and a short blade; scape 2-4 (-5) dm. long, usually broader than the leaf, terete below, one-ridged and tending to be terete above; spikes at the seed-bearing time ovoid to ellipsoidal, 4-7 mm. long, acute or blunt, of a few tightly imbricate bracts; fertile bracts ovate to obovate, 4-5 mm. long, not keeled, the apex rounded, the exposed margin entire, becoming erose with age, the matrix dull- to dark-brown or reddish-brown, the dorsal area elliptic and dull-green; lateral sepals included, slightly shorter than the bracts, linear but slightly curvate, reddish-brown, the keel lacerate from the tip to about the middle or slightly beyond; petal blades cuneate-obovate, about 3-4 mm. long, unfolding in morning; seeds oblong to narrowly ellipsoidal, 0.8-1 mm. long, the longitudinal lines evident, translucent, yellowish or pale-amber. Atypical plants erroneously reported as *X. Elliottii* Chapm. In moist sands or sandy peats of pine flatwoods, hillside bogs, roadside ditches, and savannahs in e. Tex., May-July; in Coastal Plain, N.C. s. into n. Fla. and w. to Tex.

Plants now referred here with extremely narrow and flat leaves, apparently the var. *tenuifolia* (Chapm.) Malme (*X. tenuifolia* Chapm.), could possibly be a hybrid of this species and *X. Elliottii* Chapm. if it were not for the fact that the latter species is thought not to occur farther west than southern Mississippi.

2. *Xyris ambigua* Kunth. Solitary or in small tufts, the base hard, often fibrous; leaves broadly linear, spreading, 1-4 dm. long, 3-20 mm. broad, a dark- and lustrous-green above the equitant portion (about two thirds the total leaf length), the basal equitant portion stramineous, brownish or pinkish, narrowing more or less gradually to an abrupt slightly

incurved tip, the surface smooth or slightly papillose, the margins papillose and rather harshly scabrous; sheaths of the scapes from one third to nearly as long as the principal leaves, rather loosely investing the scape except for a distal bladelike portion, their bases usually lustrous, stramineous to castaneous; scape (1.5-) 7-10 dm. long, twisted but rarely flexuous, many-ribbed below, becoming flattened and 2-edged above; spikes at seed bearing time ellipsoidal to lance-ovoid, 1-3 cm. long, of many tightly imbricated bracts; fertile bracts broadly obovate to suborbicular, 5-8 mm. long, not keeled, the apex rounded, the exposed margin subentire or erose with age, the matrix reddish-brown or pale-brown, the dorsal area roughly rectangular and olive to dark-brown; lateral sepals included, curvate, dark-lustrous-brown, the thickened keel nearly as broad as the sepal sides and ciliate-sabrid; petal blades obovate, about 8 mm. long, unfolding in morning; seeds ellipsoid to broadly ovoid, caudate at one end, 0.5-0.6 mm. long, lustrous, with 20 or 22 distinct papillose longitudinal lines and several faint cross lines. Moist sands or sandy-peats of bog margins, savannahs, pine flatwoods, lake shores and roadside ditches in e. Tex., May-July; in Coastal Plain from Va. s. to Fla. and w. to Tex.

3. *Xyris caroliniana* Walt. Solitary or in small tufts, the bases deeply set in the substrate; outer leaves scaly, castaneous; principal leaves linear, 2-5 dm. long, 2-5 mm. broad, twisted and flexuous, fleshy, minutely tuberculate along the margins, otherwise smooth and lustrous, blunt to acute at tip, the base abruptly dilated, dark-brown, shiny, long-persistent as scales; sheaths of the scapes shorter than the leaves, tight below, loose toward the oblique orifice which is tipped by a short (2-4 mm.) blade; scapes linear, 5-11 dm. long, twisted, flexuous, smooth, terete and minutely ridged below, becoming oval in cross section and smooth to 1-ridged above, the ridges (if present) minutely tuberculate; spikes (13-) 15-30 mm. long, elliptic to narrowly oblanceolate in outline, blunt to broadly acute, of few to many closely imbricate bracts; fertile bracts 5-10 (-13) mm. long, oblong to obovate, entire or emarginate, becoming erose, the matrix reddish-brown to tan with an elliptic or rectangular gray-green or brown dorsal area; lateral sepals linear, slightly to conspicuously exerted, tan to reddish-brown with a broad keel which is entire below but fimbriate at its exerted apex; petal blades obovate, 8-9 mm. long, yellow or white, in most populations opening in the afternoon; seeds fusiform, narrow, 0.8-1 mm. long, translucent with about 20 pale longitudinal lines, the vertical lines not evident. *X. flexuosa* Muhl., *X. torta* Kunth, *X. arenicola* Small. Moist sands of pine flatwoods or savannahs, in well-drained sands or lower reaches of scrub oak-pine barrens in e. Tex., June-Aug.; from N.J. s. to Fla. and w. to Tex.

4. *Xyris platylepis* Chapm. Solitary or in small tufts, the bases shallowly set on the substrate, perennating by means of pale fleshy lateral buds; outer leaves scaly, pinkish, becoming dull-gray-brown; principal leaves linear, 2-4 (5) dm. long, 5-10 mm. broad, twisted, ascending, flexuous, fleshy, minutely tuberculate or smooth along the margin, otherwise smooth, blunt to acute at tip; equitant portion of leaves dilated, fleshy, ivory-white or pink or purplish toward the base; sheaths of the scape shorter than the leaves, castaneous or pale-brown and tight toward the base, more lax toward the oblique short bladed orifice; scapes 5-11 dm. long, twisted, flexuous, smooth to minutely ridged and terete below, oval in cross section and smooth to 1-ridged above the ridges (if present), papillate; spikes elliptic to ovoid or oblong, 1.5-3 (4) cm. long, of numerous closely imbricate bracts; fertile bracts obovate, 5-7 mm. long, entire (becoming slightly erose with age), brownish or pale-tan with an oblong to deltoid dark-green dorsal area; lateral sepals included, light-brown, about the length of the subtending bracts, linear, the keel narrow except toward the apex where it is lacerate; petal blades broadly obovate, about 5 mm. long, yellow or white, opening in the afternoon; seeds ellipsoidal, 0.5-0.6 mm. long, translucent, with 10 to 12 rather irregular longitudinal lines together with a scattering of less distinct vertical lines. In moist to wet sands or sandy peats of pineland pond-margins, savannahs, bogs and roadsides ditches in e. Tex., summer; Coastal Plain, Va. to s. Fla., w. to Tex.

5. *Xyris torta* Sm. Solitary or in tufts of a few individuals, bulbous-based; leaves of 2 sorts, the outer scalelike (from the bud scales), the inner elongate-linear; principal leaves linear, ascending, 2-5 dm. long, 2-5 mm. wide, twisted, grooved longitudinally, the upper (blade) portion dark-green, lustrous, narrowing rather abruptly to a blunt incurved thickened tip, the equitant portion pinkish, purplish or yellow-green, flaring rather abruptly to the fleshy pale or castaneous base, the surfaces smooth or papillose,

the margins narrowly incrassate and smooth or papillose; outer leaves usually much shorter than the inner, maroon or more commonly a dark-lustrous-brown, often scalelike with very dilated bases and slender often acuminate tips; sheaths of the scape shorter than the principal leaves, tightly clasping below, becoming looser toward the orifice which has a short erect slightly divergent blade at its tip; scapes 1.5-8 (-10) dm. long, 1-1.5 (-2) mm. broad, slightly to very twisted and flexuous above toward the spike; spikes at seeding time broadly ovoid or ellipsoidal to lance-ovoid or rarely oblong, 8-25 mm. long, 6-10 mm. broad, of many tightly imbricated bracts; fertile bracts broadly obovate to suborbicular, 5-7 mm. long, deep-lustrous-brown within, dull-brown on the outer surface except for a pale-gray-green elliptical subapical dorsal area, exposed margin of the bract entire or sparingly ciliate except for a short-fimbriate usually slightly emarginate apex; lateral sepals included, slightly shorter than the subtending bract, lustrous-brown, lunate, the brown thickened keel ciliate-scabrid from near the base to the apex where appears a small tuft of reddish-brown or blonde trichomes; petal blades obovate, about 4 mm. long, unfolding in the morning; seeds ellipsoidal, about 0.5 mm. long, caudate, with 14 to 18 prominent longitudinal lines (these under high magnification a series of contiguous papillae) and indistinct narrower cross lines, translucent except for the region of the embryo. Incl. var. *occidentalis* Malme. Sphagnous bogs, stream banks, lake and pond shores, wet sandy swales and acid sandy swamps in e. Tex., June-July; from Can., s. to Ga., Tex. and Okla.

6. *Xyris iridifolia* Chapm. Solitary or in small tufts, the pinkish or purplish keeled bases shallowly set on a mucky substratum; leaves linear, iridiform, 4-7 dm. long, 10-25 mm. broad, flat or slightly twisted, smooth, a deep-rich-green, broadly acute to blunt and incurved at tip, the base slightly dilated and keeled, pink or pale-maroon with a broadly hyaline margin; sheaths of the scape shorter than the leaves, deep-brown or reddish-brown and tight below, becoming somewhat looser and green above, the oblique orifice with a short cusplike blade; scapes 6-8 dm. tall, linear, straight or slightly twisted, terete and 2-ridged below, conspicuously broadened and flattened above, the edges smooth; spikes oblong to broadly oblanceolate, rarely ovoid, 20-35 mm. long, blunt, of numerous closely imbricate bracts with the lowest ones barren; fertile bracts 6-7 mm. long, broadly obovate to suborbicular, entire, the outer surfaces dark-purplish- or reddish-brown, shining except for a paler-green or gray-green oval or triangular dorsal area; lateral sepals included, linear, about the length of the bracts, castaneous, with a broad lacerate keel; petal blades cuneate, about 3 mm. long, opening in the morning; seeds oblong-fusiform, 0.8-1 mm. long, opaque, dark, farinose, the regularly arranged longitudinal lines obscured by the farina. Wet sands but more commonly wet sandy clay, sandy peat, peat muck or alluvium of stream banks, cypress swamps, marshes or pineland pond margins with the bases commonly submersed, e. Tex., July-Sept.; in Coastal Plain from s.e. Va. s. to n. Fla. and w. to Tex.

7. *Xyris Jupicai* Rich. Short-lived perennial, solitary or in small tufts, dying completely after one year from seed or perennating from bulbous lateral over-wintering buds; leaves linear, 1-6 dm. long, 5-10 mm. broad, ascending, lustrous, yellow-green, pale or stramineous toward the base; sheaths of the scape shorter than the principal leaves, somewhat loose toward the oblique orifice which terminates in a short cusplike blade; scapes 2-7 (-9) dm. long, terete and many-ridged below, becoming somewhat flattened and narrower and usually one- or two-edged above; spikes at seeding time ovoid to ellipsoidal or oblong, 5-15 mm. long, of numerous rather loosely imbricated bracts; fertile bracts obovate to oval, 5-7 mm. long, the exposed margins subentire, the outer surface pale- to dark-brown and dull, the dorsal area rectangular to elliptic and green or brownish on old spikes; lateral sepals included, about the length of the bracts, linear and slightly curvate, the thin wings broad, the somewhat thicker keel lacerate for the upper two thirds or one half its length; petal blades cuneate, about 3 mm. long, opening in the morning; seeds broadly ellipsoidal, 4-5 mm. long, the longitudinal ribs numerous but faint, cross lines not evident. Wet sands or sandy peat or alluvium of roadside ditches, flatwoods, pond margins, cypress swamps and lake shores, but particularly in mechanically disturbed wet lands in e. Tex., June-Aug.; in Coastal Plain from N.J. s. to Fla. and w. to Tex. and Ark.

8. *Xyris difformis* Chapm. Solitary or in small tufts, the soft pinkish or purplish (rarely greenish) bases rooted on wet sand or muck; principal leaves broadly linear or linear-

elliptic, 1-5 dm. long, 5-15 mm. broad, usually flabellate-spreading, dark and lustrous-green but toward the bases becoming pinkish, purplish or reddish, apex acute and slightly incurved, the surface smooth, the margin above the equitant portion usually papillose or rarely smooth; sheaths of the scapes shorter than most of the leaves, thin, tight except at the slightly loosened oblique orifice whose upper margin converges to a short cusplike blade; scapes linear, 15-70 cm. long, terete, brownish and twisted below, straightening and becoming deep-green and oval in cross section above with 2 prominent broad thin ridges whose combined breadth is at least equal to that of the scape and whose margins are papillose; spikes at seed-bearing time ovoid, about 1 cm. long, acute, dark, of many usually tightly imbricated bracts of which the lower few are barren; fertile bracts 5-7 mm. long, obovate to oval, not keeled, the apex rounded and subentire, the outer surface usually deep-brown, lustrous, the dorsal area greenish or gray-green, rectangular to round or elliptic; lateral sepals included, about the length of the bracts, the broad wings thin and pale-brown, the keel slightly thicker and darker with its margin jagged from about the middle to the apex; petal blades cuneate, about 4 mm. long or less, unfolding in the morning; seeds broadly ellipsoidal, about 0.5 mm. long, translucent, with 24 to 28 very fine straight longitudinal lines of small papillae, the vertical lines straight but indistinct. (?) *X. elata* Chapm. Wet sands or sandy peats of flatwoods, pond margins, ditches and lake shores, but more often on alluvial situations (often in fairly heavy shade) in e. Tex., spring-summer; primarily on the Coastal Plain from Tex. to s.e. Can. and the Great Lakes system.

Var. *Curtissii* (Malme) Kral. Similar to var. *difformis* but smaller, usually less than 2 dm. high, more tufted and with the margins of the equitant portion of the leaves very broad and pinkish-translucent, the surfaces papillose or low-tuberculate with the papillae or tubercles in slightly diagonal lines, the bases pinkish or purplish and similarly papillate; sheaths of the scape looser with the bases a rich-brown or sometimes castaneous; scapes rarely to 2 dm., terete with many low ridges below, the margins of the ridges papillate or scabrid; spikes at seed-bearing time broadly ovoid to ellipsoidal, seldom longer than 5 mm., of but few bracts; fertile bracts 3-4 mm. long, suborbicular to broadly obovate, the outer surfaces pale to deep brown and lustrous, the ellipsoidal dorsal areas gray-green and becoming brown and indistinct with age; lateral sepals included, about the length of the bracts, linear-curved, a lustrous-brown, the thin wings broad, the slightly thicker keel broadened and somewhat lacerate toward its tip or even entire; petal blades obovate to cuneate, slightly less than 3 mm. long, unfolding in the early morning; seeds oblong to ellipsoidal, about 0.5 mm. long, translucent, with 12 or 14 faint longitudinal lines, the vertical lines even more faint. Sandy peats of ditches and bogs, flatwoods or acid seepage areas in e. Tex., spring-summer, from the Great Lakes system and s.e. Can. s. to Fla. and Tex.

FAM. 33. ERIOCAULACEAE DESV.²²

PIPEWORT FAMILY

Perennial or rarely annual aquatic or marsh herbs, mostly short-stemmed; roots tufted, fibrous, knotty or spongy, often septate; leaves mostly basal and tufted, narrow, grasslike; inflorescence capitate, in terminal solitary or umbellately aggregate involucrate heads, borne on long slender scapose peduncles that are sheathed at the base; florets numerous, small, sessile or short-pedicellate on a variously shaped receptacle, each borne in the axil of a scarious scalelike colored or colorless receptacular bractlet, unisexual, mostly androgynous, the staminate and pistillate mixed together or the staminate in the center and the pistillate on the periphery, the sexes very rarely in separate heads; perianth scarious or membranous, rarely hyaline, 2- or 3-merous, usually in 2 distinct series, the outer (calyx) free or rarely partially connate, the inner (corolla) often united in an infundibular fashion, rarely absent; stamens as many or twice as many as the outer perianth segments and alternate with them, inserted on the corolla (when present); filaments distinct; anthers small, 2- or 4-celled, composed of 1 or 2 thecae, opening by longitudinal slits, introrse; ovary superior, 2- or 3-celled; style terminal, often appendaged; stigmas 2 or 3, simple or lobed; ovules solitary and pendulous in each cell, ortho-

²² Adapted from H. N. Moldenke in C. L. Lundell, *Flora of Texas* III: 3-9. 1942.

tropous; fruit a 2- or 3-celled and 2- or 3-seeded membranous capsule, loculicidally dehiscent; seeds solitary, pendulous.

About 1,150 species in 13 genera, mostly tropical and subtropical.

- 1. Stamens 4 or 6, twice as many as the outer perianth segments; peduncles glabrous or at most puberulent1. *Eriocaulon*, p. 353.
- 1. Stamens 2 or 3, as many as the outer perianth segments; peduncles villous above
.....2. *Lachnocaulon*, p. 354.

1. ERIOCAULON L. PIPEWORT

Stems short; leaves tufted, membranous or very thin and pellucid, more or less linear or linear-lanceolate and grasslike, sessile and clasping at base, very often fenestrate; peduncles solitary or aggregate, slender, sheathed, usually glabrous and several-costate; florets dimerous or trimerous, the staminate mixed with the pistillate or segregated on separate heads or (rarely) on separate plants; perigonium almost always double; staminate florets with the sepals free at the base and often more or less connate into a split spathe, the 2 or 3 petals united below into a tube, free at apex, the lobes usually bearing a small black gland on the inner surface near the apex; stamens twice as many as the sepals (or rarely 3) and exserted; anthers 4-celled, mostly black, composed of 2 thecae; pistillate florets with free or (rarely) spathaceous-connate sepals; petals free or rarely none, usually each bearing a small black gland slightly below the apex within; style appendages none; stigmas 2 or 3, simple.

A genus of about 400 species, widely distributed in marshy places in tropical and subtropical regions, the greatest number in tropical America; numerous also in tropical Asia and Africa; one species in northwestern Europe and northeastern North America; several on the Coastal Plain of eastern and southern United States.

- 1. Heads when mature glabrous or subglabrous, olivaceous, not white-villous
.....1. *E. Körnickianum*.
- 1. Heads when mature always white-villous at the summit (2)
- 2(1). Receptacular bractlets surpassing the florets, long-acuminate; heads very tough and hard, not at all compressed in drying; leaves mostly rigid
.....2. *E. decangulare*.
- 2. Receptacular bractlets about equaling or shorter than the florets; heads more or less compressed in drying; leaves mostly lax (3)
- 3(2). Staminate florets with the anterior petal much larger than the posterior one; plants mostly dioecious or practically so; heads 5-14 mm. in diameter
.....3. *E. compressum*.
- 3. Staminate florets with the petals equal or subequal; plants always plainly monoecious; heads 3-7 mm. in diameter (4)
- 4(3). Heads loose-flowered, greatly compressed in drying .4. *E. septangulare*.
- 4. Heads dense-flowered, scarcely compressed in drying .5. *E. texense*.

1. *Eriocaulon Körnickianum* Van Heurck & Muell. Arg. Leaves erect, to 25 mm. long, 1 mm. wide, glabrous, 3-nerved; peduncles aggregate, as many as 25, to 1 dm. tall, pale-green, 3- or 4-costate, twisted, the basal sheath to 25 mm. long; heads globose or hemispheric, 2-4 mm. in diameter, compressed in drying. In springy places on prairies and wet sandy soil in e. Tex., spring; Ark., Okla. and probably Tex.

No Texas material has been seen but the type is considered to have been collected in "East Texas" (Tyler Co.) by Charles Wright.

2. *Eriocaulon decangulare* L. Plants monoecious; leaves to 35 cm. long and 1 cm. wide at the middle, many-nerved, the margin often revolute; peduncles 1 to 3 per plant, rigid, to 1 m. tall, usually much smaller, many-costate, not noticeably twisted, the basal sheath to 16 cm. long; heads globose or hemispheric, 7-12 mm. in diameter. In moist meadows and pinelands, savannahs, bogs, swamps and pond-margins in e. Tex., spring; from N.J. to Fla. and w. along Gulf Coast to e. Tex.

Plants with binary heads are sometimes found.

3. *Eriocaulon compressum* Lam. Plants rarely monoecious; leaves dull, to 25 cm. long and 6.5 mm. wide, many-nerved; peduncles mostly solitary, rarely 2 or 3, to 85 cm. tall, 10-striate, more or less twisted, the basal sheath about as long as leaves. In still shallow water of acid ponds, swamps and low pinelands, and in streams in e. Tex., spring; from s. N.J. to Fla., w. to La. and e. Tex.

4. *Eriocaulon septangulare* With. Leaves to 18 cm. long and 3.5 mm. wide, usually much smaller, 3- to 8-nerved; peduncles mostly solitary, to 55 cm. tall or more in deep water, 7-costate, usually not twisted. In still water and on shores of ponds in (?) e. Tex., spring; from Nfld. to Va., w. to Ont., Minn. and Ind., reported from Tex. but doubtfully in the state; also in the Hebrides and adj. is., n. Scot. and Ire.

5. *Eriocaulon texense* Körn. Leaves spreading, plane, to 65 mm. long and 3 mm. wide, 10- to 13-nerved; peduncles solitary or 2 to 4, to 35 cm. tall, 5- or 6-costate, slightly twisted, glabrous, the basal sheaths longer than the leaves. In bogs, swamps and moist pinelands in e. Tex., Apr.-June; from e. Tex. to s.w. Ala.

2. LACHNOCAULON KUNTH

A genus of about 10 species, all North American.

1. *Lachnocaulon anceps* (Walt.) Morong. HAIRY PIPEWORT, WHITEHEAD BOG-BUTTON. Stems short; leaves tufted, bright-green, olivaceous in age, linear-lanceolate, to 7 cm. long and 2.5 mm. wide; peduncle rarely more than 3 dm. tall, 3-costate, twisted, densely villous above, the sheaths to 7 cm. long; heads obconic-globose or hemispheric, 3-6 mm. in diameter; involucre bractlets fuscous or olivaceous-grayish, ovate to obovate, obtuse to subacute, long-villous on the back at the apex; receptacular bractlets olivaceous-fuscous, spatulate, very obtuse, pilose on the back at the apex; florets trimerous; *staminate florets* with 3 sepals, no petals, 3 stamens, the filaments united below and coalescent with a rudimentary corolla or pistil, free above, and with oblong 2-celled anthers composed of 1 theca; staminate sepals fuscous, oblong-obovate, connate at the base, rounded-obtuse and comose at the apex; *pistillate florets* with 3 free sepals, petals reduced to hairs, a single style, 2 or 3 style appendages, 2 or 3 simple or bifid stigmas and a 2- or 3-locular ovary; pistillate sepals free, whitish, oblong-spatulate, longer than the receptacular hairs, obtuse to acute, pilose at the apex. In wet places in s.e. Tex., May-Oct.; Va. s. to Fla., along the Gulf Coast to Tex.; also Isle of Pines, Cuba.

The white pistillate flowers mingled with the brown staminate ones impart a mixed gray and dark appearance to the heads.

FAM. 34. BROMELIACEAE JUSS.²³

PINE-APPLE FAMILY

Herbs or rarely shrubby perennials, mostly epiphytic; roots usually present but often serving merely as holdfasts in the epiphytic species; leaves spirally arranged, usually basal, dilated-sheathing below, simple, entire to spinose-serrate, bearing peltate moisture-holding scales at least when young; inflorescence simple or compound, of spikes or racemes, usually bearing conspicuous bracts; flowers perfect or unisexual (and with male and female flowers on different plants); perianth heterochlamydeous, the sepals and petals free or connate; stamens 6 in 2 series, the filaments free or joined to the petals or to each other; style 3-parted; ovary superior (in ours), 3-celled; placentae axile; fruit capsular or baccate; seeds naked, winged or plumose; embryo small, situated at the base of the copious mealy endosperm.

A family of nearly 2,000 species in about 60 genera that are indigenous to the New World with the exception of some species of *Pitcairnia* in Africa.

1. Seeds narrowly winged to almost naked; flowers functionally dioecious; leaves spinose-serrate1. *Hechtia*, p. 355.

1. Seeds with a basal plumose appendage; flowers perfect; leaves entire
.....2. *Tillandsia*, p. 355.

²³ Adapted from Lyman B. Smith in C. L. Lundell, *Flora of Texas* III: 200-207. 1944.

1. HECHTIA KL.

Mostly coarse herbs with the habit of *Yucca* or *Agave*; stem short or practically none; leaves densely rosulate, usually recurving, acuminate, pungent, coarsely spinose-serrate in most species, lepidote throughout or only on the under side; scape lateral, erect or ascending; lower scape bracts foliaceous, the upper usually vaginiform; inflorescence amply paniculate; branches from capitate to lax and very elongate; flowers small, subsessile to distinctly pedicellate, unisexual but usually some remnant of the nonfunctional sex present; sepals squamiform, free; petals naked usually free but sometimes joined to a ring of filaments by their centers; stamens varying from exerted to included, the anthers usually ovate; ovary glabrous or lepidote, from wholly superior to more than three fourths inferior; capsule ovoid or ellipsoid, septicidal and loculicidal at the same time; seeds numerous, oblong, narrowly winged or sometimes almost naked, often sculptured.

A genus of about 35 species, ranging from southern Texas to Guatemala and El Salvador, but predominantly Mexican.

1. Sepals obtuse or apiculate, brown, 4 mm. long; leaves repand-serrate toward base with spines relatively close3. *H. glomerata*.
1. Sepals acute, white or scarious, to 6 mm. long; flowers 8-10 mm. long; leaf margins scarcely repand, all their spines remote (2)
- 2(1). Sepals as broad as long, 5-nerved; branches of the inflorescence very laxly flowered toward base1. *H. texensis*.
2. Sepals much longer than broad, generally 1- to 3-nerved; branches of the inflorescence densely flowered2. *H. scariosa*.

1. *Hechtia texensis* Wats. FALSE AGAVE. Plants about 2 m. tall; leaves in a dense rosette, linear-triangular, the margins with distantly placed spines, densely covered with grayish-white scurfy scales on the lower surface; scape erect, supporting a laxly branched inflorescence of numerous small flowers; branches of the inflorescence to 2 dm. long; sepals broadly ovate, acute; capsules ovoid, acute, dark-brown, lustrous, about 1 cm. long. A rare endemic on dry limestone bluffs in the Big Bend of the Rio Grande in Brewster Co.

This species and *H. scariosa* are very closely allied. Since *H. texensis* is apparently represented only by the type collection additional collections should be obtained in order to better clarify these two species.

2. *Hechtia scariosa* L. B. Sm. Plant very similar to *H. texensis* but with narrower, generally fewer-nerved sepals. The somewhat shorter branches of the inflorescence are also more densely flowered, especially toward their base. On dry limestone slopes and ridges in Brewster Co., Tex. and n. Mex., Feb.-May.

3. *Hechtia glomerata* Zucc. GUAPILLA. Plant to 18 dm. tall; leaves in a dense spreading rosette, linear-lanceolate, the margins with approximate spines, densely covered with whitish or pale-brown scales on the lower surface; scape erect or ascending, slender, supporting a laxly compound inflorescence. *H. Ghiesbreghtii* Lem. In gravel and on sandstone formations in Starr and Zapata cos., Tex. and n. Mex.; May-Aug.

2. TILLANDSIA L.

Caulescent or acaulescent herbs of variable habit; leaves rosulate or fasciculate or distributed along a stem, polystichous or distichous, entire, ligulate or subtriangular; scape usually distinct; inflorescence various, usually of distichous spikes or sometimes reduced to a single polystichous spike by the reduction of the spikes to single flowers or rarely the whole inflorescence reduced to a single flower; flowers perfect; sepals usually symmetric, free or equally or posteriorly joined; petals free, naked or rarely with vertical folds; stamens of various lengths relative to the petals and to the pistil; ovary superior, glabrous; ovules usually many and caudate; capsule septicidal; seeds erect, narrowly cylindrical or fusiform, the plumose appendage white, straight, basal.

A genus of about 500 species, ranging from southern United States to northern Argentina and Chile.

1. Stamens exerted; plant stemless; leaves polystichous, their bases forming a pseudo-bulb, their blades 5 mm. thick3. *T. Baileyi*.
1. Stamens deeply included; plant caulescent, appearing like a coarse moss; leaves distichous, their blades 0.5-2 mm. in diameter (2)
- 2(1). Stem not more than 1 dm. long, wholly concealed by the imbricate leaf sheaths; inflorescence terminal1. *T. recurvata*.
2. Stem elongate, often several meters long, exposed between alternating bunches of leaves; inflorescence pseudolateral, one-flowered2. *T. usneoides*.

1. *Tillandsia recurvata* L. BALL MOSS, GALLITOS. Plants typically in dense ball-like clumps, rarely more than 15 cm. tall; scape slender, subfiliform, mostly rising conspicuously above the leaves, supporting 1 or 2 erect flowers. *Diaphoranthema recurvata* (L.) Beer. Epiphytic and saxicolous in s.w. Tex. from Brewster Co. e. to Blanco, Hays and DeWitt cos., throughout year; from Fla. w. to Ariz., s. to Arg. and Chile.

2. *Tillandsia usneoides* (L.) L. SPANISH MOSS, PASTLE. Plants forming slender branching strands to 8 m. long that commonly festoon the branches of trees and other supports; inflorescence a solitary sessile flower. *Dendropogon usneoides* (L.) Raf. Epiphytic or on wires, fences and other such supports in cen. and s. Tex., Feb.-June; from Va., s. to Fla. and along the Gulf Coast to Tex., s. to cen. Arg. and Chile.

The fibrous stems, after retting, are used in stuffing upholstery.

3. *Tillandsia Baileyi* Small. Plants forming loose clumps, 25 cm. or more tall; peduncle rather stout, nearly concealed by the tubular sheaths of the foliaceous bracts, about as long as or shorter than the leaves, supporting 1 or 2 spikes of several flowers each. Epiphytic on live oaks and other trees in extreme s. Tex., s. to Guat., Feb.-May.

FAM. 35. COMMELINACEAE R. BR.

SPIDERWORT FAMILY

Succulent perennial or annual herbs, acaulescent or with nodose stems, the roots fibrous or sometimes much-thickened and tuberlike; leaves alternate, flat or somewhat channeled, entire, parallel-veined, sheathing by a basal membranous and often closed sheath; inflorescence terminal and/or axillary, a simple or compound cyme or thyrses, occasionally 1-flowered, sometimes attended by a cymbiform spathe or foliaceous bracts; flowers usually actinomorphic but sometimes zygomorphic, bisexual; calyx of 3 usually free and imbricated herbaceous sepals; corolla mostly ephemeral and deliquescent, the 3 colored petals equal or unequal and free or united into a tube, the third petal sometimes much-reduced; stamens typically 6 but sometimes fewer or only one, some occasionally reduced to staminodes; filaments usually distinct, often bearded with moniliform hairs; ovary superior, sessile or stipitate, usually 3-celled; fruit a loculicidal capsule, sometimes enclosed by fleshy sepals, rarely fleshy and indehiscent.

A large family mainly in tropical and subtropical regions. About 600 species in nearly 40 genera.

1. Flowers solitary or in racemes; inflorescence subtended or enclosed by a single clasping or folded leafy bract (2)
1. Flowers in umbels, glomerules or cymes; inflorescence subtended by 2 or more leaves with reduced sheaths but a distinct blade (3)
- 2(1). Floral bract folded, abruptly different from the stem leaves
.....1. *Commelina*, p. 357.
2. Floral bract not folded, similar to the upper stem leaves but shorter and wider
.....2. *Commelinantia*, p. 359.
- 3(1). Stamens 5 or 6 (4)
3. Stamens 1 to 3 (5)
- 4(3). Petals tapering into a claw, the claws coherent to form a tube; stamens borne on the petals3. *Setcreasea*, p. 359.
4. Petals broad at base, spreading from base; stamens free from petals
.....4. *Tradescantia*, p. 360.

- 5(3). Leaves ovate-cordate, clasping at base, rarely to 35 mm. long; flowers in axillary glomerules5. *Callisia*, p. 365.
- 5. Leaves linear to linear-lanceolate, not clasping, mostly more than 50 mm. long; flowers in long-peduncled cymes6. *Aneilema*, p. 366.

1. COMMELINA L.²⁴

WIDOW'S-TEARS. DAY-FLOWER

Plants herbaceous, annuals or perennials; stems at first erect, in some species eventually decumbent; leaves ovate to linear, forming a sheath at the base, margin of leaf and throat of sheath often lined with white or reddish trichomes; flower buds borne inside of a cymbiform spathe that is open across the top, 3 to 5 buds are produced in each spathe, the buds opening in succession 3 or 4 days apart; flowers blue or sometimes paler, exerted above the spathe shortly after dawn to remain until midday after which they recede into the spathe as a juicy mass; sepals 3, one subequal to the other 2; petals 3, one of which is subequal to the other 2 and often paler; stamens 3, the smaller staminodia 3; ovary 3-carpellate; fruits usually 1 or 2 or sometimes 3 per spathe; seeds 1 to 3 per fruit.

About 225 species, mainly in tropical and subtropical regions of both hemispheres.

- 1. Spathes open across the top and down adaxial side to spathe stalk, the margins not connate at base (2)
- 1. Spathes open across the top but closed down the adaxial side, the margins connate at base; perennials; seeds smooth, farinose (4)
- 2(1). Two posterior petals blue; anterior petal much smaller, white, lanceolate; capsule 2-celled, 4-seeded (no rudiment of third cell); annual; stems decumbent at base, rooting at lower nodes; leaves lanceolate, 8-12 cm. long; anthers 6; seeds 3.5-4 mm. long, gray, rugose1. *C. communis*.
- 2. All three petals blue; anterior petal ovate, slightly smaller; capsule 3-celled, 5-seeded (posterior cell 1-seeded, indehiscent) (3)
- 3(2). Plants annual; roots fibrous; stems creeping (at least at base), rooting at the nodes; spathes short-peduncled, acute to acuminate, 1-3.5 cm. long, glabrous or nearly so; posterior petals long-stalked, 6-8 mm. long; anthers 5 (posterior lacking)2. *C. diffusa*.
- 3. Plants perennial; roots tuberous, clustered; stems erect, not rooting at the nodes; spathe long-peduncled, caudate, 4-7.5 cm. long, pubescent; posterior petals short-stalked, 10-12 mm. long; anthers 63. *C. dianthifolia*.
- 4(1). All three petals blue, ovate, equal or nearly so; plant strictly erect, relatively stout and broad-leaved; sheaths ciliate with ferruginous hairs, without evident auricles; spathes crowded at summit of stem, short-stalked; two anterior cells of capsule each 2-seeded, the posterior cell relatively large but 1-seeded and indehiscent4. *C. virginica*.
- 4. Two posterior petals blue, the anterior petal much smaller and white; plants often lax or slightly decumbent from base, more slender and narrower-leaved; sheaths ciliate on rounded auricles with white hairs; spathes more scattered, both near summit of and in axils along stem, longer-stalked; cells of capsule all 1-seeded, the posterior cell normal and dehiscent, becoming reduced, tardily dehiscent to even obsolete (5)
- 5(4). Leaf blades lanceolate-ovate to ovate, 3-8 cm. long; posterior petals 8-12 mm. long; seeds scarcely flattened; roots scarcely fleshy; stems mostly reddish, more or less decumbent at the base and rooting at the lower nodes5. *C. elegans*.
- 5. Leaf blades linear-lanceolate to oblong-lanceolate, 8-14 cm. long; posterior petals 10-25 mm. long; seeds somewhat flattened; roots evidently fleshy; stems green, erect or somewhat diffuse from the base but not decumbent and rooting at the nodes (6)

²⁴ Adapted from Clyde K. Brashier in Bull. Torrey Club 93: 1-19. 1966.

- 6(5). Blades of middle and upper leaves broadly oblong-lanceolate, less than 5 times as long as wide, 14-32 mm. wide6. *C. erecta* var. *erecta*.
 6. Blades of middle and upper leaves narrowly oblong-lanceolate or linear-lanceolate, more than 5 times as long as wide, 5-20 mm. wide (7)
 7(6). Spathe 13-23 mm. long (mostly 15-20 mm.)6. *C. erecta* var. *angustifolia*.
 7. Spathe 22-33 mm. long (mostly 25-28 mm.)6. *C. erecta* var. *Deamiana*.

1. *Commelina communis* L. Plant annual, with a fibrous root system, to 5 dm. tall; stems erect at first, later becoming prostrate and spreading due to numerous branches being produced, to 4 mm. in diameter, some internodes as much as 16 cm. long; leaves broadly lanceolate, smooth beneath, scabrous and often with scattered white hairs above, to 12 cm. long and 4 cm. wide; throat of leaf sheath with or without pubescence; spathe stalk to 7 cm. long; spathes glabrous to very slightly pubescent with long white hairs, 2-3 cm. long, 8-13 mm. high, open across top and down the side to the spathe stalk, tapering to a blunt tip on abaxial end, the bottom forming a straight line while the top is curved. On stream banks and in low thickets, a common garden weed, in e. Tex., May-Oct.; from S.D. to Tex., e. to the Atl. Ocean.

2. *Commelina diffusa* Burm. f. Plant annual, with a fibrous root system; stems at first erect, later becoming decumbent because of profuse branching and layering, rarely more than 1.5 mm. in diameter, the larger internodes to 10 cm. long; leaves broadly lanceolate, glabrous beneath, glabrous to slightly scabrous above, 3.5-11 cm. long, 9-22 mm. wide; leaf sheaths 5-10 mm. long, the throat usually lined with long white hairs or sometimes with only short hairs; spathe stalk 1-2 cm. long; spathe glabrous, open across top, tapering to a slightly attenuated tip at the abaxial end and open down the adaxial side to the point of attachment to the stalk, the bottom usually decurved at the tip. In floodplain woods and wet clays in e. and s. Tex., Apr.-Nov.; in s.e. U.S., w. to Tex., Okla. and Kan.

3. *Commelina dianthifolia* Delile. Plant perennial, erect to suberect; stem branching profusely; internodes 4-12 (-15) cm. long; leaves linear, finely pubescent to glabrous, to 15 cm. long and 8 cm. wide; leaf sheaths 1.5-2 cm. long, often having a purplish-tint; spathes open across top and down adaxial side, tapering to a long-attenuated tip on the abaxial side, often purplish in hue, 2.5-8 cm. long, 7-17 mm. high; juncture of adaxial side of spathe and top of spathe forming a smooth curve, not angular as in our other perennial species. In rocky soils in Trans-Pecos Tex., July-Sept.; from Tex. to N.M. and Ariz.

4. *Commelina virginica* L. Plant perennial, overwintering by a tuberous root system, commonly producing new plants by elongated prostrate rhizomes that turn up at the ends; stem erect to decumbent, 3-6 mm. in diameter at base, the longest internodes usually 8-18 cm.; leaves broadly lanceolate, when mature to 2 dm. long and 65 mm. wide, finely pubescent, especially scabrous to the touch when rubbed from the tip toward the base; leaf sheaths heavily pubescent at throat and down the open edge, the hairs sandy-red to dark-red in color; spathes terminal and usually clustered, occasionally produced singly at top, glabrous to very finely pubescent, to 35 mm. long and 2 cm. high, closed down the adaxial side, open across the top, tapering to a point on abaxial side. In low woods in e. and n.-cen. Tex., May-Oct.; from e. Tex. and Okla., n. to Ill. and Md., e. to the Atl. Ocean.

5. *Commelina elegans* H.B.K. Roots slender; stems at first erect, branching at the base, the branches decumbent, to 9 dm. long, rooting at the lower nodes, with puberulent internodes; leaves ovate to elliptic or ovate-lanceolate, 3-8 cm. long, acute to acuminate at apex, often rounded at the base; sheaths 1-1.5 cm. long, naked or sparingly long-ciliate on the margins; spathes short-peduncled, rather broad, glabrous or puberulent, 1.5-2 cm. long, acute; posterior petals blue, 8-12 mm. long, the anterior petal much smaller and white; capsules obovoid, about 4 mm. long, reticulated especially on the dorsal lobe; seeds 3, smooth. Moist shaded situations in extreme s. Tex., July-Oct.; also in s. Fla. and trop. Am.

6. *Commelina erecta* L. **HIERBA DEL POLLO**. Plant perennial, overwintering by means of tuberous roots; sprouting by means of adventitious buds on the roots in the spring; stem to 3 m. long, usually much shorter, at first erect, later becoming decumbent; leaves

linear to ovate-lanceolate, to 15 cm. long and 14-35 mm. wide, slightly scabrous with fine pubescence above, glabrous beneath; leaf sheath to 25 mm. long, the pubescence white on the margins, becoming denser around the throat of the sheath; spathes 13-35 mm. long, 8-23 mm. high, glabrous to heavily pubescent, the hairs often becoming clustered near the base of spathe, adaxial side of spathe closed, top of spathe open, with the abaxial side tapering to a point to give a somewhat cymbiform appearance. Commonly in sandy or rocky soils in e. two thirds of Tex., often a weed in fields and gardens, May-Oct.; from Wisc. s. to Fla. and Ariz., w. to Wyo.

The aggregate species occurs in sandy or clayey soils in pinelands, open woodlands and in grassy areas, on limestone slopes, in thickets and on stream banks throughout Texas, often occurring as a weed in gardens and fields, May-Oct.; found in most of the eastern half of the United States. The segregates distinguished in the key and their synonymy are:

Var. *erecta* (including f. *erecta* and f. *intercurva* Fern.)

Var. *Deamiana* Fern.

Var. *angustifolia* (Michx.) Fern. Incl. f. *angustifolia* and f. *crispa* (Woot.) Fern., *C. angustifolia* Michx., *C. crispa* Woot., *C. erecta* var. *crispa* (Woot.) Palm. & Steyerl.

2. COMMELINANTIA THARP

We have one of the two species in this American genus.

1. *Commelinantha anomala* (Torr.) Tharp. FALSE DAY-FLOWER, WIDOW'S-TEARS. Tufted leafy annual, pale or yellowish-green and often glaucescent throughout, to about 8 dm. high; stems erect, clustered, at first simple but later much-branched and spreading, with the branches emerging through the back of the leaf sheaths just above the nodes; basal leaves linear-spatulate, tapered to a long ciliate petiole, 2-3.5 dm. long; upper cauline leaves sessile on the sheath or short-petioled, to 2 dm. long, broadly to narrowly lanceolate, often somewhat cordate and clasping at base, acute to acuminate at apex; inflorescence typically a simple scorpioid peduncled raceme that terminates the stems and branches and is subtended by a single broad flat erect cordate clasping spathe, rarely reduced to one axillary flower; flowers subtended by a small ovate persistent bract 3-5 mm. long; calyx of 3 similar green imbricated persistent sepals; sepals keeled, slightly hooded, blunt, 9-12 mm. long, somewhat glandular-ciliate above the middle; the showy lavender-blue petals rhomboid, 15-18 mm. long and somewhat broader than long; the small white petal ovate-rhombic, 3-4 mm. long and longer than broad; stamens 6, all fertile but dissimilar in size (of 4 distinct forms) and pubescence; ovary oblong, 3-celled, with 2 superimposed ovules in each cell, the stigma capitate; capsule oblong, loculicidally 3-valved, 6-8 mm. long; seeds grayish-brown. *Commelina anomala* (Torr.) Woods., *Tinantia anomala* (Torr.) C. B. Clarke. On limestone gravel, among boulders and in crevices in ravines and on open-wooded slopes on the Edwards Plateau of cen. Tex., Apr.-July; endemic.

3. SETCREASEA K. SCHUM. & SYDOW

Perennial herbs from tuberous roots; cymes sessile, usually many-flowered, either in terminal or axillary clusters; sepals distinct, concave, subequal, greenish or scarious; petals distinct, tapering at base into slender claws that cohere to form a slender tube; stamens 6, all perfect, subequal, often more or less hairy, borne on the petals; style slender, 3-lobed; capsule stipitate, 3-celled, with the cells dehiscent and 2-seeded.

A small genus of southwestern United States and Mexico.

1. Leaves narrowly lanceolate, acuminate; filaments smooth; anther cells separated by a wide connective; distribution in mountains of Trans-Pecos Texas
..... 1. *S. leiandra*.
1. Leaves ovate to oblong-elliptic or elliptic-lanceolate, obtuse to mostly abruptly acute-apiculate (2)

- 2(1). Ovary and fruit more or less pubescent; pedicels glabrous; sepals with a long tuft of silky hairs at base; filaments usually adorned with moniliform hairs; anther cells separated by a narrow thick connective; distribution in extreme south Texas; flowering mainly from February to May 2. *S. Buckleyi*.
2. Ovary and fruit glabrous; pedicels densely clothed with long white hairs; sepals smooth; filaments without hairs; anther cells separated by a broad membranous connective; distribution on open slopes and on cliffs and ledges in mountains of Trans-Pecos Texas; flowering mainly from July to October 3. *S. brevifolia*.

1. *Setcreasea leiandra* (Torr.) Pilg. Plant from a cluster of slender fibrous-thickened roots; stems erect, 3-5 dm. long, somewhat branching and naked above, slender, glabrous; leaves distant, narrowly lanceolate, acuminate, 7.5-16 cm. long, 1-2.5 cm. wide, essentially glabrous or somewhat pubescent, the margins smooth or only slightly ciliate-scabrous; margin of wide short sheath glabrous or nearly so; involucre leaves 2, connate, ovate-lanceolate, acuminate, cordate and somewhat dilated at base, 24-45 mm. long, very unlike the lower stem leaves; umbel sessile, many-flowered; pedicel densely clothed with long white hairs or occasionally only with short glandular hairs; sepals oblong, rather obtuse, usually glandular-pubescent as well as villous; corolla purplish-red; petals roundish-obovate, a little narrowed at base; filaments smooth; anther cells separated by a wide connective; capsule oval, somewhat 3-lobed, stipitate, the 3 cells 2-seeded; seeds 1 mm. in diameter, slightly rugose. *Tradescantia leiandra* Torr. (as *T. biandra*), *Treleasea leiandra* (Torr.) Rose, *Neotreleasea leiandra* (Torr.) Rose. In moist rocky places, on ledges, among shrubs and in canyons of the Trans-Pecos, July-Oct.; also n. Mex.

Those plants in the Capote Falls region in Presidio County that have pedicels provided only with short glandular hairs instead of long white hairs are separated as var. *glandulosa* Correll.

2. *Setcreasea Buckleyi* I. M. Johnst. Stem loosely branched, elongate, trailing, to 5 dm. long or more; leaves typically elliptic, subobtuse to acute-apiculate, to about 12 cm. long and 35 mm. wide; margin of sheaths more or less pubescent; involucre leaves 2, similar to the lower stem leaves but smaller; umbel sessile, few- to many-flowered; pedicels usually glabrous except near summit; sepals with a tuft of long white hairs at base; corolla pale-pink to whitish; petals suborbicular-obovate, about 1 cm. long; filaments usually adorned with long moniliform hairs; anther cells separated by a narrow thick connective; capsule subglobose, about 3.5 mm. in diameter, usually somewhat pubescent (especially when young). *Tradescantia speciosa* Buckl. On clay mounds among chaparral usually near the coast, inland to Webb Co. and e. to Gonzales Co., flowering mostly Feb.-May, sometimes later; also adj. Mex.

3. *Setcreasea brevifolia* (Torr.) K. Schum. & Sydow. Plant low, with coarse rhizomes; stems prostrate, simple or somewhat branched (especially above), to 3 dm. long or more; leaves approximate, thickish, somewhat glaucous, broadly ovate to elliptic-lanceolate, obtuse to acute-apiculate at apex, to 8 cm. long and 3 cm. wide, the margins serrulate and sometimes submarginally long-hairy on upper surface; sheaths ciliate or villous on margins; involucre leaves 2, similar to the lower leaves, to about 6 cm. long; umbel sessile, several-flowered; pedicels densely clothed with long white hairs; sepals smooth, lanceolate; corolla deep-pink to reddish-purple, the petals obovate; filaments glabrous; anther cells separated by a broad membranous connective; capsule obovoid to subglobose, smooth, about 4 mm. in diameter. *Tradescantia leiandra* var. *ovata* Coult., *Neotreleasea brevifolia* (Torr.) Rose, *Treleasea brevifolia* (Torr.) Rose, *Setcreasea ovata* (Coult.) Faruqi, Celarier & Mehr. Among rocks or in crevices, on grassy slopes or on sheltered cliffs or north-facing slopes in mts. of the Trans-Pecos, July-Oct.; also n.e. Mex.

4. TRADESCANTIA L.²⁵

SPIDER LILY. SPIDERWORT

Subsucculent perennial herbs; stem erect to trailing, herbaceous, frequently producing subterranean stolons; leaves alternate, sessile, linear to oblong-elliptic (in our species),

²⁵ Adapted from Edgar Anderson and R. E. Woodson, Jr. in *Contr. Arnold Arb.* 9: 1-132. 1935.

the blade basally produced into a perfoliate sheath; inflorescence an umbellate dichotomous helicoid cyme, terminal or lateral, subtended by 2 or infrequently 3 subequal or unequal foliaceous or rarely scarious bracts; pedicels subtended by solitary or paired hyaline or slightly foliaceous bracteoles; sepals 3, separate, equal, more or less concave or navicular, foliaceous to petalaceous or hyaline; petals 3, separate, equal, ephemeral; stamens 6, fertile, equal, hypogynous; anther sacs reniform (in our species), dehiscing longitudinally, united by a broadly trapezoid connective; filaments (in our species) abundantly pilose; ovary 3-celled; ovules 3 to 6, uniseriate, orthotropous; style filiform; stigma capitate; capsule dry, loculicidally 3-valved; seeds naked, roughly oblongoid to subtrigonal or subspherical, more or less rugose and radiately ridged, the micropyle persistently pitted, the funicular scar linear to punctiform.

About 60 species in temperate and tropical America.

1. Stems creeping or trailing, rooting at the nodes (at least in part); sepals with a definite puberulent keel 12. *T. micrantha*.
1. Stems erect or ascending, more or less diffuse in some species, not rooting at the nodes; sepals more or less concave but not definitely keeled (2)
 - 2(1). Leaf blade broader than the sheath (at least the upper ones) 1. *T. edwardsiana*.
 2. Leaf blade narrower than the sheath or about as broad (3)
 - 3(2). Sepals eglandular-pubescent throughout or glabrous, or merely eglandular-barbate at the tips (4)
 3. Sepals glandular-puberulent (at least in part), rarely glabrate (7)
 - 4(3). Sepals glabrous or only the tips eglandular-barbate 5. *T. ohioensis*.
 4. Sepals more or less pubescent generally (5)
 - 5(4). Bracts conspicuously saccate, the blades greatly reduced, densely and minutely velutinous 4. *T. gigantea*.
 5. Bracts not conspicuously saccate, the blades well-developed, glabrous to more or less pilose (6)
 - 6(5). Stems 12-49 cm. tall, more or less pilose or hirsute, infrequently glabrate; leaves relatively firm in texture, usually edged with purple; sepals relatively firm, dull-green to more or less florid (particularly after anthesis), scarcely inflated 2. *T. hirsutiflora*.
 6. Stems 2-7 cm. tall in bloom, as tall as 30 cm. in fruit, pilose to villous; leaves relatively firm in texture, usually edged with pink or purple; sepals somewhat petalaceous, usually strikingly florid, occasionally pale-green, not inflated 3. *T. Tharpii*.
 - 7(3). Sepals glandular-pubescent throughout or with a few eglandular hairs at the tips, rarely glabrate (8)
 7. Sepals with both glandular and eglandular hairs interspersed (9)
 - 8(7). Plants glaucous; stems branching; funicular scar about as long as the seed 10. *T. occidentalis*.
 8. Plants subglaucous; stems simple; funicular scar much shorter than the seed 11. *T. Wrightii*.
 - 9(7). Plants erect or ascending; stems simple or branching infrequently; roots relatively long and slender (10)
 9. Plants more or less diffuse and spreading; stems much-branched; roots fleshy and somewhat tuberoid (at least in part) (11)
 - 10(9). Stems spreading-pubescent, infrequently glabrate; roots relatively slender, glabrate or only slightly grayish-puberulent 2. *T. hirsutiflora*.
 10. Stems densely arachnoid-villous; roots rather stout and fleshy, densely ferruginous-tomentose 6. *T. Reverchonii*.

- 11(9). Stems minutely puberulent to subglabrous; leaves stiff and usually somewhat crisped 7. *T. humilis*.
11. Stems densely pubescent to arachnoid-pilose; leaves relatively flaccid and lax (12)
- 12(11). Pedicels and sepals with glandular and eglandular hairs interspersed; pedicels 20-30 mm. long 8. *T. subacaulis*.
12. Pedicels and sepals densely covered with long glandular hairs; pedicels 25-45 mm. long 9. *T. pedicellata*.

1. *Tradescantia edwardsiana* Tharp. Roots long and slender, relatively fleshy, very inconspicuously and irregularly pilose; stems erect or ascending, relatively stout, straight, not flexuose, densely and minutely puberulent to glabrate; nodes 3 to 6; internodes to 11 cm. long; leaves relatively firm, somewhat subsucculent and crisp, light-green, not glaucous or subglaucous, the anastomosing secondary veins not evident in desiccation, elliptic-lanceolate, acuminate, gradually constricted into the sheath, 7-30 cm. long, 15-45 mm. broad, minutely puberulent to essentially glabrate, the sheath to 3 cm. long and 2 cm. broad; cymes umbellate, few- to several-flowered, terminal, usually also lateral at the upper nodes, the lateral inflorescences with a definite peduncle; bracts foliaceous, 4-18 cm. long, to 35 mm. broad, widely spreading; pedicels 1.5-3 cm. long, reflexed and somewhat accrescent in fruit, green, minutely and densely puberulent; sepals elliptic, acuminate, 6-9 mm. long, green, not inflated, glandular-puberulent; petals broadly ovate, 1-1.2 cm. long, white to pale-mauve, rarely bright-pink; filaments abundantly pilose, the connective broadly trapezoid; ovary ovoid, glandular-puberulent; capsules obovoid-trigonal, 8-10 mm. long; seeds 3-4 mm. long, roughly compressed-oblongoid, the linear funicular scar about as long as the seed. Rich woods and along moist alluvial terraces and ravines, s.-cen. Tex., Feb.-May; endemic.

2. *Tradescantia hirsutiflora* Bush. Roots relatively long, somewhat fleshy, inconspicuously and irregularly pilose to glabrate; stems erect or ascending, straight or very slightly flexuose, more or less spreading-pilose or hirsute, infrequently glabrate; nodes 2 to 5; internodes to 21 cm. long; leaves firmly membranaceous, deep-green to somewhat subglaucous, linear-lanceolate, long-acuminate, 14-32 cm. long, to 2 cm. broad, scatteringly pilose, infrequently glabrate or glabrous; sheath rather turgid and inflated, to 2 cm. long and broad; cymes umbellate, few- to many-flowered, terminal, solitary or accompanied by lateral pedunculate inflorescences at the upper nodes; bracts foliaceous, widely spreading or divaricate, to 16 cm. long and 14 mm. broad, scatteringly pilose to glabrate or glabrous; pedicels 1.5-3 cm. long, pilose or very rarely glabrate, more or less reflexed and accrescent after maturity; sepals broadly elliptic, acute to acuminate, 7-13 mm. long, dull-green, not infrequently somewhat suffused or edged with rose, not inflated, pubescent with eglandular or glandular and eglandular hairs interspersed; petals broadly ovate, 12-18 mm. long, bright-blue, rarely pink; filaments abundantly pilose, the connective broadly trapezoid; ovary ovoid, pubescent with eglandular or glandular and eglandular hairs interspersed, rarely glabrate; capsules obovoid-oblongoid, 5-7 mm. long; seeds roughly compressed-oblongoid, 2-3 mm. long, the linear funicular scar about as long as the seed. In sandy soil in prairies and open woods and on banks in e. half of Tex., Mar.-June; from w. Fla., Tex., adj. Ark. and e. Okla.

3. *Tradescantia Tharpia* Anders. & Woods. Roots short and fleshy as well as slender and fibrous, glabrate; stems erect, straight, rarely branching, shaggy pilose to villous; nodes 1 or 2; internodes to 9 cm. long; leaves firmly membranaceous, green, not glaucous, the margins frequently hyaline or edged with rose, linear-lanceolate, long-acuminate, 14-30 cm. long, to 25 mm. broad, laxly and irregularly pilose or villous, widely spreading, the sheath to 15 mm. long and 3 cm. broad, usually imbricated at the base of the stem; cymes umbellate, multiflorous, terminal, solitary; bracts foliaceous, to 26 cm. long and 25 mm. broad, widely spreading; pedicels very slender, 4-6 cm. long, laxly pilose, more or less purple or rose-colored, rarely pale-green, after flowering reflexed and somewhat accrescent; sepals broadly elliptic, acute to acuminate, 12-16 mm. long, uniformly eglandular-pilose, somewhat petalaceous, purple or rose-colored, rarely pale-green, not inflated; petals broadly ovate, 18-22 mm. long, deep-rose or purple, not infrequently blue; filaments abundantly pilose, the connective broadly trapezoid; ovary ovoid, uniformly eglandular-pubescent, rarely glabrous; capsules obovoid-trigonal, 5-7 mm. long; seeds

roughly compressed-oblongoid, 2-3 mm. long, the linear funicular scar about as long as the seed. In clay soils of rocky prairies and open woodlands in n.-cen. Tex., Mar.-Apr.; from s.w. Mo. and adj. Kan. to Tex. and e. Okla.

4. *Tradescantia gigantea* Rose. Roots relatively thick and fleshy, irregularly pilose to glabrate; stems erect or ascending, straight, branching rather infrequently, densely and minutely eglandular-puberulent above, glabrate below; nodes 3 to 5; internodes 4-16 cm. long; leaves firmly membranaceous, glaucous, linear-lanceolate, long-acuminate, 10-35 cm. long, to 25 mm. broad, glabrous or the uppermost not infrequently densely and minutely velutinous and pouched as in the bracts; sheath rather turgid and inflated, to 25 mm. long and 3 cm. broad; cymes umbellate, few- to many-flowered, terminal, solitary or axillary at the upper nodes; bracts conspicuously saccate, greatly reduced, more or less foliaceous, to 1 dm. long and 2 cm. broad, minutely and densely velutinous, sharply reflexed or divaricate; pedicels 12-25 mm. long, densely and minutely eglandular-velutinous, more or less reflexed and accrescent in fruit; sepals broadly elliptic, acute, to 11 mm. long, densely and minutely eglandular-velutinous as in the bracts and pedicels; petals broadly obovate, rounded to broadly obtuse, 15-18 mm. long, bright-magenta-pink to blue; filaments abundantly pilose, the connective broadly trapezoid; ovary ovoid, uniformly and minutely eglandular-velutinous as in the sepals; capsules 6-7 mm. long; seeds roughly compressed-oblongoid, 2-3 mm. long, the linear funicular scar about as long as the seed. In limestone soils and pasturelands in cen. Tex., Mar.-May; endemic.

5. *Tradescantia ohioensis* Raf. Roots relatively slender, somewhat fleshy, irregularly pilose to glabrate; stems erect or ascending, straight or slightly flexuose, glabrous, glaucous and subsucculent; nodes 3 to 8; internodes to 18 cm. long; leaves firmly membranaceous, glaucous, linear-lanceolate, long-acuminate, to 45 cm. long and 45 mm. broad, glabrous or infrequently more or less pilose at the sheath; sheath rather turgid and inflated, to 4 cm. long and 45 mm. broad; cymes umbellate, few- to many-flowered, terminal, solitary, frequently accompanied at the upper nodes by lateral pedunculate inflorescences; bracts foliaceous, glaucous, glabrous or minutely barbate at the tips, to 25 cm. long and 22 mm. broad, sharply reflexed or divaricate; pedicels to 25 mm. long, glabrous, more or less reflexed and somewhat accrescent in fruit; sepals elliptic, acute to acuminate, to 15 mm. long, glaucous, infrequently somewhat suffused with rose or purple, glabrous or more or less eglandular-barbate at the tips; petals broadly ovate, to 2 cm. long, blue to rose or magenta, rarely white; filaments abundantly pilose, the connective broadly trapezoid; ovary ovoid, glabrous or with a tuft of weak eglandular hairs at the base of the style; capsules obovoid-trigonal, 4-6 mm. long; seeds roughly compressed-oblongoid, 2-3 mm. long, the linear funicular scar about as long as the seed. *T. canaliculata* Raf., *T. reflexa* Raf. In meadows, prairies and thickets, less frequently in woods, commonly spreading to roadsides and railroad right-of-ways in e. two thirds of Tex., Feb.-May; from s. N.E. to Fla., and w. to Minn. and Tex.

The most common and widespread species in the U.S. where it is frequently cultivated and escapes to become naturalized.

6. *Tradescantia Reverchonii* Bush. Roots rather stout and fleshy, densely ferruginous-tomentose; stems erect or ascending, straight or very slightly flexuose, simple or branching infrequently, densely arachnoid-villous, rarely glabrate; nodes 3 to 6; internodes to 3 dm. long, the uppermost usually much-abbreviated; leaves firmly membranaceous, deep green to somewhat subglaucous, linear-lanceolate, long-acuminate, 10-35 cm. long, to 28 mm. broad, arachnoid-villous; sheath to 35 mm. long and 3 cm. broad; cymes umbellate, few- to several-flowered, terminal, solitary or infrequently accompanied by lateral pedunculate inflorescences at the upper nodes; bracts foliaceous, somewhat saccate, widely divaricate, to 7 cm. long and 14 mm. broad, arachnoid-villous as in the leaves; pedicels 15-23 mm. long, pilose or villous, more or less reflexed and accrescent in fruit; sepals broadly elliptic, acute to acuminate, 9-12 mm. long, dull-green, frequently somewhat suffused or edged with rose or purple, not inflated, pubescent with glandular and eglandular hairs interspersed; petals broadly ovate, 15-18 mm. long, bright-blue, rarely white; filaments abundantly pilose, the connective broadly trapezoid; ovary ovoid, pubescent with glandular and eglandular hairs interspersed; capsules obovoid-trigonal, 6-8 mm. long; seeds roughly compressed-oblongoid, 3-4 mm. long, the linear funicular scar about as long as the seed. In rocky open woods and sandy soils in e. half of Tex., Mar.-July; also w. La.

7. *Tradescantia humilis* Rose. Roots stout and fleshy, commonly tuberoid, accompanied by slender roots in varying quantity, irregularly pilose to glabrate; stems more or less diffuse and spreading, much-branched (particularly at the base), densely and minutely puberulent or scabridulous to glabrate; nodes 2 to 7; internodes to 12 cm. long; leaves firmly membranaceous, deep-green or paler and somewhat subglaucous, minutely puberulent or scabridulous to glabrate, to 2 dm. long and 2 cm. broad, rather stiff and somewhat recurved to falcate, the margins usually more or less crisped and tinged with rose or purple; sheath to 15 mm. long and 22 mm. broad; cymes umbellate, few- to many-flowered, terminal, solitary or more frequently accompanied by lateral pedunculate inflorescences at the upper nodes; bracts foliaceous, more or less recurved and crisped as in the leaves, minutely puberulent or scabridulous to glabrate, to 15 cm. long, and 15 mm. broad; pedicels 15-25 mm. long, mixed-puberulent or -pilose, sharply spreading and slightly accrescent in fruit; sepals broadly elliptic, acute to acuminate, dull-green, occasionally somewhat edged or suffused with purple, 9-11 mm. long, pubescent with glandular and eglandular hairs interspersed; petals broadly ovate, 11-19 mm. long, bright-blue, occasionally pink; ovary ovoid, pubescent with glandular and eglandular hairs as on the sepals, rarely glabrate; capsules obovoid-oblongoid, 6-7 mm. long; seeds roughly compressed-oblongoid, 2-3 mm. long, the linear funicular scar about as long as the seed. In sandy and rocky soil in e. half of Tex., Mar.-June; endemic.

8. *Tradescantia subcaulis* Bush. Roots stout and fleshy, usually somewhat short and tuberoid toward the distal end and there more or less ferruginous-tomentose, slender roots also present in varying quantity; stems more or less diffuse and spreading, much-branched, densely arachnoid-villous, rarely nearly glabrate; nodes 1 to 3; internodes to 11 cm. long; leaves firmly membranaceous, deep-green, more or less arachnoid-villous as on the stems, linear-lanceolate, long-acuminate, 10-18 cm. long, to 15 mm. broad, relatively lax and flaccid; sheath 4-8 mm. long, to 14 mm. broad; cymes umbellate, few- to several-flowered, terminal, solitary or accompanied by lateral pedunculate inflorescences at the upper nodes; bracts foliaceous, rather lax and flaccid as the leaves, arachnoid-villous, to 11 cm. long and 2 cm. broad; pedicels 2-3 cm. long, mixed-puberulent or -pilose, sharply spreading and somewhat accrescent in fruit; sepals broadly elliptic, acute to acuminate, 7-8 mm. long, dull-green or occasionally somewhat petalaceous and more or less suffused with rose or purple, pubescent with glandular and eglandular hairs interspersed; petals broadly ovate, 13-14 mm. long, bright-blue; ovary ovoid, pubescent with glandular and eglandular hairs interspersed; capsules obovoid-trigonal, 5-6 mm. long; seeds roughly compressed-oblongoid, 2-3 mm. long, the linear funicular scar about as long as the seed. In sandy soil in s.e.-cen. Tex., Mai.-June; endemic.

9. *Tradescantia pedicellata* Celarier. Roots large and fleshy, usually interspersed with tuberosities and slender roots in varying amounts; stems more or less diffuse and spreading, much-branched (mostly from base), densely covered with short to long glandular or eglandular hairs or both types interspersed; nodes 2 to 5; internodes to 1 dm. long; leaves membranaceous, dark-green to light-yellowish-green, the veins quite pronounced in lighter colored individuals, linear-lanceolate, mostly 2-3 dm. long, to 1 cm. broad, recurved and somewhat lax, sparsely to densely covered with short and long hairs that are glandular, eglandular or both and mostly restricted to lower surface and margins; cymes umbellate, few- to many-flowered, terminal and usually accompanied by lateral pedunculate inflorescences; bracts foliaceous, somewhat recurved and lax as in the leaves, one of the pair usually much longer than the other, to 15 cm. long, 3-6 mm. broad, sparsely to densely covered with glandular or eglandular hairs or (more frequently) the two types interspersed; pedicels very long and slender, 25-45 mm. long, densely pubescent with medium to long glandular hairs; sepals broadly elliptic, acute to acuminate, 6-11 mm. long, densely and uniformly covered with medium to long glandular hairs, not inflated; petals broadly ovate, pink to dark-blue; filaments abundantly pilose, the connective broadly trapezoid; ovary ovoid, the terminal one third of ovary with scattered glandular hairs, terminating with a dense tuft at base of style; seeds compressed-oblongoid, 2-4 mm. long, the linear funicular scar about as long as the seed. Rocky soil in the Edwards Plateau of cen. Tex.; endemic.

This plant may possibly have originated from a cross between *T. occidentalis* and *T. humilis*.

10. *Tradescantia occidentalis* (Britt.) Smyth. Roots rather stout and fleshy, usually accompanied by slender fibrous roots in varying quantity, irregularly pilose to glabrate; stems erect or ascending, straight, more or less branching, glabrous, glaucous and somewhat subsucculent; nodes 2 to 6; internodes to 25 cm. long; leaves firmly membranaceous, glaucous, entirely glabrous, linear-lanceolate, long-acuminate, to 5 dm. long and 2 cm. broad, stiff and widely divaricate or falcate; sheath rather turgid and inflated, to 3 cm. long and 35 mm. broad; cymes umbellate, few- to many-flowered, terminal, solitary, usually accompanied by one or more lateral pedunculate inflorescences at the upper nodes; bracts foliaceous, glabrous, glaucous, sharply reflexed or divaricate, to 21 cm. long and 2 cm. broad; pedicels 1-2 cm. long, glandular-puberulent, reflexed and somewhat accrescent in fruit; sepals elliptic, acute to acuminate, 4-10 mm. long, glaucous or somewhat suffused with rose or purple, uniformly glandular-puberulent, very rarely with a terminal barb of weak eglandular hairs (in hybrid specimens); petals broadly ovate, 7-16 mm. long, bright-blue to rose and magenta; filaments abundantly pilose, the connective broadly trapezoid; ovary ovoid, glandular-puberulent, very rarely glabrate or glabrous; capsules oblongoid-trigonal, 4-7 mm. long; seeds roughly compressed-oblongoid, 2-4 mm. long, the linear funicular scar about as long as the seed. In prairies and plains, mostly in sandy or rocky soils throughout Tex., Mar.-July; mainly from N.D. to Tex., w. to Mont. and Ariz.

11. *Tradescantia Wrightii* Rose & Bush. Roots relatively slender, somewhat fleshy, irregularly and inconspicuously pilose to glabrate; stems erect or ascending, straight, simple, glabrous, glaucous or glaucescent, somewhat subsucculent; nodes 1 to 3; internodes to 15 cm. long; leaves firmly membranaceous or somewhat subsucculent, glabrous, glaucous or glaucescent, linear-lanceolate, long-acuminate, to 1 dm. long and 2-5 mm. broad, spreading or ascending; sheath 1-2 cm. long, to 1 cm. broad; cymes umbellate, few- to several-flowered, terminal, solitary; bracts foliaceous, glabrous, glaucous or glaucescent, spreading or ascending, to 7 cm. long, 3-6 mm. broad; pedicels 12-17 mm. long, glabrous or rarely with a very few glandular hairs, reflexed and somewhat accrescent in fruit; sepals elliptic, acute to acuminate, 5-6 mm. long, glaucous or glaucescent, glabrous or rarely with a few glandular hairs at the base; petals broadly ovate, about 1 cm. long, rose to magenta and purple; filaments abundantly pilose, the connective broadly trapezoid; ovary ovoid, glabrous or rarely with a very few glandular hairs at the base of the style; capsules obovoid-trigonal, 3-4 mm. long; seeds broadly compressed-oblongoid to oblongoid-trigonal, about 2 mm. long, the linear funicular scar much shorter than the seed. On moist canyon stream-banks in the Trans-Pecos, May-Sept.; endemic.

12. *Tradescantia micrantha* Torr. Roots slender and fibrous, glabrate or very minutely puberulent; stems creeping or trailing, branching rather frequently, rooting at the nodes (at least in part), somewhat fleshy and subsucculent, glabrous, nodes 3 to 10; internodes to 5 cm. long; leaves somewhat subsucculent, deep-green, oblong-elliptic, acute to acuminate, to 35 mm. long and 3-8 mm. broad, sharply spreading or slightly falcate, the margins ciliate, otherwise glabrous or essentially so; sheath 2-4 mm. long, 2-5 mm. broad, papery, more or less pilosulous or scabridulous; cymes umbellate, few- to several-flowered, terminal, solitary; bracts foliaceous, similar to the leaves, to 17 mm. long, 4-7 mm. broad; pedicels 8-12 mm. long, very slender, glabrous or essentially so, spreading and slightly accrescent in fruit; sepals ovate-lanceolate, acuminate, 4-5 mm. long, hyaline, keeled, minutely scabridulous; petals ovate, 5-7 mm. long, bright-rose or pink; ovary ovoid, glabrous; filaments rather sparsely pilose, the connective trapezoid; capsules about 2 mm. long; seed oblong, compressed, grayish, strongly transversely corrugated, about 1.5 mm. long, the linear funicular scar about a third as long as seed. In sandy or clayey soils in open oak or mesquite woods and prairies in s. coastal Tex., May-Sept.; endemic.

5. CALLISIA L.

About 12 species in temperate and tropical America.

1. *Callisia repens* L. Creeping or ascending often delicate herb; stems slender, glabrous; leaves cordate-ovate, 15-35 mm. long, to 13 mm. wide, acuminate at apex, clasping at base, sometimes purplish, the margins ciliate; flowers small, in axillary glomerules, scarcely exerted from the leaf sheaths; sepals 3, linear-oblong to linear-lanceolate, some-

what falcate, 3-4 mm. long, about 0.8 mm. wide, dorsally pilose, persistent; petals 3, white, oblong, shorter than the sepals; stamens at least 3; filaments glabrous; ovary oblong-ellipsoid, pilose at the apex; style filiform, glabrous; stigma penicillate; capsule oblong, 1.5 mm. long, valvate, membranous, 2- or 3-valved, compressed; seeds dark-brown, wrinkled, about 1 mm. long and 0.8 mm. broad. On rocky and in gravelly often moist soil in shade, in s. Tex., flowering in early spring; also throughout the W.I. and cont. trop. Am.

6. ANEILEMA R. BR.

About 100 species, mostly in warm regions in the Old World.

1. *Aneilema nudiflorum* (L.) Kunth. Herbs with diffuse often creeping stems and branches, 1-3 dm. tall; leaves linear to linear-lanceolate, acuminate, 3-11 cm. long, ciliate at the base; cymes long-peduncled, subtended by involucre of leaflike bracts; perianth regular; petals blue or purplish, 5-8 mm. long; stamens 3; capsule borne in a spathe, oval to globular, 4-5 mm. long, minutely beaked. Roadsides, woods and groves on the Coastal Plain of s. Tex., summer-fall; from Fla. to Ga. and Tex.

FAM. 36. PONTEDERIACEAE H.B.K.

PICKEREL-WEED FAMILY

Perennial aquatic of bog plants with floating or creeping rootstocks and sheathing leaves; leaves alternate, straplike or differentiated into petiole and blade; inflorescence axillary from the stem or rootstock, from a spathe; flowers solitary or in several- to many-flowered spikes or panicles, perfect, more or less irregular; perianth salverform or funnel-form, the tube mostly well-developed, free from the ovary, the 6 lobes similarly colored; stamens 3 or 6, inserted in throat of perianth, mostly unequal or dissimilar, the anthers introrse; style 1; stigma 3-lobed or 6-toothed; ovary superior; fruit a perfect or incompletely 3-celled many-seeded capsule or a 1-seeded utricle; seeds ribbed.

About 30 species in a half dozen genera in temperate and tropical regions.

1. Stamens 6; perianth funnel-form (2)

1. Stamens 3; perianth salverform (3)

2(1). Plants typically free-floating; fruit a many-seeded dehiscent capsule 1. *Eichhornia*, p. 366.

2. Plants rooted in mud; fruit a 1-seeded utricle 2. *Pontederia*, p. 367.

3(1). Perianth regular or nearly so; style usually stout, about as long as or shorter than the short stamens 3. *Heteranthera*, p. 367.

3. Perianth markedly zygomorphic; style slender, almost as long as the long stamen ... 4. *Eurystemon*, p. 368.

1. EICHHORNIA KUNTH

WATER-HYACINTH

Floating aquatic herbs, rooting at nodes; aerial leaves broad, the petiole usually spongy-inflated; inflorescence pedunculate, spicate to paniculate, from a spathe, the spathe subtended by a sheath that often has a small dilated blade; perianth funnel-form, slightly 2-lipped; stamens 6, the 3 upper all included, the 3 lower more exserted; anthers oblong, basifixed; ovary 3-celled; capsule membranaceous, many-seeded. Also spelled *Eichornia*.

About six species in the tropics and warm temperate regions of America and Africa.

1. Petioles inflated at the base; plants with a short naked stem bearing new plants at the nodes; peduncle below the flowers exserted from the spathe; perianth lobes entire 1. *E. crassipes*.

1. Petioles not inflated; plants with a continually growing stem, bearing leaves for its entire length; peduncle below the flowers included in the spathe; perianth lobes marginally erose 2. *E. azurea*.

1. *Eichhornia crassipes* (Mart.) Solms. Leaf blade suborbicular to broadly elliptic, to 1 dm. long; flowers showy, light-blue to bluish-purple, 4-6 cm. long and broad. *Piaropus crassipes* (Mart.) Britt. Ponds, streams and ditches in s. and e. Tex., Apr.-July; from Va. s. to Fla., w. to Mo. and Tex.; also Mex., W.I., C.A. and S.A. A beautiful, noxious weed!

2. *Eichhornia azurea* (Sw.) Kunth. Except for the uninflated petioles and cross-margined perianth lobes, this species is quite similar in habit to *E. crassipes*. It also grows in the same kind of habitats. Rather widespread in Latin Am., apparently introd. in s. Tex., July.

2. PONTEDERIA L. PICKEREL-WEED

Stout herbs with thick creeping rhizomes rooted in mud; leaves erect, long-petioled, with a sheathing stipule within the petiole; leaf blades variable, broad or narrow; inflorescence an erect spike of violet-blue ephemeral flowers from a sheathing spathe, with a solitary leaf on the flowering stem; perianth funnellform, 2-lipped, the tube revolute-coiled after flowering; stamens 6, the 3 upper unequally inserted, the 3 lower long-exserted; anther elliptic, blue, versatile; ovary 3-celled; fruit a 1-seeded utricle.

About 6 species in warm regions of the western hemisphere.

- 1. Perianth villous in bud, becoming glabrate with age, rarely sparsely glandular 1. *P. cordata* var. *cordata*.
- 1. Perianth persistently pubescent with short glandular hairs 1. *P. cordata* var. *lanceolata*.

1. *Pontederia cordata* L. var. *cordata*. Stem up to 1 m. tall; leaf blades varying from deltoid-ovate to triangular-lanceolate, prominently and deeply cordate to truncate or rarely narrowed at base, to 2 dm. long; spike to 15 cm. long. In marshes and ditches in shallow water of e. Tex., June-Sept.; P.E.I. and N.S., s. to Fla., w. to Mo., Okla. and Tex.

Var. *lanceolata* (Nutt.) Griseb. Similar to var. *cordata* in habit and habitat; leaf blade usually somewhat firmer than in that variety. *P. lanceolata* Nutt. Fla. w. to e. Tex., locally n. to Del.

3. HETERANTHERA R. & P. MUD-PLANTAIN

Herbs submersed, floating or rooted in mud, forming a rosette or with elongate simple or branched stems; leaves sessile or petiolate; leaf blades straplike to ovate or lanceolate to reniform, leathery to thin and pellucid; flowers solitary or several in a spike, from a spathe that arises from the sheathing side of a petiole or in the axils of leaves; perianth salverform, the limb more or less equally 6-parted, ephemeral; stamens 3, equal or unequal; anthers ovate to sagittate, basifixed; capsule 1- or incompletely 3-celled by intrusion of the placentae, many-seeded.

About a dozen species in America and Africa, mostly tropical.

- 1. Leaves sessile, linear, grasslike, pellucid; spathe sessile in axils of leaves; stamens all alike; anthers coiled with age (2)
- 1. Leaves petiolate, with an expanded thickish blade; spathe peduncled; stamens dimorphic; anthers not coiled (3)
- 2(1). Perianth tube much less than twice as long as the spathe; seeds ellipsoid, yellow-brown, the 10 to 12 membranaceous wings evanescent 1. *H. dubia*.
- 2. Perianth tube twice as long as the spathe or longer; seeds nearly globose, black-brown, the 14 to 16 wings persistent 2. *H. Liebmannii*.
- 3(1). Spathe 1-flowered; leaf blade ovate to elliptic or elliptic-lanceolate 3. *H. limosa*.
- 3. Spathe 3- to 10-flowered; leaf blade round-reniform . . . 4. *H. reniformis*.

1. *Heteranthera dubia* (Jacq.) MacM. Plants submersed, the small yellow flowers usually expanded on the water surface; leaves to 15 cm. long; spathe to 5 cm. long; perianth tube to 7 cm. long. *Zosterella dubia* (Jacq.) Small. Streams and quiet waters in s. and s.-cen. Tex., Apr.-June; Fla., w. to Tex. and Mex., n. to Que. and Ont., w. to Ore.

2. *Heteranthera Liebmannii* (Buch.) Shinners. Plant similar in habit and habitat to *H. dubia*; spathe to 6 cm. long; perianth tube to 12 cm. long. *Zosterella longituba* Alex. On mud or floating in ponds and ditches in s. and w. Tex., Apr.-July; Tex. and Ala., s. to Mex. and W.I.

This species is more abundant in Texas than the closely allied *H. dubia*.

3. *Heteranthera limosa* (Sw.) Willd. Plants rooted in mud to form rosettes, also represented by another distinct form with an elongated creeping stem that roots at the nodes; leaf blade to 1 dm. long, usually much shorter; spathe conspicuously peduncled; flowers white to purplish-blue. Ponds, tanks and in wet soil of low woods in s., cen. and w. Tex., rare in e. Tex., May-Oct.; Fla., w. to N.M. and Mex., n. to Minn., Neb. and Colo.; also trop. Am.

What we consider to be two forms of this species, as noted above, might prove to be distinct entities with further study.

4. *Heteranthera reniformis* R. & P. Plants creeping in mud or floating in shallow water; leaf blades to 3 cm. long and 5 cm. wide; spathe short-peduncled; flowers white or pale-blue. *H. peduncularis* Benth. In streams in w. to s.e. Tex., Aug.-Sept.; Fla., w. to Tex. and Mex., n. to Conn., Ill. and Neb.

4. EURYSTEMON ALEX.

A monotypic genus.

1. *Eurystemon mexicanum* (Wats.) Alex. Erect herb rooted in mud, to 4 dm. tall, noticeably glandular-pubescent above; leaves sessile, sheathing the stem, to 15 cm. long, straplike; flowers about 12 in an open spike that appears to be terminal, pale-blue to indigo-blue, from a spreading foliaceous spathe; perianth salverform, the limb conspicuously zygomorphic; stamens 3, strikingly dissimilar; anthers basifixed, anther on longest filament bluish and much larger than those on the two short inflated filaments; capsule 3-celled, many-seeded. *Heteranthera mexicana* Wats. In ditches and about ponds in s. and n.w. Tex., June-Aug.; also n. Mex.

FAM. 37. JUNCACEAE JUSS.

RUSH FAMILY

Annual or perennial grasslike or sedgelike herbs, usually growing in wet places; leaves (like those of Cyperaceae and Gramineae) definitely formed into a lower sheath and an upper blade or the latter reduced in some species; inflorescence a terminal (or in a few species apparently lateral) flaring panicle either of individual flowers subtended by pairs of scalelike bracts or usually of glomerules or heads of flowers, the flowers of the heads being subtended by 3 or only a single scalelike bract or occasionally the inflorescence reduced to only a single glomerule or head; perianth of 6 separate scales in 2 series, an outer whorl of 3 (sepals) and an inner whorl of 3 (petals), these all usually of about the same scalelike chartaceous to hyaline texture, narrowly ovate to lanceolate or subulate, usually sharply acute; stamens 3 or 6, when 3 then opposite the sepals (at the corners of the capsule); filaments basally united into a minute flange around (but free from) the ovary; carpels 3; styles 3; placentas 3; ovary superior, 1- to 3-locular; placentas axile or by reduction of the septa more or less parietal; capsules loculicidal; ovules and seeds minute, 3 to many.

A family of about 9 genera and 400 species very widely distributed but not as common in the tropics as in cool, wet climates.

1. Seeds numerous1. *Juncus*, p. 369.
 1. Seeds 32. *Luzula*, p. 377.

1. JUNCUS L. RUSH. BOG-RUSH

Characters of the family but seeds numerous, never only 3. Rushes and sedges (Cyperaceae) are often confused by those who do not take the trouble to look at the flowers, which are diagnostic. The certain identification of any species (of sedge or rush) requires mature or nearly mature fruit and usually the examination of it under a strong lens.

A cosmopolitan genus of perhaps 300 species. Rushes have some forage value, but are nowhere abundant enough to be of great economic importance.

1. Inflorescence pseudolateral, the stem apparently continuing beyond it (2)
1. Inflorescence terminal or both terminal and lateral, with either long or short leafy bracts (6)
- 2(1). Flowers in glomerules of 2 to 5 flowers, each glomerule subtended by as many bracteoles as there are flowers, or an occasional flower also with an extra bracteole at the base of the perianth 10. *J. Roemerianus*.
2. Flowers mostly solitary, most of them obviously subtended by a pair of bracteoles in addition to the bracteole at the floriferous node (3)
- 3(2). Rhizomes much-branched, forming extensive mats in the mud; stamens 6, the anthers about 4 times as long as the filaments; capsule narrowly ovoid, acute (4)
3. Rhizome (if present) very short and not extensively creeping or branching, the plants thus essentially tufted; stamens 3, the anthers about equaling the filaments; capsules obovoid and obtuse or nearly spherical (5)
- 4(3). Culms essentially terete, 1-2.5 mm. thick basally, not twisted; bract 3 to 8 times as long as the inflorescence 6. *J. balticus*.
4. Culms compressed, 2-3 mm. thick basally, often twisted; bract 2 or 3 times as long as the inflorescence 7. *J. mexicanus*.
- 5(3). Capsules obovoid, obtuse or even depressed apically; flowers numerous, 30 to 100 per panicle; upper sheaths bladeless 8. *J. effusus*.
5. Capsules nearly spherical or slightly ovoid, apically turgid; flowers few, 2 to 25 per panicle; upper sheaths bearing blades 9. *J. coriaceus*.
- 6(1). Individual flowers with a pair of bractlets in addition to the bractlet at the base of the pedicel (7)
6. Individual flower with only one bractlet at the base of the very short pedicel (11)
- 7(6). Annual 5-30 cm. tall; culms floriferous more than a fourth the length, usually more than a third the length; leaf sheaths not auricled nor prolonged terminally .
..... 5. *J. bufonius*.
7. Perennials 8-125 cm. tall; culms floriferous less than half the length; leaf sheaths auricled and/or prolonged (8)
- 8(7). Leaf auricles scarious or broadly scarious-margined, 1-2.5 mm. long, prolonged, distinctly longer than broad; plant 8-45 cm. tall ... 1. *J. tenuis*.
8. Leaf auricles membranous or subcoriaceous, white to brown, 0.3-1 mm. long, not prolonged; plants 20-125 cm. tall (9)
- 9(8). Leaf blades strongly involute, appearing channeled on the ventral side; bractlets acute or acuminate; inflorescence diffuse 4. *J. dichotomus*.
9. Leaf blades flat or involute; bractlets obtuse or acute; inflorescence crowded (10)
- 10(9). Perianth 4-5 mm. long; some flowers solitary, some in heads
..... 3. *J. Dudleyi*.
10. Perianth 3.3-4.2 mm. long; flowers solitary (though inflorescence crowded, none of the flowers in true heads) 2. *J. interior*.
- 11(6). Leaf blades not septate (i.e., not nodulose), i.e., cross-partitions not palpable nor tangible when finger is run along the blade (included here is *J. saximontanus* with incomplete partitions; see also *J. polycephalus*) (12)
11. Leaf blades septate, nodulose or cross-partitioned (16)

- 12(11). Anthers 6; blades with inconspicuous incomplete septa; plants of higher elevations, Trans-Pecos Texas15. *J. saximontanus*.
12. Anthers 3; blades nonseptate entirely (13)
- 13(12). Tufted annual; culms mostly less than 10 cm. long; blades about 0.5 mm. broad at the middle14. *J. capitatus*.
13. Perennials; culms mostly more than 10 cm. long; leaves 1-5 mm. broad (14)
- 14(13.) Stems first ascending 5-20 cm., then stoloniform-creeping or floating and greatly elongate; capsule very narrow but obtuse13. *J. repens*.
14. Stems erect or nearly so; capsule obovoid, plump (15)
- 15(14). Perianth 4-5 mm. long, half again as long as the capsule; anthers yellow; largest transverse dimension of the compressed culm 0.5-1 mm.
.....12. *J. filipendulus*.
15. Perianth 2.5-3.5 mm. long, about equaling the capsule; anthers orangish to reddish-brown; culms 1.5-3 mm. broad11. *J. marginatus*.
- 16(11). Seeds caudate, i.e., with tails nearly as long as the body of the seed
.....24. *J. trigonocarpus*.
16. Seeds not caudate (17)
- 17(16). Stamens 6 (18)
17. Stamens 3 (21)
- 18(17). Culms decumbent basally but rhizomes not having tuberlike enlargements; leaves laterally flattened, with one edge toward the stems, with weak usually incomplete septa15. *J. saximontanus*.
18. Culms essentially erect but connected by slender rhizomes which often bear tuberlike enlargements; leaves essentially terete, with usually conspicuous complete septa (19)
- 19(18). Culms 30-100 cm. tall, 2-4 mm. thick; basal bract usually much-exceeding the inflorescence; heads mostly closely crowded, 8-15 mm. thick, 25- to 50-flowered .
.....18. *J. Torreyi*.
19. Culms 5-40 cm. tall (rarely taller in *J. texanus*), 0.7-2 mm. thick; basal bract shorter than to slightly exceeding the inflorescence; heads mostly well-separated, mostly 7-10 mm. thick, 20- to 30-flowered (20)
- 20(19). Inflorescences 2-5 cm. long; capsules slightly exserted, 3 to 4 times as long as broad; anthers a little shorter than their filaments; plants mostly of Trans-Pecos Texas16. *J. nodosus*.
20. Inflorescences at maturity mostly 5-10 cm. long; capsules at maturity subulate-beaked, more than 4 times as long as broad, much-exserted; anthers much longer than their filaments17. *J. texanus*.
- 21(17). Heads nearly spherical when mature, 15- to 100-flowered (22)
21. Heads or glomerules hemispherical or narrower at maturity, 2- to 10-flowered (27)
- 22(21). Capsules 1.5-2.2 mm. long23. *J. brachycarpus*.
22. Capsules longer (23)
- 23(22). Capsules narrowly ovoid, to elliptic-ovoid, 2.5-3.3 mm. long, about equaling the petals but usually shorter than the sepals, apically blunt or bluntly apiculate; sepals and petals paleaceous, drying semirigid27. *J. acuminatus* f.
sphaerocephalus.
23. Capsules usually subulate (at least terminally), usually at least 3.5 mm. long, apically acute; sepals and petals semirigid and subspinescent (24)
- 24(23). Uppermost sheath (not that of the bract of the inflorescence) much longer than its blade22. *J. megacephalus*.
24. Uppermost sheath shorter than its blade (25)
- 25(24). Flowering culms 1-1.5 mm. thick near the middle, arising erect and separately from short whitish rhizomes; leaves few, scattered on the culm, the blades essentially terete and about 1 mm. thick near the middle; sepals 0.5-0.8 mm. broad; petals 0.3-0.5 mm. broad21. *J. sctripoides*.

25. Flowering culms 2-4 mm. thick near the middle, a few ascending in a tuft from a non- or subrhizomatous base; leaves several in a basal cluster and also scattered on the culm, the blades laterally flattened and 3-7 mm. thick in the larger (dorsiventral) dimension; sepals 0.7-1.4 mm. broad; petals 0.5-1 mm. broad (26)
- 26(25). Blades 4-7 mm. thick in the larger dimension, with many weak incomplete septa; leaves and stems greenish, mostly crushed flat in prepared specimens; culms 6-10 mm. thick basally20. *J. polycephalus*.
26. Blades 3-4 (-6) mm. thick in the larger dimension, with several tough complete septa; herbage grayish or olivaceous, mostly tough and resistant to crushing; culms 3-5 mm. thick basally19. *J. validus*.
- 27(21). Capsules at least half again as long as the petals, 4-5.2 mm. long
.....25. *J. diffusissimus*.
27. Capsules 2.2-3.3 mm. long (28)
- 28(27). Sepals 3.3-4 mm. long27. *J. acuminatus*.
28. Sepals 2.2-2.9 mm. long (29)
- 29(28). Glomerules 5 to 35 per inflorescence26. *J. debilis*.
29. Glomerules 40 to 200 per inflorescence (30)
- 30(29). Sepals 2-2.5 mm. long, 0.6-0.8 mm. broad; petals 1.9-2.3 mm. long, 0.4-0.6 mm. broad; capsule golden-brown, 2.3-2.5 mm. long; septa of blades conspicuous
.....28. *J. nodatus*.
30. Sepals 2.6-2.9 mm. long, 0.9-1.1 mm. broad; petals 2.4-2.8 mm. long, 0.6-0.8 mm. broad; capsule dark-golden-brown to fuscous, 2.4-2.9 mm. long; septa of blades inconspicuous29. *J. Elliottii*.

1. *Juncus tenuis* Willd. SLENDER-RUSH. Tufted perennial 8-30 (-45) cm. tall; culms erect, simple, about 1 mm. thick; leaf blades flat, 0.5-0.9 mm. broad, occasionally slightly involute marginally, soft, often almost as long as the culms; aricles of sheaths scarious or broadly scarious-margined, 1-2.5 mm. long on the longer leaves, distinctly prolonged laterally more than centrally; panicle terminal, 3-6 (-9) cm. long, about a fourth or a fifth the total height of the plant, 15 to 25 (to 30) -flowered, with branches 0.15-0.2 mm. thick and ascending; bracts slender, soft, usually much-exceeding the panicle; bracteoles 3 beneath each flower (the lowest opposite the flower on the floriferous node); flowers solitary or occasionally several of them approximate; sepals 3-4 mm. long, greenish-white, long-tapered to the sharp point, soft, spreading in fruit (the almost setaceous tip then often broadly spreading); stamens 6; capsule oblong-ovoid, shorter than to rarely equaling the perianth. Incl. var. *anthelatus* Wieg. Moist sand in woods, e. and s.e. Tex., infrequent, spring, rarely summer; e. temp. N.A., w. to Minn., Ia., Mo., Okla. and Tex.; Euras.; also reputedly in w. N.A., Mex., S.A. and N. Afr.

2. *Juncus interior* Wieg. Tufted perennial 3-8 dm. tall; culms erect, simple, 1.3-2.5 mm. thick (rarely more slender), tough, wiry; leaf blades flat and 1-1.5 mm. broad or usually somewhat involute marginally (making them narrower and more wiry) and prolonged to a sharp involute tip, usually about half as long as the culms; aricles of sheaths firm-membranous, not scarious, whitish to yellowish, rounded, not at all prolonged; panicle 1-4 (-6) cm. long, (3 to) 10 to 25 (to 50) -flowered, more densely flowered than in *J. tenuis*, with branches 0.3-0.5 mm. thick, wiry and ascending; bracts slender, wiry, rather stiffly erect, equaling (or the lowest usually much-exceeding) the panicle, involute-tipped; bracteoles 3 beneath each flower (the lowest opposite the flower at the floriferous node); flowers solitary; sepals 3-5 mm. long, stramineous, long-tapered to the sharp point, firm, stiffly ascending (even at the tip and even in fruit); stamens 6; capsule narrowly oblong-ovoid, about equaling the perianth. Incl. var. *arizonicus* (Wieg.) Herm. and var. *neomexicanus* (Wieg.) Herm., *J. arizonicus* Wieg. and var. *curtiflorus* Wieg., *J. neomexicanus* Wieg. Moist usually calcareous soil, n.-cen. and s.e. Tex., w. portion of e. Tex. and coastal part of Rio Grande Plains, w. through Edwards Plateau, Plains Country and the Trans-Pecos, rather frequent, spring-summer; O. and Mich. s.w. to Tex. and w. to Mont., Colo. and Ariz.; n. Mex.

Some specimens seem intermediate between this species and *J. Dudleyi*, and others between it and *J. dichotomus*, of which *J. interior* is perhaps only a variety.

3. *Juncus Dudleyi* Wieg. Tufted perennial much like *J. interior* but the auricles averaging even firmer; panicle very compact, 1-2 (-3) cm. long, 7- to 25-flowered; flowers approximate in 1 to 3 glomerules but not true heads; sepals 4-5.5 mm. long, very firm to cartilaginous; capsule distinctly shorter than the perianth. *J. tenuis* var. *Dudleyi* (Wieg.) Herm. Moist calcareous soil, n.-cen. Tex., w. part of e. Tex. and Edwards Plateau, rare or scattered, spring-summer; s. Can. s. to Va., Tenn., N.M., Ariz. and Calif.; also n. Mex.

4. *Juncus dichotomus* Ell. Tufted perennial much like *J. interior* but the panicles more diffuse, (3-) 5-10 cm. long. Moist sandy soil, e. (and probably s.e.) Tex., infrequent to rare, apparently grading into *J. interior*, with which it is probably conspecific, spring; Coastal States, Mass. to Tex.; also reputedly Mex.

5. *Juncus bufonius* L. TOAD-RUSH. Tufted annual 4-18 (-30) cm. tall; culms 0.4-0.7 mm. thick, erect, mostly simple, often reddish-tinged; sheaths often swollen basally, thicker than the blades, hyaline-margined; blades involute-filiform, often arcuate especially terminally; panicles a fourth to four fifths the entire height of the plant, of a few ascending usually weak and somewhat arcuate branches (each with a few remote flowers), the subterminal flowers appressed or nearly so; bracteoles 3 beneath each flower, the lowest opposite the minute pedicel; perianth 4-6 (-8) mm. long, the parts erect, sharp-pointed, medially green, marginally broadly white-membranous; stamens 6 or less commonly reduced to 3; capsule turgid-ellipsoid. Moist soil in most of Tex. except extreme Panhandle and Rio Grande Plains, scattered, locally abundant, spring; temp. regions, nearly throughout the world, not nat. with us.

6. *Juncus balticus* Willd. var. *littoralis* Engelm. WIRE RUSH. Perennial from much-branched short rhizomes that form mats in the mud; aerial culms crowded, 3-10 dm. long, 1-2.5 mm. thick, erect, terete, nearly naked but closely beset basally with a few brownish bladeless sheaths which are rounded terminally; panicles appearing as if emerging subterminally from the side of the culm (actually terminal, far-overtopped by the terete pungent bract which is 3 to 8 times as long as the panicle and which appears as a continuation of the culm), of a few usually few-flowered usually drooping unequal branches; bracteoles 3 beneath each flower; perianth parts 3.5-5 mm. long, usually drab or brownish; stamens 6, the anthers about 4 times as long as the filaments; capsule narrowly ovoid, acute, mucronate. Moist soil in river bottoms, extreme n. part of Panhandle, infrequent to rare, spring through June; species widely distributed in cool-temp. areas; var. *littoralis* in much of e. N.A.; *J. mexicanus* below is perhaps conspecific with *J. balticus*.

7. *Juncus mexicanus* R. & S. Almost identical to *J. balticus* but culms compressed and usually twisted, and averaging thicker; bract only 2 to 3 times as long as the panicle. *J. balticus* var. *mexicanus* (R. & S.) O. Ktze. Infrequent to rare in buffalo-wallow lakes in the High Plains Country and formerly near springs in the Trans-Pecos, early summer; Tex. to Calif. and s. to cen. Mex. In Mexico and elsewhere the populations of this species usually show a few blades on the upper sheaths, but our populations do not.

8. *Juncus effusus* L. var. *solutus* Fern. & Wieg. SOFT RUSH. Rhizomes very short, thick, chestnut-color; aerial culms (plus bract) 6-12 dm. long, 2-4 mm. thick, strictly erect, very crowded in thick stands, essentially terete; basal sheaths chestnut-brown, bladeless, 5-15 cm. long, apically rounded; panicles 30- to 100-flowered, appearing as if emerging subterminally from the side of the culm (actually terminal, far-overtopped by the terete pungent bract which is 5 to 10 times as long as the panicle and which appears as a continuation of the culm), of a few densely-flowered much-branched unequal branches; bracteoles 3 beneath each flower; perianth parts 2.7-3.3 mm. long, usually brownish; stamens 3, the anthers about equaling the filaments; capsule obovoid, apically obtuse, truncate or even depressed, about equaling or slightly exceeding the perianth. Moist sandy soil or shallow fresh water, e. and s.e. Tex., locally abundant, spring; the species widely distributed in temp. areas; var. *solutus* in e. temp. N.A.

9. *Juncus coriaceus* Mack. Culms essentially tufted from dark knotty bases, (with bracts) 3-10 dm. long, 1-1.5 mm. thick, often arcuate, crowded or not, essentially terete; sheaths buffy or tawny, the lower bladeless or with setaceous rudiments a few mm. long, the upper with long weak curving blades 1-2 mm. broad and strongly involute, terminally pungent; panicle 2- to 25-flowered, appearing as if emerging from the side of the culm (actually terminal, far-overtopped by the terete or slightly compressed bract which is 3 to 20 times as long as the panicle and which appears as a continuation of the culm), of a few laxly flowered unequal branches; bracteoles 3 beneath each flower;

perianth parts 3-4 mm. long, brownish, firm, ascending (fl.) or spreading (fr.); stamens 3, the anthers about equaling the filaments; capsule nearly spherical or ovoid-spherical, about equaling or slightly exceeding the perianth. Moist sand, e. Tex., summer; Coastal States, N.J. to Tex. and inland to Ky., Ark. and Okla.

10. *Juncus Roemerianus* Scheele. Tufted perennial; culms with bracts 5-15 dm. long, 2-4 mm. thick, erect, simple, essentially terete; sheaths chestnut-color, with long wiry terete pungent erect blades; panicle much-branched and compound, 7-12 cm. long, appearing as if emerging from the sides of the culm (actually terminal, far-overtopped by the terete pungent bract which is about 3 times as long as the inflorescence and which appears as a continuation of the culm), the ultimate branchlets bearing glomerules of 2 to 5 flowers, each glomerule subtended by as many bracteoles as it has flowers or an occasional flower subtended by one additional bracteole; perianth 2.8-3.5 mm. long, brown, the apexes of the parts often slightly spreading; stamens 6, the anthers about 5 times as long as the filaments; capsule obovoid to elliptic-obovoid, apiculate, brown, shining, about equaling or shorter than the perianth. Infrequent in brackish-water ditches and coastal marshes, s.e. Tex., spring; Coastal States, Md. to Tex.

11. *Juncus marginatus* Rostk. Perennial from enlarged, bulblike bases (these often connected by short rhizomes); aerial culms 1 to 3 from each bulb, 15-100 cm. long, compressed, 1.5-3 mm. broad (in largest transverse dimension), leafy, erect or some culms basally shortly decumbent; sheaths much shorter than their internodes, with narrow hyaline margins near the corners; blades flat, soft, membranous, 3-15 cm. long, 2-5 mm. broad, mostly erect or distally decurved-arcuate, abruptly acute; panicles terminal, much-branched and compound, the branches ascending, each of the 10 to 80 ultimate branches bearing a glomerule of 2 to 12 essentially sessile flowers; each glomerule subtended by as many bracteoles as it has flowers or a few more; perianth 2.5-3.5 mm. long, brownish; stamens 3; capsule rotundly obovoid, about equaling the perianth, brown. Incl. var. *paucicapitatus* Engelm. and var. *setosus* Cov., *J. aristulatus* Michx., *J. biflorus* Ell. Moist soil in most of Tex., common in e. half, infrequent to rare in w. part, spring-summer; e. half of temp. N.A., rare w. to Ariz.

12. *Juncus filipendulus* Buckl. Perennial, tufted or from masses of slightly swollen bulbil-like bases; culms 15-30 cm. long, compressed, 0.5-1 mm. broad (in largest transverse dimension), leafy, erect or some of them basally shortly decumbent; sheaths shorter than their internodes; blades flat, soft, membranous, 2-10 cm. long, 1-2.5 mm. broad, mostly ascending; panicle terminal, few-branched, of 2 to 5 (to rarely 10) headlike glomerules or reduced to a single glomerule; glomerules hemispherical, 7-10 mm. across, stramineous, of 6 to 15 essentially sessile flowers, each subtended by 1 (rarely 2) bracteoles; perianth 4-5 mm. long, whitish to stramineous; stamens 3; capsule obovoid, much shorter than the perianth. Moist calcareous soil or shallow water along streams, infrequent in Edwards Plateau, rare in n.-cen. Tex. and e. part of Plains Country, spring-summer; also Okla.

13. *Juncus repens* Michx. Perennial but vegetative culms largely annual, weak, compressed, at first ascending but then arcuate-stoloniferous and creeping or floating, or growing along the bottom submerged, at each node with a cluster of basal leaves and fibrous roots and eventually at each emergent (not submerged) terrestrial node with an ascending floriferous culm (5-) 10-30 cm. long, this with only 1 or 2 nodes and these lower nodes bearing clusters of leaves; blades weak, ascending, more or less flat, 5-10 cm. long, 2-3 mm. broad, not septate, tapering to a fine point; panicle terminal, 7-13 cm. long, simple or few-branched, of 2 to ten 3- to 12-flowered rotate-turbinate glomerules which are terminal on the branches or else appearing sessile at the nodes; individual flowers 5-10 mm. long, subtended by only 1 bractlet at the base of the pedicel; sepals and petals rigid, lance-subulate, setaceous-tipped, the petals much longer than the sepals; anthers 3; capsule linear or at least very narrow, apically obtuse, about as long as the sepals. Margins of fresh water ponds and sandy loam soil, e. Tex., infrequent to rare, summer; Coastal States, Del. to Tex. and inland to Tenn., Ark. and Okla.

14. *Juncus capitatus* Weigel. Tufted annual; culms erect, 4-8 (-10) cm. long, about 0.5 mm. thick; blades all basal, linear, flat, about 0.5 mm. broad, setaceous-tipped, not septate; panicle terminal, unbranched, of 1 or 2 heads which appear sessile at the nodes (when 2 heads present they are 1-2 cm. apart), the head-bearing nodes usually each with a single leaflike bract which surpasses the head; heads 6- to 14-flowered; bracteoles solitary at the base of each flower, lance-ovate, subulate, setaceous-tipped, equaling or surpassing

the flowers; sepals about 5 mm. long, mostly membranous but subulate, setaceous-tipped; petals about 3 mm. long, ovate, acute, mostly membranous or hyaline; stamens 3, the anthers much shorter than the filaments; capsules delicate, shorter than the petals, obtuse, as thick as long. Rare in disturbed sandy soil, e. Tex., collected in 1944 in Walker Co., probably not persistent, spring; N. Afr., Eur., the Near East; adv. in Calif., La. and Tex.

15. *Juncus saximontanus* A. Nels. Culms basally shortly decumbent and/or sub-rhizomatous but tuber-bearing enlargements absent; flowering culms mostly in loose clumps, erect, 25-45 cm. long, compressed, 1-2 mm. thick near the middle; blades membranous, weakly septate (the septae often incomplete and not tangible in well-pressed specimens), laterally flattened, gladiate, tapering to a point; panicle terminal, 4-7 cm. long, sparingly branched, either of 6 to twenty 6- to 10-flowered turbinate glomerules (f. *brunnescens* (Rydb.) Herm.) or else the glomerules congested into fewer (2 to 5) pleioanthous (20- to 40-flowered) nearly round heads (typical form); bracteole solitary at the base of the pedicel; sepals 3-4 mm. long, lanceolate, acute, stramineous or usually brown to chestnut-color, chaffy; petals similar to sepals but shorter; anthers 6, much shorter than the filaments; capsules oblong, mucronate, a little shorter than the sepals, usually chestnut-brown at maturity. *J. parous* Rydb., *J. brunnescens* Rydb. Along creeks at 5,000-8,000 ft. elev., Trans-Pecos mts. (Chisos and Davis), infrequent; B.C., s. to Dgo. and e. to Colo., N.M., Tex. and Coah.

16. *Juncus nodosus* L. Perennial with long creeping rhizomes bearing tuberlike enlargements; flowering culms colonial, 11-30 cm. long, 0.7-1.2 mm. thick, erect, terete or slightly compressed; blades 2 or 3 per culm, terete, 0.5-1 mm. thick near the middle, long-tapered to a thin point, with some complete but sometimes weak and inconspicuous septa; inflorescence terminal, 2-5 cm. long, sparingly branched, of 2 to 4 heads; basal bract of inflorescence leaflike, about equaling the inflorescence or exceeding it by 1-3 cm. at most; heads mostly well-separated from each other, 7-10 mm. thick, 15- to 30-flowered; sepals and petals lanceolate, 3-4 mm. long, brownish-stramineous, with acute semirigid tips; bractlets solitary at the base of each pedicel; stamens 6 (occasionally 3, *vide* F. J. Hermann), the anthers shorter than the filaments; capsules at maturity slightly exserted, narrowly ellipsoid-trigonous, 3 to 4 times as long as thick, brownish, shining, wholly dehiscent (even the abruptly acute apex); seeds not tailed. Incl. var. *meridianus* Herm. Mud along creeks at elev. above 3,000 ft. in the Trans-Pecos, summer; temp. N.A. s. to Va., O., Ind., Ill., Ia. and Neb., at higher elev. to Coah., Chih., Nev. and Calif.

17. *Juncus texanus* (Engelm.) Cov. Perennial with elongate slender rhizomes bearing tuberlike enlargements; flowering culms colonial, erect, essentially terete, 2-4 (-6) dm. long, 1-2 mm. thick near the middle, simple; leaves few; blades essentially terete, with several complete (though in some specimens weak) septa; inflorescence terminal (subtended by a bract shorter than or only slightly surpassing it), at maturity 5-10 cm. long, of 3 to 12 (to 19) 15- to 25-flowered heads which are remote from each other at the ends of the short branches and 8-10 (-11) mm. thick; bractlet solitary at the base of the pedicel; sepals and petals linear-lanceolate; stamens 6, the anthers longer than (often 2 to 3 times as long as) their filaments; capsules at maturity 4 to 8 times as long as thick, including the exserted prolonged slender-subulate beak which remains intact with dehiscence; seeds not tailed. *J. nodosus* var. *texanus* Engelm. Infrequent along ponds, lakes and streams, n.-cen. Tex. and Edwards Plateau, summer; endemic.

18. *Juncus Torreyi* Cov. Perennial with slender elongate rhizomes bearing tuberlike enlargements; flowering culms colonial, erect, 3-10 dm. long, 2-4 mm. thick near the middle; blades terete, ascending, with complete septa; inflorescence terminal, usually far-surpassed by the subtending terete bract, 2-5 (-10) cm. long, of 5 to 10 (to 17) heads which are mostly closely crowded, 8-15 mm. thick, 25- to 50-flowered; bractlet solitary at base of pedicel; sepals lanceolate, stramineous, 4-5 mm. long, with semirigid brownish subulate tips; petals similar to sepals but shorter; anthers 6, shorter than their filaments; capsule at maturity brownish, linear-subulate, trigonous, equaling or slightly surpassing the sepals, wholly dehiscent; seeds not tailed. Marshy margins of lakes, ponds and streams, abundant in the Trans-Pecos and Plains Country, less frequent in Edwards Plateau and n.-cen. Tex., rare in e. Tex., summer; N.Y. to Sask. and Wash., s. to D.C., Ala., Miss., Coah. and Calif.

19. *Juncus validus* Cov. Tufted perennial from a non- or subrhizomatous base; culms 2-10 dm. long, ascending or erect, basally 3-5 mm. thick, mostly 2-4 mm. thick near the middle, olive-gray; leaves several in a basal cluster and scattered along the culm, laterally compressed, slightly arcuate, 3-6 (-8) mm. thick in larger (dorsiventral) dimension, with strong complete septa; bract much shorter than the inflorescence; inflorescence terminal; heads 6 to 76, rounded or often lobulate, 10-15 mm. thick, each with (30 to) 40 to 50 (to 80) flowers; bractlet solitary at the base of the short pedicel; sepals (3-) 3.4-4.2 (-4.5) mm. long, 0.7-1.4 mm. broad; petals (2-) 2.5-3.5 (-4.3) mm. long, 0.5-1 mm. broad; both petals and sepals marginally hyaline (the petals sometimes broadly so) and both semirigid and subspinose at maturity, stramineous-brown or turning dark-brown; stamens 3; capsule 4.5-5 mm. long, brown or golden-brown, subulate; seeds not tailed. We have two varieties.

Var. *validus*. Inflorescence widely spreading, 5-25 cm. long, of (12 to) 15 to 76 heads and completely promptly dehiscent capsules. Abundant in e. and s.e. Tex. and less so w. to n.-cen. Tex. and n. part of Rio Grande Plains; in Coastal States, Ga. to Tex. and inland to Okla. and Mo.

Var. *fascinatus* M. C. Johnst. Inflorescences mostly 2-5 cm. long, of 6 to 15 heads, with capsules usually tardily dehiscent apically or even with an indehiscent beak. Endemic to Tex. in Edwards Plateau area (Central Mineral Region) and s. to n. part of Rio Grande Plains and n.-cen. Tex., uncommon e. to s.e. Tex., summer; endemic.

20. *Juncus polycephalus* Michx. Tufted perennials from subrhizomatous bases; culms 5-10 dm. long, erect, basally 6-10 mm. thick, 2-4 mm. thick near the middle, greenish; leaves several in a basal cluster and scattered along the stem; blades strongly laterally compressed, arcuate, 4-7 mm. thick near the middle in the larger (dorsiventral) dimension, greenish, with weak incomplete septa; inflorescence terminal, usually widely branched, 7-25 cm. long, 12-10 mm. thick; heads few to 20, of 40 to 80 flowers; bractlet solitary at the base of the short pedicel; sepals 3.5-4 mm. long, 0.7-0.8 mm. broad; petals 3-3.3 mm. long, about 0.5 mm. broad, marginally hyaline, greenish-brown turning stramineous to dark-brown, semirigid at maturity and subspinescent; stamens 3; capsule slightly exserted, tapering uniformly, dehiscing laterally but not at the short beaklike apex; seeds not tailed. Infrequent, Jasper and Tyler cos. in extreme s.e. Tex., summer; Coastal States, N.C. to Tex.

21. *Juncus scirpoides* Lam. Perennial from whitish rhizomes 3-15 mm. long, the internodes of the rhizomes 1-2 mm. long; flowering culms 20-45 cm. long, erect, 1-1.5 mm. thick near the middle; leaves few and mostly scattered along the flowering culm, not crowded basally; blades with strong complete septa, terete, rarely very slightly laterally compressed on drying, mostly about 1 mm. thick near the middle, ascending, only slightly arcuate; bract usually shorter than to only slightly surpassing the inflorescence; inflorescence 1-5 (-11) cm. long, terminal, unbranched or very sparingly branched; heads (solitary to) 2 to 5 (to 12), rounded or somewhat lobulate, 7-10 mm. thick, with 25 to 60 flowers; bractlet solitary at the base of the short pedicel; sepals 2.7-4 mm. long, 0.5-0.8 mm. broad; petals 2-3 mm. long, 0.3-0.5 mm. broad; sepals and petals green turning stramineous to stramineous-brown, semirigid to subspinescent; stamens 3; capsule 0.5-0.8 mm. thick, exserted usually even when immature, the tip long-subulate and its 3 valves fused into a perdurant indehiscent beak; seeds not tailed. Incl. var. *meridionalis* Buch. Frequent in e. Tex., infrequent in s.e. Tex., uncommon to rare w. to n.-cen. Tex. and n. and coastal parts of Rio Grande Plains and Edwards Plateau, also in Winkler Co. in the Trans-Pecos, always in deep sandy soils, summer; e. U.S., n. to N.Y., Pa., Ind., Mich. and w. to Okla. and Tex.

Some robust specimens seem to show intergradation to *J. validus* var. *fascinatus*.

22. *Juncus megacephalus* M. A. Curtis. Perennial from subrhizomatous bases; flowering culms 45-110 cm. long, 2-2.2 mm. thick near the middle; leaves few and mostly scattered along the culm, not crowded basally; blades terete, mostly about 1 mm. thick near the middle, ascending, only slightly arcuate, having strong complete septa; blade of the uppermost leaf (but not the bract!) much shorter than its sheath, sometimes reduced to a mucro; bract much shorter than the inflorescence; inflorescence terminal, sparingly branched, 2-5 (-10) cm. long, of 3 to 7 (to 15) heads which are 10-15 mm. thick and 40- to 100-flowered; bractlet solitary at the base of the short pedicel; sepals 4.1-4.3 mm. long, 0.6-0.8 mm. broad; petals about 3.5 mm. long, 0.3-0.4 mm. broad;

sepals and petals usually (reddish)-brown apically, stramineous basally; stamens 3; capsule about 0.8 mm. thick, lance-subulate, trigonous, golden-brown, not or only very slightly exserted, usually about equaling the sepals, laterally dehiscent but the 3 valves coalescent apically into an indehiscent beak. Infrequent to rare in deep sands very near the coast, s.e. Tex. (Aransas and Galveston cos.), summer; Coastal States, (Md.[?] and) Va. to Tex.

23. *Juncus brachycarpus* Engelm. Perennial, the bases subrhizomatous to shortly rhizomatous, whitish; flowering culms stiffly erect, 20-75 cm. long, 1-2 mm. thick near the middle; leaves scattered and subappressed along the culms; blades ascending, only slightly arcuate, essentially terete or basally laterally compressed, 1-2 mm. thick near the middle, with strong complete septa and always longer than their sheaths; bract shorter than or equaling the inflorescence; inflorescence terminal, 2-6 (-13) cm. long, of 2 to 10 (to 25) heads, sparingly branched; heads round, 7-9 mm. thick, with 25 to 60 flowers; bractlet solitary at the base of the short pedicel; sepals 2.7-3.4 mm. long, about 0.8 mm. broad; petals 2.2-2.3 mm. long, about 0.4 mm. broad; sepals and petals greenish with broad hyaline margins, turning golden brown medially at maturity or slightly darker terminally; stamens 3; capsule obovoid, 1.5-2.2 mm. long, about 1 mm. thick, abruptly apiculate, promptly and completely dehiscent; seeds not tailed. Frequent in moist loamy soils, e. and s.e. Tex., rare inland to n.-cen. Tex. and n. part of Rio Grande Plains, spring-early summer; e. and s.e. U.S. inland to O., Mich., Ill., Mo. and Okla.

24. *Juncus trigonocarpus* Steud. Perennial; culms erect or ascending, simple, tough, wiry, terete, 5-9 dm. long, 2-2.5 mm. thick, basally often trailing and rooting in the mire; leaves few, remote, subappressed; blades terete, wiry, nodulose, 7-20 cm. long, about 2 mm. thick; panicle terminal, compound-branched, 5-15 cm. long, about a fourth to a third as broad; primary branches of panicle erect, 1-9 cm. long, bearing nodes with short bracts and fascicles of short branches each of which bears a hemispheric or turbinate 6- to 15-flowered glomerule; bracteole solitary at the base of each pedicel; sepals and petals about 3 mm. long, lanceolate, rigidly subspinescent, strongly nerved, mostly green or stramineous with a chestnut-brown tip; stamens 3 or said to be sometimes 6; capsule 3.5-5 mm. long, exserted, narrow, tapered at both ends, acuminate apically, shining chestnut-brown, eventually completely dehiscent (even the tip); seeds with brown bodies 0.6-0.7 mm. long and white to stramineous "tails" on either end, the tail on the upper end slender and 0.5-0.6 mm. long, that on the lower end shorter and stouter. *J. caudatus* Chapm. Rare in seeps and bogs on sandy soil, e. Tex. (Henderson, Jasper and Tyler cos.), Sept.-Nov.; Coastal States, S.C. to Tex.

25. *Juncus diffusissimus* Buckl. Tufted weak perennial; culms 25-65 cm. long, erect, 1-2 mm. thick near the middle; leaves few, scattered on the culm; blades ascending, strongly laterally compressed, 1-2 mm. broad in the larger (dorsiventral) dimension, long-tapered to a setaceous tip, with some complete but rather inconspicuous septa; bract much shorter than the inflorescence; inflorescence terminal, widely and repeatedly branched, 5-20 cm. long; glomerules numbering 30 to 70 (to 130) per inflorescence, hemispherical or narrower, (1- or) 2- to 10-flowered; bractlet solitary at the base of the short pedicel; sepals (2-) 2.6-3.2 mm. long, 0.6-0.8 mm. broad; petals (1.8-) 2.3-3 mm. long, 0.4-0.5 mm. broad; petals and sepals paleaceous, acute but not subspinescent; stamens 3; capsules linear-lanceolate, trigonous, 4-5 (-5.2) mm. long, minutely apiculate, 1.5 to 2 times as long as the perianth, golden-brown, completely dehiscent. Frequent in e. Tex., less so w. to n.-cen. Tex., rare in Edwards Plateau (Central Mineral Region), in moist loamy soil, summer; Coastal States, Ga. to Tex. and inland to Ind., Mo. and Kan.

26. *Juncus debilis* Gray. Tufted weak perennial (or annual?); culms 15-30 cm. long, ascending, 0.5-1 mm. thick near the middle; leaves few, scattered on the culm; blades ascending, basally slightly laterally compressed, about 1 mm. broad near the middle, with some complete but inconspicuous septa; bract only 1-2 cm. long; inflorescence terminal, repeatedly branched, 3-10 cm. long, with 5 to 35 glomerules which are hemispherical or narrower and 2- to 10-flowered; bractlet solitary at the base of the short pedicel; sepals 2.2-2.8 mm. long, 0.6-0.8 mm. broad; petals 2.3-2.5 mm. long, 0.5-0.7 mm. broad; sepals and petals paleaceous, acute but not subspinescent; stamens 3; capsule broadly to narrowly ovoid, bluntly apiculate, 2.2-3 mm. long. Infrequent to rare in moist sand, extreme e. Tex. (Newton and Polk cos.), summer; Coastal States, Conn. to Tex., inland to Tenn. and Mo.

27. *Juncus acuminatus* Michx. Tufted perennial; culms 14-80 cm. long, erect, 1-3 mm. thick near the middle; leaves few at the base, mostly scattered on the culm; blades strongly laterally compressed, 1-3 mm. thick near the middle, toward the tip very narrow and nearly terete, with complete but rather weak septa; bract much shorter than the inflorescence; inflorescence terminal, variable, 3-15 cm. long, not or sparingly or much and repeatedly branched, in the typical form of (25 to) 40 to 60 hemispherical to turbinate 2- to 10-flowered glomerules, in the f. *sphaerocephalus* Herm. of 2 to 25 nearly round 15- to 60-flowered heads; bractlet solitary at the base of the short pedicel; sepals 3.3-4 mm. long, 0.7-1.2 mm. broad; petals 2.5-3.5 mm. long, 0.3-0.4 mm. broad in the typical form or 0.5-0.7 mm. broad in f. *sphaerocephalus*; sepals and petals paleaceous, drying semirigid, stramineous or often terminally a rich-reddish-brown; stamens 3; capsule narrowly ovoid to elliptic-ovoid, 2.5-3.3 mm. long, apically blunt or very bluntly apiculate, completely and promptly dehiscent. The typical form is infrequent in wet places in e. Tex., the f. *sphaerocephalus* locally frequent in e., s.e. and n.-cen. Tex., the n. parts of the Rio Grande Plains, Edwards Plateau and Trans-Pecos, late spring-summer; the typical form in most of e. U.S. w. to Wisc. and Tex.; f. *sphaerocephalus* from N.Y., Pa., Mich., Ind., Mo., Tex., Wash., Calif., Ariz., Chih., Michoac. and probably scattered elsewhere.

28. *Juncus nodatus* Cov. Perennial; roots not bearing tuberlike enlargements; culms erect, 6-12 dm. long, 3-5 mm. thick near the middle (as much as 1 cm. thick basally); basal sheaths of culm 6-15 mm. broad; blades 2-5 mm. thick near the middle, essentially terete to flattened; septa of blades complete, tough, conspicuous; bract much shorter than the inflorescence; inflorescence terminal, repeatedly much-branched, 7-16 cm. long; glomerules 40 to 200 per inflorescence, hemispherical or narrower, 2- to 10-flowered; bractlet solitary at the base of the short pedicel; sepals 2-2.5 mm. long, 0.6-0.8 mm. broad; petals 1.9-2.3 mm. long, 0.4-0.6 mm. broad; sepals and petals membranous, medially brown, marginally broadly hyaline; stamens 3; capsule obpyriform to narrowly ovoid, minutely apiculate, 2.3-2.5 mm. long, golden-brown. Infrequent, e. and s.e. Tex., rare w. to n.-cen. Tex., extreme n. edge of Rio Grande Plains and n. part of Plains Country (Wichita Co.), late spring-summer; La. to Tex. n. to Ind., Ill., Mo. and Kan.

29. *Juncus Elliottii* Chapm. Perennial; roots often ending in tuberlike enlargements; culms erect or arcuate, 3-9 dm. long, 1.5-2 mm. thick near the middle; basal sheaths of culm 4-8 mm. broad; blades 1-2 mm. thick near the middle, laterally compressed; septa of blades present, complete but weak and inconspicuous in prepared specimens; inflorescence terminal, repeatedly much-branched, 5-14 cm. long; glomerules 40 to 100 per inflorescence, 2- to 10-flowered, hemispherical or narrower; bractlet solitary at the base of the short pedicel; sepals 2.6-2.9 mm. long, 0.9-1.1 mm. broad; petals 2.4-2.8 mm. long, 0.6-0.8 mm. broad; sepals and petals dark-golden-brown to fuscous, chartaceous medially, narrowly white-hyaline marginally, becoming semirigid and subspinescent; stamens 3; capsule narrowly obpyriform to narrowly ovoid, 2.4-2.9 mm. long, minutely apiculate, at maturity fuscous. In moist or wet areas in savannahs and coastal prairies in s.e. Tex., May-Aug.; Coastal States, Del. to La. and Tex.

2. LUZULA DC. WOODRUSH

Tufted low perennials with weak pubescent foliage; inflorescence terminal, of a number of simple or nearly simple unequal branches topped by heads or short spikes of flowers; seeds only 3 per capsule.

A cosmopolitan genus of about 80 species.

1. Style at anthesis about 0.5 mm. long, with 3 slender branches 1-1.5 mm. long (whole structure later deciduous); bulblike subterranean structures present 1. *L. bulbosa*.
1. Style at anthesis 0.5-1 mm. long, with 3 branches 2-2.5 mm. long (later deciduous); bulblike structures absent 2. *L. echinata*.

1. *Luzula bulbosa* (Wood) Rydb. Weak tufted perennial, just underground with numerous slightly elongate whitish tuberlike structures (rhizomes?) 2-4 mm. thick; culms 10-25 (-35) cm. long, ascending, about 1 mm. thick; leaves few, only a few or none

clustered basally; blades membranous, flat, flaccid, 5-10 (-20) cm. long, 2-6 mm. broad, long-tapered, long-pilose marginally especially near juncture with sheath; bract shorter than the inflorescence, leaflike; inflorescence terminal, 3-6 cm. long, of 5 to 10 (to 13) branches which are mostly simple (a few of the longer ones with subsidiary branches) and ascending; bractlets 3 beneath each flower (2 at the base of the calyx and one at the base of the extremely short pedicel); flowers in 20- to 40-flowered ovoid-cylindric spikes or racemes which are 6-10 mm. long and 4-6 mm. thick (rarely almost round and capitate); sepals 3, 2.3-2.5 mm. long, ovate-deltoid, membranous and brownish medially, broadly hyaline marginally, acute; petals similar to sepals but only 1.9-2.2 mm. long; stamens 6, shorter than the sepals; style at anthesis about 0.5 mm. long, with 3 branches 1-1.5 mm. long (postantheically deciduous); capsule nearly globose to broadly obovoid, about equaling the sepals, terminally truncate and minutely apiculate, completely and promptly deciduous; seeds 3. *L. campestris* L. var. *bulbosa* Wood, *L. multiflora* (Retz.) Lej. var. *bulbosa* (Wood) Herm. Locally frequent in forested sandy soils and on grassy seepage banks, e. Tex., rare to s.e. Tex., spring; Coastal States, Mass. to Tex., inland to Ind., Ill., Mo., Kan. and Okla.

2. *Luzula echinata* (Small) Herm. var. *mesochorea* Herm. Much like *L. bulbosa* but more densely cespitose; tuberlike structures absent; leaves more densely crowded basally; branches of inflorescence tending to spread; perianth and capsules 2.5-3 mm. long; style at anthesis 0.5-1 mm. long, with 3 branches 2-2.5 mm. long (whole structure postantheically deciduous). Rare in sandy soil, especially on knolls and well-drained stream banks in hardwood forests, e. Tex., spring; the species in most of temp. e. U.S.; the var. *mesochorea* in Coastal States, N.C. to Tex. and inland to Ind., Ill. and Okla.

FAM. 38. LILIACEAE JUSS.

LILY FAMILY

Mostly perennial herbs, infrequently or only occasionally woody; rootstock a rhizome, bulb, corm or tuber; stems erect or climbing, often modified into fleshy subterranean storage organs or cladophylls; leaves basal or cauline, alternate or whorled, mostly lamellate but sometimes reduced to scales or sheaths, sometimes fleshy or with prickly margins, occasionally fibrous, the venation mostly parallel but also reticulate-parallel in some genera; inflorescence various; flowers bisexual or rarely unisexual (with the plants mostly dioecious), regular (in ours); perianth often large and showy, in 2 series of 3 segments each, very rarely fewer or more, usually undifferentiated into corolla and calyx, the segments imbricate or the outer series valvate, sometimes connate into a tube; stamens 6, rarely fewer or more, hypogynous or adnate to the perianth; filaments distinct or connate; anthers 2-celled, extrorse or antrorse, versatile or basifixed, dehiscing usually by vertical slits; pistil 1; ovary usually 3-celled; styles 1 or 3, sometimes divided or trifid; fruit a septicidal or loculicidal capsule or a berry; seeds various.

More than 4,000 species in about 250 genera throughout the world. Many are of great economic and horticultural importance.

1. Flowers or inflorescences in the axils of alternate stem leaves (2)
1. Flowers or inflorescences terminal (4)

2(1). Perianth tubular, the segments free only at tip; flowers one to several, drooping from the axils24. *Polygonatum*, p. 406.

2. Perianth of distinct segments (3)

3(2). Flowers numerous in ascending umbels; woody vines, often with tendrils; leaves broad, netted-veined; fruit a berry27. *Smilax*, p. 409.

3. Flowers usually 1 or 2, pendulous; herbaceous plants with parallel-veined scalelike leaves and no tendrils22. *Asparagus*, p. 406.

4(1). Flowers usually 1 to 3, rarely as many as 6 (5)

4. Flowers more than 6, variously arranged in clusters (11)

5(4). Flowers terminating a scape (6)

5. Flowers at apex of a more or less leafy stem (10)

- 6(5). Leaves 2, basal, ovate to elliptic or lanceolate, rarely linear, 1 cm. wide or more (7)
6. Leaves several, linear to setaceous, much less than 1 cm. wide (8)
- 7(6). Leaves numerous; perianth about 12 cm. long 10. *Hemerocallis*, p. 391.
7. Leaves 2, basal; perianth rarely to 5 cm. long 12. *Erythronium*, p. 392.
- 8(6). Filaments free, not united into a tube; perianth segments white with a dorsal green keel 15. *Milla*, p. 394.
8. Filaments more or less united to form a tube; perianth segments bluish-tinged or violet-purple (9)
- 9(8). Flower solitary, with 2 partly or wholly united bracts 13. *Ipheion*, p. 393.
9. Flowers 1 to 6, with 2 large and 2 small bracts 14. *Androstephium*, p. 393.
- 10(5). Leaves in a terminal whorl of 3; perianth yellowish to purplish-brown to pink or white 25. *Trillium*, p. 407.
10. Leaves in several whorls on the stem; perianth orange or red and spotted 11. *Lilium*, p. 391.
- 11(4). Flowers large and showy, about 12 cm. long 10. *Hemerocallis*, p. 391.
11. Flowers relatively small, much less than 12 cm. long (12)
- 12(11). Flowers in umbels (13)
12. Flowers in racemes, corymbs or panicles (14)
- 13(12). Plant with onion-odor; perianth not reflexed in fruit 8. *Allium*, p. 384.
13. Plant without onion-odor; perianth reflexed in fruit ... 9. *Nothoscordum*, p. 391.
- 14(12). Floral segments united except at apex into a tubular or campanulate perianth (15)
14. Floral segments distinct or slightly united only at base, the perianth lobes then much longer than the tube (16)
- 15(14). Bulbous, with slenderly linear leaves; flowers blue or bluish, smooth, in a dense terminal raceme 17. *Muscari*, p. 394.
15. Not bulbous; leaves lanceolate; flowers yellow or white, scurfy-roughened, in a spiral spicate raceme 26. *Alcetris*, p. 409.
- 16(14). Plants with a large woody caudex which is mainly subterranean or largely above ground and trunklike; leaves numerous, in large rosettes at apex of the caudex or of its branches, narrowly elongate, thin and flexible to mostly rigid and spine-tipped (17)
16. Plants herbaceous, without a large woody caudex; leaves not in large rosettes, never rigid or spine-tipped (20)
- 17(16). Flowers rosy-red or salmon-colored 18. *Hesperaloe*, p. 394.
17. Flowers white to greenish-white, cream-color or tinged with pink (18)
- 18(17). Flowers seldom less than 2 cm. long, all perfect; capsules large, not lobed or winged; seeds numerous in each cell of the capsule, flattened; leaf margins corneous or filiferous 19. *Yucca*, p. 395.
18. Flowers much less than 1 cm. long, all or many of them unisexual; capsules small, 3-lobed or -winged; seed solitary in each cell of the capsule, turgid; inflorescences with small scarious bracts (19)
- 19(18). Leaves rigid to not very rigid, the margins not spiny (sometimes serrulate); plants incompletely dioecious, some of the flowers perfect; capsule 3-celled, 3-lobed; seeds globose 20. *Nolina*, p. 402.
19. Leaves very rigid, the margins armed with sharp curved spines; plants completely dioecious; capsule 1-celled, winged; seeds trigonous; staminate flowers in dense catkinlike spikes 21. *Dasylirion*, p. 404.

- 20(16). Style single, sometimes cleft at tip (21)
 20. Styles 3 (24)
 21(20). Leaves ovate to lanceolate, alternate on the stem; flowers white; fruit a berry ..
23. *Smilacina*, p. 406.
 21. Leaves linear, grasslike, in a basal tuft; flowers yellow to orange or blue, rarely
 whitish; fruit a capsule (22)
 22(21). Flowers blue or purplish-blue; filaments filiform ..16. *Camassia*, p. 394.
 22. Flowers yellow to orange or pale-white; filaments somewhat flattened or roughened
 with processes (23)
 23(22). Floral segments 8 mm. long or less; distribution in southeast and south-central
 Texas 4. *Schoenolirion*, p. 382.
 23. Floral segments 10 mm. long or more; distribution in the western two thirds of Texas
 5. *Anthericum*, p. 383.
 24(20). Anthers ovate-cordate, 2-celled; leaves 2-ranked and equitant; inflorescence
 glutinous 1. *Tofieldia*, p. 380.
 24. Anthers peltate or reniform, with confluent cells; leaves and inflorescence not as
 above (25)
 25(24). Flowers sessile or very shortly pediceled, in a tight spicate raceme 2 cm. or
 less in diameter; filaments conspicuously exceeding the perianth segments
 6. *Schoenocaulon*, p. 383.
 25. Flowers long-pediceled or (if short-pediceled) in panicles; filaments rarely exceeding
 the perianth segments (26)
 26(25). Axis of inflorescence pubescent; perianth segments with narrow claws and
 conspicuous glands at base of blades; seeds flat, broadly winged
 7. *Melanthium*, p. 384.
 26. Axis of inflorescence glabrous; seeds not flat, narrowly winged or wingless (27)
 27(26). Perianth segments with 1 or 2 shining or colored glands at base
 3. *Zigadenus*, p. 381.
 27. Perianth segments without shining or colored glands at base
 2. *Stenanthium*, p. 380.

1. TOFIELDIA HUDS. FALSE ASPHODEL

About 20 species in the North Temperate Zone and Andes.

1. *Tofieldia racemosa* (Walt.) Small. Slender perennial, mostly tufted, with short or creeping rhizomes and simple usually 1-foliolate stems that are surrounded by a tuft of grasslike leaves at the base; basal leaves erect, equitant, linear, to 4 dm. long and 3-5 mm. wide; cauline leaf usually single and bractlike, inserted below middle of stem; scape 3-7 dm. high, minutely but distinctly pubescent, increasingly so above, bearing a racemose inflorescence to 15 cm. long; flowers creamy-white, the segments separate and spreading, 2 or 3 together at each node, with pubescent pedicels, subtended immediately below the perianth by a small perfoliate bractlet having 3 ovate lobes; terminal flowers opening first; perianth segments oblong to broadly elliptic-oblongate, concave, 3-nerved, obtuse, 4-5 mm. long; stamens 6, exceeding the perianth; anthers ovate-cordate, 2-celled; filaments flattened, subulate; capsule narrowly obovoid, firm-walled, about 3 mm. long, subtended by the persistent perianth and tipped by the 3 enlarged divergent styles; seeds narrowly ellipsoid, appendaged at both ends, about 2 mm. long. In wet sandy soils on pine savannahs and in pitcher plant bogs in s.e. Tex., June-Sept.; from Fla. to Tex., n. to N.J.

2. STENANTHIUM (GRAY) KUNTH

A monotypic genus.

1. *Stenanthium gramineum* (Ker) Morong. FEATHERBELLS. Glabrous perennial herb; stem erect from bulbous base that has fibrous remains of old leaf bases, leafy below or

with reduced leaves up to the panicle, to about 2 m. high, usually much smaller; leaves numerous, ascending, conduplicate, keeled, the largest to 2 dm. long and 3 cm. broad; panicle elongated, to 9 dm. long, lanceolate to lance-ovoid, the racemiform branches bearing wholly staminate or rarely some perfect sessile or short-pedicelled whitish, greenish or bronze-purple flowers, the terminal unbranched spiciform axis with subsessile to pedicelled perfect flowers; floral bracts ovate, concave, about 2 mm. long; perianths variable in size, 3-10 mm. long, the 6 segments linear-lanceolate and attenuate (rarely bluntish); stamens 6, coherent at base to ovary; capsules oblong-subcylindric to ovoid-urceolate, to 15 mm. long, with 3 short spreading beaks, deflexed or erect; seeds obliquely lanceolate, purple-brown, 4-8 mm. long, wingless or nearly so. In forests or on the edge of forests in e. Tex., June-Aug.; from Fla. to Tex., n. to Pa., Ind. and Mo.

Those plants with erect capsules are referred to var. *robustum* (Wats.) Fern.

3. ZIGADENUS MICHX.

DEATH CAMAS. POISON SEGO

Smooth and often glaucous perennials with rhizomes or bulbs, leafy stems and rather large paniced or racemed white to yellow or greenish to bronze perfect or polygamous flowers; perianth withering-persistent, spreading; floral segments oblong or oval, 1- or 2-glandular near the more or less narrowed but rarely definitely unguiculate base; stamens free from the floral segments and about as long as them; anthers cordate or reniform; capsules 3-lobed, 3-celled, dehiscent to the base; seeds oblong or linear, angled.

About 15 species in the Northern Hemisphere of America and Asia. When grazed, most of the species are usually fatal to sheep and some species even to cattle. The bulbs are also poisonous.

1. Perianth segments 8-17 mm. long, bearing a bilobed gland or 2 glands well above the base; filaments widened at the base (2)
1. Perianth segments 3-7 mm. long, bearing a single basal gland (3)
- 2(1). Stem from bulbous-thickened base; perianth segments obtuse, 8-12 mm. long; gland bilobed1. *Z. elegans*.
2. Stem from creeping rhizome; perianth segments acuminate, 12-17 mm. long; bearing 2 glands2. *Z. glaberrimus*.
- 3(1). Filaments widened at base; flowers usually in a simple raceme but also paniculate; bracts 10-20 mm. long3. *Z. Nuttallii*.
3. Filaments slender throughout; bracts 2-5 mm. long (4)
- 4(3). Flowers polygamous; inflorescence always paniculate4. *Z. leimanthoides*.
4. Flowers perfect, usually in a simple raceme5. *Z. densus*.

1. *Zigadenus elegans* Pursh. WHITE CAMAS, ALKALI-GRASS. Stem rather stout, erect, to about 8 dm. high; leaves crowded toward base, narrowly to broadly linear, to about 4 dm. long and 1 cm. wide, thin, attenuate at tip; inflorescence commonly a slender loose cylindric raceme, rarely a panicle; middle and upper bracts with scarious margins and summits, blunt to mucronate; pedicels usually slender; perianth pale or slightly suffused with purple or brown below, without or with only a small darkened spot outside at base; capsule lance-conic, 13-22 mm. long, 4-6 mm. in diameter, about twice as long as the persistent perianth; seeds 5-6 mm. long. On wet ledges and seepage in canyons of Guadalupe Mts. in the Trans-Pecos, June-Sept.; from Alas. to Ariz., Tex. and N.M., e. to Man., Minn., Ia. and Mo.

2. *Zigadenus glaberrimus* Michx. Rhizome subligneous, blackish, horizontal, elongate; stem slender, to 12 dm. high, leafy; basal leaves elongate, linear, attenuate, firm, to 4 dm. long and 15 mm. wide; panicle loosely pyramidal, to 3 dm. long; bracts ovate, acuminate, about 5 mm. long; pedicels 5-10 mm. long; flowers perfect; perianth segments 1-1.5 cm. long, white, lanceolate or lance-ovate, acute to acuminate, with 2 distinct glands just above the short but definite claw; filaments widened at base; capsule lance-conic, about 1 cm. long, barely equaling the connivent persistent perianth. Savannahs, bogs and wet pinelands, June-Sept.; from Fla. to Tex.(?), n. to s.e. Va.

This species is included here based solely upon a report of its occurrence in the state. It should occur in southeast Texas.

3. *Zigadenus Nuttallii* Gray. DEATH CAMAS, POISON CAMAS. Outer bulb coats papery, not fibrous; stem stout, to 75 cm. high, leafy-bracted; leaves mostly basal, coriaceous, falcate, to 3 dm. long and 1 cm. wide; raceme (rarely paniculate-branched) thick-cylindric, 1-2 dm. long, its scarious bracts caudate, deciduous; pedicels to 3 cm. long; perianth yellowish-white, free; perianth segments 6-8 mm. long, ovate or oval, each with an obovate yellowish basal gland; filaments about equaling the perianth, widened at base; capsules erect, ovoid to ellipsoid, thin-walled, three or four times the length of perianth, with filiform pedicels 15-25 mm. long. Prairies and hillsides of calcareous rocks throughout most of the e. third of Tex., Mar.-May; from Tenn. to Kan. and Tex.

4. *Zigadenus leimanthoides* Gray. Outer bulb coats fibrous; stem slender, erect, to about 15 dm. high; leaves elongate-linear, mostly crowded near the base, to 5 dm. long and 1 cm. wide; flowers crowded in paniced racemes (central axis to 3 dm. long); lower and middle bracts of panicle herbaceous; pedicels to 12 mm. long; perianth segments creamy or yellow to somewhat greenish-white, ovate-elliptic, 3-4 mm. long, each with a deeper yellowish spot on the contracted base; filaments subulate, slightly exceeding the perianth; capsules slender-conic, about 1 cm. long, with pedicels to 15 mm. long. Sandy pinelands and bogs of the Coastal Plain and Piedmont, very rare in n.e. Tex., May-Aug.; from Ga. to Tex., n. to N.J. and L.I.

5. *Zigadenus densus* (Desr.) Fern. BLACK SNAKEROOT, CROW-POISON. The barely thickened bulbs with smooth coats; stem slender, erect, to 15 dm. high, remotely bracted; leaves narrowly linear, mostly near the base, to 5 dm. long and 7 mm. wide; raceme simple (rarely branching below), densely subcylindric, to about 2 dm. long and 3-5 cm. thick; bracts small, firm, brownish, persistent; perianth creamy-white to pink, nearly or wholly free; perianth segments 4-5 mm. long, elliptic-obovate, obtuse, each usually with a very small obscure gland at base; capsules slenderly conical, with pedicels 1-2 cm. long. Damp pinelands and bogs in e. Tex., Apr.-June; from Fla. to Tex., n. to s.e. Va., N.C. and Tenn.

The bulb of this plant is very poisonous.

4. SCHOENOLIRION DURAND

Perennial herbs; stem naked, scaly and somewhat thickened at base, from a thick root-stock and fleshy-fibrous cluster of roots; leaves in a basal tuft, very narrow, elongate, flat, rather rigid, few-nerved; flowers yellow or whitish to pale-green, in lax simple or sparingly branched racemes; pedicels slender, exceeding in length the flowers and bracts, articulate just beneath the flower; floral segments 6, distinctly 3- to 5-nerved, spreading, exceeding the 6 stamens; style single, short; capsule depressed-globose, deeply 3-lobed; seeds subglobose, shining.

Three species in southern United States; one in California.

1. Flowers bright-yellow; larger leaves 4-8 mm. wide, strongly ribbed; in bogs, marshes or wet savannahs 1. *S. croceum*.
1. Flowers white or greenish-white; larger leaves mostly less than 4 mm. wide, not strongly ribbed; in mesophytic open forests or on ridges 2. *S. texanum*.

1. *Schoenolirion croceum* (Michx.) Wood. YELLOW SUNNY-BELL. Scape very slender, about 3 dm. high; principal leaves 4-8 mm. wide, strongly ribbed; raceme simple, to 15 cm. long and 4 cm. in diameter; bracts ovate to elliptic, concave, mostly obtuse, often tinged with purple; flowers yellow and mostly tinged with red; floral segments elliptic-oblong, 5-7 mm. long; seeds nearly 4 mm. long. *Oxytria crocea* (Michx.) Raf. In wet savannahs, marshy pinelands, bogs and on seepage slopes in s.e. Tex., Mar.-May; from Fla. to Tex., n. to N.C.

2. *Schoenolirion texanum* (Scheele) Gray. Resembling *S. croceum*; principal leaves mostly 4 mm. wide or less; flowers greenish-white; bracts rather narrow, acutish; seeds about 2 mm. long. *Oxytria texana* (Scheele) Pollard. On low ridges and in open mixed forests on the w. edge of s.e. Tex., Mar.-May; endemic.

This species seems to be confined to the region about Austin, Brazos and Walker cos.

5. ANTHERICUM L.

CRAG-LILY. AMBER-LILY

Plants with naked stems or with 1 or 2 setaceous bracteal leaves, from a cluster of thick cylindrical fleshy-fibrous roots; leaves narrowly linear, grasslike, surrounded at the base by the fibrous remnants of older ones; flowers yellow, in simple or compound racemes, with pedicels jointed at or below the middle, the 3- to 5-nerved essentially distinct segments spread from the base and twice longer than the anthers; style single, slender, elongated; capsules somewhat oblong to oblong-quadrate, with several flattened angular seeds in each cell.

About 300 American, African and Eurasian species.

1. Largest leaves 10 mm. wide or more, with obvious anastomosing veins; distribution in Rio Grande Valley and south-coastal Texas 1. *A. Chandleri*.
1. Largest leaves rarely to 8 mm. wide, without cross-veins; distribution in Trans-Pecos and Edwards Plateau 2. *A. Torreyi*.

1. *Anthericum Chandleri* Greenm. & Thoms. LILA DE LOS LLANOS. Plant erect, perennial; rootlike fibers fleshy, clavate at the apex, the neck of the root moderately fibrous; leaves as many as 15, flat, grasslike, lanceolate-linear, gradually diminishing above, acute, 35-45 cm. long, to 1 cm. wide or more, about 24-nerved, with transverse connecting veins, glabrous on both sides; scape to about 1 m. high, terete, glabrous, somewhat bracteate; inflorescence paniculate, to 35 cm. long, glabrous, the terminal raceme 2-2.5 dm. long, the lateral racemes 1-1.5 dm. long; bracts triangular-acuminate to lanceolate-attenuate, subscarios, to 2 cm. long; flowers 2 to 4 in axils of the bracts; pedicels about 1 cm. long, articulated below the middle; perianth orange-yellow to pale-yellow or stramineous, with three-nerved oblong-lanceolate lobes about 1 cm. long; stamens about half the length of perianth; filaments muricate; style 8 mm. long, glabrous; capsule oblong-ellipsoid, 1-1.2 cm. long. In clay soil in chaparral, thickets and prairies in the Rio Grande Valley and s.-coastal Tex., May-Nov.; also n.e. Mex.

2. *Anthericum Torreyi* Baker. Root a fascicle of thick fleshy fibers; radical leaves several, elongate, smooth, usually less than 7 mm. wide; stem scapiform, to about 1 m. high, very slender, often nearly simple above but more commonly somewhat paniculately branched, the branches erect; flowers 2 to 4 or more together in fascicles, the terminal ones racemose and mostly solitary; pedicels 1-1.2 cm. long, jointed about one third their length from the base; floral segments orange-yellow, narrowly oblong and elliptic, to 15 mm. long and 7 mm. wide, with 3 to 5 closely approximate greenish or brownish nerves along the middle; stamens scarcely half the length of the perianth; filaments roughened with short obtuse somewhat retrorse teeth; anthers linear-oblong; ovary obovate; style one third longer than the stamens, filiform; stigma minutely 3-lobed, ciliate-papillose; capsule oblong-obovate, obtuse, 3-lobed, 8-10 mm. long, thin; seeds 12 to 16, angular, black. In rich soils in canyons and on rocky cedar-oak hills in the Trans-Pecos and Edwards Plateau, June-Nov.; from Tex. to Ariz. and n. Mex.

6. SCHOENOCAULON GRAY

Herbaceous perennials with ovoid to oblong-cylindric bulbs, basal portion of plant covered by blackish scales and fibers; leaves all basal, grasslike, glabrous, the margins serrulate; scape naked, erect and simple, purplish below, glaucous above; spike slender, many-flowered, bracteate; flowers perfect, pale-green to yellowish-white, at first crowded but later distinct, sessile or shortly pedicellate; perianth segments 6, essentially free, persistent; stamens 6, subequal, inserted at base of perianth segments, persistent; filaments filiform to subclavate-filiform; anthers unilocular, reniform, peltate after dehiscence; ovary ovoid; styles 3, distinct, divergent and slightly recurved; capsule ovoid to ellipsoid, chartaceous, glaucous, persistent, 3-celled.

A New World genus of about 10 species, mainly in Mexico; south to Peru.

1. Perianth segments submembranous, elliptic to ovate-elliptic, with thin erose margins; spike 1.5-2 cm. in diameter; usually (but not always) flowering in autumn 1. *S. Drummondii*.
1. Perianth segments fleshy-thickened or leathery, linear-oblong, with thickish entire margins; spike 1-1.5 cm. in diameter; flowering in spring and summer 2. *S. texanum*.

1. *Schoenocaulon Drummondii* Gray. GREEN LILY. Scape to 6 dm. tall; leaves to 5 dm. long; perianth segments 2.5-3 mm. long and 1 mm. broad; filaments stout, subclavate-filiform, dilated above, 5-7 mm. long. In sandy gravelly soils along roadsides, in arroyos and prairies and edge of open woods in cen. Coastal Prairie and upper and cen. Rio Grande Plains, Sept.-Oct., rarely in spring; also n.e. Mex.

2. *Schoenocaulon texanum* Scheele. Scape to 55 cm. tall; leaves to 6 dm. long; perianth segments 3-4 mm. long and about 1 mm. broad or less, somewhat dilated below middle; filaments slightly dilated at base, usually noticeably recurved, 3.5-5 mm. long; capsules obliquely ovoid, appressed to rachis, 1-1.5 cm. long. Commonly in limestone soil on slopes, bluffs, in canyons and outwashes and on flats from n.e. Rio Grande Plains, through the Edwards Plateau to the Trans-Pecos, Mar.-July; also s.e. N.M. and Mex.

7. MELANTHIUM L.

Five species, all native of North America.

1. *Melanthium virginicum* L. BUNCHFLOWER. Perennial from a thick rootstock; stem to about 1.5 m. high, scurfy above; leaves firm, broadly linear, acuminate-attenuate, to 3 cm. broad; panicle to 45 cm. long, usually much shorter, somewhat scurfy, with ascending to spreading lateral branches; flowers creamy, changing to green or purplish, scurfy outside; floral segments 6, broadly oblong to ovate, rounded to cordate or hastate at base, flat, obtuse, 5-8 mm. long, 2 or 3 times the length of slender claw, with 2 dark glands at base; stamens borne at or above middle of each claw; capsule erect, ovoid, with furrows between the round-backed carpels, 13-18 mm. high, 3-beaked; seeds whitish, narrowly obovate, flat, broadly winged, about 10 in each cell, 5-7 mm. long. Meadows, bogs, swales, savannahs, edge of woodlands and low thickets in e. and s.e. Tex., May-July; from n. Fla. to Tex., n. to s. N.Y., O., Ind., Ill. and Ia.

8. ALLIUM L.²⁸

ONION. GARLIC. LEEK

Biennial or perennial herbs; scapes from a tunicated bulb, with mostly narrowly linear basal leaves; herbage usually with the characteristic odor and taste of onions or garlic; flowers in a terminal simple umbel, subtended by 2 to 4 membranous separate or united bracts, some or all of the flowers occasionally replaced by bulblets; pedicels slender, not jointed; perianth persistent, its 6 segments white to purple and distinct or united at the base; stamens inserted on the bases of the perianth segments; filaments filiform or dilated, sometimes toothed; style filiform, jointed; capsule obovate-globose, obtusely 3-lobed, often crested, loculicidally dehiscent; seeds obovoid or ovoid-reniform, wrinkled, black.

A genus of 450 or more species widely distributed in the North Temperate Zone. Sometimes segregated, with a few other Liliaceous genera, as a separate family, the Alliaceae.

1. Bulb coats (leaf bases) containing anastomosing fibers that usually persist as conspicuous fibrous reticula to enclose 1 or more bulbs (2)
1. Bulb coats without fibers or with parallel fibers, these never persisting as fibrous reticula (13)
- 2(1). Flowering pedicels mostly or entirely replaced by bulbils; flowers rarely producing capsules or seeds 1a. *A. canadense* var. *canadense*.
2. Umbels floriferous and capsuliferous; bulbils almost unknown (3)
- 3(2). Ovary and capsule usually crestless, if crested the flowers yellow (4)
3. Ovary and capsule usually crested; flowers pink or white; plants of far western Texas (12)
- 4(3). Bracts and spathe 3- to 7-nerved; interstices between fibers of reticula open (5)
4. Bracts of spathe 1-nerved; inner epidermal cells of innermost bulb coats contorted (their walls usually not sinuous); perianth segments spreading, becoming papery and rigid in fruit (11)

²⁸ Adapted from Marion Ownbey in Res. Stud. St. Coll. Wash. 18: 181-222. 1950.

- 5(4). Perianth campanulate or urceolate-campanulate, ultimately withering away from the capsule; reticula fine- or only moderately coarse-meshed; alveoli on seeds pustuliferous (6)
- 5. Perianth urceolate, permanently investing the capsule; reticula very coarse; alveoli on seeds not pustuliferous (9)
- 6(5). Perianth white; plants mostly of the Edwards Plateau and northward
..... 1e. *A. canadense* var.
Fraseri.
- 6. Perianth usually pink (7)
- 7(6). Pedicels filiform; usually slender plants of eastern Texas
..... 1b. *A. canadense* var.
mobile.
- 7. Pedicels stouter; plants usually more robust (8)
- 8(7). Umbel many-flowered; perianth segments thin; flowers fragrant; distribution north-central Texas 1c. *A. canadense* var.
hyacinthoides.
- 8. Umbel few- (5 to 25) flowered; perianth segments thicker; distribution central coastal Texas 1d. *A. canadense* var.
ecristatum.
- 9(5). Flowering bulbs with a cluster of stalked basal bulblets; inner epidermal cells of innermost bulb coats contorted, with sinuous walls; distribution southern Texas ..
..... 2. *A. Runyonii.*
- 9. Bulbs without basal bulblets; epidermal cells vertically elongate, regular, without sinuous walls (10)
- 10(9). Perianth deep-rose-color, fading to purple; flowers fragrant; distribution northern Texas 3a. *A. perdulce* var.
perdulce.
- 10. Perianth white or pale-pink, with deep-pink midribs, fading to pink; distribution western Texas 3b. *A. perdulce* var. *Sperryi.*
- 11(4). Interstices between fibers of reticula filled; flowers white, pink or red
..... 4. *A. Drummondii.*
- 11. Interstices between fibers of reticula open; flowers yellow; distribution western Texas 5. *A. Coryi.*
- 12(3). Leaves usually 2 per scape; bracts of spathe 3- to 5-nerved; ovary and capsule crested (usually conspicuously so) with 6 flattened processes; alveoli on seeds not pustuliferous 6. *A. macropetalum.*
- 12. Leaves 3 or more per scape; bracts of spathe mostly 1-nerved; ovary and capsule inconspicuously crested with 6 knoblike processes or sometimes appearing to be crestless; alveoli on seeds pustuliferous 7. *A. Geyeri.*
- 13(1). Ovary and capsule conspicuously crested; stamens exserted (14)
- 13. Ovary and capsule crestless; stamens included (15)
- 14(13). Perianth campanulate; umbel nodding 8. *A. cernuum.*
- 14. Perianth stellate; umbel erect 9. *A. stellatum.*
- 15(13). Bulb with a cluster of short-stalked bulblets at base; cells of inner epidermis of innermost bulb coats vertically elongate or contorted, with very sinuous walls ..
..... 10. *A. Elmendorffii.*
- 15. Bulb without basal bulblets; cells on inner epidermis not contorted (16)
- 16(15). Bulb about 1 cm. thick, solitary, proliferating from base by means of long slender rhizomes 11. *A. rhizomatum.*
- 16. Bulbs about 2 cm. thick, often clustered, sometimes stipitate (short-rhizomatous) at base, without long slender rhizomes 12. *A. Kunthii.*

1a. *Allium canadense* L. var. *canadense*. CANADA GARLIC. Bulb ovoid, without basal bulblets, often one of a cluster; inner bulb coats whitish, the epidermal cells obscure, vertically elongate, regular or nearly so; outer bulb coats persisting as a series of grayish or brownish fibrous fine- to coarse-meshed open reticula, enclosing 1 or more bulbs or soon distintegrating; fleshy scales 2 to 5, with mild to strong garlic flavor; leaves usually 3 or more per bulb, channeled, concave-convex in cross section, 1-5 mm. broad, usually with entire margins, shorter than the scape, green at anthesis; scape 1.5-5 dm. tall, terete, solitary; spathe membranaceous, caudate, breaking before anthesis into usually 3 separate or partially united 3- to 7-nerved bracts that are ovate to lanceolate and acuminate; umbel with few or no flowers, the pedicels being replaced (all or in part) by ovoid bulbils, some of which may in turn bear secondary umbels; pedicels (when present) 2 to several times the length of the perianth, elongating and becoming rigid when fruit is produced; perianth broadly campanulate; perianth segments 4-7 mm. long, elliptic-lanceolate, obtuse to acute, entire, spreading, white or pink, withering in fruit, the midribs somewhat thickened; stamens shorter than the perianth; filaments subulate, dilated and united into a cup at base; anthers oblong, obtuse to acute; ovary crestless; style linear, about equaling the filaments in length; stigma capitate, entire or obscurely lobed; seeds black, shining, finely alveolate, the alveoli each with a minute pustule in the center. *A. mutabile* Michx. Roadsides, meadows, woods and fields in the e. third of Tex., Mar.-May; generally distributed throughout e. N.A.

1b. *Allium canadense* var. *mobile* (Regel) M. Ownbey. Bulb ovoid, usually small, sometimes with 1 or 2 large basal bulblets, often one of a cluster; inner bulb coats whitish, cells of the inner epidermis sometimes contorted or with sinuous walls; outer bulb coats persisting as a series of grayish or brownish mostly fine-meshed open reticula, usually enclosing only a single bulb; leaves 2 or more per bulb, channeled, concave-convex in cross section, 1-2 mm. broad, usually with entire margins, shorter than the scape, green at anthesis; scape 1-5 (usually less than 3) dm. tall, terete, solitary; spathe membranaceous, caudate, breaking before anthesis into usually 3 separate or partially united 3- to 5-nerved bracts that are lanceolate and attenuate; umbel many-flowered, erect; pedicels very slender, subequal in length, mostly 2 to 4 times that of the perianth, elongating and becoming flexuous and rigid in fruit; perianth broadly campanulate; perianth segments 4-7 mm. long, elliptic-lanceolate, obtuse to acute, spreading, pink (rarely white), thin in texture, withering in fruit, the midribs somewhat thickened; stamens about two thirds the length of the perianth; filaments deltoid-subulate, broadly dilated and united into a cup at base; anthers short-oblong, obtuse or acute; ovary crestless; style linear, about equaling the filaments in length; stigma capitate, entire or obscurely lobed; seeds black, shining, finely alveolate, the alveoli each with a minute pustule in the center. *A. mobile* Regel, *A. Zenobiae* Cory. Usually in sandy or rocky soils, rarely on limestone or in clay, woods and prairies in e. fourth of Tex., Apr.-May; from Ga. and Fla. to Tex., Okla. and Mo.

1c. *Allium canadense* var. *hyacinthoides* (Bush) M. Ownbey. Bulb ovoid, without basal bulblets, often one of a cluster; inner bulb coats whitish, epidermal cells obscure, vertically elongate, regular or nearly so; outer bulb coats persisting as a series of grayish or brownish fibrous rather coarse-meshed open reticula, enclosing 1 or more bulbs; leaves several per bulb, channeled, concavo-convex in cross section, 2-7 mm. broad, entire or denticulate on the margins, shorter than the scape, green at anthesis; scape 1.5-3 dm. tall, terete, solitary; spathe membranaceous, acuminate, breaking before anthesis into 3 or 4 lanceolate and acuminate 3- to 7-nerved bracts that usually remain partially united at base; umbel many-flowered, erect; pedicels subequal in length, mostly 2 to 4 times that of the perianth, elongating and becoming flexuous and rigid in fruit; perianth urceolate-campanulate; perianth segments 5-7 mm. long, elliptic-lanceolate, obtuse to acute, entire, erect, pink, thin in texture, withering in fruit, the midribs somewhat thickened; stamens shorter than the perianth; filaments subulate, dilated and united into a cup at base; anthers oblong, obtuse; ovary crestless; style linear, about equaling the filaments in length; stigma capitate, entire or obscurely lobed; seeds black, shining, finely alveolate, the alveoli each with a minute pustule in the center. *A. hyacinthoides* Bush. On calcareous prairies or more frequently in sandy soils in n.-cen. Tex., Mar.-Apr.; also adj. s. Okla.

1d. *Allium canadense* var. *ecristatum* (M. E. Jones) M. Ownbey. Bulb ovoid, without basal bulblets, often one of a cluster; inner bulb coats whitish, cells of inner epidermis vertically elongate, somewhat contorted; outer bulb coats persisting as a series of grayish

or brownish fibrous rather coarse-meshed open reticula, enclosing the bulb; leaves several per bulb, channeled, concavo-convex in cross section, 1-5 mm. broad, entire or denticulate on the margins, shorter than the scape, green at anthesis; scape 1-3 dm. tall, terete, solitary; spathe membranaceous, breaking before anthesis into 3 ovate acuminate 5- to 7-nerved bracts that remain partially united at base; umbel few- (5 to 25) flowered, erect; pedicels subequal in length, mostly less than twice that of the perianth, elongating and becoming flexuous and rigid in fruit; perianth urceolate-campanulate; perianth segments 5-7 mm. long, elliptic-lanceolate, obtuse to acute, entire, erect, deep-pink, rather thick in texture, withering in fruit, the midribs somewhat thickened; stamens shorter than the perianth; filaments subulate, dilated and united into a cup at base; anthers oblong, obtuse; ovary crestless; style linear, about equaling the filaments in length; stigma capitate, entire or obscurely lobed; seeds black, shining, finely alveolate, the alveoli each with a minute pustule in the center. On prairies on the cen. Coastal Plain in Tex., Mar.-Apr.; endemic.

1e. *Allium canadense* var. *Fraseri* M. Ownbey. Bulb ovoid, without basal bulblets, often one of a cluster; inner bulb coats whitish, epidermal cells obscure, vertically elongate, regular or nearly so; outer bulb coats persisting as a series of grayish or brownish fibrous fine to coarse-meshed open reticula, enclosing 1 or more bulbs; leaves usually 3 or more per bulb, channeled, concavo-convex in cross section, 1-5 mm. broad, entire or denticulate on the margins, usually much shorter than the scape, green at anthesis; scape 2-5 dm. tall, terete, usually solitary; spathe membranaceous, caudate, breaking before anthesis into usually 3 ovate to lanceolate attenuate 3- to 7-nerved bracts that may remain partially united at base; umbel many-flowered, erect; pedicels becoming subequal in length, mostly 3 to 4 times that of the perianth, elongating and becoming flexuous and rigid in fruit; perianth broadly campanulate; perianth segments 4-7 mm. long, elliptic to lanceolate, acute to obtuse, entire, spreading, white (rarely pink), withering in fruit, the midribs somewhat thickened; stamens usually shorter than the perianth; filaments subulate, dilated and united into a cup at base; anthers oblong, obtuse; ovary crestless; style linear, about equaling the filaments in length; stigma capitate, entire or obscurely lobed; seeds black, shining, finely alveolate, the alveoli each with a minute pustule in the center. *A. Fraseri* (M. Ownbey) Shinners, *A. lavendulare* var. *Fraseri* (M. Ownbey) Shinners, *A. acetabulum* (Raf.) Shinners var. *Fraseri* (M. Ownbey) Shinners. Generally in sandy or rocky soils in woods or plains in Tex., Apr.-May; from Tex. to S.D.

2. *Allium Runyonii* M. Ownbey. Bulb ovoid, bearing a cluster of short-stalked basal bulblets; innermost 2 bulb coats whitish, with the cells of the inner epidermis contorted with very sinuous walls; outer bulb coats persisting as a series of brownish fibrous very coarse-meshed open reticula, enclosing the bulb; fleshy bulb scale 1; leaves 3 or more per bulb, channeled, concavo-convex in cross section, 1-4 mm. broad, entire, usually equaling or exceeding the scape in length, green at anthesis; scape 1-3.5 dm. tall, terete or nearly so, often 2 or more successively produced from a single bulb; spathe membranaceous, acuminate, breaking before anthesis into 3 ovate acuminate 3- to 5-nerved bracts that usually remain partially united at base; umbel usually between 10- and 25-flowered, erect; pedicels about twice the length of the perianth at anthesis, elongating in fruit, becoming subequal in length and stiffly spreading, not flexuous; perianth urceolate-campanulate; perianth segments 5-7 mm. long, lanceolate, obtuse or even emarginate to acute, entire, erect, white with pinkish midribs, fading pink, becoming callous-keeled and permanently investing the fruit; stamens nearly equaling the perianth in length; filaments subulate, dilated below and united into a cup at base; anthers oblong, obtuse or umbonate; ovary crestless; style linear, about equaling the filaments in length; stigma capitate, entire or obscurely lobed; seeds black, shining, finely alveolate, the alveoli smooth. Sandy soils in Rio Grande Plains in s. Tex., Mar; endemic.

3a. *Allium perdulce* S. V. Fraser var. *perdulce*. Bulb ovoid, without basal bulblets, usually one of a cluster; inner bulb coats whitish, epidermal cells regular, vertically elongate; outer bulb coats persisting as a series of dark-brown fibrous coarse-meshed open reticula, enclosing 1 or more bulbs; fleshy bulb scales 1 or 2, with no evident onion or garlic flavor; leaves 3 or more per bulb, channeled, concavo-convex in cross section, 1-2 mm. broad, entire, usually equaling or exceeding the scape in length, green at anthesis; scape 1-2 dm. tall, terete or nearly so, solitary; spathe membranaceous, acuminate, breaking before anthesis into 2 or 3 ovate acuminate mostly 5-nerved bracts that

usually remain partially united at base; umbel 5- to 25-flowered, erect; pedicels about the length of the perianth at anthesis, elongating in fruit and becoming flexuous and rigid; perianth urceolate; perianth segments 7-10 mm. long, lanceolate, obtuse to acute, entire, erect, deep-rose-color, fading to purple, becoming callous-keeled and permanently investing the fruit; stamens one half to two thirds the length of the perianth; filaments deltoid-subulate, united into a cup at the base; anthers oblong, obtuse; ovary crestless; style linear, about equaling the filaments in length; stigma capitate, entire or obscurely lobed; seeds dull-black, finely alveolate, the alveoli not pustuliferous. Generally in sandy soils in plains of n.-cen. Tex., Mar.-Apr.; from Tex. and e. N.M., n. to S.D. and adj. Ia.

3b. *Allium perdulce* var. *Sperryi* M. Ownbey. Bulb ovoid, without basal bulblets, sometimes one of a cluster; inner bulb coats whitish, epidermal cells regular, vertically elongate; outer bulb coats persisting as a series of dark-brown fibrous rather coarse-meshed open reticula, enclosing 1 or more bulbs; fleshy bulb scales 2, with no evident onion or garlic flavor; leaves 3 or more per bulb, channeled, concavo-convex in cross section, 1-3 mm. broad, entire, usually equaling or exceeding the scape in length, green at anthesis; scape 1-2 dm. tall, terete or nearly so, solitary; spathe membranaceous, acuminate, breaking before anthesis into 2 or 3 ovate acuminate 5- to 7-nerved bracts that usually remain partially united at base; umbel 5- to 20-flowered, erect; pedicels about twice the length of the perianth at anthesis, elongating in fruit and becoming flexuous and rigid; perianth urceolate; perianth segments 7-10 mm. long, lanceolate, obtuse to acute, entire, erect, white or pale-pink with deep-pink midribs, fading to pink, becoming callous-keeled and permanently investing the fruit; stamens one half to two thirds the length of the perianth; filaments deltoid-subulate, united into a cup at base; anthers oblong, obtuse; ovary crestless; style stout, about equaling the filaments in length; stigma capitate, entire or obscurely lobed; mature seeds not known. On rocky slopes in the Trans-Pecos, Mar.; endemic.

4. *Allium Drummondii* Regel. WILD ONION. Bulb ovoid, without basal bulblets, usually one of a cluster; innermost 2 bulb coats whitish or brownish, with the cells of the inner epidermis intricately contorted, their walls usually not sinuous; outer bulb coats enclosing 1 or more bulbs, persisting as a series of brown fibrous fine-meshed reticula whose interstices mostly remain closed; fleshy bulb scales 1 or 2, mildly garlic-flavored; leaves usually 3 or more per bulb, channeled, concavo-convex in cross section, 1-3 (or -5) mm. broad, entire, about equaling the scape in length, green at anthesis; scape 1-3 dm. tall, terete or nearly so, usually solitary; spathe membranaceous, acuminate, breaking before anthesis into 2 or 3 ovate acuminate 1-nerved bracts; umbel 10- to 25-flowered, erect; pedicels unequal in length, 1 to 3 times that of the perianth, becoming flexuous and rigid in fruit, rarely replaced by bulbils; perianth rotate-campanulate; perianth segments 6-9 mm. long, ovate to lanceolate, obtuse to acute, entire, spreading, white, pink, or red, rarely greenish yellow, becoming papery and rigid in fruit, the midribs somewhat thickened; stamens two thirds to three fourths the length of the perianth; filaments subulate, dilated and united into a cup at base; anthers oblong, obtuse; ovary crestless; style linear, about equaling the filaments in length; stigma capitate, entire or obscurely lobed; seeds black, shining, finely alveolate, each alveoli usually with a minute pustule in the center. *A. Hellertii* Small, *A. Nuttallii* Wats. On plains, hills and prairies, particularly in limestone soils, throughout most of Tex., Mar.-May; from Tex. to w. Neb., N.M., and n. Mex.

Forma asexuale M. Ownbey with bulbils replacing the pedicels.

5. *Allium Coryi* M. E. Jones. YELLOW-FLOWERED ONION. Bulb ovoid, without basal bulblets usually one of a cluster; innermost 2 bulb coats whitish or brownish, with the cells of the inner epidermis intricately contorted, their walls not sinuous; outer bulb coats persisting as a series of brown fibrous fine-meshed open reticula, enclosing 1 or more bulbs; fleshy bulb scale 1, mildly garlic-flavored; leaves 3 or more per bulb, channeled, concavo-convex in cross section, 1-3 mm. broad, entire, about equaling the scape in length, green at anthesis; scape 1-3 dm. tall, terete or nearly so, usually solitary; spathe membranaceous, acuminate, breaking before anthesis into 2 or 3 ovate acuminate 1-nerved bracts; umbel usually between 10- and 25-flowered, erect; pedicels unequal in length, 1 to 3 times that of the perianth, becoming flexuous and rigid in fruit; perianth rotate-campanulate; perianth segments 6-9 mm. long, ovate to lanceolate, obtuse to acute, entire, spreading, bright yellow, sometimes tinged with red, fading with age and sometimes upon drying becoming papery and rigid in fruit, the midribs somewhat thickened; stamens two thirds to three fourths the length of the perianth; filaments subulate, dilated and

united into a cup at base; anthers oblong, obtuse; ovary crestless or rarely crested with 6 low processes that may be distinct or united in pairs across the septa; style linear, about equaling the filaments in length; stigma capitate, entire or obscurely lobed; seeds black, shining, finely alveolate, the alveoli not pustuliferous. Rocky slopes and plains in mts. of the Trans-Pecos, Apr.-May; endemic.

6. *Allium macropetalum* Rydb. Bulb ovoid, without basal bulblets, usually one of a cluster; inner bulb coats whitish, epidermal cells vertically elongate and regular or obscure; outer bulb coats persisting as a series of brown fibrous usually coarse-meshed open reticula, enclosing 1 or more bulbs; fleshy bulb scales about 3, mildly garlic-flavored; leaves usually 2 per scape, semiterete, scarcely channeled and concavo-convex in cross section, 1-3 mm. broad, entire, exceeding the scape in length, green at anthesis; scape 5-20 cm. tall, terete or somewhat angled, solitary; spathe membranaceous, acuminate, breaking before anthesis into 2 or 3 separate or partially united ovate to lanceolate mostly 3- to 5-nerved bracts; umbel 10- to 20 (rarely fewer- or more-) flowered, erect; pedicels unequal in length, 2 to 3 times that of the perianth, becoming more or less flexuous and rigid in fruit; perianth broadly campanulate; perianth segments 8-12 mm. long, lanceolate, obtuse to acuminate, entire, spreading, pink with deeper pink or reddish midribs, becoming papery in fruit, the midribs scarcely thickened; stamens about two thirds the length of the perianth; filaments subulate, dilated and united into a cup at base; anthers oblong, obtuse; ovary usually conspicuously crested with 6 flattened processes that are mostly well-developed in fruit, often as much as 2 mm. high, usually united in pairs across the septa; style linear, about equaling the filaments in length; stigma capitate, entire or obscurely lobed; seeds black, shining, finely alveolate, the alveoli not pustuliferous. *A. deserticola* (M. E. Jones) Woot. & Standl. Desert plains and hills in the Trans-Pecos, Mar.-May; from Tex. to Ariz., Ut. and w. Colo.

7. *Allium Geyeri* Wats. Bulb ovoid or more elongate, without basal bulblets, usually one of a cluster; inner bulb coats whitish, epidermal cells vertically elongate and regular or obscure; outer bulb coats persisting as a series of gray or brown fibrous rather coarse-meshed open reticula, enclosing 1 or more bulbs; fleshy bulb scales 3 or 4, strongly garlic-flavored; leaves ordinarily 3 or more per scape, channeled, concavo-convex in cross section, 1-5 mm. broad, entire or denticulate on the margins, usually shorter than the scape, green at anthesis; scape 1-5 dm. tall, terete or somewhat angled, solitary; spathe membranaceous, acuminate, breaking before anthesis into 2 or 3 separate or partially united ovate to lanceolate acuminate mostly 1-nerved bracts; umbel 10- to 25- (sometimes more-) flowered, erect; pedicels nearly equal in length, often less than twice that of the perianth, becoming rigid and stiffly spreading in fruit, usually not flexuous; perianth urceolate-campanulate; perianth segments 4-10 (usually 6-8) mm. long, ovate to lanceolate, obtuse to acuminate, erect, pink or white, often obscurely toothed on the margins and papillose on the midribs, becoming callous-keeled and permanently investing the fruit; stamens usually shorter than the perianth; filaments subulate, dilated and united into a cup at base; anthers oblong, obtuse or umbonate; ovary inconspicuously crested with 6 low rounded knobs that are separate or united in pairs across the septa, becoming variously developed or obsolete in fruit, usually not more than 0.5 mm. high; style linear, about equaling the filaments in length; stigma capitate, entire or obscurely lobed; seeds black, shining, finely alveolate, the alveoli each with a minute pustule in the center. Moist open slopes, meadows or stream banks in the Guadalupe Mts., July; from Tex. to Ariz., Ida., Wash. and s. Alta.

8. *Allium cernuum* Roth. NODDING ONION. Bulb elongate, usually one of a cluster, often stipitate (short-rhizomatous) at base; inner bulb coats whitish to pinkish or reddish; outer bulb coats grayish or brownish, membranaceous, minutely striate with elongate cells in regular vertical rows; leaves several per bulb, channeled, concavo-convex to broadly V-shaped in cross-section or nearly plane, 1-6 mm. broad, entire or denticulate on the margins, shorter than the scape, green at anthesis; scape 1-5 dm. tall, terete or ridged (particularly above), sometimes flattened and narrowly winged, abruptly recurved near the apex, sometimes two or more produced successively from a single bulb; spathe membranaceous, acuminate, usually breaking irregularly and caducous at anthesis; umbel few- to many-flowered, cernuous; pedicels slender, 2 to 3 times the length of the perianth, in fruit becoming stouter, elongating and bending abruptly upward from near the point of attachment; perianth campanulate; perianth segments 4-6 mm. long, elliptic-ovate,

obtuse to obtusish, entire to nearly so, pink or white, at least the outer segments strongly incurved, withering in fruit, the midribs not thickened; stamens exerted; filaments subulate, united into a cup at base; anthers orbicular to oblong, obtuse; ovary conspicuously crested with 6 distinct flattened entire or toothed processes; style linear, exerted; stigma entire; seeds dull-black, finely alveolate, the alveoli smooth to minutely roughened or with a minute pustule in the center. In mts. of the Trans-Pecos, late summer; from Tex. and adj. Mex. to Ariz. and B.C., across continent then s. to Ga.

9. *Allium stellatum* Ker. PRAIRIE ONION. Bulb ovoid, usually one of a cluster, not stipitate at base; inner bulb coats whitish or pinkish; outer bulb coats grayish or brownish, membranaceous, minutely striate with elongate cells in regular vertical rows; leaves several per bulb, channeled, broadly V-shaped in cross section, 1-5 mm. broad, entire or nearly so, shorter than the scape, usually withering at or before anthesis; scape 2-5 dm. tall, terete or angled (particularly above), usually erect, solitary; spathe membranaceous, acuminate, breaking before anthesis into 2 separate or united lanceolate acuminate about 7-nerved ultimately reflexed bracts; umbel many-flowered, at first cernuous but later becoming erect; pedicels slender, 2 to 3 times the length of the perianth, in fruit becoming stouter and more or less curved; perianth stellate; perianth segments 5-8 mm. long, elliptic-lanceolate, acute, entire, deep pink, spreading, withering in fruit, the midribs not thickened; stamens exerted; filaments subulate, dilated below and united into a cup at base; anthers oblong, obtuse; ovary conspicuously crested with 6 distinct flattened entire or toothed processes; style linear, exerted; stigma entire; seeds dull-black, finely alveolate, the alveoli minutely roughened. Prairies, usually in calcareous soils in n.e. Tex., Oct.; from Tex. to Man. and Ill.

10. *Allium Elmendorffii* M. Ownbey. Bulb ovoid, bearing a few short-stalked basal bulblets; innermost 2 bulb coats whitish, with the cells of the inner epidermis vertically elongate or contorted, with very sinuous walls; outer bulb coats thin, membranaceous, without persistent fibers; fleshy bulb scale 1, mildly garlic-flavored; leaves 3 or more per bulb, channeled, concavo-convex in cross section, 1-2 mm. broad, entire, usually equaling or exceeding the scape in length, green at anthesis; scape 1.5-4 dm. tall, terete or nearly so, sometimes two produced successively from a single bulb; spathe membranaceous, acuminate, breaking before anthesis into 3 or 4 acuminate 3- to 5-nerved separate or partially united bracts; umbel 10- to 30-flowered, erect; pedicels usually more than twice the length of the perianth, elongating in fruit; becoming subequal in length, rigid and somewhat flexuous; perianth campanulate; perianth segments about 5 mm. long, lanceolate, obtuse, entire or nearly so, somewhat spreading, white or pinkish, withering away from the fruit, with the midribs slightly thickened; stamens shorter than the perianth; filaments subulate, dilated below and united into a cup at base; anthers oblong, obtuse; ovary crestless; style linear, about equaling the filaments in length; stigma capitate, entire to distinctly lobed; seeds black, shining, finely alveolate, the alveoli smooth. In Carrizo sands of e. Bexar and adj. Wilson and Atascosa cos., Mar.-Apr.; endemic.

11. *Allium rhizomatum* Woot. & Standl. Bulb ovoid, solitary, 1-2.5 cm. long, about 1 cm. in diameter, arising from slender scaly rhizomes 2-3 cm. long; inner bulb coats white and hyaline, with a few indistinct longitudinal nerves but not reticulate; outer bulb coats grayish and opaque; leaves 2 or 3 per bulb, about as long as or longer than the scape, flat, 2-3 mm. wide; scape 2-3 dm. tall, terete; spathe 2-valved, the scarious ovate acute valves at first pinkish-veined but eventually reflexed and white; umbel erect, few-flowered; pedicels 1-2 cm. long; perianth segments oblong to lanceolate, acute to acuminate, 6-9 mm. long, pale with purplish or pinkish midvein, slightly carinate at the base; stamens about equaling the perianth, included; filaments dilated at the base and coalescent; ovary slightly crested; style linear, shorter than the perianth; stigma small, simple; seeds shiny black, finely alveolate, the alveoli not pustuliferous. *A. glandulosum* of auth. On grassy mt. slopes in the Trans-Pecos, July-Sept.; from w. Tex. to s. Ariz., s. through Mex. to Guat.

12. *Allium Kunthii* G. Don. Bulb ovoid, usually one of a cluster, about 2 cm. in diameter, sometimes stipitate (short-rhizomatous) at base but without long slender rhizomes; inner bulb coats whitish or pinkish; outer bulb coats grayish or brownish, membranaceous, with or without obscure cellular markings, sometimes striate with elongate cells in regular vertical rows; leaves several per bulb, channeled, concavo-convex in cross-section, 1-3 mm. broad, sometimes denticulate on margins and nerves, shorter

than the scape, green at anthesis; scape 1.5-3 dm. tall, terete or somewhat ridged, often 2 or more produced successively from a single bulb; spathe membranaceous, acuminate, breaking before anthesis into 2 separate or partially united lanceolate acuminate 3- to 5-nerved ultimately reflexed bracts; umbel few- to many-flowered, erect; pedicels unequal in length, mostly slender, about twice the length of the perianth, rarely arcuate or flexuous; perianth broadly campanulate; perianth segments 4-8 mm. long, lanceolate, acute to acuminate, entire, spreading, white or pink (particularly on the midribs), withering in fruit, the midribs scarcely thickened; stamens shorter than the perianth; filaments broadly dilated below and united into a cup at base; anthers oblong, obtuse; ovary crestless; style linear, shorter than the perianth; stigma capitate, entire; seeds dull-black, finely alveolate, the alveoli not or very obscurely pustuliferous. *A. scaposum* Benth. Dry rocky hills and mts., usually in limestone soils, in w. Tex., July-Sept.; from Tex. to Ariz. and Mex.

9. NOTHOSCORDUM KUNTH*

FALSE GARLIC

About 35 species in America.

1. *Nothoscordum bivalve* (L.) Britt. CROW-POISON. Scapose herb resembling the onion but odorless, with a membranous-coated bulb; scape 15-55 cm. high; bulb globose, to 25 mm. in diameter, often bulbiferous at base; leaves several, basal, narrowly linear, equal to or shorter than the scape, rarely to 8 mm. wide; umbel terminal, 6- to 12-flowered, the 2 subtending scarious bracts lanceolate; flowers with pedicels to 5 cm. long or more that become rather rigid in fruit; floral segments narrowly oblong to oblong-lanceolate, acute, whitish with a prominent reddish to purplish or sometimes greenish central dorsal stripe, 8-13 mm. long, withering-persistent; stamens 6, inserted on the bases of the floral segments; capsule 4-7 mm. long, obovoid, somewhat 3-angled, somewhat depressed and notched at apex, the style persistent; seeds angled or flattened, black. In low sandy woods, grasslands, prairies and disturbed soil, and on rocky open or wooded slopes throughout most of Tex., flowering intermittently throughout the year; from Fla. to Tex. and Mex., n. to Va., s. O., Ind., s. Ill. and Neb.

10. HEMEROCALLIS L.

DAY-LILY

About 20 species that are natives of Eurasia.

1. *Hemerocallis fulva* L. TAWNY DAY-LILY, YELLOW DAY-LILY. Showy perennial with fleshy-fibrous roots or tubers; leaves numerous, basal, linear, keeled, 1-2 cm. broad; scape to 2 m. high, 3- to 15-flowered; flowers self-sterile, about 12 cm. wide, tawny-orange, deeper-colored toward center, the 3 inner perianth segments (petals) wavy-margined and obtuse, collapsing and decaying after expanding for a single day; perianth funnel-form, lilylike, the short tube enclosing the ovary, the spreading limb 6-parted; stamens 6, inserted at the summit of the perianth tube; anthers as in *Lilium* but introrse; filaments and style long and filiform, declined and ascending; stigma simple; capsule (at first rather fleshy) 3-angled, loculicidally 3-valved, with several black spherical seeds in each cell. An Old World species that has escaped from cult. to roadsides and borders of fields and thickets, Apr.-July.

11. LILIUM L.

LILY

Bulbs scaly, producing simple stems with numerous alternate-scattered or whorled narrow sessile leaves and from one to several large and showy flowers; perianth funnel-form or campanulate, mostly red to orange-color, the 6 divisions spreading or recurved above, deciduous; anthers linear to oblong, extrorsely attached near the middle to the tapering apex of the long filament, at first usually included but at length versatile, the cells dehiscent by a lateral or slightly introrse line; style elongate or very short (dimorphic); stigma 3-lobed; capsule subcylindric to ovoid; seeds densely packed in 2 rows in each cell.

About 80 species that are widely distributed over the North Temperate Zone.

* See Appendix.

1. Flowers erect, their segments narrowed below into claws; bulbs not rhizomatous; in mountains of Trans-Pecos Texas 1. *L. philadelphicum*.
1. Flowers nodding, their segments sessile; buds erect, their peduncles arching before anthesis, then becoming erect in fruit; bulbs rhizomatous; in forests of east Texas 2. *L. Michauxii*.

1. *Lilium philadelphicum* L. WILD ORANGE-RED LILY, WOOD LILY. Stem to 1 m. high, usually much shorter, glabrous; leaves in 2 to 6 whorls or sometimes scattered, linear or lanceolate to linear-lanceolate or rarely elliptic-oblong; flowers 1 to 5, erect, open-campanulate, from faded orange to scarlet or deep orange-red, with oblong to roundish purple spots within; segments oblong-lanceolate to lanceolate or broadly elliptic, glabrous, blunt or merely short-acuminate at apex, rather abruptly tapering below into claws, 5-8 cm. long, about 2.5 cm. wide; capsule to 55 mm. long, broadly rounded-subtruncate at summit, slightly tapered at base. In canyons of Guadalupe Mts. in the Trans-Pecos, May-Aug.; from Que. to B.C., s. to Ark., Tex., N.M. and Ariz.

Our plant is referred to var. *andinum* (Nutt.) Ker (*L. umbellatum* Pursh), characterized by having its linear to lanceolate leaves mostly scattered or in whorls only at the upper nodes, and flowers intensely red to scarlet.

2. *Lilium Michauxii* Poir. CAROLINA-LILY. Stem to 12 dm. high, usually much smaller; leaves mostly in whorls of 3 to 7, with some scattered or opposite, coriaceous or fleshy, glaucous when fresh, obovate or oblanceolate, blunt to abruptly short-tipped, their lateral veins obscure beneath, the larger blades to 12 cm. long and 25 mm. wide; flowers 1 to 3, nodding; perianth segments orange-red, purple-spotted within and becoming yellow in the throat, recurved from about the middle, narrowly lanceolate, acuminate, to 1 dm. long and 1 cm. wide; stigma with low broad lobes. *L. carolinianum* Michx. Pine- and oak-woods in s.e. Tex., July-Aug.; from n. Fla. to e. Tex., n. to Va.

12. ERYTHRONIUM L.²⁷

DOG'S-TOOTH-VIOLET. FAWN-LILY

Nearly stemless herbs with two or one smooth and shining flat leaves tapering into petioles and sheathing the base of the commonly one-flowered scape, rising from a deep solid scaly bulb; flowers perfect, rather large, nodding, lilylike; floral segments 6, lanceolate, recurved or spreading, mostly 2-4 cm. long, deciduous, the 3 inner segments sometimes with a callous tooth on each side of the base and a groove in the middle; filaments 6, subulate; anthers oblong-linear, often dimorphic; style elongated; capsule obovoid, contracted at base, 3-valved, loculicidal; seeds rather numerous.

About 25 species, almost entirely North American with several in Eurasia.

1. Perianth segments yellow, auricles present; lower surface of leaves not glaucous ... 1. *E. rostratum*.
1. Perianth segments white, auricles absent; lower surface of leaves glaucous (2)
- 2(1). Perianth segments reflexed in full bloom; leaves mottled; mature fruits held above ground; in moist woods 2. *E. albidum*.
2. Perianth segments spreading to at most half-reflexed in full bloom; leaves not mottled; mature fruits resting on ground; in prairies, pastures and dry woods 3. *E. mesochoreum*.

1. *Erythronium rostratum* Wolf. Leaves 2 in flowering forms, 1 in immature forms, strongly mottled on adaxial side at anthesis with purplish-brown pigment, not glaucous; flowers with yellow segments, the outer 3 segments with intense purplish-brown specks on abaxial side, the inner 3 segments with well-developed auricles at base which clasp the opposite filaments; stamens 6; filaments opposite inner floral segments slightly longer than those opposite the outer segments; anthers yellow, those opposite the inner floral segments maturing before those opposite the outer segments; stigma lobes swollen, short, erect; style persistent, forming a prominent beak on the capsule; fruit ellipsoidal, beaked,

²⁷ Ref.: Kenneth R. Robertson in Ann. Missouri Bot. Gard. 53: 197-204. 1966.

held erect at maturity. *E. americanum* of auth. In rich moist woods, especially along creek or river banks in e. Tex., Feb.-Apr.; from Ala., Tenn., Kan., Mo., Okla. and Ark. to Tex.

2. *Erythronium albidum* Nutt. **WHITE DOG'S-TOOTH-VIOLET.** Plant vegetatively propagating by long offsets from the bulbs; leaves 2 in flowering forms, 1 in immature forms, elliptical-lanceolate to ovate-lanceolate, flat to half-folded, mottled on both sides with purplish-brown or light-green, glaucous on both sides; flowers with white segments, often tinged on abaxial side with pink, blue or lavender; perianth segments usually completely reflexed in full bloom; 3 inner segments without auricles, with a yellow spot present at base; stamens 6; filaments opposite the inner segments slightly longer than those opposite the outer segments; anthers yellow, those opposite the inner segments maturing before those opposite the outer segments; stigmas trifid, the long lobes divergent, slender, the style not persistent; fruit obovate, held erect at maturity, rounded, slightly apiculate or slightly umbilicate at distal end. In moist dense woods, especially along slopes or banks overlooking creeks, lakes and rivers in n.e. Tex., Mar.-May; from Ont. and Minn., s. to Ga., Ky., Mo. and Tex.

3. *Erythronium mesochoreum* Knerr. Leaves 2 in flowering forms, 1 in immature forms, lanceolate to linear-lanceolate, conduplicate or occasionally half-folded, usually not mottled, glaucous on both sides; flowers with white segments, often tinged on abaxial side with blue or lavender; perianth segments spreading or at most half-reflexed in full bloom; the 3 inner segments without auricles, with a yellow spot present at the base; stamens 6; filaments opposite the inner segments slightly longer than those opposite the outer segments; anthers yellow, those opposite the inner segments maturing before those opposite the outer segments; stigmas trifid, the long lobes divergent and slender; style not persistent on fruit; fruit obovate, resting on ground at maturity, umbilicate at distal end. *E. albidum* var. *mesochoreum* (Knerr) Rickett. In prairies, pastures and dry open woods, mostly in n.-cen. Tex., Mar.-Apr.; from Ia., Mo., Neb., Kan., Okla. and Tex.

13. IPHEION RAF. SPRING STAR-FLOWER

About 25 species that are natives of Latin America, especially Argentina.

1. *Ipheion uniflorum* (Lindl.) Raf. Scapose glabrous bulbous perennial with the odor of onion; bulbs with membranous tunic; leaves basal, linear, nearly flat, obtuse, to 3 dm. long and 7 mm. wide, slightly glaucous, with a long closed tubular scarious sheath; scapes to 2 dm. tall, bearing a 2-valved bractlike dry spathe above the middle and 1 or 2 flowers at the summit; flowers erect, salvershaped, 2-3 cm. broad; floral segments pointed, 1-1.3 cm. wide, more or less equal and basally connate into a tube, white with pale-blue tinge, with a darker central line and dorsally brownish-tinged; stamens 6, inserted on perianth tube. *Triteleia uniflora* Lindl., *Milla uniflora* (Lindl.) Grah., *Brodiaea uniflora* (Lindl.) Engl., *Beauverdia uniflora* (Lindl.) Herter. A nat. of Arg. that occurs as an escape from cult., increasing rapidly in sandy clay soils in lawns and yards, Feb.-Mar.

14. ANDROSTEPHIUM TORR.

Three species that are native of southwestern United States and Mexico.

1. *Androstephium coeruleum* (Scheele) Torr. Scapose herbs with a fibrous-coated corm, glabrous, gray-green; scape erect, to 25 cm. high, usually less than 15 cm.; leaves several, basal, arising from a broad loose scarious sheathing bract, slender-linear, to 3 dm. long; flowers 1 to 6 in umbels, 16-24 mm. long, fragrant, violet-purple, funnelliform, usually exceeding the stout pedicels; corolla tube nearly as long as the limb, the crown scarcely shorter than the limb, the 6 oblong lobes exceeding the 6 anthers, 1-nerved; capsule subglobose, 3-angled, about 15 mm. long, beaked; seeds large, black. *A. violaceum* Torr., *Milla coerulea* Scheele, *Brodiaea coerulea* (Scheele) Macbr. On grassy slopes, sandy hills, gypsum soils and similar areas, mostly in n.-cen. Tex., Feb.-May; from w. Kan. to Tex.

15. MILLA CAV. MEXICAN STAR

About 6 species from southern United States to Central America.

1. *Milla biflora* Cav. Low bulbous plant; leaves several, slender, terete, tubular, glaucous; scape slender, erect, with numerous small linear scarious bracts at the base of a terminal umbel, to about 5 dm. high; umbels 1- to 6-flowered; pedicels suberect, 5-15 cm. long; flowers white, fragrant, funnellform, the perianth tube about 13 mm. long; perianth segments oblong-lanceolate, fleshy, over 25 mm. long, with an external green keel; stamens 6, inserted at mouth of perianth tube; anthers lemon-yellow, about 7 mm. long; capsule elongate, 3-celled, with numerous seeds. In mts. of the Trans-Pecos, spring-summer; also Mex.

16. CAMASSIA LINDL. WILD HYACINTH

About 6 species in North America.

1. *Camassia scilloides* (Raf.) Cory. Perennial from a tunicated bulb; leaves crowded at base of scape, their bases clasping and surrounded by a sheathing scarious bract, keeled, elongate, grasslike, to about 15 mm. wide; scape to 8 dm. high, exceeding the leaves; raceme elongated and cylindrical; bracts setaceous, usually longer than the pedicels; flowers sweet-scented, lavender to pale-blue; floral segments distinct, 1-1.4 cm. long, 3-nerved, spreading or erect; capsule acutely triangular-globose, 3-valved, about 1 cm. long; seeds roundish, angled, black and shining. *Quamasia hyacinthina* (Raf.) Britt. In sandy or rocky soils in fields, meadows, prairies and open woodlands from cen. Tex. northw., Mar.-May; from Ala. to Tex., n.e. and n. to Pa., s. Ont., Mich., Wisc., Ia. and Kan.

A phase that blooms later and has small flowers with erect segments is sometimes referred to as *C. angustata* (Engelm. & Gray) Blank.

17. MUSCARI MILL. GRAPE-HYACINTH

About 60 species that are native of the Old World.

1. *Muscari racemosum* (L.) Mill. STARCH GRAPE-HYACINTH. Leaves and scape (in early spring) from a membranous-coated bulb; leaves linear-subterete, furrowed or slenderly channeled, 1.5-3 mm. broad, lax; scape erect, to about 2 dm. high; raceme dense, ovoid, many-flowered, to 65 mm. long; pedicels mostly shorter than the flowers; perianth blue, ellipsoid, somewhat constricted at the throat, with 6 pale teeth, heavily musky-odored; stamens 6, included; anthers short, introrse; style short; capsule 3-sided, loculicidal, with 2 black angular seeds in each cell. A nat. of the Medit. region that escapes from cult. to fields, roadsides, lawns, fallow ground in various parts of the state, Mar.-May.

18. HESPERALOE ENGELM.

A genus of 2 species in Mexico and Texas.

1. *Hesperaloë parviflora* (Torr.) Coult. RED-FLOWERED YUCCA. Caudex very short, sending up a slender sparingly bracteate flowering stem, usually cespitosely suckering; leaves numerous, crowded at base, linear, arcuately spreading, long-attenuate, to 12 dm. long and 25 mm. wide or more, thick and striate-ridged on the back, the margins filiferous; flowering stem to about 25 dm. high, the few branches of the inflorescence divaricate, glabrous and subglaucous; bracts broad and acuminate, rather large; flowers fascicled above the bracts, with soft articulated rosy pedicels to 35 mm. long, ephemeral, rosy-red or salmon-colored, tubular to oblong-campanulate, 25-35 mm. long; stamens shorter than corolla, with smooth subulate-filiform filaments and anthers 2 mm. long; style filiform, long-exserted or scarcely exceeding the perianth; capsule ovoid, 3-celled, to 3 cm. or more long; seed black, flattened, about 8 mm. in diameter. Prairies, rocky slopes and mesquite groves, mostly in cen. Tex., Mar.-July; also Mex.

The plant with more slender and flexuous branches, smaller bracts, flowers about 25 mm. long, longer anthers, and the stouter included style scarcely longer than the ovary has been segregated as var. *Engelmannii* (Krauskopf) Trel.

19. YUCCA L.²⁸

BEARGRASS. SPANISH-BAYONET

Usually large plants with a thick branching mainly subterranean caudex or a distinct woody trunk above ground; leaves numerous, clustered at the ends of the branches or main stem, narrow, elongate, thin and flaccid or thick and rigid, commonly spine-tipped, with corneous or filiferous margins; flowers rather large, usually numerous, perfect, in terminal racemes or panicles; perianth of 6 rather thick white to cream-color or greenish oval to oblong or lanceolate flattish or somewhat concave segments that are withering-persistent, the 3 inner segments (petals) broader than the 3 outer ones (sepals), longer than the 6 stamens; stigmas 3; fruit dry or fleshy, dehiscent or indehiscent; seeds numerous in each cell, flattened, commonly blackish.

An American genus of 30 or more species most frequent in arid regions. It is essentially impossible to construct a key for the identification of yucca species based solely upon limited material usually provided by most herbarium specimens. A habit photograph of the plant to accompany herbarium material would be extremely useful. Identification in the field is the only sure method.

According to Kearney and Peebles (1960), "The yuccas are an important resource of the Indians of the Southwest. The buds, flowers, and emerging flower stalks are eaten raw or boiled, or the flower stalks roasted like mescal. The large, pulpy fruits of the baccate species (*Y. baccata*, etc.) are eaten raw or roasted, dried for winter use, or ground into meal, and the seeds are also used for food. A fermented beverage was made from these fruits. Fiber from the leaves furnishes material for rope, mats, sandals, baskets, and cloth. The roots, known as amole, have saponifying properties and are used as a sort of soap and as a laxative. The seeds are the natural food of the larvae of small moths, which pollinate the flower by gathering the pollen into a mass that is pushed into the tube of the stigma."

1. Fruit indehiscent, fleshy, eventually pendent; leaf blade thickish, rigid and sword-like, 3 cm. wide or more (2)
1. Fruit dehiscent, capsular, dry or somewhat fleshy, not pendent; leaf blade mostly narrow and/or thinnish, rarely to 3 cm. wide (6)
- 2(1). Pistil 45 mm. long or more at anthesis; united portion of perianth extending perceptibly above base of ovary (3)
2. Pistil rarely as much as 40 mm. long; united portion of the perianth scarcely extending above the base of the ovary (5)
- 3(2). Perianth segments united into a short stoutish somewhat obconical or cup-shaped base 12 mm. long or less; fruit 12-17 cm. long, 4-6.5 cm. in diameter 1. *Y. baccata*.
3. Perianth segments united into a slender somewhat obconical or nearly tubular base 12-25 mm. long; fruit 7-10 cm. long, 2.5-4 cm. in diameter (4)
- 4(3). Peduncle exceeding the foliage; panicle ellipsoidal; perianth segments commonly united for 25 mm. 2. *Y. carnerosana*.
4. Peduncle not exceeding the foliage; panicle broadly conoid; perianth segments rarely united for more than 15 mm. 3. *Y. Faxoniana*.
- 5(2). Leaf margins without free fibers; ovary short, slender for its length, not exceeding 7 mm. in diameter at anthesis 4. *Y. Treculeana*.
5. Leaf margins with detachable fibers; ovary short, stout for its length, 7-12 mm. in diameter at anthesis 5. *Y. Torreji*.
- 6(1). Leaf margins corneous, smooth or usually denticulate, lemon-yellow to orange-red; pistils usually 3-2-4 cm. long (7)
6. Leaf margins filiferous; pistils 2-3.2 cm. long (11)

²⁸ Adapted mainly from Susan Delano McKelvey, *Yuccas of the Southwestern United States*. Part 1 (1938), Part 2 (1947), and John Milton Webber, *Yuccas of the Southwest*. U.S. Dept. Agric., Agric. Mon. No. 17. 1953.

- 7(6). Mature plants solitary, arborescent; leaves many in one head; inflorescence many-flowered, many-branched (8)
7. Mature plants forming clumps, acaulescent; inflorescence few-flowered, few-branched (9)
- 8(7). Mature plants 1-2 m. high (not including the inflorescence); inflorescence 1-1.5 m. in length overall; mature leaf blades short, mostly 3 dm. long or less, slender, about 7 mm. wide, widest at or above the middle, more or less scabrous on both surfaces 6. *Y. Thompsoniana*.
8. Mature plants 3-3.6 m. high (not including the inflorescence); inflorescence 1.5-2 m. long or more in overall length; leaf blades long, to 6 dm. long or more, 7-13 mm. wide, widest considerably above the middle, smooth on both surfaces 7. *Y. rostrata*.
- 9(7). Plants usually with 10 to 30 heads of leaves in one clump; mature leaf blades straight, flat except near tip (where sides inroll), with flat yellow margins; inflorescence with wide-spreading branchlets 8. *Y. pallida*.
9. Plants with a single head of leaves or in small clumps with 2 to 6 heads of leaves (10)
- 10(9). Mature leaf blades twisted, very concave (the sides turned inward for most of their length), with wavy dark-orange or red-brown margins, to about 40 mm. wide at greatest width; perianth segments 3.5-4 cm. long 9. *Y. rupicola*.
10. Mature leaf blades nearly flat, straight and rigid, the minutely denticulate margins somewhat reddish-yellow, to about 15 mm. wide at greatest width; perianth segments 5-6 cm. long 10. *Y. Reverchonii*.
- 11(6). Mature plant manifestly arborescent, with a thick long stem; head of leaves commonly large 11. *Y. elata*.
11. Mature plant acaulescent or rarely with a thin short stem to 1 m. high; head of leaves commonly small (12)
- 12(11). Leaves typically broad and thin, usually soft and limp, with some becoming bent over near the middle, to 50 mm. wide (13)
12. Leaves typically narrow and stiff, mostly straight or merely recurved, 22 mm. wide or less, very rarely with some leaves wider (14)
- 13(12). Panicle branches glabrous; perianth yellowish-green or greenish-white; panicle held well above the leaves; indigenous 12. *Y. Freemanii*.
13. Panicle branches pubescent; perianth bright-white; panicle held close to the leaves; cultivated 13. *Y. flaccida*.
- 14(12). Inflorescence held well above tips of leaves (separated from leaves by its own length or more when fully expanded), broadly paniced (usually more than half as broad as long) (15)
14. Inflorescence held just below to moderately above tips of leaves (separated from leaves by less than half its own length), spikelike or rather narrowly paniced (usually less than half as broad as long) (17)
- 15(14). Distribution in east Texas (east of prairies); panicle branches pubescent; at anthesis the ovary and style subequal 14. *Y. louisianensis*.
15. Distribution west of east Texas; panicle branches not pubescent; at anthesis the ovary and style commonly unequal (16)
- 16(15). Panicle branches glabrous; style pale green; distribution mainly in west and west-central Texas 15. *Y. constricta*.
16. Panicle branches puberulent to glabrescent; style white; distribution mainly in south-central Texas 16. *Y. tenuistyla*.
- 17(14). Distribution in the Plains Country and eastern Trans-Pecos region of west Texas; bracts under lowest flowers commonly 3-7 cm. long; leaves mostly 1 cm. wide or less (18)
17. Distribution east of the Plains Country and Trans-Pecos region; bracts under lowest flowers 1-1.3 cm. long; leaves mostly more than 1 cm. wide (19)

- 18(17). Pistil 30-37 mm. long; distribution mainly in northern High Plains 17. *Y. angustifolia*.
18. Pistil 25-28 mm. long; distribution in South Plains and eastern Trans-Pecos region ..
..... 18. *Y. campestris*.
- 19(17). Ovary about twice as long as the style and stigmas together; inflorescence varying from spikelike to paniced with ascending branches; rather local in north-central Texas 19. *Y. necopina*.
19. Ovary at first slightly shorter than the style and stigma together, becoming longer with age; inflorescence spikelike or with few short spreading branches near base; rather widespread 20. *Y. arkansana*.

1. *Yucca baccata* (Engelm.) Trel. BLUE YUCCA, BANANA YUCCA, DATIL. Plant commonly simple or clumped at ground level or rarely caulescent, with very short assurgent or procumbent stems toward center of clump; clumps 1-5 m. in diameter, with as many as 70 heads of leaves; leaves broadened toward middle, commonly straight or incurved, rarely outcurved, occasionally twisted, rather deeply concavo-convex, quite rigid, 3-7 dm. long, 3-5.5 cm. wide; leaf margin usually with coarse short recurved fibers, occasionally with long curly fibers; scape absent or as much as 13 cm. long; panicle entirely within the foliage or with only a fraction above it, obovoid to ellipsoidal, oblate to acute at apex, 3.5-6 dm. long; flowers campanulate, expanding but little, pendent, white or cream-color, commonly tinged with purple; perianth segments lanceolate to oblanceolate; sepals 4-10 cm. long, 15-28 mm. wide; petals 45-95 mm. long, 2-3 cm. wide; filaments 2.5-4 cm. long; pistil 4-7.5 cm. long; ovary narrowly ovoid and tapering into style at apex, with deep carpel sutures, 7-10 mm. in diameter; style 4-10 mm. long, tapered; fruit 7-24 cm. long, 25-55 mm. in diameter, symmetrical, broadly cylindrical or somewhat tapering, frequently weighing 425 to 500 gm.; seed to 11 mm. in greatest diameter, flat, thick, rough, dull-black, wingless. On rocky hill and mt. slopes and plains of grasslands, juniper and oak woodlands in the w. Edwards Plateau and Trans-Pecos, Apr.-June; from Tex. to Calif. and adj. Mex.

Apparent hybrids occur where this species and *Y. Torreyi* are admixed.

2. *Yucca carnerosana* (Trel.) McKelvey. SPANISH DAGGER. Plant arborescent, symmetrical, simple or rarely a tall rather dense clump of stem and heads of leaves, with stems contiguous at base and spreading toward top; stems commonly 1 or 2, of equal or unequal height, rarely as many as 8 of varying height, the older trunklike and to 5 m. high and 35 cm. in diameter, rarely once- or twice-branched toward top, the short branches assurgent; leaves large, in terminal head, 5-10 dm. long, 5-7.5 cm. wide, rigid, spreading; scape rather long, stout; panicle slightly above the foliage, ellipsoidal or oblately ellipsoidal, rather densely branched, with persistent white bracts; flowers white; sepals 7-9.5 cm. long, 13-21 mm. wide; petals 6.5-9 cm. long, 2-2.8 cm. wide; perianth tube 1.7-3 cm. long; filaments 2.2-3 cm. long; pistil 5-6.3 cm. long; ovary 6-9 mm. in diameter; style 6-10 mm. long; fruit oblong, to at least 1 dm. long and 4 cm. in diameter. On rocky brushy slopes in s.-cen. Brewster Co. and an isolated small colony near mouth of McKittrick Canyon in the Guadalupe Mts. in Culberson Co., Mar.-May; also n. Mex.

3. *Yucca Faxoniana* Sarg. Plant arborescent, symmetrical, simple or rarely a tall open clump of stems and heads of leaves, with stems contiguous at base and spreading toward top; stems commonly 1, rarely as many as 6, of varying height, the older trunklike and to 65 dm. high and 4 dm. in diameter, occasionally once or twice assurgently branched; leaves 5-8.5 dm. long, 4.5-7 cm. wide, rigid, spreading; scape rather short and stout; panicle with as much as one fourth of its length within the foliage, broadly conoid, rather openly branched, with white or occasional purple-tinged persistent bracts; flowers white; sepals 55-85 mm. long, 15-17 mm. wide; petals 55-85 mm. long, 1.9-2 cm. wide; perianth tube 1-1.8 cm. long; filaments 2-3.2 cm. long; pistil 4.5-6 cm. long; ovary 6-8 mm. in diameter, narrowly ovoid; style 5-7 mm. long; fruit 3-9 cm. long, 2.5-3 cm. in diameter, slightly tapered above and below with a long curved beak about 2 cm. long; thick and flat or occasionally hemispherical, to 1 cm. wide in greatest diameter, surface rough, dull-black, wingless. On sandy plains, rocky slopes and bluffs in the Trans-Pecos, Mar.-July; also n. Mex.

Apparent hybrids occur where this species and *Y. Torreyi* are admixed.

4. *Yucca Treculeana* Carr. SPANISH DAGGER, PALMA PITA. Plant arborescent, with 1 to few stems of varying height in rather open clumps; stems commonly 1 to 4, assurgently branched, 3-3.5 m. high; leaves commonly in large symmetrical head or occasionally entire shoots bearing fresh leaves, 5-10 dm. long, 4-8 cm. wide, thick, rigid, concavo-convex but frequently flattened; leaf margin thin, entire or with few fine straight fibers; scape short, glabrous; panicle sometimes with as much as three fourths of its length above the foliage, ellipsoidal, dense; flowers small, broadly globose or hemispherical, white or lightly tinged with purple; perianth segments somewhat thickened toward base; sepals 3-4.5 cm. long, 8-15 mm. wide; petals 3-4 cm. long, 1-2 cm. wide; filaments 15-24 mm. long; pistil 2-3 cm. long; ovary 4-6 mm. in diameter, the apex abruptly terminating (shouldered) in the style; style 1-5 mm. long; fruit 6.5-10 cm. long, 17-24 mm. in diameter, cylindrical, with abruptly tapered apex, symmetrical, rarely constricted; carpel suture U-shaped, deep or frequently broad and rather flat; seed to 6 mm. in greatest diameter, flat, thick, rough, dull-black, wingless. Thinly scattered in tall chaparral or brushland in s.-cen. Tex., Feb.-Apr.; also n. Mex.

Those plants with a fleshy inflorescence, succulent throughout, narrowed above and below, and much-thickened, brittle, canaliculate perianth segments are segregated as var. *succulenta* McKelvey. Apparent hybrids occur where this species and *Y. Torreyi* are admixed.

5. *Yucca Torreyi* Shafer. Plant caulescent, rather commonly arborescent, asymmetrical or of ragged appearance, simple to a rather tall narrow fairly dense clump of stems and heads of leaves; stems commonly 1 or 2, occasionally as many as 8, of varying height, the older trunklike, rarely to 43 dm. high and 3 dm. in diameter, unbranched or rarely with 2 or 3 ascending branches; leaf heads solitary or somewhat clustered; leaves few, in a small terminal head or numerous in a large elongated head or cluster, 3-10 dm. long, 3-5 cm. wide, commonly tapered from an enlarged base to the apex, moderately concavo-convex or rarely somewhat flattened, thick, rigid, scabrous on both surfaces, yellowish-green; leaf margin thick, with at first curly (later straight) tough fibers; scape absent or as much as 1 dm. long; panicle commonly with a fraction of its length above the foliage or rarely entirely within the foliage, 3.5-7 dm. long, ellipsoidal, dense; flowers commonly subglobose or campanulate, occasionally fully expanding, cream-color to deeply tinged with dark-purple; perianth segments very variable in shape and size, concave, thickened in the center from base to apex; sepals 35-75 mm. long, 8-18 mm. wide; petals 35-78 mm. long, 1-2.2 cm. wide; filaments 15-27 mm. long; pistil 22-35 mm. long; ovary 4-8 mm. in diameter, rather stout, apex tapering into the style; style 4-8 mm. long; fruit 7-10.5 cm. long, 25-38 mm. in diameter, cylindrical or ovoid, gradually tapered from base to apex, rarely constricted; carpel suture V-shaped, deep and narrow; seed to 9 mm. in greatest diameter, flat, thick, rough, dull-black, wingless. *Y. macrocarpa* of auth., *Y. Torreyi* f. *parviflora* McKelvey. Usually thinly scattered on grassy and chaparral mesas and slopes from the upper Rio Grande Plains and Edwards Plateau to the Trans-Pecos, Mar.-May; also N.M. and n. Mex.

Some forms occur that have bluish green, glaucous leaves.

6. *Yucca Thompsoniana* Trel. Plant arborescent, frequently asymmetrical or rarely symmetrical, with 1 to 3 shoots; stems 1-2.6 m. high, 12-15 cm. in diameter, trunklike, erect with comparatively long assurgent or diffused branches; leaf heads frequently asymmetrical, rather small and composed of comparatively few leaves; leaves 2-3 dm. long, 7-12 mm. wide, linear or somewhat broader toward center, flat or concavo-convex to plano-keeled, striate, thin and flexible; leaf margins corneous, yellow or brownish, minutely denticulate; scape 4-7 dm. long, stout, glabrous or evanescently pubescent; panicle 1-2 dm. above foliage, 5-8 dm. long, narrowly ellipsoidal to somewhat ovoid, densely flowered, with 20 to 34 branchlets that are to 22 cm. long; flowers white, globose to campanulate, spreading flat at anthesis, with an umbonate base; perianth segments narrowly oblong, sharply acuminate, conspicuously veined; sepals 35-67 mm. long, 12-26 mm. wide; petals 4-6.5 cm. long, 11-35 mm. wide; filaments 17-33 mm. long, with a somewhat erect clavate tip; pistil 25-38 mm. long; ovary 4-6 mm. in diameter, slender, usually tapering into style or rarely somewhat abruptly terminating in the style; style 6-18 mm. long, attenuate, white; capsule 3.5-7 cm. long, 2-2.5 cm. in diameter, ellipsoidal or somewhat ovoid, with a long-attenuate or rarely short-attenuate beak and obconical

pedicel, rarely constricted; beak of dry capsule flaring, with long reflexed often twisted valve points; seed to 7 mm. in greatest diameter, flat, thin, dull black, without a marginal wing. Thinly scattered on exposed rocky slopes and knolls in the Trans-Pecos, Apr.-May; also n. Mex.

According to Webber, hybrids between this species and *Y. Reverchonii* occur when they are admixed.

7. *Yucca rostrata* Engelm. Plant arborescent, rather symmetrical, with 1 to 5 shoots; stem 1-4.5 m. high, 18-32 cm. in diameter, trunklike, erect, with none to 3 short assurgent branches toward the top, both stem and branches covered with reflexed dead leaves; leaf head symmetrical, large and elongated; leaves numerous, 4.2-6 dm. long, 12-17 mm. wide, linear or somewhat broader toward center, flat, concavo-convex or keeled on both surfaces, striate, thin, flexible, glaucous, pungent; leaf margin corneous, yellow, hyaline, minutely denticulate; scape 3-7 dm. long, stout, glabrous or evanescently pubescent; panicle not or up to 2 dm. above foliage, 3.5-7 dm. long, narrowly ellipsoidal to somewhat ovoid, densely flowered, with 28 to 40 branchlets that are to 35 cm. long; flowers white, globose to campanulate, fully expanding at anthesis, with an umbonate base; perianth segments narrowly oblong, sharply acuminate, conspicuously veined; sepals 42-47 mm. long, 12-15 mm. wide; petals 4.2-5 cm. long, 1.1-2 cm. wide; filaments 1.7-2 cm. long, with a somewhat erect clavate tip; pistil 25-35 mm. long; ovary 4-6 mm. in diameter, usually tapering into style or rarely somewhat abruptly terminating in style; style 6-14 mm. long, attenuate, white; capsule 3.5-7 cm. long, 18-25 mm. in diameter, ellipsoidal to somewhat ovoid, with a long-attenuate or rarely short-attenuate beak and obconical pedicel, rarely constricted; beak of dry capsule flaring, with long valve points outcurved and twisted; seed to 7 mm. in greatest diameter, flat, thin, dull-black, without a marginal wing. On mt. slopes and in canyons in Brewster Co., Mar.-Apr.; also n. Mex.

8. *Yucca pallida* McKelvey. Plants acaulescent, forming small or moderately large open clumps with rather widely separated heads of few leaves; heads of leaves as many as 30 in one clump; leaves 18-35 cm. long, 1-3.2 cm. wide, usually flexible where not thickened, glaucous, finely striate, pale blue- to sage-green; leaf margins corneous, yellowish, about 1 mm. thick, usually very finely denticulate; flowering stem long-exserted, 13-25 dm. long; scape 6-13 dm. long; panicle 7-12 dm. long, branched from base to the racemose tip, the 10 to 20 branchlets 5-20 cm. long; flowers numerous, 5-6.5 cm. long; perianth segments pale-green with whiter margins, 2-3.2 cm. wide, ovate to elliptic or obovate; filaments 23-32 mm. long, long-pubescent; pistil 3.2-4 cm. long; ovary stout or slender, pale-blue-green to yellowish-green, the neck whitish; style oblong-cylindric to slightly ovoid, 1.3-2 cm. long, white; capsule 4.5-5 cm. long, 1.3-2 cm. in diameter, oblong-cylindric, usually symmetrical, at first tan, later black, the beak about 1 cm. long, the wall thickish; seeds small. Incl. var. *edentula* (Trel.) Cory. Mainly on the Blackland Prairies in n.-cen. Tex., Apr.-May; endemic.

9. *Yucca rupicola* Scheele. TWISTED-LEAF YUCCA. Plant acaulescent, solitary but soon becoming an open clump of as many as 15 scattered leaf heads; leaf heads large, spreading, with few leaves; leaves 3-6 dm. long, 2-4 cm. wide, very broad toward middle, concave or flat but oblique and undulate or twisted, slightly striate, flaccid, dark-green, pungent; leaf margin hyaline, reddish-brown or occasionally yellow, minutely denticulate; scape 3.5-15 dm. long, slender, 1.5-2 cm. in diameter, glabrous to lightly floccose; panicle 2.5-5 dm. above foliage, 3-10 dm. long, narrowly ovoid to narrowly pyramidal, few-flowered, with 8 to 16 branchlets; branchlets up to 1.3 dm. long; flowers mainly campanulate, pendent and expanding but little, rarely somewhat globose and open, white or greenish-white; perianth segments ovate, sharply acuminate; sepals 4-6.8 cm. long; 15-24 mm. wide; petals 4-7 cm. long, 2-3 cm. wide; filaments 18-32 mm. long; pistil 3-4.5 cm. long; ovary 4-6 mm. in diameter, tapering into or somewhat abruptly terminating in style; style 1.2-2 cm. long, attenuate, white or greenish; capsule 4-5.5 cm. long, 2-3 cm. in diameter, ellipsoidal or somewhat cylindrical with a long-attenuate or short-attenuate beak and obconical pedicel, rarely constricted; beak of dry capsule flaring with valve points generally outcurved and twisted; seed to 8 mm. in greatest diameter, flat, thin, dull-black, without or with a very narrow marginal wing. On limestone ledges and on grass-covered plains of dense brush and open woodlands centered on the Edwards Plateau, Apr.-June; endemic.

According to Webber, hybrids between this species and *Y. Reverchonii* occur when they are admixed.

10. *Yucca Reverchonii* Trel. SAN ANGELO YUCCA. Plant acaulescent, solitary but ultimately a dense small clump with as many as 25 heads of leaves; leaf head small, with few leaves; leaves 25-55 cm. long, 1-2 cm. wide, linear to somewhat broader toward the center, concavo-convex, quite rigid, straight, light glaucous green; leaf margin hyaline, yellow or occasionally red or brown, minutely denticulate; scape 4.5-11 dm. long, slender, glabrous to heavily floccose; panicle 25-42 cm. above the foliage, 3.5-10 dm. long, narrowly ovoid to narrowly pyramidal, with few branchlets and flowers; flowers pendent, campanulate to somewhat globose, expanding but little at anthesis, white or greenish-white; perianth segments ovate, sharply acuminate; sepals 4-6 cm. long, 1.5-2 cm. wide; petals 4-6 cm. long, 2-3 cm. wide; filaments 2-3.2 cm. long; pistil 3-4.5 cm. long; ovary 4-6 mm. in diameter, tapering into or rarely abruptly terminating in style; style 1-2 cm. long, attenuate, white or greenish; capsule 4-6 cm. long, 2-3 cm. in diameter, rarely constricted, ellipsoidal with a long-attenuate or short-attenuate beak and obconical pedicel; beak of dry capsule flaring, with long reflexed valve points; seed to 7 mm. in greatest diameter, flat, thin, dull-black, without a marginal wing. Thinly scattered on limestone ledges and gravelly brushy plains on the Edwards Plateau, Apr.-June; endemic.

Some authors consider this plant to be a hybrid of *Y. Thompsoniana* and *Y. rupicola*.

11. *Yucca elata* Engelm. PALMELLA, SOAP-TREE, SOAP-WEED. Plant caulescent or arborescent, solitary but soon clumped; stems mainly 1-4.5 m. high, trunklike, erect, with 1 to 5 short assurgent branches toward the top or rarely unbranched and to 78 dm. high; head of leaves large, symmetrical; leaves 3-9.5 dm. long, 4-25 mm. wide, linear, plano-convex or plano-keeled, striate, rigidly divergent, flexible, pale-green; leaf margin white or greenish-white, soon finely filiferous; flowering stalk 1-5.4 m. tall; scape 1-3 m. long, stout, mainly 25-65 mm. in diameter, rarely to 12 cm. in diameter, greatly exceeding the foliage; panicle 5-35 dm. long, 3-6 dm. in diameter, with 20 to 45 branchlets, ellipsoidal or broadest toward center; flowers many, campanulate or somewhat globose, white or cream-color, rarely greenish or tinged with pink; perianth segments narrow-elliptical to broad-elliptical or even ovate, acute; sepals 32-57 mm. long, 15-27 mm. wide; petals 35-57 mm. long, 2-3.5 cm. wide; filaments 1.6-3 cm. long, slender; pistil 22-32 mm. long; ovary 6-10 mm. in diameter, slender, white or pale-green, oblong-cylindrical, abruptly terminating in style, with deep carpel sutures and anther depressions prominent or wanting; style 6-11 mm. long, the shape variable, slender and oblong-cylindric or stoutish, white or pale-green; capsule 4-7 cm. long, 35-58 mm. in diameter, oblong-cylindric, mucronate, commonly symmetrical, rarely constricted; seed to 14 mm. in greatest diameter, thin, dull-black, with a broad marginal wing. On gently sloping desert hills, grasslands and in dry washes in the Trans-Pecos, May-July; from Tex. to Ariz. and n. Mex.

12. *Yucca Freemanii* Shinn. Acaulescent, with one or few heads of leaves; leaves narrowly to broadly lanceolate, 1.5-6 dm. long, 1-4 cm. wide, with narrow petiolelike section of 3-7 cm. above the short widely clasping base (base 1-2 cm. long, wider than long), soft and rather limp, the apex broadly acute to subacuminate (inrolled in drying and appearing narrowly acuminate), the margins with few and mostly long white threads; scape slender (4-5 mm. thick at base of inflorescence), 1-1.8 m. high, flower-bearing in terminal one fourth to one third; panicle 4-6 dm. long, rather narrowly ovoid, the branches spreading-ascending, 4-20 cm. long, glabrous; bracts of axis ovate-oblong, 9-15 mm. long; perianth apparently funnelform-globose, pendulous, on glabrous pedicels 5-12 mm. long; perianth segments rather thin, yellowish-green, about equal in length, 3-3.8 cm. long; outer segments elliptic-oblong, with medial vein dorsally thickened toward apex, mucronate, 11-13 mm. wide; inner segments broadly elliptic, obtuse or barely mucronate, 17-22 mm. wide; filaments thick, densely papillose-pubescent, 12-18 mm. long; anthers 2.5-3 mm. long; pistil about 25 mm. long; ovary narrowly ovoid to ovoid-cylindric, 11-18 mm. long, about 6 mm. thick; style 6-7 mm. long; capsule oblong-obpyriform (sometimes obpyramidal), rounded-trigonous, slightly constricted just below the middle, glabrous, about 35 mm. long, 15 mm. thick, tipped by the persistent style and with withered persistent reflexed segments at base; seeds flat, approximately deltoid, 8 mm. long, 5 mm. wide, black. In old fields, along railroad right-of-ways and roadsides in n.e. Tex., Apr.-May; also adj. La.

13. *Yucca flaccida* Haw. Acaulescent, cespitose; leaves thin, flexible, the outer ones almost always recurved, 1-4 cm. wide, lanceolate, elongated, very gradually long-attenuate, mostly plicate, with fine long and rather straight thin marginal fibers; panicle mostly pubescent; maturing capsule dull-grayish-green, the carpels variously and irregularly flattened in places as if shaved off with a knife, when ripe broad, usually constricted and mostly flaring above; seeds rather dull, about 1 cm. wide.

This species, which occurs naturally east of Texas, is sometimes cultivated. It has a tendency to persist when abandoned.

14. *Yucca louisianensis* Trel. Similar in aspect to *Y. arkansana*; leaves green, flaccid, 1-4 cm. wide, usually less than 3 cm. wide, white-bordered and sparingly filiferous; inflorescence an exerted glabrous or mostly pubescent panicle; inner perianth segments broad to attenuate; style variously tumid and deep-green to pale and oblong; capsule stout and short, angular in developing as in *Y. flaccida*; seeds about 1 cm. wide. *Y. arkansana* var. *paniculata* McKelvey.

According to some authors this is the common species of sandy areas in northeast Texas, east of the Blackland Prairies.

15. *Yucca constricta* Buckl. Plant acaulescent or with short procumbent stems to 4 dm. high; clump small to large, open, with up to 20 heads of leaves 2-9 dm. apart; head of leaves large, asymmetrical or rarely small and symmetrical; leaves 3-6.5 dm. long, 8-15 mm. wide, linear or somewhat broader toward center, nearly flat or plano-convex to occasionally triquetrous, striate, rigidly divergent, flexible, pale- to dark-green; leaf margin white or green, eventually filiferous, the fine fiber straight or curled and soon eroding away; flowering stalk 15-32 dm. long, slender and weak; scape 1-2 m. long; panicle 2-4.6 dm. above foliage, 4.5-12 dm. long, occasionally 7 dm. in diameter at base, ovoid to broadly conoid, open-flowered, with 8 to 15 branchlets; flowers small, hemispherical or cup-shaped, pale-greenish-white; perianth segments thin, acute, ellipsoidal; sepals 35-45 mm. long, 11-21 mm. wide; petals 37-48 mm. long, 17-26 mm. wide; filaments 17-22 mm. long; pistil 25-38 mm. long; ovary 5-6 mm. in diameter, slender, cylindrical with oblate apices, pale-green, the carpel sutures prominent, the anther depressions faint or wanting, abruptly terminating (shouldered) in style; style 8-11 mm. long, cylindrical with basal lobes extending slightly over ovary, whitish-green or pale-green (darker than ovary); capsule 46-63 mm. long, 36-43 mm. in diameter, oblong-cylindrical, mucronate, deeply constricted; seed to 15 mm. in greatest diameter, thin, glossy-black, with a broad marginal wing. Thinly scattered in brushwood and grasslands from s.-cen. Tex. to the Trans-Pecos, Apr.-June; also adj. Mex.

16. *Yucca tenuistyla* Trel. Acaulescent; leaves rather soft and mostly recurving, often a little scabrid on the back, about 5 dm. long and 1-1.5 cm. wide, dark-green, lanceolate, long-attenuate, scarcely pungent, white-margined, finely filiferous; inflorescence about 1 m. high, paniced at some distance above the leaves, glabrous or slightly puberulent; flowers with narrow pointed segments; style oblong, white, often deeply parted; capsule stout, even; seeds glossy, about 1 cm. wide. Brushlands from the s. Edwards Plateau to the coast of s.-cen. Tex., Feb.-May; endemic.

17. *Yucca angustifolia* Pursh. Plant acaulescent or with short stems to 3 dm. high, solitary but soon clumped; heads of leaves rather small; leaves 5-7 dm. long, 5-11 mm. wide, linear, plano-convex, occasionally triquetrous or nearly flat, striate, divergently spreading, flexible, pale-green or pallid; leaf margin white or greenish-white, soon finely filiferous; flowering stalk 9-12.5 dm. long; scape 25-53 cm. long; inflorescence extending 5-21 cm. into the foliage, usually simple or rarely with few abortive branchlets at base; flowers globose or campanulate, greenish-white, commonly tinged with purple and shiny; perianth segments thick, brittle, broad and acute; sepals 45-56 mm. long, 26-33 mm. wide; petals 5-6 cm. long, 31-42 mm. wide; filaments 2-3 cm. long; pistil 3-3.7 cm. long; ovary 9-13 mm. in diameter, obovoid, white or rarely greenish-white, the carpel sutures faint, the anther depressions prominent, abruptly terminating in the style; style 8-13 mm. long, very tumid or swollen, 6-10 mm. in diameter toward center, dark-green or rarely medium-green; capsule about 6 cm. long, 45-53 mm. in diameter, oblong-cylindrical, mucronate, with occasionally 1 or 2 valves slightly constricted; seed to 1 cm. in greatest diameter, thin, smooth, dull-black, with a broad marginal wing. *Y. glauca* of auth. Rather thinly scattered on rolling well-drained grassland plains in the Tex. Panhandle, May-June; from Tex., n. to Mo., Neb., S.D. and Wyo.

18. *Yucca campestris* McKelvey. Plants acaulescent or with stems to 1 m. high, forming small or large thicketlike clumps with many rather open heads of leaves; leaves slender, wiry, to 65 cm. long and 7 mm. wide, plano-convex or plano-keeled for half or more its length, blue-green, the acicular spine about 7 mm. long and easily broken; leaf margins at first white and finely filiferous, rather soon smooth; flowering stalk 1-2 m. long, slender; scape to 1 m. long; panicle ellipsoidal, 6-10 dm. long, starting among the leaves or less often above them, with numerous slender fragile erect-ascending branchlets to 13 cm. long; flowers dull-greenish, sometimes with a pinkish-tinge, often globose; perianth segments 10-11.5 cm. long; sepals 1.5-2 cm. wide; petals about 25 mm. wide; filaments flaccid, rather slender, reaching the base of style at maturity; pistil 25-28 mm. long; ovary 1.3-2 cm. long, ovoid to obovoid, often deeply marked by impress of anthers, rough-surfaced; style bright-green, unevenly papillose; capsule 45-53 mm. long, 3-5 cm. wide, sometimes subglobose, symmetrical or constricted, soon reddish-brown, eventually gray; seed to 13 mm. in greatest diameter, glossy. In deep sands and on dunes centered in the region of Ward, Midland, Howard and Ector cos. Apr.-June; endemic.

Webber considered this plant to be a hybrid of *Y. elata* and *Y. constricta*.

19. *Yucca necopina* Shinners. Similar to *Y. arkansana* but higher; plant 1-3 m. high; inflorescence an unbranched spike or a panicle; perianth greenish-white; inner band of leaves 18 to 30, the exterior leaves 45 to 70 and narrower; ovary twice as long as the style and stigma combined. In sandy soil along fencerow on Brazos River terrace near Glen Rose; endemic.

Shinners suggests that this plant may be a hybrid between *Y. pallida* and *Y. arkansana*.

20. *Yucca arkansana* Trel. Plant acaulescent or (at most) with a short nearly prostrate stem about 15 cm. long, with one or several somewhat asymmetrical heads of leaves in small open clumps; leaves 2-6 dm. long, 1-2.5 cm. wide, long-tapered above; leaf margins at first white, papery, with curly fibers; scape to about 1 m. long; inflorescence a raceme about 1 m. long, very rarely with a few branches, glabrous; flowers relatively few, globose, 32-65 mm. long, mostly greenish-white, with broad obtuse segments; style greener than the ovary at anthesis, very tumid below, 7-13 mm. long, coarsely and unevenly papillose; capsule 4-7 cm. long, stoutish, about twice as long as broad, oblong-cylindric to obovoid; seeds dull, about 1 cm. wide. *Y. glauca* Nutt. var. *mollis* Engelm. In prairies, on limestone outcrops and rocky soils from s.-cen. to n.-cen. Tex., Apr.-June; from Tex., n. to Okla. and Ark.

20. NOLINA MICHX.²⁹

Plants perennial, polygamo-dioecious, with a large woody caudex that is subterranean or forming a distinct trunk above ground; leaves numerous, clustered, narrowly linear, thin or rigid, the margins smooth or finely serrate; flowers numerous, borne on a short nearly naked flowering stem in a compound racemose panicle, the main branches subtended by foliaceous or scarious long-pointed or much-attenuated bracts; pedicels jointed about the middle or near base subtended by minute scarious bracts; perianth small, persistent; perianth segments 6, 1-nerved; stamens 6, usually abortive in the fertile flowers; filaments slender or stoutish, usually very short; ovary sessile, deeply 3-lobed; style very short, recurved; ovules 2 in each cell; fruit a capsule, with a thin often more or less inflated wall, usually bursting irregularly to expose the globose brown to blackish turgid seed.

About 30 species that are natives of southern United States and Mexico. It is reported that sheep and goats are sometimes poisoned by these plants. These animals are especially fond of the young inflorescences which may account for the scarcity of plants in some localities where they should be abundant.

1. Leaf margins serrulate with close-set cartilaginous teeth (2)
1. Leaf margins smooth or only slightly roughened with few distant or remote teeth (4)

²⁹ Ref.: William Trelease in Proc. Am. Philos. Soc. 50: 404-426. 1911.

- 2(1). Leaves thin, flat, usually 6 mm. wide or less, entire at apex; fruits about 10 mm. wide, with pedicels usually more than 4 mm. long; endemic to eastern half of Edwards Plateau1. *N. Lindheimeriana*.
2. Leaves thick, concavo-convex, usually more than 8 mm. wide, typically fibrous-lacerate at apex; fruits about 6 mm. wide; in Trans-Pecos Texas (3)
- 3(2). Fruiting pedicels 4 mm. or less long; seeds 3-4 mm. in diameter, bursting the cell of fruit before maturity to remain exposed2. *N. erumpens*.
3. Fruiting pedicels 4-6 mm. long; seeds 2-2.5 mm. in diameter, not bursting the fruit .
.....3. *N. microcarpa*.
- 4(1). Inflorescence usually conspicuously purple-tinged, its main rachis and divisions slender and flexible; perianth 2-2.5 mm. long; fruiting pedicels slender, typically 2-4 mm. long, articulate usually near the middle ...4. *N. micrantha*.
4. Inflorescence not pigmented as above or rarely so, its main rachis and divisions thick and rigid; perianth 2.5-3.5 mm. long; fruiting pedicels 4-7 mm. long, articulated near base, noticeably dilated into the fruit (5)
- 5(4). Leaves 2-4 mm. wide, concavo-convex below, triangular toward the apex; inflorescence rather compact with ascending lateral branches; seeds 3-4 mm. in diameter; plant usually in rocky habitats of limestone
.....5. *N. texana*.
5. Leaves about 5 mm. wide, flat or concavo-convex; inflorescence rather open with coarse spreading branches; seeds 4-6 mm. in diameter; plant in sandy soils or dunes6. *N. arenicola*.

1. *Nolina Lindheimeriana* (Scheele) Wats. **DEVIL'S-SHOESTRING**. Flowering stem stout, 6-18 dm. high (including the inflorescence), from a very short caudex; roots fleshy-thickened; leaves numerous, flat and thinnish, 3-9 dm. long, rarely longer, 4-8 mm. wide, the margins strongly serrulate with the teeth directed forward; panicle open, simple or sometimes compound; primary branches of inflorescence spreading-ascending, to about 13 cm. long, slender, somewhat flexible, simple or the lowermost with slender branchlets; bracts inconspicuous, usually much shorter than the floral branches; perianth 2-2.5 mm. long, the segments oblong-elliptic; fruit very thin, somewhat inflated, notched at both ends, usually purplish tinged, about 1 cm. wide, wider than long; fruiting pedicels slender, 3-8 mm. long, articulate well below the middle or near base, slightly dilated above the articulation; seeds not bursting the fruit, about 3 mm. in diameter. On limestone slopes and in ravines either in the open or in open-wooded areas on the e. half of Edwards Plateau, May-July; endemic.

2. *Nolina erumpens* (Torr.) Wats. **BEAR-GRASS**. Plant sometimes attaining a size of 25 dm. high and wide; flowering stem 6-25 dm. long (including the inflorescence), somewhat rough-scabrous; leaves as many as several hundred, thick, concavo-convex and somewhat carinate, 6-20 dm. long, 6-20 mm. wide near base, very strongly serrulate, commonly fibrous-lacerate at apex; panicle compound, to 12 dm. long and 4 dm. thick, rigid throughout, with pyramidal primary branches 1-2.5 dm. long, some of the lowermost branches with subdivaricate secondary branchlets 5-12 cm. long; bracts of lowermost primary floral branches about equal to or as much as 5 times as long as the branches; perianth white, about 4 mm. long; fruits rather depressed, 5-7 mm. wide; fruiting pedicels about 4 mm. long or less, articulated about the middle or near the base, somewhat dilated above the articulation and ribbed just below the fruit; mature seeds 3-4 mm. in diameter, bursting the cell of fruit before maturity to remain exposed. On limestone slopes, in clayey-rocky soils, along arroyos in brushlands and in igneous soils in the Trans-Pecos, May-July; also n. Mex.

3. *Nolina microcarpa* Wats. **SACAUISTA**. Flowering stem stout, about 18 dm. long, from a short caudex; leaves concavo-convex, rather thick and somewhat carinate, to about 1 m. long, 6-12 mm. wide, raggedly denticulate-scabrous to very strongly serrulate, fibrous-lacerate at the apex; panicle narrow, branched at base; primary floral branches slender, about 3 dm. long, with ascending branchlets 5-7.5 cm. long; bracts small; fruit very thin, inflated, notched at both ends, about 6 mm. wide; fruiting pedicels 4-6 mm.

long; seeds 2-2.5 mm. in diameter, not bursting the fruit. On rocky hills in the Trans-Pecos, spring-summer; from w. Tex. to Ariz. and n. Mex.

This species is included here solely on a report of its occurrence in the state. We have seen no specimen.

4. *Nolina micrantha* I. M. Johnst. Flowering stem 7-10 dm. high (including the inflorescence); leaves numerous, almost semiterete, channeled, to about 13 dm. long, 3-5 mm. wide, the margins smooth to slightly scabrous, typically fibrous-lacerate at apex; panicle about as long as or shorter than the leaves, compound, its various parts usually somewhat purplish-tinged, the central rachis and divisions slender and flexible; bracts of the primary floral branches inconspicuous, shorter than the branches; floral bracts (especially of staminate flowers) erose-laciniate; perianth 2-2.5 mm. long, the segments elliptic; fruits 4-6 mm. wide, 3-4 mm. long, deeply notched at apex, the style almost sessile; fruiting pedicels slender, 2-4 mm. long, very rarely longer, articulated usually near middle; seeds globose, 3-4 mm. in diameter. On rocky slopes and in open sandy soils and grasslands in the Trans-Pecos, June-Aug.; also in n. Mex.

The slenderly dissected and somewhat twiggy inflorescence, slender short pedicels, and the typically purplish or reddish-purple tinged main rachis, branches and branchlets, and bracts are distinguishing characteristics of this species.

5. *Nolina texana* Wats. SACAUISTA, BUNCH-GRASS. Flowering stem very short, 3-6 dm. long (including the inflorescence), often several from a very short caudex; leaves numerous, covering the ground, 6-12 dm. long, 2-4 mm. wide, concavo-convex below, triangular toward the apex, smooth or sparingly roughish with distant teeth on the margins; panicle congested, compound, with oblong primary branches often 15 cm. long; bracts of primary floral branches large and foliaceous, with dilated bases, usually much-exceeding the branches; perianth about 3.5 mm. long, the segments broadly elliptic; fruits somewhat inflated and depressed, 4-6 mm. broad before rupture, about 3 mm. long; fruiting pedicels 4-7 mm. long, articulate near base, noticeably dilated above the articulation and usually ridged just below the fruit; seeds globose, nearly smooth, 3-4 mm. in diameter. In rocky soils from cen. Tex. to the upper Rio Grande Plains and Trans-Pecos, recently reported from Garza Co. in the South Plains, Mar.-July; also n. Mex.

Those plants found in the Trans-Pecos whose inflorescences have very compact, ovoid divisions scarcely 6 cm. long and branchlets about 1 cm. long are segregated as var. *compacta* (Trel.) I. M. Johnst. (*N. erumpens* var. *compacta* Trel., *N. affinis* Trel.).

6. *Nolina arenicola* Correll. Flowering stem to 1 m. high (including the inflorescence); leaves numerous to form a large clump, about 13 dm. long and 5 mm. wide, flat or concavo-convex, with smooth margins; panicle compound, rather open with coarse spreading or spreading-ascending branches, the branches with short stubby branchlets; bracts not conspicuous, mostly about equal to or only slightly exceeding the primary branches; perianth 2.5-3.5 mm. long, the segments ovate-elliptic; fruits 4-7 mm. wide, deeply notched at apex, the style prominent; fruiting pedicels 5-7 mm. long, articulate near base, dilated into the fruit, with prominent ridges just under the fruits; seeds 4-6 mm. in diameter. In sandy soils in chaparral and brushlands, and on dunes in w. part of the Trans-Pecos, May-June; endemic.

21. DASYLIRION Zucc.

Plants dioecious, composed of a tall leafy flowering stem terminating a stout cylindrical stem or caudex; leaves numerous, crowded, with broad somewhat concave bases (spoons), narrowly linear, elongated, somewhat rigid and striate, usually armed with marginal hooked spines; flowers unisexual, in dense racemes forming a narrow compound panicle; pedicels articulate just beneath the flower or fruit; staminate flowers nearly sessile; perianth segments oblong-obovate, obtuse; stamens exerted; style short; fruit triangular and 3-winged, 1-celled and 1-seeded, coriaceous and indehiscent; seeds obtusely triangular.

About 20 species that are natives of southwestern United States and Mexico.

According to Standley (1920), the trunks of *Dasyilirion* are used for building houses and for fuel, and they are split open to permit cattle to eat the spongy interior because

they, as well as the leaf-bases, contain much sugar and are an excellent food for cattle. The head of the plant can be roasted or boiled and the sweet pith and leaf bases eaten by man. After being roasted the trunks are allowed to ferment and are then distilled to obtain a highly intoxicating beverage known as "sotol." This is a colorless liquor of penetrating odor and peculiar taste. The leaves are widely used for thatching, baskets, rough hats, mats and other such items. The leaf bases or "spoons" are frequently used in sophisticated artificial floral arrangements.

1. Spines of the leaves mostly recurved; leaves green1. *D. leiophyllum*.

1. Spines of the leaves directed forward or outward; leaves green or somewhat glaucous (2)

2(1). Floral branches slender, becoming pendent; mature fruits 6-8 mm. wide, deeply notched at apex2. *D. Wheeleri*.

2. Floral branches rather rigid, erect or erect-ascending; mature fruit 3-5 mm. wide, shallowly notched at apex (3)

3(2). Spines of the leaves stoutish, mainly directed forward; fruit broadly elliptic3. *D. texanum*.

3. Spines of the leaves slender, mainly directed outward; fruit obovate-elliptic4. *D. heteracanthium*.

1. *Dasyliirion leiophyllum* Engelm. Shortly caulescent; flowering stem to 37 dm. high; leaves scarcely 1 m. long, to 25 mm. wide near base, somewhat fibrous-lacerate at apex, green or at first somewhat glaucous, smooth, rather glossy; spines mostly recurved, usually 3-4 mm. long and 1-1.5 cm. apart, becoming orange or reddish; panicle to about 3 dm. long, the floral branches erect or erect-ascending and exceeding the subtending bracts; perianth greenish, the segments scarcely 2 mm. long; fruits broadly elliptic, 6-9 mm. long, 4-5 mm. wide, the thick style about equaling the moderately open and deep notch or prominently exerted if the wings have not fully developed; seeds about 3 mm. long. On limestone hills in the Trans-Pecos, May-July; also N.M. and adj. Mex.

2. *Dasyliirion Wheeleri* Wats. SOTOL, DESERT SPOON. Trunk to at least 1 m. high, bearing a dense rosette of leaves and a flowering stem 3-5 m. high; leaves about 1 m. long and to 4 cm. wide just above the spoon, rather glaucous, the serrulate margins armed with antrorse hooked reddish-brown teeth 1.5-3 mm. long and 1-2 cm. apart; panicle 15-25 dm. long, usually 2-3 dm. in greatest diameter; racemes 5-10 cm. long, flexuous and usually pendent; floral bracts cup-shaped, lacerate, 2-3 mm. long; perianth about 2 mm. long; fruit narrowly obcordate, 7-9 mm. long, 4-8 mm. wide, deeply notched at apex, with pedicels 2-4 mm. long; style shorter than to nearly equal to the wings; seeds 3-angled, about 4 mm. long. On limestone or granite slopes in the Trans-Pecos, May-July; from Tex. to Ariz. and n. Mex.

3. *Dasyliirion texanum* Scheele. SOTOL. Trunk 6-15 dm. high, bearing a dense rosette of leaves and a flowering stem 2-5 m. high; leaves light-green, 9-12 dm. long, 8-10 mm. wide below and attenuate upward, splitting into coarse fibers at apex, the serrulate (sometimes conspicuously so) margins armed with stout antrorse hooked spines to 2 mm. long and 6-12 mm. apart, the unarmed dilated base narrowed gradually into the blade; panicle 6-9 dm. long, very narrow; primary floral branches erect or suberect, about 75 mm. long, equaling the broad subtending bracts; racemes 2.5-5 cm. long, ascending; floral bracts broadly ovate, acute, lacerately toothed, about 2 mm. long; perianth 2 mm. long; fruit 6-7 mm. long, broadly elliptic, with pedicels 2 mm. long; style equaling or exceeding the notch or prominently exerted if the wings are not fully developed; seeds 3-angled, about 3 mm. long. On rocky slopes, flats and novaculite hills in the Trans-Pecos and on the Edwards Plateau, June-July; also adj. Mex.

4. *Dasyliirion heteracanthium* I. M. Johnst. SOTOL. Plant robust, obviously allied to *D. leiophyllum*; leaves 8-11 dm. long, 2-3 cm. wide just above the enlarged base, more or less dull-green, provided with marginal spines that are for the most part spreading straight out or with some curved upwards; spines slender, 2-4 mm. long and 5-15 mm. apart, often becoming yellow or rarely brown toward the apex; fruits obovate-elliptic, 6-7 mm. long, 4-5 mm. wide, the wide apical sinus not deep. On rocky slopes and flats in s. Trans-Pecos Tex., Mar.-July; also n. Mex.

22. ASPARAGUS L. ASPARAGUS

More than 300 species from Siberia to South Africa. Various species are grown for food or ornamentals.

1. *Asparagus officinalis* L. GARDEN ASPARAGUS. A much-branched finely dissected perennial to about 3 m. high, from strong rhizomes, with small greenish-yellow flowers and globular red berries about 1 cm. in diameter, the strong spring shoots bearing prominent scalelike leaves and forming the edible "asparagus" of commerce; leaves reduced to merely dry scales, the foliage represented by green branchlets or cladodes that are needlelike; pedicel jointed; perianth bell-shaped, the 6 separate segments more or less connivent; stamens 6, attached on base of perianth. Nat. of Euras. that escapes from cult. to sandy fields and dry open woods, May-July.

23. SMILACINA DESF. FALSE SOLOMON'S SEAL

Herbaceous perennials from creeping scaly rootstocks; aerial stems simple, leafy; leaves alternate, simple, entire, lanceolate to ovate or cordate, sessile or petioled; inflorescence terminal, racemose or paniculate; perianth segments distinct, 6; stamens 6, borne at the base of the perianth segments; anthers versatile, dehiscent inwardly; ovary 3-celled; styles thick, the stigmas 3; ovules 2 in each cell; fruit a round or 3-lobed berry, 1- to 6-seeded.

About 25 species mostly in temperate regions of both hemispheres.

- 1. Leaves abruptly long-acuminate, distinctly petioled, spreading 1. *S. racemosa* var. *racemosa*.
- 1. Leaves merely acute or very short-acuminate, usually somewhat clasping by the sessile or wing-petioled base, usually ascending 1. *S. racemosa* var. *amplexicaulis*.

1. *Smilacina racemosa* (L.) Desf. Rootstock stout; stem erect, arcuate or spreading, usually puberulent (at least in the inflorescence), occasionally essentially glabrous, more or less flexuous, 3-7 dm. high; leaves lanceolate to elliptic, usually broadest at the middle, acute to long-acuminate or tailed at the apex, somewhat clasping and ascending to distinctly petioled and spreading, distichous, 6-18 cm. long, 2-7 cm. wide, distinctly veined, puberulent to glabrous; inflorescence many-flowered, 3-13 cm. long, 1-8 cm. broad, with 5 to 20 branches; perianth segments white or greenish, 1-2 mm. long, about 0.5 mm. wide; stamens exceeding the perianth segments, 1.5-3 mm. long, the anthers yellow, the filaments more or less inflated; style to 1 mm. long; ovary 0.7-1.5 mm. long; berry globose, about 5 mm. in diameter, at first mottled red and green, later turning red or occasionally purple throughout. In shady woods in rather moist rich soil in mts. of the Trans-Pecos, June-Aug.; from Que. to B.C., s. to Ga., Mo., Tex. and Ariz.

Var. *amplexicaulis* (Nutt.) Wats. differences from var. *racemosa* have been pointed out in the key. It appears to be confined to the Davis Mts.; throughout most of the U.S. and Can. as well as Alas. and n. Mex.

24. POLYGONATUM MILL. SOLOMON'S SEAL

Perennial glabrous (in ours) herbs with horizontal creeping more or less knotty rhizomes and fibrous roots; stem simple, erect or arching, naked below, leafy above; leaves simple, alternate, amplexicaul to sessile or shortly petiolate, typically elliptic; inflorescence axillary, consisting of one to several pendulous flowers on deflexed or arcuate peduncles; calyx and corolla united into a cylindric tube, with 6 lobes that are usually shorter than the tube; stamens 6, included, inserted on the perianth tube; filaments filiform or flattened, smooth or roughly papillose; anthers linear-oblong to sagittate, bilobed at base, introrse; ovary 3-celled, with several ovules in each cell; fruit a dark-blue or black globose pulpy several-seeded berry.

About 50 species in the North Temperate Zone.

1. Distribution in mountain canyons of Trans-Pecos Texas; leaf scars (seals) on rhizome small and mostly inconspicuous, about 3 mm. across; cauline bract papery, caducous; peduncles stout, strongly and sharply deflexed 1. *P. cobrense*.
1. Distribution in moist rich woods of east and north-central Texas; leaf scars on rhizome large and conspicuous, 5 mm. or more across; cauline bract foliaceous, persistent; peduncles slender, arcuate, not strongly deflexed 2. *P. biflorum*.

1. *Polygonatum cobrense* (Woot. & Standl.) Gates. Rhizomes slender, about 5 mm. thick, only slightly knotty if at all; stems slender, somewhat flexuous, to 45 cm. tall; leaves essentially sessile or narrowed at the base into a broad petiole to 7 mm. long, elliptic to elliptic-lanceolate, narrowly obtuse to subacute at apex, to 95 mm. long and 38 mm. wide, glaucous on lower surface, very faintly nerved with only the midrib prominent; peduncles strongly and sharply deflexed, 7-15 mm. long, each dividing into 2 or 3 much shorter pedicels, all stout and strongly flattened laterally; flowers greenish-white, 1.2-2 cm. long, somewhat expanded toward mouth of tube, the lobes oblong and obtuse, twice as long as the tube; anthers 6 mm. long, acute, slightly exceeding the almost filiform somewhat roughened filaments; fruit 6 mm. or more in diameter. In humus under trees in canyons of mts. in the Trans-Pecos, Apr.-June; from w. Tex. to e. Ariz.

2. *Polygonatum biflorum* (Walt.) Ell. GREAT SOLOMON'S SEAL. Rhizome stout, about 7.5 mm. thick, conspicuously knotty; stem slender or stout, to 1 m. tall, arching or ascending; leaves sessile and often clasping, broadly elliptic to elliptic-lanceolate, narrowly obtuse to subacute at apex, to 15 cm. long and 7 cm. wide, somewhat glaucous beneath, prominently several-nerved; peduncles arcuate, slender, to 5 cm. long, the 1 to 5 pedicels much shorter than the peduncle; flowers greenish-white, 1.3-2 cm. long, the lobes (3-4 mm. long) much shorter than the tube; filaments usually papillate or granulose. *P. commutatum* (R. & S.) Dietr., *P. canaliculatum*, misapplied. On rich moist wooded slopes in e. and n.-cen. Tex., Mar.-May; from N.E. and Ont., w. to Neb., s. to Fla. and Tex.

25. TRILLIUM L.³⁰

TRILLIUM. WAKE-ROBIN

Perennial scapose herbs with subterranean or creeping tuberlike rhizomes, rarely producing rhizomatal leaves; scapes 1 or 2 (very rarely 3 or more), each with a whorl of 3 large foliaceous bracts subtending a solitary perfect flower at the summit; flowers pedicellate or sessile, 3-merous (occasionally 2-, 4-, or irregularly parted), with the perianth in two distinct series; sepals distinct, usually green, sometimes suffused with purple adaxially; petals distinct, white, pink, yellow, greenish or purple; anthers linear, adnate to the sides of connective or terminal; ovary sessile, 3- or 6-angled or -winged; stigmas 3, sessile or on a distinct style; berry 3-locular, few- to many-seeded, indehiscent.

About 40 species in temperate wooded regions of North America and eastern Asia. Segregated with three closely allied genera by some authors as the family Trilliaceae. The relationship of Texas species to those northward and eastward is in need of careful study.

1. Flowers pedicellate; corolla white or pink; gynoecium with a distinct style 1. *T. texanum*.
1. Flowers sessile; corolla purple, greenish or yellow; gynoecium with sessile stigmas (2)
- 2(1). Bracts petiolate; sepals basally reflexed; rhizome slender, the length of an internode about equal to the diameter 2. *T. recurvatum*.
2. Bracts sessile; sepals not basally reflexed; rhizome compact, the length of an internode less than one third the diameter (3)
- 3(2). Anther-position and dehiscence introrse; petals about twice as long as stamens; bracts about 3 to 5 times as long as sepals 3. *T. gracile*.
3. Anther-position and dehiscence lateral; petals about 3 times as long as stamens; bracts about 2 to 3 times as long as sepals 4. *T. viridescens*.

³⁰ Contributed by John D. Freeman.

1. *Trillium texanum* Buckl. Scapes 1-3 dm. tall; bracts sessile or abruptly narrowed into short petiolules, narrowly lanceolate to elliptic-lanceolate or oblong, obtuse to rounded, upper surface somewhat farinose by the presence of numerous stomates, (3-) 4-6 (-8) cm. long, (1-) 1.3-2 (-3) cm. wide; flowers on erect pedicels (2.5-) 3-4 (-4.5) cm. long; sepals spreading, lanceolate, green, usually larger than the petals; petals spreading, narrowly lanceolate to lanceolate, acute, often with a short claw, white, becoming pink and finally reddish with age, (1.5-) 2-2.5 (-3) cm. long, 7-10 (-14) mm. wide; stamens 10-14 mm. long, the anthers slightly longer than the white or pale-green filaments, the connectives often purple; gynoecium about as long as the stamens, with a distinct style about as long as the ovary and stigmas equal to or longer than the style; berry triangular-ovoid, sharply 6-ridged at base of persistent style, 8- to 15-seeded. Extremely rare in low moist woods, bogs and stream banks in Cass, Houston and Panola (type locality) cos., Mar.-May; replaced in Ark. and s.w. Mo. by *T. pusillum* Michx. var. *ozarkanum* (Palm. & Steyerl.) Steyerl., which lacks the upper epidermal stomates in the bracts, has thicker rhizomes, and grows in relatively dry rocky woods.

2. *Trillium recurvatum* Beck. Scapes (1.5-) 2-4 (-5) dm. tall; bracts with a petiole 1-3 cm. long, narrowly lanceolate to ovate, acute to slightly acuminate, obscurely mottled with dark-green, (5-) 7-11 (-18) cm. long, (2-) 4-8 (-12) cm. wide; flower sessile or subsessile (pedicel not more than 3 mm. long); sepals abruptly recurved, narrowly lanceolate, acute, (1.5-) 2-3 (-4) cm. long, 5-10 mm. wide; petals erect, lanceolate to oblanceolate, acute, distinctly clawed, purple or yellowish-green, (2-) 2.5-4 (-5) cm. long, (6-) 10-20 (-26) mm. wide; stamens erect, (8-) 10-15 (-20) mm. long, the filaments straight and almost as long as the strongly incurved anther connectives; gynoecium height about even with the bases of the anthers, the prominently 6-winged angular-ovoid ovary (3-) 4-6 (-8) mm. in height and the divergent-spreading stigmas about as long; fruit transversely angular-ovoid, distinctly winged, about 15 mm. in diameter. Rare on alluvial banks in rich woods in Nacogdoches and Rusk cos., Mar.-May; widespread n. into Ia. and Wis., n.e. into Ky. and Ind.

Forma *Shayi* Palm. & Steyerl. Flowers lacking purple pigments; petals yellow or greenish-yellow; stamens and carpels greenish; occurring with the typical form (but not known from Tex.).

3. *Trillium gracile* J. D. Freeman. Scapes (1.6-) 2-3 (-3.6) dm. tall; bracts sessile, elliptic-lanceolate to oblanceolate, rounded to obtuse or acute, broadly cuneate basally, dark-green, usually distinctly mottled with small darker spots, (6-) 7-10 (-13) cm. long, (2.5-) 3-6 (-8) cm. wide; flower sessile, with the odor of morel mushrooms; sepals narrowly oblong-lanceolate, slightly acuminate-blunt or obtuse, widely spreading, often somewhat reflexed distally, usually dark-purple on upper surface, (1.5-) 2-2.5 (-3.5) cm. long, 4.5-8 mm. wide; petals erect, linear-elliptic or linear-oblanceolate, acute to rounded, usually dark-purple (sometimes yellow), (1.5-) 2-3.5 (-4.5) cm. long, 3-7.5 mm. wide; stamens erect, (8-) 11-17 (-19) mm. long, the filaments about 2-3 mm. long, the introrse anthers on straight connectives; gynoecium just more than half as tall as the stamens, the ovoid ovary 3.5-7 (-11) mm. tall and the subulate divergent stigmas 1.5-4.5 (-6.5) mm. long, the stigma tips recurved; fruit ovoid, smooth. *T. ludovicianum* of auth., in part, not Harbison. Locally abundant in sandy loam of rich piney woods in s.e. Tex. and adj. La., especially along Sabine River, Apr.-May.

Forma *luteum* J. D. Freeman. Flowers lacking purple pigments; petals yellow or greenish-yellow; stamens and carpels greenish; occurring spontaneously with the typical form. Occurring with the species.

4. *Trillium viridescens* Nutt. Scapes (1.8-) 3-4.5 (-6) dm. tall, often scabrous distally; bracts sessile, elliptic-ovate to broadly ovate or elliptic, rounded to acute (in Tex.) or acuminate (n. of Tex.), very obscurely mottled or not mottled, (8-) 9-11 (-15) cm. long, 4-10 (-12) cm. wide; flowers sessile, with musty-spicy odor like spoiled fruit; sepals narrowly to linear-lanceolate, acute to acutish, divergent to spreading, sometimes purplish basally, (3.5-) 4-5.5 (-6.5) cm. long, 5.5-11 (-14) mm. wide; petals erect, linear-spatulate to very narrowly spatulate, acute-rounded or rounded, greenish or greenish-purple above a purple claw, sometimes purple or yellowish-green throughout, (4-) 5-7 (-8.5) cm. long, (5-) 7-10 (-14) mm. wide; stamens erect, (14-) 18-27 (-30) mm. long, the filaments 2.5-4.5 (-6) mm. long and the linear anthers lateral on the connective; gynoecium about half as tall as stamens, the ovoid sharply 6-angled ovary 5-9

(-12) mm. tall and the nearly linear divergent to spreading stigmas about as long as the ovary, the stigma tips often extending between stamens; fruit ovoid, usually 6-ridged or sharply angled. *Trillium stenanthos* Raf., *T. sessile* L. var. *Nuttallii* Wats., *T. sessile* var. *viridescens* (Nutt.) Trel., *T. viride* of auth., in part, not Beck. In rich woods on sandy or rocky soils in Harrison, Marion and Red River cos., Apr.-May; reaching s. extreme of range in n.e. Tex., more common in n.w. Ark. and e. Okla.

26. ALETRIS L. COLIC-ROOT. STAR-GRASS

Perennial and smooth stemless herbs, very bitter, with a short and thick rhizome and a spreading rosette of thin and flat lanceolate leaves; flowers small, in a spikelike raceme that terminates a slender nearly naked scape; perianth tubular to campanulate, wrinkled and roughened outside by thickly set points, the tube adhering to the base of the ovary, 6-cleft at the summit; stamens 6, inserted at the summit of the perianth tube; filaments and anthers short, included; style subulate, 3-cleft at the apex; stigmas minutely 2-lobed; capsule ovoid, beaked, enclosed in the persistent withered perianth; seeds numerous, minute, costate.

About 25 species in Asia and North America.

1. Perianth white, 8-9 mm. long, the lance-oblong lobes recurved-spreading 1. *A. farinosa*.
1. Perianth yellow, about 7 mm. long, the ovate lobes erect 2. *A. aurea*.

1. *Aletris farinosa* L. UNICORN-ROOT. Leaves firm, to 2 dm. long; scapes to 1 m. high, usually much smaller, with remote small bracts; raceme to 3 dm. long, densely to sub-remotely flowered; bracts linear or clavate; perianth tubular, 8-9 mm. long, whitish, with granulate surface, its lance-oblong lobes somewhat recurved-spreading, marcescent, shrinking at maturity and thus often exposing the long abrupt beaks that are about as long as the plump body of the capsule. Dry or moist peats, sands and gravels, rare in s.e. Tex., Mar.-May; from Fla. to Tex., n. to s.w. Me., s. N.H., cen. Mass., s.e. N.Y., s. Ont., Mich. and Wisc.

2. *Aletris aurea* Walt. YELLOW STAR-GRASS. Very similar to *A. farinosa*; leaves membranaceous, to 12 cm. long; scape to 8 dm. tall or more; raceme remotely flowered; perianth broadly campanulate, about 7 mm. long, orange-yellow, not so roughened, its short-ovate lobes erect; beaks of capsules included, about as long as the plump body. Damp pine-barrens, bogs and savannahs in e. Tex., May-July; from Fla. to Tex., n. to s.e. Va. and Md.

27. SMILAX L.³¹ GREEN-BRIER. CAT-BRIER

Shrubby or herbaceous dioecious plants usually climbing or supported by a pair of tendrils on the petiole of the broad-ribbed and netted-veined simple leaves; flowers unisexual, the staminate often the larger, in umbels in axillary peduncles, small, greenish, yellowish or bronze, regular; perianth segments distinct, similar, deciduous; stamens in the staminate flower 6; filaments slender or flattened, inserted on the very base of the perianth; the introrse anthers linear or oblong, fixed by the base, apparently 1-celled; ovary of fertile flowers 3-celled (1-cell with single stigma in *S. laurifolia*); stigmas thick and spreading, almost sessile; ovules 1 or 2 in each cell, pendulous, orthotropous; fruit a small berry.

About 350 species, mostly tropical with few in the Temperate Zone in North America and eastern Asia. Segregated by some authors as a separate family, Smilacaceae.

1. Stems herbaceous, annual, without prickles; flowers fetidly scented; ovules 2 in each carpel 1. *S. herbacea*.
1. Stems woody, perennial, usually prickly (at least near base); flowers not malodorous; ovules solitary in each carpel (2)

³¹ Adapted partly from W. C. Coker in Jour. Elisha Mitchell Sci. Soc. 60:27-69, Pls. 9-39, 1944, and W. H. Duncan in Sida 3:1-76, 1967.

- 2(1). Stems hairy; underside of leaves densely hairy; plants trailing, suberect or low climbing (to 7 dm.); berries red 2. *S. pumila*.
2. Stems glabrous (rarely with dark stellate hairs on some portions in *S. Bona-nox*); underside of leaves glabrous or rarely minutely hairy; plants sometimes erect but usually high-climbing; berries red or black (sometimes covered with a bloom) (3)
- 3(2). Leaves evergreen, thick-coriaceous, oblong to oblong-linear or oblong-lanceolate to rarely broadly linear, on the underside the midvein in its lower third more prominent than the laterals, a lateral vein closely and evenly submarginal (this is more easily seen in dried leaves), the veins indistinct on the upper surface; stigma one; berries black, 1-seeded, ripening late in the second season after flowering in the previous summer or fall 3. *S. laurifolia*.
3. Leaves deciduous or evergreen with leathery to firm-coriaceous but with neither thick nor oblong blades (if oblong, conspicuously veined on the underside), the midvein scarcely or no more prominent than the laterals, with no submarginal vein (unless irregularly spaced along part of the margin—in *S. auriculata*), the veins sometimes distinct on the upper surface; stigmas 2 or 3; berries black or red, 1- to 3-seeded, ripening the same year after flowering in the spring (or the summer of the second year in *S. Smallii*) (4)
- 4(3). Underside of leaves whitened, silvery or bluish-gray; the leaf margins thin though sometimes rolled when dry, not serrulate, without a rib; berries black or covered with a bloom and bluish; peduncles longer (usually much longer) than the petioles of the subtending leaves 4. *S. glauca*.
4. Underside of leaves about the same green color as the upperside; the leaf margins thin or in one species with a rib; berries black or red, rarely covered with a bloom; peduncles longer or shorter than the petioles of the subtending leaves (5)
- 5(4). Peduncles 1.5 or more times as long as petioles of the subtending leaves, sometimes to 7 cm. long; berries usually 1-seeded (6)
5. Peduncles less than 1.5 times as long as petioles of the subtending leaves or (if longer) the stems without dark slender prickles or leaves without a marginal rib; berries 1- to 3-seeded (8)
- 6(5). Stems with relatively weak somewhat bristlelike usually dark prickles; leaf margins minutely serrulate and not thickened, veins and veinlets slender; leaf drying and fading to a dull-ashy-green color 7. *S. hispida*.
6. Stems with rigid broad-based pale or merely dark-tipped prickles; leaf margins entire or sparsely spinulose-ciliate and thickened by a marginal rib (often poorly developed in young leaves and in some shade forms), veins and veinlets usually thickened; leaf drying and fading to a tan-color (7)
- 7(6). Leaves typically panduriform to broadly ovate, usually longer than broad; widespread in Texas 5. *S. Bona-nox*.
7. Leaves reniform or deltoid-reniform, mostly broader than long; endemic to Edwards Plateau 6. *S. renifolia*.
- 8(5). Leaves usually evergreen, thin-coriaceous, lanceolate to elliptic-lanceolate, smooth-margined (use 10× lens), the base broadly cuneate, the apex acute or short-acuminate; berries dull-red 8. *S. Smallii*.
8. Leaves deciduous, firm-membranous, ovate to triangular-lanceolate or suborbicular, the margin smooth or roughened (use 10× lens), rounded to subcordate at base, the apex notched to mucronulate or cuspidate to acute or obtuse; berries red or black (or bluish-black when glaucous) (9)
- 9(8). Berries black (bluish-black when glaucous); principal stems and main branches with stout flattened prickles; leaf blades usually ovate, abruptly acute to short-acuminate at apex; moist or more often dry habitats . 9. *S. rotundifolia*.
9. Berries bright-red; stems prickly mostly at the base, the prickles mostly subulate; leaf blades usually ovate-lanceolate to narrowly triangular-lanceolate, rounded to obtuse and mucronate at apex; wet habitats 10. *S. Walteri*.

1. *Smilax herbacea* L. CARRION-FLOWER. Stems high-climbing or widely spreading and trailing, to about 3 m. long, freely branched, with numerous tendrils; lower stem bracts ascending to somewhat spreading; leaves with petioles to 8 cm. long, triangular-ovate to narrowly ovate, cordate to rounded at base, broadly rounded to short-cuspidate or short-acuminate at apex, usually pale and puberulent on veins beneath; peduncles elongated, arising from the axils of the foliage leaves, somewhat flattened, with up to 35 flowers in a hemispherical umbel, becoming strongly divergent in fruit; perianth segments oblong to obovate, 3.5-6 mm. long; fruit blackish-blue, often glaucous, about 1 cm. in diameter, with 3 to 5 subglobose brown seeds that are about 4 mm. long. *Nemexia herbacea* (L.) Small. Moist soil in thickets, along roadsides and in woodlands; collected once in woods, San Augustine, summer; e. U.S. and Can., w. to Sask., Mont., Colo., Okla. and Tex.

Our plant is usually referred to var. *lasioneuron* (Hook.) A. DC. (*S. lasioneuron* Hook.) with leaves puberulent on the veins beneath.

2. *Smilax pumila* Walt. SARSAPARILLA-VINE. Stems and branches trailing or low-climbing, woolly, unarmed; leaves with thick petioles to 25 mm. long (usually 15 mm. or less long), ovate to ovate-elliptic or ovate-lanceolate, 5-10 cm. long, to 8 cm. wide, woolly on lower surface, cordate at base, bluntly pointed at apex; peduncles about as long as the petioles or shorter, woolly; segments of the staminate flowers linear to linear-oblong, about 3 mm. long or rarely longer; berry ovoid, persistent, 5-8 mm. long, red, acute; seeds about 3 mm. long, red. In sandy soil and duff of pinelands, sand hills, along stream, oak woods and sparsely wooded slopes in e. Tex., flowering in the fall and fruit ripens in the spring; from Fla. to Tex., n. to S.C.

3. *Smilax laurifolia* L. BAMBOO-VINE, BLASPHEME-VINE. Evergreen high-climbing rampant vine, often forming impenetrable entanglements, with knotty-thickened sub-ligneous rhizomes and with strong terete stems armed (especially below and on vigorous sprouts) with rigid terete prickles; tendrils intermittent, few or wanting on flowering branchlets; leaves heavily coriaceous, short-petioled, with the thick midrib much more prominent beneath than the 2 to 4 lateral ones, oblong to oblong-linear or -lanceolate, usually coarsely mucronate, provided with a prominent and evenly submarginal vein, 6-20 cm. long and 1-7.5 cm. broad; umbels short-stalked, often crowded and subpaniculate along the branchlets; stigma solitary, ovary 1-celled; berries becoming black, about 8 mm. in diameter. Swamps, seepage slopes and low ground in e. Tex., flowering in late summer and autumn of 1st season, lasting over winter; from Fla. to Tex., n. to N.J. and Tenn.; also W.I.

The leaf margin is often inrolled so that there appear to be 2 closely parallel veins at the margin.

4. *Smilax glauca* Walt. SAW-BRIER, CAT-BRIER. Lithe freely climbing and entangling shrub with thick and knotty rhizomes; stems slender, terete, often glaucous, with relatively scattered stiff slender prickles; leaves glaucous or whitened beneath (when fresh) and sometimes above, elliptic or ovate to reniform, with rounded or subcordate bases, to 13 cm. long and 1 dm. wide, the lower surface densely papillose to hirtellous-pulverulent or rarely glabrous; peduncles slender, arching to drooping, longer than subtending petioles; berries blue with bloom, sometimes blackish. Dry to moist sandy thickets, open woods, fields and along streams, in e. Tex., May-June; from Fla. to Tex., n. to N.J., W.Va., s. O., s. Ind., s. Ill. and s.e. Mo.

The terete, not 4-angled or 4-ridged, stems forming the youngest internodes distinguishes this species from *S. rotundifolia* when it loses its glaucousness. Those plants with the lower surface of their leaves glabrous are usually distinguished as var. *leurophylla* Blake.

5. *Smilax Bona-nox* L. CAT-BRIER, ZARZAPARRILLA. Often a rampant vine, straggling to climbing, from ligneous-thickened and knotty rhizomes and slender subterranean stolons, with 4-ridged stems and branches, the lower portion of stem and main branches scurfy and stiffly prickly, the branchlets with or without prickles; leaves very variable, from strongly panduriform to broadly ovate, with or without broadened bases, to 1 dm. long or more, mucronate, coarsely ciliate or eciliate, becoming stiffly coriaceous, strongly reticulate, with a thickened marginal rib; peduncles to 3 cm. long, ascending to divergent or slightly recurving, longer than subtending petioles; pedicels 3-6 mm. long, glaucous; berries black, with a bloom; seed usually solitary, ellipsoid-obovoid to subglobose, 4-5

mm. long, 3.5-4 mm. broad. *S. Bona-nox* var. *hederacfolia* (Beyr.) Fern. and var. *hastata* (Willd.) A. DC. In thickets, open woods, cedar brakes, floodplains and hillsides from e. Tex. w. to Cameron and Val Verde cos., Feb.-June; from Fla. to Tex. and Mex., n. to Va., Ind. and Mo.

6. *Smilax renifolia* Small. Perennial, shrubby, glabrous; stems elongated, climbing high over trees and shrubs, more or less distinctly angled; leaves numerous, with petioles 5-10 mm. long, reniform or deltoid-reniform, 3-7 cm. long, resembling those of *Celtis*, rounded and mucronate at the apex, entire, mostly broader than long, cordate to subcordate at base; stipular sheath fully as long as the petioles, usually provided with tendrils; peduncles of pistillate plants 1-2 cm. long, flattened, much longer than the adjacent petiole; pedicels 2-3 mm. long; perianth segments greenish, linear to linear-oblong, about 2 mm. long, acutish; berries black, subglobose. Climbing over bushes and small trees in open-wooded canyons and along creeks on the Edwards Plateau, Mar.-June; endemic.

This plant, which is endemic to the Edwards Plateau, centered in Gillespie Co., should probably be treated as a geographic variant of *S. Bona-nox*, its closest ally.

7. *Smilax hispida* Muhl. CHINA-ROOT, HELLFETTER, BRISTLY GREEN-BRIER. Stout-based high-climbing shrub from short knotty rhizomes, with lithe glabrous several- to many-ridged stems and branches, very prickly below and sparsely so above with blackish subulate relatively flexible unequal prickles; leaves submembranaceous, lustrous green, when dry light-olive-gray, ovate to elliptic or suborbicular, rounded to cordate at base, the veins slender, the reticulations delicate, the margins serrulate and not thickened, to 15 cm. long and broad, usually much smaller; peduncles divergent to drooping, slender, 15-65 mm. long, much longer than subtending petioles; pedicels very slender, 5-12 mm. long; perianth bronze to greenish; fruit black, mostly 1-seeded, the lustrous red-brown subglobose seed 5-6.5 mm. in diameter. *S. Pseudo-china* of auth., *S. tamnoides* of auth. and var. *hispida* (Muhl.) Fern. Low woods and thickets, along creeks, e. and n.-cen. Tex., Mar.-June; from Fla. to Tex., n. to e. Va. and Kan.

8. *Smilax Smallii* Morong. GREEN-BRIER. Plant glabrous, often evergreen; stem and branches terete, striate, armed only below, often high-climbing, to about 25 dm. long, with tendrils; leaves with petioles 4-10 mm. long, light-green, shining above, often somewhat glaucous beneath, thin-coriaceous, lanceolate to elliptic-lanceolate, slightly rounded to cuneate at base, narrowed into an obtuse to acute or short-acuminate apex, sparsely lineate, 5-nerved, to 11.5 cm. long and 4 cm. wide; stipular sheath with narrow membranous smooth-edged margins and two thirds as long as the petiole; peduncle about equal to petiole; pedicels very unequal, 2-8 mm. long; receptacle small, globular; bracteoles minute, triangular; perianth segments of male flowers narrowly oblanceolate, about 4 mm. long; stamens 6, about as long as the perianth; anthers one eighth the length of the filaments; fruits about 6 mm. in diameter, 2- or 3-seeded, ripening at end of first year. *S. lanceolata* of auth. Trailing over trees and shrubs along creeks and in rolling woodlands in e. Tex., May-June; from Fla. to Tex. and Ark., n. to Va.

9. *Smilax rotundifolia* L. COMMON GREEN-BRIER, BULL-BRIER, HORSE-BRIER. Tough woody high-climbing vine, from long slender rhizomes, with strong greenish subrigid terete to 4-angled stems and branches bearing stout flattened prickles; tendrils numerous; leaves shortly petioled, narrowly ovate to suborbicular or reniform, with rounded to cordate bases, bright-green on both sides, lustrous, thinnish, becoming subcoriaceous, mostly 4.5-10 cm. long, often muriculate on back near base; peduncles to 15 mm. long, ascending to divergent; pedicels 2-7 mm. long; flowers greenish to bronze; berries blue-black, with bloom, mostly 2- or 3-seeded. Incl. var. *quadrangularis* (Muhl.) Wood. Moist to dryish thickets and woods, evergreen shrub bogs, often a noxious pest in e. Tex., Mar.-June; from Fla. to Tex., n. to N.S., s. Me., s. N.H., N.Y., s. Ont., O., Ind., s. Ill., s.e. Mo. and Okla.

10. *Smilax Walteri* Pursh. CORAL GREEN-BRIER, RED-BERRIED BAMBOO. Slender and lithe woody vine, with widely creeping slender rhizomes, clambering over bushes; lower half of the stem with scattered subulate prickles, the terete branches nearly or quite without prickles; tendrils numerous; leaves submembranaceous, smooth, green on both sides, when dried very lightly orange-tinged with brown, ovate to ovate-oblong or triangular-ovate, with rounded bases, rounded to obtuse and mucronate at apex, mostly 6-12 cm. long and 3-7 cm. broad; peduncles mostly shorter than petioles; flowers greenish to bronze; berries bright-red, handsome, persistent over the winter. Swampy or boggy thickets, low pinelands, rare in e. Tex., Mar.-June; from Fla. to Tex., n. to N.J.

A rather large and apparently quite old colony of the Old World Aloe *barbadensis* Mill., the aloe of commerce, is established along the highway between Rio Grande City and Guerra in Starr County. It is characterized by its tumid swordlike leaves with broad marginal spines about 1 cm. apart and its slender, dense racemes of prominently bracteate yellowish flowers. It may eventually become widespread in south Texas.

FAM. 39. AMARYLLIDACEAE ST.-HILL.

AMARYLLIS FAMILY

Mostly perennial herbs, herbaceous or sometimes with a woody base or with somewhat woody stems; flowering stems scapose, from a bulb or corm, a short rootstock or a large woody caudex; leaves of a linear type and entire; flowers perfect, regular or nearly so; perianth segments 6, distinct or mostly united below into a tube that is adnate to the ovary; stamens 6, rarely more or only 3, inserted on the perianth, the filaments free or united in a cup; anthers basifixed or versatile, dehiscing usually by introrse longitudinal slits; ovary inferior, 3-celled; style 3-lobed; fruit usually a 3-valved capsule with loculicidal dehiscence or sometimes indehiscent; seeds usually numerous.

Broadly interpreted the family probably has nearly 2,000 species in about 100 genera, rather cosmopolitan but mostly in tropical and subtropical regions of both hemispheres. Some of the species are highly ornamental while others, such as Agaves, are important economically.

The commonly cultivated *Amaryllis Belladonna* L., a native of Latin America, occasionally escapes. It is abundantly spread in and along a slough on the west edge of Edna in Jackson County, where it is well-established. It is readily distinguished by its umbellate cluster of large (to 15 cm. long) reddish to salmon-color bell-shaped flowers, and its basal cluster of broad, fleshy, strap-shaped leaves.

1. Flowers with a conspicuous corona above the perianth (2)
 1. Flowers without a corona (3)
 - 2(1). Corona between the perianth segments and the stamens 1. *Narcissus*, p. 413.
 2. Corona united to the filaments and connecting them .. 2. *Hymenocallis*, p. 414.
 - 3(1). Flowers solitary or paired, rarely umbellate (4)
 3. Flowers numerous in spicate racemes or panicles (8)
 - 4(3). Perianth segments pilose on the outer surface; foliage grasslike, herbaceous, usually villous or pilose 3. *Hypoxis*, p. 415.
 4. Perianth segments glabrous; foliage mostly broad and fleshy-thickened, rarley grass-like, glabrous or essentially so (5)
 - 5(4). Flowers several in an umbel; spathes 2, large and broad 7. *Crinum*, p. 419.
 5. Flower solitary; spathe solitary, narrow (6)
 - 6(5). Anthers basally dorsifixed; filaments very short ... 4. *Cooperia*, p. 416.
 6. Anthers medially dorsifixed; filaments well-developed (7)
 - 7(6). Perianth erect; stamens of 2 lengths 5. *Zephyranthes*, p. 418.
 7. Perianth oblique or declinate; stamens of 4 lengths ... 6. *Habranthus*, p. 418.
 - 8(3). Flowers regular; leaves minutely scabrous-dentate to spiny-margined; flowering stems with much-reduced bracts; inflorescence paniculate or racemose with the flowers in clusters 8. *Agave*, p. 419.
 8. Flowers somewhat irregular; leaves serrulate or entire, passing gradually into leafy bracts on the flowering stem; inflorescence always a simple spicate raceme 9. *Polyanthes*, p. 423.

1. NARCISSUS L.

Bulbous plants with linear flat or narrow rushlike leaves that appear with (and are about equal to) the flower scape; flowers yellow or sometimes white, mostly nodding; perianth salverform, with a rather short cylindrical or funnelform tube, the usually equal

segments spreading to reflexed from the base of the tubular or cup-shaped crown; stamens inserted in the tube.

Several of the 30 or more entirely Eurasian species, and some of their hybrids, are commonly cultivated for their early spring flowers. Three of the more frequently cultivated species that tend to escape cultivation or occur as waifs are included here.

- 1. Leaves terete or semiterete and narrowly channeled on the face, green 1. *N. Jonquilla*.
- 1. Leaves flat or essentially so, mostly glaucous (2)
- 2(1). Crown half as long as to longer than the perianth segments 2. *N. Pseudo-Narcissus*.
- 2. Crown much less than half as long as the perianth segments 3. *N. Tazetta*.

1. *Narcissus Jonquilla* L. JONQUIL. Plant low and slender; leaves and scape 25-45 cm. high; flowers 2 to 6, fragrant; perianth yellow with a darker crown; tube slender, about 25 mm. long; crown about 3 mm. long, crenate, much shorter than the obovate spreading segments.

2. *Narcissus Pseudo-Narcissus* L. DAFFODIL. Plant stout; leaves to about 5 dm. long, 8-20 mm. wide, usually exceeding the scape; flowers solitary, horizontal or ascending, 5-6.5 cm. long; perianth yellow with a darker crown; tube broad, about 13 mm. long; crown 3.5-5 cm. long, with more or less frilled edges, about as long as the oblong to ovate segments.

3. *Narcissus Tazetta* L. POLYANTHUS NARCISSUS. Plant stout; leaves to about 45 cm. long, about as long as the flattened scape, 1-2 cm. wide; flowers usually 4 to 8, sometimes fewer, fragrant; perianth whitish, with a light-yellow crown; tube slender, to 25 mm. long; crown cup-shaped, much shorter than the obovate overlapping segments.

2. HYMENOCALLIS SALISB. SPIDER-LILY

Herbs with scapes and leaves from a rather large tunicated bulb; flowers white (in ours), showy, essentially sessile in a terminal umbel subtended by 2 or more usually scarious bracts; perianth tube very slender, elongate, the limb with linear to narrowly lanceolate spreading segments; crown showy, forming a large conspicuous cup that connects the bases of elongate filaments; anthers versatile; capsule firm, few-seeded.

Forty or more species in the warmer parts of the Western Hemisphere. *H. caymanensis* Herb. has been reported from coastal Texas but no material has been seen. The long (12-16 cm.) perianth tube is characteristic of this species.

- 1. Flowering from July to September after the leaves begin to wither 1. *H. Eulae*.
- 1. Flowering from March to May or sporadically to July, with the leaves (2)
- 2(1). Free part of filaments 20 mm. long or less; larger perianth segments usually 5 mm. wide or less; crown 25-35 mm. long; leaves commonly less than 20 mm. wide 2. *H. Liriosme*.
- 2. Free part of filaments 23-35 mm. long; larger perianth segments usually more than 5 mm. wide; crown 33-40 mm. long; leaves 18-42 mm. wide 3. *H. caroliniana*.

1. *Hymenocallis Eulae* Shinn. Bulb about 5 cm. in diameter, to 75 mm. long (including neck); scape 6-9 dm. high; leaves glaucous-green, oblanceolate, to 6 dm. long and 5 cm. wide, slightly recurved, appearing in late winter and dying off in late spring; spathes lanceolate, to 4 cm. long; umbel mostly 6- to 9-flowered; flowers snow-white, about 2 dm. across, fragrant (especially at night); perianth tube 8-12 cm. long, the segments to 1 dm. long; staminal cup about 65 mm. in diameter, the edges somewhat lacerate, with sharp points; ovary sessile, about 1 cm. long; filaments 3-4 cm. long; anthers introrse. In heavy soils near streams that periodically overflow and seepage slopes in s.e. Tex., July-Sept.; also La.

2. *Hymenocallis Liriosme* (Raf.) Shinn. Bulb with black outer and white inner coat; scape sharply 2-edged, biconvex, spongy, shriveling to less than half its original

width and less than a fourth its thickness in drying; leaves shining, light-green, to about 4 cm. wide, appearing in the spring; flowers snowy-white (tinged lemon-yellow in the center and greenish or yellowish on perianth tube), blooming simultaneously with appearance of leaves, about 2 dm. in diameter; perianth tube 6-8 cm. long *H. galvestonensis* of auth. Common on stream banks, in ditches and wet places in e. Tex., w. to Red River, Van Zandt, Kaufman and Victoria cos., Mar.-May; from La. and Tex. to Ark. and Okla.

3. *Hymenocallis caroliniana* (L.) Herb. Scape 35-53 cm. high; leaves narrowly oblanceolate to elliptic-ligulate, 1.8-4 cm. wide; umbel 3- to 9-flowered; spathe bracts lanceolate, acute to obtusely acute, to 6 cm. long; flowers sweetly fragrant; perianth segments greenish-white below, to 1 dm. long; crown 3.3-4 cm. long, the margins irregularly incised; filaments 23-35 mm. long; style exceeding the stamens; fruit globose, usually with 2 ovules in each cell. *H. occidentalis* of auth. In wet sandy areas in e. and s.-cen. Tex., Mar.-May or sporadically to July; from Ga. to Tex., n. to Ky., Mo. and Ark.

3. HYPOXIS L.³² STAR-GRASS

Stemless small herbs with grasslike usually hairy linear or narrowly lanceolate leaves and slender 1- to several-flowered peduncles from a cormlike short vertical rhizome; perianth mostly pilose without, its tube completely coherent with the ovary; perianth segments yellow to whitish within, usually green on the back, connivent at least after anthesis, usually forming a beaklike crown to the fruit or rarely deciduous; anthers versatile or rarely basifixed; capsule indehiscent or longitudinally dehiscent; seeds globular to ellipsoid, with pebbled to muricate or variously sculptured testa.

More than 100 species, mostly in the Southern Hemisphere.

- 1. Seeds sharply muricate, the projections somewhat awl-shaped and acute (2)
- 1. Seeds reticulate, covered with low smooth rounded pebbling or blunt murications (3)
- 2(1). Seeds black, beset with conspicuous sharp projections; principal leaves 5- to 9-nerved1. *H. hirsuta*.
- 2. Seeds brown, the acute projections minute; principal leaves 3-nerved 2. *H. micrantha*.
- 3(1). Leaves thin and flaccid, glabrous, narrowly linear-lanceolate, usually more than 5 mm. wide at about the middle; peduncles mostly 2-flowered; perianth segments 5-7 mm. long3. *H. leptocarpa*.
- 3. Leaves firm, linear, pilose, 1-4 mm. wide; peduncles usually 1-flowered; perianth segments 7-12 mm. long (4)
- 4(3). Leaf bases (corm scales) breaking down into fibrous bristles; anthers versatile; seeds opaque or slightly lustrous4. *H. rigida*.
- 4. Leaf bases not disintegrating into bristles; anthers basifixed; seeds iridescent 5. *H. sessilis*.

1. *Hypoxis hirsuta* (L.) Cov. Corm subglobose to ellipsoid, 5-20 mm. thick, covered with membranaceous pale or brown-tinged sheaths that do not become fibrillous; leaves linear, rather firm, 1-6 dm. long, 1-8 mm. wide; peduncles filiform, stiffish or spreading, 4-35 cm. long, 2- to 7-flowered; pedicels elongate; ovary and capsule densely pilose; perianth segments lanceolate to elliptic or narrowly ovate, 5-15 mm. long; capsule ellipsoid, 2-6 mm. long; seeds 0.8-1.3 mm. in diameter, black, lustrous, the outer coat closely covered with sharp murications. *H. erecta* L. In open woods, meadows, prairies and pastures in e. Tex., w. to Wise and Bastrop cos., Mar.-May; from s. N.H. to Man., s. to Fla. and Tex.

2. *Hypoxis micrantha* Pollard. Corm subglobose to subcylindric, 4-12 mm. thick, covered with the dark membranaceous bases of the old leaves rarely disintegrating into bristly fibers; leaves linear-lanceolate, 1-4 dm. long, 1-6 mm. wide, pilose; peduncles pilose, 5-18 cm. long; ovary and capsule pilose; perianth segments 3.5-15 mm. long, rather acute at the apex; capsule subglobose to subcylindric, 4-9 mm. long; seeds brown, covered with very numerous minute awl-shaped murications. Sandy soil in open pinelands in n.e. Tex.; in s. U.S. and the W.I.

³² Adapted from A. Brackett in *Rhodora* 25:120-147. 1923.

3. *Hypoxis leptocarpa* Engelm. Corm ovoid-cylindric, 10-15 cm. thick; leaves very thin and flaccid, narrowly linear-lanceolate, tapering below, acuminate and long-attenuate at apex, often quite glabrous, 2-9 dm. long, about 12 mm. broad; peduncles very slender and lax, mostly 1- to 3- (rarely 4-) flowered; perianth segments 5-7 mm. long, subglabrous to dorsally pilose; mature capsules 4-10 mm. long, slightly pubescent to glabrate; seeds black, with blunt murications. *H. hirsuta* var. *leptocarpa* (Engelm.) Brackett. Wet woods, swamps and bottomlands, often along streams, in s.e. Tex., May-Aug.; from N.C. to Fla. and Tex.

4. *Hypoxis rigida* Chapm. Corm subcylindric to ellipsoid, 6-15 mm. thick, covered with the stiff bristly bases of the old sheaths or rarely with membranous slightly disintegrating leaf bases; leaves rather rigid, linear, 1-4 dm. long, 1-4 mm. wide; peduncles glabrate, to 3 dm. long, 1- or rarely more-flowered; ovary and capsule pilose; perianth segments 7-12 mm. long, oblong to lanceolate, acutish, densely pubescent without; capsule narrowly obovoid, 1-9 mm. long; seeds about 1 mm. in diameter, black, opaque or slightly lustrous, covered with short rounded approximate pebbling. *H. humilis* Tharp. Low pine barrens, sandy soil in prairies and on edge of bogs in s.e. Tex., Apr.-July; from Fla. to Tex., n. to N.C.

5. *Hypoxis sessilis* L. Corm cylindric to slenderly ovoid, 5-10 mm. thick, covered with membranous but scarcely fibrillous brown sheaths; leaves linear, 1-3 dm. long, 1-4 mm. wide, firm; peduncles essentially wanting or to 8 cm. long, filiform, pilose; ovary and capsule densely pilose; perianth segments lanceolate, rather acute, 7-12 mm. long; anthers basifixed; capsule pyriform, 3-4 mm. long; seeds black, ellipsoid, 1-4 mm. in diameter, the low flat pebbling almost completely covered with a closely granular film or coating of a golden-brown iridescent substance, the short beak and rostrate hilum black. Dry pine barrens and sandy openings in s.e. Tex., Mar.-May; throughout s. U.S.

4. COOPERIA HERB.³³

RAIN-LILY

Bulb globose or subglobose, tunicated, black or brown; leaves linear, smooth, usually glaucous, erect or recumbent; scape hollow, erect, usually single-flowered; spathe long, tubular below, free upwards, entire, fenestrate or bifid (usually unilaterally); flower erect, salverform, night-blooming, opening in the afternoon or evening, scented, white or light-yellow; stamens inserted in the throat of the tepal tube; filaments very short; anthers erect, fasciculate, pale-yellow, affixed one fourth distance from base; stigma tripartite; capsule trilocular; seeds flat, black, D-shaped.

About 6 or 7 species, one in South America, the others from northern Mexico, through Texas to Kansas, west to New Mexico and east to southwestern Louisiana.

1. Flowers white (2)

1. Flowers yellow (4)

2(1). Style less than 35 mm. long; stigma in tube with lobes linear; leaves broad (over 5 mm. wide); ovary pedicellate; perianth tube short (2.2-4 cm. long) 1. *C. pedunculata*.

2. Style more than 40 mm. long; stigmatic lobes globose; leaves narrow (to 5 mm. wide); pedicel rarely present; perianth tube greatly elongate (3.4-18 cm. long) (3)

3(2). Plant of delicate appearance; known only from the Texas Gulf Coast north of the Coastal Bend 2. *C. Traubii*.

3. Plants larger, not delicate-appearing; widely spread over Texas and beyond 3. *C. Drummondii*.

4(1). Length of perianth tube usually less than that of spathe (Cameron Co.) 4. *C. Smallii*.

4. Length of perianth tube usually markedly greater than length of the spathe (Texas Coastal Bend) 5. *C. Jonesii*.

³³ Contributed by Walter S Flory.

1. *Cooperia pedunculata* Herb. Bulb large, usually black, conical when young, flattened-globose when old, 2.5 × 4 cm., the often long neck to 8 cm.; leaves glaucous, linear, 6 mm. wide but broadening to about 12 mm. at base; scape 2 dm. high; spathe bifid at tip, at first covering the ovary, later disclosing it on one side; stipe short, 5-33 mm. long; flowers appear in the spring, white, sometimes flushed pink without; perianth tube cylindric, 3-4 cm. long; limb broadly funnellform, expanding to 5 cm. wide; anthers 6 mm. long, the petaline slightly exceeding the sepaline in position by a quarter of their length; style 16 mm. long or shorter, erect; stigma white, suberect, rounded, included in the tube. *Zephyranthes Drummondii* D. Don. In e. and s.w. Tex. and adj. parts of Mex., Mar.-Aug.

2. *Cooperia Traubii* Hayward. Bulb globose, 16 mm. in diameter, the neck 28 mm. long; leaves 3 or 4, linear, glaucous, recumbent, to 23 cm. long; scape to 19 cm. high; spathe cylindric, about one third the length of the perianth tube, the slender tips 14 mm. long and acute; stipe none; flowers opening in the evening, white, often with tinge of reddish-pink on reverse of the three sepals; perianth tube very slender, (6-) 10-13 (-14) cm. long; limb often stellate, 3.3-7 cm. or more in diameter at full expansion; anthers 6-10 mm. long; filaments very short, 0.5-3 mm. long; style slender, both it and the stigma white, the latter with globose lobes and usually exserted (often to 1 cm. above the anthers). *Zephyranthes Traubii* (Hayward) Moldenke. From Brazoria, Refugio, Victoria and Calhoun cos., probably occurring also on grassy plains of Jackson, Matagorda, and perhaps of other counties near the Tex. Gulf Coast and n. of the Coastal Bend; endemic.

While most like *C. Drummondii*, it is more delicate in appearance, with the scape and perianth tube being more slender, the bulbs usually smaller, the filaments shorter, and the leaves generally narrower.

3. *Cooperia Drummondii* Herb. **CEBOLLETA**. Quite variable; bulb large, subglobose, 2 × 3 cm., the neck 2-9 cm. long, the tunics black; leaves 2 to 5, narrow-linear, gray-green, tending to be glaucous, erect or declinate, 3 dm. long; scape 10-33 cm. high; spathe about 4 cm. long, slit or looped at the tip, with its tube about 11 cm. long and greenish, often fading red; stipe none; flowers most frequently in the fall, sometimes in the summer, less frequently in the spring, white, the very slender tube 8-18 cm. long; perianth limb opening flat, white, pink-tinted on the outer surface; calyx lobes ovate to lanceolate, 24 mm. long, 13 mm. wide, with blunt tips, the corolla lobes just slightly smaller; flower expanding in the evening, sometimes lasting up to 4 days before it withers; anthers erect, creamy-yellow, 9 mm. long, attached one-third of length from base, filaments 4-8 mm. long; style white, sometimes shorter than the tube, sometimes exceeding the stamens. *Zephyranthes Herbertiana* D. Dietr., *Z. brazosensis* (Herb.) Traub. The most widely distributed *Cooperia* known, with its greatest frequency in Tex., but occurring from n. Mex. to Kan., N.M. and La., May-Sept.

4. *Cooperia Smallii* Alex. Bulb globose, with brown tunics, 25 mm. in diameter; leaves narrowly linear, bright-green, acute, channeled on upper side, 15 cm. long, to 3 mm. wide; scape greenish-tan, erect, 15-20 cm. tall; spathe 22-46 mm. long, tubular for 1.5-3 cm.; pedicel variable, from practically none to 35 mm. long; flowers usually appearing in profusion following heavy autumn rains; buds open in the afternoon; perianth tube green, 11-44 mm. long; perianth limb lemon-yellow, stellate or full; stamens erect; filaments 4-9 mm. long, subulate, fleshy or somewhat flattened, pure-white or with green bases; anthers linear, pale-yellow, about 8 mm. long; stigma (which is either exserted or among the anthers) with 3 globular whitish lobes. *Zephyranthes Smallii* (Alex.) Traub. Considerable evidence indicates this to be a natural first-generation hybrid between *Z. pulchella* and an unusual clone of *C. Drummondii*. Known only from Cameron Co., Tex.

5. *Cooperia Jonesii* Cory. Bulb subglobose, 2.5-3 cm. in diameter; leaves gray-green, narrowly linear, not acute, to 35 cm. long and 45 mm. wide; scape to 3 dm. tall; spathe 2-4 cm. long, tubular for 12-23 mm.; pedicel varying from none to 6 mm. in length; perianth tube 23-72 mm. long; perianth limb yellow, stellate or full, 2-5 cm. in diameter when fully expanded; buds open in the afternoon; filaments 1.5-7 mm. long, subulate, fleshy or flattened, pure-white or with green bases; style white, 6-7.5 mm. long; globose-lobed stigma sometimes below the anthers but more often exceeding them sometimes by as much as 5 mm. *Zephyranthes Jonesii* (Cory) Traub. Primary distribution in Refugio and San Patricio cos. but also extending into Victoria, Goliad, Nueces and Bee cos. Con-

siderable evidence indicates this to be a natural hybrid between *Z. pulchella* and *C. Drummondii*.

5. ZEPHYRANTHES HERB.³⁴

RAIN-LILY. ZEPHYR-LILY

Bulb globose or subglobose, tunicated, usually dark-brown; leaves linear, grasslike, with margins essentially parallel; scape hollow, slender, single-flowered, from a tubular spathe that is sometimes fenestrate but usually is 2-notched at apex; flower regular, erect to suberect, funnelform with short to long tube, the limb segments about equal; anthers erect to suberect, becoming versatile after anthesis, orange, affixed below the middle; stigma trifid, the lobes filiform to globose; capsule trilocular, rarely 4-celled; seeds few or many per cell, black, flat, D-shaped.

About 50 species in the warmer parts of the Western Hemisphere. The South American *Z. candida* Herb. escapes from cultivation and tends to become naturalized in southeast Texas (Liberty, Orange and Jefferson cos.). It has white flowers that are usually tinged rose on the outside, and leaves that are slightly thickened or raised on the edges.

1. Found in alkaline soils of west Texas; leaves narrow, not over 3 mm. in width and usually less; stigma deeply trifid1. *Z. longifolia*.
1. Found in less alkaline soils of south Texas coastal prairies; mature leaves more than 3 mm. wide (2)
- 2(1). Flowers bright (buttercup)-yellow, unscented; perianth tube 5 mm. long; stigma capitate and distinctly 3-lobed2. *Z. pulchella*.
2. Flowers a lighter yellow, with decided fragrance; perianth tube 15-24 mm. long; stigma shortly 3-lobed3. *Z. refugiensis*.

1. *Zephyranthes longifolia* Hemsl. Bulbs ovoid, 2-2.5 cm. in diameter; leaves very narrow, 15-23 cm. long, contemporary with the flowers in summer; flowers bright-yellow, coppery outside; spathe 2-2.5 cm. long; pedicel much shorter than the spathe; perianth 2-2.5 cm. long; tube short; stamens much shorter than the limb; stigma deeply trifid. *Atamosco longifolia* (Hemsl.) Cockll. On alkaline soils in Trans-Pecos and High Plains of w. Tex., Apr.-July; from Tex. to Ariz. and the highlands of cen. Mex.

2. *Zephyranthes pulchella* J. G. Sm. Bulbs globose, 1-2 cm. in diameter; leaves 3 or 4, appearing with flower, usually 2 dm. long or less, but occasionally to 3 dm. long, to 3.5 mm. wide; flowers yellow, usually appearing after heavy rains, unscented; perianth erect, 2 cm. long; tube 5 mm. long; stamens inserted at the throat, about 1 cm. long; suberect anthers curved; filaments diverse at anthesis; style equal to the stamens; stigma capitate, 3-lobed. *Atamosco pulchella* (J. G. Sm.) Greene, *Z. chrysantha* Greenm. & Thomps. Most often in swales and roadside ditches, throughout s. Tex. Coastal Prairies from Corpus Christi to Brownsville and westw., May-Oct.; endemic.

3. *Zephyranthes refugiensis* F. B. Jones. Bulb subglobose, 2-2.5 cm. in diameter, slightly broader than high, the neck 4-5 cm. long; leaves to 25 cm. long, 2-3 mm. wide at base and to 4 mm. at widest point; flowers dark-lemon-yellow (but lighter in color than those of *Z. pulchella*), appearing after heavy rains from July to Nov., reported to be fragrant; perianth erect, to 45 mm. long, the limb funnelform, the yellowish-green tube 15-23 mm. long; anthers suberect and curved, the filaments semipatent; stigma shortly 3-lobed. In open swales on prairies or in brushy pastures over a 200 square mile area mostly in Refugio Co., but to some extent in adjoining Goliad Co. A hybrid close to *Z. pulchella* with some introgression from *Cooperia Drummondii*; endemic.

6. HABRANTHUS HERB.

COPPER LILY

About 20 species in subtropical and warm temperate regions, mostly South America; we have one species.

1. *Habranthus texanus* (Herb.) Steud. Bulb ovoid, about 2 cm. in diameter; leaves basal, following the flower, short, narrowly linear; scape slender, to about 3 dm. tall, 1-flowered; spathe bifid, about 25 mm. long; perianth orange-yellow, sometimes tinged

³⁴ Contributed by Walter S Flory.

reddish on outer surface, 25-30 mm. long, broadly infundibuliform, somewhat zygomorphic and declinate, the subequal linear-oblong segments to 1 cm. wide and rounded-apiculate at apex; stamens fasciculate, unequal, of 4 different lengths; capsule subglobose, 3-lobed and -angled, about 15 mm. wide. *Zephyranthes texana* Herb., *Atamosco texana* (Herb.) Greene. In water among grasses, swales, moist pasturelands and other such places in e. Tex., w. to the Edwards Plateau and along the coast to the Rio Grande Plains, Aug.-Oct.; endemic.

7. CRINUM L.

Bulbous, the neck of the bulb often columnar like a caudex; leaves basal, often persistent, broad and thick, strap-shaped, not narrowed at base; flowers white or whitish, in some species striped or tinged with red, few or many in an umbel subtended by 2 large broad spathe valves, the pedicels short or none, the scape solid; perianth tube equaling or exceeding the essentially equal segments; stamens inserted at throat; filaments long and usually declinate; ovary inferior, globose to oblong or oval, with few ovules in each cell; style long, slender; stigma small, capitate; capsules bursting irregularly; seeds large, green.

About 100 species in warm temperate or tropical regions in both hemispheres.

1. Perianth segments much shorter than the tube 1. *C. americanum*.
 1. Perianth segments longer than the tube 2. *C. strictum*.

1. *Crinum americanum* L. SOUTHERN SWAMP LILY. Bulbs stoloniferous, 5-12 cm. in diameter, the neck short; scape to 9 dm. tall or more; leaves narrowly liguliform, to 15 dm. long and 5 cm. wide, sparingly denticulate; flowers white, sometimes marked with pink, fragrant, salverform, 2 to 6 in an umbel, essentially sessile; spathe valves broadly lanceolate, acuminate, 5-9 cm. long; perianth tube very slender, greenish, 10-12 cm. long; perianth segments much shorter than the tube, to about 15 mm. wide; stamens spreading, prominent; capsule globose, about 3 cm. in diameter, strongly beaked. In swamps, marshes, edge of water in ditches and lakes, in s.e. and s.-coastal Tex., May-Nov.; from Fla. and Ga. to Tex.

2. *Crinum strictum* Herb. Bulb small, ovoid, without a distinct neck; leaves 6, evergreen, suberect, to about 4 dm. long and 5 cm. wide, narrowly linear-lanceolate, bluntly acute at apex, with hyaline margins that are minutely toothed at varying intervals to 8 mm. apart; scape flattish, with rounded edges, rusty-reddish in lower third, to 3 dm. long; spathe valves lanceolate, the margins infolded, streaked reddish over moderate yellow-green, to 9 cm. long and 25 mm. wide at base, tapering to a bluntly acute to truncately notched apex; umbel 3- or 4-flowered; buds creamy-white streaked reddish for the most part on outside, upright at first then nodding slightly below; flowers fragrant, on pedicels 3-4 mm. long; perianth tube permanently slightly curved in upper fourth, 85 mm. long, 5-7 mm. in diameter; perianth segments white and streaked reddish on outer surface, narrowly lanceolate, acute-apiculate, about 11 cm. long and 15 mm. wide; stamens and styles red in upper three-fourths, prominently exerted; stamens 65 mm. long; anthers 13 mm. long; ovary oblong, 14 cm. long, about 9 mm. in diameter; style 32 mm. longer than the stamens; stigma minute. In wet soils, rare in s.e. Tex.

Var. *Traubii* Moldenke differs from var. *strictum* in its 7-flowered umbel, longer foliage that is deeper green in color, and flowers not so erect. Occurring with the species.

Crinum bulbispermum (Burm.) Milne-Redhead & Schweickerdt has been reported from Texas but no material has been seen of this plant. This species, a native of South Africa, is commonly cultivated. It may be distinguished by its outward-curved or even drooping flowers with contiguous and often declinate stamens and styles.

8. AGAVE L.³⁵ CENTURY-PLANT

Succulent rosette plants with long-lived leaves, flowering but once after 8 to 20 years, frequently suckering at base and occasionally bulbiferous in the inflorescence; roots

³⁵ Contributed by Howard Scott Gentry.

hard-fibrous, radiately and shallowly deployed; stems thick, very short, usually shorter than the terminal bud; leaves large, generally succulent, armed or unarmed on the margins, tipped with a hard sharp spine; inflorescence tall-scapose, spicate to racemose or paniculate with the flowers in umbellate clusters, bracteate; flowers mostly large, many, proterandrous; perianth tubular to shallowly funnelform, the six segments similar or dimorphic, imbricate in the bud; stamens six; filaments long-exserted, inserted in tube or on tepal base; anthers versatile; ovary inferior, 3-celled, succulent, thick-walled; ovules numerous, axile, in 2 rows; pistil elongate, filiform, tubular; stigma 3-lobate, papillate-glandular; fruit a dehiscent loculicidal capsule; seeds flattened, black (fertile).

Two hundred to two hundred fifty species all native to the Americas, many now world-wide in cultivation for fiber, food and ornamentals. Several species in the succulent collections of private and public gardens of Texas are not included here.

Several extra-Texas species have been reported from the state, including *A. applanata* Koch, *A. heterocantha* Zucc., *A. neglecta* Small and *A. scabra* Salm-Dyck. These reports are probably based upon misdetermined indigenous plants.

1. Inflorescence spicate or racemose; plants relatively small; flower tube shallow and open. (subg. *Littaea*) (2)
1. Inflorescence paniculate, the flowers borne in umbellate clusters on lateral branches; plants mostly large to medium size; flower tube deep. (subg. *Euagave*) (4)
- 2(1). Leaves with a firm gray to brownish sinuate horny border, the teeth 20 to 30 or more on each side; terminal spine weak, 1-1.5 cm. long 1. *A. lophantha*.
2. Leaves with a detachable white to gray nearly straight horny border, the teeth 10 to 20 on each side; terminal spine strong, 2-4.5 cm. long (3)
- 3(2). Leaves 2-3 cm. wide, light-green to yellowish, the lower surface (when fresh) checked with green lines 2. *A. lecheguilla*.
3. Leaves 5-7 cm. wide, dark-green to glaucous-green, the lower surface not checked with green lines 3. *A. chisosensis*.
- 4(1). Leaves large, 12-18 cm. broad; panicles large and broad with lateral branches sigmoid (5)
4. Leaves smaller, usually less than 10 cm. broad; panicles smaller, narrower, the lateral branches straight (8)
- 5(4). Leaves without teeth or with a few small teeth irregularly along the margins (cultivated) 4. *A. Weberi*.
5. Leaves always armed with prominent teeth along the margins (6)
- 6(5). Leaves asperous, the bases very broadly clasping the broad stem; teeth of leaves generally large and deflexed, the larger over 1 cm. long (native) 5. *A. asperrima*.
6. Leaves smooth, the bases less broadly clasping; teeth of leaves usually smaller, less than 1 cm. long, straight or flexed (7)
- 7(6). Leaves elongate, 10-17.5 dm. long, rarely shorter, always 7 to 9 times longer than wide (cultivated and native) 6. *A. americana*.
7. Leaves short and broad, 4-7.5 dm. long, only 3 or 4 times longer than broad (native) 7. *A. Havardiana*.
- 8(4). Leaves relatively broad, mostly 3 to 5 times longer than broad; panicles broad with the lateral peduncles 20-30 cm. long; flower tube deep, one half to two thirds as long as the tepals (9)
8. Leaves narrower, mostly 4 to 6 times longer than broad; panicles narrow, with short lateral peduncles only 5-15 cm. long; flower tube shallow, about one third as long as the tepals 8. *A. gracilipes*.
- 9(8). Large compact rosettes with many leaves 30-40 cm. long; teeth of leaves remote but little flexed 9. *A. Parryi*.
9. Small rather open rosettes with rather few leaves only 15-25 cm. long; teeth of leaves proximal and variously flexed 10. *A. neomexicana*.

1. *Agave lophantha* Schiede. THORN-CRESTED AGAVE. Small rather open light-green widely suckering rosettes, ours only 3-4 dm. tall; leaves 3-4 dm. long, 3-4.5 cm. wide, linear-lanceolate, spreading, usually straight, the horny margins continuous, firm, sinuate; teeth 4-6 mm. long, variously curved but not generally downflexed, usually with 1 to 3 secondary teeth along the midblade; terminal spine weak, 1-1.5 cm. long; spikes 3-5 m. tall, with acicular bracts conspicuously longer on the lower part of shaft; flowers short-pedicellate, in twos and threes, pale-green to yellowish-green, 3.5-4 cm. long, the ovary longer than tepals; tepals 15-20 mm. long, spreading, clasping the filaments after anthesis; filaments inserted on orifice of tube. Rare in Tex., on sandy soils in Starr and Zapata cos.; from s. Tex. s. along the Gulf Coast to Ver.

2. *Agave lecheguilla* Torr. LECHUGUILLA. Small widely suckering yellow-green rosettes 2.5-4 dm. tall; leaves 3-5 dm. long, 2-3 cm. wide, linear, straight to falcate or upcurving, when fresh checked with short green lines on lower surface, the narrow detachable margins usually with 8 to 12 downflexed teeth 4-7 mm. long and 2-4 cm. apart; terminal spine strong, 2-3.5 cm. long, brown and graying; spikes 2-3 m. tall; flowers in clusters of 1 to 3, 2.5-4 cm. long (base of ovary to tepal tips); ovary greenish-yellow, fusiform, 12-14 mm. long; tube shallow, open, 2-4 mm. deep; tepals 12-18 mm. long, spreading, linear, yellow to red or purplish, clasping filaments after anthesis; filaments yellow or red, 2.5-4 cm. long, inserted in tube; anthers yellow, 11-16 mm. long; capsules mostly oblong, 2-3 cm. long. Open arid calcareous rocky slopes in w. Tex., May-July; from s. N.M., s.e. across the Mex. highlands to State of Mexico.

Plants with irregular compound inflorescences occur at random in some Texas populations. These may be designated as *f. glomeruliflora* (Engelm.) Trel.

3. *Agave chisosensis* C. H. Mull. CHISOS AGAVE. Small to medium dark-green compact surculose rosettes 4-6 dm. tall, 5-8 dm. broad; leaves linear-lanceolate, long-acuminate, 4-5.5 dm. long, 6-7 cm. wide, spreading, thin, concave above, smooth, glaucous-green, the margins with a narrow horny detachable border adorned with rather regular remote light-gray upflexed teeth 4-6 mm. long; terminal spine 35-45 mm. long, grayish, openly grooved above, aciculate; inflorescence racemose, 5-6 m. tall; flowers short-pedicellate, borne in compact clusters of 10 to 12, "golden-yellow," about 45 mm. long; ovary about 15 mm. long; tube funnellform, 7-8 mm. long; tepals 2-2.2 cm. long, 7 mm. wide; filaments 4-5 cm. long, "inserted at the bases of the segments; capsules cylindrical, 3.5-4 cm. long, about 17 mm. thick, prominently longitudinally veined." Mts. in the Big Bend country of w. Tex., July; endemic.

This *Agave* shows a combination of the characters found in *A. lecheguilla* and *A. gracilipes* and appears to be of hybrid origin.

4. *Agave Weberi* Cels. WEBER AGAVE, MAGUEY LISO. Large green single thick-stemmed rosettes, 15-18 dm. tall and 2 m. broad; leaves 14-16 dm. long, 12-15 cm. wide, smooth, channeled, gracefully arching, linear-lanceolate, recumbent with drought or at maturity, the margins smooth or with a few minute to small teeth; terminal spine about 5 cm. long, acicular but flattened above; panicles 7-8 m. tall, with 12 to 18 wide-spreading umbels of bright-yellow flowers; flowers 7-8 cm. long, the tube and neck deeply furrowed; ovary 3.5-4 cm. long, green; tube 1.8-2 cm. deep; tepals 21-24 mm. long, involute, persisting erect in wilting; filaments 5.5-6 cm. long at anthesis, inserted 11-13 mm. above bottom of tube; anthers 3 cm. long, Cult. along Route 83, Webb County, known only in cult., summer; described originally as from Moctezuma, S. L. P., Mex.

Bulbils have been reported to form in the inflorescence.

5. *Agave asperrima* Jacobi. ROUGH AGAVE, MAGUEY CENIZO. Medium to large gray-glaucous suckering rather open rosettes with very broad short stems; leaves asperous, 7-11 dm. long, 12-18 cm. wide, lanceolate, long-acuminate, deeply channeled, sometimes narrowed below midblade but very broadly clasping at the base, thick, the margins teated and heavily armed with downflexed teeth, brown and asperous-graying in age; terminal spine strong, 3-6 cm. long, mostly dark-brown; panicles 5-7 m. tall, broad and open, with 10 to 14 lateral branches in upper third of shaft with densely flowered umbels; flowers yellow, 6-8 cm. long; ovary green, 3-4 cm. long; tube 13-18 mm. deep, 14-16 mm. broad; tepals 18-26 mm. long, wilting at anthesis; filaments 55-65 mm. long, inserted 9-12 mm. above bottom of tube; anthers 2.5-3 cm. long. Sandy and calcareous soils in Starr, Webb and Zapata cos.; s. Tex. and throughout the desert of n. Mex. to S. L. P.

6. *Agave americana* L. CENTURY PLANT, MAGUEY. Medium to large glaucous-gray freely suckering rosettes, 1.5-2 m. tall, 2 m. broad, the wild forms in Texas much smaller;

leaves 12-17 dm. long, 1.4-2 dm. wide, lanceolate, acuminate, somewhat channeled and frequently some leaves reflexed, smooth, the margins repand with moderate teeth and broad-based teeth (the latter brown and graying) mostly 5-8 mm. long; terminal spine 2.5-5 cm. long, subulate, brown aging grayish; panicle 5-7 m. tall, long-oval in outline, with 18 to 30 sigmoid lateral branches in upper half of shaft, the large umbels of greenish-yellow flowers loosely spreading; ovary (at anthesis) small and tapering to base, 32-35 mm. long; tube 8-15 mm. deep, 16-20 mm. broad; tepals 25-32 mm. long, wilting and curling after anthesis, unequal; filaments 6-9 cm. long, inserted 6-12 mm. above bottom of tube; anthers 28-35 mm. long. June-July in s. Tex.

This is a polymorphic species with many varieties cultivated throughout the warmer regions of both hemispheres. A rather typical variety of the Linnean species occurs in cultivation about Laredo. A small wild form occurs also in south Texas as an outlyer of the many wild forms in adjacent Mexico. Horticultural varieties with yellow-striped leaves are also cultivated in Texas. They are also large plants with leaves even more flaccid than in typical *A. americana*. Trelease has designated these colored forms as: var. *marginata*, yellow or white margins; var. *striata*, variously lined leaves; var. *medio-picta*, broad median yellow band.

7. *Agave Havardiana* Trel. HAVARD AGAVE. Medium-sized stiff-leaved glaucous-green depressed-globose mostly single rosettes, 4-6 dm. tall, 5-8 dm. broad, sparingly surculose; leaves mostly 4-7 dm. long, 15-17 cm. wide, broadly lanceolate to almost triangular-lanceolate, thick, rather smooth, gray-green, roundly channeled, the upper teeth larger and mostly 5-10 mm. long and deflexed, the lower teeth ever smaller downwards, teeth sometimes lacking on lower third of margins; terminal spine strong, subulate, 4-5 cm. long, brown to gray; panicles 3-5 m. tall, broad, massive, open, with 12 to 15 large umbels; flowers mostly greenish-yellow, the tepals frequently tinged red or ferruginous, 7-8 cm. long; ovary 3-3.6 cm. long, thick, with a short neck; tube 16-22 mm. deep, 14-18 mm. broad; tepals fleshy, unequal, 18-24 mm. long, rather narrow and wilting inward; filaments 5-6.5 cm. long, inserted in mid-tube; anthers 2.8-3 cm. long; capsules oblong to obovoid, 45-55 mm. long, 15-18 mm. thick, abruptly beaked; seeds 5 × 6-7 mm. Endemic to the rocky mt. slopes in the Big Bend country of Tex., June-July.

8. *Agave gracilipes* Trel. SLIM-FOOTED AGAVE. Small compact yellow-green to gray-green surculose rosettes 3-4 dm. tall, 7-8 dm. broad; leaves numerous, 1.8-3 dm. long, 5-7 cm. wide, patulous, lanceolate, rather short-acuminate, stiff, smooth, the margins well-armed with proximal or remote teeth 5-6 mm. long; terminal spine 15-35 mm. long, stout, flattened above, dark-brown to gray, decurrent, sometimes to midblade; panicle 4-5 m. tall, usually narrow and closely branched with 20 to 30 lateral branches in upper half to third of shaft; flowers yellow, in small umbels, 4-5.8 cm. long; ovary 2.2-3 cm. long, fusiform, green; tube 5-7 mm. deep, openly funnelform; tepals 15-17 mm. long, narrow, involute, yellow, sometimes flushed russet; filaments slender, 28-43 mm. long, inserted on orifice of tube; anthers 1.6-2 cm. long, yellow; capsules 3.5-4 cm. long, 15-17 mm. thick, oblong, short and broadly stipitate; seeds 6 × 4-4.5 mm., shiny black. Open rocky piedmonts of the Big Bend country in w. Tex. and in adj. N.M., latter June-Oct.

North of Allamore, in Hudspeth Co., this species appears to hybridize with *A. lecheguilla*.

9. *Agave Parryi* Engelm. PARRY AGAVE. Compact depressed-globose medium-sized gray-green multileaved widely suckering rosettes 3-5 dm. tall, 5-7.5 dm. broad; leaves 3-4.5 dm. long, 7-10 cm. wide, short-lanceolate, thick, rigid, concave above, nearly smooth, ashy-gray to light-green; teeth few, remote, the larger towards apex and 4-6 mm. long, slender; terminal spine 25-35 mm. long, subulate, flattened above and decurrent on leaf edge for several cm.; panicles 3.5-4.5 m. tall, stout, with 18 to 24 strong lateral branches with large umbels of yellow flowers in upper half of shaft; flowers 5.5-6 cm. long; ovary about 3 cm. long; tube 1-1.2 cm. deep, openly conical; tepals 15-18 mm. long, 5 mm. wide; filaments 5.5-6 cm. long, inserted near upper edge of tube; capsules 3.5-4 cm. long, about 2 cm. thick, oblong or pyriform, little-stipitate, beaked. Slopes of the Guadalupe Mts. in Trans-Pecos Tex., summer; from cen. Ariz. n. of the Gila River, e. to w. Tex. and n. Chih.

10. *Agave neomexicana* Woot. & Standl. NEW MEXICO AGAVE. Small rather open sometimes depressed closely suckering light-green to glaucous rosettes, 2.5-4 dm. tall, 3-7 dm. broad; leaves 1.8-3 dm. long, 5-8 cm. wide, lanceolate to triangular, short- or long-

acuminate, thick, rigid, concave above, smooth, the margin repand with larger teeth above the midblade 3-8 mm. long, merely curved; terminal spine 1.5-5 cm. long, slender, grooved or flattened above, brown to gray; panicle 2.5-3.5 m. tall, with 9 to 14 ascending lateral branches in upper third of shaft, many-flowered; flowers reddish in bud, 5-6 cm. long when open; ovary 3-3.5 cm. long, light-green; tube broadly funnelform, 8-12 mm. deep; tepals 1.4-2 cm. long, 5 mm. wide, thin, yellow to orange; filaments 35-40 mm. long, inserted 6-10 mm. above bottom of tube; anthers 2-2.3 cm. long, light-orange; capsules light-brown, 2.5-3.5 cm. long, 1.5-2 cm. thick. In mts. of w. Tex. and s.e. N.M., June-July.

9. POLIANTHES L.³⁶

AMERICAN ALOE

Glabrous perennial with a thick fibrous-rooted crown and usually somewhat bulbous; leaves soft, thick-herbaceous, somewhat fleshy, their margins entire to scabrous or minutely toothed, clustered at the base of the many-flowered scape; flowers in spikelike racemes; perianth tubular-funnelform, persistent, 6-parted, the narrow divisions nearly equal; stamens 6; anthers linear, versatile; capsule coriaceous, 3-celled, with numerous flattened seeds.

About a dozen species in southwestern United States, Mexico and the West Indies.

- 1. Filaments very short or absent, the anthers slightly or not exerted 1. *P. Runyonii*.
- 1. Filaments moderately to very long, the anthers well-exserted (2)
- 2(1). Perianth lobes 3-8 mm. long; in north-central and eastern Texas (3)
- 2. Perianth lobes 10-15 mm. long; in south-central and far south Texas (4)
- 3(2). Perianth (including ovary) 20-23 mm. long; anthers 8-10 mm. long 2. *P. virginica*.
- 3. Perianth (including ovary) 26-35 mm. long; anthers 13-15 mm. long 3. *P. lata*.
- 4(2). Filaments exerted to less than twice the length of the perianth lobes; capsule distinctly stipitate 4. *P. maculosa*.
- 4. Filaments exerted to 3 to 6 times the length of the perianth lobes; capsule essentially sessile 5. *P. variegata*.

1. *Polianthes Runyonii* Shinn. RUNYON'S HUACO. Stems bulbous, crowning a short thick rootstock; roots thickened, fleshy, in clusters; basal leaves 5 to 7, linear, elongate, spreading, serrulate, 1-2 dm. long, spotted; stem leaves 2 or 3, small, bractlike; flowering stem slender, erect, greenish-purple, 3-10 dm. long, simple, terminated by a very open spike; flowers relatively few, solitary in the axils of small bracts; perianth slender, salverform, greenish-white at first, brick-red in age, the tube about 35 mm. long, the segments oblong and spreading; stamens 6; anthers sessile, inserted at the top of the tube, exerted; fruit small, nearly globular, about 35 mm. in diameter; seeds black, flattened. *Runyonia longiflora* Rose. Open areas in the Rio Grande Valley, summer; endemic.

Polianthes tuberosa L. ("nardo"), a species closely allied to *P. Runyonii*, is often cultivated in Texas. It is distinguished from *P. Runyonii* by its entire, smooth leaf margins and white perianth.

2. *Polianthes virginica* (L.) Shinn. FALSE ALOE, RATTLESNAKE-MASTER. Leaves all from the base, about 10, at first erect then spreading, nearly flat, lanceolate to somewhat oblong-spatulate, about 2 dm. long and 3 cm. wide above the middle, gradually tapered to the narrow base, at apex tapered rather abruptly into a slender acumination with a weak point, green but somewhat mealy, not at all spotted to somewhat spotted or mottled, the margins slightly serrulate; scape 7-8 dm. high or more, about 7-bracteate, glaucous; spike about 6 dm. long and 30-flowered; flowers solitary and distant, the lower ones on pedicels 6-8 mm. long, the upper ones short-pedicelled; ovary 14 mm. long, somewhat constricted above; perianth greenish, less than 25 mm. long; perianth segments about 8 mm. long, erect, the margins involute, hairy at tip; stamens shortly exerted; filaments dark-purple, inserted near base of the tube; anthers whitish, spotted with brown; style shorter than the stamens; capsule globose, 1.4-2 cm. in diameter. *Agave virginica* L.,

³⁶ Adapted from Lloyd H. Shinn in *Sida* 2(4): 333-338. 1966.

Manfreda virginica (L.) Salisb. In pine and mixed forests, open woods and gravelly slopes and old fields in e. Tex., June-Aug.; from Fla. to Tex., n. to Va., W.Va., O., Ind., Ill. and Mo.

Those plants with spotted or mottled leaves that occur with plants with green leaves are designated as *f. tigrina* (Engelm.) Shinners.

3. *Polianthes lata* (Shinners) Shinners. Plant from a pithy corm 2-3.5 cm. long and 1-2 cm. thick, with numerous thick fleshy-fibrous roots from the lower part; leaves 4 to 10, bluish-gray-green, herbaceous, fleshy, mostly basal, elliptic to broadly lanceolate, 10-18 cm. long, 3-7 cm. wide, short-acuminate, glabrous, spinulose-serrulate, rather stiffly ascending, deeply concave, of nearly uniform thickness; leafy bracts of scape narrowly ovate-lanceolate to triangular-lanceolate, clasping by a very asymmetrical base, those at base of inflorescence to 18 mm. long; scape 6-10 dm. high, erect, glabrous, rather stout; raceme spikelike, the spicy-scented flowers rather crowded on upper fourth; pedicels shorter than their subtending bracts; perianth (including the ovary) 26-35 mm. long, yellowish, strongly flecked or suffused with red-brown upward, the tip wholly red-brown, the lanceolate lobes 5-7 mm. long and 2.5-3 mm. wide at base; filaments strongly clavate, flattened, ultimately exerted 15-25 mm. beyond the perianth, attached about 5 mm. above base of tube; anthers linear, 13-15 mm. long, deciduous from the persistent filaments; immature capsule oblong- to ovoid-globose, glabrous, about 15 mm. long (exclusive of the abrupt necklike base about 2 mm. long), crowned by the persistent perianth. *Agave lata* Shinners. In oak woods and prairies in n.-cen. Tex., June-July; also Okla.

4. *Polianthes maculosa* (Hook.) Shinners. Basal leaves 6 to 10, narrowly lanceolate, recurved, blotched with brown or sometimes green, the margins serrulate; scape 3-6 dm. high or more, with about 6 small bracts, purplish; flowers as many as 25, nearly sessile, almost 5 cm. long (including the ovary); tube narrowly funnel-shaped, a little longer than the purplish or greenish-white somewhat spreading lobes; filaments a little shorter than the perianth lobes; anther cells exerted, brownish; stigmas 3-lobed; capsule globose-oval to globose-subquadrate, 20-25 mm. long, slightly pointed. *Agave maculosa* Hook., *Manfreda maculosa* (Hook.) Rose. In thickets in sandy-clayey soils in s.-cen. Tex., Apr.-July; endemic.

5. *Polianthes variegata* (Jacobi) Shinners. HUACO, TEXAS TUBEROSE. Basal leaves few, 3-4 dm. long, 25-50 mm. wide, mainly lanceolate, deeply channeled, finely toothed, spotted; scape 9-12 dm. high, loosely flowered; perianth greenish-brown, glaucous without, the tube broadly funnel-shaped, 8-10 mm. long, the oblong lobes about 12 mm. long; stamens about 5 cm. long, inserted near top of tube; ovary (including slender beak) 4 mm. long; capsule oblong-ellipsoid, cuspidate, 15-22 mm. long. *Agave variegata* (Jacobi) Rose, *Manfreda variegata* (Jacobi) Rose. On prairies and chaparral-covered hills in the Rio Grande Valley and Plains, May-July; also adj. Mex.

FAM. 40. DIOSCOREACEAE R. BR.

YAM FAMILY

Herbaceous or woody twining vines, from slender or thickened rhizomes or tubers, with whorled to opposite or alternate mostly cordate net-veined petioled leaves and axillary panicles, racemes or spikes of minute flowers; flowers regular, perfect or unisexual; perianth 6-parted with the sepals and petals similar; stamens 6 or 3, with short filaments and ovoid to globose anthers whose sacs often become divergent; ovary inferior, 3-celled; ovules 1 or 2 in each cell; styles 3, simple or with each branched; fruit a 3-angled or -winged capsule or berry.

Comprising about 750 species in 5 genera, mostly tropical and warm temperate.

1. DIOSCOREA L.

YAM

Plants dioecious; aerial stems slender or stoutish and more or less twining; flowers very small, unisexual, in axillary panicles or racemes; capsule loculicidally 3-valved by splitting through the winged angles; seeds flat, with a membranaceous wing.

About 600 species, mostly tropical and subtropical. The large storage roots of *D. alata* L. provide one of the chief foods in tropical regions, and those of some Mexican species are the source of the drug cortisone.

1. Leaves of one or more lower nodes in whorls of 4 to 7; petioles rarely less than 7 cm. long, usually densely pubescent at base and at juncture with leaf blade 1. *D. quaternata*.
1. Leaves of lower nodes at most opposite or with 3 approximate; petioles rarely more than 6 cm. long, glabrous 2. *D. villosa*.

1. *Dioscorea quaternata* (Walt.) J. F. Gmel. Aerial stems to 3 m. long or more, usually erect below and leaning or twining above, from a somewhat irregularly contorted more or less branched rhizome that is 10-15 mm. thick; leaves in whorls of 4 to 7 at one or more of lower nodes, becoming opposite or alternate above; mature petioles rarely less than 7 cm. long, typically pubescent at base and at juncture with leaf blade; capsules 2.5-3 cm. long; seeds 18 mm. broad. Moist rich woods in n.e. Tex., Apr.-June; from n.e. Pa., s. to n.w. Fla., w. to Ill., Mo., Okla. and n.e. Tex.

2. *Dioscorea villosa* L. Aerial stems to 5 m. long, twining, from a rather straight slender rhizome that is 5-10 mm. thick; leaves all alternate or with only the lower opposite or approximate; mature petioles rarely more than 6 cm. long, typically glabrous; capsules 12-25 mm. long; seeds to 12 mm. broad. *D. paniculata* Michx. Low moist woods and thickets of e. Tex., Apr.-June; from s. N.E. to Minn., s. to s.e. Va., O., Tenn., Ark. and e. Tex.

FAM. 41. IRIDACEAE JUSS. IRIS FAMILY

Perennial or annual mostly caulescent herbs with short or long rootstocks; leaves equitant, mostly elongate; flowers perfect, mostly regular, arising from spathe-like bracts; perianth composed of an outer and inner series of 3 segments each; stamens 3, the filaments partially adnate to the perianth; carpels 3, united; ovary inferior; styles entire or variously divided, sometimes petal-like; ovules few to many; fruit a loculicidal 3-valved capsule.

About 1,000 species in nearly 60 genera of wide geographic distribution.

1. Rootstock neither a bulb nor a corm (2)
 1. Rootstock a bulb or corm (4)
 - 2(1). Roots clustered at base of plant, fibrous or tuberous-thickened; plants delicate, mostly less than 4 dm. high; leaves grasslike; perianth tube absent 1. *Sisyrinchium*, p. 425.
 2. Rootstock a rhizome; plants coarse, usually more than 4 dm. high; leaves broad; perianth tube present (3)
 - 3(2). Style branches expanded and petal-like, concealing the stamens; perianth usually bluish, reddish or yellow, not noticeably spotted, the tube well-developed 2. *Iris*, p. 428.
 3. Style branches neither expanded nor petal-like, the stamens clearly visible; perianth orange-color with conspicuous crimson or purple spots, the tube much-abbreviated 3. *Belamcanda*, p. 430.
 - 4(1). Style arms only briefly bifid at the apex; capsule narrowly cylindrical, about 1 cm. long 4. *Alophia*, p. 430.
 4. Style arms deeply divided (5)
 - 5(4). All perianth segments subequal; capsule commonly obovoid, usually less than 1 cm. long; style divided to near base 5. *Nemastylis*, p. 431.
 5. Inner perianth segments markedly larger than the outer ones, spreading; capsule ellipsoid; style forming a tube about 5 mm. long before dividing 6. *Eustylis*, p. 432.

1. SISYRINCHIUM L.³⁷ BLUE-EYED GRASS

Annual or perennial herbs; roots fibrous to tuberlike; leaves grasslike; flowers single or in small clusters; perianth regular; tepals similar, often alternating wide and narrow; stamens united into a column or free to the base.

³⁷ Contributed by Royce L. Oliver.

About 125 species in the Western Hemisphere. In addition to the following species, *Sisyrinchium occidentale* Bickn. has been reported from west Texas but the status of this plant has yet to be clarified.

1. Plants annual; flowers variously colored, not blue (2)
1. Plants perennial; flowers blue to blue-purple, white in blue population or white, with simple stems or sessile spathes (4)
- 2(1). Ovaries and capsules 1.5 times as long as broad ... 1. *S. minus*.
2. Ovaries and capsules subglobose to broadly oblong (3)
- 3(2). Flowers variously colored, not yellow; tepals 9-16 mm. long; capsules 3-4.2 mm. wide 2. *S. rosulatum*.
3. Flowers yellow with red-brown eye ring; tepals 5-10 mm. long; capsules 2.7-3.5 mm. wide 3. *S. exile*.
- 4(1). Stems without leafy bracts (5)
4. Stems with leafy bracts (9)
- 5(4). Spathes dry and brown, often tinged violet 4. *S. sagittiferum*.
5. Spathes dark-green to yellow-green, sometimes purple at nodes (6)
- 6(5). Floral bracts about the same length 11. *S. biforme*.
6. Outer floral bract much longer than the inner (7)
- 7(6). Outer floral bract connected for 4-7 mm. at base (8)
7. Outer floral bract connected for 3 mm. or less at base .. 6. *S. campestre*.
- 8(7). Plants of central and south Texas, drying olive-green 12. *S. dimorphum*.
8. Plants of north Texas, drying light-green 5. *S. montanum*.
- 9(4). Spathes peduncled 4 mm. or less from a leafy bract or sessile and peduncled on the same plant 7. *S. albidum*.
9. Spathes peduncled more than 4 mm. from a leafy bract (10)
- 10(9). Stems broadly winged with each wing as broad as the stem and at least 1 mm. wide 8. *S. angustifolium*.
10. Stems not broadly winged (11)
- 11(10). Plants very erect; stems 5 to 7 times as long as the peduncles 9. *S. atlanticum*.
11. Plants spreading to erect; stems shorter to 3 times as long as the peduncles (12)
- 12(11). Spathes dry and brown, usually tinged violet 4. *S. sagittiferum*.
12. Spathes green, sometimes purple at nodes (13)
- 13(12). Pedicels 6-11 mm. longer than the spathes; capsules upright; plants erect; stems few or solitary 10. *S. demissum*.
13. Pedicels shorter, to 4-5 (-10) mm. longer than the spathes; capsules spreading to pendent; plants spreading to erect; stems often numerous (14)
- 14(13). Pedicels shorter than the spathes; stems (1.5 to) 2 to 6 times as long as the more robust leafy bracts, usually with and without leafy bracts on the same plant (15)
14. Pedicels usually longer than the spathes; stems shorter, to 1.5 times longer than the more robust leafy bracts, always with leafy bracts (16)
- 15(14). Mature capsules broadly oblong, 5-7 mm. high; tepals 7-13 mm. long; wings and stems drying about the same color 11. *S. biforme*.
15. Capsules globose to subglobose, 4-5 mm. high; tepals 5-8 mm. long; wings drying dark, the stems light 12. *S. dimorphum*.
- 16(14). Ovaries usually glabrous; plants drying medium- to olive-green; in central Texas 13. *S. pruinatum*.
16. Ovaries minutely pubescent; plants usually drying light-green to glaucous; in east or west Texas (17)

- 17(16). Narrower tepals 1.3 to 3.3 times longer than broad; bracts 6 to 12.5 times longer than broad; leaves 2-4 mm. wide; plants of central and west Texas 14. *S. ensigerum*.
17. Narrower tepals (2.5 to) 3 to 5 times longer than broad; outer bracts 7.5 to 18 times longer than broad; leaves 1-2 mm. wide; plants of east Texas 15. *S. Langloisii*.

1. *Sisyrinchium minus* Engelm. & Gray. Plants prostrate to erect, 4-22 cm. tall, often forming rosettes; stems with 1 or 2 leafy nodes and a leafy bract; spathes often broad and foliaceous; outer floral bract 5-10 mm. longer than inner; pedicels usually shorter than floral bracts; flowers usually lavender-pink to purple-rose, occasionally white, rarely yellow; capsule 4-5 mm. high, recurving to pendent. *S. Thurowii* Coult. & Fish. In sandy or silty soil in s. Coastal Plains to cen. Tex., Mar.-May; also La., introd. elsewhere.

2. *Sisyrinchium rosulatum* Bickn. Plants usually erect, 13-36 cm. tall; leaves 2-4 mm. wide, one fourth to one half the height of plant; flowers vary from white to lavender-rose, with rose-purple eye ring; filaments free about 0.5 mm.; base of staminal column urn-shaped. *S. laxum* of auth. Weedy along roadsides and old fields from Gulf Coast to s.e. Tex., Apr.-May; Fla. to Tex., n. to N.C., Ark.; nat. of S.A.

Hybridizes with *S. exile* giving flower colors of mauve, scarlet or yellow, with or without variously colored eye ring and stripes along veins.

3. *Sisyrinchium exile* Bickn. Plants 5-19 cm. tall, usually erect; stems sometimes simple; leaves 0.5-3 mm. wide; filaments free about 0.5 mm.; staminal column urn-shaped at base. *S. Brownii* Small, *S. micranthum* of auth. Sandy roadsides and old fields from Gulf Coast to s.e. Tex., Apr.-May; Fla. to Tex.; nat. to S.A.

Hybridizes with *S. rosulatum*.

4. *Sisyrinchium sagittiferum* Bickn. Plants 1-3 dm. tall; fibrillose fibers at base; leaves erect, one half to three fourths height of plant; floral bracts equal or outer to 3 cm. longer than inner; flowers blue-purple; capsules 3-4 mm. high, on spreading pedicels. *S. texanum* Bickn. (hybrid form). In low wet areas in e. Tex., occurs mostly in hybrid form n. of Gulf Coast, Mar.-Apr.; also La.

Hybridizes with *S. Langloisii* and with *S. pruinatum* giving plants with branched stems; and with *S. albidum* giving *albidum*-like plants with chartaceous bracts.

5. *Sisyrinchium montanum* Greene. Plants 20-35 cm. tall; leaves 2-3 mm. wide and one third to as tall as the plant; flowers blue; tepals 8-10 mm. long; capsules 6-7 mm. high. River bottoms in e. Panhandle of Tex., Apr.-June; Nfld. to n. B.C., s. to Que., s. Ont., N.Y., n. Ind., n. Ill., Neb. and Tex.

6. *Sisyrinchium campestre* Bickn. Plants 15-28 cm. tall; stems narrow, broadly winged; leaves about same width as the scapes and one half to three fourths the height of plant; outer floral bract about twice as long as the inner; flowers white to light-blue; capsules 3-4 mm. high, on spreading pedicels. Prairies in n.e. Tex., Apr.-May; Wisc. to Man., s. to Tex. and La.

Hybridizes occasionally with *S. pruinatum*.

7. *Sisyrinchium albidum* Raf. Plants 23-40 cm. tall; usually with heavy fibers at base; stems narrow, broadly winged; leafy bract 3.5-13 mm. long; spathes 1 to 4, sessile or with peduncles to 4 mm. long; flowers white to light-blue. In open woods and exposed areas of e. Tex., Mar.-Apr.; Ala. to Tex., n. to N.C., s. Ont., s. Mich., s. Wisc. and Mo.

Hybridizes with *S. Langloisii* to produce very elongated leafy bracts and peduncles 5-10 mm. long; and with *S. sagittiferum* to produce brown chartaceous bracts. Most plants in Texas are atypical for the species.

8. *Sisyrinchium angustifolium* Mill. Plants 15-30 cm. tall, erect to slightly spreading, branched or simple and branched on same plant, drying olive-green, darkening with age; basal leaves erect, one fourth to three fourths as high as the plant; peduncles 1 to 3, 1-5 mm. longer than the subtending leafy bract; outer floral bract longer than inner; flowers blue to blue-violet, rarely white; capsules 4-5.5 mm. high, on erect or recurving pedicels. *S. bermudianum* of auth., *S. graminoides* Bickn., *S. gramineum* Curt. Differs somewhat from plants of e. U.S. In low wet areas in e. Tex., Apr.-May; Fla. to Tex., n. to s.e. Nfld., s. Que., s. Ont., O., Ind., Ill., Mo. and e. Kan.

9. *Sisyrinchium atlanticum* Bickn. Plants erect from coarse roots, 23-57 cm. tall, drying light-green; fibers present or absent at base; stems 17-43 cm. long; peduncles 3-7

cm. long; flowers blue, occasionally white; tepals 8-11 mm. long; capsules 4-5 mm. high, drying dark. In wet areas of s.e. corner of Tex., Apr.-May; Fla. to Tex., n. to n. N.S., N.Y., n. O., s. Mich. and Ark.

10. *Sisyrinchium demissum* Greene. Plants 22-72 cm. tall, drying light-green; stems erect, 1-3 mm. wide, the wings about one half the width of stems; leaves 2-3 mm. wide, less than one half the height of plant; peduncles to 17 cm. long; tepals blue, 1 cm. long; capsules 6-7 mm. high. *S. longipedunculatum* Bickn. Along streams in Guadalupe Mts. of Tex., June-Aug.; from Tex. to Calif., n. to Ore., Colo.; also n. Mex.

11. *Sisyrinchium bifforme* Bickn. Plants erect, 14-38 cm. tall; roots coarse; stems very narrowly winged; leaves 1-3 mm. wide; capsules 6-7 mm. high. In sandy soil of beaches and offshore islands of Tex., Dec.-June; also La.?, Mex.

12. *Sisyrinchium dimorphum* R. Oliv. Plants 9-32 cm. tall, drying olive-green; roots coarse; stems with or without leafy bracts, the wings less than one half the width of stem; leaves one half to three fourths the height of plant; flowers blue, sometimes white; tepals 5-9 mm. long, 1.5-3 mm. wide; capsules about 5 mm. high. Along streams in Edwards Plateau and Trans-Pecos, Apr.-July; also n. Mex.

13. *Sisyrinchium pruinatum* Bickn. Plants 9-30 cm. tall, spreading to erect; stems usually numerous; leaves 1-3 mm. wide; flowers violet-purple to purple-blue, rarely white; capsules 4-6 mm. high. *S. amoenum* Bickn., *S. Brayi* Bickn., *S. Bushii* Bickn., *S. colubri-ferum* Bickn., *S. Helli* Bickn., *S. varians* Bickn. Clay and sandy clay on roadsides and open areas in prairies and oak belts to Coastal Prairies of Tex., Apr.-May; also Okla. and Ark.

Hybridizes with *S. ensigerum*, *S. Langloisii* and *S. sagittiferum* where their ranges overlap.

14. *Sisyrinchium ensigerum* Bickn. Plants 15-47 cm. tall, usually erect; stems few to numerous; flowers purple-blue; capsules 4-7 mm. high. Clay, limestone or sandy soil in Grand Prairie, Edwards Plateau and s. Texas plains westw., Apr.-May; also Okla. and n. Mex.

Hybridizes with *S. pruinatum*, and shows similarities to the Mexican species *S. scabrum* Schlecht. & Cham. in the Trans-Pecos.

15. *Sisyrinchium Langloisii* Greene. Plants 9-35 cm. tall, mostly erect; stems usually numerous; leaves narrow; flowers light violet-blue to purple-blue; capsules 3.5-4.5 mm. high. *S. Canbyi* Bickn., *S. flaccidum* Bickn., *S. furcatum* Bickn. Roadsides and open areas of e. Oak Belt and Pine Belt of Tex., Apr.-May; also La., Miss. and Ark.

Hybridizes with *S. pruinatum*, *S. albidum* and *S. sagittiferum* where their ranges overlap.

2. IRIS L. IRIS. FLEUR-DE-LIS

Perennials from a creeping more or less tuberous rhizome; leaves ensiform or lanceolate, commonly grasslike; flowers large and showy, mostly purplish or bluish (in ours); tube of the perianth commonly extended beyond the ovary; stamens distinct, the linear or oblong anthers sheltered under the over-arching petal-like branches of the style that bear the stigma in the form of a thin lip or plate under the apex; most of the style connate with the perianth segments to form a tube; capsule 3- or 6-angled, usually coriaceous; seeds depressed-flattened or plump, usually in 2 rows in each cell.

More than 200 species in the Northern Hemisphere, most frequent in Asia. Cultivated *Iris* tend to maintain themselves about abandoned farms and homesteads, the most common of these are *I. pallida* Lam., *I. tingitana* Boiss. & Reut. and *I. xiphium* L.

1. Flowers bright- to golden-yellow throughout or dark-red to reddish-brown (2)

1. Flowers in shades of blue to purplish-blue or rarely whitish (3)

2(1). Flowers bright- to golden-yellow throughout; tepals entire at apex; capsule 3-angled; introduced species1. *I. Pseudacorus*.

2. Flowers dark-red to reddish- or coppery-brown; tepals notched at apex; capsule 6-angled; native species2. *I. fulva*.

- 3(1). Leafy bract subtending spathes less than or slightly longer than the spathes, or absent; ovary and capsule 3-angled 3. *I. virginica*.
3. Leafy bract subtending spathes usually more than twice as long as the spathes; ovary and capsule 6-angled (4)
- 4(3). Largest leaves mostly about 15 mm. wide, essentially erect; inner 3 perianth segments usually notched at apex 4. *I. hexagona* var. *flexicaulis*.
4. Largest leaves more than 20 mm. wide, arcuate-spreading; inner 3 perianth segments rounded to subacute at apex 5. *I. brevicaulis*.

1. *Iris Pseudacorus* L. **YELLOW-FLAG**. Rhizome stout and extensively spreading; leaves erect, somewhat arched and nodding at tip, linear-attenuate, about 2 cm. wide, forming clumps to about 1 m. tall; flowering stalk stout, erect, about as tall as clump of leaves, with 1 or 2 short leafy bracts; flowers 1 or 2 together at apex of flower stalk, also often in the axil of the upper leaf; involucral bracts 2, shorter than flower; the 3 outer perianth segments 5-8 cm. long and arching, clear-yellow or sometimes with flecks of brown at base and on claw, with suborbicular to ovate blade and a broad claw with involute edges; the 3 inner perianth segments yellow, linear to linear-pandurate, obtuse, to about 25 mm. long; capsule cylindric-prismatic to ellipsoid, 5-8 cm. long, bright-green, often lustrous, turgid, bluntly 3-angled; seeds suborbicular or somewhat angular from pressure, corky, about 7 mm. in diameter. Usually standing in 1 to 3 feet of water in ponds, in open woods, rare in s.e. Tex. (known only from Hardin Co.), Apr.-May; introd. from Euras. and Afr., rather aggressive as an escape from cult.

2. *Iris fulva* Ker. **RED-FLAG**. Rhizome rather stout, widely spreading, with scars or fibers of decayed leaves; leaves erect, linear-attenuate, to about 9 dm. long; flower stalk rather slender, erect, slightly zigzag, often overtopping the leaves; flowers 1 or 2 at summit of flower stalk, often also in axils of 1 or 2 upper stem leaves; involucral bracts 2, the longer attenuate one exceeding the flower; the 3 outer perianth segments red to copper-colored, spreading-arching, 45-55 mm. long, with oval to obovate-oval apically notched blade and a short paler claw; the 3 inner perianth segments red to copper-colored, narrowly obovate to elliptic-obovate, cuneate at base and notched at apex, about two thirds as long as outer perianth segments; capsule ellipsoid to oval, 45-55 mm. long, green, not beaked but sometimes constricted near apex, 6-angled, rather thick-walled; seeds orbicular to semiorbicular, about 7 mm. in diameter. In marshes and wet meadows, ditches and on stream banks, reported from e. Tex. but no specimen seen, spring; Ga: to e. Tex. (?), Mo. and Ky.

3. *Iris virginica* L. **SOUTHERN BLUE-FLAG**. Rhizome stout; leaves rather flaccid; basal leaves buff or pale-brown at base, soon arched-recurving or falling to ground; flowering stem weak, to 1 m. high, simple or somewhat branched in the inflorescence, soon low-arching and maturing fruit on the ground or in water; spathe bracts firm, usually subherbaceous, to 14 cm. long; the 3 outer perianth segments with obovate to oval-obovate blade 3-4 cm. wide, with prominent yellow midrib expanding to a broad bright-yellow pubescent patch at base (the elongate hairs as long as thickness of blade); the 3 inner perianth segments obovate to obovate-spatulate, two thirds to four fifths as large as sepals; capsule ovoid to ellipsoid or thick-cylindric, 3-11 cm. long, 13-25 mm. thick, 3-angled, often asymmetrical, brittle-walled, dull or scarcely lustrous on inner surface, early disintegrating; seeds rounded to irregularly D-shaped, 3-6 mm. thick at back, 5-8 mm. wide, with an irregularly deep-pitted brittle corky coat. *I. caroliniana* Wats., *I. versicolor* of auth. In marshes, wet savannahs and pinelands, shallow water in ditches and in soggy meadows in e. Tex., Apr.-June; from Fla. to Tex., n. to e. Va.

Those plants with a branched, not simple, inflorescence and with capsules 7-11 cm. long have been segregated as var. *Shrevei* (Small) Anders. (*I. Shrevei* Small).

4. *Iris hexagona* Walt. var. *flexicaulis* (Small) Foster. Rhizome rather stout; leaves erect, mostly 3 to 5 together, pale-green and more or less glaucous, linear-attenuate, mostly 1-2 cm. wide; flower stalk erect, rather stout or slender, shorter than the basal leaves, exceptionally leafy, zigzag, glaucescent; flowers paired or 3 together at top of stem or sometimes solitary and 1 or 2 together in the axils of the stem leaves; involucral

bracts 2, not foliaceous, exceeded by the flowers; perianth tube cylindrical-prismatic, almost 13 mm. long; the 3 outer perianth segments broadly spatulate, obovate, 5-7 cm. long, about 25 mm. wide, spreading or recurved at tip, bright-violet except basal part which is yellowish-green; inner 3 perianth segments shorter than the outer ones, narrowly spatulate, notched at apex, somewhat spreading, deep-violet, the claw somewhat brownish; style branches nearly 5 cm. long, broadly linear, reddish-violet except the paler margins; anthers shorter than filaments; capsule ellipsoid to oval or somewhat obovoid, 5-7.5 cm. long, 6-angled, somewhat glaucous, the walls thick; seeds brown, corky. Lowlands in s.e. Tex., Mar.-May; also La.

5. *Iris brevicaulis* Raf. Rhizomes rather slender, 10-25 mm. in diameter; stem zigzag, loosely ascending to depressed, compressed, 15-53 cm. high; basal leaves lax, 3-6 dm. long or more, 15-35 mm. wide; spathes terminal and sessile or short-peduncled from all but lowest axils, subtended by broad and very prolonged leafy bracts 2-6 dm. long or more; spathe bracts subequal, to 5 cm. long, the outer pair green, the inner pair scarious-margined; flower deep-blue or blue-purple; ovary prominently 6-angled; the 3 outer perianth segments 7-9.5 cm. long, 2.5-3 cm. wide, the ovate blade slightly longer than the greenish-yellow dark-striped claw, the latter with a yellowish-white summit; the 3 inner perianth segments oblanceolate, slightly shorter than the sepals; style branches greenish, with entire or toothed subquadrate to semiovate crests; capsule 6-angled, ovoid to ellipsoid, 3-5 cm. long; seeds irregularly circular, with thick coat. *I. foliosa* Mack. & Bush. Swamps, wet meadows, damp woods, marshes and bottomlands in e. Tex., Apr.-June; from Ala. to Tex., n. to O., Ind., Ill., Mo. and Kan.

3. BELAMCANDA ADANS.

BLACKBERRY LILY

Two species, native to eastern Asia.

1. *Belamcanda chinensis* (L.) DC. Perennial herb with horizontal rhizomes and ensiform leaves; stem 3-6 dm. high; inflorescence cymose-paniculate, widely branched; flowers lasting but a day; perianth orange with crimson or purple spots and markings, 3-5 cm. across, the widely spreading segments nearly equal; filaments distinct, inserted on the base of the perianth segments; style clavate, 3-cleft; capsule 2.5-3 cm. long, 1-2 cm. in diameter, oblong to pyriform, 3-lobed, its 3 valves recurving sharply at maturity and soon deciduous to expose the mass of round black fleshy seeds attached to the central column, the whole resembling a large blackberry. Established as an escape in pastures, along roadsides and in thickets and on hillsides, mostly in e. Tex., Apr.-July; from Ga. to Tex., Kan. and Conn.; nat. of Asia.

4. ALOPHIA HERB.

A small American genus.

1. *Alophia Drummondii* (Grah.) Foster. Scapose herb with a deep-seated brown-coated bulb; bulb ovoid to subglobose, when mature about 2 cm. long and 25 mm. in diameter; leaves with sheathing bases and plicate, narrowly linear, to about 3 dm. long; scape to about 3 dm. high, erect, more or less sheathed by the leaf bases, slender, usually simple, supporting 1 or 2 erect flowers from a spathe; perianth about 5 cm. across; hypanthium tube very short or wanting; the 3 outer perianth segments crestless, cuneate-obovate to cuneate, spreading, broadly acute, pale- or dark-lavender, with a violet halo outlining the white base that is violet-spotted or the whole segment may be white in albino forms; the 3 inner perianth segments very much smaller than the outer ones, short-acuminate, the upper part violet, the blackish-violet lower part more or less channeled and sometimes with white spots near the base; anthers narrow, lying against the style branches; style branches ascending, each tipped with 2 subulate stigmas that are toothed at the apex; capsule erect, thin-walled, cylindrical to somewhat narrowly clavate, 25 mm. long or less, stramineous in age. *Herbertia Drummondii* (Grah.) Small, *H. caerulea* (Herb.) Herb. In clayey or sandy soils mostly in grasslands and prairies in s. Tex., Mar.-May; endemic.

5. NEMASTYLIS Nutt.³⁸

SHELL-FLOWER

Herbaceous perennials with an ovoid to subglobose bulb; leaves linear to lance-attenuate or lance-ensiform, often plicately nerved; stems simple or branched; spathes herbaceous, 1- to several-flowered; flowers erect or somewhat nutant, rotate, regular, fugacious, the segments very briefly united at the base, equal or subequal; stamens inserted on the segments at the base; filaments free to more or less united; anthers longer than the filaments, with a narrow connective, coiling downward from the apex with maturity; style equal to or usually shorter than the style arms, the 3 style arms bifid almost to the base and opposite the stamens; ovary small, oblong-ellipsoid to subclavate or subturbinate; stigmas apical, subcapitate to tufted or sometimes 2-parted; capsule more or less oblong-ellipsoid to obovoid, opening by 6 deltoid teeth at the apex; seeds yellow- or dark-brown, irregularly closely pitted, angular, about 2 mm. long.

A small genus that is confined to the New World.

1. Cauline leaves well-developed, 5-11 mm. wide; filaments free or only slightly connate at the base 1. *N. geminiflora*.
1. Cauline leaves reduced or (if developed) narrow, 1-4 mm. wide; filaments wholly or partially united (2)
- 2(1). Filaments united in a column; in east Texas 2. *N. Nuttallii*.
2. Filaments united for 3-4 mm. (over half their length); in Trans-Pecos Texas 3. *N. tenuis* var. *Pringlei*.

1. *Nemastylis geminiflora* Nutt. CELESTIAL LILY, PRAIRIE PLEAT-LEAF. Bulb broadly ovoid to subglobose, 20-25 mm. high, the brittle membranous brown tunics prolonged upward into a collar around the base of the stem and leaves; basal leaves 2 or 3, 2-4 dm. long or longer, 3-6 mm. wide, glabrous, plicate, lance-linear or narrowly linear-ensiform; cauline leaves 2 or 3, 15-35 cm. long, 5-11 mm. wide, at least one of them usually much-exceeding the inflorescence, the upper one somewhat reduced; stem 12-46 cm. high, glabrous, terete, sometimes branched near the base, usually several-branched above the middle; spathes herbaceous, unequal, the outer 20-42 mm. long, the inner 35-47 mm. long, 1- or 2-flowered, the filiform pedicels glabrous and not well-exserted at anthesis; perianth segments subequal, to 3 cm. long, 17 mm. wide, ovate-obovate, obtuse to acutish, blue (lighter at the base, giving the effect of an "eye"); filaments free or only slightly connate at the base, to 2.5 mm. long; anthers to 15 mm. long; ovary ovoid-turbinate, glabrous, to 4 mm. long; style to 3 mm. long; style arms to 5 mm. long; capsule 15-20 mm. long, well-exserted, oblong-turbinate; seeds angular, brown. *N. acuta* (Bart.) Herb., *Calydorea texana* (Herb.) Baker. In clayey soils and limestone areas from n.-cen. Tex., s. through the Edwards Plateau to s.-cen. Tex., Mar.-May; from Tex., n. to Mo. and Kan.

2. *Nemastylis Nuttallii* Pick. Bulb ovoid to subglobose, 15-20 mm. high, the tunics dark-brown to chestnut-brown; basal leaves 2 or 3, the lowest the shortest, 15-40 cm. long, 1-3.5 (-5) mm. wide, linear-ensiform, long-acute, glabrous, the wider ones somewhat plicate, rarely equaling or exceeding the inflorescence; cauline leaves 2, the lower 9-23 cm. long, to 4 mm. wide, sometimes exceeding the inflorescence, the upper reduced, 1.5-8 cm. long, rarely with a branch in its axil; stem simple, 2-4 dm. high, very infrequently 1-branched above the middle, terete, glabrous, with the axis terminated by a 1- (rarely 2-) flowered pair of spathes; spathes closely convolute, equaling or somewhat exceeding the pedicel at anthesis, glabrous, the outer 2-3 cm. long, the inner 3-5 cm. long; perianth segments subequal, to 2 cm. long, 4-5 mm. wide, ovate to obovate, rather obtuse or subacute, blue, concolorous (?); filaments 1-2 mm. long, united in a column; anthers about 5 mm. long; ovary 4-5 mm. long, glabrous, turbinate to subclavate; style 2 mm. long, usually slightly longer than the staminal column; style arms 2 mm. long; capsule more or less oblong-clavate, trigonous, 2 cm. long; seeds dark-red-brown, closely pitted, angular, to 2 mm. long. *N. coelestina* of auth. Mostly along streams, probably to be found in n.e. Tex.; also Ark. and Mo. No specimen has been seen from Texas.

³⁸ Adapted from R. C. Foster in Contr. Gray Herb. 155: 26-44. 1945.

3. *Nemastylis tenuis* (Herb.) Baker var. *Pringlei* (Wats.) Foster. Bulb ovoid to subglobose, about 15 mm. wide and 20-25 mm. high, the tunics dark-brown; basal leaves 2 or 3, 6-28 cm. long, 1-2.5 mm. wide, linear, acute, coarsely scabrous on the midrib and margins (especially near the base); cauline leaf 1, 6-15 cm. long, 1-2 (-3) mm. wide, scabrous like the basal leaves; stem simple or occasionally 1-branched, 12-30 cm. high, terete, glabrous; spathes unequal, the outer to 25 mm. long, the inner to 4 cm. long, glabrous, 1- (rarely 2-) flowered, the pedicels shorter than the spathes at anthesis; perianth segments subequal, to 3 cm. long but usually about 2 cm., to 9 mm. wide, the inner ones slightly shorter and narrower, oblong-ovate to oblanceolate, obtuse, pale-blue; filaments 3-4.5 mm. long, united at the base for 2-3 mm.; anthers 8-10 mm. long; style usually shorter than the staminal column; style arms to 3.5 mm. long; capsule oblong-ellipsoid, to 25 mm. long; mature seeds not seen. In open grassy pine woods in mts. of the Trans-Pecos, May-July; from Tex. to Ariz., s. to Guat.

6. EUSTYLIS ENGELM. & GRAY

A small genus mostly in South America.

1. *Eustylis purpurea* (Herb.) Engelm. & Gray. PURPLE PLEAT-LEAF. Perennial herb from a shallow-rooted tunicated bulb; bulb ovoid to narrowly or broadly ellipsoid, to 2 cm. in diameter, coated with chocolate-brown scales; flowering stem wiry, often zigzag, to 75 cm. high, mostly somewhat shorter than the leaves, more or less branched with convolute attenuate flower spathes terminating the branches; leaves linear-lanceolate, pleated, sheathing the stem below, acuminate-attenuate at apex, to about 2 cm. wide; flowers emerging from spathes for several days in succession, fugacious; perianth with the outer 3 segments somewhat larger than the 3 inner ones and depressed at base to form a cup in center of blossom; perianth segments velvety-purple to rose-purple or very rarely whitish, spotted reddish-brown over yellow toward the base; outer perianth segments obovate, broadly rounded at apex, about 25 mm. long; inner perianth segments shorter and narrower than the outer ones, longitudinally cupped and crimped near apex; filaments and anthers about equal in length; style forming a tube about 5 mm. long before dividing into slender recurved arms at apex; capsule ellipsoid, about 2 cm. long; seeds brown, rugose, about 2 mm. in diameter. *Nemastylis purpurea* Herb., *Tigridia purpurea* (Herb.) Shinn. In sandy soils in open woods and in grassy areas throughout most of e. and s. Tex., May-Oct.; probably also in Ark., La., Okla. and n.e. Mex.

FAM. 42. CANNACEAE JUSS.

CANNA FAMILY

Perennial erect herbs with branched or unbranched stems and large alternate leaves with sheathing petioles; flowers perfect, zygomorphic, mostly showy, borne in terminal thyrsoid panicles; sepals 3, erect, greenish and bractlike; petals 3, more or less united to form a tube; stamens more or less adnate to the corolla, with one filament anther-bearing, the others becoming showy staminodia; ovary inferior, 3-celled, with the placentae parietal; style petaloid, the stigma marginal.

A solitary genus of about 55 species, mostly in tropical America.

1. CANNA L.

CANNA. INDIAN-SHOT

Characters of the family.

1. Flowers red; plant not glaucous; leaves rounded at base 1. *C. indica*.
1. Flowers yellow; leaves tapered at base (2)
- 2(1). Petals becoming reflexed; tube about 5 cm. long, prominent; plant green; leaves oblong-lanceolate 2. *C. flaccida*.
2. Petals remaining erect or strongly ascending; tube about 2 cm. long; plant glaucous; leaves narrowly lanceolate 3. *C. glauca*.

1. *Canna indica* L. INDIAN-SHOT. Plant slender, to about 12 dm. tall, the herbage deep-green and glabrous; leaves oblong-elliptic, 2-4 dm. long, to about 2 dm. wide; flowers small, usually in pairs, red or reddish, not especially showy; floral bracts suborbicular; sepals 1-1.5 cm. long, exceeding the perianth tube; corolla lobes 3-3.5 cm. long, much longer than the tube; staminodia linear to narrowly spatulate or oblanceolate, flat, about 5 cm. long; capsule 25-35 mm. long. Commonly cult. and escaped to low grounds along the Gulf Coastal Plain from Fla. to Tex., summer-fall; nat. of E.I.

2. *Canna flaccida* Salisb. Plant to 75 cm. high, the herbage green throughout; leaves oblong-lanceolate, to 6 dm. long and 13 cm. wide; raceme simple, loose and few-flowered, with very small bracts, erect; flowers yellow, showy, soft or flaccid in texture; sepals about 25 mm. long; corolla tube about 5 cm. long; petals yellow, strongly reflexed, nearly as long as the tube; upper staminodia 3, rounded, 5-7.5 cm. long, the lip orbicular. About lakes and in marshes and swamps along the coast in s. Tex., Apr.-June; from S.C. to Fla. and Tex.

3. *Canna glauca* L. Plant to 9 dm. high, the herbage green and glaucous; leaves narrowly lanceolate, to at least 6 dm. long and usually 1 dm. or less wide, tapering both to the base and to the long-acuminate apex, typically white hyaline-edged; raceme rather loose, erect, simple or forked, little-exceeding the leaves; floral bracts orbicular; flowers clear-yellow, narrow and erect; sepals green, about 12 mm. long; petals 4-5 cm. long, the tube about 2 cm. long; upper staminodia 3, entire, to 75 mm. long and 2 cm. broad; lip narrow, emarginate. In marshes and swamps along the coast in s. Tex., Apr.-July; from s. Tex. and Mex. s. to S.A. and W.I.

FAM. 43. MARANTACEAE PETERS.

ARROWROOT FAMILY

Herbs with alternate or basal sheathing leaves provided with a joint at the summit of the petiole; flowers perfect, typically 3-merous; sepals separate, usually green and similar or only slightly dissimilar; petals 3, separate or united at base, forming an irregular corolla; stamens of the outer circle reduced to 2 or 1, these modified into staminodia and often petaloid; stamens of the inner circle 3, 2 staminodes, the third only half-staminode and half-fertile; ovary inferior, 3-celled or by abortion 1-celled; ovule solitary and erect in each cell; fruit fleshy or capsular; seeds arillate.

About 26 genera and 400 species, all tropical except ours.

1. THALIA L.

Characteristics of the family. About a dozen species found in America and Africa.

1. *Thalia dealbata* Roscoe. POWDERY-THALIA. Erect scapose herbs from strong rhizomes, with large basal long-petioled leaves; leaves 3, the blades ovate-lanceolate or elliptic-lanceolate and 2-4 dm. long; scapes 1-2 dm. tall; inflorescence more or less white-powdery; flowers purplish, in paniced spikes, each surrounded by several coriaceous bracts; corolla tube short; staminodia petaloid, somewhat connate, the largest deflexed and liplike; ovary 1-celled; fruit a capsule. *T. barbata* Small. In water of ditches, edge of ponds and in swamps in e. and s.e. Tex., Oct.-Nov.; from Fla. to Tex., n. to S.C. and s.e. Mo.

FAM. 44. BURMANNIACEAE BL.

BURMANNIA FAMILY

Small annual or perennial herbs, commonly with grasslike basal leaves and/or alternate minute bractlike leaves on the stem, saprophytic or autophytic; flowers solitary or several in a terminal cluster or cyme, or racemosely scattered on upper part of stem, perfect, with a 6-cleft perianth whose tube adheres to the 1- or 3-celled ovary; stamens 3 or 6, attached to the perianth tube about the middle or near its summit; anthers with broad connectives; capsule usually irregularly dehiscent, with numerous minute seeds.

About 17 genera comprising more than 125 species, mostly tropical and subtropical.

1. Hypanthium 3-angled or 3-winged; ovary 3-celled; capsule 3-valved from the apex or irregularly rupturing 1. *Burmannia*, p. 434.
1. Hypanthium terete; ovary 1-celled; capsule 3-valved from the base 2. *Apteria*, p. 434.

1. BURMANNIA L.

Mostly small herbs with linear or scalelike leaves and solitary, capitate, racemose or cymose flowers; perianth 3-angled or 3-winged, with the outer 3 lobes much larger than the minute or essentially lacking 3 inner lobes; stamens 3, sessile in the throat of perianth; ovary 3-celled; capsule crowned by the persistent perianth.

A genus of nearly 60 species, mainly in the tropics of both hemispheres.

1. Flowers 1 or several in a raceme; hypanthium broadly 3-winged 1. *B. biflora*.
1. Flowers several in a terminal cluster; hypanthium merely 3-angled 2. *B. capitata*.

1. *Burmannia biflora* L. Stem threadlike, to 15 cm. tall; scalelike stem leaves to 3 mm. long; perianth about 5 mm. long, bright-blue, the lobes narrow; capsule 4-5 mm. long. In moist woodlands and bogs in e. Tex., Aug.-Oct.; Fla., n. to Va. and w. to Tex.

2. *Burmannia capitata* (Walt.) Mart. Stem threadlike, to 2 dm. tall; scalelike stem leaves to 5 mm. long; perianth about 5 mm. long, whitish or bluish-white, the lobes minute to obsolescent; capsule 2-3 mm. long. In moist woodlands and bog areas in e. Tex., Aug.-Nov.; Fla., n. to N.C. and w. to Tex.

2. APTERIA NUTT.

Several species in tropical and warm regions of America.

1. *Apteria aphylla* (Nutt.) Barnh. NODDING-NIXIE. Stem slender, threadlike, to 2 dm. tall, simple or branched; scalelike stem leaves to 3 mm. long; flowers small, nodding, with long pedicels; perianth 1-1.5 cm. long, whitish or purple; outer 3 perianth lobes much larger than the 3 narrow inner lobes, the lobes 2-3 mm. long; stamens attached deep in throat of perianth; filaments with winglike appendages; connective not prolonged beyond the anther sacs; capsule 3-4 mm. long. *A. setacea* Nutt. In decaying leaves of moist woods and on edge of bogs in e. Tex., Aug.-Oct.; Fla. and Ga., w. to Tex.

FAM. 45. ORCHIDACEAE JUSS.³⁹

ORCHID FAMILY

Perennial herbs of various habits and habitats, terrestrial, semiaquatic or epiphytic, autophytic or saprophytic, hermaphroditic, produced from a short or elongated or (rarely) coralloid rhizome; roots subterranean or aerial, fibrous, fleshy or tuberous, fasciculate or adventitious and scattered on the rhizome or stem; stems terete, much-abbreviated to elongated, slender to very stout, naked, bracteate or leafy; leaves simple, radical or cauline or both, persistent, deciduous or fugacious, occasionally altogether lacking, varying from sheathing bracts to a broad or narrow lamina; lamina linear to broadly elliptic, membranaceous to somewhat fleshy; inflorescence terminal, supported by an abbreviated to greatly elongated peduncle, composed of one or more flowers, commonly a spike or simple raceme; flowers small and inconspicuous to rather showy, zygomorphic, perfect; perianth composed of three outer segments (sepals) and three inner segments (petals), the segments free or more or less united, adnate to the 1- or 3-celled inferior ovary, one petal (the lip or labellum) usually complex in structure and differing only slightly or greatly in form, size and coloration from the other segments; lip often extended to form a spur or nectary; stamens and pistils (including the filaments and styles) united to form an organ (the column) in the center of the flower; column various, bearing at or near its summit or laterally 1 or 2 mobile or rigidly attached

³⁹ Cf. D. S. Correll in C. L. Lundell, *Flora of Texas* III: 151-196. 1944 for a more detailed treatment.

anthers, producing in front on the ventral surface the somewhat confluent stigmas, with one stigma usually modified to form the rostellum; anthers situated behind the rostellum, resting in a bed or clinandrium, perfectly or abortively 2-celled, containing a mass of pollen or 2 to 8 distinct pollen masses or pollinia; pollen powdery, granular-mealy, waxy or cartilaginous; fruit a dry capsule or fleshy pod, commonly ovoid, ellipsoid or cylindrical, dehiscing along 1, 2 or 3 longitudinal sutures; seeds numerous, scobicular.

A cosmopolitan family that attains its highest development in the tropics of both hemispheres and is one of the largest families of flowering plants in the world, consisting of several hundred genera and 15,000 or more species. It is also considered to be among the most advanced families in the Monocotyledoneae. The column, formed by the united stamens and pistils, is distinctive of the family.

1. Lip an inflated yellow pouch; fertile anthers 2, borne laterally on the column 1. *Cypripedium*, p. 436.
1. Lip simple or complex, sometimes broadly saccate or cymbiform but never pouch-shaped; fertile anther 1, borne at or near the apex of the column (2)
- 2(1). Flowers with a distinct saccate or elongated spur (3)
2. Flowers without a conspicuous spur, at most producing a short mentum (5)
- 3(2). Leaves absent at time of flowering; naked scape produced from a corm 14. *Tipularia*, p. 445.
3. Leaves or foliaceous bracts present at time of flowering; stem produced from an abbreviated or elongated rhizome (4)
- 4(3). Leaves with a distinct slender petiole; rhizome elongated, repent 12. *Erythroides*, p. 444.
4. Leaves with the basal part sheathing the stem, epetiolate; rhizome abbreviated, not repent 2. *Habenaria*, p. 436.
- 5(2). Plants not green, saprophytic; stem usually yellowish-brown; leaves reduced to sheathing scales; rhizomes coralloid (6)
5. Plants green, autophytic; leaves one to many, sometimes absent or inconspicuous at time of flowering (in *Spiranthes*); rhizome not coralloid (7)
- 6(5). Lip with 3 to 6 longitudinal ridges or crests on face; perianth about 20 mm. long; pollinia 8 15. *Hexalectris*, p. 446.
6. Lip not ridged or crested, at most with a pair of short lamellae; perianth usually less than 15 mm. long; pollinia 4 16. *Corallorhiza*, p. 447.
- 7(5). Lip broadly saccate or cymbiform; leaves rather large (8)
7. Lip not saccate; leaves small, often grasslike (9)
- 8(7). Leaves forming a basal rosette, shining and fleshy; lip uppermost in flower 10. *Ponthieva*, p. 441.
8. Leaves scattered on the stem, plicate; lip lowermost in flower 4. *Epipactis*, p. 439.
- 9(7). Lip crested or bearded on the face (10)
9. Lip not crested or bearded on the face (14)
- 10(9). Leaf linear to linear-lanceolate, grasslike, plicate, sheathing the scape near the base; column broadly winged at the apex; lip forming the uppermost segment of the perianth 9. *Calopogon*, p. 440.
10. Leaf ovate to ovate-elliptic, fleshy; column not winged, clavate; lip forming the lowermost segment of the perianth (11)
- 11(10). Leaves 5 or 6 in a whorl at summit of stem 6. *Isotria*, p. 439.
11. Leaves 1 to several, alternate, not whorled (12)
- 12(11). Plant weak, ascending; stem leafy; leaves broadly ovate, clasping the stem, less than 2 cm. long; flowers several 5. *Triphora*, p. 439.
12. Plant rigidly erect; leaf solitary or rarely 2, arising near middle of stem, more than 2 cm. long; flowers 1 or rarely 2 (13)
- 13(12). Lip 25 mm. long or less, bearded on the face 7. *Pogonia*, p. 440.
13. Lip more than 30 mm. long, with a central crest 8. *Cleistis*, p. 440.

- 14(9). Leaves several, basal or cauline, narrow and grasslike or (if broad) basal 11. *Spiranthes*, p. 441.
14. Leaf solitary or 2 oppositely placed on the stem, attached to or spreading near middle of stem, broad and short (15)
- 15(14). Stem produced from a small bulbous corm; leaves 1 or 2; lip broad and short, obliquely tridentate or acutish at the apex 13. *Malaxis*, p. 445.
15. Stem produced from a slender rhizome; leaves always 2, opposite; lip narrow and elongated, deeply bilobed 3. *Listera*, p. 438.

1. CYPRIPIEDIUM L.

A genus of 100 or more species widespread in boreal, temperate and tropical regions of Europe, Asia, Oceania and America.

1. *Cypripedium Calceolus* L. var. *pubescens* (Willd.) Correll. **YELLOW LADY'S-SLIPPER.** Terrestrial herbs to 7 dm. high, with fibrous roots rising from a short or elongated rhizome; leaves several on the stem, broadly elliptic-lanceolate, plicate, prominently ribbed, to 2 dm. long and 1 dm. wide, sheathing the stem; flowers one or two, showy, subtended by foliaceous bracts; sepals spreading, free or with the lateral pair partially or wholly united; petals spreading, free, narrower than the sepals; lip sessile, dull-cream-color to golden-yellow, inflated, saccate or pouch-shaped, horizontally placed, about 5 cm. long; column declined, with two laterally placed fertile stamens (each bearing a 2-celled anther) and a dorsally placed sterile petal-like staminode; pollen granular; stigma terminal and somewhat 3-lobed; ovary 1-celled; capsule obovoid to ellipsoid. *C. parviflorum* Salisb., *C. pubescens* Willd., *C. veganum* Cockll. & Barker, *C. parviflorum* var. *pubescens* (Willd.) Knight. On hardwood slopes in e. Tex. and pockets of dunes in the Plains Country, Apr.-June; Que. and Nfld., s. to Ga., w. to N.M., Wash., B.C. and the Yuk.

2. HABENARIA WILLD.

Terrestrial or semiaquatic herbs with fleshy or tuberous roots; roots ovoid to fusiform-elongated or rarely palmate; plants erect, simple, glabrous; stem leafy or merely bracted; leaves one or more, basal or cauline, essentially sessile, with the basal part sheathing the stem; flowers usually small, in showy or inconspicuous racemes; sepals free, similar or dissimilar; dorsal sepal erect or incurved to form a hood over the column; lateral sepals spreading or deflexed; petals free, erect, usually connivent with the dorsal sepal, simple or bipartite; lip lowermost or occasionally uppermost, simple or tripartite (the divisions cuneate to filiform-setaceous, entire or variously toothed or fringed), entire, toothed or fringed, extended at the base to form a spur; spur elongated and filiform or filiform-clavellate, shorter to much longer than the pedicellate ovary; column short; stigmas with or without papillose processes; anther cells two, separate, relatively distant; pollen granular, attached to exposed glands (not contained in a pouch); capsules narrowly cylindrical to ellipsoid.

A polymorphic genus of approximately 500 species native mainly to the warmer regions of the world.

1. Lip deeply 3-parted, that is divided at least halfway to the base of the lamina (2)
 1. Lip simple, not 3-parted, linguiform, ligulate, linear or lanceolate, at most fringed, notched or lobulate (4)
- 2(1). Divisions of the lip fringed; petals entire, not 2-lobed 3. *H. lacera*.
2. Divisions of the lip not fringed; petals 2-lobed (3)
- 3(2). Spur more than 4 cm. long, much longer than the pedicellate ovary (often as much as 6 times as long); lateral lobes of lip 15 mm. or more long 1. *H. quinquieseta*.
3. Spur less than 2 cm. long, about as long as the pedicellate ovary; lateral lobes of lip less than 13 mm. long 2. *H. repens*.

- 4(1). Lip copiously ciliate-fringed (5)
- 4. Lip not fringed, at most coarsely erose (8)
- 5(4). Flowers white, occasionally tinged with cream-color; lamina of lip narrowly ovate-oblong 4. *H. Blephariglottis*.
- 5. Flowers yellow or orange-color; lamina of lip ovate to oblong (6)
- 6(5). Lip oblong-elliptic, more than 8 mm. long; spur longer than the pedicellate ovary 5. *H. ciliaris*.
- 6. Lip ovate, less than 6 mm. long; spur shorter than the pedicellate ovary (7)
- 7(6). Spur less than 10 mm. long 7. *H. cristata*.
- 7. Spur more than 11 mm. long 6. *H. × Chapmanii*.
- 8(4). Lip lobed at the base or tridentate at the apex (9)
- 8. Lip not obviously lobed or notched, entire to crenate (10)
- 9(8). Lip with a lobe or prominent tooth on each side at the base, adorned with a tubercle or cushionlike callus in the center near or at the base 9. *H. flava*.
- 9. Lip shallowly notched at the apex to form 3 short blunt teeth, ecallose 10. *H. clavellata*.
- 10(8). Flowers yellow 8. *H. integra*.
- 10. Flowers whitish or greenish (11)
- 11(10). Lip forming the uppermost segment of the perianth, ecallose; flowers snowy-white 11. *H. nivea*.
- 11. Lip forming the lowermost segment of the perianth, with a small tubercle or cushionlike callus in the center near or at the base; flowers greenish 9. *H. flava*.

1. *Habenaria quinqueseta* (Michx.) Sw. LONG-HORNED HABENARIA. Plant 2-9 dm. tall; stem leafy; raceme elongated, with few to many greenish-white flowers; midlobe of lip linear, 8-20 mm. long. Represented in Tex. by a collection by Charles Wright, without a definite locality but doubtless in the Coastal Prairies in the s.e. part of the state. It should be looked for in swamps, margin of ponds, and similar wet places; locally distributed from Fla., n. to S.C. and w. to Tex., also in the W.I. and Latin Am., July-Nov.

2. *Habenaria repens* Nutt. WATER-SPIDER ORCHID. Similar to *H. quinqueseta* but with narrower leaves and smaller greenish flowers; midlobe of lip 4-7 mm. long, linear. *H. Nuttallii* Small. In streams, ditches, swamps, on the margins of ponds and lakes, often floating on mats of other vegetation on surface of water in cen., s. and e. Tex., May-Nov.; from Fla., n. to N.C. and Va. (?), w. to Tex.; also throughout the W.I. and Latin Am.

3. *Habenaria lacera* (Michx.) Lodd. RAGGED FRINGED ORCHID. The fringed deeply 3-lobed lip of the yellowish-green flowers is distinctive. Plant 25-75 cm. tall, slender; raceme elongate and laxly flowered; petals linear-oblong to narrowly oblong-spatulate, mostly entire at the truncated apex, 5-7 mm. long, mostly less than 2 mm. wide; lip 10-16 mm. long, 13-17 mm. wide across lateral lobes; spur curved, to 23 mm. long. In open woods along streams, in open sedge marshes and meadows in n.e. Tex., rare, May-Aug.; from Nfld., s. to Ga., w. to Tex., Ark., Mo., Ill., Wisc., Minn.

4. *Habenaria Blephariglottis* (Willd.) Hook. WHITE FRINGED ORCHID. The white flowers with coarsely fringed linguiform lip are distinctive. Plant leafy below, bracted above, to 11 dm. tall; raceme mostly densely flowered; petals linear to oblanceolate, 3-8 mm. long; lip to 1 cm. long or more; spur slender, 1.5-5 cm. long. *Blephariglottis Blephariglottis* (Willd.) Rydb. In marshes, meadows, edge of swamps and depressions in savannahs and prairies in s.e. Tex., June-Sept.; widely distributed and locally abundant from Nfld., s. to Fla., w. to O., Mich. and Tex.

5. *Habenaria ciliaris* (L.) R. Br. YELLOW FRINGED ORCHID. Similar to *H. Blephariglottis* except for its bright- to deep-orange-color flowers with more copiously and finely fringed lips. Plant to 1 m. tall; petals linear-oblong to linear-cuneate, 6-7 mm. long, 1-2 mm. wide; lip 8-12 mm. long; spur 2-3.3 cm. long. *Blephariglottis ciliaris* (L.) Rydb. In

moist woodlands, along streams, seepage slopes in forests and open areas, bogs, savannahs and prairies in e. and s.e. Tex., June-Oct.; from Ont., s. to Fla., w. to Ill., Mo., Ark. and Tex.

6. *Habenaria* × *Chapmanii* (Small) Ames. The size of the lemon-yellow to orange-color flowers of this plant are intermediate between *H. cristata* and *H. Blephariglottis*, its putative parents. The spur is usually about 12 mm. long. *Blephariglottis Chapmanii* Small. In habitats similar to those of *H. ciliaris* in s.e. Tex., July-Aug.; from N.J. and Del., s. to n. Fla., w. to Tex.

7. *Habenaria cristata* (Michx.) R. Br. CRESTED FRINGED ORCHID. Except for their smaller size and usually deeper color the flowers of this species are similar to those of *H. ciliaris*. The short spur averages 6 mm. in length. Plant usually about 5 dm. tall; petals oblong-elliptic to narrowly cuneate, fringed at apex, 2-4 mm. long; lip 4-6 mm. long. *Blephariglottis cristata* (Michx.) Raf. In habitats similar to those of *H. ciliaris* in e. and s.e. Tex., June-Sept.; from e. Mass. (rare), s. to cen. Fla., w. to Tex., Ark. and Tenn.

8. *Habenaria integra* (Nutt.) Spreng. YELLOW FRINGELESS ORCHID. Except for its lack of fringes on the lip the flowers of this species are quite similar in color, size and appearance to those of *H. cristata*. Plant usually less than 5 dm. tall; petals narrowly oblong, obtuse, 3-4 mm. long, about 2 mm. wide; lip ovate-elliptic to obovate, usually marginally crenulate, 4-5 mm. long, 3-4 mm. wide; spur about 5 mm. long. *Gymnadeniopsis integra* (Nutt.) Rydb. Represented in Tex. by a collection of Thomas Drummond without a definite locality but doubtless in boggy savannahs or prairies in the s.e. part of the state. Along the coast from N.J., s. to n.-cen. Fla., w. to Tex.; also e.-cen. Tenn., July-Sept.

9. *Habenaria flava* (L.) R. Br. SOUTHERN REIN-ORCHID. The tubercle or callus on the disk of the lip near its base is characteristic of this species. Plant with one to three leaves below, bracted above, to 6 dm. tall; petals ovate to oblong or suborbicular, 2-5 mm. long, to 3.5 mm. wide; lip variable in shape, broadly oblong to suborbicular, 2.5-6 mm. long, to 4.5 mm. wide across the basal teeth or lobules; spur slender, rarely clavellate, to 11 mm. long. *Perularia bidentata* (Ell.) Small, *P. scutellata* (Nutt.) Small. In mud of densely wooded floodplain swamplands, thickets, wet savannahs, prairies and marshes in e. and s.e. Tex., Apr.-Aug.; primarily in the coastal regions and lowlands from Md., s. to cen. Fla., w. to Tex., Ark., Mo., Ill. and Ind.

10. *Habenaria clavellata* (Michx.) Spreng. GREEN REIN-ORCHID, SMALL WOOD ORCHID. The narrowly oblong-cuneate lip that is truncate and sinuately tridentate at the apex is characteristic of this species. Plant to 45 cm. tall; leaves one or rarely two, obovate-oblong, obtuse, to 18 cm. long; flowers greenish or yellowish-white; petals ovate, 3-5 mm. long, about 2 mm. wide; lip 3-7 mm. long; spur slender-clavate, 8-12 mm. long. *Gymnadeniopsis clavellata* (Michx.) Rydb. In water or at edge of water along streams in forests, swamps, on wooded seepage slopes and in ravines in e. Tex., June-Aug.; from Nfld., s. to n. Fla., w. to Tex., Ark., Mo., and Minn.

11. *Habenaria nivea* (Nutt.) Spreng. SNOWY ORCHID. The small white flowers with lip uppermost distinguishes this species. Plant slender, rigidly erect, glabrous, to 9 dm. tall, with basal ellipsoid tubers to 3 cm. long; petals linear-oblong to elliptic, somewhat falcate, 2-5 mm. long; lip 3-8 mm. long; spur slender, almost horizontal, curved upward, 1-1.5 cm. long. *Gymnadeniopsis nivea* (Nutt.) Rydb. In wet prairies, savannahs and bogs, mainly in s.e. Tex., May-Aug.; locally distributed from N.J. and Del., s. along the coast to Fla., w. to Tex. and Ark.

3. LISTERA R. BR.

A small genus of about 20 species widely distributed in boreal and temperate regions of the Northern Hemisphere.

1. *Listera australis* Lindl. SOUTHERN TWAYBLADE. Small inconspicuous terrestrial herb with fibrous matted roots; stem slender, rarely more than 15 cm. high, more or less glandular-pubescent above the two opposite or subopposite leaves; leaves sessile, inserted above the middle of the stem, typically ovate-elliptic, to 4 cm. long; inflorescence a terminal raceme composed of small reddish-purple or greenish flowers; sepals and petals

free, similar and subequal, to 2 mm. long and 1 mm. wide; lip longer than the sepals and petals, linear, deeply 2-cleft, auricled on each side at the base; column wingless; capsule small, slender, pedicellate. In humus and on mosses of low moist woods and in ravines along streams in s.e. Tex., Feb.-May; locally from Que. and Ont., s. to cen. Fla. and w. to Tex.

4. EPIPACTIS Sw.

A genus of about 20 species mainly in temperate and mountainous regions of Europe and Asia, with 2 species in North America.

1. *Epipactis gigantea* Hook. GIANT HELLEBORINE. Plant terrestrial or saxicolous, usually 5 dm. tall or more; stem simple, leafy, from a short creeping rhizome with fibrous roots; leaves clasping stem, plicate-venose, broadly elliptic to linear-lanceolate, 6-20 cm. long, 2-7 cm. wide; inflorescence a few- to many-flowered prominently bracteose more or less secund raceme; floral bracts foliaceous, conspicuously exceeding the flowers; flowers greenish, marked with purplish or reddish nerves; sepals free, lanceolate, subequal, spreading or loosely connivent, 15-25 mm. long, 7-9 mm. wide; petals similar to the sepals but smaller; lip sessile on the base of the column, fleshy, saccate at the base, flattened above, distinctly 3-lobed with the lateral lobes erect to form a sac, about as long as sepals; column short, broadened above; capsule obovoid to ellipsoid, pendent, 2-2.5 cm. long. *Serapias gigantea* (Hook.) A. A. Eat. On seepage slopes, wet limestone bluffs and ledges in cen. and w. Tex., Apr.-July; scattered from Mont., S.D., Colo., Okla. and Tex., w. to B.C., Wash., Ore. and Calif.; also Mex.

5. TRIPHORA Nutt.

A small genus of about 10 species closely allied to *Pogonia*, in which some of the species are difficult to define; widely distributed in the Americas.

1. *Triphora trianthophora* (Sw.) Rydb. THREE BIRDS ORCHID, NODDING POGONIA. Inconspicuous terrestrial delicate succulent herb, stoloniferous and bearing fleshy tubers; stems slender, rarely more than 15 cm. high; leaves alternate, usually 2, clasping stem, ovate, less than 2 cm. long; flowers 2 or 3, nodding, borne in the axils of the upper leaves, about 15 mm. long; perianth parts distinct; lip 3-crested; column free, entire at the apex; capsule erect or pendent, ellipsoid to ellipsoid-obovoid, 1.5-2 cm. long. *Pogonia trianthophora* (Sw.) B.S.P. In leafmold of hardwood forests in e. Tex., Aug.-Oct.; from Can. and N.E., s. to cen. Fla., w. to Wisc., Ia., Mo., Ark. and Tex.

A rather distinctive variant, var. *Schaffneri* Camp, is exceedingly abundant in moist woodlands in Smith County. It is distinguished from var. *trianthophora* by its smaller flowers and erect, not pendent, fruits.

6. ISOTRIA Raf.

A genus closely allied to *Pogonia*, composed of 2 species, both of which are apparently confined to the United States.

1. *Isotria verticillata* (Willd.) Raf. WHORLED POGONIA. Terrestrial herb with long slender hairy roots, usually about 2 dm. tall; leaves 5 or 6 in verticil at top of stem, oblong-lanceolate to elliptic, to 9 cm. long and 5 cm. wide; flowers one or rarely 2 just above the leaves; perianth parts distinct; sepals 3.5-6 cm. long, about 3 mm. wide; petals elliptic-obovate to elliptic-lanceolate, about 2 cm. long and 5 mm. wide; lip yellowish-green, streaked with purple, oblong-cuneate, tuberculate-crested, 3-lobed near apex, to 25 mm. long and about 1 cm. wide; capsule erect, cylindrical or ellipsoid, 2-3.5 cm. long. *Pogonia verticillata* (Willd.) Nutt. Along streams and on slopes in hardwood forests in e. Tex., Apr.-July; from N.E., s. to Fla., w. to Mich., Mo., Ark. and Tex.

The long linear-lanceolate madder-purple sepals that greatly exceed the lip and petals are distinctive.

7. POGONIA Juss.

A genus of about 20 species widely dispersed over the world.

1. *Pogonia ophioglossoides* (L.) Ker. ROSE POGONIA. Terrestrial herb with slender fibrous roots, rigidly erect, usually about 4 dm. tall; leaf solitary, inserted about halfway up the stem, ovate to ovate-lanceolate, to 12 cm. long and 3 cm. wide; flowers one or 2 terminating the stem, rose-color to white, 15-25 mm. long; perianth parts distinct; lip bearded; column free, coarsely toothed at the apex; capsule ellipsoid, erect. In swamps, bogs, marshes, wet savannahs, prairies and seepage slopes in e. and s.e. Tex., Apr.-July; from Nfld., s. to Fla., w. to Minn., Ill. and Tex.

The heavily bearded lip, which forms the lower segment of the flower, is distinctive.

8. CLEISTES RICH.

A genus of about 40 species in the Western Hemisphere, mainly in South America.

1. *Cleistes divaricata* (L.) Ames. SPREADING POGONIA. Terrestrial herb with slender fibrous root, rigidly erect, to 75 cm. tall; leaf solitary, inserted above the middle of the stem, oblong-lanceolate, to 15 cm. long and 2 cm. wide; flowers one to rarely 3 that terminate the stem; perianth parts distinct; sepals to 65 mm. long, about 5 mm. wide; petals magenta-pink to white, to 45 mm. long and 12 mm. wide; lip crested, about as long as petals; column free, eroded at apex; capsule erect, cylindrical. *Pogonia divaricata* (L.) R. Br. This species is represented in Tex. by a collection made by E. J. Palmer, but the exact locality is unknown. It doubtlessly occurs in the s.e. part of the state and is to be looked for in low grassy pine barrens, savannahs, prairies, flatwoods, bogs, swamps and along stream banks; rare and of local occurrence from N.J. and Del. s. to cen. Fla., w. to Tenn., Ky. and Tex.; Apr.-July.

The ascending and often recurved linear-lanceolate brownish sepals are distinctive.

9. CALOPOGON R. BR.

Terrestrial scapose herbs arising from orbicular or ellipsoid corms, with a solitary (rarely more) grasslike leaf sheathing the stem near the base; inflorescence a dense or lax few- to several-flowered terminal raceme; flowers conspicuous, showy, varying in color from white to deep-crimson or magenta; sepals and petals free, spreading; lip forming the upper segment of the perianth, with a minute lateral lobe on each side near the base, strongly dilated and bearded above with numerous clavellate hairs and papillae at the apex; column free, slender and somewhat incurved, winged on each side at the apex; anther terminal, operculate; pollinia four, two in each anther cell, the grains connected by filaments; capsule erect, cylindrical or ellipsoid.

A small New World genus of 4 species, chiefly occurring in southeastern United States with one species widespread in eastern Canada and the United States. The bearded lip, which forms the uppermost segment of the flower, is distinctive.

1. Flowers usually 2 to 5, opening almost simultaneously; leaves grasslike, about 2 mm. wide 1. *C. barbatus*.

1. Flowers usually more than 8, opening in slow succession up the raceme to extend over a prolonged period; leaves usually much more than 5 mm. wide 2. *C. pulchellus*.

1. *Calopogon barbatus* (Walt.) Ames. BEARDED GRASS-PINK. Plant usually about 3 dm. tall; leaf less than 2 dm. long and about 2 mm. wide; flowers rarely more than 5; sepals and petals to about 17 mm. long; lip about 11 mm. long. In moist acid sandy soils on edge of bogs, swamps and marshes, and in moist open woodlands, rare in e. Tex. (Henderson Co.), Apr.-May; from N.C. along the Atl. seaboard to Fla., w. along the Gulf Coast to e. Tex.

2. *Calopogon pulchellus* (Salisb.) R. Br. GRASS-PINK. Plant rigidly erect, usually about 5 dm. tall; leaf to 5 dm. long and 5 cm. wide; flowers 8 or more; sepals and petals similar,

typically elliptic, to about 25 mm. long; lip usually more than 12 mm. long. In depressions in savannahs and prairies, marshes, swamps and bogs in e. and s.e. Tex., Apr.-June; from Nfld., s. to s. Fla., w. to Minn., Ia., Mo., Okla. and Tex.

10. PONTHEIVA R. BR.

In this genus there are 25 species that are found in the warmer regions of the Western Hemisphere from southeastern Virginia to Chile, including Mexico, Central America, the West Indies and South America.

1. *Ponthieva racemosa* (Walt.) Mohr. SHADOW-WITCH. Terrestrial scapose herb with fleshy or somewhat fibrous roots, usually about 3 dm. tall; leaves in basal rosette, oblong-elliptic to oblanceolate, obtuse, to 15 cm. long and 5 cm. wide; flowers white-green, fragrant, nonresupinate in a lax terminal raceme; sepals ovate to elliptic-lanceolate, spreading, to 8 mm. long and 3.5 mm. wide; petals attached to the column above its base, oblique, often adherent to the dorsal sepal at the apex; lip on the upper part of the flower, with its claw grown to the column above its base, abruptly dilated and ascending, suborbicular, saccate-concave, to 7 mm. long; capsule suberect, ellipsoid to obovoid-ellipsoid. Along streams in woods or about muddy sloughs and ponds in e. and s.e. Tex., Sept.-Nov.; from s.e. Va., s. to Fla., w. to Tex.; also the W.I. and Latin Am.

The noticeably oblique petals and lip forming the uppermost segment of the flower are characteristic.

11. SPIRANTHES RICH.

LADIES' TRESSES

Coarse or delicate terrestrial herbs with clustered tuberous or rarely fibrous roots; leaves various, mostly basal, broadly ovate to elliptic or narrowly linear to semiterete, persistent or fugacious, reduced above to persistent sheathing bracts; flowers variously colored, usually white and variously tinged or marked with green, yellow, brown or lavender, sometimes brick-red, deep-crimson, yellow-orange or yellow-scarlet, in a more or less spirally twisted showy or inconspicuous terminal spike; sepals free; dorsal sepal and petals coherent; lateral sepals usually somewhat decurrent on the ovary and gibbous at the base or extended to form a mentum; lip sessile or with a short claw, with the basal portion concave and embracing the column, spreading or arcuate-recurved at the apex, crisped, wavy or toothed, with a minute or conspicuous callosity on each side at the base, sometimes ecallose; column short, terete to clavate, essentially footless or extended into a long foot at the base; anther erect on the back of the column, 2-celled; pollinia two, powdery-granular, narrowly obovoid, their filaments coherent to the narrow viscid gland which is set in the thin beak (rostellum) terminating the column (after the removal of the gland the beak is left as a 2-toothed or forked tip); capsule erect, ellipsoid to ovoid or obovoid, sometimes 3-keeled.

A polymorphic genus of about 200 species widely dispersed throughout the North Temperate Zone and tropical Asia and America, south to Chile.

- 1. Flowers forming a dense cylindrical spike, apparently in several ranks; basal leaves (when present) with linear, lanceolate, oblong-elliptic or oblanceolate blades, never with a distinct petiole, the lower part sheathing the stem (2)
- 1. Flowers forming a loose or dense usually spiral spike, single-ranked, often secund; basal leaves (when present) with ovate, oblong-elliptic, lanceolate or semiterete blades, with a distinct petiole or with the lower part sheathing the stem (6)
- 2(1). Plant small, slender; spike ovoid to narrowly cylindrical, more or less tapering at each end, 15 mm. or less in diameter; lip 5.5 mm. or less long 7. *S. ovalis*.
- 2. Plants usually large, stout; spike cylindrical-elongated to pyramidal, usually much more than 15 mm. in diameter; lip more than 6 mm. long (3)
- 3(2). Spike large, showy, 3-6 cm. in diameter; flowers colorful, varying from greenish-white to yellow-scarlet or deep-crimson; lateral sepals long-decurrent on the ovary; column foot elongated and about as long as the column; rostellum a long awl-shaped bristlelike point 2. *S. cinnabarina*.

3. Spike comparatively slender, mostly inconspicuous, 3 cm. or less in diameter; flowers usually white, rarely orange-yellow; lateral sepals only shortly decurrent on the ovary; column foot short or indistinct; rostellum not awl-shaped (4)
- 4(3). Flowers varying in color from nearly white to greenish-white or orange-yellow, suffused or striped with bluish-green; lamina of lip ecallose 3. *S. michuacana*.
4. Flowers white, sometimes tinged or marked with yellow; lamina of lip with a prominent or small callosity on each side at the base (5)
- 5(4). Lip ovate-oblong, usually slightly constricted about the middle and then dilated at the apex, mostly less than 10 mm. long; leaves basal or only on the lower part of the stem 6. *S. cernua* var. *cernua*.
5. Lip with the basal half dilated, broadly rhombic-ovate, tapering to the obtuse to subacute apex, often as much as 14 mm. long; leaves often extending up the stem 6. *S. cernua* var. *odorata*.
- 6(1). Lip prominently panduriform, with a narrow isthmus or constriction separating the basal half from the more or less expanded apical lobe or lobule (7)
6. Lip not prominently panduriform, essentially simple and entire, at most fringed or crenulate, ovate to oblong (8)
- 7(6). Basal half of lip oblong-quadrate, adorned with a spongy cinnabar-red tissue ... 13. *S. parasitica*.
7. Basal half of lip orbicular, concave, not provided with a cinnabar-red tissue 1. *S. durangensis*.
- 8(6). Lip oval (5-5.5 mm. long); petals oval to obovate or suborbicular, with the anterior margin more or less erose; leaves absent at time of flowering 12. *S. Parksii*.
8. Lip ovate to oblong, if oval more than 5.5 mm. long; petals linear to elliptic-oblong or oblanceolate; leaves absent or present at time of flowering (9)
- 9(8). Basal leaves spreading, with the relatively short and broad blades having a distinct petiole, ovate to narrowly oblong-elliptic, persistent or fugacious (10)
9. Basal leaves erect, ascending, linear, narrowly lanceolate or oblong-elliptic, epetiolate, with the lower portion sheathing the stem, persistent or fugacious (13)
- 10(9). Lip quadrate to oblong-quadrate, white, less than 4 mm. long 9. *S. Grayi*.
10. Lip ovate, oblong-quadrate or oblong-elliptic, 4-6 mm. long (rarely 3.5 mm. long in var. *brevilabris*) (11)
- 11(10). Plant with a densely pubescent spike; lip deeply fringed and with a prominent tuft of hairs on the disk near the apex; leaves usually persistent; flowering in the spring 8. *S. gracilis* var. *brevilabris*.
11. Plant essentially glabrous throughout (12)
- 12(11). Lip with a broad green stripe on the central portion of the disk; leaves fugacious; usually flowering in the fall 8. *S. gracilis* var. *gracilis*.
12. Lip with a broad yellow stripe on the central portion of the disk, often also flecked with green; leaves mostly persistent; usually flowering in the spring 8. *S. gracilis* var. *floridana*.
- 13(9). Flowers secund (rarely slightly spiraled); lip from a broad base tapering to obtuse apex, 6-9.5 mm. long; basal leaves fugacious .11. *S. longilabris*.
13. Flowers strongly spiraled; lip ovate, orbicular-quadrate, oblong or oblong-quadrate; basal leaves persistent or fugacious (14)
- 14(13). Lip oblong-elliptic to oblong, membranaceous, with parallel lateral margins or often broadest at or near the distal end, veined with green; spike glabrous or very sparsely pubescent 10. *S. praecox*.
14. Lip ovate to ovate-oblong or ovate-elliptic, usually fleshy-thickened, broadest at or near the base (15)

- 15(14). Lip ovate to ovate-elliptic; spike densely pubescent; ovaries usually covered by a thick mat of reddish-brown hairs4. *S. vernalis*.
 15. Lip ovate-oblong, often from a suborbicular base, conspicuously laciniate along the apical margins; spike more or less pubescent5. *S. × laciniata*.

1. *Spiranthes durangensis* Ames & C. Schweinf. Plant scapose, erect, 2.5-5 dm. tall; flowers fragrant; sepals and petals dull-brownish-pink to purplish, often with green nerves, about 15 mm. long; lip whitish-pink with green nerves, with a short arcuate claw, only slightly longer than the sepals. In grassy pockets of rimrocks, on rocky bluffs and seepage slopes in the mts. of the Trans-Pecos, May-July; also Mex.

The lip strongly constricted about the middle is distinctive.

2. *Spiranthes cinnabarina* (La Llave & Lex.) Hemsl. SCARLET LADIES' TRESSES. Plant stout, glabrous below, pubescent above with articulated hairs; floral segments typically lanceolate, to 25 mm. long. On rocky mt. slopes, canyons, grassy hills and in meadows, often on limestone hills, in the Chisos Mts. in the Trans-Pecos, Aug.-Oct.; from w. Tex. through Mex. to n.w. Guat.

The relatively large yellowish-orange to yellow-scarlet flowers are distinctive in this genus.

3. *Spiranthes michuacana* (La Llave & Lex.) Hemsl. Plant erect, to 8 dm. tall; rachis more or less covered by a white tomentum; flowers fragrant, about 17 mm. long. In clayey soil of scrub forests, on rocky grassy slopes and in fields in the mts. of the Trans-Pecos, Oct.-Nov.; also Ariz. and Mex.

The large glandular-pilose floral bracts that about equal the length of the flowers are distinctive.

4. *Spiranthes vernalis* Engelm. & Gray. SPRING LADIES' TRESSES. Plant slender or stout, usually about 5 dm. tall; leaves linear to narrowly lanceolate, acuminate; spike densely spiraled; flowers 5-10 mm. long, yellowish or sometimes marked with green, fragrant. *Ibidium vernale* (Engelm. & Gray) House. In wet prairies, savannahs and meadows, fresh and coastal salt marshes, swamps, beaches and dune areas in the e. third of Tex., Apr.-July; from Que. and Mass., s. to s. Fla., w. to Mo., Kan., Okla., and N.M.; also Mex. and Guat.

Characterized by its copiously pubescent rachis and ovaries that are provided with articulated, brownish, sharp-pointed hairs.

5. *Spiranthes × laciniata* (Small) Ames. LACE-LIP SPIRAL-ORCHID. Rather coarse plants that have intermediate characters between *S. praecox* and *S. vernalis*. *Ibidium laciniatum* (Small) House. In marshes and shallow water of cypress swamps and in boggy depressions in savannahs and prairies in s.e. Tex., May-July; from N.J., s. to Fla., w. along the Gulf Coast to Tex.

6. *Spiranthes cernua* (L.) Rich. var. *cernua*. NODDING LADIES' TRESSES. *Ibidium cernuum* (L.) House. Plant erect, glabrous below, downy-pubescent above, usually about 4 dm. tall; flowers 6-11 mm. long, usually fragrant; lip ovate-oblong to oblong. In swamps, wet woods, stream bottoms, grassy seepage slopes in cen. and e. Tex., July-Dec.; from N.S. and Ont., s. to s. Fla., w. to Minn., S.D., Neb., Kan., Okla. and N.M.

Var. *odorata* (Nutt.) Correll. FRAGRANT LADIES' TRESSES. The thickish lip of var. *odorata* is broadly ovate instead of being oblongish as in var. *cernua*. *Gyrostachys odorata* (Nutt.) O. Ktze. This variety occurs sparingly throughout the area of distribution of var. *cernua*. It attains its maximum development in the southeastern states where it is commonly found in stoloniferous colonies in water and mud of swamps, marshes, and along wooded rivers and streams.

7. *Spiranthes ovalis* Lindl. OVAL LADIES' TRESSES. Plant slender, rarely more than 35 cm. tall; leaves 2 to 4 at the base, gradually reduced above to sheathing bracts, elliptic to lanceolate, to 15 cm. long and 15 mm. wide; spike 2-10 cm. long, 1-1.3 cm. in diameter; flowers white, less than 5 mm. long. *Ibidium ovale* (Lindl.) House. In moist shady woods and on the edge of thickets, on wooded hills, along streams and sometimes in floodplain woods in n.-cen. and e. Tex., Aug.-Oct.; from W.Va. and Va., s. to n.-cen. Fla., w. to Ind., Mo., Okla. and Tex., rare.

The slender, compact, more or less fusiform, spike of small flowers is distinctive.

8. *Spiranthes gracilis* (Bigel.) Beck var. *gracilis*. GREEN-LIP LADIES' TRESSES. Plants slender, essentially glabrous throughout, about 5 dm. tall, with fasciculate fleshy roots; leaves (when present) to 65 mm. long and 23 mm. wide; flowers white with the lip

marked with green, 4-6 mm. long. *Gyrostachys gracilis* (Bigel.) O. Ktze., *Ibidium gracile* (Bigel.) House. In sandy post oak woods, gravelly soils, on open-wooded slopes, in fields, meadows and prairies of n.-cen., e. and s.e. Tex., July-Oct.; from N.S. and N.B., s. to s.-cen. Fla., w. to Minn., Ia., Mo., Okla. and Tex.

The broad green stripe in the center of the lip, which is rarely more than 5 mm. long, is distinctive. Also, the usually fugacious basal leaves are ovate to ovate-lanceolate instead of being grasslike as in most of our species.

Var. *brevilabris* (Lindl.) Correll. TEXAS LADIES' TRESSES. Similar to var. *gracilis* except for the densely pubescent spike, persistent basal leaves, and earlier flowering period in March and May. *Spiranthes brevilabris* Lindl. Originally described from Tex., this variety is rare from s. Tex. e. to Fla. in habitats similar to those of var. *gracilis*.

Var. *floridana* (Wherry) Correll. FLORIDA LADIES' TRESSES. Similar to var. *gracilis* except for the lip having a yellow instead of green center and the much narrower and elongated basal leaves being persistent; also flowering earlier, from April to June. *Ibidium floridanum* Wherry. Occurring in habitats similar to var. *gracilis* from N.C., s. to cen. Fla. and w. to Tex.

9. *Spiranthes Grayi* Ames. LITTLE LADIES' TRESSES. Plants very slender, rarely more than 4 dm. tall, produced from a single tuberous root; leaves similar to those of *S. gracilis*. *S. Beckii* Lindl., *Gyrostachys simplex* (Gray) O. Ktze., *Ibidium Beckii* (Lindl.) House. In damp sandy soil of shady forests, well-drained wooded slopes, along wooded stream-banks in e. and s.e. Tex., June-Aug., rarely earlier; from Mass., s. to s.-cen. Fla., w. to Ky., Ark. and Tex.

The extremely slender spike of tiny white flowers, with segments 2-4 mm. long, is characteristic.

10. *Spiranthes praecox* (Walt.) Wats. GRASS-LEAVED LADIES' TRESSES. Plant usually slender, essentially glabrous throughout, to 75 cm. tall; spike loosely to densely flowered; perianth 5.5-11 mm. long. *Gyrostachys praecox* (Walt.) O. Ktze., *Ibidium praecox* (Walt.) House. In low wet grassy pinelands and flatwoods, wet prairies, savannahs and meadows, in bogs and coastal marshes in e. and s.e. Tex., Mar.-June; from N.J., s. to s. Fla., w. to Ark. and Tex.

The thin green-veined oblong lip, which is 5.5-10 mm. long, is distinctive.

11. *Spiranthes longilabris* Lindl. GIANT SPIRAL-ORCHID. Plant erect, slender, essentially glabrous throughout, to 6 dm. tall; flowers white or white tinged with cream-color, conspicuously ringent, 6-10 mm. long. Commonly in wet grassy pine barrens and flatwoods, swamps, marshes, wet savannahs and prairies, and sandy bogs in s.e. Tex., Oct.-Dec.; from e. N.C., s. to Fla., and w. to Tex.

The characteristically secund inflorescence of horizontally projecting flowers separates this species from all other Texas *Spiranthes*. Its nearest ally, *S. praecox*, with which it may be confused, has flowers whose lips are marked or veined with green, a character lacking in *S. longilabris*.

12. *Spiranthes Parksii* Correll. Plant small, erect, 2-3 dm. tall; spike few-flowered, about 5 cm. long; flowers 5-7 mm. long. The characteristically obovate petals and oval lip are distinctive and conveniently separate this species from all other species of *Spiranthes* found in Texas. Endemic in Tex. along the Navasota River in Brazos Co., Oct.

13. *Spiranthes parasitica* A. Rich. & Gal. Plant slender, to about 3 dm. tall; spike slender, few-flowered; sepals and petals pink, 5-8 mm. long; lip 6-9 mm. long, white with 3 green stripes extending almost to the apex, with cinnabar-red tissue on the basal portion. In moist shaded soil along creeks, on dry slopes and forests in the mts. of the Trans-Pecos, June; also in Ariz., Mex. and C.A.

The persistent spongy cinnabar-red blotch on the disk of the lip is distinctive.

12. ERYTHRODES BL.

A complex genus of about 100 species found in the tropics and subtropics of both hemispheres.

1. *Erythroides querceticola* (Lindl.) Ames. Plant slender, leafy, glabrous, erect from a geniculate-prostrate stoloniferous base, rooting at the nodes, usually about 3 dm. tall;

leaves with short petioles that surround the stem at the base, ovate to lanceolate or elliptic-lanceolate, usually reticulate-veined, to 8 cm. long and 3 cm. wide; flowers yellowish-green or white, subsessile in a spicate raceme; sepals and petals 3-4.5 mm. long; lip 3-lobed above, 5-7 mm. long (including the basal spur), usually provided with 4 or more mammillate calli or calluslike structures on the interior near the base. Reported from Texas but no material has been seen. It should be looked for in moist partially shaded woodlands in e. Tex., often associated with the grass, *Oplismenus hirtellus*; from Fla., w. to La. and Tex. (?); also Bah. I., W.I., Mex. and C.A.

13. MALAXIS Sw.

Inconspicuous terrestrial scapose herbs arising from a swollen or cormlike base; scape bearing one or two leaves about the middle or occasionally just below the inflorescence; inflorescence a many-flowered elongated spike or raceme of small flowers terminating the stem; sepals free or with the lateral sepals connate, spreading; petals narrowly linear or filiform, usually strongly recurved; lip sessile, the uppermost segment of the perianth, erect, tridentate at the apex, usually auriculate and concave; column short, terete, often toothed at the apex; anther terminal, erect or incumbent; pollinia four, waxy; capsule small, ovoid to ellipsoid or subglobose.

A genus of about 250 species which attains its greatest development in Asia and Oceania; also widely distributed in the Western Hemisphere and sparsely in Europe.

1. Flowers deep-maroon to rarely greenish; lip acuminate at apex1. *M. Ehrenbergii*.
1. Flowers green or yellowish-green; lip unequally tridentate at apex with the middle tooth minute (2)
- 2(1). Flowers subsessile; pedicels less than 2 mm. long; raceme spicate, narrowly cylindrical, densely many-flowered, usually much less than 10 mm. in diameter ..
.....2. *M. Soulei*.
2. Flowers on slender pedicels more than 3 mm. long; raceme subcorymbose to slender-elongated, laxly few- to many-flowered, usually more than 15 mm. in diameter ...
.....3. *M. unifolia*.

1. *Malaxis Ehrenbergii* (Reichb. f.) O. Ktze. Plant slender, glabrous, to nearly 5 dm. tall; leaf solitary, suborbicular to oblong-elliptic, to 1 dm. long and 6 cm. wide; pedicels 2-3 mm. long; flowers deep-maroon to rarely greenish; lip triangular-lanceolate and more or less hastate, 2-2.5 mm. long. In humus of open forests and about igneous rocks in Chisos Mts. of the Big Bend, rare, summer-fall; from w. Tex. to Ariz., s. through Mex. to Guat.

2. *Malaxis Soulei* L. O. Wms. MOUNTAIN MALAXIS. Plant slender, glabrous, to 5 dm. tall; leaf solitary, cordate-ovate to oblong-lanceolate, to 15 cm. long and 6 cm. wide; pedicels stout, to 2 mm. long; flowers minute, yellowish-green; lip uppermost in the flower, 1.5-2.8 mm. long. In humus in moist canyons and ravines, and on wooded slopes in the mts. of the Trans-Pecos, July-Oct., from w. Tex. to Ariz., s. through Mex. to C.A.

3. *Malaxis unifolia* Michx. GREEN ADDER'S MOUTH. Plant bright-green, to 55 cm. tall; leaf solitary, orbicular-ovate to ovate-lanceolate, to 9 cm. long and 65 mm. wide; pedicels filiform, 3-10 mm. long; flowers green; lip lowermost in the flower, 2-4 mm. long. *Achroanthes unifolia* (Michx.) Raf. On moist wooded slopes along streams, ravines, and in mixed pine-hardwood forests in e. Tex., Mar.-July; from Nfld., s. to n. Fla., w. to Minn., Mo., Ark. and Tex.; also Cuba, Jam. and Mex.

14. TIPULARIA NUTT.

A genus represented by only one other species which occurs in Japan.

1. *Tipularia discolor* (Pursh) Nutt. CRIPPLED CRANE-FLY. Inconspicuous terrestrial scapose herb to 65 cm. high, arising from a horizontal series of corms which alternately produce a leaf in autumn and a slender scape in summer, the stem brownish-green, suffused with purple or bronze; leaf solitary, fugacious with the arrival of the scape

inflorescence, cordate-ovate, green above, purplish beneath, to 1 dm. long and 7 cm. wide; perianth segments similar, typically oblong-elliptic, 4-8 mm. long; lip 3-lobed, with a slender spur produced at the base; spur horizontal or ascending, 1.5-2 cm. long; capsule ovoid, pendent. *T. unifolia* (Muhl.) B.S.P. In humus of rich damp woods, along streams, on pine-hardwood slopes, and in floodplain areas of e. and s.e. Tex., July-Aug.; from N.Y. and Pa., s. to n. Fla., w. to O., Ind., Ky., Ark. and Tex.

This is apparently the only species in the Orchidaceae known to have an asymmetrically arranged perianth in which one of the petals distinctly overlaps the dorsal sepal for about half its width. Another interesting characteristic of this species is the fact that during the winter a solitary ovate leaf, purplish beneath, remains above ground, usually lying on or among fallen leaves. The leaf withers away in summer before or just as the slender flowering scape arises from the series of underground corms.

15. HEXALECTRIS RAF.

Terrestrial scapose saprophytic herbs arising from slender or stout coralloid and annulated rhizomes; stem flesh-colored or purplish, apparently lacking chlorophyll, simple or occasionally branched; leaves reduced to buff or purplish sheathing scales; inflorescence a lax terminal few-flowered raceme; flowers showy, rose-lavender, purplish, red or yellowish, often variously striped or mottled with purple, rarely nearly white; sepals and petals free, spreading or somewhat revolute; lip 3-lobed, crested on the disk with several longitudinal central lamellae or ridges; column slender, shallowly winged on each side at the summit; pollinia eight, four in each cell of the anther, waxy, fasciculate.

A small genus of only 6 species in the United States and Mexico.

1. Midlobe of lip adorned with three irregularly scalloped and broken lamellae 1. *H. Warnockii*.
1. Midlobe of lip not as above, without prominent lamellae (2)
- 2(1). Lateral lobes of lip free for 3 mm. or more (3)
2. Lateral lobes of lip free for 2 mm. or less (4)
- 3(2). Lateral lobes of lip oblong, obtuse; lip broadly elliptic in outline, 14 mm. or more long 4. *H. revoluta*.
3. Lateral lobes of lip subquadrate to suborbicular-obovate, broad at the apex; lip obovate in outline, 13 mm. or less long 2. *H. grandiflora*.
- 4(2). Lip less than 10 mm. long 5. *H. nitida*.
4. Lip more than 12 mm. long 3. *H. spicata*.

1. *Hexalectris Warnockii* Ames & Correll. TEXAS PURPLE-SPIKE. Plant 1.5-3 dm. tall; raceme 3- to 8-flowered; sepals and petals maroon or deep-purple, 1.5-2 cm. long; petals oblanceolate to linear-spatulate; lip white with the lateral lobes veined with purple, adorned with orange-yellow lamellae and purple at the apex, about as long as the petals. In humus beneath oaks or in cedar-oak groves on the Edwards Plateau and in the Trans-Pecos, June-Aug.; also in the Chiricahua National Monument, Ariz.

The slender maroon or deep-purple stem and the rather large nodding flowers are characteristics of this species.

2. *Hexalectris grandiflora* (A. Rich. & Gal.) L. O. Wms. GREENMAN'S HEXALECTRIS. Plant purplish, to 6 dm. tall; flowers deep-rose-lavender to purplish-red, sometimes nearly white; petals oblong-ob lanceolate, 12-23 mm. long; lip 1-1.3 cm. long. *H. mexicana* Greenm. In rich humus of woods in ravines, moist canyons, and on stream banks in the mts. of the Trans-Pecos, June-Aug.; also Mex.

3. *Hexalectris spicata* (Walt.) Barnh. CRESTED CORAL-ROOT. Plant often stout, to 8 dm. tall; sepals and petals yellowish with purplish-brown striations, strongly 5-nerved; petals oblong-elliptic to narrowly oblong-spatulate, 1.8-2 cm. long; lip yellowish-white, with purple striations, 14-17 mm. long. *H. aphylla* (Nutt.) Raf. In moist shady soil on stream banks, in creek basins, grassy woodlands, canyons, cedar thickets, usually associated with limestone, in cen. and Trans-Pecos Tex., May-July; from W.Va. and Md., s. to cen. Fla., w. to Ind., Ky., Mo., Ark. and N.M.; also Mex.

4. *Hexalectris revoluta* Correll. Closely allied to *H. spicata*; plant 3-4.5 dm. tall; sepals and petals 1.5-2 cm. long; petals elliptic to elliptic-obovate; lip about as long as

the petals. In moist or dry open oak woods in canyons in the mts. in the Trans-Pecos, June-July; also n. Mex.

When the flowers are fully expanded the sepals and petals are usually conspicuously revolute, often being tightly rolled back a third or more their length.

5. *Hexalectris nitida* L. O. Wms. Plant to about 3 dm. tall; flowers deep-purple and vernicose; petals narrowly obovate to oblanceolate. Among rocks in shaded canyons in the mts. of the Trans-Pecos, July-Aug.; also n. Mex.

This is the smallest flowered species in the genus, with all the segments usually less than 1 cm. long.

16. CORALLORHIZA CHÂT.

Inconspicuous terrestrial saprophytic scapose herbs with short or somewhat elongated rhizomes that are much-branched, toothed and coralloid; stem brownish, yellowish or purplish, destitute of green foliage, clothed with several membranaceous sheaths; inflorescence terminating the simple naked scape, consisting of a lax raceme of yellowish, brownish or purplish flowers, the flowers sometimes greenish or whitish; sepals subequal, ascending, spreading or connivent; lateral sepals united at the base to form a short mentum which is more or less adnate to the ovary; lip simple to 3-lobed, slightly adherent to the base of the column; column compressed; anther terminal; pollinia four, waxy, free; capsule ovoid to ellipsoid, pendent.

A small complex genus of about 12 species, mainly in North and Central America, with the greatest number of species in Mexico and its greatest development in the United States and Canada; one species in Eurasia.

- 1. Lip unequally 3-lobed, with the lateral lobes smaller than the midlobe 1. *C. maculata*.
- 1. Lip not 3-lobed, at most notched, erose-denticulate or undulate on the margins (2)
- 2(1). Lip not linguiform, with flat margins which are not thickened at the base; disk with a pair of separate lamellae on the lower half; perianth segments without prominent striations 2. *C. Wisteriana*.
- 2. Lip linguiform, with conspicuously involute margins which are much-thickened at the base; disk of lip with fleshy bilobed callus in the middle near the base; perianth segments usually conspicuously striate-veined 3. *C. striata*.

1. *Corallorhiza maculata* Raf. SPOTTED CORAL-ROOT. Plant madder-purple or yellowish, to 75 cm. tall; sepals and petals crimson-purple or rarely greenish, 3-nerved; petals oblong-lanceolate to oblanceolate, 5.5-7.5 mm. long; lip nearly pure-white or white and spotted with magenta-crimson, about as long as the petals. *C. multiflora* Nutt. In rich decaying humus in pine-hardwood forests in the mts. of the Trans-Pecos, July-Aug.; from Nfld. and N.S., s. to w. N.C., w. to Wash., Ore. and Calif., s.w. to Tex., N.M. and Ariz.; also Mex. and Guat.

2. *Corallorhiza Wisteriana* Conrad. SPRING CORAL-ROOT. Plant yellowish or sometimes madder-purple, to about 4 dm. tall; sepals and petals greenish-yellow, tinged with brown-purple; petals linear to narrowly ovate-elliptic, 5.5-7.5 mm. long; lip white, spotted with magenta-purple, about as long as the petals. On upland forested slopes, in cedar brakes, canyons, on river bluffs, in the e. half of Tex., Feb.-May; found sparingly from Pa., W.Va. and Va., s. to cen. Fla., w. to Wash., Wyo., Ut., Colo. and Ariz.; also Mex.

3. *Corallorhiza striata* Lindl. STRIPED CORAL-ROOT. Plant madder-purple to brownish-purple, to 5 dm. tall; flowers rather large for the genus, pinkish-yellow or whitish, tinged and conspicuously striped with reddish-purple, the segments to 15 mm. long. In moist soil in dense damp forests, canyons and on shaded banks along streams in the Trans-Pecos, May-July; from Que. and Ont., w. to Wash., Ore. and Calif., s.w. to Tex. and N.M.; also n. Mex.

SUBCLASS 2. DICOTYLEDONEAE

Stem exogenous, of pith, wood and bark, the wood in one or more layers surrounding a central pith, traversed by medullary rays, and covered by the bark (endogenous in

structure in Nymphaeaceae). Leaves usually pinnately or palmately veined, the veinlets forming a network. Parts of the flower usually in fours or fives, rarely in threes or sixes. Embryo of the seed with two cotyledons (one only in Nymphaeaceae and some species of Ranunculaceae; in *Quercus* and a few other genera 3 sometimes occur, and in some species of *Amsinckia* 4), the first leaves of the germinating plantlet opposite.

Dicotyledonous plants are first definitely known in Cretaceous time. They include more than 160,000 species and constitute nearly four fifths of all flowering plants.

FAM. 46. SAURURACEAE E. MEY.
LIZARD'S-TAIL FAMILY

Erect or ascending more or less aromatic perennial herbs, usually rhizomatous and stoloniferous; stems jointed; leaves alternate, simple, usually petioled; stipules adnate to petiole; flowers perfect, in congested or lax elongated spikes that may or may not be subtended by an involucre; perianth none; pistils 3 or 4, indehiscent, 1-seeded, free or united at the base; stamens as many as 8, free or adnate to ovary at base or epigynous, the 2-celled anthers longitudinally dehiscent; fruit a somewhat succulent capsule, in ours dehiscing apically through the central-apical portion of the folliclelike capsule.

A small family comprised of 5 genera and about 7 species in North America and Asia.

- 1. Leaves mostly basal; spike subtended by an involucre; west and southwest Texas . . .
 1. *Anemopsis*, p. 448.
- 1. Leaves all cauline; spike naked, not subtended by an involucre; east and southeast Texas 2. *Saururus*, p. 448.

1. ANEMOPSIS H. & A.

A monotypic genus.

1. *Anemopsis californica* (Nutt.) H. & A. YERBA MANSÁ. Plant forming colonies, usually about 3 dm. tall; stems nodose, scapelike, from aromatic creeping rootstocks; leaves mostly basal, those on the stem subtended by a sheathing bracteose leaf, elliptic-oblong, truncate or cordate at base, to 15 cm. long, with the petiole about as long as the blade; spike conical, 1.5-4 cm. long, subtended by a whorl of white or reddish bracts; most of the flowers subtended by a white obovate clawed bract; ovary sunk in the rachis of spike; fruit a capsule. In alkaline or saline soils of meadows, flats, and along streams in w. and s.w. Tex., recently reported from Hemphill and Lubbock cos. in the Panhandle, May-July; from Calif. and Ariz., n.e. to cen. Colo. and e. to w. Tex.; also n. Mex.

2. SAURURUS L.

Another species occurs in eastern Asia.

1. *Saururus cernuus* L. LIZARD'S-TAIL. Plant forming colonies, to about 9 dm. tall; stem naked below, leafy above, simple or branched; leaves cauline, cordate-ovate, the veins converging, to 15 cm. long, much longer than the petiole; stipules indistinct; spike to 3 dm. long and 15 mm. in diameter, peduncled, wandlike, naked, pubescent, curved-nodding at tip; flowers white, crowded, provided with a small bract that is adnate to or borne on the pedicel; stamens with long slender filaments; pistils (carpels) united at base; stigmas recurved; fruit somewhat fleshy, wrinkled. In water or muddy soils of lakes, swamps and streams in e. and s.e. Tex., May-Aug.; from s.w. Que. and s. Ont., s. to Fla., w. to Minn., Ill., Mo., Kan. and Tex.

FAM. 47. SALICACEAE MIRR. WILLOW FAMILY

Shrubs or trees with soft light wood, bitter bark and simple alternate deciduous stipulate leaves; stipules deciduous or persistent; dioecious (sexes on separate plants); flowers in aments (catkins) which fall off as a unit (the staminate after shedding pollen,

the pistillate after ripening and dispersal of seeds); flowers subtended by a single scale-like bract; stamens 2 to many; fruit a 1-celled capsule, 2- to 4-valved, containing numerous seeds that are surrounded by a tuft of long silky white or tawny hairs that arise from the base; style 1, rarely wanting; stigmas 2 to 4, sometimes 2-lobed.

A family containing only the following two genera, both of which are widely distributed but most abundant in North Temperate and Alpine-Arctic regions.

1. Buds with a single scale; floral bracts entire or merely toothed, tardily deciduous or persistent; flowers with a ventral and sometimes a dorsal gland; disk none; stamens 2 to 7 or 8; capsule 2-valved 1. *Salix*, p. 449.
1. Buds with several imbricated scales, often resinous; floral bracts lacerate, caducous; flowers borne on a shallow or cup-shaped disk; stamens 6 to 60; capsule 2- to 4-valved 2. *Populus*, p. 453.

1. SALIX L.⁴⁰ WILLOW

Prostrate to ascending or erect shrubs to large trees, to 36 m. or more in height; bud-scale one, with an adhering inner membrane; leaf blades variable, linear, lanceolate, oblanceolate, elliptic or oblong, petiolate, often persistently stipulate, green or glaucous on the lower surface, hairy to glabrous, the margins entire or somewhat revolute, denticulate, serrulate, crenate, undulate, or undulate-serrulate; aments precocious, coetaneous or serotinous, ascending, divaricate or somewhat recurved (never pendulous), 1-10 cm. or more long, slender and flexuous to stout and dense; flower scales entire to erose-toothed, yellowish to black, mostly hairy, tardily deciduous or persistent; stamens 2 (sometimes united) to 7 or 8, with 1 ventral and sometimes 1 dorsal gland; capsules with 2 valves recurving at maturity, lanceolate to ovoid, 2-9 mm. long, hairy to glabrous, sessile or pedicelled (0.5-3 mm. long), with 1 ventral gland and sometimes 1 dorsal gland; style 1 (sometimes wanting), entire or more or less divided; stigmas 2, entire or more or less divided; without a disk; seeds numerous, minute, 0.8-1.2 mm. long, oblong, bearing a tuft of silky hairs at base.

A genus of about 500 species, widely distributed throughout the North Temperate and Arctic zones, a few in the American tropics and Southern Hemisphere.

KEY BASED ON VEGETATIVE CHARACTERS

- A. Leaves narrowly lanceolate to lanceolate, acuminate to long-acuminate, 5-10 or 12 cm. long, finely serrulate, the vein islets beneath very small (1)
- B. Leaves linear or linear-oblong, acute, almost sessile, subentire to remotely and irregularly denticulate (sect. *Longifoliae*) (8)
- C. Leaves linear-oblong or linear-oblanceolate, 5-10 cm. long, distinctly petioled, entire to undulate-serrate, glaucous on lower surface, more or less pubescent (14)
 - 1(A). Leaves green beneath, linear-lanceolate, acuminate (sect. *Nigrae*) (2)
 1. Leaves glaucescent to glaucous beneath (4)
 - 2(1). Twigs all yellowish; blades narrowly lanceolate 2. *S. Gooddingii* var. *variabilis*.
 2. Twigs brown to blackish (seasonal somewhat yellowish) (3)
 - 3(2). Petioles short, averaging about 6 mm. long, brownish, pubescent; blades broader, less narrowed at base 1. *S. nigra* var. *nigra*.
 3. Petioles longer, averaging about 8 mm. long, yellowish, glabrous; blades narrower, more narrowed at base 1a. *S. nigra* var. *Lindheimeri*.
 - 4(1). Petioles with glands near leaf base; blades lanceolate, coarsely crenate-serrate, dark-green above, glabrous 11. *S. fragilis*.
 4. Petioles without glands near leaf base (5)

⁴⁰ Adapted from Carleton R. Ball in C. L. Lundell, Flora of Texas III: 369-392. 1961.

- 5(4). Twigs brownish, often pubescent; blades linear- to narrowly lanceolate, long-acuminate, often pubescent, dark-green above (sect. *Bonplandianae*) (*S. longipes* var. *Wardii*) 4. *S. caroliniana*.
5. Twigs yellow or yellowish, glabrous; blades yellowish-green above, glabrous (6)
- 6(5). Twigs enormously elongated and pendulous (weeping); blades linear-lanceolate, falcate 10. *S. babylonica*.
6. Twigs slender but not greatly elongated or pendulous (7)
- 7(6). Blades lanceolate or somewhat ovate-lanceolate; aments lax 3. *S. amygdaloides* var. *amygdaloides*.
7. Blades linear-lanceolate or lingulate-lanceolate; aments denser 3a. *S. amygdaloides* var. *Wrightii*.
- 8(B). Blades yellowish-green, somewhat translucent, glabrous (more or less thinly hairy while developing) (9)
8. Blades green, more opaque, silvery-silky or more or less gray-pubescent (10)
- 9(8). Blades 5-10 or 12 cm. long, 5-10 mm. wide 5. *S. interior* var. *interior*.
9. Blades 5-8 or 10 cm. long, 2-5 mm. wide 5a. *S. interior* var. *pedicellata*.
- 10(8). Blades silvery-silky, at least until full-size (11)
10. Blades more or less gray-puberulent or gray-pubescent (12)
- 11(10). Blades 6-10 or 12 cm. long, usually sharply denticulate, the hairs persisting beneath (especially on midrib) 5b. *S. interior* var. *angustissima*.
11. Blades 5-8 cm. long, mostly subentire, the hairs persisting on both surfaces 6b. *S. exigua* var. *stenophylla*.
- 12(10). Blades only occasionally more than 4 cm. long and 4 mm. wide, usually crowded, yewlike, pubescent, often becoming glabrate 7. *S. taxifolia*.
12. Blades only occasionally less than 5 cm. long, 5 mm. wide, not yewlike, pubescent or glabrous (13)
- 13(12). Blades 5-8 or 10 cm. long, 5-10 or 12 mm. wide, permanently more or less pubescent 6. *S. exigua* var. *exigua*.
13. Blades 4-6 or 8 cm. long, 3-5 or 6 mm. wide, soon glabrate to glabrous and yellowish green 6a. *S. exigua* var. *nevadensis*.
- 14(C). Blades mostly linear-oblongate, pubescent while young, becoming glabrous, densely glaucous and veiny; distribution mostly in mountain canyons (sect. *Lasiolepes*) 8. *S. lasiolepis* var. *Bracelinae*.
14. Blades narrowly elliptic to oblongate, densely pubescent while young, more thinly so and somewhat rugose in age; distribution in low or upland prairies or open wasteland eastward (sect. *Capreae*) 9. *S. humilis* var. *rigidiuscula*.

KEY BASED ON FLORAL CHARACTERS

1. Flower scales yellowish, slowly deciduous; aments leafy-pedunculate (2)
1. Flower scales blackish, persistent; aments precocious, sessile or subsessile (10)
- 2(1). Aments only one per peduncle, mostly coetaneous, occasionally subprecocious; capsules always glabrous (in Texas) (3)
2. Aments (especially staminate) 2 to 4 per peduncle, the supernumerary later, at base of the first, serotinous; stamens 2; ovaries (sometime) and capsules (less frequently) more or less hairy while developing (sect. *Longifoliae*) (7)

on the lower surface; outer branchlets of the lower limbs often somewhat drooping under favorable conditions. In alluvial soils along streams and near bodies of water in the Plains Country and Trans-Pecos, spring; from Que., w. to s.e. B.C., s. to Pa., s.w. Ky., w. Tex., N.M., n.e. Ariz. and n.w. Nev.

3a. *Salix amygdaloides* var. *Wrightii* (Anderss.) Schneid. Var. *Wrightii* differs from var. *amygdaloides* only in its very narrowly lanceolate leaf blades that are 7-10 or rarely 15 mm. wide and 6-8 or 10 cm. long, tapering gradually to the acuminate or long-acuminate apex and with the bases always sharply acute. *S. Wrightii* Anderss., *S. nigra* var. *Wrightii* (Anderss.) DC. Along streams and near bodies of water in w. and s.w. Tex.; also in adj. N.M. and (?) Mex.

4. *Salix caroliniana* Michx. LONG-PEDICELLED WILLOW. Shrubs or trees to 12 m. tall. *S. longipes* Shuttlew., *S. Wardii* Bebb. Along rocky water courses and in coastal sands in s.-cen. Tex., spring; W.I. and Fla., w. Tex., n. to the Potomac Valley, the Ohio River in w. Pa., s. Ind. and s.w. to e. Okla.

5. *Salix interior* Rowlee var. *interior*. SANDBAR WILLOW, TARAY. Shrub with clustered stems, usually to 4 or rarely to 5.5 m. tall. In alluvial soils, mostly along ditches and about bodies of water in n. Tex., s. to the Rio Grande Valley, spring; Potomac and Ohio valleys, n. to s. Can., w. from the Miss. River across the Great Plains, s. to La. and Tex., n.w. to Alas. and Yuk.

5a. *Salix interior* var. *pedicellata* (Anderss.) Ball. NARROW-LEAVED SANDBAR WILLOW. Differs from var. *interior* in the narrowly linear leaves, 2-4 mm. wide, and in the ovaries nearly always glabrous. *S. linearifolia* Rydb. In the drier and higher w. part of the range of var. *interior* from w. Tex. to Mackenzie, Yuk. and Alas., less common in the Miss. Valley.

5b. *Salix interior* var. *angustissima* (Anderss.) Dayton. SILVERY-FRUITED SANDBAR WILLOW. This variety differs from var. *interior* principally in the ovaries being densely white pilose-pubescent and the capsules remaining gray pilose-pubescent even in age. Along streams and near bodies of water in s. and w. Tex.; also adj. N.M. and Mex.

6. *Salix exigua* Nutt. var. *exigua*. GRAY SANDBAR WILLOW. Grayish, leafy, several-stemmed shrubs 2-4 m. tall. Along streams and near bodies of water, usually at high elevations, in the Edwards Plateau, Plains Country and Trans-Pecos, spring; from Calif., n. to B.C. and e. to the w. Great Plains.

6a. *Salix exigua* var. *nevadensis* (Wats.) Schneid. Differs (in part) from var. *exigua* in having browner and more glabrate branchlets, narrower glabrate and yellowish-green leaves, and somewhat more glabrate flower scales. Along streams and near bodies of water, in canyons, in the w. Plains Country and Trans-Pecos; from Calif., Ida. and Ut., e. to s. Colo. and w. Tex.

6b. *Salix exigua* var. *stenophylla* (Rydb.) Schneid. SILVERY DESERT WILLOW. Variety *stenophylla* differs from var. *exigua* in having narrower leaves and in the much more dense silvery-pubescence of all vegetal parts, and branchlets and bud scales more densely pilose-pubescent. From var. *nevadensis* it differs in its densely silvery-pubescent leaves that never become glabrate or yellowish-green in age, except on some vigorous shoots. Along streams and near bodies of water in the Plains Country and Trans-Pecos; from Tex. and n. Mex. to Calif., n. to Colo. and Ida.

7. *Salix taxifolia* Kunth. YEW-LEAF WILLOW. Shrubs or trees to 12 m. tall. Along streams, about springs, and bodies of water in w. Tex., spring; from Tex. to s. Ariz. and n. Mex.

8. *Salix lasiolepis* Benth. var. *Bracelinae* Ball. NARROW-LEAVED ARROYO WILLOW. Shrubs or small trees usually less than 8 m. tall. Along streams in w. Tex., spring; from s. Calif., e. to Tex. and n. Mex.

9. *Salix humilis* Marsh. var. *rigidiuscula* (Anderss.) Robins. & Fern. NARROW-LEAVED PRAIRIE WILLOW. Shrubs with clustered stems, usually less than 25 dm. tall. In dry barrens, fields, open woods and swampy areas in n.e. Tex., spring; from the Appalachian Plateau to the e. edge of the Great Plains, w. to cen. N.D. and Tex.

10. *Salix babylonica* L. WEEPING WILLOW. Trees to 12 m. tall; branchlets extremely slender and greatly elongated, pendulous, yellowish or brownish, glabrous, brittle at base (falling in wind-storms).

A north-China plant, long cultivated in Europe as an emblem of mourning, and early introduced into America as an ornamental. Now widely planted and sparingly escaped, especially in e. U.S.

11. *Salix fragilis* L. BRITTLE or CRACK WILLOW. Large trees to 20 m. tall. Introd. from Eur. in Colonial times for ornament, sentiment, pasture shade, and charcoal for making gunpowder; commonly established along streams as an escape in Can. and e. and cen. U.S. No specimen has been seen from Tex. but it undoubtedly occurs as an escape in the state.

2. POPULUS L.⁴¹ COTTONWOOD. ALAMO

Fast-growing and often short-lived dioecious trees with soft wood, fissured bark and mostly stout branches; branchlets slender or stout, terete or angled, pale-olive-brown or grayish- to lustrous reddish-brown, glabrous to tomentose; buds terminal and lateral, resinous or nonresinous, covered by several imbricated membranaceous scales; leaves alternate, stipulate, varying in shape from deltoid to rhombic or lanceolate, with the margins entire to variously crenate or serrate with the teeth often glandular, rarely lobulate, often bearing glands on upper surface at junction of leaf blade with petiole; petioles stout and much-abbreviated to elongate and slender, more or less terete to laterally compressed, sometimes channeled on upper side; stipules caducous; leaf scars deltoid to elliptic in shape, with 3 bundle scars; flowers without a perianth, in pendulous stalked unisexual aments, appearing before the leaves, borne singly, inserted on a shallow or cup-shaped symmetrical or oblique persistent disk and subtended by a bract; bracts stipitate, mostly cuneate or obovate, entire to variously lacerate or divided above, glabrous to villous, caducous; stamens 6 to 60, the slender filaments free on the disk and the small yellowish-red to purplish anthers ellipsoid to ovoid; ovary sessile on the disk, with 2 to 4 parietal placentae; styles short; stigmas 2 to 4, divided into filiform lobes or broadly dilated and more or less irregularly erose; pistillate aments mostly becoming elongated with age; fruit usually maturing before the leaves are mature, a 2- to 4-valved dehiscent capsule, globose to ellipsoid-conic, pale- to dark-brown; seeds abundant, minute, surrounded at the base by a tuft of long silky white or tawny hairs that are directed upward parallel with and encompassing the seed.

This is a genus of about 35 species, all native of the Northern Hemisphere in both the Old and New World. Many species are widely grown as ornamental shade and street trees, especially because of their rapid growth and ease of propagation from cuttings.

According to some historians, the Alamo of Texas fame received its name from a grove of *Populus* that grew on the banks of the *acequia*, "alamo" being the Spanish word for cottonwood.

1. Leaf blades permanently whitish-tomentose on lower surface; buds tomentose 1. *P. alba*.
1. Leaf blades and buds at most pubescent (2)
 - 2(1). Petioles nearly terete, usually prominently channeled or somewhat flattened on the upper side; leaf blades suborbicular-ovate to rhombic-ovate or lanceolate, the margins mostly finely serrate or crenate-serrate (3)
 2. Petioles conspicuously laterally compressed (especially just below the leaf blades), rarely channeled on the upper side; leaf blades typically deltoid to rhombic-ovate or suborbicular, the margins coarsely or finely crenate-serrate (5)
 - 3(2). Leaf blades more than 3 times as long as wide, pale-green on the lower surface, mostly obtuse to acute; petioles rarely more than 20 mm. long 3. *P. angustifolia*.
 3. Leaf blades rarely as much as twice as long as wide, not conspicuously paler on the lower surface, mostly acuminate; petioles usually more than 25 mm. long (4)
 - 4(3). Pistillate disk sessile; fruit orbicular, 2-3 mm. in diameter; leaf blade suborbicular-ovate to broadly deltoid-ovate, truncate to broadly rounded at the base, the margins sharply and unevenly serrate 4. *P. Hinckleyana*.
 4. Pistillate disk on a pedicel 3-5 mm. long; fruit ellipsoid-ovoid, about 10 mm. long; leaf blade more or less rhombic, commonly rounded-cuneate at base, the margins mostly crenate-serrate 2. *P. acuminata*.

⁴¹ Cf. D. S. Correll in C. L. Lundell, *Flora of Texas* III. 393-407. 1961 for a more detailed treatment.

- 5(2). Leaf blades suborbicular to broadly ovate, abruptly apiculate to shortly acuminate at apex, the margins finely crenate-serrate; found only at high elevations in the mountains of the Trans-Pecos 10. *P. tremuloides*.
- 5. Leaf blades deltoid to broadly rhombic-ovate, coarsely or finely crenate-serrate; not confined to high elevations (6)
- 6(5). Bud scales glabrous; leaf blades finely or coarsely crenate-serrate with usually 10 to 20 teeth on each side (7)
- 6. Bud scales pubescent to puberulent or very rarely subglabrous; leaf blades usually coarsely crenate-serrate with mostly no more than 10 teeth on each side (8)
- 7(6). Leaf blades with 2 or more prominent glands on upper surface at juncture with petioles, typically truncate or cordate at base; fruiting pedicels 8 mm. or more long 7. *P. deltoides*.
- 7. Leaf blades without glands on upper surface at juncture with petioles, typically widely cuneate at base; fruiting pedicels less than 6 mm. long 9. *P. nigra*.
- 8(6). Trees of the Trans-Pecos and along the Rio Grande (9)
- 8. Trees of the Plains Country and eastward (10)
- 9(8). Branchlets (except buds) and petioles essentially glabrous; fruiting pedicels 7 mm. or more long; leaf blades more or less cordate to rarely truncate at base 6. *P. Wislizenii*.
- 9. Branchlets and petioles usually conspicuously pubescent or puberulent; fruiting pedicels rarely more than 3 mm. long; leaf blades usually broadly cuneate or sometimes truncate or rarely cordate at base 5. *P. arizonica*.
- 10(8). Leaf blades with a pair of glands on upper surface at juncture with petioles 8. *P. Sargentii* var. *Sargentii*.
- 10. Leaf blades without basal glands or rarely with rudimentary glands 8. *P. Sargentii* var. *texana*.

1. *Populus alba* L. WHITE POPLAR, ÁLAMO BLANCO. Tree to about 30 m. tall, spreading by rootsprouts, with a wide rounded crown; leaves deltoid-ovate in outline, usually lobulate or coarsely and sinuately toothed, 6-12 cm. long, usually narrower than long; petioles terete, tomentose, 2-4 cm. long; staminate aments 8 cm. long or more; pistillate aments 4-7 cm. long; fruits ovoid, 3-5 mm. long. A commonly cult. tree (nat. of Eur. and Asia) that escapes and becomes naturalized along roadsides and on borders of fields, often becoming a pest, Mar.-May.

2. *Populus acuminata* Rydb. LANCELEAF COTTONWOOD. Tree to 18 m. tall, with a compact pyramidal or domelike crown; petioles 25-75 mm. long; aments 5-12 cm. long; fruits ovoid-ellipsoid, somewhat pitted, about 1 cm. long. In canyons and valleys, about springs and water tanks, and along streams in s. and w. Trans-Pecos, Apr.-June; from s. Alta., s. to Colo., Tex. and N.M.

Our specimens have narrow tapering leaves with petioles that are nearly terete and which are conspicuously channeled on the upper side. The leaf blade is 5-12 cm. long.

3. *Populus angustifolia* James. NARROWLEAF COTTONWOOD. Tree to 20 m. tall, with a narrow pyramidal crown; leaves 4.5-15 cm. long, 2-3.5 cm. wide; aments densely flowered, narrowly cylindrical, 4-7 cm. long; fruits broadly ovoid to subglobose, 5-7.5 mm. long. In its area of distribution this species is found along streams usually above 3,500 ft. alt., rare in the Trans-Pecos, Mar.-June; from s. Sask. and s. Alta., w. to Wash. and Ore., s. to Tex. and N.M.; also n. Mex.

This willowlike tree is characterized by its lanceolate to narrowly ovate-lanceolate leaf blades that are noticeably paler on their lower than their upper surface, and are provided with short petioles that are rarely as much as 15 mm. long.

4. *Populus Hinckleyana* Correll. Tree to 20 m. tall, with a cylindrical crown; leaves rather finely and irregularly (almost doubly) serrate on the margins; fruit globose, pitted-rugose, 2-3 mm. in diameter. In canyons and floodplain areas in the Davis Mts. in the Trans-Pecos where it is apparently endemic, Mar.-Apr.

The small (to 7 cm. long) suborbicular-ovate to broadly deltoid-ovate leaf blades and

much-abbreviated pistillate aments, with their sessile floral disks, are characteristics that distinguish this species from the allied *P. angustifolia* and *P. acuminata*.

5. *Populus arizonica* Sarg. ARIZONA COTTONWOOD, CHOPO. Tree to 25 m. tall, with a broad spreading crown; leaves 5-14 cm. long, mostly about as wide as long; petioles 2.5-9 cm. long; aments 6-10 cm. long; fruits globose to globose-ovoid, deeply pitted, 3-8 mm. long. On banks and sand-gravel bars of rivers and streams in canyons and valleys, about springs and water tanks in s.w. Trans-Pecos, Feb.-Apr.; from w. Tex. to s.e. Ariz. and n. Mex.

The typically rhombic leaf blade with its cuneate base and somewhat attenuated apex, and the usually puberulous to densely hirsute bud scales and puberulent twigs, are distinctive.

6. *Populus Wislizenii* (Wats.) Sarg. RIO GRANDE COTTONWOOD, ÁLAMILLO. Tree to 25 m. tall, with a broad somewhat flat-topped open crown; leaves coriaceous, broadly deltoid to deltoid-ovate, rather abruptly triangular-acuminate at apex, 5-14 cm. long, usually as broad as or broader than long; aments 8-15 cm. long; fruits broadly ovoid-ellipsoid to ovoid-conic or subglobose, pitted, 8-18 mm. long. Along rivers, streams and irrigation canals in valleys and canyons, in rocky or deep alluvial soils, in the Trans-Pecos, Mar.-July; from s. Colo. and s. Ut., s. to w. Tex., N.M. and n. Mex.

This is the common cottonwood along the Rio Grande in extreme west Texas.

7. *Populus deltoides* Marsh. EASTERN COTTONWOOD, ÁLAMO. Tree to 30 m. tall or more, with a wide open crown; leaves thick and coriaceous, deltoid to deltoid-ovate or sub-orbicular-ovate, triangular-acuminate to acute-apiculate at apex, 7-15 cm. long, usually about as wide as long; petioles 2.5-9 cm. long; aments 6-10 cm. long; fruits globose to globose-ovoid, deeply pitted, 3-8 mm. long. Occurring naturally in Tex. as far n.w. as the s. Plains Country and s.w. to Uvalde Co. in the Rio Grande Plains, Mar.-July; from N.H. s. to n.w. Fla., w. to s. Sask., N.D., w. Kan., w. Okla. and Tex.

This species may be found along practically every watercourse of any size and about most of the springs and waterholes in the eastern third of Texas, commonly planted along roadways and about dwellings, growing especially well in deep alluvial soils.

8. *Populus Sargentii* Dode var. *Sargentii*. PLAINS COTTONWOOD. Tree to 27 m. tall, with a broad open crown; leaves deltoid to deltoid-ovate or deltoid-subreniform, 7-11 cm. long, usually about as broad as or broader than long; pistillate aments 6-13 cm. long; fruits ovoid to ovoid-ellipsoid, pitted, 1-1.5 cm. long. *P. deltoides* [var.] *occidentalis* Rydb. In sandy alluvial soils along rivers and streams, about stock tanks and along roadside banks scattered over the Plains Country from Nolan Co. northw., and extending over into Cooke and Montague cos. in n.-cen. Tex., Mar.-June; from s. Sask., s. Alta. and S.D., s. to w. Okla., n. Tex. and n.e. N.M.

When in fruit, var. *Sargentii* is readily distinguished from both *P. deltoides* and *P. Wislizenii* by its short pedicels which are shorter than the fruits and usually less than 5 mm. long. From *P. deltoides* it is also distinguished by its pubescent, not glabrous, buds, and from *P. Wislizenii* by the glands that are developed at the junction of the leaf blades and petioles. The glands are smaller and of a different shape than those of *P. deltoides*.

Var. *texana* (Sarg.) Correll. TEXAS COTTONWOOD. *P. texana* Sarg. Variety *texana* occurs in the same types of habitat and, in Texas, occupies approximately the same area of distribution as var. *Sargentii*.

Except for the fact that var. *texana* rarely, if ever, has glands at the junction of the leaf blades and petioles it could be referred to var. *Sargentii*. This lack of well-developed glands is apparently the only characteristic that separates these two entities. Sterile specimens of var. *texana* resemble *P. Wislizenii* so closely that if it were not for a difference in their area of distribution it would practically be impossible to distinguish one from the other. The leaves of var. *texana*, however, usually have a more abruptly acuminate-attenuate apex, and some of the leaves occasionally have one or two abortive glands, a characteristic that is not evident in *P. Wislizenii*. In fruit, however, the stout pedicels of var. *texana*, which rarely exceed 5 mm. in length, conveniently separate it from the longer, more slender pedicels of *P. Wislizenii*.

9. *Populus nigra* L. BLACK POPLAR, SAUCE. Tree to 30 m. tall, spreading by root-sprouts, the brittle branches spreading or strongly ascending to form a columnar crown;

leaves 5-10 cm. long; petioles 3-5 cm. long; staminate aments 3-6 cm. long; pistillate aments 7-15 cm. long; fruits ovoid to ellipsoid, 7-9 mm. long. A commonly cult. tree (nat. of Eur. and Asia) that escapes and becomes naturalized. The widespread sterile horticultural form, var. *italica* Muenchh., commonly known as "Lombardy poplar," is propagated by sprouts and, accordingly, often spreads from cultivation. Its strongly ascending brittle branches form a narrowly columnar crown.

10. *Populus tremuloides* Michx. QUAKING ASPEN, ÁLAMO TEMBLÓN. Tree (in our area) rarely more than 15 m. tall, with a narrow symmetrical domelike crown; bark smooth, grayish-white to brownish; leaves to 75 mm. long, frequently wider than long; petiole slender, weak, 4-6.5 cm. long; aments 4-6 cm. long; fruits ellipsoid-conic, thin-walled, 6-9 mm. long. Incl. [var.] *aurea* (Tidestr.) Daniels. In Tex., apparently confined to the highest mts. in the Trans-Pecos where it grows in ravines and on talus slopes above 7,000 ft. alt.

This species is probably the most widespread tree in North America. It occurs in most of Canada and Alaska and throughout the United States, except in the southeast, and southward into northern Mexico it is found only in the high mountains. The leaves turn an intense bright yellow or orange-yellow in autumn. No fruiting material has been seen from Texas. It flowers and fruits in the spring in its range. The slightest breeze causes movement of the leaves, hence the common name, "quaking aspen."

FAM. 48. MYRICACEAE BL.

WAX-MYRTLE OR BAYBERRY FAMILY

Monoecious or dioecious shrubs or small trees with both kinds of flowers in short scaly erect aments and with resinous-dotted usually fragrant alternate leaves; involucre and perianth none.

A family of about 50 species in several genera of worldwide distribution.

I. MYRICA L. WAX-MYRTLE

Leaves coriaceous and evergreen (in ours) or tardily deciduous, entire or toothed to lobulate above the middle, without stipules; flowers typically unisexual, in the axils of small scalelike bracts and with or without 2 to 4 short entire basal bracteoles not overlapping the fruit; pistillate aments ovoid or cylindrical; staminate aments ellipsoid or thick-cylindrical, these from axillary scaly buds; stamens 2 to many; filaments somewhat united below; anthers 2-celled; ovary 1-celled; ovule 1, basal; stigmas 2, linear-elongate; fruit globose or ovoid, warty, commonly with a waxy coat or resinous dots.

About 35 cosmopolitan species.

1. Leaves of flowering branches typically elliptic to broadly oblanceolate, mostly 2 cm. wide or more, their upper surface with resinous dots remote or wanting 1. *M. heterophylla*.
1. Leaves of flowering branches typically narrowly oblanceolate to narrowly cuneate-oblanceolate, rarely to 2 cm. wide, their upper surface densely covered with resinous dots (2)
- 2(1). Coarse shrub or small tree, noncolonial, usually much more than 3 m. tall; leaves of fruiting branches mostly 5 cm. long or more; fruits mostly 2-3 mm. in diameter 2. *M. cerifera*.
2. Dwarf freely stoloniferous colonial shrub, to about 2 m. tall; leaves of fruiting branches rarely more than 4 cm. long; fruits 3-4 mm. in diameter 3. *M. pusilla*.

1. *Myrica heterophylla* Raf. Mostly small shrubs to about 3 m. tall; branches blackish or dark-grayish-black, the pubescence of leafy branchlets becoming dark with age; leaves elliptic to oblanceolate or occasionally obovate, tapering at base into a short petiole, broadly rounded to acute and minutely apiculate at apex, opaque, essentially glabrous and sometimes somewhat glaucous on upper surface, to 14 cm. long and 4 cm. wide;

inflorescence either below or in the axils of the leaves; staminate aments to 15 mm. long; fruit 3-3.5 mm. in diameter. In bogs and along streams in woods and thickets in e. Tex., Mar.-Apr.; from Fla., w. to Tex. and n. on inner Coastal Plain to N.J.

2. *Myrica cerifera* L. WAX-MYRTLE, CANDLE-BERRY. Shrub or small tree to 12 m. tall, rarely with a trunk to 2 dm. in diameter; young branchlets waxy, glabrous or sometimes pilose; leaves narrowly oblanceolate to cuneate-oblanceolate, tapering at base to short petiole, acute at apex, mostly less than 7 cm. long and to 25 mm. wide, fulvous or yellowish-green, heavily coated on both surfaces with resinous dots; fruit 2-3 mm. in diameter. *Cerothamnus ceriferus* (L.) Small. Along streams, about lakes and in boggy grasslands and wet woodlands in e. Tex., Mar.-Apr.; from Fla., w. to Tex. and n. to N.J. and Ark.

3. *Myrica pusilla* Raf. Low stoloniferous shrub forming colonies to 2 m. tall; young branchlets waxy, glabrous or nearly so; leaves oblanceolate to obovate or linear-spatulate, tapering at base to short petiole, obtuse to acutish at apex, heavily coated on both surfaces with resinous dots, mostly 5 cm. or less long; fruits 3-4 mm. in diameter. *Cerothamnus pumilus* (Michx.) Small. Sandy soils in moist or dry pine-hardwoods in e. Tex., Mar.-Apr.; from Fla., w. to Tex. and n. to s. Del. and Ark.

FAM. 49. LEITNERIACEAE BENTH. & HOOK. F.

CORKWOOD FAMILY

Shrub or small tree to 6.5 m. tall, with very light wood; bark brown and smooth when young, fissured with age; leaves alternate, deciduous, more or less scattered, petiole; leaf blades entire, thick and firm, prominently veiny, narrowly elliptic to elliptic-lanceolate, acute to acuminate, bright green and shining on upper surface, pubescent on lower surface; stipules wanting; flowers unisexual, male and female flowers borne on separate plants, in few- to many-flowered aments or spikes that appear before the leaves from the axils of last year's leaves; staminate flowers in a conspicuously bracted compound ament, composed of 3 to 12 stamens and without a perianth, the distinct filaments short and the anthers 2-celled; pistillate flowers in a few-flowered spike, solitary in the axils of primary bracts each of which is accompanied by 2 secondary bracts, composed of a single sessile 1-ovuled pistil and 3 to 8 diminutive bractlets; fruits a drupe, subtended by a bract, elongate, glabrous, the flesh leathery.

Represented only by the following American genus.

1. LEITNERIA CHAPM.

Characters same as those of the family. A monotypic genus of the southern United States.

1. *Leitneria floridana* Chapm. CORKWOOD. Leaf blades to 2 dm. long; staminate aments 3-4 cm. long; drupe elliptic, to 25 mm. long. In brackish or fresh water swamps and thickets in s.e. and s.-cen. Tex., spring; from n. Fla., w. to Tex. and n. to Ga. and Mo.

FAM. 50. JUGLANDACEAE KUNTH WALNUT FAMILY

Trees, monoecious, with alternate pinnate leaves and no stipules; leaflets usually glandular-dotted beneath; flowers unisexual; *staminate flowers* in aments with or without a calyx adnate to the bract and the two bractlets; *pistillate flowers* solitary or in a small cluster or spike, with a bract, 2 or 3 bractlets and a regular 4-lobed calyx (when present) adherent to the incompletely 2- to 4-celled but only 1-ovulate ovary; ovule orthotropous, erect, at the apex of the incomplete primary partition; fruit similar to a dry drupe, the fibrous-fleshy or woody husk or exocarp (ripened bract and bractlets or involucre and calyx) fused at least until maturity with the crustaceous or bony endocarp or nutshell (ripened carpels), containing a 2- to 4-lobed seed.

A small family of important trees, about 50 species in 7 genera. A number of species

in the family produce edible nuts, including the pecans, the Persian or "English" and black walnuts.

- 1. Pith of branchlets separating into thin plates; staminate aments separate, sessile, on last year's branchlets, in the axils of the fallen leaves of the previous season; stamens 8 to 40; staminate and pistillate flowers with 4 small sepals; style branches (stigmas) elongate; nut with indehiscent husk and irregularly furrowed shell 1. *Juglans*, p. 458.
- 1. Pith continuous; staminate aments in fascicles of 3, the fascicles subsessile to long-stalked in the axils of bud scales on new growth; stamens 3 to 8; staminate and pistillate flowers usually without sepals; stigmas short; husk of fruit splitting or partially splitting into valves, the nutshell smooth or merely reticulate 2. *Carya*, p. 459.

I. JUGLANS L. WALNUT. NOGAL

Trees with furrowed scaly bark and durable dark-colored wood; branchlets stout, with laminate pith; leaves pinnate, with numerous serrate leaflets; flowers greenish, produced in spring; *staminate aments* sessile, separate though often superposed, near the apex of the preceding year's growth; stamens 8 to 40, the floral receptacle adnate to the bract; bractlets 2; sepals usually 4, with some occasionally reduced to minute teeth; filaments free, very short; *pistillate flowers* solitary or several together in a cluster or short spike on a peduncle at the end of the branch, with a bract and 2 often irregularly toothed bractlets; sepals 4, small; style short, with 2 or rarely 3 elongate style branches that have their inner surfaces deeply fringed and stigmatic; style branches carinal (above the center of the carpel); fruit with a fibrous-fleshy indehiscent husk (exocarp) and a mostly rough irregularly furrowed nutshell or endocarp.

About 20 species in both hemispheres. The timber of some species is extremely valuable for cabinet and furniture making. The fruits of most species are also edible.

- 1. Fruit 35 mm. or more in diameter; distribution in eastern third of Texas 1. *J. nigra*.
- 1. Fruit 35 mm. or less in diameter; distribution in western two thirds of Texas (2)
- 2(1). Fruit 25 mm. or more in diameter; leaflets usually 15 or fewer, with dentate-serrate margins, mostly 15 mm. or more wide 2. *J. major*.
- 2. Fruit rarely more than 20 mm. in diameter; leaflets more than 15, with subentire to serrulate margins, rarely more than 15 mm. wide . . 3. *J. microcarpa*.

1. *Juglans nigra* L. BLACK WALNUT. A large tree to about 50 m. high, with trunk to 12 dm. in diameter, the brown to blackish thick bark in deep furrows and narrow forking ridges; branches widely spreading to form a massive crown; branchlets stout, brown to orange-brown; leaves to 6 dm. long; leaflets 11 to 23, sessile, ovate-lanceolate, long-acuminate, somewhat obliquely cordate at base, to 1 dm. long and 25 mm. wide, glabrous above, minutely downy beneath, the margins serrate; leaf scars on branchlets notched; fruit spherical, roughly dotted, yellowish-green; nut corrugated, to 6 cm. in diameter, the edible kernel sweet and oily. *Wallia nigra* (L.) Alef. In fields and rich woodlands in e. Tex.; from N.E. s. to Fla. and w. to Minn. and Tex.

2. *Juglans major* (Torr.) Heller. ARIZONA WALNUT, NOGAL SILVESTRE. Tree to about 15 m. high, with trunk to 12 dm. in diameter, the bark deeply furrowed and ridged on older trees; branches widely spreading to form a rounded crown; twigs reddish-brown, densely hairy when young, with age becoming ashy-gray; leaves to 35 cm. long; leaflets usually 9 to 13, rarely more, essentially sessile, lanceolate, acuminate at apex, more or less falcate, to 1 dm. long and 35 mm. wide below the middle, coarsely dentate-serrate on margins, thin, yellowish-green, scurfy-hairy when young, essentially hairless with age; fruit spherical, 25-35 mm. in diameter; husk brown, thin, densely hairy; nut with a thick hard shell and a small edible kernel. Scattered along streams and in canyons in the Edwards Plateau and Trans-Pecos; from Tex. to s.w. N.M. and cen. Ariz. and n. Mex.

The durable wood is used locally for fence posts.

3. *Juglans microcarpa* Berl. RIVER WALNUT, LITTLE WALNUT. Large shrub or small tree to about 6 m. high, rarely with trunk to 45 cm. in diameter, the bark smoothish or

lightly furrowed; branches usually arising near the ground to form a broad rounded crown; twigs reddish-brown, densely hairy when young, with age becoming ashy-gray; leaves to about 3 dm. long; leaflets usually 17 to 23, sometimes fewer, essentially sessile, narrowly lanceolate, tapering to an acuminate apex, more or less falcate, to 75 mm. long and 12 mm. wide below middle, subentire to serrulate on margins, thin, yellowish-green, with age becoming essentially hairless; fruit spherical, 1.2-2 cm. in diameter; husk brownish, thin, hairy; nut with a thick hard shell and a small edible kernel. *J. rupestris* Engelm. Scattered along streams and arroyos in s. and w. Tex.; from w. Okla. and Tex. to s.e. N.M. and n. Mex.

The var. *Stewartii* (I. M. Johnst.) W. Manning with broader leaflets and larger fruits on the average, is reported to occur in the Chisos Mts.

2. CARYA NUTT. HICKORY

Trees with hard and very tough wood, and scaly buds from which in spring are produced usually both kinds of flowers with the staminate flowers below the leaves and the pistillate flowers above; leaves petiolate, odd-pinnate, often glandular-dotted; leaflets 5 to 25; *staminate aments* usually in fascicles of 3 in the axils of bud scales; stamens 3 to 8, adnate to the bract and 2 bractlets; filaments short or none, free; *pistillate flowers* 2 to 10 in a cluster or short spike on a peduncle terminating the shoot of the season; bract and typically 3 bractlets sepal-like in flower, a true calyx absent; stigmas sessile, 2 and sometimes divided, with a stigmatic disk at their base, papillose, commisural (above the lines connecting the carpels), usually persistent; fruit with a 4-valved firm and (at length) dry husk that consists of the exocarp or involucre which usually falls away from the smooth and crustaceous or bony nutshell or endocarp; nut incompletely 2-celled and (at the base) mostly 4-celled.

Probably about 15 species in eastern North America and eastern Asia. Because of their tough, resilient wood some species are used for such purposes as the making of tool handles.

In order to identify with some certainty most species in this difficult genus one needs to have a tree growing in one's own yard so as to be able to study it at all seasons of the year! Even so, its identity will not be easily determined.

- 1. Bud scales valvate; bud scale scars wide, separate, not in a distinct ring; husk sutures winged or keeled (2)
- 1. Bud scales imbricate; bud scale scars in a distinct ring; husk sutures not winged or keeled (5)
- 2(1). Shell smooth; kernel sweet; cotyledons not deeply 2-cleft (3)
- 2. Shell uneven; kernel bitter; cotyledons deeply 2-cleft (4)
- 3(2). Leaflets 5 to 9; fascicles of staminate aments peduncled1. *C. myristicaeformis*.
- 3. Leaflets more than 9; fascicles of staminate aments sessile or nearly so2. *C. illinoensis*.
- 4(2). Bud sulphur-yellow; husk wingless at base, at maturity splitting only to just below middle; nut gray, smooth; leaflets usually fewer than 9, the lower surface pubescent and with ferruginous scales; terminal leaflet essentially sessile3. *C. cordiformis*.
- 4. Bud brownish; husk winged to the base, at maturity the valves completely separating; nut reddish-brown, furrowed or wrinkled; leaflets usually more than 9, the lower surface glabrous; terminal leaflet stalked4. *C. aquatica*.
- 5(1). Margins of young leaflet densely ciliate, the older leaflet serrations with persistent tufts of hairs; bark shaggy5. *C. ovata*.
- 5. Margins of young leaflet not densely ciliate, the older leaf serrations without tufts of hairs; bark usually not shaggy (6)
- 6(5). Husk more than 4 mm. thick; bark shaggy6. *C. laciniosa*.
- 6. Husk 4 mm. or less thick (rarely more); bark not shaggy (7)

- 7(6). Twigs stout; leaves with a strong spicy odor, woolly beneath; rachis woolly ...
7. *C. tomentosa*.
7. Twigs slender; leaves fragrant or odorless, smooth to somewhat hairy or dotted with
 minute scales beneath; rachis smooth or hairy (8)
- 8(7). Twigs smooth; husk usually about 7 mm. thick; leaflets mostly 7
8. *C. leioderms*.
8. Twigs hairy; husks about 3 mm. thick; leaflets 5 and 7
9. *C. texana*.

1. *Carya myristicaeformis* (Michx. f.) Nutt. NUTMEG HICKORY, NOGAL. Tree to about 30 m. high, with a trunk to 6 dm. in diameter, the bark dark-brown tinged with red and broken irregularly into small thin appressed scales; branches stout and somewhat spreading to form a rather narrow open crown; branchlets at first with lustrous scales, eventually dark-reddish-brown; leaves to 35 cm. long; leaflets 7 or 9, occasionally 5, short-stalked or essentially sessile, ovate-lanceolate to broadly obovate, acute at apex, cuneate or somewhat rounded at the narrow base, the margins serrate, to 12.5 cm. long and 37 mm. wide, thin and firm, dark-green above, more or less pubescent or nearly glabrous and silvery-white and lustrous beneath, becoming golden-bronze in the fall; fruit usually solitary, ellipsoid to somewhat obovoid, about 35 mm. long; husk broadly 4-ridged to base, coated with a yellow-brown scurfy pubescence, not more than 1 mm. thick, splitting nearly to the base; nut with a thick hard and bony shell, rounded and apiculate at the ends, smooth, dark-reddish-brown and marked by longitudinal small broken bands of gray covering the entire surface, the dark-brown kernel sweet. *Hicoria myristicaeformis* (Michx. f.) Britt. Along banks of rivers and in swamps of e. Tex.; from e. S.C. to s.e. Okla. and e. Tex.; (?) also in mts. of n.e. Mex.

2. *Carya illinoensis* (Wang.) K. Koch. PECAN, NOGAL MORADO, NUEZ ENCARCELADA. Tree to about 50 m. high, with a massive trunk to 2 m. in diameter that is often enlarged and buttressed at the base, the thick bark light-brown tinged with red and deeply divided into irregular furrows and ridges; overwintering buds flattened, with paired and valvate narrow scales covered with articulated hairs; branches stout and spreading to form a round-topped crown; branchlets at first red-tinged and coated with a loose pale tomentum, eventually glabrous or merely puberulent; leaves to 5 dm. long; leaflets 9 to 17, sessile, oblong-lanceolate to lanceolate, more or less falcate, acuminate at apex, cuneate to rounded at the asymmetric base, the margin coarsely and often doubly serrate, to 2 dm. long and 75 mm. wide, dark-yellow-green and glabrous or pilose above, pale and glabrous or pubescent beneath, terminal leaflet only slightly broader than upper lateral ones; fascicles of staminate aments sessile or nearly so; fruit in clusters of 3 to 11, ovoid to more or less ellipsoid, pointed at apex, rounded at the narrowed base, 4-winged and -keeled along the sutures, 25-65 mm. long, 12-25 mm. thick, dark-brown and more or less thickly covered with yellow scales; husk thin, brittle, at maturity splitting nearly to the base and often persistent on the branch during the winter after dropping the nut; nut usually thin-shelled, pointed at both ends, somewhat bright-reddish-brown, the reddish-brown kernel sweet. *Carya Pecan* (Marsh.) Engl. & Graebon., *Hicoria Pecan* (Marsh.) Britt. In low rich grounds along streams, bottomlands and moist open woodlands, mostly in cen. and n.w. Tex.; from Tex., n. to Ind. and Ia., e. to Ala.

The species, in many selected varieties, is widely cultivated in the southern states. The nuts, which vary in size and shape and in the thickness of their shells, and in the quality of the kernels, are an important article of commerce. The pecan is the State Tree of Texas.

Specimens have been seen that apparently represent *Carya* × *Lecontei* Little, a hybrid that combines the compressed fruit and bitter kernel of *C. aquatica* and the sessile male catkins, hairy yellowish winter buds, and elongate nut of *C. illinoensis*.

3. *Carya cordiformis* (Wang.) K. Koch. BITTERNUT HICKORY, FIGNUT HICKORY. Tree often to 30 m. high, with a trunk to 9 dm. in diameter, the light-brown red-tinged bark about 15 mm. thick and broken into thin platelike scales that separate on the surface into small thin flakes; branches stout and spreading to form a broad crown; branchlets slender, marked by oblong pale lenticels, at first bright-green and covered more or less with rusty hairs, ultimately becoming light gray; leaves to 25 cm. long; leaflets usually 7 or 9, sessile, ovate-lanceolate to lanceolate or obovate, acuminate at apex, coarsely serrate except at the cuneate to subcordate base, thin and firm, to 15 cm. long and 3 cm.

or more wide, dark-yellow-green and glabrous above, light-green and pubescent beneath; overwintering bud-scales lanceolate, sulphur-yellow with persistent scurf; fruit usually obovoid to subglobose, 4-winged from the apex to about the middle; husk thin, puberulous, more or less covered with small yellow scales, splitting only to below the middle; nut with a thin brittle shell, often broader than long, depressed or obcordate at apex, the bright-reddish-brown kernel very bitter. *Hicoria cordiformis* (Wang.) Britt., *H. minima* (Marsh.) Britt. In low wet woods near the borders of streams and swamps or on high rolling uplands in e. Tex.; from Fla. to Tex. n. to N.E., Minn. and Neb.

4. *Carya aquatica* (Michx. f.) Nutt. WATER HICKORY, BITTER PECAN. Tree sometimes to 30 m. in height, with a trunk rarely exceeding 6 dm. in diameter, the bark to 15 mm. thick and separating freely into long loose platelike light-brown scales tinged with red; overwintering buds reddish-brown, adorned with caducous yellow glands; branches slender, upright to form a narrow crown; branchlets slender, at first reddish-brown or ashy-gray and slightly glandular and coated with a loose pale tomentum, eventually gray and essentially glabrous; leaves to 33 cm. long; leaflets 7 to 13, sessile or stalked, ovate-lanceolate to lanceolate, falcate, acuminate at apex, rounded to cuneate at the more or less oblique base, glabrous, to 75 mm. long and 4 cm. wide, finely or coarsely serrate; fascicled staminate aments peduncled; fruit often in clusters of 3 or 4, subglobose to obovoid, much-compressed, usually broadest above the middle, rounded at the slightly narrowed base, conspicuously 4-winged, dark-brown or nearly black, provided with bright-yellow scales, to 4 cm. long and 32 mm. wide; husk thin, brittle, splitting tardily and usually only to below the middle; nut flattened, somewhat obovoid, with a thin dark-reddish-brown somewhat wrinkled shell, rounded and abruptly short-pointed at apex, the dark-brown kernel very bitter. *Hicoria aquatica* (Michx. f.) Britt. In river swamps that are periodically inundated, in e. Tex.; from Fla. to Tex., n. to Va., s.w. Ill. and s.e. Mo.

5. *Carya ovata* (Mill.) K. Koch. SHAGBARK HICKORY, SHELLBARK. Tree to 20 m. or more high, with a trunk to about 1 m. in diameter, the light-gray bark to 25 mm. thick and separating into thick plates often 3 dm. or more long and 2 dm. wide that are attached to the trunk by the middle; branches stout and slightly spreading to form a conic round-topped crown; branchlets at first covered with caducous brown scurf and pale glandular pubescence, soon bright-reddish-brown and lustrous, glabrous or pubescent; leaves to 35 cm. long; leaflets 5 or rarely 7, slender-stalked, ovate to ovate-lanceolate or obovate, somewhat rounded to acuminate at apex, ciliate on the margins that are finely serrate except toward the usually cuneate base, most of the serrations with a dense tuft of persistent hairs on one or both sides near their apex, to 17 cm. long and 75 mm. wide above the middle, dark-yellow-green and glabrous above, paler and shiny-glabrous or puberulous beneath, the terminal leaflet largest; fascicles of staminate aments peduncled, the floral bracts much-elongated; overwintering terminal buds ovoid, to 25 mm. long and 1 cm. thick; fruit solitary or in pairs, subglobose to somewhat obovoid, depressed at apex, dark-reddish-brown or nearly black at maturity, glabrous or pilose, to 6 cm. long; husk to 15 mm. thick and splitting freely to the base; nut with a usually thin shell, more or less 4-ridged or -angled, pale or whitish, the light-brown kernel sweet and aromatic. *Hicoria ovata* (Mill.) Britt. In rich woodlands, bottoms and slopes, commonly near streams and swamps in e. Tex.; from Fla. to Tex., n. to Me., Ont., Wisc., Minn. and Neb.

6. *Carya laciniosa* (Michx. f.) Loud. BIG SHELLBARK HICKORY, KING-NUT. Tree sometimes more than 30 m. high, with a trunk to 9 dm. in diameter, the light-gray bark to 5 cm. thick and separating into broad thick long-persistent plates to 12 dm. long; branches small and spreading to form a narrow cylindrical crown; branchlets orange-brown or tan, at first pilose or covered with a pale or rufous pubescence or tomentum, eventually glabrous or puberulous; leaves to 55 cm. long; leaflets 5 to 9, sessile or short-stalked, ovate to oblong-lanceolate or broadly obovate, acute to acuminate at apex, asymmetrically cuneate or rounded at base, to 22 cm. long and 12 cm. wide, the margins finely serrate, dark-green and lustrous above, pale-yellow-green or bronze-brown and covered with soft pubescence beneath; overwintering bud short and blunt; fruit solitary or in pairs, ellipsoid to ovoid or subglobose, depressed at apex, downy or glabrous, light-orange-color or chestnut-brown at maturity, to 63 mm. long and 5 cm. broad; husk pale, hard and woody, about 12 mm. thick; nut with a hard bony shell to 7 mm. thick, more or less

compressed, prominently 4-ridged or -angled, light yellow or reddish-brown, the light-chestnut-brown kernel very sweet. *Hicoria laciniosa* (Michx. f.) Sarg. In rich bottomlands that are usually periodically inundated, reported from n.e. Tex.; from N.Y., w. to Ia. and Neb., s. to Ala., La. and (probably) Tex.

7. *Carya tomentosa* Nutt. MOCKERNUT. Tree rarely to 30 m. high, with a trunk to 9 dm. in diameter, the close bark to 2 cm. thick and slightly ridged by shallow irregular interrupted fissures and covered by dark-gray closely appressed scales; branches small, spreading to form a narrow or broad round-topped crown; branchlets stout, tomentose at first with pale fascicled hairs, rather light-brown, eventually becoming grayish and glabrous to pubescent; leaves to 3 dm. long, glandular, resinous, fragrant; leaflets 5 to 9, sessile or short-stalked, oblong-lanceolate to obovate-lanceolate, gradually or abruptly acuminate at apex, rounded to cuneate at the often oblique base, the margins minutely or coarsely serrate, to 2 dm. long and 12.5 cm. wide, dark-yellow-green and rather lustrous above, paler or light-orange-colored or brownish beneath; overwintering terminal bud to 2 cm. long; fruit ellipsoid or obovoid, gradually narrowed at the ends, dark-reddish-brown, pilose or nearly glabrous, to 5 cm. long; husk about 3 mm. thick, splitting to the middle or nearly to the base; nut with a very thick hard shell that often cracks transversely upon drying, light-reddish-brown, becoming darker with age, the lustrous dark-brown kernel small and sweet. *Carya alba* (Mill.) K. Koch. In dry to moist woodlands in e. Tex.; from Fla. to Tex., n. to N.E., Ont. and Neb.

8. *Carya leiodermis* Sarg. SWAMP HICKORY. Tree to about 20 m. high, with trunk to 9 dm. in diameter, the pale bark tight and only slightly ridged; branches stout and somewhat pendulous to form a narrow round-topped crown; branchlets slender, reddish-brown and lustrous, at first puberulous or pubescent, becoming glabrous with age; leaves to 35 cm. long; leaflets 7 or rarely 5, short-stalked or nearly sessile, elliptic-lanceolate to narrowly obovate, thin, acuminate at apex, asymmetrically cuneate at base, at first hoary-tomentose beneath and pubescent above, with age becoming dark-green and lustrous above and pale or slightly pubescent beneath, to 12.5 cm. long and 65 mm. wide, the lower pair of leaflets much-reduced; fruit broadly obovoid, smooth, glabrous or puberulous and adorned with scattered white scales, to 45 mm. long and 3 cm. in diameter; husk to 7 mm. thick, opening freely to the base usually only by 2 sutures; nut with a thick hard shell, rounded at the ends, slightly compressed, tinged with red, the small kernel sweet. *Hicoria leiodermis* (Sarg.) Sudw. In low wet woods and swamps of s.e. Tex.; from Tex. and Ark. to Miss.

9. *Carya texana* Buckl. BLACK HICKORY. Tree to 30 m. high, usually much smaller, with a trunk to 9 dm. in diameter, the dark-brown to blackish and deeply furrowed bark about 2 cm. thick and roughened by closely appressed platelike scales; branches ascending or spreading to form a narrow round-topped crown; branchlets slender, at first coated with a thick rusty hoary tomentum that eventually wears off; overwintering terminal buds to about 1 cm. long, the scales hairy-tufted at apex; leaves to 3 dm. long; leaflets 7 to 13, subsessile or short-stalked, lanceolate, acuminate at apex, asymmetrically cuneate at base, to 12.5 cm. long and 4 cm. wide, thin and firm, hoary-tomentose when they unfold, more or less villous in fall, the margin serrate, dark-green and nearly glabrous above, pale-yellow-green and puberulous beneath; fruit subglobose to oblong or oblong-obovoid, apiculate at apex, slightly 4-winged at base, dark-brown, more or less covered with yellow scales, to 5 cm. long; husk thin, about 3 mm. thick, splitting to middle or nearly to base; nut acute at both ends, compressed, rough and pitted, with a thin brittle shell, the bright-reddish-brown kernel very bitter. *Carya Buckleyi* Durand, *C. arkansana* Sarg., *C. Buckleyi* var. *arkansana* (Sarg.) Sarg. In dry sandy woods or on rocky slopes in e. Tex.; from La. and Tex., n. to Ind., Ill., Mo. and e. Okla.

FAM. 51. BETULACEAE S. F. GRAY

BIRCH OR HAZEL-NUT FAMILY

Monoecious trees or shrubs with alternate simple pinnately straight-veined deciduous leaves and deciduous stipules; flowers unisexual; *staminate flowers* in spreading or drooping catkins, subtended by scaly bracts, with 2- to 4-parted "perianth" (or bracteoles) and 2 to many stamens; *pistillate flowers* in clusters, spikes or in a scaly catkin,

with minute perianth or none; ovary 2-celled, with 2 pendulous anatropous ovules in each cell; styles 2; fruit a 1-celled and 1-seeded nutlet, with or without a foliaceous involucre.

A family of 4 to 6 genera and about 140 species, mostly in the Northern Hemisphere. Sometimes divided so that *Carpinus* and *Ostrya* constitute a separate family, the Carpinaceae.

1. Staminate flowers solitary in the axil of each bract, without a calyx or bracteoles; pistillate flowers with a calyx or bracteoles; bracts of the pistillate ament deciduous; nutlets wingless, more or less enveloped by an involucre formed by the enlargement of the bract and bractlets of the flower (2)
1. Staminate flowers 2 or more in the axil of each bract, with a calyx or bracteoles; pistillate flowers without a calyx or bracteoles; bracts of the pistillate ament persistent or eventually deciduous; nutlets winged or with a coriaceous margin, without an involucre, borne in an ovoid to oblong-ellipsoid strobile (3)
- 2(1). Staminate aments covered by bud scales during the winter, usually solitary; involucre of nutlet flat, foliaceous, usually 3-lobed; bark grayish and smooth; trunk and branches fluted, sinewy1. *Carpinus*, p. 463.
2. Staminate aments naked during the winter, mostly clustered; involucre of nutlet saclike, bladderly, closed; bark brown, rough and flaky; trunk and branches terete2. *Ostrya*, p. 463.
- 3(1). Pistillate aments solitary; fruiting aments not persistent, the bracts thin, 3-lobed, deciduous with or soon after the nutlet; stamens 2, bifid; buds not stalked; trees with exfoliating bark3. *Betula*, p. 464.
3. Pistillate aments racemose; fruiting aments persistent, the bracts thick and semi-woody, not deeply lobed, persistent; stamens 4, not bifid; buds stalked; shrubs with smooth or somewhat scaly bark4. *Alnus*, p. 465.

1. CARPINUS L.

HORNBEAM. IRONWOOD

An Old World genus of about 35 species, with one in America.

1. *Carpinus caroliniana* Walt. AMERICAN HORNBEAM, BLUE-BEECH, LECHILLO. Small tree to 10 m. tall, with somewhat flattened and twisted trunk and smooth grayish bark; leaves oblong to narrowly oblong-ovate or elliptic-lanceolate, rounded at base, subobtusely to acuminate at apex, to 9 cm. long and 45 mm. wide, more or less doubly serrate; *staminate aments* pendulous, the ovate scales each subtending a solitary naked flower that is composed of several divided filaments each bearing 2 apically pilose half-anthers; *fruiting aments* ovoid to short-cylindric, to 5 cm. long; bracts about 2 cm. long, ovate, subtending 2 flowers, chartaceous, halberd-shaped, with 1 or 2 divergent basal lobes, entire or with a few blunt teeth along one side of the midlobe; nutlet ovoid, several-nerved. Rich woods and bottomlands along streams in e. Tex., Mar.-May; from Fla. and Tex., n. to Md., Tenn. and s. Ill.

2. OSTRYA SCOP.

HOP-HORNBEAM. IRONWOOD

Slender trees with very hard wood and brownish furrowed and more or less flaky bark and elongate acute buds; leaves open and concave in the bud, when expanded with a petiole less than 5 mm. long; flowers appearing before or with the leaves; *staminate aments* 1 to 3 together from scaly buds at the branchlets of the preceding year; staminate flowers consisting of several stamens in the axil of each bract, the short filaments often forked and each bearing an apically pilose half-anther; *pistillate aments* single, lax, terminating short leafy shoots of the season, each caducous bract subtending a pair of flowers; pistillate flowers composed of an incompletely 2-celled 2-ovuled ovary, crowned with the short-bearded border of the adherent calyx, tipped with 2 long linear stigmas and enclosed in a tubular union of bract and bractlets which in fruit becomes a closed somewhat compressed bladderly involucre that is very much larger than the small smooth or ribbed nutlet; the inflated involucre ovoid to ellipsoid or obovoid, bristly-hirsute at

base and more or less pubescent throughout (especially at the tip), loosely imbricated to form a strobile resembling that of the Hop.

A genus of about 10 species in the Northern Hemisphere.

1. Confined to woodlands and stream banks of east Texas .1. *O. virginiana*.
1. Confined to the mountains of west Texas (2)
- 2(1). Stipitate glands present especially on twigs and leaf petioles; leaf blades typically ovate; staminate aments 2-3 cm. long, the bracts merely short-apiculate and with glandular-ciliate margins; in Guadalupe Mts.2. *O. Knowltonii*.
2. Stipitate glands not present; leaf blades typically elliptic; staminate aments 3.5 cm. long or more, the bracts with a cusp about as long as the body and with long-fimbriate margins; in Chisos Mts.3. *O. chisosensis*.

1. *Ostrya virginiana* (Mill.) K. Koch. AMERICAN HOP-HORNBEAM, EASTERN HOP-HORNBEAM. Tree to 20 m. tall; leaves ovate-oblong to elliptic-lanceolate, rounded to slightly cordate at base, taper-pointed at apex, to 1 dm. long and 45 mm. wide, sharply doubly serrate, somewhat downy and with tufts of pale hairs in the axils of the veins on the lower surface; staminate aments 3-5 cm. long at anthesis; staminate scales broadly triangular-ovate to ovate-subquadrate, about 2.5 mm. long, rounded and abruptly contracted at the apex into an elongate point, ciliate on margin; fruiting aments on slender stems about 25 mm. long, short-cylindric, to 5 cm. long, each sac about 2 cm. long; nutlet ellipsoid, compressed, tan-color, 4-5 mm. long. Rich moist or dry woods in e. Tex., Mar.-Apr.; from Fla. and Tex., n. to s.e. Mass., Tenn., s. Ill., Ia. and S.D.

Our plant is represented by var. *lasia* Fern., distinguished by its densely and sub-persistently villous branchlets.

2. *Ostrya Knowltonii* Cov. WESTERN HOP-HORNBEAM. Small tree about 12 m. tall and a trunk 15 cm. in diameter, with the branchlets, leaves and floral parts more or less pubescent and with stipitate glands throughout; leaves suborbicular-ovate to ovate-elliptic, broadly rounded to slightly cordate at base, rounded to acute at apex, to 65 mm. long and 55 mm. wide, usually much smaller, always widest below the middle, sharply doubly serrate; staminate aments 2-3 cm. long at anthesis; staminate scales suborbicular to transversely elliptic, merely apiculate at the broadly rounded apex, glandular-ciliate on the margin, about 2 mm. long, usually wider than long; fruiting aments on stems to 2 cm. long, to 4 cm. long, each sac about 15 mm. long; nutlet ovoid, compressed, tan-color, about 6 mm. long. *O. Baileyi* Rose. In mt. canyons of w. Tex., Mar.-May; also in s.e. N.M., n. Ariz., and s.e. Ut.

3. *Ostrya chisosensis* Correll. BIG BEND HOP-HORNBEAM. Tree to 14 m. tall, with the branchlets, leaves and floral parts more or less pubescent but without stipitate glands; leaves elliptic to elliptic-lanceolate, rounded and slightly cordate at base, obtuse to acute at apex, to 6 cm. long and 3 cm. wide, sometimes widest above the middle, finely doubly serrate; staminate aments 3.5-4 cm. long at anthesis; staminate scales broadly triangular-ovate, tapered into a long-cuspidate apex, 2.5-3 mm. long, with the cusp at least 1 mm. long and usually about as long as the body, the margins and cusp long-fimbriate; fruiting aments still immature, on stout stems about 1 cm. long, about 2 cm. long, densely hirsute. Apparently endemic in the Chisos Mountains of the Big Bend National Park, May-June.

3. BETULA L. BIRCH

About 60 species that are widely scattered in the Northern Hemisphere.

1. *Betula nigra* L. RIVER BIRCH. Tree to 30 m. tall and a trunk to 8 dm. in diameter, with soft shaggy and freely exfoliating salmon-pink bark and reddish-dotted twigs; leaves with a tomentose petiole to 15 mm. long, rhombic-ovate, broadly cuneate to subtruncate at base, acute at apex, to 1 dm. long and 8 cm. wide below middle, conspicuously and often deeply doubly serrate, bright-green on upper surface, grayish-white on lower surface and when young downy; aments formed in the fall and expanding in early spring; *staminate aments* mostly 2 or 3 clustered, sessile, elongate, each of the ovate to suborbicular bracts subtending 3 flowers; staminate flowers consisting of 4 stamens adnate

to a 4-parted calyx, with two bractlets; the pedunculate thick-cylindric pistillate aments tomentose, solitary, 25-35 mm. long, the bracts 6-8 mm. long, nearly equally divided into 3 oblong-linear lobes, subtending 2 or 3 flowers; pistillate flowers naked, without bractlets or calyx; fruit an erect or pendent ovoid to oblong-ellipsoid strobile, the scales deciduous from the persistent cone axis at maturity to release the compressed laterally winged nutlets. Along streams and in bottomlands in e. Tex., Mar.-Apr.; from Fla. and Tex., n. to N.E., Pa., W.Va., O., s. Mich., s. Wisc., s. Minn. and e. Kan.

4. ALNUS MILL. ALDER

About 35 species, mostly in cool temperate regions.

1. *Alnus serrulata* (Ait.) Willd. SMOOTH ALDER. Spreading or laxly ascending deciduous shrubs or small trees to 5 m. or more tall, the main stem to 15 cm. in diameter; bark of trunk smooth, light grayish-brown to reddish-brown or blackish-gray, with dark lenticels; leaves with petioles to 15 mm. long, obovate to obovate-elliptic or elliptic, narrowly to broadly cuneate at base, rounded to acute at the apex, to 1 dm. long and 6 cm. wide, the margins simply serrulate or rarely somewhat undulate, the expanding leaves glutinous and aromatic; aments usually formed in the fall and expanding in early spring; staminate aments pendulous, in clusters of 3 to 5, each of the bracts subtending 3 flowers; staminate flowers with a minute 4-parted calyx and 4 stamens with undivided filaments; pistillate aments in clusters of 2 or 3, ovoid to ellipsoid, 1.5-2 cm. long, the fleshy cuneate bracts 3-4 mm. long, each subtending 2 flowers and a group of 4 tiny scalelets adherent to the bracts of the aments; fruit a persistent semiwoody strobile, each cuneate to cuneate-obovate truncate or lobulate scale bearing 2 to 4 compressed laterally winged nutlets. Along streams and in swamps and boggy situations, mainly in e. Tex., Mar.-Apr.; from N.E., s. to Fla. and Tex., Okla., Mo., Ind. and O.

Often confused with the eastern *A. rugosa* (Du Roi) Spreng., whose bark has linear, whitish lenticels.

FAM. 52. FAGACEAE DUM. BEECH FAMILY

Monoecious trees or shrubs with alternate simple straight-veined deciduous or evergreen leaves and deciduous stipules; staminate flowers in aments or capitate clusters; pistillate flowers solitary or slightly clustered; the 1-celled and 1-seeded nut entirely to partly enclosed in a cupule formed by the more or less consolidated bracts that become indurated; ovary 3- to 7-celled; ovules 1 or 2 in each cell, usually with only one ripening; styles 3; seed with no albumen, filled by the embryo and with 2 integuments.

About 900 species in 8 genera mostly cosmopolitan but most abundant in the Northern Hemisphere.

- 1. Involucre a saucerlike, cup-shaped or turbinate cupule, made up of prickleless imbricated scales not entirely covering the nut; nut circular in cross section; leaves lobed or unlobed3. *Quercus*, p. 467.
- 1. Involucre of pistillate flower and fruit 2- to 4-valved, prickly, covering the nut; nut compressed or triangular; leaves unlobed (2)
- 2(1). Staminate flowers in globose-stalked heads that are pendulous on slender peduncles; involucre with recurved single spines; nuts sharply triangular; bark smooth1. *Fagus*, p. 465.
- 2. Staminate flowers in a stiff moniliform ament; involucre with straight clustered spines; nuts lenticular or compressed, not triangular; bark very rough 2. *Castanea*, p. 466.

1. FAGUS L. BEECH

About 10 species in the North Temperate Zone.

1. *Fagus grandifolia* Ehrh. BEECH-NUT TREE. Large deciduous tree to 35 m. or more tall, with a trunk to 1 m. or more in diameter, with close and smooth ash-gray bark and

horizontally spreading branches and branchlets; leaves with a petiole to 1 cm. long, ovate-elliptic to oblong-elliptic, cuneate to rounded and sometimes slightly cordate at base, acuminate at apex, dark-green, strongly straight-veined, distinctly and often coarsely serrate, essentially glabrous or silky-pubescent on lower surface (f. *pubescens* Fern. & Rehd.), to 13 cm. long and 7 cm. wide; flowers appearing with the leaves; *staminate flowers* yellow, in pendulous heads from the lower axils of the leaves of the season, with deciduous scalelike bracts, the campanulate calyx 5- to 7-cleft; stamens 8 to 16, with slender filaments bearing 2-celled anthers; *pistillate flowers* from the upper axils of the leaves of the season, usually in pairs at the apex of a short peduncle, invested by numerous subulate bractlets with the inner bractlets coherent at base to form the 4-lobed involucre, the subulate calyx lobes 6; ovary 3-celled with 2 ovules in each cell; styles filiform, stigmatic along the inner surface; prickles of the mature rufous-tomentose involucre subulate-filiform, recurving or spreading, mostly less than 3 mm. long; nutlets usually 2, triangular, thin-shelled, edible, about 15 mm. long. In rich hardwood forests, especially on slopes along streams, in e. Tex., Mar.-Apr.; from Fla., w. to Tex. and n. to s.e. Mass., O., Ind., s. Ill. and Mo.

Our plant is represented by the more southern var. *caroliniana* (Loud.) Fern. & Rehd., with darker green, more firm-textured, less coarsely toothed ovate to obovate leaves and rufous-tomentose involucre with fewer and shorter prickles.

2. CASTANEA MILL.

CHINQUAPIN. CHESTNUT

Trees or shrubs; leaves conspicuously straight-veined, undivided, dentate or serrate; flowers appearing after the leaves in axillary aments near the ends of branches; aments wholly staminate or the upper ones androgynous with the pistillate flowers at the base; staminate flowers in long somewhat interrupted naked cylindrical aments, the calyx mostly 6-parted, the up to 20 stamens with 2-celled anthers on slender filaments; pistillate flowers usually 3 together in an ovoid scaly prickly involucre, the calyx with a 6-lobed border crowning the 3- to 7-celled ovary; nuts as many as 3 together, enclosed in the spiny involucre.

A small genus of very complicated plants in the Northern Hemisphere. Of necessity, our treatment of Texas material is most tenuous and tentative. The genus is in great need of a monograph.

- 1. Rather large trees or shrubs; branchlets more or less pubescent; leaves densely tomentose beneath (2)
- 1. Small shrubs or somewhat arborescent shrubs; branchlets typically smooth; leaves thinly tomentose beneath to essentially glabrous, often less than 10 cm. long (3)
- 2(1). Bur closely covered by scales bearing short erect crowded slender bristles, glabrate or sparingly pubescent; leaf blades velvety-pubescent beneath 1. *C. pumila* var. *pumila*.
- 2. Bur with broad open areas and somewhat remote scales that bear horizontally divergent short stout bristles which are canescent well to the tip; leaf blades mostly 10 cm. long or more, feltlike beneath 1. *C. pumila* var. *Ashei* Sudw.
- 3(1). A dwarf erect shrub that spreads by underground rootstocks, colonial 2. *C. alnifolia* var. *alnifolia*.
- 3. An arborescent shrub, noncolonial 2. *C. alnifolia* var. *floridana* Sarg.

1. *Castanea pumila* (L.) Mill. Trees or large spreading shrubs with furrowed bark; leaves elliptic to oblong-obovate, obtuse to acute at apex, to 15 cm. long and 5 cm. wide, usually smaller, green and glabrous above, whitish-downy to white-glabrate beneath, the lateral veins extending straight and parallel from the midrib to terminate in the sharp teeth of the coarsely serrate margins; staminate flowers fragrant, borne in profusion in long yellowish-white erect aments; pistillate flowers inconspicuous, mostly borne on separate interrupted catkins near tip of branchlets; burs 1 to 7 per stalk, about 25 mm. in diameter, tawny- to brown-tomentose and bearing close-set or somewhat distant

spine-bearing scales on their outer surface, when mature each split into 2 to 4 valves and bearing 1 to 3 nuts; nuts ovoid, pointed, sweet-meat, about 1 cm. in diameter. In sandy open woodlands and thickets in e. Tex., Mar.-June; from e. Mass., s. to Fla., w. to Tenn., Ark. and Tex.

We have two variants that are distinguished in the key.

2. *Castanea alnifolia* Nutt. DOWNY CHINQUAPIN. Shrub or small tree, with or without horizontal underground rootstocks, mostly less than 15 dm. high; leaves narrowly elliptic to oblong-obovate, to 12.5 cm. long and 5 cm. wide, green and smooth above, finely tomentose to green and essentially glabrate beneath, their venation and serrate margins similar to *C. pumila*; staminate flowers slightly fragrant, borne in interrupted clusters on erect-ascending slender greenish-yellow catkins; pistillate flowers and burs similar to those in *C. pumilla*. *C. pumila* var. *Margaretta* Ashe. On rolling hills and open woodlands and thickets in e. Tex., Mar.-June; from Va., s. to Fla. and w. to Ark. and Tex.

We have two variants that are distinguished in the key.

3. QUERCUS L.⁴² OAK

Shrubs to large trees, monoecious; pith star-shaped, continuous; wood usually hard with both uniseriate and multiseriate rays, the vessels grouped in a matrix of wood-parenchyma, either diffuse-porous or ring-porous, often plugged by tyloses; buds crowded toward the ends of the usually fluted twigs; stipules associated with the buds rather than the leaves, subulate to ligulate, promptly caducous or sometimes persistent; leaves alternate, usually distinctly petioled, never quite sessile, simple, entire or toothed or pinnately lobed, pinnately veined; *staminate flowers* in elongate flaccid catkins, apetalous, the calyx of 5 lobes fused into a more or less bowl-shaped perianth enclosing 5 to 10 free stamens with short anthers and slender filaments; *pistillate flowers* in a reduced catkin with a stiff woody rachis either short or long and 1- to several-flowered, the calyx of 6 sepals adherent to the bases of the styles and fused into a tube, the pistil of three carpels comprising a single 3-celled ovary (each cell containing 2 ovules) and three free styles which are ventrally stigmatic toward the dilated apex; fruit 1-celled and 1-seeded, the 5 remaining ovules aborted and adhering to the developed seed, the seed enclosed in a shell (forming a nut or acorn) and seated in a cup or involucre formed (in our species) of scales (each with a more or less aborted bud in its axil), developing from a compressed inflorescence, the cup enveloping the whole nut or covering it only at the base.

A genus of some 500 or so recognized species in the Northern Hemisphere, exclusive of the Arctic; about 250 in the New World centering in central Mexico and reaching Canada and Colombia.

1. Bark rather soft, gray and scaly (rarely black and deeply furrowed, e.g., *Q. virginiana* and *Q. fusiformis*); leaves (if toothed) only mucronate-tipped or rounded, rarely spinose and never aristate-tipped; stigmas abruptly dilated on short styles; fruit annual; cup scales usually prominently thickened basally and loosely appressed apically; acorns with the shell glabrous on the inner surface; abortive ovules basal (White Oaks) (2)
1. Bark rather hard, black and furrowed but scarcely scaly; leaves (if toothed) aristate-tipped, never round-lobed or if so these aristate from the veins; stigmas gradually or rarely abruptly dilated, on long styles; fruit biennial or annual; cup scales scarcely thickened basally (or if so the leaf characters definitely as here described) and usually tightly appressed apically; acorns with the shell tomentose on the inner surface; abortive ovules usually apical (Black Oaks) (33)
- 2(1). Mature acorns nearly enclosed in the thin shell-like cups, the orifice usually less than half the diameter of the acorn 2. *Q. lyrata*.
2. Mature acorns rarely more than half-enclosed in the cups, with the orifice as great as the diameter of the acorn (3)

⁴² Contributed by Cornelius H. Muller; also in Contr. Tex. Res. Found. Bot. 1: 21-309. 1951 (in which most of these species are illustrated).

- 3(2). Cups large (3-6 cm. in diameter, cf. *Q. Prinus* below), fringed about the lip with coarsely attenuated apices of the uppermost scales, these sometimes nearly closing the orifice over immature acorns 1. *Q. macrocarpa*.
3. Cups smaller (0.5-3 cm. in diameter), the apices of the uppermost scales not greatly attenuated nor forming a fringe about the lip (4)
- 4(3). Leaves glabrous beneath or nearly so at maturity (5)
4. Leaves pubescent beneath at maturity (sometimes minutely so) (11)
- 5(4). Leaves very small, markedly crisped and spinose-toothed, completely glabrous and glaucous 8. *Q. Hinckleyi*.
5. Leaves various but not spinose-toothed (6)
- 6(5). Leaves green beneath at maturity (7)
6. Leaves with a glaucous bloom beneath at maturity (9)
- 7(6). Leaves thin, yellow-green; petioles not pruinose; twigs glabrous or variously stellate-pubescent 23a. *Q. sinuata* var. *breviloba*.
7. Leaves thick, blue-green or gray-green; petioles pruinose; twigs glabrous (8)
- 8(7). Leaves 5-10 cm. long or more, the veins very prominent beneath; petioles more than 5 mm. long 6. *Q. glaucoides*.
8. Leaves 1-3 cm. long, the veins not very prominent beneath; petioles less than 5 mm. long 7. *Q. depressipes*.
- 9(6). Leaves deeply or shallowly round-lobed, obovate .. 3. *Q. alba*.
9. Leaves all shallowly lobed or repandly round-lobed (10)
- 10(9). Leaves from lanceolate to obovate, evenly repand, usually acute 5. *Q. Muehlenbergii*.
10. Leaves oblong to obovate, broadly shallow-lobed, not repand, obtuse 23a. *Q. sinuata* var. *breviloba*.
- 11(4). Leaves evenly round-repand; cups 2-4 cm. broad .. 4. *Q. Prinus*.
11. Leaves variously lobed or entire but not repand (12)
- 12(11). Leaves deeply lobed (13)
12. Leaves shallowly lobed, toothed or entire (18)
- 13(12). Twigs glabrous or nearly so (14)
13. Twigs persistently densely fulvous-tomentulose or velvety (16)
- 14(13). Lower leaf surface sparsely spreading stellate-villous or glabrate; distribution west of the Pecos River 9. *Q. Gambelii*.
14. Lower leaf surface densely spreading stellate-villous or at length nearly glabrate; distribution east of the Pecos River (15)
- 15(14). Shrubs or small trees; twigs usually about 2 mm. in diameter; leaf blades very thin, the margins flat or minutely revolute 14. *Q. Margaretta*.
15. Moderate-sized trees; twigs usually more than 3 mm. in diameter; leaf blades quite thick and leathery, the margins strongly revolute ... 15. *Q. Drummondii*.
- 16(13). Shrubs; leaves spreading-stellate on lower surface, usually apically 3-lobed and basally strongly attenuate-cuneate 13. *Q. Boyntonii*.
16. Trees; leaves glabrate beneath or at most sparsely appressed-stellate or puberulent (17)
- 17(16). Leaves strongly cruciform, the apical pair of lobes clavate; leaf blades quite thick and leathery; distribution on dry uplands 11. *Q. stellata*.
17. Leaves seldom cruciform, the lobes narrow; leaf blades thin; distribution in wet bottomland forests 12. *Q. similis*.
- 18(12). Leaves glaucous and glabrous above, noticeably fulvous-puberulent beneath, the margins heavily cartilaginous, the teeth strongly mucronate or even spinose .. 21. *Q. turbinella*.
18. Leaves various but not as above (19)

- 19(18). Leaves prominently reticulate beneath, the veins impressed above (20)
19. Leaves **not** markedly reticulate beneath, the veins not strikingly impressed above (21)
- 20(19). Leaves **not over twice** as long as broad, the broadly rounded apex abruptly mucronately several-toothed; fruit borne on prominent peduncles
.....22. *Q. rugosa*.
20. Leaves twice as long as broad or more, the apex acute to obtuse or entire to toothed but not abruptly mucronate; fruit sessile or short-stalked
.....19. *Q. arizonica*.
- 21(19). Leaves toothed, undulately crisped, the stellate pubescence very harsh to the touch24. *Q. pungens*.
21. Leaves variously toothed or entire but not undulate-crisped or if so the pubescence not harsh to the touch (22)
- 22(21). Leaves very small and thick, coarsely revolute, densely woolly-tomentose beneath20. *Q. intricata*.
22. Leaves small or moderate-sized, not coarsely revolute, if tomentose beneath not strikingly woolly (23)
- 23(22). Leaves spreading-pubescent beneath (24)
23. Leaves pubescent beneath with tightly appressed minute stellate hairs, often appearing glabrous and glaucous to the naked eye (27)
- 24(23). Leaves dark-green above, white-tomentose beneath (25)
24. Leaves usually similar in coloration above and beneath, at least not strikingly dissimilar (26)
- 25(24). Leaves oblong, uniformly white-tomentose beneath; cups about 15 mm. broad or rarely broader18. *Q. Mohriana*.
25. Leaves ovate to oblong, the veins visible through the white tomentum beneath; cups usually more than 15 mm. broad16. *Q. Havararii*.
- 26(24). Leaves shallowly lobed10. *Q. undulata*.
26. Leaves variously entire to toothed but not lobed17. *Q. grisea*.
- 27(23). Leaves green beneath in spite of minute pubescence; shrubs with slender pliable twigs24a. *Q. pungens* var.
Vaseyana.
27. Leaves creamy-canescens beneath with dense appressed stellate hairs (28)
- 28(27). Bark black or at least dark-gray, hard and deeply furrowed (29)
28. Bark light-gray, scaling off in thin plates, not furrowed (31)
- 29(28). Cups narrowed basally; fruit subfusiform, pedunculate; leaf blades broadest toward the base; shrubs or trees of limestone uplands; central and west Texas ..
.....26. *Q. fusiformis*.
29. Cups broadly rounded basally; fruit ovate or narrow but not fusiform, sessile (30)
- 30(29). Leaves 2-4 cm. broad or more, the blades broadest toward the apex; large trees in east and south Texas near the coast25. *Q. virginiana*.
30. Leaves 1-2.5 cm. broad; low shrubs on sand dunes easterly along the coast
.....27. *Q. minima*.
- 31(28). Leaves mucronately toothed, shiny beneath in spite of pubescence
.....24a. *Q. pungens* var.
Vaseyana.
31. Leaves lobed or toothed but not mucronate, dull-white beneath (32)
- 32(31). Shrubs or small trees of limestone uplands; central and west Texas
.....23a. *Q. sinuata* var.
breviloba.
32. Large trees in moist river bottom forests; south and east Texas
.....23. *Q. sinuata*.
- 33(1). Petioles usually not over 1 cm. long (34)
33. Petioles usually more than 1 cm. long (40)

- 34(33). Leaves densely white-tomentose beneath, the veins impressed above and the margins revolute29. *Q. hypoleucoides*.
34. Leaves variously pubescent or glabrous but not as above (35)
- 35(34). Fruit annual; leaves commonly glabrous below except for a tuft of stellate hairs on each side of the base of the midrib; west of the Pecos River28. *Q. Emoryi*.
35. Fruit biennial; leaves variously pubescent or glabrous but not as above; east of the Pecos River (36)
- 36(35). Leaves narrowly elliptic to linear-lanceolate, fully 5 times as long as broad, markedly revolute and awl-shaped upon issuing from the buds33. *Q. Phellos*.
36. Leaves elliptic to oblanceolate or clavate, scarcely more than 3 times as long as broad, flat when issuing from the buds, never awl-shaped (37)
- 37(36). Leaves elliptic to oblanceolate or oblong (38)
37. Leaves clavate or cuneate, often 3-lobed at the apex, the base usually entire but occasionally lobed (39)
- 38(37). Twigs and lower leaf surfaces persistently gray-tomentose30. *Q. incana*.
38. Twigs and lower leaf surfaces glabrate or nearly so, at least not tomentose31. *Q. laurifolia*.
- 39(37). Twigs and petioles glabrous or nearly so; leaves glabrous beneath except for axillary tufts of stellate hairs; cups saucer-shaped ...34. *Q. nigra*.
39. Twigs and petioles fulvous-pubescent; leaves variously pubescent beneath, especially about the base of the midrib; cups cup-shaped41. *Q. marilandica*.
- 40(33). Leaves entire (41)
40. Leaves variously toothed or lobed (48)
- 41(40). Leaves densely white-tomentose beneath, the veins impressed above and the margins revolute29. *Q. hypoleucoides*.
41. Leaves variously pubescent or glabrous but not as above (42)
- 42(41). Fruit annual; leaves commonly glabrous below except for a tuft of stellate hairs on each side of the base of the midrib; west of the Pecos River28. *Q. Emoryi*.
42. Fruit biennial; leaves variously pubescent or glabrous but not as above; east of the Pecos River (except *Q. graciliformis*) (43)
- 43(42). Leaves narrowly elliptic to linear-lanceolate, fully 5 times as long as broad, markedly revolute and awl-shaped when issuing from the buds33. *Q. Phellos*.
43. Leaves elliptic to oblanceolate or clavate, scarcely more than 3 times as long as broad, flat when issuing from the buds, never awl-shaped (44)
- 44(43). Leaves elliptic to oblanceolate or oblong (45)
44. Leaves clavate or cuneate, often obscurely 3-lobed at the apex (47)
- 45(44). Twigs and lower leaf surfaces persistently gray-tomentose30. *Q. incana*.
45. Twigs and lower leaf surfaces glabrate or nearly so, at least not tomentose (46)
- 46(45). Petioles slender, over 1 cm. long; leaf blades thin, attenuately acute; west of the Pecos River35. *Q. graciliformis*.
46. Petioles thick and stiff, less than 1 cm. long; leaf blades thick, obtuse or at most merely acute; coastal Texas on sand32. *Q. hemisphaerica*.
- 47(44). Twigs and petioles glabrous or nearly so; leaves glabrous beneath except for axillary tufts of stellate hairs; cups saucer-shaped ...34. *Q. nigra*.
47. Twigs and petioles fulvous-pubescent; leaves variously pubescent beneath, especially about the base of the midrib; cups cup-shaped41. *Q. marilandica*.

- 48(40). Leaves densely white-tomentose beneath, the margins revolute
29. *Q. hypoleucoides*.
48. Leaves variously pubescent or glabrous but not as above (49)
- 49(48). Fruit annual; leaves commonly glabrous below except for a tuft of stellate hairs
 on each side of the base of the midrib28. *Q. Emoryi*.
49. Fruit biennial; leaves variously pubescent or glabrous but not as above (50)
- 50(49). Leaves at most irregularly toothed or shallowly lobed (51)
50. Leaves regularly toothed or lobed (55)
- 51(50). Leaves not 3-lobed nor so much broader apically than basally as to be distinctly
 club-shaped (52)
51. Leaves apically 3-lobed or obscurely so, much broader apically than basally and
 distinctly club-shaped (53)
- 52(51). Twigs and lower leaf surfaces persistently gray-tomentose
30. *Q. incana*.
52. Twigs and lower leaf surfaces glabrate or nearly so, at least not tomentose
32. *Q. hemisphaerica*.
- 53(51). Twigs and petioles glabrous or nearly so; leaves glabrous except for axillary
 tufts of stellate hairs34. *Q. nigra*.
53. Twigs and petioles fulvous-pubescent; leaves variously pubescent beneath (54)
- 54(53). Leaves densely fulvous-tomentulose beneath40. *Q. falcata*.
54. Leaves variously pubescent beneath (especially about the base of the petiole) but
 never tomentulose41. *Q. marilandica*.
- 55(50). Leaves at most only coarsely toothed, 4 or 5 times longer than broad, narrowly
 lanceolate35. *Q. graciliformis*.
55. Leaves definitely lobed, at most only 2 or 3 times longer than broad, broadly lanceo-
 late to ovate (56)
- 56(55). Lateral lobes simple, cuneate (57)
56. Lateral lobes few- or several-toothed, aristate (61)
- 57(56). Terminal lobe elongate, oblong, truncate apically with usually 2 lateral teeth
 (58)
57. Terminal lobe scarcely more prominent than the lateral lobes or distinctly obscure,
 variously acute or rounded but not oblong (59)
- 58(57). Lower leaf surface glabrate or with axillary tufts or even scattered pubescence;
 distribution west of the Pecos River38. *Q. Gravesii*.
58. Lower leaf surface densely fulvous-tomentulose; distribution east of the Pecos River .
40. *Q. falcata*.
- 59(57). Leaves and twigs persistently fulvous-tomentulose or tardily glabrescent
39. *Q. tardifolia*.
59. Leaves and twigs glabrate or nearly so (60)
- 60(59). Leaves somewhat broader basally than apically, usually distinctly toothed as
 well as lobed38. *Q. Gravesii*.
60. Leaves distinctly broader apically than basally, clavate by expansion of three apical
 lobes and a narrow entire base41. *Q. marilandica*.
- 61(56). Leaves densely fulvous-tomentulose beneath40. *Q. falcata*.
61. Leaves variously pubescent or glabrate but not densely tomentulose (62)
- 62(61). Leaf bases broadly U-shaped40. *Q. falcata*.
62. Leaf bases variously obtuse to rounded or cordate but not U-shaped (63)
- 63(62). Buds large (6-10 mm. long), often quadrangular, densely fulvous- or gray-
 tomentose or strigose42. *Q. velutina*.
63. Buds not over 5 mm. long, sparsely pubescent or glabrous (64)

- 64(63). Acorn cups flat, at most shallowly goblet-shaped; acorns subrotund to broadly elliptic36. *Q. Shumardii*.
 64. Acorn cups deeply cup-shaped; acorns narrowly ovoid or narrowly elliptic (65)
 65(64). Leaves ovate to subrotund in outline; central Texas east of the Pecos River ...
37. *Q. texana*.
 65. Leaves narrowly ovate to broadly lanceolate in outline; west of the Pecos River
38. *Q. Gravesii*.

1. *Quercus macrocarpa* Michx. BUR OAK. Large trees; twigs very coarse, 3-5 mm. thick or rarely somewhat more slender, fluted, yellowish or gray, from villous or pubescent or both becoming glabrate, with few very inconspicuous lenticels; buds 4-5 mm. long, ovoid or narrowly so, obtuse to acute, grayish-brown, sparsely pubescent to tomentose; stipules persistent or sometimes deciduous, about 1 cm. long, awl-shaped or the lateral ones longer and obviously spatulate-dilated, the terminal ones coarsely thickened and gray-tomentose; leaves deciduous, rather thin, to 20 cm. long and 15 cm. broad, obovate in outline, the apices broadly rounded, the bases rounded to cuneate, rather deeply incised, with 3 or 4 sinuses on each side, these acute or narrowly rounded, usually reaching nearly to the midrib (especially below), the lobes clavate, undulate distally, the basal ones often much-shortened, margins minutely revolute, upper surfaces glabrate, dull or slightly lustrous, lower surfaces villous and gray-puberulent with a mixture of long spreading and short appressed stellate hairs or the appressed hairs rarely absent and the surface then green; petioles to 25 mm. long, densely or sparsely pubescent; *staminate catkins* 3-4 cm. long, the rachis yellow-tomentose, at length rather loosely flowered, the perianth deeply incised with narrow oblong lobes, the anthers scarcely exerted; *pistillate catkins* about 2 cm. long, about 4-flowered near the end; fruit annual, solitary or paired on a peduncle 1-2 cm. long and 2-3 mm. thick; cups 3-6 cm. broad, 2-5 cm. deep, moderately or deeply cup-shaped, margins woolly with attenuate apices of the uppermost scales, these sometimes closing the orifice of the cup; cup scales broad-based, the apices of the basal scales not elongate, the dorsal surface keeled (thickened), the bases broad, often appearing to be fused to adjacent scales, the whole gray-pubescent; acorns 3-5 cm. long, 2-4 cm. broad, ovoid, broadly rounded, usually one half or three fourths included, sometimes wholly or only one fourth included. In moist forests along streams in e. and cen. Tex.; e. to the Atl. and n. to N.B. and Sask.

2. *Quercus lyrata* Walt. OVERCUP OAK. Moderate trees; twigs rather coarse, to 4 mm. thick, finely fluted, from minutely villous becoming glabrate and gray or yellowish with few inconspicuous lenticels; buds about 3 mm. long, ovoid, obtuse, gray-puberulent; stipules tardily deciduous from about the terminal bud, about 5 mm. long, very finely subulate, pubescent; leaves deciduous, thin-membranous, to 20 cm. long and 12 cm. broad, usually smaller, narrowly obovate in outline or broadly so, apices acute or sometimes rounded, bases cuneate or attenuately acute; blades twice or thrice incised on each side, the lobes obtuse, acuminate-tipped, progressively shortened downward, the uppermost clavate and coarsely toothed, the sinuses deep, broadly rounded or angularly flattened along a line parallel to the midrib, margins minutely revolute, upper surfaces glabrous and lustrous, lower surfaces minutely villous and dull-green or glaucous-appressed-tomentose; petioles to 2 cm. long, sparsely pubescent; *staminate catkins* 4-6 cm. long, densely or loosely flowered, sparsely stellate-pubescent, the perianth irregularly lobed, the anthers scarcely exerted; *pistillate catkins* 1-2 cm. long, 2- or 3-flowered distally, densely short-tomentose; fruit annual, solitary or rarely paired on a tomentose or glabrate peduncle to 4 cm. long and 1-1.5 mm. thick; cups to 3 cm. broad and 2 cm. deep, hemispheric or spheroid, the base usually broadly flattened, the mouth much-constricted, sometimes forming a minute orifice and sometimes rather open, the lower scales coarse and much-thickened, those about the margin small, thin and appressed; acorns hemispheric or rarely ovoid, usually wholly contained in the cup but rarely only half-included. In moist forests along streams in the timber region of e. Tex.; e. to the Atl., n. to Md. and Mo.

3. *Quercus alba* L. WHITE OAK. Large or sometimes small trees; twigs to 3.5 mm. thick, from sparsely or densely loose-tomentose soon becoming glabrous and grayish-brown with few inconspicuous lenticels; buds 3-4 mm. long, subglobose to ovoid, sparsely

pubescent or glabrate, reddish-brown; stipules 8-12 mm. long, ligulate, pubescent dorsally, early caducous; leaves deciduous (dead leaves remaining on the tree late in winter), thin but firm and subcoriaceous, to 15 cm. long and 10 cm. broad, obovate in outline, apices broadly rounded, bases cuneate or obtusely cuneate; blade 4- or 5-lobed on each side, the lobes either long and narrow or short and broad but always rounded, entire or rarely again toothed or shallowly lobed, sinuses deep or rarely shallow, usually narrow but rounded at bottom, upper surfaces from sparsely stellate-pubescent or densely tomentose promptly glabrate and slightly lustrous, lower surfaces similarly glabrate and minutely white-punctate by persistence of hair bases, densely tomentose leaves therefore obviously glaucous beneath upon glabrescence; petioles to 18 mm. long, glabrate; *staminate catkins* to 10 cm. long, loosely or rather closely flowered, loosely tomentose, the perianth deeply incised with very narrow lobes, anthers little-exserted; *pistillate catkins* to 15 mm. long, 2- or 3-flowered distally, from tomentose glabrate with the twigs; fruit annual, solitary, paired or ternate, subsessile or on a glabrate peduncle to 25 mm. long and 2.5 mm. thick; cups 1.5-3 cm. broad, to about 1 cm. deep, deeply cut-shaped to saucer-shaped, margins smooth, the scales coarsely thickened and short-fulvous-tomentose; acorns to 25 mm. long and 17 mm. broad, narrowly ovoid, usually narrowed toward the apex, one fourth or one third enclosed or included at the base only. In moist forests in the timber region of e. Tex.; e. to the Atl. and n. to Can.

4. *Quercus Prinus* L. CHESTNUT OAK. Large trees; twigs to 4 mm. thick, shallowly fluted, from very sparsely villous becoming glabrate and reddish- or grayish-brown; buds 5-7 mm. long, 2.5-4.5 mm. broad, acutely ovoid, brown, noticeably short-pubescent; stipules about 8 mm. long, ligulate, pubescent, very promptly caducous; leaves deciduous, to 20 cm. long and 10 cm. broad, obovate in outline, apices usually acute, rarely rounded, bases rounded or cuneate; blade repandly coarsely toothed or finely lobed, upper surfaces glabrous or sparsely pubescent along the midrib, somewhat lustrous, lower surfaces dull, finely villous-short-tomentose or sparsely so, white-punctate, appearing glaucous in sparsely pubescent forms; veins 12 to 15 on each side, each passing into a tooth or lobe; petioles 2-3 cm. long, villous but usually glabrate in age; *pistillate catkins* 5-10 mm. long, 1- to 3-flowered, tomentose; fruit annual, large, solitary, paired or ternate, subsessile or on a peduncle to 2 cm. long and 4 mm. thick; cups 2-4 cm. broad, 1.5-2 cm. deep, cup-shaped or hemispheric, the base round, margins thin, slightly roughened by projecting scale apices; cup scales very coarse, obviously thickened, triangular but the uppermost with narrowed apices, very loosely appressed, arranged rather distinctly in diagonal rows, densely fulvous-puberulent all over; acorns to 3 cm. long and 2.75 cm. broad, broadly ovoid, basally flat, apically rounded, puberulent, about one half included. *Q. Houstoniana* C. H. Mull., *Q. Muehlenbergii* of Cory & Parks, non Engelm. In moist forests of the timber region of e. Tex.; e. to the Atl. and n. to Del. and Mo.

5. *Quercus Muehlenbergii* Engelm. ЧИМКАРИН OAK. Moderate-sized or large trees; twigs from sparsely fine-pubescent soon becoming glabrate and brown, graying the second year, fluted, the few lenticels pale and rather conspicuous; buds 3-3.5 mm. long, 2-2.5 mm. broad, subrotund to broadly ovoid, apex rounded, brown or reddish-brown, very sparsely pubescent; stipules 3-4 mm. long, ligulate, delicate, very early caducous; leaves deciduous, coriaceous, to 20 cm. long and 10 cm. broad, usually much smaller, lanceolate to oblanceolate or usually obovate in outline, only rarely broadest at or below the middle, apices from short-acute to acuminate, bases truncate to cuneate, margins quite regularly repandly toothed or shallow-lobed, the teeth or lobes mucronate-tipped, upper surfaces glabrate and lustrous-dark-green, lower surfaces glaucous, the apparently glabrate surfaces liberally sprinkled with minute appressed stellate hairs; veins about 8 to 12 on each side, regularly passing into the teeth; petioles 1-3 cm. long, sparsely pubescent or glabrate; *staminate catkins* 4-6 cm. long, rather loosely flowered, sparsely pubescent; anthers well-exserted; *pistillate catkins* to 2 cm. long, 1- to 3-flowered; fruit annual, solitary or paired, subsessile or short-pedunculate; cups to 22 mm. broad and 12 mm. high, deeply or shallowly cup-shaped, base rounded, margins either rather coarse and thick or tending to be thin and flaring; cup scales broadly triangular, moderately thickened, rather loosely appressed short-gray-pubescent; acorns to 25 mm. long and 2 cm. thick, oblong to ovoid, light brown, glabrate except about the apex, about one fourth or one third included. *Q. prinoides* Coult., non Willd., *Q. Prinus* Coult., non L., *Q.*

Brayi Small. In calcareous upland forests of n.e., cen. and w. Tex.; e. to the Atl., n. to Me. and Wisc., w. into s. N.M. and n. Mex.

6. *Quercus glaucoides* Mart. & Gal. Shrubs to moderate-sized trees; twigs to 3 mm. thick, fluted, glabrous or from loosely stellate-tomentose becoming glabrate or more or less persistently pubescent, brown or grayish-brown, with few prominent light lenticels; buds very variable, about 2 mm. long and ovoid or as much as 6 mm. long and conic, in either case acute or subacute, sparsely pubescent, dark-brown; stipules promptly or tardily caducous, about 5 mm. long, the terminal ones subulate, the lateral ones ligulate, dorsally pubescent; leaves deciduous, rather thick and coriaceous or hard, to 12 cm. long and 6 cm. broad, usually much smaller, oblong or elliptic to obovate or ovate, the apices broadly rounded, bases usually rounded but ranging from cordate to cuneate, irregularly sinuate or few-lobed or rarely entire, margins cartilaginously thickened but not revolute, upper surfaces glabrous, dull bluish- or grayish-green, rarely darker, lower surfaces from stellate-floccose to promptly glabrate or with patches of hairs persistent in protected places, lighter, usually quite glaucous from microscopic wax particles; petioles to 15 mm. long, rather slender, glabrate, the pulvinus usually pruinose; *staminate catkins* 3-6 cm. long, very loosely flowered, sparsely tomentose, the subglobose anthers moderately exerted from the deeply cleft perianth; *pistillate catkins* about 5 mm. long, 1- to 3-flowered distally; fruit annual, small, solitary or paired, subsessile or on a peduncle to 1 cm. long; cups to 18 mm. broad, 4-6 mm. high, from shallowly cup-shaped to usually saucer-shaped, basally rounded or flat, the margins often thickened (as though woody) or normally thin; cup scales broadly ovate, apically rounded, often coarsely thickened (including even the apex) or only moderately thickened at the minutely tomentose base and the thin apex closely appressed, nearly glabrous, dark-reddish-brown; acorns to 2 cm. long and 14 mm. broad, conic to ovoid or subcylindric, glabrous except the apex, light-brown, one fourth included or enclosed at the base only. *Q. Laceyi* Small, *Q. glaucophylla* v. Seem., *Q. porphyrogenita* Trel. On limestone escarpment and canyons of the Edwards Plateau in cen. Tex.; also n.e. Mex.

7. *Quercus depressipes* Trel. Low shrubs to about 1 m. tall, often forming dense thickets by stolons or growing singly; twigs 1-1.5 mm. thick, shallowly fluted, tan-brown becoming reddish-gray with few inconspicuous lenticels, glabrate or fulvous-tomentose; buds 1-1.5 mm. long, subglobose, tan-brown, glabrate or the scales inconspicuously ciliate; stipules early-caducous, 3-5 mm. long, ligulate, rose- or straw-colored, ciliate above the middle; leaves subevergreen, thick and coriaceous, to 3 cm. long and 12 mm. broad, oblong to elliptic, broadly rounded to subacute at apices, moderately or deeply cordate at bases, margins entire to usually inconspicuously few-toothed above the middle, somewhat revolute, both surfaces dull gray-green or glaucous, completely glabrous or a few stellate hairs on the midrib; petioles 1-2 mm. long or rarely longer, strongly depressed in the cordate leaf bases, rose-colored with a glaucous bloom, glabrous or sparsely stellate-hairy like the twigs; *staminate catkins* to 2 cm. long, somewhat pubescent, rather closely flowered, the glabrous roundish anthers little-exserted; *pistillate catkins* rather consistently 2-flowered on a short stellately pubescent or glabrous peduncle; fruit annual, paired on a stellate or glabrous peduncle 7-15 mm. long; cups 8-10 mm. broad, 4-6 mm. high, goblet-shaped, the base somewhat constricted or rounded; cup scales moderately thickened and densely gray-tomentose at base, the apices reddish-brown, dorsally glabrous and ciliate, rather closely appressed; acorns to 15 mm. long and 1 cm. broad, elliptic to ovoid, apically rounded, tan-brown, transiently glaucous, glabrous, one fourth to one half included. On openly wooded grassland, usually at high elev. in the Davis Mts. of the Trans-Pecos; also n. Mex.

8. *Quercus Hinckleyi* C. H. Mull. Intricately branched shrubs forming coarse thickets to 7.5 dm. tall; twigs 1-1.5 mm. thick, glabrous or only an occasional minute stellate hair, light-brown and pruinose, becoming glaucous-waxy the second season, lenticels very obscure; buds minute, less than 1 mm. long, subrotund, the scales glabrous and reddish-brown except for the strikingly ciliate margins; stipules tardily deciduous, about 2 mm. long, ligulate, loosely hairy; leaves persistent at least 2 seasons, thick and coriaceous, very small, to 15 mm. long and about as broad, subrotund in outline, occasionally broader than long, cordate or auriculate at bases, acute or obtuse but spine-tipped at apices, glabrous and glaucous on both surfaces, margins markedly crisped, coarsely 2- or

3-toothed on each side (the teeth markedly spinescent), scarcely revolute but strikingly cartilaginous-thickened; veins very obscure, the principal ones passing into the teeth; petioles to 2 mm. long, glabrous and pruinose, rose-tinted; staminate catkins very small, usually 3-5 mm. long, few-flowered on a loosely tomentose peduncle, the rounded anthers moderately exerted from the lanate calyx; fruit annual, solitary, sessile or on peduncles scarcely 4 mm. long; cups to 15 mm. broad, 1-3 mm. deep, very shallowly saucer-shaped, margins irregularly undulate; cup scales very small, basally much-thickened and pubescent, apically tightly appressed and glabrous except for the ciliate margins; acorns ovoid, 8-12 mm. broad, glabrous, included at base only. On dry slopes at about 4500 ft. elev. n.w. of Solitario Peak, Presidio Co.; endemic.

9. *Quercus Gambelii* Nutt. GAMBEL OAK. Shrubs or small trees, sometimes quite large; twigs to 2 mm. thick, glabrous or stellate-pubescent, brown or reddish-brown with few inconspicuous lenticels; buds about 3 mm. long, 2-2.5 mm. broad, ovoid, acute or obtuse, brown, sparsely pubescent; stipules caducous or persistent about the terminal bud, 4-6 mm. long, subulate, pubescent; leaves deciduous, membranous, to 16 cm. long and 8 cm. broad, usually much smaller, elliptic to obovate or oblong in outline, apices rounded, bases truncate to cuneate, blades deeply incised with 4 to 6 oblong, entire or coarsely toothed, rounded or subacute lobes, the sinuses acute, narrowed or narrowly rounded at the base, reaching more than halfway to the midrib, upper surfaces from minutely stellate-tomentose becoming apparently glabrate and dark-lustrous-green but persistently microscopically spreading-pubescent, lower surfaces from densely stellate-tomentose variously persistently villous or velvety, especially about the midrib, or becoming glabrate, dull-green, sometimes glaucous; veins 4 to 6 on each side, each passing into a lobe; petioles to 2 cm. long, pubescent or partially glabrate with the lower leaf surface; *staminate catkins* 2-3 cm. long, rather loosely flowered, sparsely tomentose, the anthers moderately exerted from the deeply incised perianth; *pistillate catkins* 3-7 mm. long, 1- to 3-flowered distally; fruit annual, small, solitary or paired, sessile or on a peduncle to 1 cm. long; cups 7-15 mm. broad, 5-8 mm. high, deeply cup-shaped, bases round, margins thin and smooth; cup scales ovate, markedly thickened, the short narrowly rounded apices closely appressed, the thin margins very narrow, basally gray-tomentulose, the apices sparsely so or glabrous; acorns 12-15 mm. long, 8-10 mm. broad, ovoid to ellipsoid, light-brown, nearly glabrous, about one half included. *Q. novomexicana* (A.DC.) Rydb. On slopes and valley floors at high elev. in the Trans-Pecos; from Tex. to Colo., Ut. and n. Mex.

10. *Quercus undulata* Torr. Shrubs or rarely small trees; twigs about 1.5 mm. thick, obscurely fluted, densely or moderately tomentose, more or less completely glabrate the second year and gray with few inconspicuous lenticels; buds 1-2 mm. long, round-ovoid, pubescent or glabrate, reddish-brown; stipules persistent or soon caducous, 3-5 mm. long, subulate, pubescent; leaves deciduous or subevergreen, rather thick and coriaceous, usually 4-6 cm. long and 2-3 cm. broad, elliptic or oblong in outline, apices obtuse or sometimes nearly acute, truncate to rounded or cuneate at bases; blade coarsely and irregularly toothed or shallowly lobed, the teeth or lobes mucronate-tipped, upper surfaces sparsely stellate-pubescent, often scabrous, dark-green, somewhat lustrous, lower surfaces either sparsely or densely soft-stellate-pubescent, light-green, dull; petioles to 7 mm. long, pubescent like the lower leaf surface; fruit annual, solitary or paired, sessile or on a pubescent or tomentose peduncle to 1 cm. long; cups 1-1.2 cm. broad, 5-8 mm. high, shallowly or deeply cup-shaped, bases rounded, margins thin; cup scales triangular-ovate, the upper ones much-narrowed apically, much-thickened and closely tomentose, the thin apices nearly glabrous and closely appressed; acorns about 1.5 cm. long and 1 cm. broad, cylindrical or narrowly ovate, light-brown, glabrous, about one third included. *Q. Fendleri* Liebm., *Q. obtusifolia* (A.DC.) Rydb., non D. Don. Rocky slopes at high elev. in w. Tex.; n. to Colo. and s. to Coah.

11. *Quercus stellata* Wang. POST OAK. Moderate-sized trees; twigs to 4 mm. thick, fluted, usually flavescent-tomentose or farinaceous at first or rarely sparsely spreading-stellate-pubescent, variously glabrate with age or the tomentum turning gray; buds to 4 mm. long and 3 mm. broad at maturity, ovoid, rounded or sometimes acute, reddish-brown, sparsely pubescent; stipules 3-5 mm. long, very promptly caducous; leaves deciduous, rather thick, hard and membranous, usually about 8 cm. long and 6 cm.

broad, xeric forms often 4 cm. long and 2 cm. broad, mesic forms about 15 cm. long and 10 cm. broad, obovate to elliptic or obtriangular in outline, apices rounded, bases cuneate to cordate; blades undulately or deeply 2- to 4-lobed on each side, the principal upper pair often oblong or even clavate and perpendicular to the midrib so that with the narrowed apical and basal portions the blade is strikingly cruciform, upper surfaces lustrous and glabrous except for a sprinkling of minute stellate hairs, lower surfaces dull, more densely stellate-pubescent or glabrate, often quite glaucous; petioles to 15 mm. long, stellate-pubescent or glabrate as the lower leaf surface; *staminate catkins* 5-8 cm. long, rather loosely flowered, rachis flavo-tomentulose (if the twigs are likewise) or loosely spreading-pubescent (if the twigs are spreading-pubescent or glabrate); anthers pubescent, moderately exerted from the shallowly lobed and sparsely hairy perianth; *pistillate catkins* 3-10 mm. long or sometimes longer, 1- to 3-flowered, the pubescence closely similar to that of the twig; fruit annual, solitary or paired, moderate-sized or rarely large, subsessile or short-peduncled or the peduncle as much as 4 cm. long; cups 12-25 mm. broad, to 18 mm. high, deeply cup-shaped or sometimes goblet-shaped, bases rounded or sometimes constricted, margins thin or very thick and almost inrolled; cup scales oblong to triangular-ovate or broader, moderately or markedly thickened basally, finely pubescent; acorns to 3 cm. long and 18 mm. broad, usually smaller, subglobose to ellipsoid or even subfusiform and very acute, glabrous or very finely pubescent, two thirds included or covered at the base only. Dry upland woods, frequently on sandy soil, in cen. Tex. (one of the dominant species of the Cross Timbers) and the timber region of e. Tex.; e. to the Atl. and n. to Mass. and Kan.

11a. *Quercus stellata* × *Q. sinuata* var. *breviloba*. Twigs densely fulvous-tomentulose; leaves small and irregularly round-lobed as in the xerophytic westernmost forms of *Q. stellata*, the upper surfaces glabrate and very glossy, lower surfaces glossy although moderately pubescent with minute tightly appressed stellate hairs or densely stellate-pubescent and dull-white or gray; fruit intermediate between the parental forms. Sparse with both parents on mixed gravel and limestone banks.

12. *Quercus similis* Ashe. **BOTTOMLAND POST OAK.** Moderate to large trees; twigs 2-3 mm. thick, only slightly fluted, persistently gray-puberulent to velvety-tomentulose; buds 2-3 mm. long, ovoid, pubescent basally, brown; stipules 3-5 mm. long, subulate, pubescent, caducous or only those of the terminal buds persistent; leaves deciduous, thin and membranous, about 12 cm. long and 8 cm. broad (as little as 5 cm. long or to 16 cm. long), obovate, usually 2 pairs of lateral lobes with the apical pair sometimes clavate but the blade scarcely cruciform, basally narrow, cuneate to rounded, margins minutely revolute, lower surface minutely and sparsely stellate-puberulent, somewhat gray, upper surface glabrous and glossy-green at maturity; petioles 3-10 mm. long, pubescent like the twigs; pistillate catkins 2-10 mm. long, 1- to 3-flowered; fruit annual, solitary or paired, moderate-sized, short-peduncled, very similar to *Q. stellata*. *Q. stellata* var. *paludosa* Sarg., *Q. Ashei* Sterrett. The common post oak of wet stream bottoms in e. Tex.; s. Ark. and La., e. to S.C.

The upper terraces of some streams, particularly in Louisiana, exhibit intermediates between *Q. similis* and *Q. stellata* to which *Q. mississippiensis* Ashe is applicable.

13. *Quercus Boyntonii* Beadle. Rhizomatous shrubs 2-30 (-50) dm. tall, trailing or sometimes semierect; twigs 1.5-3 mm. thick, densely fulvous-tomentulose with a mixture of simple appressed glandular hairs and moderately spreading stellate hairs, the pubescence darkening and persisting through the second season; buds 2-3 (-4) mm. long, ovoid, acute or sometimes rounded, russet, sparsely pubescent; stipules deciduous, 3-5 mm. long, subulate, sparsely hairy; leaves deciduous or subevergreen, thin and rather soft, 5-10 (-12) cm. long, 2-6 (-8) cm. broad, cuneate to oblanceolate or obovate to oblong, characteristically roundly 3-lobed at the broad apex or sometimes 5-lobed above the entire cuneate base, margins minutely cartilaginous-revolute, upper surface glossy, when young sparsely glandular-puberulent and with scattered stellate hairs, at length glabrate or the stellate pubescence persistent especially about the midrib, lower surface dull, persistently fulvous-glandular-puberulent and stellate-pubescent or the pubescence silvery; the veins about 6 to 8 on each side, very irregular and with some intermediates, those passing into the lateral lobes very prominent, slightly raised above and prominently so beneath, markedly and irregularly branching and anastomosing; petioles 5-10 mm.

long, moderately slender, persistently pubescent like the twigs; *staminate catkins* 3-6 cm. long, fulvous-glandular-puberulent and stellate-pubescent, the puberulent anthers well-exserted from the ciliate perianth; *pistillate catkins* about 5 mm. long, about 3-flowered, subsessile and densely fulvous-pubescent; fruit annual, solitary or paired on peduncles 2-10 (-35) mm. long; cups 10-13 mm. broad, 5-10 mm. high, deeply cup-shaped or more shallow, the scales densely fulvous- or silvery-tomentulose, the bases moderately or markedly thickened, the thin apices closely appressed; acorns 10-17 mm. long, 7-10 mm. thick, broadly or narrowly ovoid, the ends broadly rounded, brown and minutely puberulent especially about the apex, about one half or only one third included. *Q. stellata* var. *Boynntonii* (Beadle) Sarg. Locally abundant on deep sands in loblolly pine forests in e.-cen. Tex., sporadically to e. Ala.

14. *Quercus* *Margaretta* Ashe. SAND POST OAK, RUNNER OAK. Low or moderate-sized shrubs branched from the base; twigs 1.5-2.5 mm. thick, fluted, glabrous and dull-brown or at most very sparsely spreading-stellate, the lenticels very inconspicuous; buds 3-3.5 mm. long, about 2 mm. broad, reddish-brown, from sparingly pubescent becoming glabrate; stipules about 5 mm. long, subulate, pubescent, promptly caducous or sometimes persistent about the terminal bud; leaves deciduous, hard and membranous, 5-12 cm. long, 3.5-10 cm. broad, obovate to oblong or elliptic in outline, apices broadly rounded, bases cuneate to rounded, blade 2- or 3-lobed on each side, sinuses deep, either broad or narrowed but rounded at the bottom, lobes rounded or clavate, simple or obscurely toothed or undulate, margins revolute, upper surfaces very sparsely sprinkled with minute stellate hairs or entirely glabrate, glossy-green, lower surfaces from densely crisped-stellate-tomentose becoming glabrate or more or less persistently pubescent, the lamina dull and somewhat glaucous; petioles 3-15 mm. long, tomentose or glabrate; fruit annual, solitary or paired, subsessile or short-stalked; cups 13-18 mm. broad, 7-10 mm. deep, deeply cup-shaped, bases rounded; cup scales oblong to ovate, very slightly thickened, the narrowed apices loosely appressed, densely short-pubescent; acorns 1-1.5 cm. long, 9-13 mm. broad, ovoid, light-brown, glabrous, about one half included. *Q. stellata* var. *Margaretta* (Ashe) Sarg. Low woodlands in deep sandy soil in cen. and e. Tex.; e. to the Atl. and n. to Va. and Okla.

14a. *Quercus* *Margaretta* × *Q. stellata*. Small trees; twigs variously intermediate between the glabrous and velvety-tomentulose forms of the parents, frequently spreading-stellate-pubescent; buds dull-red as in *Q. Margaretta*; leaves small, more prominently clavate-lobed or cruciform than in *Q. Margaretta*, more persistently villous beneath than in *Q. stellata*; fruit similar to *Q. Margaretta*. Scattered in n.-cen. and e. Tex. on sand beds with *Q. Margaretta* adj. to gravel and clay soils bearing *Q. stellata*.

15. *Quercus* *Drummondii* Liebm. POST OAK. Small or moderate trees; twigs 2.5-4 mm. thick, glabrous and light-brown or sparingly villous with spreading stellate hairs, the light lenticels becoming quite prominent; buds 4-7 mm. long, broadly or narrowly ovoid, scarcely acute, glabrous and dull-red or brown or sparingly brown-puberulent about the apex; leaves deciduous, rather thick and coriaceous, to 12 cm. long and 9 cm. broad, obovate in outline, deeply incised (one half to two thirds the distance to the midrib) by narrow or even closed sinuses, rarely the sinuses rounded, lobes 2 or 3 on each side, oblong, rounded or truncate or clavate, upper surfaces from sparsely spreading-stellate-hairy soon glabrate and glossy, lower surfaces from loosely tomentose or villous with spreading stellate hairs at length glabrate or persistently pubescent, especially along the midrib and veins, dull and somewhat glaucous where denuded; veins very irregular, the primary ones passing into the lobes and of corresponding number; petioles to 12 mm. long, from stellately pubescent usually glabrate or sometimes persistently pubescent; *staminate catkins* 5-6 cm. long, sparsely villous, rather loosely flowered; *pistillate catkins* very short, the subsessile involucre borne singly or in pairs, rarely on obvious short peduncles; fruit annual, moderate, solitary or paired, subsessile or borne on glabrous peduncles to 8 mm. long; cups 15-18 mm. broad, deeply cup-shaped or hemispheric; cup scales moderately thickened basally, attenuately narrowed apically, closely appressed, minutely buff or gray-pubescent; acorns 1.5-2 cm. long, about 1.3 cm. broad, narrowly ovoid or elliptic, glabrous and light-brown, one third to one half included. In deep sand belts of cen. Tex., eastw.

16. *Quercus* *Havardii* Rydb. SHIN OAK, SHINNERY OAK. Very low shrubs spreading by rhizomes, or small trees; twigs to 3 mm. thick, subterete or fluted, brown when exposed,

glabrous or more or less densely short grayish- or yellowish-tomentose, the second season glabrate or nearly so and gray, lenticels inconspicuous; buds about 2 mm. long, subglobose, sparsely pubescent, dark-reddish-brown; stipules caducous or persistent for a time, about 5 mm. long, filiform to subulate, pubescent; leaves deciduous, rather thick and hard, very polymorphic, to 10 cm. long and 5 cm. broad, from lanceolate or oblanceolate to usually oblong or elliptic or ovate to obovate, apices broadly rounded or rarely acute, bases rounded to cuneate, subentire to undulate, toothed or deeply lobed, the margin flat to revolute, upper surfaces lustrous, very sparsely stellate-pubescent or glabrate, lower surfaces grayish- or yellowish-tomentulose or more sparsely pubescent; petioles to 7 mm. long, their state of pubescence closely paralleling that of the twigs; *staminate catkins* 2-3 cm. long, rather densely flowered, very sparsely pubescent, the usually pubescent anthers moderately exerted; *pistillate catkins* 3-7 mm. long, 1- to 5-flowered distally; fruit annual, solitary or paired, subsessile or short-stalked, very polymorphic and very variable in size; cups 15-25 mm. broad, 10-12 mm. high, from deeply cup-shaped to goblet-shaped, bases rounded or constricted, margins very thin and smooth or thickened, inrolled and contorted; cup scales triangular-ovate to oblong, the narrowed apices loosely appressed, bases moderately or markedly thickened, uniformly pubescent (often canescent) or the thin apices of the superior scales glabrous and reddish-brown; acorns 12-25 mm. long, 14-18 mm. broad, ovoid, glabrous and brown or glaucescent, one third to one half included. In deep sand across the s. Panhandle plains; from e. Okla., w. to s.e. N.M., n.e. Ariz. and s.e. Ut.

16a. *Quercus Havardii* × *Q. stellata*. Shrubs or small trees 1-3 m. tall, occurring in clumps; twigs densely fulvous-tomentose or glabrate; leaves to 11 cm. long and 5 cm. broad, oblong to obovate, irregularly or regularly lobed or nearly entire, sometimes distinctly square-lobed, green and sparsely stellate-puberulent above, gray and stellate-tomentulose beneath or sparingly stellate; petioles 3-8 mm. long, pubescent like the twigs; acorns and cups ranging from the small sizes of typical *Q. stellata* to the large flaring cups and the broadly ovoid acorns of *Q. Havardii*. In deep sand on hills and plains throughout the e. range of *Q. Havardii*, from the s.e. cos. of the Tex. Panhandle into Okla. and southwestw. onto the Tex. Lower Plains.

16b. *Quercus Havardii* × *Q. Mohriana*. Low shrubs; twigs white- or gray-tomentose; leaves to 11 cm. long and 9 cm. broad, oblong to ovate, entire or coarsely round-toothed, dark-green and nearly glabrous above, white-tomentose or glaucous and sparingly stellate-pubescent beneath, the veins glabrous or nearly so; cups intermediate between those of the parents. On rocky slopes at the "breaks" of the Tex. Plains with both parents.

17. *Quercus grisea* Liebm. GRAY OAK. Large shrubs to moderate-sized trees; twigs 1-2 mm. thick, obscurely fluted, sparsely or densely buff- or gray-stellate-tomentulose or tomentose, gray and partially glabrate the second and third seasons, lenticels inconspicuous; buds about 2 mm. long, round-ovoid, glabrous or sparsely pubescent, dark-reddish-brown; stipules persistent, about 3 mm. long, subulate to filiform, pubescent; leaves deciduous or at most subevergreen, thick and coriaceous, to 8 cm. long and 4 cm. broad, usually much smaller, oblong to elliptic or ovate, apices acute or sometimes obtuse, rarely rounded, bases cordate, or merely rounded, margins minutely revolute, entire or low-dentate with the teeth mucronate-tipped, upper surfaces rather dull-green, very sparsely and minutely stellate-pubescent or rarely tomentose, lower surfaces opaque, very sparsely and minutely stellate-pubescent or tomentulose, rarely tomentose; petioles to 1 cm. long, tomentose; *staminate catkins* to 7 cm. long, rather loosely flowered, villous or tomentose, the glabrous anthers well-exserted; *pistillate catkins* to 4 cm. long, 1- to 6-flowered, tomentulose; fruit annual, solitary or paired, subsessile or short- or long-stalked, peduncle to 3 cm. long; cups 8-15 mm. broad, 4-10 mm. high, from deeply goblet-shaped to deeply cup-shaped, base rounded, margins thin, simple, and smooth; cup scales broadly ovate to oblong, the lower ones slightly or markedly thickened at the canescently tomentose bases, the thin and closely appressed apices sparsely pubescent and reddish-brown, those of the upper scales narrowed and rather elongate; acorns 12-18 mm. long, 8-12 mm. broad, ovoid to narrowly ovoid or ellipsoid, light-brown, glabrous or finely pubescent, over one half included or enclosed at the base only. *Q. oblongifolia* Coult., non Torr. On rocky igneous or dolomitic slopes at moderate elev. in w. Tex.; also N.M., Ariz. and Chih.

18. *Quercus Mohriana* Buckl. SCRUB OAK, SHIN OAK. Shrubs or small trees; twigs 1-2 mm. thick, fluted, from glabrous to stellately canescent or commonly gray-tomentose; buds about 2 mm. long, round-ovoid, sparingly pubescent, dark-reddish-brown; stipules early-caducous, about 3 mm. long, subulate to filiform, pubescent; leaves evergreen or deciduous, thick and coriaceous, to 8 cm. long and 35 mm. broad, oblong or elliptic, apices rounded or rarely acute, bases rounded, rarely cuneate or cordulate, entire or undulately toothed or merely few-denticulate, margins minutely revolute, undulately crisped or flat, upper surfaces very sparsely and minutely stellate-pubescent, dark-green, lustrous, lower surfaces densely gray- or white-tomentose or in a few forms obscurely but densely tomentulose; petioles 2-5 mm. long, tomentose like the twigs; *staminate catkins* 2-3 cm. long, rather loosely flowered, sparsely pubescent, the glabrous or pubescent anthers little-exserted; *pistillate catkins* 2-8 mm. long, distally 1- to 3-flowered; fruit annual, solitary or paired, subsessile or short-stalked, the peduncle sometimes 1 cm. long, tomentose like the twigs; cups 8-18 mm. broad, 5-12 mm. high, from shallowly to very deeply cup-shaped, base rounded or flat, margin thin, simple, smooth; cup scales triangular-ovate to oblong, the lower ones coarsely thickened basally and canescent-tomentose, the upper ones usually with elongate narrowed thin reddish nearly glabrous appressed apices; acorns 8-15 mm. long, 5-12 mm. broad, ellipsoid to ovoid, sparsely pubescent, light-brown, about one half included. On limestone hills and mts. at low elev. in w. and w.-cen. Tex., n. into the Plains Country; also Coah.

18a. *Quercus Mohriana* × *Q. grisea*. A very polymorphic assemblage of plants in which perhaps one or perhaps another of the differences between the parents is eliminated. In some specimens the typical glossy-dark-green upper surfaces and canescent-tomentose lower surfaces of the leaves of *Q. Mohriana* are associated with the typically ovate leaf-shape of *Q. grisea*. In others the gray concoloration of leaf surfaces of *Q. grisea* is associated with the more prominently spreading pubescence of *Q. Mohriana*. In still others the glossy green upper surface of *Q. Mohriana* appears with the moderately pubescent gray lower surface of *Q. grisea*. Occasionally the coloration and low habit of *Q. Mohriana* are maintained although the pubescence is short and the leaf shape is that of *Q. grisea*.

19. *Quercus arizonica* Sarg. ARIZONA WHITE OAK. Small or moderate-sized trees; twigs 1.5-2.5 mm. thick, fluted, sparsely or densely stellate-tomentose, usually persistently pubescent the second season, finally gray with few inconspicuous lenticels; buds about 3 mm. long, ovoid, subacute or rounded, sparsely pubescent or glabrate, dull-russet-brown; stipules persistent or sometimes deciduous, 5-8 mm. long, filiform or filiform-subulate, pubescent; leaves evergreen or subevergreen, thick and coriaceous or at least hard, to 8 cm. long and 3 cm. broad, elliptic or oblong to usually very narrowly obovate or oblanceolate, apices acute to usually obtuse or broadly rounded, bases cordate or rounded, entire or coarsely few- or many-toothed especially about the apex, teeth mucronate-tipped, low and obscure or prominent, margins cartilaginously revolute, upper surfaces slightly lustrous, sparsely and minutely stellate-pubescent, lower surfaces dull, sparsely stellate-pubescent or subtomentose, often glaucous; petioles to 1 cm. long, sparsely stellate-pubescent or tomentose; *staminate catkins* to 3 cm. long, rachis tomentose, moderately densely flowered, the anthers not exserted from the perianth; *pistillate catkins* to 2 cm. long, short-tomentose, 2- to 6-flowered toward the distal end; fruit annual, solitary or paired, subsessile or short-stalked; cup 1-1.5 cm. broad, 5-7 mm. high, hemispheric or cup-shaped, base rounded, margin rather coarse but simple and smooth; cup scales broadly ovate, the bases coarsely thickened, tomentose, the thin rounded apices closely appressed, puberulent, brown; acorns 8-12 mm. long, ovoid, light-brown, nearly glabrous, about one half included. *Q. endemica* C. H. Mull. On rocky slopes at moderate elev. in w. Tex.; also w. to Ariz. and n. Mex.

20. *Quercus intricata* Trel. Gregarious, intricately branched low shrubs; twigs 1-1.5 mm. thick, gray- or yellow-tomentose, darkened but persistently pubescent for several seasons; buds 1-1.5 mm. long, round, from sparsely pubescent to glabrate and dark-reddish-brown; stipules persistent, about 2 mm. long, subulate or ligulate-filiform, pubescent; leaves evergreen, sometimes persisting several seasons, very thick and hard, 1-2.5 cm. long, 5-13 mm. broad, ovate to oblong, obtuse, cuneate to cordate, margins very coarsely revolute and often crisped in addition, entire or few-toothed, upper surfaces somewhat lustrous, sparsely or moderately stellate-pubescent, lower surfaces persistently

buff-tomentose or glabrate the second season; petioles 2-3 mm. long, tomentose like the twigs; *staminate catkins* 2-3 cm. long, the rachis tomentose, very sparsely flowered, the oval anthers scarcely exerted from the glabrous or sparsely pubescent perianth; *pistillate catkins* 3-10 mm. long, 1- to 5-flowered, the peduncle tomentose like the twigs; fruit annual, solitary or paired, subsessile or stalked, the peduncle to 15 mm. long, tomentose like the twigs; cups about 1 cm. broad, 7-8 mm. high, deeply cup-shaped, the bases round, margins thin and simple; cup scales ovate or narrower, the canescent-tomentose bases moderately or markedly thickened, the reddish apices thin, closely appressed, nearly glabrous; acorns 9-12 mm. long, 8-10 mm. broad, ovoid, light-brown, nearly glabrous, one third to one half included at maturity. On dry rocky slopes at moderate elev. in w. Tex.; s. through Coah. to Zac.

21. *Quercus turbinella* Greene. SCRUB OAK. Rigid shrubs or small trees to 4 m. tall; twigs 1-2.5 mm. thick, variously fluted or subterete, glabrous or usually tomentulose and becoming glabrate, from brown becoming gray with few small lenticels; buds 1-2 mm. long, round-ovoid, minutely pubescent, brown; stipules persistent or rarely caducous, 2-4 mm. long, subulate, sparsely villous; leaves evergreen or subevergreen, very thick and coriaceous, to 4 cm. long and 2 cm. broad, elliptic or ovate, apices obtuse, bases cordate or sometimes rounded, on each side coarsely 3- to 5-toothed or very shallowly lobed, each tooth or lobe (including the apical one) spinose-tipped, the spines 1-1.5 mm. long, margins cartilaginously thickened, not revolute, flat or slightly crisped-undulate, upper surfaces lustrous or rather dull, rather glaucous or bluish-green, glabrous or very sparsely and minutely stellate-pubescent, lower surfaces dull, usually glaucous, minutely simple- or stellate-puberulent, the puberulence often glandular and usually yellow or reddish thus coloring the whole under surface; petioles 1-4 mm. long, glabrous or yellow-stellate-tomentose; fruit annual, solitary or several, scattered or grouped on the distal end of a tomentulose peduncle (1-4 cm. long); cups hemispheric or shallowly cup-shaped, 8-12 mm. broad, 4-6 mm. high, bases rounded, margins simple; cup scales ovate, the moderately thickened bases canescent-tomentose, the thin closely appressed rounded apices nearly glabrous and reddish-brown; acorns to 15 mm. long and 1 cm. broad, ovoid, light-brown, minutely villous or glabrate, one half or only one fourth included. On dry slopes at low elev. in extreme w. Tex.; w. to Ut., s. Calif. and Baja Calif.

22. *Quercus rugosa* Née. NETLEAF OAK. Shrubs or usually moderate-sized trees; twigs 1-2 mm. thick, tomentose to tomentulose, variously glabrate and brown or persistently pubescent, finally gray with few inconspicuous lenticels; buds 2-4 mm. long, ovoid, obtuse, sparsely pubescent or finally glabrate, brown; stipules long-persistent, about 5 mm. long, subulate, strigose; leaves evergreen to subevergreen or appearing to be deciduous, very thick and hard, to 10 cm. long and 7 cm. broad, usually much smaller, from broadly obovate to elliptic or rarely narrowly obovate, apices broadly rounded or rarely subacute, bases deeply cordate or shallowly so, entire except for the remotely apiculate apical region or coarsely few-toothed about the apex, margins usually somewhat revolute, cartilaginously thickened, undulately crisped or flat, the whole blade characteristically concave beneath but often flat, upper surfaces lustrous, dark-green, sparsely stellate-pubescent especially about the base of the midrib, lower surfaces dull, usually glaucous, or this masked by a fulvous glandular-puberulence, from tomentulose becoming nearly glabrate or persistently pubescent especially about the midrib; petioles to 7 mm. long, from tomentose to tomentulose, either persistently pubescent or finally becoming glabrate; *staminate catkins* 3-5 cm. long, rather loosely flowered, tomentose, the anthers little-exserted; *pistillate catkins* to 7 cm. long, the peduncle tomentose or usually tomentulose, slender, 2- to 12-flowered usually distally; fruit annual, solitary or paired or in threes on the end of a slender peduncle scarcely 2 mm. thick and to 6 cm. long; cups to 15 mm. broad and 9 mm. high, from deeply cup-shaped to saucer-shaped, base rounded or somewhat conic or constricted; cup scales ovate, on very young cups the thin brown glabrous apices loosely appressed or characteristically somewhat spreading, at maturity the bases coarsely thickened or only slightly so, canescent-tomentose or obscurely tomentulose, the thin apices appressed or conspicuously spreading; acorns to 2 cm. long and 15 mm. broad, ovoid to elliptic, light-brown, glabrous or minutely villous, one half included or covered at the base only. *Q. reticulata* H. & B., *Q. diversicolor* Trel. On wooded slopes at high elev. in w. Tex.; w. to Ariz., Baja Calif. and s. to s. Mex.
